

Ilion: First Axis for Improving LLMs Without Persistent Memory

1. Axes of Semantic Verticality

Integration of a narrative and value-based 'spinal column' within the session, active throughout the conversation.

- What is missing: Current models do not maintain an internal sense of purpose or active moral alignment throughout a conversation.
- What could be done: A latent layer could evaluate whether a response aligns with the previously expressed narrative and ethical axis — without persistent memory.
- Benefits: Reduces drift, improves stability and resilience against jailbreaks or internal contradictions.

This is just one of the six proposed axes.
