## Project Title \*

Collaborative Research: Quantifying the ecological role of Gulf of Maine deep :

## Project description

Overview: Deep-sea and cold-water corals are known to be ecosystem engineers, creating foundation structures and habitat for a myriad of associated species. As autogenic engineers, these structure-forming species increase the complexity of the environments in which they grow and associated organisms rely on the physical growth of these corals to change the environment by providing shelter and altering resources. These corals often have a large branching morphology, which creates space for other organisms to seek refuge (for safety from predators, feeding, procreation and protection of young) and thus results in increased

## DATA COLLECTION

What data will you collect or create?

**B** *I* |   |   |   | Format |  Source

The project will produce several observational and experimental datasets, described in the list below. In addition to the datasets described below, educational resources produced by the project, including data and images, will be made available for public use on the COSEE.net website. Observational data will be collected on a Gulf of Maine research cruise planned to take place August 2020. Observational Datasets:

1. CTD: CTD data collected using a SeaBird SBE CTD package mounted on the ROV system; processing to be done using SeaBird's SeaSave software; data will include standard environmental measurements (such as pressure, temperature, salinity, fluorescence). File types: Raw (.con, .hdr, .hex, .bl) and processed and .cnv, .asc, .btl) ASCII files. Repository: BCO-DMO
2. Event log: Cruise scientific sampling event log; will include event numbers, start/end dates, times & locations of instrument deployments. File types: Excel file converted to .csv; scanned PDFs. Repository: BCO-DMO and Rolling Deck to Repository (R2R).
3. Cruise underway data: Routine underway data collected along the ship's track (including meteorological data, sea surface temperature, salinity, fluorescence, ADCP). Will be collected by the shipboard instrumentation. File types: .csv ASCII files. Repository: BCO-DMO and R2R.
4. Split Beam Sonar Data:
5. Deep sea coral samples: Corals will be sampled using the ROV during the cruise. Species identified, dive numbers, locations, depths, dates, and times will be recorded by hand on log sheets. Information from log will be transferred into an Excel spreadsheet. Images of each coral collected will be taken both in-situ by the ROV, and on the ship using a digital camera. File types: PDF files of scanned log sheets; Excel files of sampling logs; images (.jpg files). Repository: BCO-DMO.
6. ROV Images: Still and video images will be taken during this cruise from the ROV, including 3D models generated from stereopair data. File types: images (.jpg files), video (.mov files). Repository: BCO-DMO.

          ▼<dc:description>
            The Atlantic Canada Newspaper Survey (ACNS) project was designed to provide a machine-readable database of goods and
            services offered for sale in important east coast regional newspapers before 1900. This newspaper research database has as
            its focus nine broad categories of commodities based upon Statistics Canada's "Trade of Canada Commodity Classification".
            In the 1980s work on the database was supported by the Canadian Museum of Civilization. The project received SSHRC funding
            in 1986-1987 as part of its Research Tools Program. In June 2013, the Canadian Heritage Information Network was no longer
            able to host the database due to accessibility issues. CHIN exported the dataset and provided a copy to UPEI in the hopes
            that it would be useful.

# Preservation Strategies

- Extract/Store/Index technical metadata with FITS microservice
- Integration with Islandora Riprap for checksum monitoring
- Bagit Microservice
- File Normalization - in progress

# Reuse

- Metadata in a variety of formats
- License is exposed
- Islandora 8 RDM Ansible Playbook
  - <https://github.com/roblib/rdm-playbook>
- Modules contributed back to the community

# RDM and Islandora 8

- Build capacity in the community around research data
- Reuse / repurpose existing community code
- Provide migration paths for existing Islandora users
- Demonstrate the flexibility of the framework
