

ON A MANUSCRIPT LIST
OF THE
LINNEAN HERBARIUM
IN THE
HANDWRITING OF CARL VON LINNÉ,
PRESUMABLY COMPILED IN THE YEAR
1755.

BY
BENJAMIN DAYDON JACKSON,
GENERAL SECRETARY OF THE LINNEAN SOCIETY
OF LONDON.

To which is appended a Catalogue of the Genera
in the Herbarium, with the numbers of sheets
of specimens.

*PREPARED FOR THE ANNIVERSARY MEETING OF THE LINNEAN
SOCIETY OF LONDON, 24TH MAY, 1907, IN CELEBRATION OF THE
200TH ANNIVERSARY OF THE BIRTH OF CARL VON LINNÉ.*

No portion of the Linnean Society's collections is so frequently consulted as the Linnean Herbarium. Suggestions have been frequently made that a full catalogue of this Herbarium should be printed and issued by the Society, but the difficulties in the way of complying with such suggestions have hitherto proved insuperable. In the original cabinets are contained nearly 14,000 sheets, which would need a thick octavo volume merely to record the names of the species and accompanying notes. So brief a catalogue would be of very little service to the botanists who refer to the Herbarium, while a complete critical enumeration of every specimen is at present quite unattainable. A host of specialists would be required, and as the specimens naturally are not allowed to be taken from the Society's rooms, nor tampered with in any way, it would mean that these experts would have to perform their task under disadvantageous conditions; they would have to rely upon their recollection and not upon their power to match species by placing specimens side by side.

There have been numerous references to special genera and species scattered throughout the literature of descriptive botany, from the days of Sir J. E. Smith to the present time, but we may say that only five considerable portions of the Herbarium have hitherto been adequately examined and the reports published. These are:—

1. HARTMAN (C.).—"Anteckningar vid de Skandinaviska växterna i Linnés Herbarium." *Handl. K. Sv. Vet.-Akad. Stockholm*, 1849 (1850) pp. 145-191; *ibid.* 1851 (1853) pp. 211-426.
2. MUNRO (W.).—"On the Identification of the Grasses of Linnæus's Herbarium . . ." *Journ. Linn. Soc., Bot.* vi. (1861) pp. 33-58.
3. ANDERSON (T.).—"On the Identification of the Acanthaceæ of the Linnean Herbarium . . ." *Journ. Linn. Soc., Bot.* vii. (1863) pp. 111-118.
4. SCHIMPER (W. P.).—"Synonymia Muscorum herbarii Linnæani . . ." *Journ. Linn. Soc., Bot.* xi. (1869) pp. 246-252.
5. CLARKE (C. B.).—"On certain authentic Cyperaceæ of Linnæus." *Journ. Linn. Soc., Bot.* xxx. (1894) pp. 299-315.

By the foregoing statement it will be understood how small a

portion of the Herbarium has been investigated by experts, and how large a portion remains only partially explored.

The mere cataloguing of the sheets offers considerable difficulty: it can only be accomplished by some person adequately equipped with a knowledge of the handwriting of the various persons who contributed the plants to Carl von Linné; a transcriber only would be useless.

Though the perfect catalogue is to be hoped for rather than expected, the Linnean Society has two catalogues which supply some information, and the present paper is concerned with these. In the Banksian collections, formerly at the British Museum, at Bloomsbury, and now at Cromwell Road, South Kensington, there exists a copy of Linné's '*Species Plantarum*,' first edition, marked by either Solander or Dryander (probably the latter) with a short stroke under the running number of each species, showing what species at some unstated date were represented in the Linnean Herbarium (see *Journ. Bot.* xxxiv. (1896) pp. 359-362). These references were copied by Mr. W. Carruthers into a copy of the '*Species Plantarum*' which he gave to the Royal Botanic Gardens, Kew, in 1871, which copy also contains the suppressed pages reprinted in facsimile by Herr von Flatt in the '*Botanisches Centralblatt*,' Bd. lxvi. (1896) pp. 218-219. It was formerly supposed that these marks were inserted during the winter of 1784-5, when the Linnean Herbarium was compared with that belonging to Sir Joseph Banks (*Proc. Linn. Soc.* 1887-88 (1890) pp. 27-28), but this is probably an error, for amongst the Linnean books, one of the two interleaved and annotated copies of the first edition of the '*Species Plantarum*' is marked in the same manner; it seems certain that from this Dryander copied his notes.

Notwithstanding the interest attaching to this copy and its secondary copies, another list exists of a somewhat later date, and fuller in details. It consists of a small quarto volume, 20 cm. × 16 cm., without title or heading, in contemporary binding with calf back and corners, and sides covered with sprinkled paper; it contains 39 leaves written on both sides in double column (except the last page) of all the names of plants then known, with a mark against such as were in the Herbarium. This mark was at first an underscore as in the '*Species Plantarum*,' but from the sixth page onwards the mark consists of a dot placed before the figure in front of each name, as shown in the specimen page annexed (p. 95). A blank leaf was left between each written leaf, but at some later period three of these blank leaves were roughly

torn out, and the remainder used for drafts of specific descriptions by the younger Carl von Linné.

The age of the list may be placed about the middle of 1755 for the following reasons:—

The significant mark is changed in the course of transcription from an underscore to a dot, apparently an afterthought when copying from the book record. Another proof of the relative ages of the two records may be found in this, that the supplementary part of the 'Species Plantarum' (pp. 1190–1200), and two pages added without pagination after 'Nomina trivialia,' are inserted in their proper sequence, e. g. *Thalia*, p. 1193, is placed in the MS. list under Monandria Monogynia between *Kæmpferia* and *Boerhavia*, and the three species of *Filago* from the end, are correctly placed. Too much reliance must not be placed on this, for *Boerhavia diandra* (p. 1194) is interpolated on the first page of the MS. thus

3 *scandens*,
5 *diandra*,
4 *repens*.

Again, in the list as originally drawn up we find some species which were published afterwards, occupying their proper position, thus seeming as if the plants were known to the compiler but were awaiting their opportunity to be published. For possibly two years the author seems to have added names chiefly from the theses 'Demonstrationes plantarum' resp. J. C. Höjer, Oct. 1753, 'Herbarium Amboinense' resp. O. Stickman, Maii 1754, and 'Centuria plantarum I.' resp. A. D. Juslenius, Febr. 1755; from 'Centuria plantarum II.' resp. E. Torner, Jun. 1756, I find only one entry, and from the fact that practically all the species from Cent. I. are entered and practically none from Cent. II., we may conclude that the entries ceased soon after the former was printed, that is in the spring of 1755, to which period I would assign this catalogue.

The list offers many points of interest, but I must confine my remarks to a few only. It was written without special care, for I find no fewer than eighteen species published in the 'Species Plantarum' which were overlooked and inserted afterwards, such as the *Boerhavia diandra* previously mentioned. Some of the interpolations are incorrect; the following are referred to as from the 'Cent. I.,' but they will be found as noted in parentheses—*Bupleurum semicompositum* (Dem.), *Cistus hirta* (Sp. Pl.), *Antirrhinum sparteum* and *A. molle* (both Sp. Pl.), and *Trifolium Cherleri* (Dem.). It must be noted that these citations are from

the original theses, and not from the reprints in 'Amœnitates Academicæ,' iv. pp. 261–296, where several names were changed, e. g. *Antirrhinum sparteum* and *A. molle* became *A. junceum* and *A. glaucum* respectively, and *Potentilla heptaphylla* is changed to *P. opaca*. Further, *Dianthus hyssopifolius* was changed in 'Am. Acad.' to *D. superbus*, *Geranium versicolor* became *G. striatum*, and *Hieracium tomentosum* was renamed *Andryala lanata*. Several names also occur which were not published with diagnosis till later; such are *Convolvulus Dorycnium*, *Silene quadrifida*, *Psidium Cujavus*, *Myrtus Leucadendra*, *Dolichos tetragonolobus* and *D. pruriens*, which appeared in the tenth edition of the 'Systema' in 1759, the last four being mentioned only by name in 'Herb. Amb.'

There remain three names in the list deserving of special attention: (1) *Sison ammoides*, a manuscript and unpublished name for *Seseli ammoides*, Sp. Pl.; (2) *Lupinus stoloniferus*, Cent. I., was not brought forward in 'Am. Acad.' and proves to be *L. hirsutus*, Sp. Pl.; and (3) *Trifolium retusum*, which has escaped all recognition in later works, proves to be that species described in 'Demonstrationes plantarum,' p. 21, in a footnote as "*TRIFOLIUM capitulis fructus imbricatis, calycibus reflexis patulis corolla longioribus*. Habitat in Hispania, Loeß." etc. [These seven lines as well as the name "retusum," were not reprinted in 'Am. Acad.' iii. p. 419 (1756).] This is the "*Trifolium retusum album, calycibus reflexis patulis*" of Loeßling's 'Iter hispanicum,' Stockholm, 1758, p. 88. A reference to the Linnean Herbarium shows the specimen, as unfortunately is so often the case, without any note of its origin, to be *Trifolium strictum*, Linn.! the word "*retusum*" being written by Linné at the base of the specimen.

In concluding these remarks on the volume specified, I may perhaps be permitted to refer to the Herbarium itself. It must not be allowed to escape our minds that the Linnean Herbarium differs in many respects from the modern idea of an herbarium. Carl von Linné in a multitude of cases described his species from the books of his predecessors, and his dried plants were frequently used to modify the diagnoses of the previously described species. It was only when he was strictly confined to a single specimen that Linné was forced to keep to the plant actually under his eyes, and to describe it as would now be done with newly found plants.

I have formerly set forth the method by which the Linnean Herbarium came into being, and how it grew (Proc. Linn. Soc.

1887-88, pp. 18-22). That account may be supplemented by the statement that the Herbarium appears to be practically as it was on the death of the elder Linné, the bulk of his son's accretions being incorporated in the herbarium of Sir J. E. Smith, also in the possession of the Linnean Society. The collection may be said to consist of three series of plants—(a) those cited in the two editions of the 'Species Plantarum'; (b) those omitted from that work, but named by Linné himself, and probably acquired at a later date or intentionally set aside, amongst these being the plants of the 'Mantissæ' and the 'Supplementum'; and (c) various additions, some of which perhaps never came under the scrutiny of the elder Linné, but were put in by the son. The plants which Smith gave to Banks, 81 in number, were duplicates, as I have satisfied myself (Proc. Linn. Soc. 1902-3, p. 10).

A transcript of the catalogue of the genera contained in the Linnean Herbarium is appended; it was drawn up by order of the Council of the Linnean Society, 21st May, 1836, and consists of, firstly, an enumeration of the genera in the Linnean order with a running number prefixed, and followed by the number of sheets under each genus; and, secondly, an alphabetic arrangement, with reference to the running numbers, so that any required genus can be as readily found as a page in a book by its index.

A comparison of this list of genera with the Linnean manuscript catalogue shows a few discrepancies; thus Linné enumerates the following which will not be found in the appended catalogue :—

Leucadendron; merged in *Protea*.

Diodia; wanting.

Cupania; wanting.

Scurrula; merged in *Loranthus*.

Barreria; proves to be *Agathosma imbricata*, Willd., and the type-sheet is in the *Diosma* cover.

Calamus; wanting.

Bartramia; merged in *Triumfetta*.

Dalibarda; is *Rubus Dalibarda*.

Sarracenia; cover empty.

Nepenthes; wanting. A small unmarked sheet in Smith's herbarium may be this.

I have searched Smith's herbarium under each of these missing genera, but, with the possible exception mentioned under *Nepenthes*, I have found nothing to throw any light on the omissions, which cannot have occurred since the collection came into the possession of the Linnean Society.

[RECTO OF LEAF 45 OF THE MS. CATALOGUE.]

Lupinus	·1	perennis stoloniferus <i>Cent.</i>	Pisum	1	sativum
	·2	albus		2	arvense

LIST

OF THE

GENERA IN THE LINNEAN HERBARIUM.

-
1. SYSTEMATICALLY ARRANGED AFTER THE LINNEAN SYSTEM, in 1292 genera, with 13753 sheets of specimens.
 2. ALPHABETICALLY ARRANGED, giving the running numbers of the genera as index numbers.
