

This paper introduces a groundbreaking theory suggesting that the universe is structured as a seven-dimensional closed-loop system, where energy, information, and consciousness interact through an infinite network of Fibonacci-based spirals. Unlike traditional models of linear evolution, this theory proposes that energy is continuously emitted in infinite Fibonacci spirals from a central source and returns to itself in a self-reinforcing cycle, akin to the Ouroboros symbol of eternal r...

A novel aspect of this theory is the proposition that the first stable material formation from energy compression in this Fibonacci field is carbon-12, suggesting a fundamental connection between structured energy waves and the emergence of matter. This could revolutionize our understanding of matter formation, hinting that carbon-12 might not merely be a product of stellar fusion, but an inherent consequence of energy condensation within a structured fractal field.
