

Library Management System

Scenario: A library management system is a software designed to manage a library's primary operations. Libraries use library management systems to keep track of their asset collections and interactions with their patrons. Library management systems assist libraries in keeping track of books and their checkouts, as well as subscriber profiles and subscriptions. Keeping track of new books and documenting books that have been borrowed with their due dates and user information is another part of library management systems along with calculating fines for delayed returns. Members of the library can look up books by title, author, subject category, and publication date or place reservations for books that are currently unavailable. Each book is assigned a unique identification number as well as additional information such as a shelf number, which aids identify the actual location of the book.
