

Evolving Event-driven Programs with SignalGP: Statistics

Here, we provide fully detailed statistical test results, including the R code used to generate them. Across experiments, we performed a Kruskal-Wallis rank sum test to determine if a set was significant, and if significant, we performed a post-hoc Dunn's test, applying a Bonferroni correction for multiple comparisons. See the paper for full context.

Each post-hoc Dunn's test was performed using the FSA package.

```
library(FSA)
```

```
## ## FSA v0.8.17. See citation('FSA') if used in publication.  
## ## Run fishR() for related website and fishR('IFAR') for related book.
```

We'll set our significance threshold to 0.05.

Changing Environment Problem

In this section, we give the statistical details for the Changing Environment Problem broken down by environment-size.

First, we'll load the fitness data.

```
ce_ff_data <- read.csv("../data/chg_env/mt_final_fitness.csv")
```

A note about how treatments are named within the data: treatment names describe the parameters and their values used when running the experiment. Parameters and their values are adjacent in the name, and parameter-value combinations are separated by underscores. For example, ED1_AS1_ENV2_TSK0 indicates that event-driven (ED) signals were enabled (1), active sensors (AS) were enabled (1), and there were two environments states. In other words, ED1_AS1_ENV2_TSK0 indicates the two-state environment combined treatment. The trailing TSK0 can be ignored.

Okay, next we'll partition out different subsets of the data.

```
# two-state environment  
# -- overall data --  
ce_ff_data_2 <- ce_ff_data[grep("_ENV2_", ce_ff_data$treatment),]  
ce_ff_data_2 <- ce_ff_data_2[ce_ff_data_2$analysis == "fdom",]  
ce_ff_data_2$treatment <- relevel(ce_ff_data_2$treatment, ref="ED1_AS1_ENV2_TSK0")  
# -- teasing apart combined treatment data --  
ce_tff_data_2 <- ce_ff_data[grep("ED1_AS1_ENV2_", ce_ff_data$treatment),]  
ce_tff_data_2$treatment <- relevel(ce_tff_data_2$treatment, ref="ED1_AS1_ENV2_TSK0")  
  
# four-state environment  
# -- overall data --  
ce_ff_data_4 <- ce_ff_data[grep("_ENV4_", ce_ff_data$treatment),]  
ce_ff_data_4 <- ce_ff_data_4[ce_ff_data_4$analysis == "fdom",]  
ce_ff_data_4$treatment <- relevel(ce_ff_data_4$treatment, ref="ED1_AS1_ENV4_TSK0")  
# -- teasing apart combined treatment data --  
ce_tff_data_4 <- ce_ff_data[grep("ED1_AS1_ENV4_", ce_ff_data$treatment),]  
ce_tff_data_4$treatment <- relevel(ce_tff_data_4$treatment, ref="ED1_AS1_ENV4_TSK0")  
  
# eight-state environment
```

```

# -- overall data --
ce_ff_data_8 <- ce_ff_data[grep("_ENV8_", ce_ff_data$treatment),]
ce_ff_data_8 <- ce_ff_data_8[ce_ff_data_8$analysis == "fdom",]
ce_ff_data_8$treatment <- relevel(ce_ff_data_8$treatment, ref="ED1_AS1_ENV8_TSK0")
# -- teasing apart combined treatment data --
ce_tff_data_8 <- ce_ff_data[grep("ED1_AS1_ENV8_", ce_ff_data$treatment),]
ce_tff_data_8$treatment <- relevel(ce_tff_data_8$treatment, ref="ED1_AS1_ENV8_TSK0")

# sixteen-state environment
# -- overall data --
ce_ff_data_16 <- ce_ff_data[grep("_ENV16_", ce_ff_data$treatment),]
ce_ff_data_16 <- ce_ff_data_16[ce_ff_data_16$analysis == "fdom",]
