

# **Building a seismic event classifier in the Pacific Northwest using AI**

Distinguishing Earthquakes, Explosions & Surface Events

**Akash Kharita**  
**University of Washington, Seattle**

**Dr. Marine Denolle (UW), Dr. Alex Hutko (PNSN), Dr. Weston Thelen (CVO), Dr. Renate Hartog (PNSN), Dr. Steve Malone (PNSN)**

**2025 CRESCENT Machine Learning Technical Short Course**

**Why do we need a seismic event classifier in  
the Pacific Northwest?**

# Huge Diversity of Seismic Sources

## Subduction Zone

microseismicity

Intraplate seismicity

Low frequency tremors

Megathrust earthquakes

## 20 volcanoes

Volcanic seismicity

Glacier seismicity

Deep Long Period Seismicity

## Surface events

## Several quarries

Active source experiments

# Magnitude 3.2 earthquake ??

Rainier Rockfall

# What is this event?

# Current State of Monitoring

Snow Avalanche

Rock and Ice Fall

Debris Flow

Rock Avalanche

Surface event

Over **9k Unidentified surface events** in the PNSN catalog and this number is **continuously increasing ...**

# Current State of Monitoring

Ni et al. (2023)

To assist analysts in their decision

Confusing events, low mag, low snr

# **Why do we need a seismic event classifier in the Pacific Northwest?**

Locating them not always possible

Developing a surface event catalog

Huge number of unreviewed events

STA/LTA cannot detect emergent events

**How to build a seismic event classifier using AI?**

# Developing a seismic event classifier

## 1. Labeled Dataset

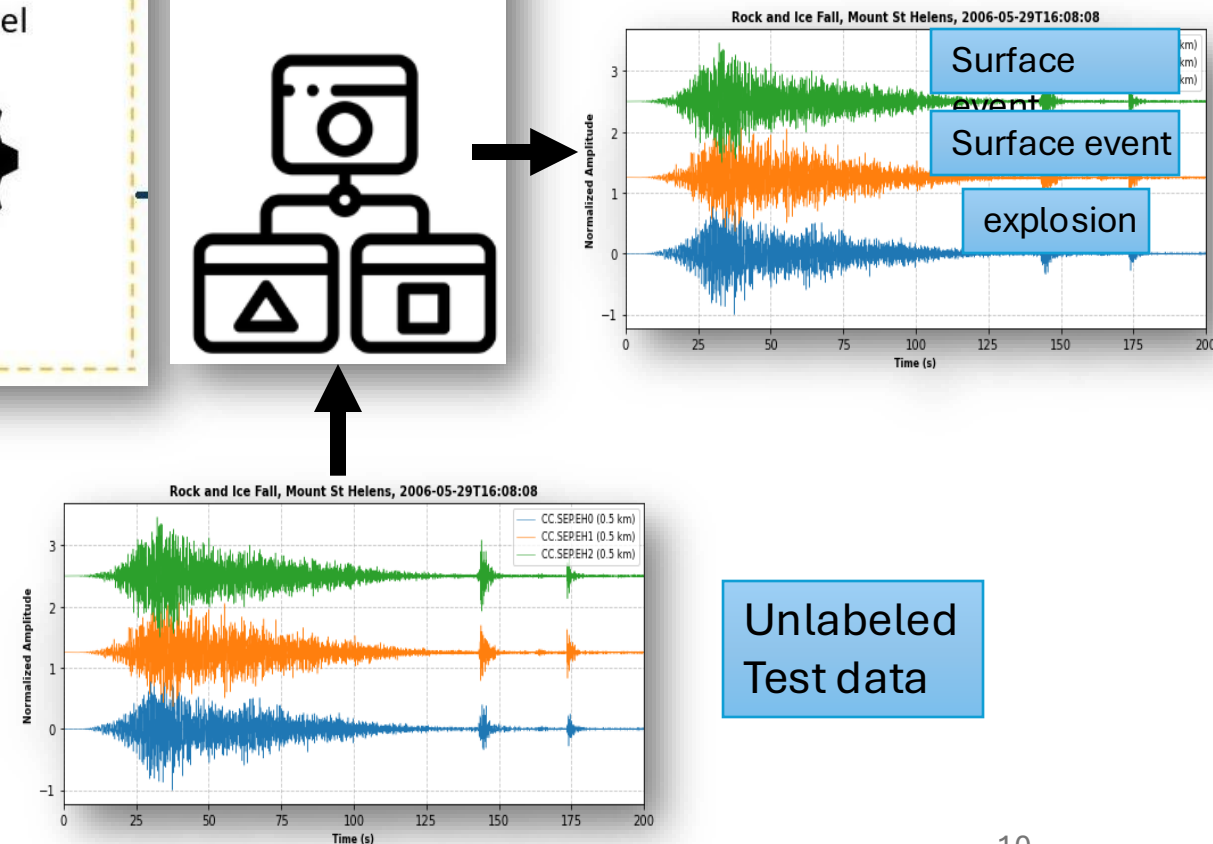

## 2. Feature Extraction

## 3. Model Training

## 4. Model Evaluation

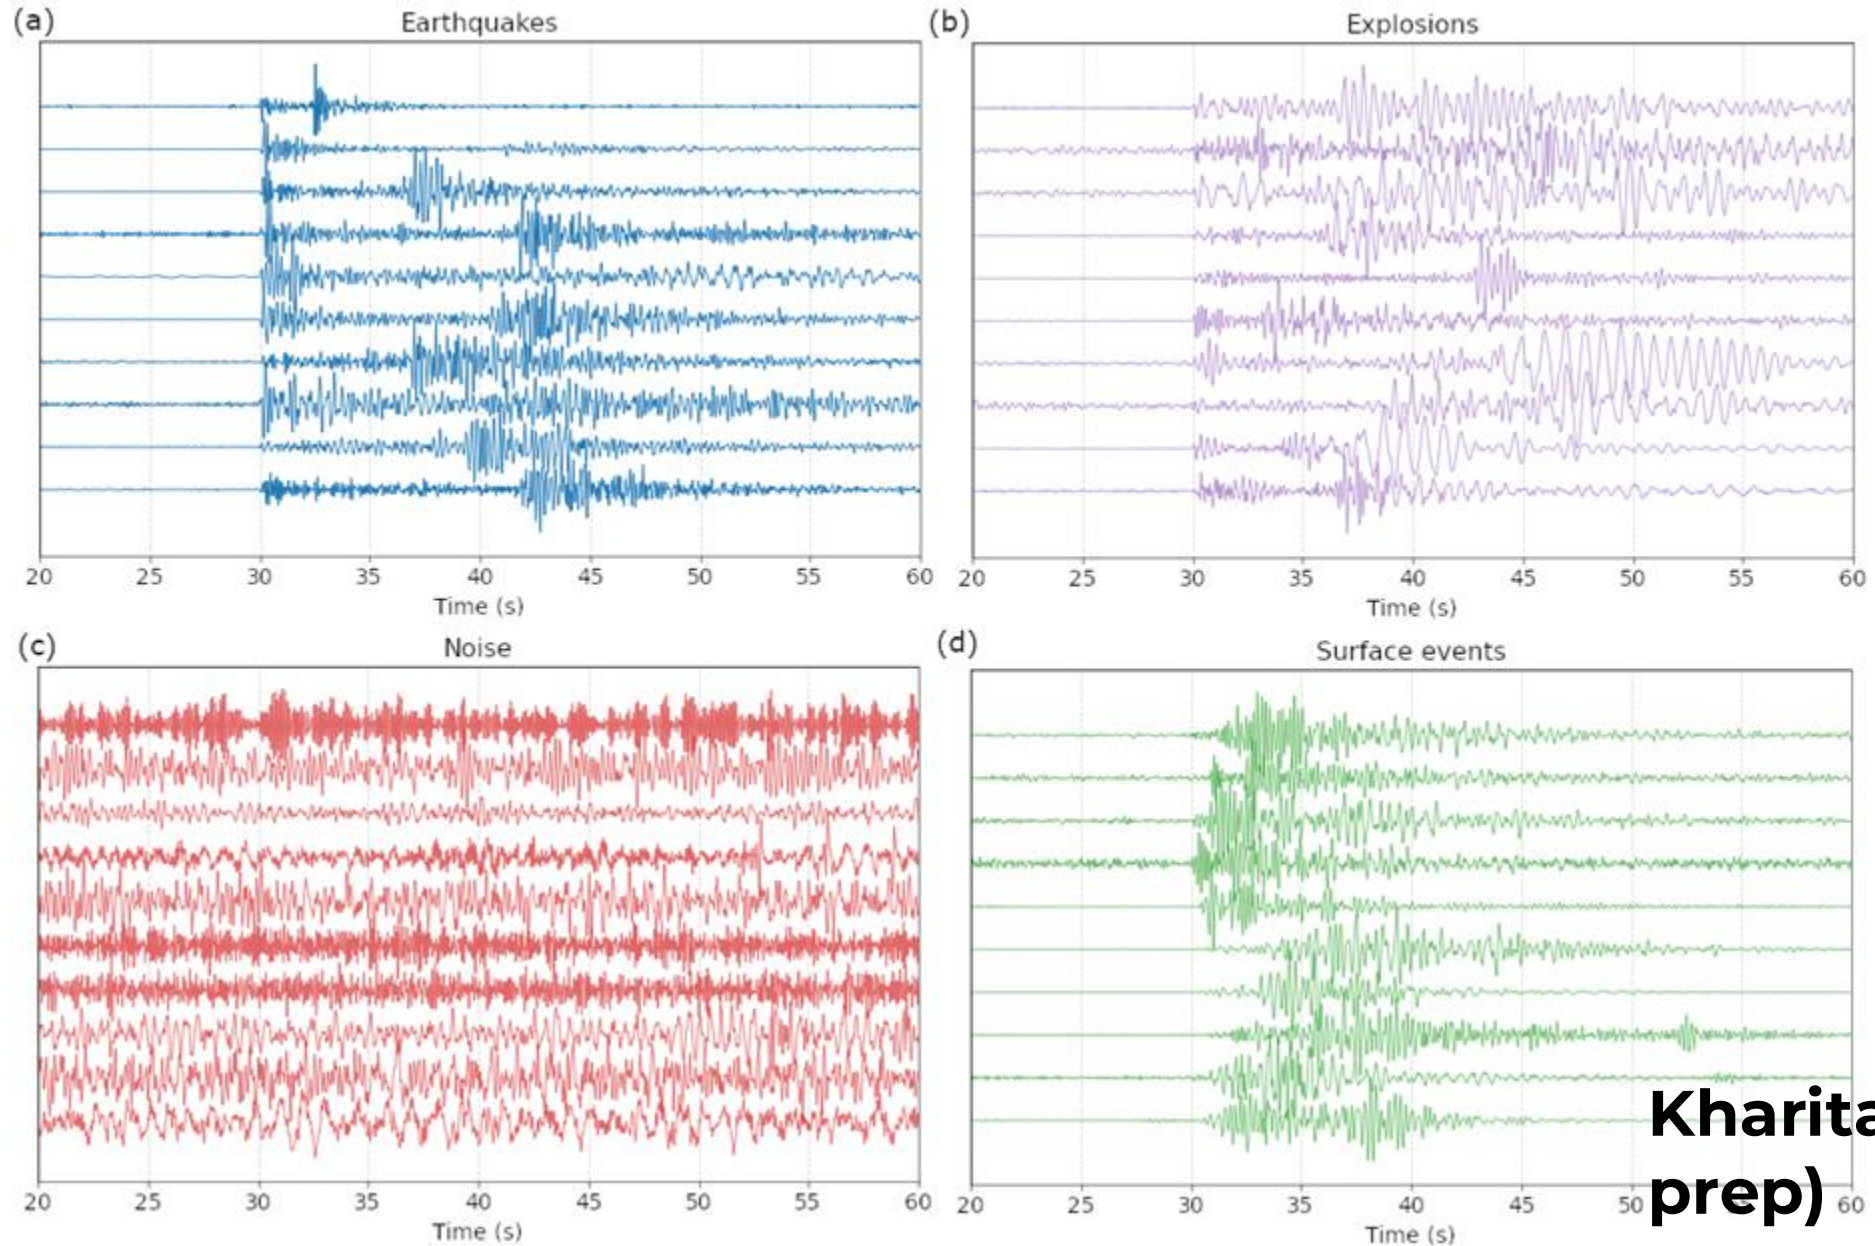

# 1. Labeled Dataset

# The PNW curated data set has diverse source types, with mainly Earthquakes, Explosions, and Surface events

**Kharita et al. (in  
prep)**

The PNW curated data set has diverse source types, with mainly Earthquakes, Explosions, and Surface events

**Impulsive, strong S, short window**

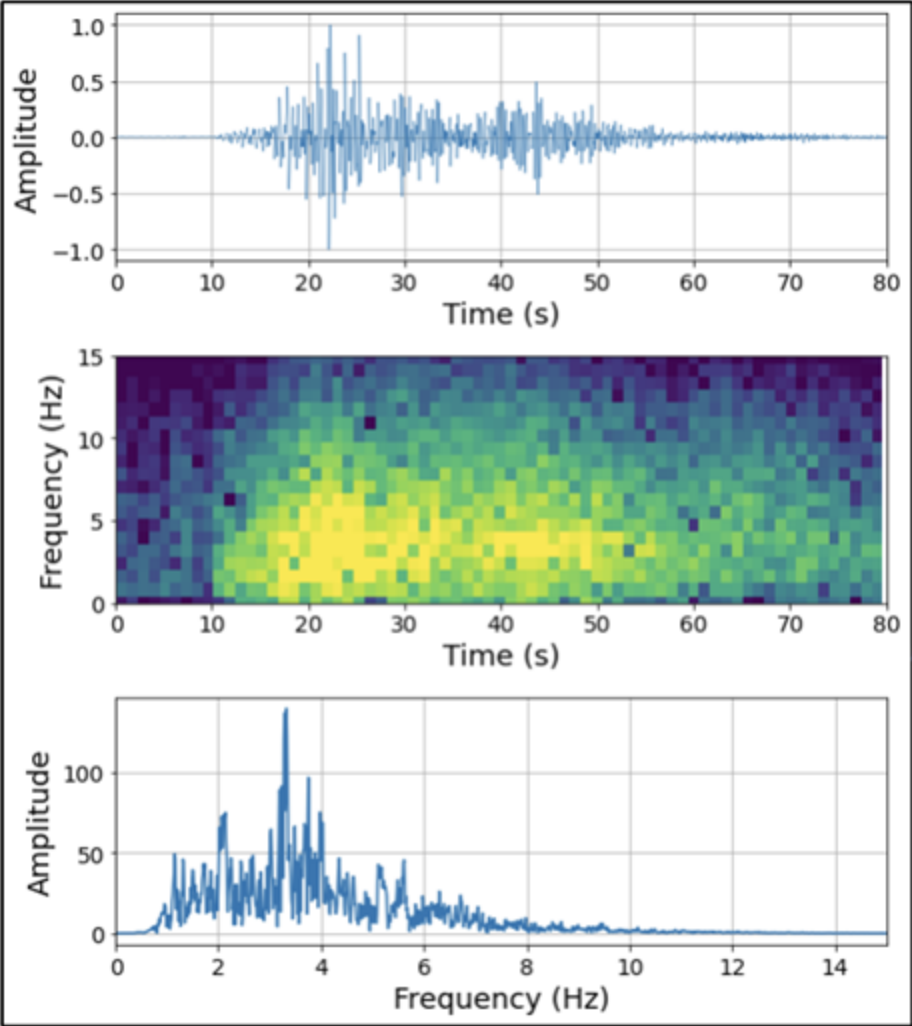

**Strong P, long coda**

**Emergent, long duration**

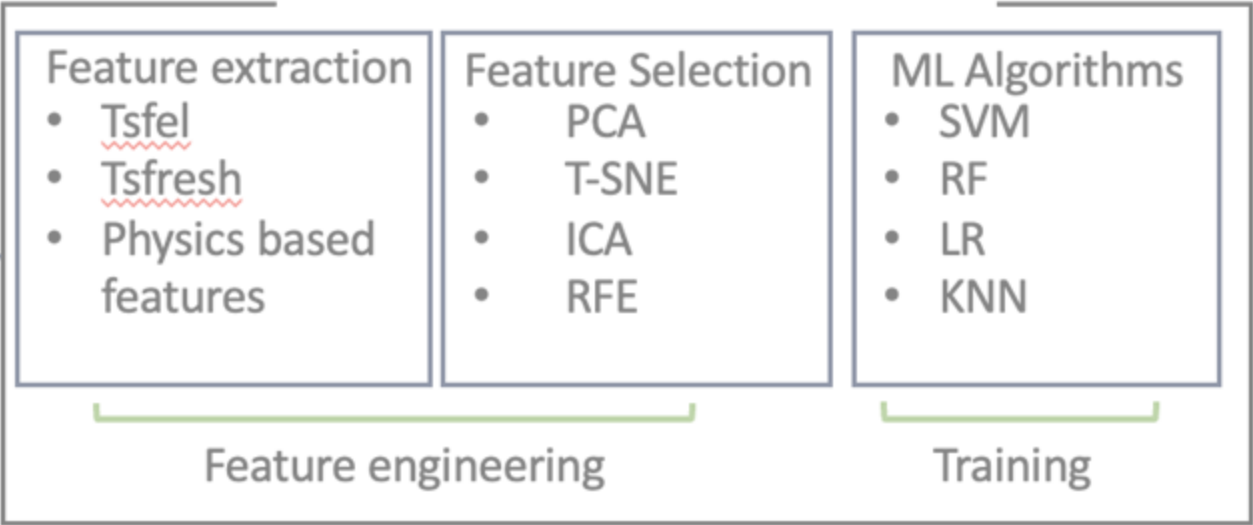

**Diffuse, no transient**

# Classic Machine Learning:

## Decision-Trees-based models always win

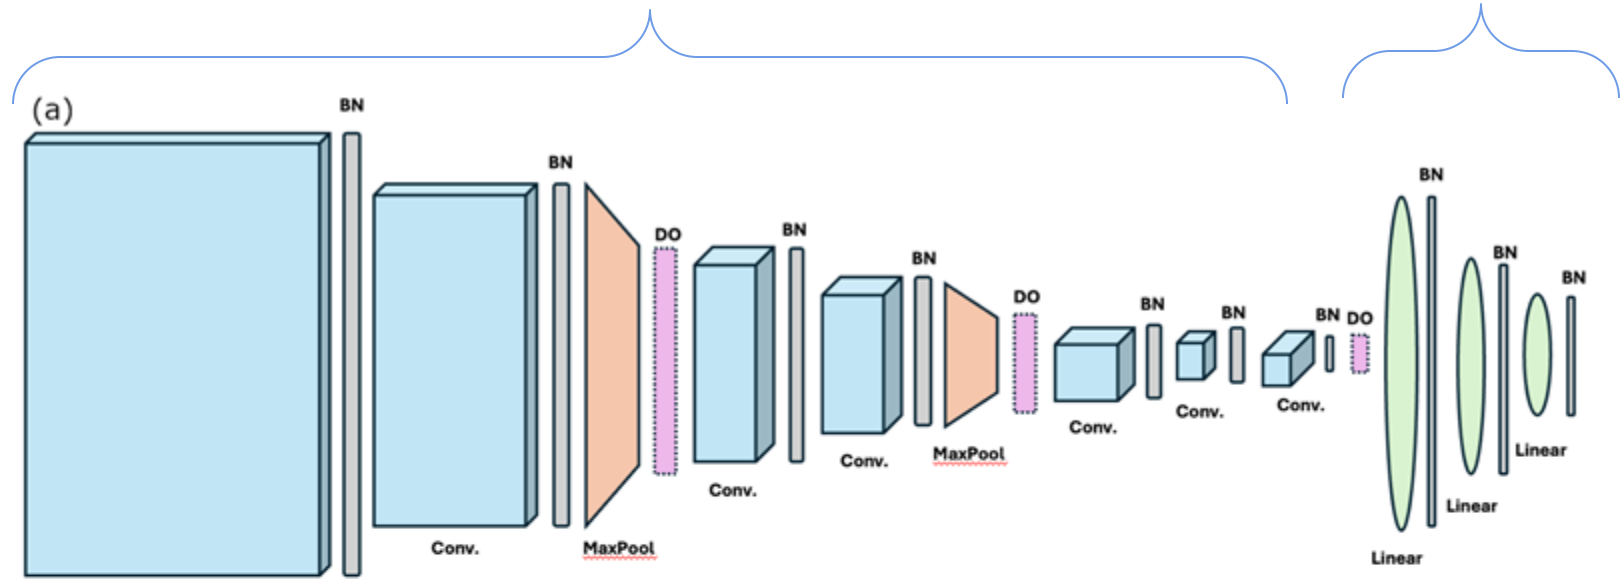

**Kharita et al. (in prep)**

# Deep Learning: CNNs are great and simple for classification

Feature extraction

classifier

Long skinny  
*QuakeXNet*

Shallow & wide  
*SeismicCNN*

Kharita et al. (in prep)

# Performance

**Deep Learning  
outperforms  
classic Machine  
Learning**

(on balanced data  
sets)

**Kharita et al. (in**

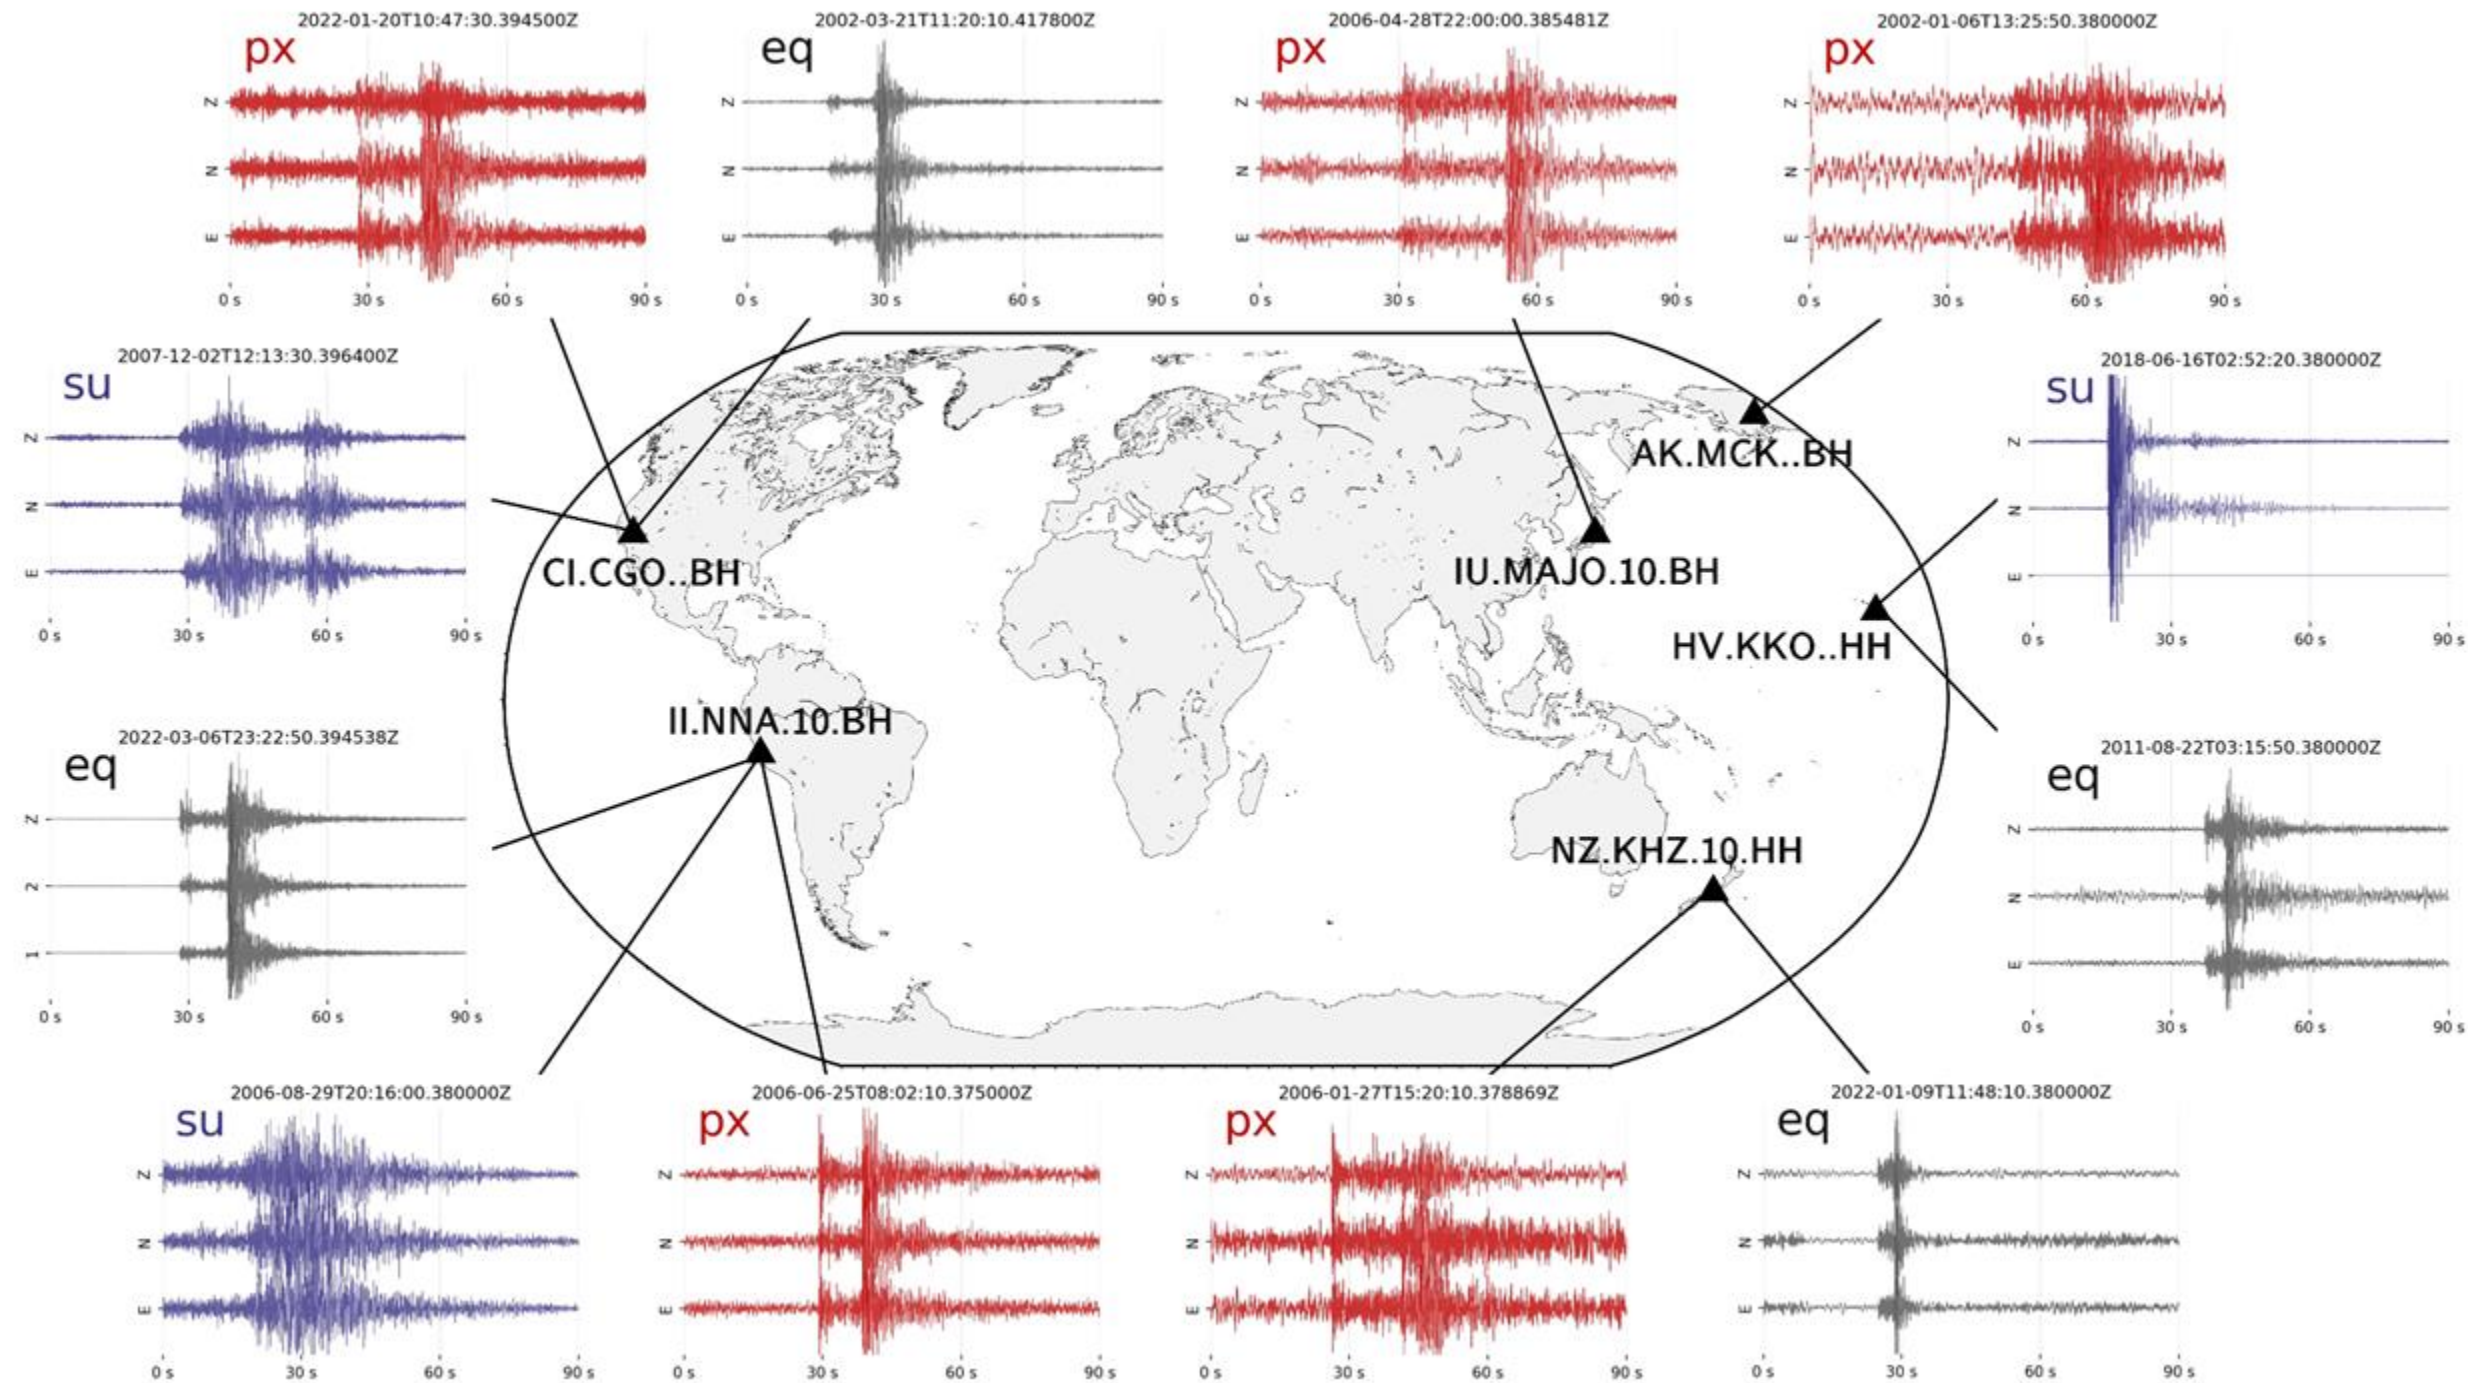

# Computational performance

Extracting features from time series takes much longer than DL inference.

Kharita et al. (in prep)

# Thank you
