# Clinical Characteristics and Risk Factors for Severe COVID-19 infections in Malaysia

*Xin Ci Wong<sup>1</sup>, Benedict Sim Lim Heng<sup>2</sup>, Chee Peng Hor<sup>1,3</sup>, Suresh Kumar Chidambaram<sup>2</sup>, Hiu Jian Chua<sup>2</sup>, Mohan Dass Pathmanathan<sup>1</sup>, Kalaiarasu M. Peariasamy<sup>1</sup>, Pik Pin Goh<sup>1</sup> and ClinData\_COVID-19 Research Team*

1. Institute for Clinical Research, Malaysia
2. Infectious Disease Department, Sungai Buloh Hospital, Malaysia
3. Clinical Research Centre, Seberang Jaya Hospital, Penang

# Introduction

- COVID-19 pandemic emerged in China late 2019<sup>1</sup>
- Malaysia's 1st case on 25 January 2020<sup>2</sup>
- Policy of contact tracing and hospitalising of patients, regardless of severity

# Aim

- To conduct a nationwide multi-centre observational study of hospitalised patients for COVID-19
- To determine risk factors associated with disease severity

# Methodology

- Cohort study included adult patients (aged  $\geq 12$  years) with RT-PCR confirmed COVID-19
- Admitted to **18 hospitals** between Feb 1 and April 30, 2020
- Disease stage classified as **mild (Stage I-III)** and **severe (Stage IV-V)**
- Exclusion:
  - <12 years old, Missing data  $\geq 90\%$ , PUI, Incomplete outcome

# Methodology

## Mild COVID-19

**Stage I**

Asymptomatic

**Stage II**

Symptomatic  
without pneumonia

**Stage III**

Pneumonia  
without hypoxia

## Severe COVID-19

Pneumonia  
with hypoxia

**Stage IV**

Critically ill

**Stage V**

**Staging** <sup>3,4</sup>

# Methodology

- Case Report Form adapted from ISARIC-WHO<sup>3</sup>
- Clinical characteristics and outcomes entered into REDCap
- Univariate and multivariate regression analyses were used to identify determinants for disease severity.
- Ethics Approval : NMRR-20-580-54339 &  
MREC (KKM/NIHSEC/P20-706)

# Results

- 5889 patients
- Median age 34 yrs
- 4221 (71.7%) males
- 5418 (92%) mild
- 193 (3.3%) ICU
- 73 (1.2%) died

**Mild**

**Severe**

# Results

# Results

## Determinants for disease severity ( $p < .05$ )

- Older age ( $>50$ years)
- Fever
- Cough
- Diarrhoea
- Breathlessness
- Tachypnoea
- History of CKD
- High serum CRP ( $\geq 5$ mg/dL)
- Abnormal CXR on admission

**Figure 1: Baseline Chest Radiograph for two COVID-19 patients**  
(a) mild COVID-19 disease without progressing into severe  
(b) mild on admission but worsened into severe COVID-19 at later stage

# Results

## Case severity upon admission ( $p < .001$ )

## ICU Duration (days)

<  
(N=142)

14

≥  
(N=51)

38 (26.8)

on admission

26 (51.0)

80 (56.3)

1 - 5 days

20 (39.2)

17 (12.0)

6 - 10 days

4 (7.8)

7 (4.9)

≥ 11 days

1 (2.0)

$p < .05$

# Discussion

- Provides nationwide clinical data - first in South East Asia.
- Findings are in line with other studies suggesting older age, abnormal CXR, higher CRP, breathlessness and tachypnoea are associated with severe COVID-19.<sup>5-9</sup>
- Hospitalisation allows risk stratification and early ICU access
  - 85% of our ICU admissions occurred within 5 days.
  - In US - median time from onset to ICU admission @ 7 days.<sup>9</sup>

# Discussion

- Younger adults had fewer pre-existing condition and mild SARS-CoV-2 infection when compared with older patients.<sup>10,11</sup>
- Observations underline the need of implementing strategies to prevent patient deterioration.<sup>12,13</sup>

# Conclusion

Hospitalised individuals with severe COVID-19 disease in Malaysia shared different features than mild cases.

There is a need to consider stratification based on different clinical presentations in the management of COVID-19.
