

WEC-Sim Webinar #1

BEMIO and MCR

April 18, 2017

Yi-Hsiang Yu and Jennifer van Rij (NREL)
Kelley Ruehl (Sandia)

WEC-Sim Team

- Kelley Ruehl (Sandia)
- Yi-Hsiang Yu (NREL)
- Jennifer van Rij (NREL)

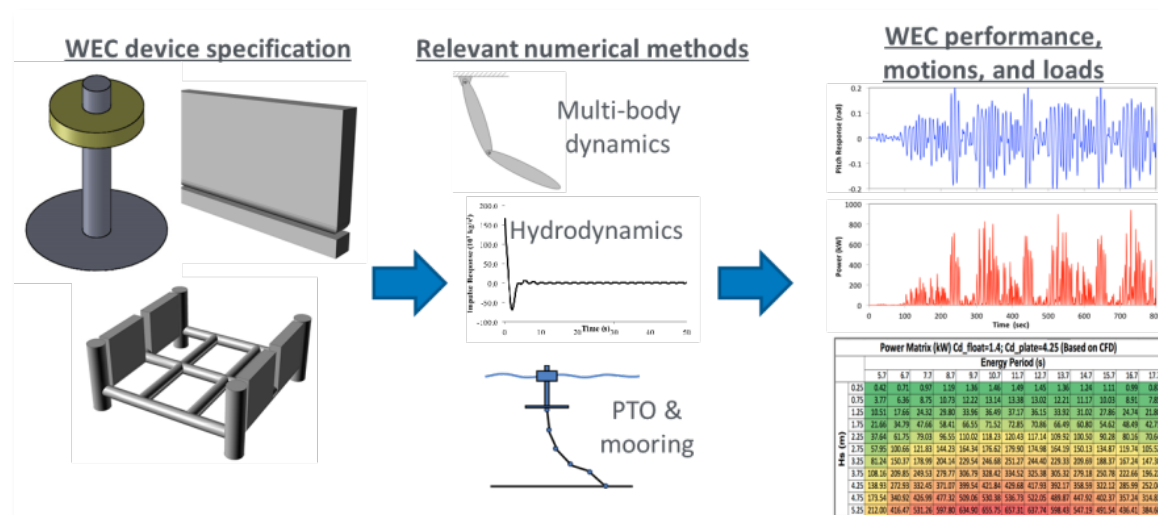

U.S. DEPARTMENT OF
ENERGY

Sandia
National
Laboratories

NREL
NATIONAL RENEWABLE ENERGY LABORATORY

Advanced Feature Webinars *1hr each*

- **April 18:** bemio and mcr, application for power matrix
- **May 24:** nl-hydro, b2b, non-hydro and drag
- **June 7:** pto and control, application for desalination
- **July 18:** mooring and visualization

Training Courses

- **May 1:** *1hr* WEC-Sim workshop at METS, for new users
- **TBD:** *half-day* WEC-Sim code structure course, for advanced users/developers

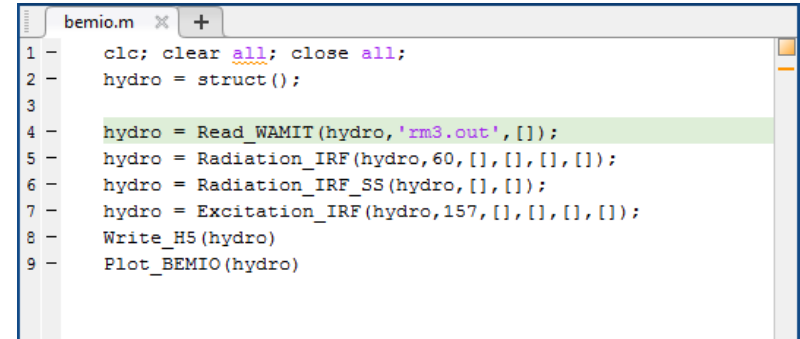

BEMIO
BEM Input/Output

Jennifer van Rij (NREL)

- What is BEMIO?
 - Workflow
 - Purpose
 - History
 - Locations
- BEMIO Functions
 - Read_WAMIT
 - Read_NEMOH
 - Read_AQWA
 - Normalize
 - Combine_BEM
 - Radiation_IRF
 - Radiation_IRF_SS
 - Excitation_IRF
 - Write_H5
 - Plot_BEMIO
- Examples and Usage
 - WAMIT example
 - NEMOH example w/ WAMIT comparison example
 - Data structures
- Possible Improvements
 - Documentation
 - Read_AQWA
 - Meshing & visualization
 - Post-processing functions
 - Integration with Nemoh

- Workflow: BEM → **BEMIO** → WEC-Sim
 - The BEMIO (**B**oundary **E**lement **M**ethod **I**nput/**O**utput) functions are used to preprocess the BEM hydrodynamic data prior to running WEC-Sim.
- Purpose
 - Read BEM results from WAMIT, NEMOH, or AQWA.
 - Calculate the radiation and excitation impulse response functions (IRFs).
 - Calculate state space realization coefficients for the radiation IRF.
 - Save the resulting data in Hierarchical Data Format 5 (HDF5).
 - Plot typical hydrodynamic data for user verification.
- History
 - A few python BEMIO legacies... meshing utilities, .h5 file, MATLAB data structure
- Locations
 - Functions: ...\\WEC-Sim\\source\\functions\\BEMIO
 - Documentation: <http://wec-sim.github.io/WEC-Sim/features.html#bemio>

Reads data from a WAMIT output file

```
1 - clc; clear all; close all;
2 - hydro = struct();
3
4 - hydro = Read_WAMIT(hydro, 'rm3.out', []);
5 - hydro = Radiation_IRF(hydro, 60, [], [], [], []);
6 - hydro = Radiation_IRF_SS(hydro, [], []);
7 - hydro = Excitation_IRF(hydro, 157, [], [], [], []);
8 - Write_H5(hydro)
9 - Plot_BEMIO(hydro)
```

hydro = Read_WAMIT(hydro, filename, ex_coeff)

hydro - data structure

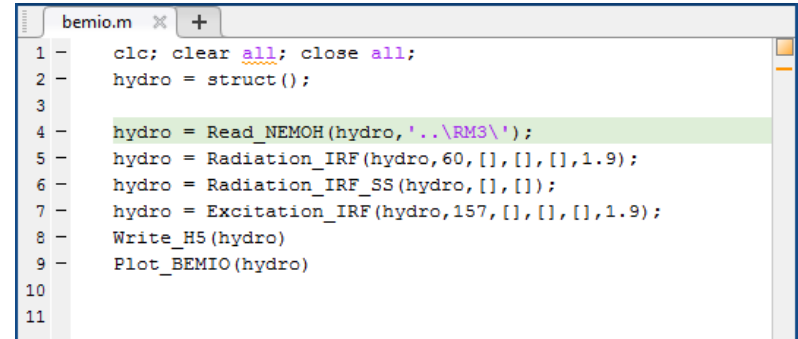

filename - WAMIT output file

ex_coeff - flag indicating the type of excitation force coefficients to read, 'diffraction' (default, []), 'haskind', or 'rao'

Notes:

- If generalized body modes (currently only a research application) are used, the output directory must also include the *.cfg, *.mmx, and *.hst files.
- If simu.nlHydro = 3 (not implemented yet) will be used, the output directory must also include the .3fk and .3sc files.

Reads data from a NEMOH
working folder

```
1 - clc; clear all; close all;
2 - hydro = struct();
3
4 - hydro = Read_NEMOH(hydro, '..\RMS\');
5 - hydro = Radiation_IRF(hydro, 60, [], [], [], 1.9);
6 - hydro = Radiation_IRF_SS(hydro, [], []);
7 - hydro = Excitation_IRF(hydro, 157, [], [], [], 1.9);
8 - Write_H5(hydro)
9 - Plot_BEMIO(hydro)
10
11
```

hydro = Read_NEMOH(hydro, filedir)

hydro - data structure

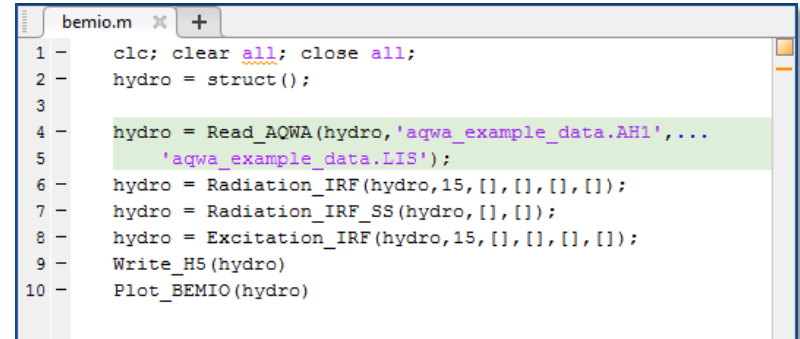

filedir - NEMOH working folder, must include:

- Nemoh.cal
- Mesh/Hydrostatics.dat (or Hydrostatics_0.dat, Hydrostatics_1.dat, etc. for multiple bodies)
- Mesh/KH.dat (or KH_0.dat, KH_1.dat, etc. for multiple bodies)
- Results/RadiationCoefficients.tec
- Results/ExcitationForce.tec
- Results/DiffractionForce.tec - If simu.nHydro = 3 will be used
- Results/FKForce.tec - If simu.nHydro = 3 will be used

Notes:

- NEMOH website recently updated; <https://lheea.ec-nantes.fr/logiciels-et-brevets/nemoh-running-192930.kjsp?RH=1489591054559>

Reads data from AQWA
output files

A screenshot of a MATLAB script editor window titled 'bemio.m'. The script contains 10 lines of code. Line 4 and line 5 are highlighted in green. The code initializes a structure 'hydro', reads AQWA data from 'aqwa_example_data.AH1' and 'aqwa_example_data.LIS', and then performs further calculations and plotting.

```
1 - clc; clear all; close all;  
2 - hydro = struct();  
3 -  
4 - hydro = Read_AQWA(hydro, 'aqwa_example_data.AH1', ...  
5 - 'aqwa_example_data.LIS');  
6 - hydro = Radiation_IRF(hydro, 15, [], [], [], []);  
7 - hydro = Radiation_IRF_SS(hydro, [], []);  
8 - hydro = Excitation_IRF(hydro, 15, [], [], [], []);  
9 - Write_H5(hydro)  
10 - Plot_BEMIO(hydro)
```

hydro = Read_AQWA(hydro, ah1_filename, lis_filename)

hydro – data structure

ah1_filename – .AH1 AQWA output file

lis_filename – .LIS AQWA output file

Normalizes NEMOH and AQWA hydrodynamic coefficients in the same manner that WAMIT outputs are normalized. And, if necessary, sorts data according to ascending frequency (WAMIT).

$C_{i,j}/\rho g$ - linear stiffness

$A_{i,j}/\rho g$ - added mass

$B_{i,j}/\rho \omega$ - radiation damping

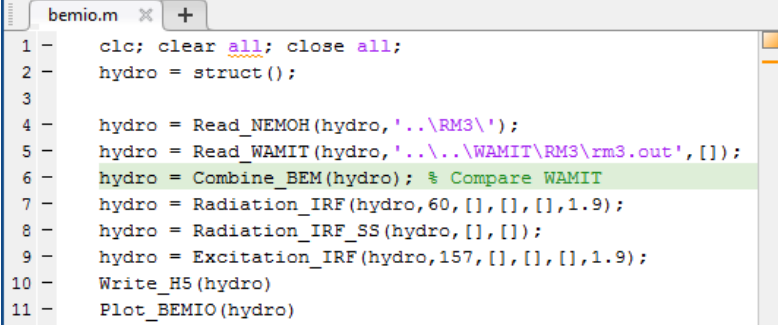

$X_i/\rho g$ - exciting forces

hydro = Normalize(hydro)

hydro – data structure

Combines multiple BEM
outputs into one
hydrodynamic 'system.'

hydro = Combine_BEM(hydro)
hydro – data structure

```
1 - clc; clear all; close all;  
2 - hydro = struct();  
3  
4 - hydro = Read_NEMOH(hydro, '..\RM3\');  
5 - hydro = Read_WAMIT(hydro, '..\..\WAMIT\RM3\rm3.out', []);  
6 - hydro = Combine_BEM(hydro); % Compare WAMIT  
7 - hydro = Radiation_IRF(hydro, 60, [], [], [], 1.9);  
8 - hydro = Radiation_IRF_SS(hydro, [], []);  
9 - hydro = Excitation_IRF(hydro, 157, [], [], [], 1.9);  
10 - Write_H5(hydro)  
11 - Plot_BEMIO(hydro)
```

Calculates the normalized radiation impulse response function:

$$\bar{K}_{i,j}(t) = \frac{2}{\pi} \int_0^{\infty} \frac{B_{i,j}(\omega)}{\rho} \cos(\omega t) d\omega$$

```

bemio.m x +
1 - clc; clear all; close all;
2 - hydro = struct();
3
4 - hydro = Read_WAMIT(hydro, 'rm3.out', []);
5 - hydro = Radiation_IRF(hydro, 60, [], [], [], []);
6 - hydro = Radiation_IRF_SS(hydro, [], []);
7 - hydro = Excitation_IRF(hydro, 157, [], [], [], []);
8 - Write_H5(hydro);
9 - Plot_BEMIO(hydro);
    
```

hydro = Radiation_IRF(hydro, t_end, n_t, n_w, w_min, w_max)

hydro – data structure

t_end – calculation range for the IRF, where the IRF is calculated from $t = 0$ to t_{end} , and the default is 100 s

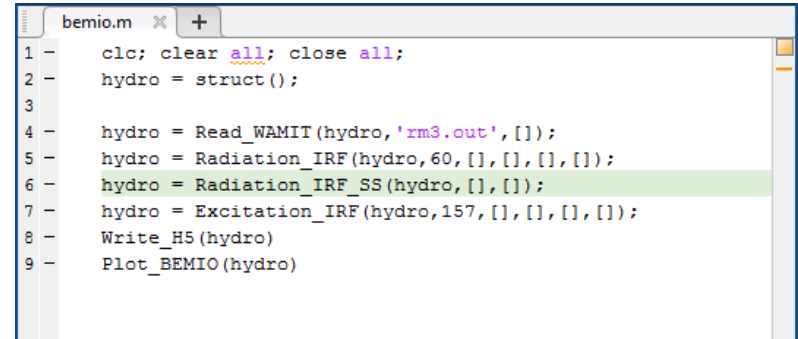

n_t – number of time steps in the IRF, the default is 1001

n_w – number of frequency steps used in the IRF calculation (hydrodynamic coefficients are interpolated to correspond), the default is 1001

w_min – minimum frequency to use in the IRF calculation, the default is the minimum frequency from the BEM data

w_max – maximum frequency to use in the IRF calculation, the default is the maximum frequency from the BEM data.

Calculates the state space (SS) realization of the radiation IRF. If this function is used, it must be implemented after the Radiation_IRF function.

```
bemio.m x +
1 - clc; clear all; close all;
2 - hydro = struct();
3
4 - hydro = Read_WAMIT(hydro, 'rm3.out', []);
5 - hydro = Radiation_IRF(hydro, 60, [], [], [], []);
6 - hydro = Radiation_IRF_SS(hydro, [], []);
7 - hydro = Excitation_IRF(hydro, 157, [], [], [], []);
8 - Write_H5(hydro)
9 - Plot_BEMIO(hydro)
```

hydro = Radiation_IRF_SS(hydro, Omax, R2t)

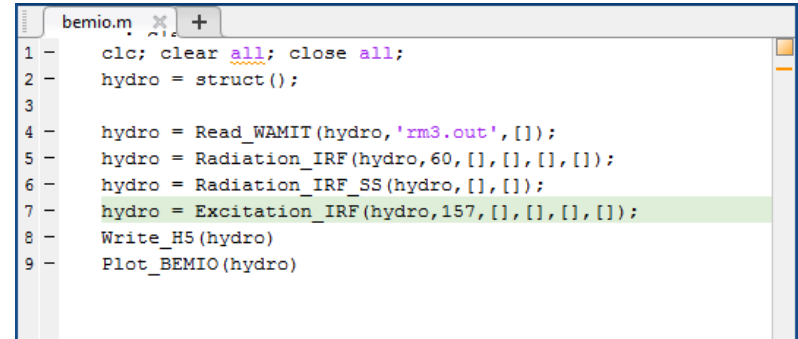

hydro – data structure

Omax – maximum order of the SS realization, the default is 10

R2t – R2 threshold (coefficient of determination) for the SS realization, where ***R2*** may range from 0 to 1, and the default is 0.95

Calculates the excitation
impulse response function:

$$\bar{K}_i(t) = \frac{1}{2\pi} \int_{-\infty}^{\infty} \frac{X_i(\omega, \beta)}{\rho g} e^{i\omega t} d\omega$$

```

1 - clc; clear all; close all;
2 - hydro = struct();
3 -
4 - hydro = Read_WAMIT(hydro, 'rm3.out', []);
5 - hydro = Radiation_IRF(hydro, 60, [], [], [], []);
6 - hydro = Radiation_IRF_SS(hydro, [], []);
7 - hydro = Excitation_IRF(hydro, 157, [], [], [], []);
8 - Write_H5(hydro)
9 - Plot_BEMIO(hydro)
    
```

hydro = Excitation_IRF(hydro, t_end, n_t, n_w, w_min, w_max)

hydro - data structure

t_end - calculation range for the IRF, where the IRF is calculated from $t = -t_{end}$ to t_{end} , and the default is 100 s

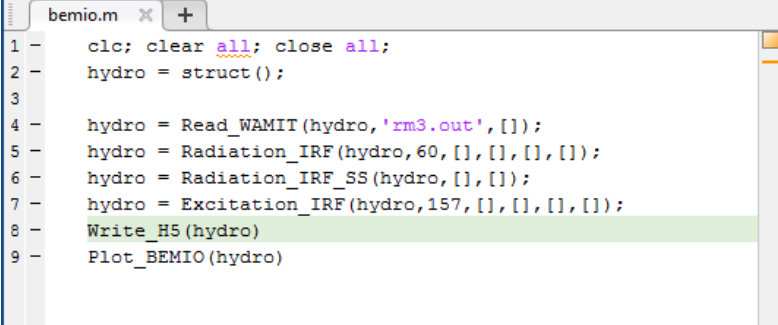

n_t - number of time steps in the IRF, the default is 1001

n_w - number of frequency steps used in the IRF calculation (hydrodynamic coefficients are interpolated to correspond), the default is 1001

w_min - minimum frequency to use in the IRF calculation, the default is the minimum frequency from the BEM data

w_max - maximum frequency to use in the IRF calculation, the default is the maximum frequency from the BEM data.

Writes the hydro data structure to a .h5 file.

```
bemio.m x +
1 - clc; clear all; close all;
2 - hydro = struct();
3
4 - hydro = Read_WAMIT(hydro, 'rm3.out', []);
5 - hydro = Radiation_IRF(hydro, 60, [], [], [], []);
6 - hydro = Radiation_IRF_SS(hydro, [], []);
7 - hydro = Excitation_IRF(hydro, 157, [], [], [], []);
8 - Write_H5(hydro);
9 - Plot_BEMIO(hydro);
```

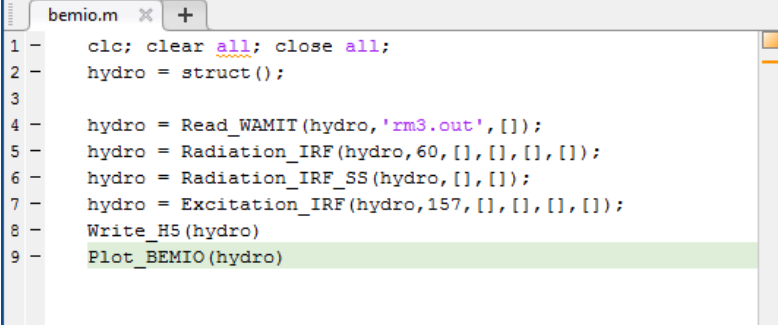

Write_H5(hydro)

hydro – data structure

Plots the added mass, radiation damping, radiation IRF, excitation force magnitude, excitation force phase, and excitation IRF for each body in the heave, surge and pitch degrees of freedom.

Plot_BEMIO(hydro)

hydro – data structure

A screenshot of a MATLAB script editor window titled 'bemio.m'. The script contains the following code:

```
1 - clc; clear all; close all;  
2 - hydro = struct();  
3  
4 - hydro = Read_WAMIT(hydro, 'rm3.out', []);  
5 - hydro = Radiation_IRF(hydro, 60, [], [], [], []);  
6 - hydro = Radiation_IRF_SS(hydro, [], []);  
7 - hydro = Excitation_IRF(hydro, 157, [], [], [], []);  
8 - Write_H5(hydro)  
9 - Plot_BEMIO(hydro)
```

The line 'Plot_BEMIO(hydro)' is highlighted in green.

MCR

Multiple Condition Runs

Yi-Hsiang Yu (NREL)

Multiple Condition Runs (MCR)

- WEC-Sim allows users to run multiple cases using **wecSimMCR** (in the MATLAB Command Window)
- The MATLAB function file (wecSimMCR.m) is located under [<WEC-Sim Path>/source/functions](#).
- Examples are provided in the “WEC-Sim Application” repository https://github.com/WEC-Sim/WEC-Sim_Applications

<https://wec-sim.github.io/WEC-Sim/features.html#multiple-condition-runs-mcr>

- How does MCR work?
- Examples of running MCR
 - https://github.com/WEC-Sim/WEC-Sim_Applications/tree/master/RM3_MCR
 - Specify a range of sea states and PTO damping coefficients
 - Using an excel file that contains a set of wave statistic data
 - User define option
- MCR user defined function (userDefinedFunctionsMCR.m) and Post-processing

How Does MCR Work?

- Create a **mcr** function that includes all the parameters that is needed to run all multiple cases one after another automatically.
- **mcr** function includes:
 - mcr.header: the name of the parameters and functions
 - mcr.cases: the given value or “option” for the parameters and functions

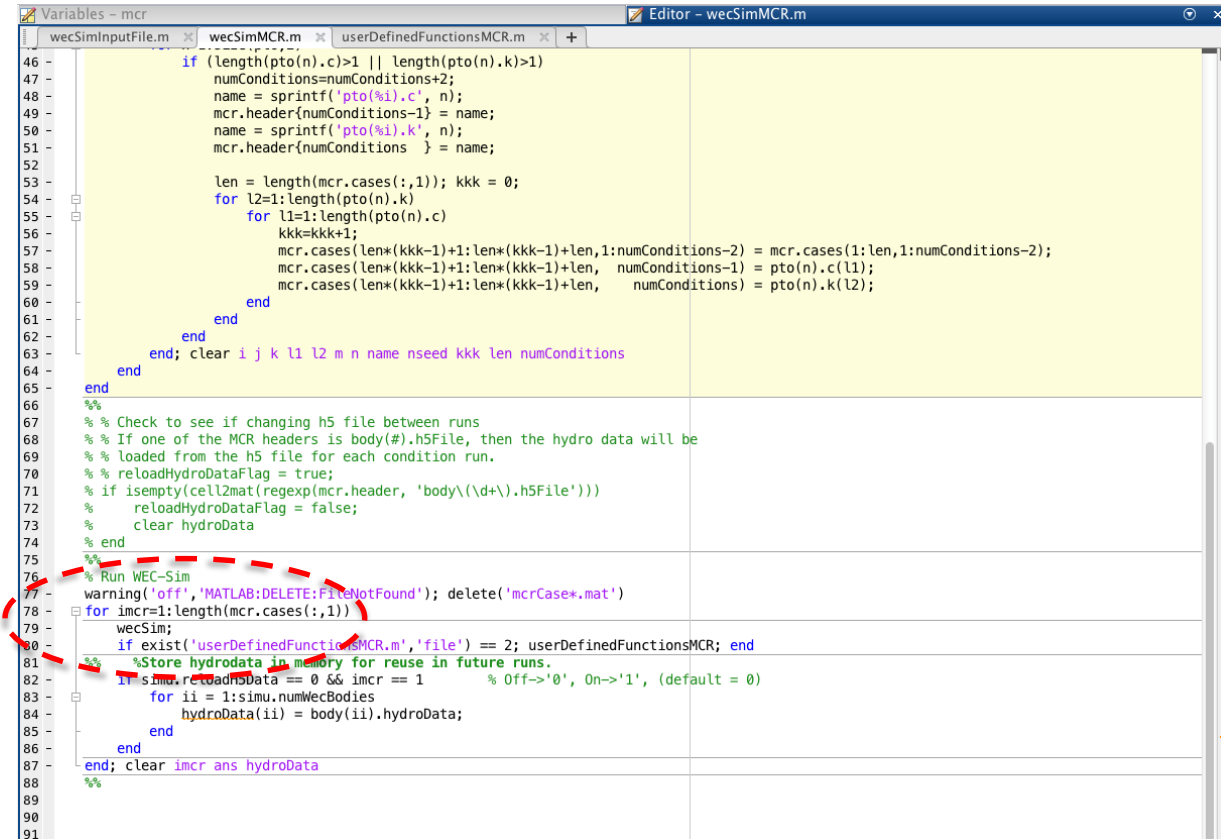

The screenshot shows the 'mcr.header' table in the Editor. It has 5 columns and 16 rows. The first row contains the headers: 'waves.H', 'waves.T', 'pto(1).c', and 'pto(1).k'. The remaining rows are empty.

| | 1 | 2 | 3 | 4 | 5 |
|----|---------|---------|----------|----------|---|
| 1 | waves.H | waves.T | pto(1).c | pto(1).k | |
| 2 | | | | | |
| 3 | | | | | |
| 4 | | | | | |
| 5 | | | | | |
| 6 | | | | | |
| 7 | | | | | |
| 8 | | | | | |
| 9 | | | | | |
| 10 | | | | | |
| 11 | | | | | |
| 12 | | | | | |
| 13 | | | | | |
| 14 | | | | | |
| 15 | | | | | |
| 16 | | | | | |

The screenshot shows the 'mcr.cases' table in the Editor. It has 5 columns and 16 rows. The first row contains the headers: '1', '2', '3', '4', and '5'. The remaining rows contain numerical values for each column.

| | 1 | 2 | 3 | 4 | 5 |
|----|--------|---|---------|---|---|
| 1 | 1.5000 | 6 | 1200000 | 0 | |
| 2 | 1.5000 | 8 | 1200000 | 0 | |
| 3 | 2.5000 | 6 | 1200000 | 0 | |
| 4 | 2.5000 | 8 | 1200000 | 0 | |
| 5 | 1.5000 | 6 | 2400000 | 0 | |
| 6 | 1.5000 | 8 | 2400000 | 0 | |
| 7 | 2.5000 | 6 | 2400000 | 0 | |
| 8 | 2.5000 | 8 | 2400000 | 0 | |
| 9 | | | | | |
| 10 | | | | | |
| 11 | | | | | |
| 12 | | | | | |
| 13 | | | | | |
| 14 | | | | | |
| 15 | | | | | |
| 16 | | | | | |

- wecSimMCR** will then execute wecSim.m file for each given case

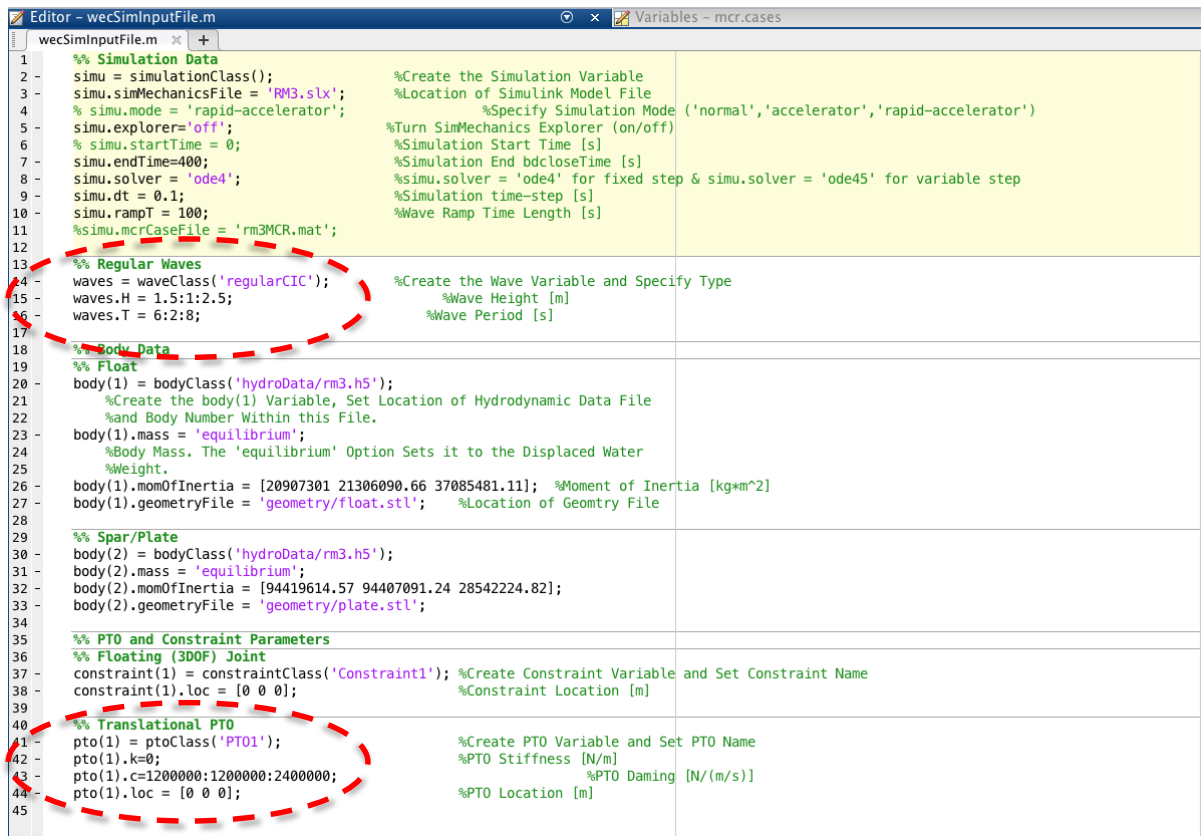

```
46- if (length(pto(n).c)>1 || length(pto(n).k)>1)
47- numConditions=numConditions+2;
48- name = sprintf('pto(%i).c', n);
49- mcr.header(numConditions-1) = name;
50- name = sprintf('pto(%i).k', n);
51- mcr.header(numConditions) = name;
52-
53- len = length(mcr.cases(:,1)); kkk = 0;
54- for l2=1:length(pto(n).k)
55-     for l1=1:length(pto(n).c)
56-         kkk=kkk+1;
57-         mcr.cases(len*(kkk-1)+1:len*(kkk-1)+len,1:numConditions-2) = mcr.cases(1:len,1:numConditions-2);
58-         mcr.cases(len*(kkk-1)+1:len*(kkk-1)+len, numConditions-1) = pto(n).c(l1);
59-         mcr.cases(len*(kkk-1)+1:len*(kkk-1)+len, numConditions) = pto(n).k(l2);
60-     end
61- end
62- end; clear i j k l1 l2 m n name nseed kkk len numConditions
63- end
64- end
65- end
66- %%
67- %% Check to see if changing h5 file between runs
68- %% If one of the MCR headers is body(#).h5File, then the hydro data will be
69- %% loaded from the h5 file for each condition run.
70- %% reloadHydroDataFlag = true;
71- %% if isempty(cell2mat(regex(mcr.header, 'body\(\d+\).h5File')))
72- %%     reloadHydroDataFlag = false;
73- %%     clear hydroData
74- %% end
75- %%
76- % Run WEC-Sim
77- warning('off','MATLAB:DELETE:FileNotFound'); delete('mcrCase*.mat')
78- for imcr=1:length(mcr.cases(:,1))
79-     wecSim;
80-     if exist('userDefinedFunctionsMCR.m','file') == 2; userDefinedFunctionsMCR; end
81-     %% Store hydrodata in memory for reuse in future runs.
82-     if simu.reloadH5Data == 0 && imcr == 1 % Off->'0', On->'1', (default = 0)
83-         for ii = 1:simu.numWecBodies
84-             hydroData(ii) = body(ii).hydroData;
85-         end
86-     end
87- end; clear imcr ans hydroData
88- %%
89-
90-
91-
```

- For each case, wecSim.m will overwrite the default parameters using the parameters and options described in the **mcr** function.

This command executes the Multiple Condition Run (MCR) option, which can be initiated three different ways:

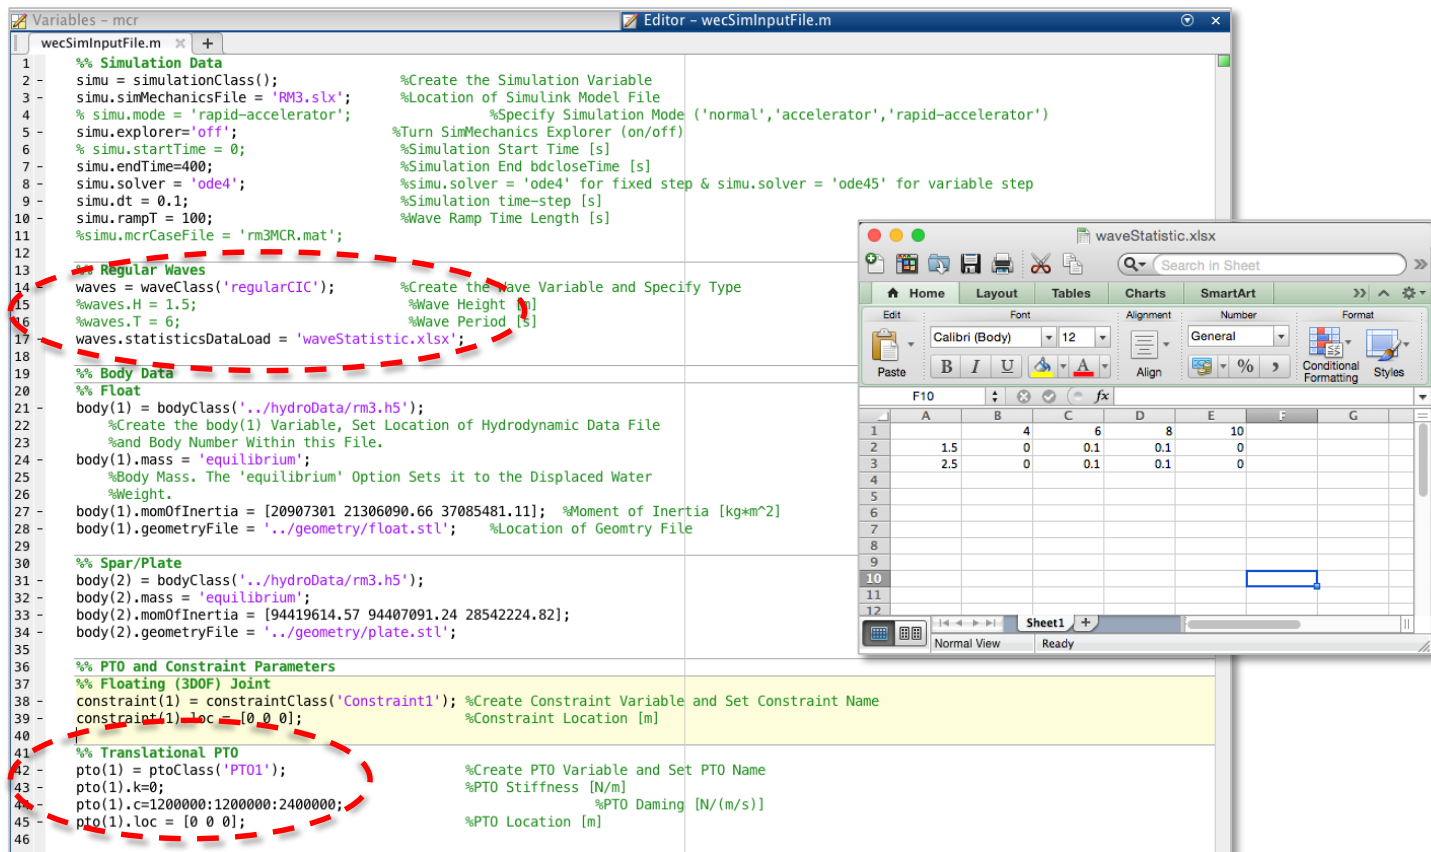

- Option 1- Specify a range of sea states and PTO damping coefficients in the WEC-Sim input file.
- Option 2- Specify the excel filename that contains a set of wave statistic data in the WEC-Sim input file.
- Option 3- Provide a MCR case *.mat file, and specify the filename in the WEC-Sim input file.

- Specify a range of sea states and PTO damping coefficients in the WEC-Sim input file
- Example: waves.H = 1.5:1:2.5; waves.T = 6:2:8; pto(1).c=1200000:1200000:2400000

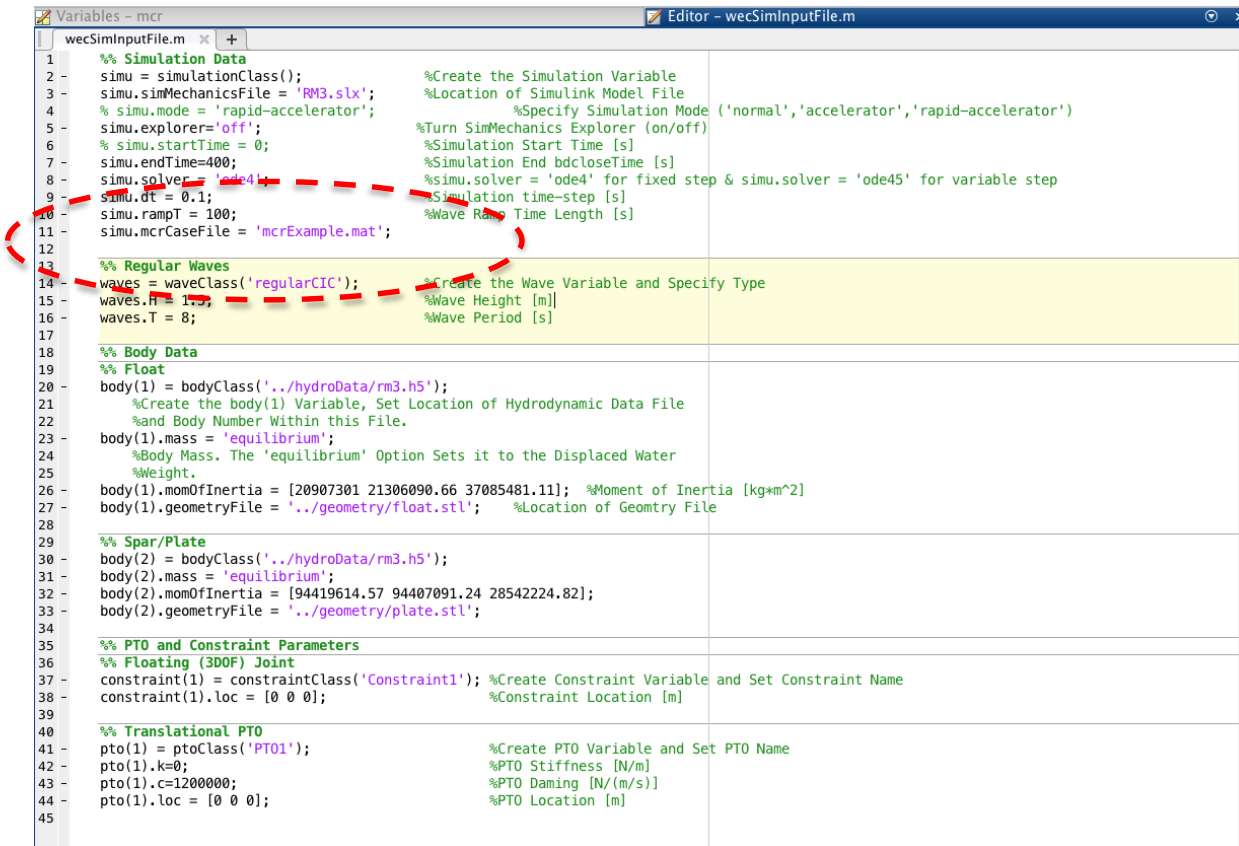

```
1  %% Simulation Data
2  simu = simulationClass(); %Create the Simulation Variable
3  simu.simMechanicsFile = 'RM3.slx'; %Location of Simulink Model File
4  % simu.mode = 'rapid-accelerator'; %Specify Simulation Mode ('normal','accelerator','rapid-accelerator')
5  simu.explorer = 'off'; %Turn SimMechanics Explorer (on/off)
6  % simu.startTime = 0; %Simulation Start Time [s]
7  simu.endTime = 400; %Simulation End bdcloseTime [s]
8  simu.solver = 'ode4'; %simu.solver = 'ode4' for fixed step & simu.solver = 'ode45' for variable step
9  simu.dt = 0.1; %Simulation time-step [s]
10 simu.rampT = 100; %Wave Ramp Time Length [s]
11 %simu.mcrCaseFile = 'rm3MCR.mat';
12
13 %% Regular Waves
14 waves = waveClass('regularCIC'); %Create the Wave Variable and Specify Type
15 waves.H = 1.5:1:2.5; %Wave Height [m]
16 waves.T = 6:2:8; %Wave Period [s]
17
18 %% Body Data
19 %% Float
20 body(1) = bodyClass('hydroData/rm3.h5');
21 %Create the body(1) Variable, Set Location of Hydrodynamic Data File
22 %and Body Number Within this File.
23 body(1).mass = 'equilibrium';
24 %Body Mass. The 'equilibrium' Option Sets it to the Displaced Water
25 %Weight.
26 body(1).momOfInertia = [20907301 21306090.66 37085481.11]; %Moment of Inertia [kg*m^2]
27 body(1).geometryFile = 'geometry/float.stl'; %Location of Geomtry File
28
29 %% Spar/Plate
30 body(2) = bodyClass('hydroData/rm3.h5');
31 body(2).mass = 'equilibrium';
32 body(2).momOfInertia = [94419614.57 94407091.24 28542224.82];
33 body(2).geometryFile = 'geometry/plate.stl';
34
35 %% PTO and Constraint Parameters
36 %% Floating (3DOF) Joint
37 constraint(1) = constraintClass('Constraint1'); %Create Constraint Variable and Set Constraint Name
38 constraint(1).loc = [0 0 0]; %Constraint Location [m]
39
40 %% Translational PTO
41 pto(1) = ptoClass('PTO1'); %Create PTO Variable and Set PTO Name
42 pto(1).k=0; %PTO Stiffness [N/m]
43 pto(1).c=1200000:1200000:2400000; %PTO Damping [N/(m/s)]
44 pto(1).loc = [0 0 0]; %PTO Location [m]
45
```

- Specify the excel filename that contains a set of wave statistic data in the WEC-Sim input file.
- This option is generally useful for power matrix generation, example:
`waves.statisticsDataLoad = "<Excel file name>.xlsx"`

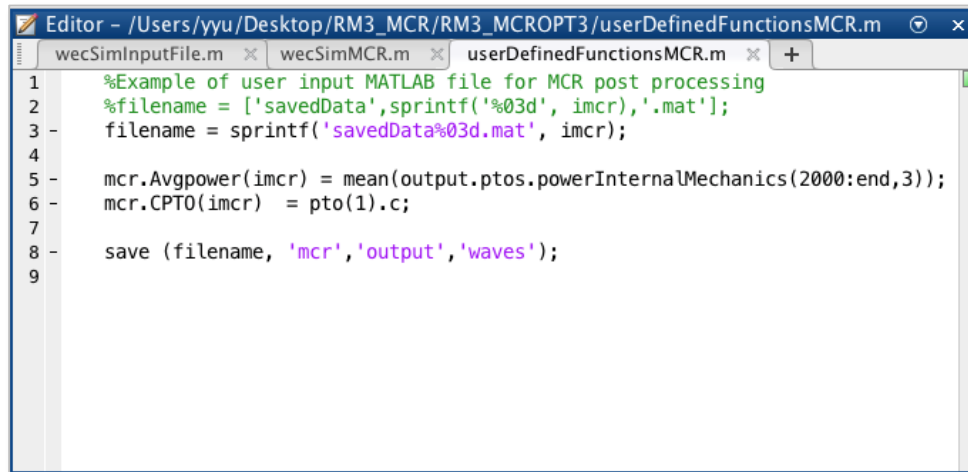

- Provide a MCR case *.mat file, and specify the filename in the WEC-Sim input file, example: `simu.mcrCaseFile = '<File name>.mat'`
- Option 3 **overrides** Option 2 & Option 1

```
1  %% Simulation Data
2  simu = simulationClass();           %Create the Simulation Variable
3  simu.simMechanicsFile = 'RM3.slx'; %Location of Simulink Model File
4  % simu.mode = 'rapid-accelerator'; %Specify Simulation Mode ('normal','accelerator','rapid-accelerator')
5  simu.explorer='off';              %Turn SimMechanics Explorer (on/off)
6  % simu.startTime = 0;              %Simulation Start Time [s]
7  simu.endTime=400;                 %Simulation End bdcloseTime [s]
