

The Gravitational Anomaly Phenomenon

Additional Space-time Distortion, made by the Temporal and Spatial
position of the Physical Monomers

This paper explores and explains Dark matter, 4D and CCM theory,
Observations of Black holes, Space-time distortions and Space ship
etc.

I'll just introduce the Space ship. However, it contains only the core
concepts, and I will only introduce the method.

I will introduce the method of accelerating to The Gravitational
anomaly Phenomenon. First of all, you only need to consider the
shape and steering system. It is a form in which additional space-time
distortion is adjusted and placed outside the space ship. If the mass is
well designed, it is possible to fix the external position because it is a
nonlinear coupling. As a result, the nonlinear coupling of the

distortion field is induced out of the space ship. and when designing, the steering body is simply a pillar that holds the steering body and steering body can move close to 360 degrees and moves forward and backward. the direction in which the steering body moves is designed to be high mass.

One is dangerous if one of them fails, but the four are stable because they can fit enough complementary software. Then, when the distortion field is developed enough to beat Earth's gravity, it will naturally rise up. after entering the zero-gravity space, the front-heavy steering body falls forward the additional space-time distortion above comes to the front of the spacecraft from the top, By forming the curvature of space-time, the spacecraft is subject to infinite acceleration
