

Page 1: Add Page Title

ID: 4

Welcome, this is the report we created for your project.

We analysed the reviews that have been merged in the last year, focusing on which changes were applied to the code under review.

We found out that you successfully merged **35** reviews!

(please, note that we restricted the scope of our tool only to the Java files in your project)

ID: 17

Text / Instructions

Code changes happening during code review in your project

How does your code change thanks to the work your team puts during the reviews? The code changes that happen during the review process are, substantially, one of the main outcomes of the code review process. We call them *review changes*. How do these review changes look like in your project?

We could classify the review changes that happened during your code review process in two main categories:

- 1. **Functional** changes
- 2. **Evolvability** changes

1. Functional changes impact how the program functions. A reviewer may require a functional change to the code, for instance, to check how the variables or resources are used, as well as to improve an algorithm.

Here an example from your project:

531
532

public IFile findFileFromPath(IPath file)
{

531
532

{
 // can't use a null or empty path below
533 * if (file == null || file.isEmpty()) {
534 * *
535 * return null;
536 * }
}

Link to review

2. Evolvability changes do not directly impact the functionality of a program, but make the software more maintainable and easier to evolve.

Examples of evolvability changes are reorganising the code, removing dead lines, and adding a comment.

ID: 19

Text / Instructions

Most of the changes that happen during the reviews in your projects are evolvability changes. For this reason, we further divided the **Evolvability** changes in **3 groups**:

2.1 Documentation: Changes that tackle any issue in the documentation of the code. They include changes to comments and names in the program.

An example from your project:

201

202

hostConfigBuilder.privileged(selectionModel.isPrivileged());

if (selectionModel.isBasicSecurity()) {

201

202

203

204

hostConfigBuilder.privileged(selectionModel.isPrivileged());

// if user has asked for basic security, use a readonly rootfs,

// make /tmp and /run use tmpfs, and drop all capabilities

if (selectionModel.isBasicSecurity()) {

Link to review

2.2 Visual Representation: Changes that modify the layout of the code. In other words, any formatting that does not impact the compilation result.

An example from your project:

43

44

45

46

47

48

import org.eclipse.linuxtools.internal.docker.core.DockerHostConfig;

public class ContainerCommandProcess extends Process {

private String containerId;

private IDockerConnection connection;

43

44

45

46

47

48

import org.eclipse.linuxtools.internal.docker.core.DockerHostConfig;

public class ContainerCommandProcess extends Process {

private String containerId;

private IDockerConnection connection;

Link to review

2.3 Structure: Changes to the organisation of the code itself or how a particular solution is implemented (without having an effect on the functionality of the code).

124

125

126

127

String fnctnName = GcovStringReader.readString(stream);

if (version >= 1094201714) {

Alexander Kurtakov Would you please make this magic number a constant somewhere? Jun 6, 2018

Roland Grunberg Yes, I'll do this. Had to fix another issue with the number. Jun 6, 2018

// long artificial = (stream.readInt() & MasksGenerator.UNSIGNED_INT_MAX

stream.readInt();

127

128

129

130

String fnctnName = GcovStringReader.readString(stream);

if (version >= GCC_VER_8_1_0_R) {

// long artificial = (stream.readInt() & MasksGenerator.UNSIGNED_INT_MAX

stream.readInt();

Visualising Review Changes Stats

This is a mock-up of our tool interface. Please take into account the space limitation; the following figure is meant to just give a general overview of the data. Our tool interface adds three new visualization on the bottom of the page.

The single graphs will be shown again with more details later in the report.

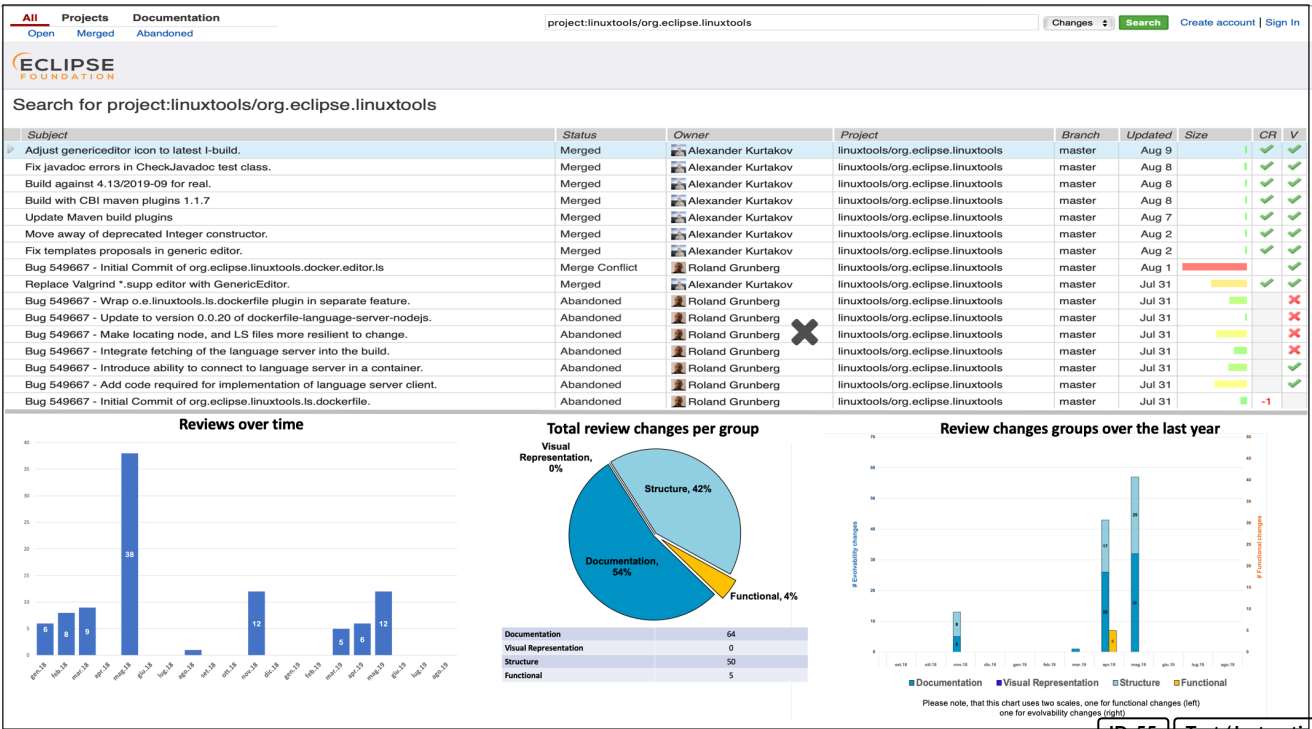

The graph in the bottom left shows the number of reviews merged per month.

The graph in the middle shows the amount of review changes according to the types we have presented before: Documentation (2.1), Visual representation (2.2), Structure (2.3) and Functional (1).

The graph in the bottom right shows the distribution of the review changes over the last year.

Details - Chart 2

This visualisation shows the amount of code review changes per group during last year.

Please take note that this chart uses two scales: one for functional changes (right), one for evolvability changes (left).

Background

Role in OSS project

19. What is your involvement with the development of the project analyzed in this report?

I am a core developer

I have committing/merging rights

I am an external contributor (no merge rights)

I am an active user (e.g., I open issue reports, but do not develop any code in it)

I am an external user (I am not involved in the development at all)
