

DiverIMPACTS A Horizon 2020 multi-actor project

European arable agricultural systems are often characterised by short rotations or even monocultures, leading to problems such as higher pest pressure, soil erosion, loss of soil fertility, and loss of biodiversity.

In this context, the overall goal of DiverIMPACTS is to promote the diversification of cropping systems, with the aim to improve productivity, help deliver ecosystem services, and support the development of resource-efficient and sustainable value chains.

DiverIMPACTS will develop a range of technical and organisational innovations to help remove barriers all along the value chain from farmers to consumers, as well as create strategies and recommendations to strengthen crop diversification practises on the long-term.

The project has 34 partners from 11 countries and covers the main biogeographical regions in Europe.

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 727482 (DiverIMPACTS)

DiverIMPACTS Key activities

- DiverIMPACTS co-designs technical and organisational innovations to promote crop diversification and co-learning.
Field day in Borwede, Germany.

- DiverIMPACTS demonstrates the benefits of crop diversification for farmers and society.
Market stand, Switzerland.

- DiverIMPACTS aims to remove barriers to crop diversification at the farm, value chain and territory levels.
Field visits with practitioners, Switzerland.

- DiverIMPACTS develops comprehensive and long-term strategies and tools for more resilient crop diversification.
Intercropping with soya and winter oat, Switzerland.

What is crop diversification?

Crop diversification can be achieved using a variety of techniques, such as

- > Growing different crop species on the same land in successive growing seasons (i.e. rotation);
- > Growing different crop species on the same land within a growing season (i.e. multiple cropping);
- > Growing different species in proximity in the same field (i.e. mixed, row, and strip intercropping).

Case studies and field experiments

DiverIMPACTS demonstrates the potential of diversification through 25 multi-actor case studies.

Picture: Field trial of mixed crop with wheat and maize.

DiverIMPACTS aims to quantify the performances of crop diversification using 10 existing field experiments across Europe.

Picture: Long-term field experiment in Borwede, Germany.

Promoting crop diversification in Europe: Expected DiverIMPACTS results and outcomes

- > Assessment of the direct and indirect impacts of crop diversification along the crop value chain;
- > Identification of success and failure factors of crop diversification experiences;
- > Policy analysis and recommendations for tailored policy instruments;
- > A multi-criteria assessment tool designed to assess benefits and drawbacks of crop diversification;
- > Specifications of machinery equipment that could help foster crop diversification;
- > Logistic and contractual schemes as well as economic instruments to promote crop diversification;
- > Novel business models resulting from crop diversification and short supply chains;
- > Innovative collaboration paths between rural actors, from farmers to consumers;
- > A network of key actors and experts of sociotechnical systems beyond the project;
- > A learning-for-innovation platform and new training and education strategy to enhance crop diversification;
- > A long-term network of standardised field experiments across Europe;
- > A practical decision tree to help actors assess benefits of crop diversification.

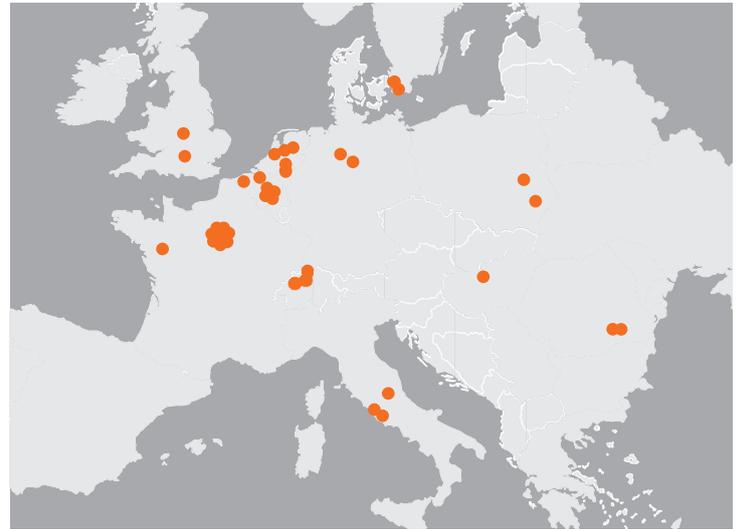

DiverIMPACTS work packages

1. Identification of success and failure factors of crop diversification
2. Promoting crop diversification in case studies through actor-oriented research
3. Quantification of the benefits from diversified cropping systems through field experiments
4. Sustainability assessment of crop diversification at the farm, value chain and territory levels
5. From lock-ins to innovations and value chain redesign
6. Strategies, methods and tools to sustain crop diversification all along the value chain
7. Transfer, dissemination and communication of the project outcomes
8. Consortium coordination and project management
