## Abstract

The present paper deals with the taxonomy of *Selaginella* from Nepal based on the examination of herbarium collections housed in major herbaria of Europe and Asia (with additional collections from virtual herbaria). A total of 25 species are recognised here, while *Selaginella trichophylla* and *S. laxistrobila* are two new records for the flora of Nepal, India (Sikkim) and Bhutan; *Selaginella monospora* var. *ciliolata* is synonymised to *S. trichophylla*; detailed descriptions, distribution and ecology and IUCN conservation status assessments (based on literature) are presented. For most of the species, illustrations of the leaves and strobili are provided for identification of the morphologically similar taxa.

## Keywords

Lycophytes, Nepalese flora, new records, taxonomy

## Introduction

*Selaginella* P. Beauv. is the largest genus of lycophytes, with more than 700 species distributed all over the world but with highest diversity in the tropics (Jermy 1986, Zhou et al. 2015, PPG I 2016, Weststrand and Korall 2016). The Himalaya is one of the diversity centers of ferns and lycophytes of the World. Alston (1945) published the first account of Indian (including Nepalese) *Selaginella* P. Beauv. Earlier Don (1824), in his “Prodromus Florae Nepalensis”, described seven species in *Lycopodium* L., including species of heterosporous *Selaginella*. Thapa (2002) listed 23 species of *Selaginella*. Fraser-Jenkins et al.’s (2015) revision of Nepalese *Selaginella* also recognised 23 species.

The purpose of our study was to revise the taxonomy of the genus *Selaginella* of Nepal, providing a taxonomic treatment with diagnostic keys by macro-morphological characters.

## Material and methods

This study was based on materials deposited at the following herbaria: AAU, B, BM, E, GH, K, KATH, KUN, KYO, L, P, PE, TI and US (herbarium acronyms follow Thiers 2019). Images of type specimens of all species from Nepal and neighboring countries were studied by accessing those at E (<http://data.rbge.org.uk/herb>), K (<http://apps.kew.org/herbcat/gotoHomePage.do>), P (<https://science.mnhn.fr/all/search>), B (<http://ww2.bgbm.org/herbarium/default.cfm>), GH (<https://huh.harvard.edu/collections/gray.html>), US (<http://collections.si.edu/search/results.htm>), L (<https://biportal.naturalis.nl>) and JSTOR Global Plants project database (<https://plants.jstor.org>). It is worth noting that part of the collections from Edinburgh Botanic Garden (E) and British Natural History Museum (BM) were borrowed and carefully examined in the Herbarium PE (Beijing). About 350 herbarium specimens, including types for most species associated with taxonomy of *Selaginella* from Nepal, and many photos of the herbarium collections from KYO and TI provided by Mr. C.R. Fraser-Jenkins, were checked.

Morphological characters, such as ventral (lateral), dorsal (median) and axillary leaves were carefully observed. The morpho-photographs of the plants were taken with a Nikon DXM 1200F camera connected to a stereomicroscope (Nikon SMZ 1000) and computer and measurement was done by D 3.10 (<http://www.nikoninstruments.com>).

Descriptions of the species follow the form of Zhang et al. (2013), with minor changes, and were prepared based on examined dried herbarium specimens from Nepal and neighboring countries. IUCN categories (IUCN 2001) are based on published data/assessments following Fraser-Jenkins et al. (2015).

The distribution information was gathered from herbarium specimens, and literature.

## Taxonomic treatment

### Key to species of *Selaginella* from Nepal

- |   |   |                     |
|---|---|---------------------|
| 1 | Sporophylls monomorphic.....  | 2                   |
| – | Sporophylls dimorphic.....  | 11                  |
| 2 | Leaves dimorphic or slightly dimorphic .....  | 3                   |
| – | Leaves monomorphic, spirally arranged on all sides of stem and branches, linear-lanceolate..... | 1. <i>S. indica</i> |
| 3 | Rhizophores restricted to base of stem, forming thick massive rootstock.....                    | 4                   |
| – | Rhizophores at intervals throughout creeping stem and branches or in basal part.....            | 5                   |

- 4 Main stems branched near and above base, rosette plants, xerophytic ..... **2. *S. pulvinata***
- Main stems branched from near middle part, not rosette plants, xerophytic ... **3. *S. bryopteris***
- 5 Stems and branches cylindrical, often reddish, sterile leaves not obviously dimorphic, or almost monomorphic, adpressed to stems and branches ..... **6**
- Stems and branches cylindrical, not reddish, sterile leaves dimorphic ..... **7**
- 6 Leaves ciliolate at margin ..... **4. *S. adunca***
- Leaves entire or slightly denticulate at margin ..... **5. *S. aitchisonii***
- 7 Plants with creeping subterranean rhizome and stolons ..... **8**
- Plants with rhizophores at intervals throughout length of main stem, borne on ventral or dorsal side in axils of branches ..... **9**
- 8 Plants 50–100 cm long, main stem erect, leaves ciliate at base ..... **6. *S. fulcrata***
- Plants up to 16–65 cm, leaves denticulate with false vein on each side of mid-vein ..... **7. *S. involvens***
- 9 Rhizophores borne on ventral side in axils of branches, ventral and dorsal leaves ovate, margin dentate-serrulate ..... **8. *S. pallida***
- Rhizophores borne on dorsal side in axils of branches ..... **10**
- 10 Stem articulate, ventral leaves ovate-lanceolate ..... **9. *S. remotifolia***
- Stem not articulate, ventral leaves oblong-lanceolate ..... **10. *S. semicordata***
- 11 Strobili cylindrical or rather lax ..... **12**
- Strobili dorsiventrally complanate ..... **14**
- 12 Strobili cylindrical, sporophylls monomorphic ..... **11. *S. helvetica***
- Strobili not cylindrical, sporophylls rather lax, often forked ..... **13**
- 13 Plants to 25 cm long, ventral leaves ovate, ovate-triangular or ovate-lanceolate, margin denticulate ..... **12. *S. pallidissima***
- Plants to 6 cm high, ventral leaves ovate-triangular, margin ciliolate ..... **13. *S. laxistrobila***
- 14 Apex of dorsal leaves mucronate or aristate, arista curved ..... **15**
- Apex of dorsal leaves acuminate or aristate ..... **16**
- 15 Apex of dorsal leaf aristate, arista curved, up to 1/2–4/5 as long as leaf, margin sparsely ciliolate; ventral leaves oblong, apex apiculate, margin ciliolate or denticulate ..... **14. *S. bisulcata***
- Apex of dorsal leaf arista, up to 1/2–3/4 as long as leaf; ventral leaves oblong or oblong-ovate, apex acute or apiculate, margin sparsely shortly ciliolate ..... **15. *S. pennata***
- 16 Main stems tuberous at base ..... **16. *S. chrysocaulos***
- Main stems not tuberous at base ..... **17**
- 17 Sporophylls at margin long ciliate ..... **17. *S. ciliaris***
- Sporophylls at margin dentate, or not long ciliate ..... **18**
- 18 Plants creeping ..... **19**
- Plants sub-erect or creeping ..... **20**

- 19 Plants long creeping, ventral leaves ovate-triangular or oblong-falcate, margin denticulate; dorsal leaves ovate-lanceolate or elliptic, margin denticulate, apex acuminate or shortly aristate ..... **18. *S. monospora***
- Plants long creeping, ventral leaves ovate-triangular, margin ciliolate, dorsal leaves ovate, margin ciliolate, apex aristate ..... **19. *S. trichophylla***
- 20 Plants creeping..... **21**
- Plants sub-erect or ascending ..... **22**
- 21 Plants ascending from decumbent base, leaves on main stems rather approximate, base of ventral leaves long ciliolate; axillary leaves ovate or ovate-lanceolate, margin shortly ciliolate ..... **20. *S. repanda***
- Plants up to 10 cm, creeping, fertile stems erect, leaves on main stems and branches distant, margin denticulate in basal half, elsewhere subentire, or very ciliolate at base; axillary leaves ovate-triangular, margin ciliolate in basal half, elsewhere subentire ..... **21. *S. vaginata***
- 22 Plants c. 15 cm long, acroscopic base of ventral leaves dentate ..... **23**
- Plants more 15 cm long, acroscopic base of ventral leaves dentate or dentate-ciliolate ..... **24**
- 23 Apex of dorsal leaves shortly cuspidate ..... **22. *S. chrysorrhizos***
- Apes of dorsal leaves not cuspidate ..... **23. *S. reticulata***
- 24 Ventral leaves ovate to ovate-lanceolate, acroscopic base ciliate-dentate, auriculate at base; dorsal leaves ovate, base obtuse or slightly subcordate, margin ciliolate to denticulate ..... **24. *S. subdiaphana***
- Ventral leaves ovate, acroscopic base denticulate, base cordate, dorsal leaves ovate, base subcordate, margin minutely dentate ..... **25. *S. tenuifolia***

– *Selaginella longipila* auct. non Hieron; Alston 1945; Tryon 1955; Dixit 1992.

**Description.** Stems 5–15 cm, creeping. Rhizophores at intervals throughout the length of the creeping stem and branches, borne on dorsal side in axils of branches, densely hairy. Main stems anisotomously branched throughout, strongly dorsi-ventral in posi-

tion, glabrous. Lateral branches arranged on main stem 0.5–1 cm apart, second branches simple or forked. Leaves spirally arranged on all sides stem and branches, more or less isomorphic, long linear-lanceolate, 0.8–2.3 mm excluding seta, 0.3–0.5 mm wide, margin shortly ciliolate, apex acuminate, in apex with long apical seta c. 1/5 as long as leaves. Strobili solitary on erect branchlets, tetragonal, 5–25 × 1.5–2 mm. Sporophylls monomorphic, ovate-triangular or ovate-lanceolate, margin ciliolate, apex acuminate. Megaspores pale-orange, surface rugose; microspores deep yellow, surface rugose to reticulate.

**Ecology.** Epilithic, xerophytic, summer-green, in dry areas, forming clumps on moss covered rocks. Alt. 1350–2800 m.

**Distribution in Nepal.** W, C, E.

Nepalese threatened status: NT (Fraser-Jenkins et al. 2015).

**General distribution.** CHINA (Sichuan, Xizang, Yunnan), INDIA (Andhra Pradesh, Chhattisgarh, Jharkhand, Karnataka, Madhya Pradesh, Meghalaya, Odisha, Tamil Nadu, Uttarakhand, West Bengal).

**Chromosome number.** not available data.

***Selaginella aitchisonii* Hieron.**

*Selaginella aitchisonii* Hieron., Nat. Pflanzenfam. 1(4): 674. 1902; Dixit 1992; Thapa 2002; Fraser-Jenkins et al. 2015; Fraser-Jenkins et al. 2017.

≡ *Selaginella sanguinolenta* f. *aitchisonii* (Hieron.) Alston, Proc. Nat. Inst. Sci. India 11(3): 215. 1945. **Type.** PAKISTAN. Kurram Valley, Shend Toi, *J.E.T. Aitchison 369* (syntype: B [20 0121871]; K, CAL); KYRGYZSTAN. Turkestan, Akburtaseh, *A. Regel 1878* (syntype: B [20 0121870]); KYRGYZSTAN. Turkestan, Musart-Thal., *A. Regel 1877* (syntype: B [20 0121869]).

**Description.** Stems 10–25 cm, erect, slender. Rhizophores restricted to the basal part of stems, located on ventral side. Main stems branches from near bases, lateral branches dichotomously compound. Main stems terete, reddish, in basal part main stem 1.0–1.1

mm in diam. Axillary leaves symmetrical, ovate-oblong, carinate, at base obtuse, margin hyaline, at base denticulate, in middle and upper part entire, apex acuminate. Leaves isomorphic, slightly asymmetrical, ovate-lanceolate, uniauriculate at base, obtuse, peltate, margin hyaline, denticulate at base, entire in middle and upper part, apex mucronate to acuminate. Strobili solitary, terminal, compact, tetrahedral,  $6.0\text{--}10.0 \times 1.0\text{--}2.0$  mm, slightly wider branches. Sporophylls monomorphic, ovate, truncate at base, strongly keeled, apex mucronate to acute. Megaspores yellow, irregular verrucate. Microspores deep yellow, surface rugulose-tuberculate, with perispore on surface.

**Ecology.** On mossy rocks. Alt. 2200–3400 m.

**Distribution in Nepal.** W.

Nepalese threatened status: VU, globally threatened (Fraser-Jenkins et al. 2015).

**General distribution.** AFGHANISTAN, INDIA (Jammu and Kashmir), KYRGYZSTAN, PAKISTAN.

**Chromosome number.** not available data.

Selected specimens examined:

**W Nepal: HUMLA:** “Phal Ko Odar to Pipling, on mossy stone. 2600 m, 6 Jun 1980, P.R. Shakya & B. Roy 5514” (KATH).

**Note.** *Selaginella aitchisonii* is morphologically closely related to the widespread *S. sanguinolenta*, a species complex consists of several morphological variable forms which might be recognised as distinct species pending our molecular phylogentic analysis (data not published).

### *Selaginella fulcrata* (Buch.-Ham. ex D. Don) Spring

Figs 2(2A–C), 9C, 16

*Selaginella fulcrata* (Buch.-Ham. ex D. Don) Spring, Bull. Acad. Brux. 10: 231, no.138. 1843; Iwatsuki 1988; Dixit 1992; Thapa 2002; Fraser-Jenkins et al. 2015; Fraser-Jenkins et al. 2017.

≡ *Lycopodium fulcratum* Buch.-Ham. ex D. Don, Prodr. Fl. Nepal. 17. 1824.

≡ *Lycopodioides fulcrata* (Buch.-Ham. ex D. Don) Kuntze, Revis. Gen. Pl. 1: 826. 1891. **Type.** (lectotype, designated by Fraser-Jenkins et al. 2015) NEPAL. *Lycopodium fulcratum* Ham. ex D. Don, Prod Fl. Nep. p. 17. Napaul. Dr. Buchanan (BM, top of sheet).

**Description.** Stems glabrous, 50–110 cm, erect. Main stems simple at base, branched from middle part of stem, unequally angular, drying stramineous-brown, 1.3–3.0 mm in diam. in lower part, primary branched copiously pinnate, elongate-deltoid. Axillary leaves ovate-elliptic,  $1.2\text{--}1.5 \times 0.5\text{--}0.7$  mm, base obtuse, margin ciliate up to middle, rest entire. Ventral leaves ovate-oblong,  $1.4\text{--}2 \times 0.5\text{--}0.7$  mm, base obtuse, acroscopic base ciliate, rest entire and revolute, basiscopic base with few cilia, apex acute. Dorsal leaves decurrent,  $0.8\text{--}1.3 \times 0.3\text{--}0.6$  mm, unequally attenuate, subfalcate, subacute,

only older leaves ciliate at base, rest entire and younger ones entire throughout. Strobili solitary, terminal, compact, 8–12 × 1–2 mm. Sporophylls monomorphic, ovate, cordate at base, margin denticulate or entire, apex abruptly acute. Megaspores reddish-brown, surface papillate; microspore reddish-brown, surface papillate.

**Ecology.** On damp sheltered earth banks at lower elevation. Alt. 200–1200 m.

**Distribution in Nepal.** W, C, E.

Nepalese threatened status: LC (Fraser-Jenkins et al. 2015).

**General distribution.** INDIA (Bihar).

**Chromosome number.** not available data.

≡ *Selaginella caulescens* (Wall. ex Hook. & Grev.) Spring, Bull. Acad. Roy. Sci. Bruxelles 10(1): 137, no. 12. 1843. **Type.** NEPAL. At the River Rapti, Nepal, *Dr. Wallich* 137 (holotype: K [001109362]; isotype BM?).

**Description.** Plants 15–45(–65) cm, with creeping subterranean rhizome and stolons; leaves on rhizome and stolons scale-like, pale yellow. Rhizophores restricted to basal part. Main stems branched from middle upward, pinnately branched, stramineous, unbranched main stem 3–20 cm tall, 1–1.5 mm in diam. in lower part, terete, not sulcate, glabrous; primary leafy branches 7–12 pairs, 2 or 3 times pinnately branched, secondary branches 1 or 2 times pinnately branched. Axillary leaves ovate to triangular, 1.1–1.6 × 0.4–1.1 mm, base exauriculate, margin denticulate in basal to middle part, to upper entire, apex acute. Ventral leaves ovate to triangular, 1.4–2.4 × 0.4–1.4 mm, basiscopic base rounded, margin entire, acroscopic base enlarged, broader, overlapping stem and branches, margin denticulate, falsely two nerved, apex subacute or apiculate. Dorsal leaves ovate-triangular or ovate-elliptic, 0.6–1.2 × 0.2–0.5 mm, slightly carinate, base cuneate, margin denticulate, apex long acuminate to shortly aristate. Strobili solitary, terminal, compact, tetragonal, 5–15 × 1–1.4 mm. Sporophylls monomorphic, ovate-triangular, margin denticulate, apex acuminate. Megaspores whitish or brown, with equatorial flange, surface with spinulose microsculptures; microspores yellowish orange, surface verrucate with blunt spines.

**Ecology.** Epilithic or xerophytic, in damp forests or on moss covered boulders and cliffs, evergreen or seasonally green. Alt. 650–3000 m.

**Distribution in Nepal.** W, C, E.

Nepalese threatened status: not available data.

**General distribution.** BHUTAN, CHINA (Anhui, Chongqing, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hainan, Henan, Hubei, Hunan, Jiangxi, Shaanxi, Sichuan, Taiwan, Xizang, Yunnan, Zhejiang), INDIA (N, E, C and S), JAPAN, KOREA, LAOS, MALAYSIA, MYANMAR, PHILIPPINES, SRI LANKA, THAILAND, VIETNAM.

**Description.** Plants 15–45 cm, creeping, fertile branches erect. Rhizophores at intervals throughout length of creeping stem and branches, on dorsal side in axils of stem branches. Main stems branched above at base, 0.5–1.5 mm in diam. in lower part. Stems oval or terete, sulcate, glabrous, with single vascular bundle. Axillary leaves ovate-lanceolate or elliptic, 1.4–2.4 × 0.5–1.2 mm, base cuneate, margin slightly denticulate, apex slightly obtuse. Ventral leaves spreading, ovate-lanceolate, 1.8–3(–3.6) × 0.8–1.4(–1.7) mm, base rounded, acroscopic base not overlapping on stem and branches, margin minutely denticulate or subentire, apex acute. Dorsal leaves elliptic-lanceolate or ovate-elliptic, 1.4–2(–2.8) × 0.4–0.9(–1.2) mm, base uniauriculate, margin subentire or minutely denticulate, apex long acuminate. Strobili solitary, terminal and lateral to branches, compact, tetragonal, 3.5–6 × 1–3 mm. Sporophylls monomorphic, ovate-lanceolate, carinate, margin denticulate, apex acuminate. Megaspores gray-white, surface irregular reticulum; microspores pale yellow, surface with triangular and striped spines.

**Ecology.** Terrestrial, evergreen, sub-open forest banks, previously overlooked or on slopes in shade. Alt. 1800–2650 m.

**Distribution in Nepal.** C, E.

Nepalese threatened status: EN (Fraser-Jenkins et al. 2015).

**General distribution.** CHINA (Chongqing, Fujian, Guangxi, Guizhou, Hubei, Hunan, Jiangxi, Sichuan, Taiwan, Yunnan, Zhejiang), NE INDIA, INDONESIA (Sumatra), JAPAN, PHILIPPINES.

**Chromosome number.** Not available data.

Selected specimens examined:

(*Selaginella burghallii* R. Sim., Priced Cat. Ferns 6: 61. 1859, nom. nud.)

**Description.** Stems to 150 cm, creeping, slender. Rhizophores at intervals throughout length of creeping stem and branches, on dorsal side in axils of stem branches. Stem slender, sulcate. Main stems, branched throughout, arise alternately from base of plant, branches short, pinnately, flabellate, distant located. Axillary leaves oblong-lanceolate, 2.1–2.6 × 1.3–1.8 mm, base rounded-cuneate, apex truncated; on branches, obovate, 1.3–2.0 × 0.6–0.9 mm. Ventral leaves oblong-lanceolate, 1.9–2.5 × 0.7–1.2 mm, rounded at base, acroscopic base slightly enlarged, not overlapping stem and branches, margin in apex part suberose, apex subobtuse to subacute. Dorsal leaves oblong, 1.5–1.8 × 0.5–0.7 mm, imbricate, in basal part oblique, margin entire to minutely denticulate at apex, apex shortly cuspidate. Strobili solitary, terminal, tetragonal, compact, 5.0–15 × 1.5–2.3 mm. Sporophylls monomorphic, 1.6–2 × 0.8–1 mm, ovate, keeled, margin entire, apex acute. Megaspores dark-brown, surface verrucate; microspores pale, surface exine with white, translucent wing-like perispore supported with hook-like structure.

**Ecology.** Terrestrial, growing in paddy field or marshland or shady areas among the grasses with abundant water content. Restricted low altitude species of wet. Alt. 100–150 m.

**Distribution in Nepal.** C, E.

Nepalese threatened status: EN (Fraser-Jenkins et al. 2015).

**Description.** Stems 5–15(–25) cm, short-creeping, fertile stems erect. Rhizophores at intervals throughout length of creeping stem and branches, borne on ventral side in axils of branches. Main stems branched throughout, 0.2–0.4 mm in diam. in lower part. Stems stramineous, stem angulate, sulcate, primary leafy branches 2–5 pairs, simple, forked, or once pinnately branched, branchlets sparse, branches arranged on main stem 2–3 cm apart. Axillary leaves ovate-lanceolate or elliptic, 1.4–1.6 × 0.4–0.8 mm, base exauriculate, margin ciliolate. Ventral leaves oblong-ovate or broadly ovate, 1.6–2 × 0.8–1.2 mm, leaves on branches spreading or slightly deflexed, basiscopic margin ciliolate, acroscopic base enlarged, broader, overlapping stem and branches, margin ciliolate, apex acute or aristate, often bent upward. Dorsal leaves symmetrical or not, ovate or ovate-lanceolate, 1.2–1.6 × 0.5–0.8 mm, base obtuse, margin ciliolate, apex long acuminate or aristate, often reflexed. Fertile branches erect, 3–6 cm. Strobili solitary or forked, terminal, lax or lax in lower part, and compact in upper part, cylindrical, 12–35 × 2–4 mm. Sporophylls unlike sterile leaves or similar, margin ciliolate, apex long acuminate. Megaspores orange or yellowish orange, surface verrucate; microspores orange or orange-red, surface verrucate.

**Ecology.** On moss-covered cliffs, in rock crevices, on damp shaded banks in mixed forests, to mossy areas. Alt. 2300–4000 m.

**Distribution in Nepal.** W, C.

Nepalese threatened status: NT (Fraser-Jenkins et al. 2015).

– *Selaginella integerrima* sensu Strachey, Gaz. North-West Prov.: 66. 1882, non Spring, 1850.

**Description.** Stems 15–35 cm, creeping. Rhizophores at intervals throughout length of main stem, borne on ventral side in axils of branches. Main stems branched throughout, pinnately branched, 0.3–0.5 mm in diam. in lower part. Main stems stramineous or reddish, angulate, sulcate. Axillary leaves ovate, 2–3 × 1–1.5 mm, base subcordate, margin minutely denticulate, apex acuminate. Ventral leaves ovate or ovate-triangular, 1.8–3.2 × 1.1–1.8 mm, basiscopic base rounded, margin denticulate, acroscopic base enlarged, overlapping stem and branches, margin denticulate or ciliolate in basal portion, apex acute. Dorsal leaves ovate or ovate-lanceolate, 1.5–2.2 × 0.6–1.3 mm, base subcordate, margin minutely denticulate or ciliolate, apex acuminate. Strobili solitary or rarely paired, terminal, 6–10 × 1–2 mm. Sporophylls dimorphic, dorsal sporophylls ovate, oblique, in base subcordate, margin shortly ciliolate or denticulate, apex acute, ventral sporophylls ovate or oblong-ovate, not carinate, margin denticulate. Megaspores sulfur colored or yellowish orange, surface verrucate, microspores orange-red, surface covered with spinulose microsculpture.

**Ecology.** Terrestrial or epilithic, on steep, open, rather dry banks among grasses, seasonally green. Alt. 2700–3300 m.

**Distribution Nepal.** W, C, E.

Nepalese threatened status: LC (Fraser-Jenkins et al. 2015).

**General distribution.** CHINA (Sichuan, Yunnan, Xizang), INDIA (Uttar Pradesh, Himachal Pradesh).

**Chromosome number.** Not available data.

### ***Selaginella laxistrobila* K.H. Shing**

Figs 4(3A–C), 10A, 23

*Selaginella laxistrobila* K.H. Shing, Acta Phytotax. Sin. 31: 569. 1993; Zhang 2004; Zhang et al. 2013. **Type.** CHINA. Sichuan: Kanding, jieba, Sewuroug, alt. 3350 m., ad clivum australem in sylvis Quercorum, 2 Aug 1981. *S.S. Kung 6067* (holotype: PE).

**Description.** Stems 1–6 cm, with creeping main stems and few upright stems over a short distance. Rhizophores restricted to lower part of stem. Main stems branched from near base upward, 0.2–0.4 mm in diam. in lower part. Stems stramineous, angulate, sulcate. Axillary leaves elliptic, 1–1.8 × 0.3–0.7 mm, base exauriculate, margin slightly denticulate, apex acute, not aristate. Ventral leaves ovate-triangular, 1.8–2.3 × 0.8–1.2 mm, acroscopic base enlarged, broader, slightly overlapping stem and branches, margin ciliolate, apex acute. Dorsal leaves ovate, 1.2–1.8 × 0.6–0.8 mm, base subcordate or obtuse, margin ciliolate, apex acuminate. Sporophylls dimorphic, similar to sterile leaves in form and arrangement. Strobili solitary or forked, terminal, lax, dorsiventrally complanate, 10–20 × 3–5 mm. Ventral sporophylls ovate, margin shortly ciliolate, apex acuminate; dorsal sporophylls ovate-lanceolate, margin shortly ciliolate, apex acuminate. Megaspores orange or yellowish orange, surface verrucate; microspores orange, surface verrucate.

**Ecology.** Terrestrial, evergreen, under shrubs in damp places mixed forests, on rocks, soil banks. Alt. 2650–3200 m.

**Distribution in Nepal.** C, E.

Nepalese threatened status: not available data.

**General distribution.** CHINA (Sichuan, Yunnan), INDIA.

**Chromosome number.** Not available data.

Selected specimens examined:

**C Nepal: RASUWA:** “between Ghora Tabela and Lama Hotel. 2 Sep 1986, *T. Nakaike 1319*” (PE).

***Selaginella bisulcata* Spring**

Figs 5(1A–C), 10B, 24

*Selaginella bisulcata* Spring, Mém. Acad. Roy. Sci. Belgique 24: 259. 1850; Iwatsuki 1975; Iwatsuki 1988; Dixit 1992; Thapa 2002; Zhang 2004; Zhang et al. 2013; Fraser-Jenkins et al. 2015; Fraser-Jenkins et al. 2017.

≡ *Lycopodioides bisulcata* (Spring) Kuntze, Revis. Gen. Pl. 2: 826. 1891, as “*bisulcatum*”. **Type.** INDIA. N.E. India, Meghalaya, Khasia, *W. Griffith* (mislabelled as “Gorval”, i.e. Garhwal, Uttarakhand) (holotype: K).

= *Selaginella bisulcata* var. *spinulosa* Spring, Mém. Acad. Roy. Sci. Belgique 24(2): 260. 1850. **Type.** INDIA. Assam, *Griffith* s.n. (holotype: K).

**Description.** Stems 20–45 cm, creeping. Rhizophores at intervals throughout stems, located on ventral side in axis branches. Main stems branched from near base upwards, in basal part main stem 1.2–1.8 mm in diam. Main stems subquadrangular, sulcate, branched throughout their length, primary leaves branches arranged 5–8 pairs. Axillary leaves elliptic, 3–4.6 × 1.1–1.6 mm, base exauriculate, margin denticulate or sparsely ciliate. Ventral leaves asymmetrical, slightly ascending or spreading or deflexed, oblong, 3.2–5 × 1.2–2 mm, apex apiculate, in base margin entire or subentire, denticulate at apex, leaves not overlapping stem and branches, margin ciliate or denticulate in basal and apical portions, entire in middle. Dorsal leaves asymmetrical, 1–2.4 × 0.6–1.5 mm, base obliquely cuneate, margin sparsely ciliate, apex mucronate or aristate with arista curved, up to 1/2–4/5 as long as leaf, 0.4–0.8 mm. Strobili solitary, terminal, compact, 6–10 × 3.5–5.5 mm. Sporophylls dimorphic, ventral sporophylls ovate-lanceolate or oblong-ovate, in base dilated, margin ciliate or lacerate-ciliate; dorsal sporophylls oblong-lanceolate, carinate, margin ciliate, apex acuminate or aristate, with sporophyll-ptyx incomplete and ciliate. Megaspores white-brown, surface smooth; microspores orange, surface verrucate.

**Ecology.** Evergreen, often in open dry slope areas, or in a little shade in light forest. Alt. 1500–2700 m.

**Distribution in Nepal.** W, C, E.

Nepalese threatened status: not available data.

**General distribution.** BHUTAN, CHINA (Sichuan, Yunnan), INDIA (Assam State, Sikkim, Manipur, Meghalaya, Nagaland, West Bengal), INDONESIA, MYANMAR, THAILAND, VIETNAM.

**Description.** Stems 5–25 cm, evergreen or seasonally green, erect, with elongate tuber at base. Rhizophores restricted to base of stem or borne in lower part. Main stems branched from near base or from lower part upward, in basal part main stem 0.5–1 mm in diam. Stems stramineous, terete or subquadrangular, primary leafy branches 6–12 pairs, forked or once or twice pinnately branched, branchlets sparse. Axillary leaves asymmetrical, narrowly ovate or narrowly elliptic,  $2-3 \times 1-1.4$  mm, base exauriculate, in base margin ciliolate, apex blunt-acute. Ventral leaves asymmetrical, ovate-lanceolate,  $1.4-2 \times 0.8-1.4$  mm, leaves on branches slightly ascending or spreading, margin sparsely minutely denticulate or ciliolate at base, apex acute. Dorsal leaves asymmetrical, narrowly ovate,  $0.6-1 \times 0.3-0.5$  mm, base subcordate or obliquely cordate, carinate or not carinate, in basal part margin denticulate or ciliolate, apex acuminate or aristate. Strobili solitary, terminal, compact,  $3-5 \times 1-1.5$  mm. Sporophylls slightly or strongly dimorphic, ventral sporophylls ovate, margin denticulate; dorsal sporophylls with sporophyll-ptyx incomplete and ciliolate, margin ciliolate. Megaspores yellowish, surface verrucate; microspores orange, surface verrucate.

**Ecology.** On clay soil or on damp shaded banks in forest. Alt. 1400–2900 m.

**Distribution in Nepal.** W, C, E.

Nepalese threatened status: not available data.

**General distribution.** BHUTAN, CHINA (Guizhou, Sichuan, Xizang, Yunnan), INDIA (Darjeeling, Himachal Pradesh, Jharkhand, Jammu and Kashmir, Manipur, Meghalaya, Sikkim, Nagaland, Uttarakhand, West Bengal), MALAYSIA (Peninsular), MYANMAR, PAKISTAN, VIETNAM.

= *Selaginella gorvalensis* Spring, Mém. Acad. Roy. Sci. Belgique. 24: 256. 1850.

≡ *Lycopodioides gorvalensis* (Spring) Kuntze, Revis. Gen. Pl. 2: 826. 1891. **Type.** INDIA. Gorval: *Griffith* s.n., in error for Khasia (holotype: K).

= *Selaginella microclada* Baker, J. Bot. 22: 246. 1884. **Type.** INDIA. Sikkim, Chongtong, alt. 4000 ft. 22 Jul 1862. *Dr. Anderson 1404* (holotype: K [001067485]).

**Description.** Stems 35–85 cm, creeping. Rhizophores at intervals throughout length of main stem, borne on ventral side in axils of branches. Main stems branched throughout, pinnately branched. 1.5–2 mm in diam. in lower part. Axillary leaves ovate, narrowly ovate, or narrowly elliptic, 2–3 × 0.8–1.6 mm, base exauriculate, margin denticulate, apex acute. Ventral leaves ovate-triangular or oblong-falcate, 2.6–4.3 × 0.9–1.4 mm, basiscopic base decurrent, margin subentire or entire; acroscopic base enlarged, broader, overlapping stem and branches, margin denticulate, apex subacute. Dorsal leaves ovate-lanceolate or elliptic, 1–1.6 × 0.3–0.7 mm, carinate or strongly carinate, base obtuse, not peltate, margin denticulate, apex acuminate or shortly aristate. Strobili solitary, terminal, compact, 3–15 × 1.9–5 mm, sporophylls isomorphic, slightly dimorphic to strongly dimorphic. Sporophylls dimorphic, ventral sporophylls ovate-lanceolate, carinate, base dilated, margin denticulate; dorsal sporophylls lanceolate, sharply carinate, margin minutely denticulate, apex acuminate. Megaspores brown, surface verrucate; microspores orange, surface verrucate.

**Ecology.** On moss covered rocks or on damp slopes in forests, sparse in open slopes on edge of forest. Alt. 1650–3000 m.

**Distribution in Nepal.** C, E.

Nepalese threatened status: not available data.

**General distribution.** BHUTAN, CHINA (Guangdong, Guangxi, Guizhou, Hainan, Xizang, Yunnan), INDIA (Assam, Kerala, Manipur, Meghalaya, Tamil Nadu, Sikkim, West Bengal), MYANMAR, THAILAND, VIETNAM.

### *Selaginella trichophylla* K.H. Shing

Figs 6(3A–C), 10G, 29

*Selaginella trichophylla* K.H. Shing, Acta Phytotax. Sin. 31(6): 569, pl. 2. 1993; Zhang et al. 2013.

≡ *Selaginella monospora* Spring subsp. *trichophylla* (K.H. Shing) X.C. Zhang, Fl. Reipubl. Popularis Sin. 6(3): 189. 2004. **Type.** CHINA. Yunnan, Gongshan, Dulongjiang River, alt. 1450–1500 m, in sylvis frondosis, 22 VIII 1982, *Qinghai-Xizang Exped.* 9451 (holotype: PE! [00452190]).

= *Selaginella monospora* var. *ciliolata* W.M. Chu, Fl. Yunnan. 20: 719. 2006, syn. nov. **Type.** CHINA. Yunnan: Jingdong Xian, Ailao Shan, Xujiaba, alt. 2450 m., under evergreen broad-leaved forest, 22 Apr 1982, *J.J. He* 13352 (holotype: PYU!; isotype: PE!).

**Description.** Plants 20–35 cm, creeping. Rhizophores at intervals throughout length of main stem, borne on ventral side in axils of branches. Main stems pinnately branched throughout, stramineous, 1.0–1.5 mm in diam., in lower part, stem oval or terete, not sulcate, primary leafy branches 8–12 pairs, once or twice pinnately branched, branches sparse or thick, adjacent primary branches on main stem 1.5–2.5 cm apart. Axillary leaves on branches symmetrical, ovate or ovate triangular, 1.2–3.1 × 0.7–2.3 mm, base exauriculate or slightly subcordate, margin ciliolate at base, apex acute. Dorsal leaves ovate, 1.1–2.6 × 0.6–1.2 mm, slightly carinate, base obtuse or oblique subcordate, not

peltate, margin ciliolate (more densely ciliolate at base), apex aristate. Ventral leaves ovate-triangular,  $1.5\text{--}3.6 \times 0.9\text{--}2.1$  mm, margin denticulate; basiscopic base in base with few cilia or entire, acroscopic base enlarged, broader, overlapping stem and branches, margin ciliolate, in upper part denticulate, apex acute. Strobili solitary, terminal, compact, dorsiventrally complanate,  $4.0\text{--}6.5 \times 1.2\text{--}2.6$  mm, sporophylls dimorphic, resupinate, not white-margined; dorsal sporophylls ovate-lanceolate, carinate, margin denticulate, apex acuminate; ventral sporophylls ovate-lanceolate, carinate, margin denticulate. Megaspores whitish surface verrucate or papillate; microspores orange, surface verrucate.

**Ecology.** On moist cliffs, in evergreen broad-leaved forest. Alt. 1500–1600(2200) m.

**Distribution in Nepal.** C, E, rare, requiring additional research.

Nepalese threatened status: Data-deficient (DD) according to the IUCN (2001) criteria.

**General distribution.** BHUTAN (“Rukubi (2600) – Chendebi (2300) – Charikhachor (2250) – Neylong (2200), 14 Apr 1967, *H. Hara, H. Kanai, G. Murata, H. Ohashi, O. Tanaka & T. Yamazaki 4105*” (KYO); “Yuto La, between Bumthang and Trongsa, 8500 ft., Shady banks in deciduous forest. *F. Ludlow, G. Sherriff, J.H. Hicks 17023*” (KYO; L.4328981)), CHINA (Yunnan, Guangxi, Guizhou, Guandong, Hainan), INDIA (Sikkim (E Sikkim District. Above and S. of Penlang Bazaar, below and on way up to Namphung Peak of the Tinjure ridge, W. of Tashi View-Point, Across valley to the north of Gangtok. Just below crest on N. side of densely mixed-forest ridge. 29 Sep 1998. *C.R. Fraser-Jenkins 27054 (FN 3031)*” (L.4328985)), VIETNAM (Cao Bang).

**Chromosome number.** Not available data.

Selected specimens examined:

**C Nepal: DOLAKHA:** “Jiri, Dolakha, alt. c. 2200 m, 4 Oct 1988, *T. Nakaike 3076*” (PE).

**E Nepal: ILAM:** “Mai Majuwa-Dhara Pani, alt. 1500–1600 m, 4 Dec 1963, *H. Hara et al.*” (KUN; L.3498103).

**Note.** We examined the type and general collections in herbaria PE, KUN and PYU for *S. trichophylla* and *S. monospora* var. *ciliolata*: the taxon described as *S. monospora* var. *ciliolata* W.M. Chu (in Chu 2006) and listed in the “Uncertain taxa” in Flora of China (Zhang et al. 2013: 66) has many similarities in morphological features with *S. trichophylla*. The only distinct feature is the spinules on the upper side of the leaves, but these are not always present and it is likely that this trait is associated with a more humid habitat.

### ***Selaginella repanda* (Desv. ex Poir.) Spring**

= *Selaginella suberecta* Baker, J. Bot. 22: 245, no. 146. 1884. **Type.** MALAYSIA. Malacca, *Griffith* s.n. (?).

**Description.** Stems 5–30 cm, suberect to erect. Rhizophores borne from base to upper part of main stem or restricted to creeping rhizomes and stolons, on ventral side in axils of branches. Main stem branches above base, without branching part up to 15 cm, stems oval or terete. Axillary leaves more or less similar to lateral leaves, ovate or ovate-lanceolate, 2–3 × 1–1.4 mm, base exauriculate, margin ciliolate, in upper part subdentate, apex obtuse. Ventral leaves spreading, ovate, 2.2–3 × 1–1.5 mm, sub-falcate, rounded at base, basiscopic base with few cilia, acroscopic base rounded, not overlapping stem and branches, margin ciliolate in basal half, in middle and upper part dentate to denticulate, apex acute. Dorsal leaves ovate, imbricate, base cordate, in base margin ciliolate, margin in middle and upper part denticulate, apex acute to acuminate. Strobili tetragonous, submonomorphic, 3–8 × 1.5–3 mm. Sporophylls uniform, submonomorphic or sometimes dorsal sporophylls longer, ovate, margin ciliolate, apex acuminate. Megaspores yellowish orange, baculate, surface regulate or reticulate; microspores orange, surface irregular elevations.

**Ecology.** In the open or semi-shaded places on rocks or under shrubs on soil banks. Alt. 200–400 m.

**Distribution in Nepal.** C, E.

Nepalese threatened status: VU (Fraser-Jenkins et al. 2015).

**General distribution.** CAMBODIA, CHINA (Guangxi, Guizhou, Hainan, Taiwan, Yunnan), INDIA (Andhra Pradesh, Assam State, Bihar, Chhattisgarh, Jharkhand, Karnataka, Madhya Pradesh, Meghalaya, Maharashtra, Mizoram, Nagaland, Odisha, Rajasthan, Sikkim, Tamil Nadu, Uttarakhand, Uttar Pradesh, West Bengal), INDONESIA, LAOS, MALAYSIA, MYANMAR, PHILLIPINES, THAILAND, VIETNAM.

**Chromosome number.** Not available data.

Selected specimens examined:

Griffith” (K); and South India, Tamil Nadu, “Nelligheries [Nilgiris], G.S. Perottet 642 (P [= *S. radicata*]).

= *Selaginella thomsonii* Hieron, Hedwigia 43: 38. 1904. **Type.** INDIA. India orientalis: habitat in montibus Khasia, alt. s.m. 4–6000 feet, regione temperate, J.D. Hooker et T. Thomson (holotype: K?; isotype: B [20 0176901]).

**Description.** Stems 3.5–10 cm, creeping, fertile stems erect. Rhizophores restricted at intervals throughout length of creeping stem and branches and to lower part of erect fertile branches, borne on ventral side in axils of branches. Main stems branched throughout, 0.2–0.4 mm in diam. in lower part. Stem stramineous, terete, sulcate or not, branches few; erect fertile stems pinnately branched throughout. Axillary leaves ovate-triangular, 1.2–2.5 × 0.5–1.5 mm, base exauriculate, margin ciliolate in basal part, subentire in middle and upper part. Ventral leaves ovate-lanceolate or oblong-falcate, 1.6–3.2 × 0.8–1.5 mm, basiscopic base rounded, margin denticulate in basal half, denticulate upward; acroscopic base endlonged, broadly overlapping stem and branches, margin ciliolate, sparsely long ciliolate at base, apex acute. Dorsal leaves ovate-lanceolate, 0.8–2.3 × 0.4–1.1 mm, imbricate, base subcordate, cuneate, or obtuse, not peltate, margin long ciliolate at base, shortly ciliolate (rarely long ciliolate) upward, apex acuminate or aristate. Strobili solitary or in pairs, terminal, 10–15(–40) × 2–3.5 mm. Sporophylls dimorphic or slightly dimorphic, dorsal sporophylls ovate-lanceolate, margin ciliolate or denticulate, apex acuminate; ventral sporophylls ovate-lanceolate, margin denticulate or ciliolate, apex acuminate. Megaspores yellowish, surface verrucate; microspores orange, surface verrucate and rugate.

**Ecology.** Terrestrial or epilithic, forming a carpet on vertical banks and rocks evergreen or seasonally green. Alt. 500–2900 m.

**Distribution in Nepal.** W, C, E.

Nepalese threatened status: not available data.

**General distribution.** BANGLADESH, BHUTAN, CAMBODIA, CHINA (Beijing, Chongqing, S Gansu, Guangxi, Guizhou, Henan, Shaanxi, Sichuan, Xizang, Yunnan), INDIA (Assam State, Chhattisgarh, Himachal Pradesh, Jammu and Kashmir, Jharkhand, Madhya Pradesh, Manipur, Meghalaya, Nagaland, Odisha, Sikkim, Tripura, Uttarakhand, West Bengal), LAOS, MYANMAR, PAKISTAN, THAILAND, VIETNAM.

***Selaginella chrysorrhizos* Spring**

Figs 7(3A–C), 11A, 32

*Selaginella chrysorrhizos* Spring, Monogr. Lycop. 2: 251, no. 189. 1850, p. p.; Iwatsuki 1975; Dixit 1992; Thapa 2002; Fraser-Jenkins et al. 2015; Fraser-Jenkins et al. 2017.

**Type.** (lectotype, designated by Fraser-Jenkins et al. 2017) Assam, *Griffith 141* (K). = *Selaginella panchghaniana* R.D. Dixit, Bull. Bot. Surv. India 25(1–4): 226, t. 1, f. 3. 1985; Dixit 1992. **Type.** INDIA. Maharashtra-Mahabaleshwar: Panchghani, 7 Nov 1966, *Panigrahi 11739* (holotype: BSA).

**Description.** Stems 8–12 cm, evergreen or seasonally green, suberect. Rhizophores restricted to base of stem. Main stems branched from near base or from lower part upward, in basal part main stem 0.5–1.1 mm in diam. Stems glabrous, glossy yellow, sulcate, primary leafy branches 5–8 pairs, forked or once or twice pinnately branched. Axillary leaves ovate-oblong, 1.0–2.0 × 0.5–0.8 in base slightly cuneate, margin denticulate, apex obtuse. Ventral leaves ovate-oblong, 0.6–0.8 × 1–2 mm, ascending, acroscopic base ovate-oblong, slightly dilated, imbricate, distantly rotundate at the base, margin denticulate, basispic base, entire, except apices, apex obtuse. Dorsal leaves ovate, 1.8–2 × 0.5–0.8 mm, subfalcate, margin denticulate, apex shortly cuspidate. Strobili solitary, terminal, compact, 3–7 × 1.5–2 mm. Sporophylls dimorphic, ventral sporophylls ovate, aristate, margin ciliate; dorsal sporophylls oblong, obtuse, margin ciliate-dentate. Megaspores dark-brown, surface verrucate; microspores pale-brown, surface verrucate.

**Ecology.** On banks and on large stones. Alt. 200–2000 m.

**Distribution in Nepal.** W, C, E.

Nepalese threatened status: not available data.

**General distribution.** BANGLADESH, BHUTAN, INDIA (Assam, Kerala, Madhya Pradesh, Manipur, Meghalaya, Mizoram, Sikkim, West Bengal), LAOS, MYANMAR, THAILAND, VIETNAM.

**Chromosome number.** Not available data.

**Description.** Stems 6–15 cm, erect or suberect. Rhizophores in basal part or one-third creeping stem and branches, on ventral side in axils of stem branches. Main stems, much branched, slender, primary branches on intervals, 0.8–1.2 mm in diam. in lower part, second branches simple or forked. Axillary leaves, ovate, 0.9–1.3 × 0.5–0.8 mm, base rotundate, margin dentate, apex subacute. Ventral leaves ovate, 1.7–2 × 0.7–1 mm, base rotundate, basiscopic base slightly denticulate, acroscopic base rounded, not overlapping stem and branches, margin denticulate, apex subobtuse to subacute. Dorsal leaves ovate, 0.7–1 × 0.3–0.5 mm, oblique, margin thickened, distantly serrulate, apex acute to very slightly acuminate. Strobili solitary, terminal, compact, 4–7 × 1.5–3 mm. Sporophylls dimorphic, dorsal sporophylls ovate-oblong, margin ciliolate, apex acuminate; ventral sporophylls ovate, sub-pellucid, margin ciliolate, apex shortly acute. Megaspore yellow or dark-brown, surface granulose; microspores orange, surface smooth granulose.

**Ecology.** Growing in groups on moist shaded rocks and banks at the bases of hills. Alt. 1100–3700 m.

**Distribution in Nepal.** W, C, E.

**Figure 8.** Morphological diversity of the leaves of Nepalese *Selaginella* species **1A–C** *S. reticulata* (Nakaike 1760, PE) **2A–C** *S. subdiaphana* (Zhang 5, PE) **3A–C** *S. tenuifolia* (PE-Xizang Exped. ***Selaginella tenuifolia* Spring**

Figs 8(3A–C), 11D, 35

*Selaginella tenuifolia* Spring, Mém. Bull. Acad. Roy. Sci. Belgique 24(2): 253, n. 192. 1850; Alston 1945; Iwatsuki 1975; Iwatsuki 1988; Dixit 1992; Thapa 2002; Singh and Panigrahi 2005; Fraser-Jenkins et al. 2015; Fraser-Jenkins et al. 2017; Zhang 2018. **Type.** “Mishmi Hills, *Griffith*” (syntype: K), INDIA. Khasi Hills (cited by Spring as “Gorval” in error), *Griffith* (syntype: K).

= *Selaginella aureola* Spring, Mém. Acad. Sci. Brux. 24: 244. no. 182. 1850; Alston 1945. **Type.** (lectotype, designated by Fraser-Jenkins et al. 2015) INDIA. Churra-Punjee, Khasya, [W.] *Griffith* (182), [in 1835], Herbarium Hookerianum 1867 (K).

**Description.** Stems 10–20 cm, erect. Rhizophores restricted to lower one-third part of main stems, very slender, long, 0.9–1.3 mm in diam. in lower part, lateral branches forked a few times. Stem slender, glabrous, stramineous, pinnately branched. Axillary leaves ovate or slightly ovate-lanceolate, 2.5–3.5 × 1.5–2.0 mm, margin denticulate in basal part, apex acute. Ventral leaves ovate, 3.5–4.5 × 2.0–2.8 mm oblique, in base cordate, acroscopic base endlarged, broadly overlapping stem and branches, margin denticulate, basiscopic base rounded, margin entire, apex sub-obtuse. Dorsal leaves ovate, 1.4–2.0 × 1.0–1.5 mm, oblique, in base subrounded, margin minutely dentate, apex aristate. Strobili solitary, terminal, compact, 4–8 × 1–2.5 mm. Sporophylls dimorphic, dorsal sporophylls ovate-oblong, spreading, in basal part slightly longer than apical, margin denticulate; ventral sporophylls ovate, with round base, margin denticulate, apex aristate. Megaspores brownish, surface verrucate; microspores yellowish-brown, surface irregularly verrucate.

**Ecology.** Terrestrial or epilithic, seasonally green, scattered in moist shady places or clayey soils in forest. Alt. 700–2200 m.

**Distribution in Nepal.** C, E.

Nepalese threatened status: NT (Fraser-Jenkins et al. 2015).

**General distribution.** CHINA (Xizang), INDIA (Assam State, Meghalaya, Sikkim, West Bengal), MYANMAR, THAILAND.

**Chromosome number.** Not available data.

Selected specimens examined:

**C Nepal: DOLAKHA:** “Jiri, Dolakha, alt. 2000–2500 m, 3 Oct 1988, *T. Nakaike 3065*” (PE); “Jiri, Dolakha, alt. 2000–2500 m, 3 Oct 1988, *T. Nakaike 3061*” (PE).

**MAKAWANPUR:** “above Liot village, Basmari, c. 5 km W of Hetauda, off Narayanghat road. Densely sal-forested and rocky stream-gully on slope of first range of foothills beyond (N of) the Churiya Ghats. On rocks in forest, 24 Sep 1997, *C.R. Fraser-Jenkins et al. 25756 (FN 1734)*” (US, photo).

**Figure 9.** Diversity strobili of Nepalese *Selaginella* species **A** *S. indica* (Nakaike 1325, PE) **B** *S. bryopteris* (Tabata et al. 11989, PE) **C** *S. fulcrata* (Nakaike 1923, PE) **D** *S. involvens* (Zhang 345, PE) **E** *S. pallida* (Nakaike 3740, PE) **F** *S. remotifolia* (Nakaike 3522, PE) **G** *S. semicordata* (Jenkins s.n., PE) **H** *S. helvetica* (Zhang 0638, PE) **I** *S. pallidissima* (Zhang 2746, PE). Scale bars: 1 mm (**A–G**), 2 mm (**F, H–I**).

**Note.** As reported by Fraser-Jenkins et al. (2015), *S. tenuifolia* is a rather uncommon low to mid altitude species, and widespread from Himalaya to Thailand. In our study (data not published) two collections were included, one from Nepal (*T. Na-*

**Figure 10.** Diversity strobili of Nepalese *Selaginella* species **A** *S. laxistrobila* (Nakaike 1319, PE) **B** *S. bisulcata* (Nakaike 3786, PE) **C** *S. pennata* (Nakaike 3507, PE) **D** *S. chrysocaulos* (Nakaike 1058, PE) **E** *S. ciliaris* (s.n. 1225, PE) **F** *S. monospora* (Tabata et al. 11051, PE) **G** *S. trichophylla* (Lu & Zhang 27625-B, PE) **H** *S. repanda* (Nakaike 3708, PE) **I** *S. vaginata* (Nakaike 1102, PE). Scale bars: 2 mm (**A, B**), 2 mm (**C, D, G, H**), 1 mm (**E, F, I**).

**Figure 11.** Diversity strobili of Nepalese *Selaginella* species **A** *S. chrysorrhizos* (Nakaike 3708, PE) **B** *S. reticulata* (Nakaike 1760, PE) **C** *S. subdiaphana* (Zhang 5, PE) **D** *S. tenuifolia* (PE-Xizang Exped. PE6280, PE). Scale bars: 1 mm (**A**, **D**), 2 mm (**B**, **C**).

*kaike 3065*), and another from SW Xizang (*PE-Xizang Expedition PT6280*). Examined samples were studied on three grounds: gross morphology, morphology of spores and molecular data. Results of gross morphology did not show big differentiation in morphology features for examined samples (incl. observation of ventral and dorsal leaves, shape of leaf margin, strobili, ventral and dorsal sporophylls). Ventral leaves broadly overlapping stem and branches, margin denticulate; Dorsal leaves: ovate, at apex aristate, margin denticulate. Strobili oval in shape; ventral and dorsal sporophylls at margin denticulate.

In both examined collections megaspores on the proximal and distal surfaces are covered with irregularly sized verrucae, the main surface is vermiculate, micro-sculptures are dense spinulose. Microspores on the proximal and distal surfaces are covered with irregularly sized verrucae, micro-sculptures are echinulate.

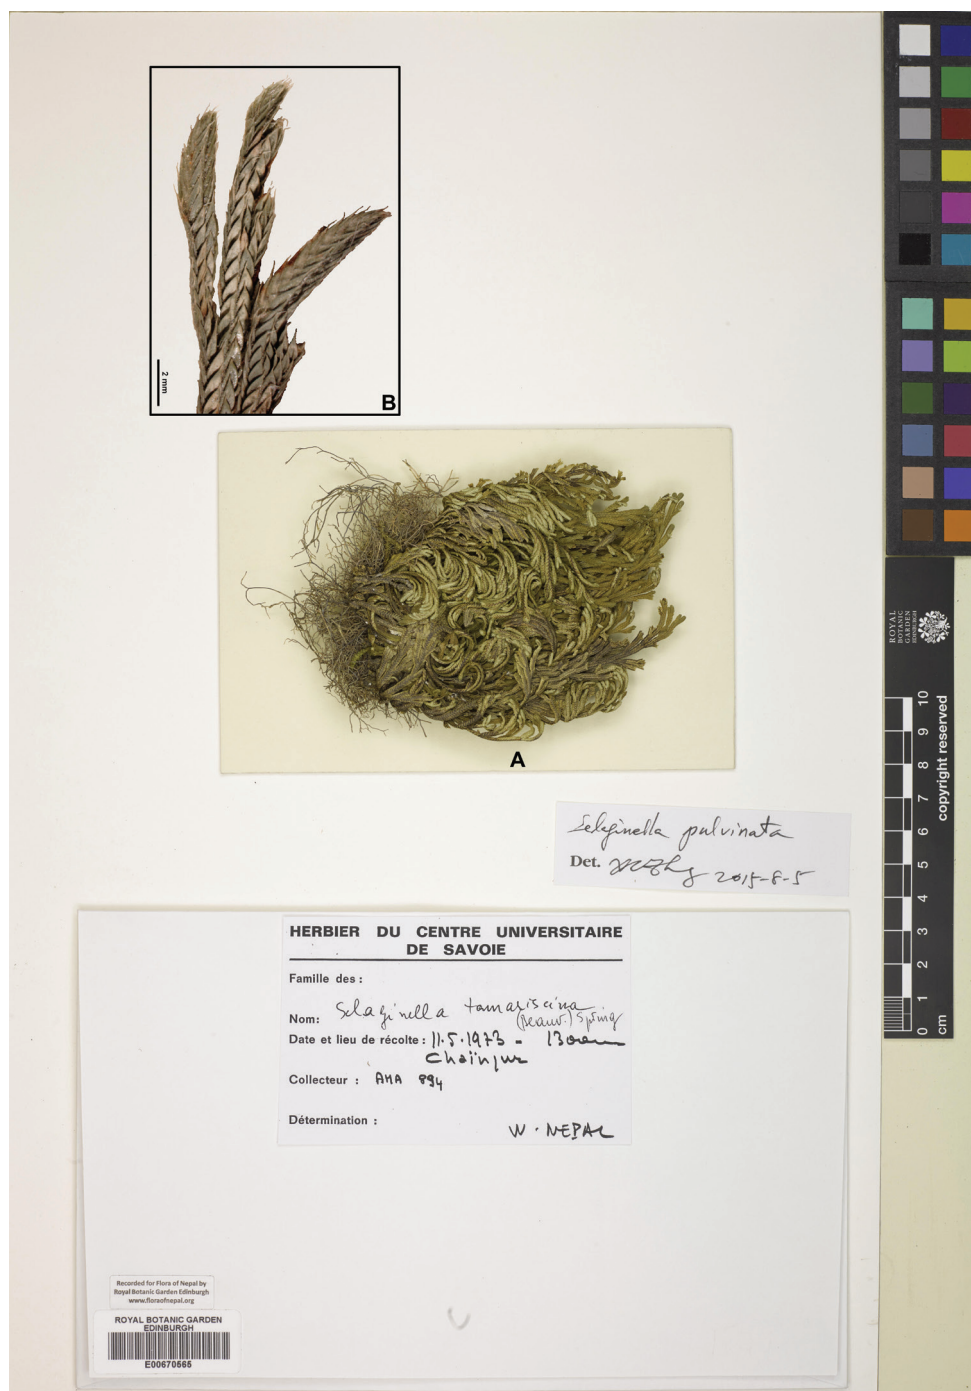

The molecular data also support the results of morphological studies.

As a result, we consider the distribution of the species not only at low and medium altitudes but also in the highlands.

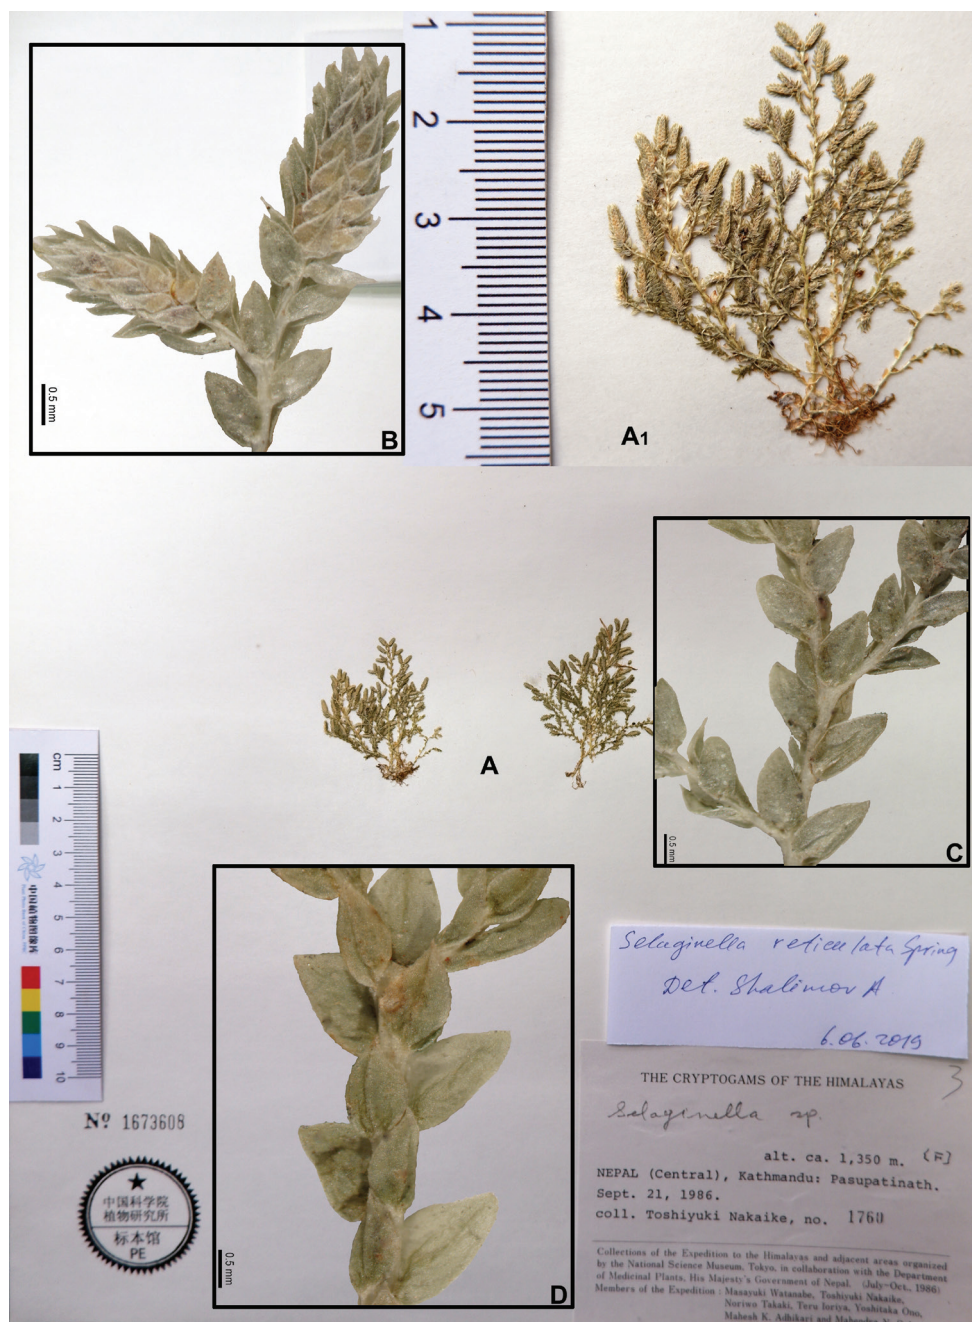

**Figure 31.** *Selaginella vaginata* Spring **A** Habit **B** strobilus, lower surface **C** fragment of the upper surface of the lateral branches **D** fragment of the lower surface of the lateral branches (*T. Nakaike* 1102, PE).

**Figure 32.** *Selaginella chrysorrhizos* Spring. **A (A1)** Habit, lower surface **B** habit, upper surface **C** strobilus, lower surface **D** fragment of the upper surface of the lateral branches **E** fragment of the lower surface of the lateral branches (*T. Nakaike* 3723, PE).

**Figure 33.** *Selaginella reticulata* (Hook. & Grev.) Spring. **A (AI)** Habit, lower surface **B** strobilus, lower surface **C** fragment of the lower surface of the lateral branches **D** fragment of the upper surface of the lateral branches (*T. Nakaike* 1760, PE).

**Figure 35.** *Selaginella tenuifolia* Spring. **A (A1, A2)** Habit, upper surface (J.H. Lance s.n., E) **B** strobilus, lower surface **C** fragment of the upper surface of the lateral branches (**A(A1, A2)** J.H. Lance s.n., E; **B, C** PE-Xizang Expedition PE 6280, PE) Link: (<http://data.rbge.org.uk/herb/E00800185>).

## Acknowledgements

We are grateful to the herbarium curators, and collection managers who helped us in our study. Special thanks to the curators of the herbarium of BM, E and P for sending on loan the specimens. Special thanks to Dr. T. Nakaike for sending duplicates of *Selaginella* he collected from Yunnan, Nepal and Pakistan to PE, and Mr. C.R. Fraser-Jenkins for providing many herbarium photographs and valuable suggestions to improve the distribution and literature citation of this manuscript. The authors are grateful to Prof. S.P. Khullar and Prof. S.C. Verma for their help in preparing this manuscript. This study was supported by the National Natural Science Foundation of China (NSFC, No. 31670205 and No. 31770237). The first author is grateful for funds received from “CAS-TWAS President’s Fellowship for International Ph.D. Students”.
