
IV. On the Proteaceæ of Jussieu. By Mr. Robert Brown, Lib. L.S.

Read Jan. 17, 1809.

THE Linnean system of botany, though confessedly artificial, has not only contributed more than all others to facilitate the knowledge of species, but, by constantly directing the attention to those essential parts of the flower on which it is founded, has made us acquainted with more of their important modifications than we probably should have known, had it not been generally adopted, and has thus laid a more solid foundation for the establishment of a natural arrangement, the superior importance of which no one has been more fully impressed with than Linnæus himself.

There are still, however, certain circumstances respecting the stamina and pistilla, which appear to me to have been much less attended to than they deserve, both by Linnæus and succeeding botanists. What I chiefly allude to is the state of these organs before the expansion of the flower. The utility of ascertaining the internal condition of the ovary before fœcundation will hardly be called in question, now that the immortal works of Gærtner and Jussieu have demonstrated the necessity of minutely studying the fruits of plants in attempting to arrange them according to the sum of their affinities, as in many cases the true nature of the ripe fruit, especially with respect to the placentalation of the seeds, can only be determined by this means. Its importance is indeed expressly inculcated by many botanists, who,

who, however, have frequently neglected it in practice: nor do I find any one who has steadily kept it in view, except Aubert Du Petit-Thouars in his excellent work on the plants of Madagascar and the Isles of France and Bourbon.

The bursting of the antheræ has, it is true, been generally observed, and many of its most unusual modes have been introduced into the characters of genera; but the examination of these organs, at a still earlier period, has been universally neglected; and hence the very imperfect knowledge which, even now, is possessed of their real nature in two of the most remarkable families of plants, the Orchideæ and Asclepiadeæ.

Examples of the great advantage of observing the antheræ in this early stage will hereafter be given in my general remarks on the order which is the proper subject of this essay. But I trust I shall be pardoned for here introducing some account of their structure in Asclepiadeæ, as it will enable me not only to bring forward the most striking proof of the importance of this consideration with which I am acquainted, but also, as I apprehend, to decide a question which has long occupied, and continues to divide, the most celebrated botanists.

The point in dispute is whether this order, comprehending Asclepias, Cynanchum, Pergularia, Stapelia, and several genera, at present confounded with these, ought to be referred to Pentandria or Gynandria, and, if to the latter, whether the antheræ are to be considered as five or ten; all of which opinions have had advocates of the greatest name in the science.

According to Linnæus, Jussieu and Richard they belong to Pentandria.

Linnæus has assigned no reason for his opinion, which, however, it appears he retained after he became acquainted with the observations of Jacquin and Rottboell; but it is probable he was

was induced to adopt it more from the consideration of the close analogy these plants have with the manifestly pentandrous Apocineæ, than from regarding them as strictly referable to this class ; for, in his natural generic characters of *Asclepias* and *Pergularia*, he very clearly describes both these genera as gynandrous.

Jussieu has entered more fully into the subject, but seems also to have been chiefly guided by this analogy and the observations of others ; as he concludes by expressing his doubts, respecting both the origin and use of the parts.

Richard, whose description of these organs I find in Persoon's Synopsis, has indeed come nearer to the solution of the question ; his account, however, of the origin of the lateral processes hereafter mentioned, proves that this description was not altogether formed on actual observation.

Jacquin, the first botanist that submitted these plants to minute examination, and whose figures well illustrate most points of their structure, has adopted a very different opinion, referring them to Gynandria, in which he is followed by Koelreuter, Rottboell and Cavanilles, all of whom likewise agree with him in considering them as decandrous ; while Dr. Smith, in his late valuable Introduction to Botany, who conceives that " no plants can be more truly gynandrous," regards them as having only five antheræ. And lastly Desfontaines supposes the five glands of the stigma to be the true antheræ, considering the attached masses of pollen as mere appendages to these.

All the authors who thus refer them to Gynandria seem quite confident in the justness of their views ; and yet the inspection of a single flower bud overturns, as it appears to me, with irresistible evidence, the conclusion they had formed from premises apparently so satisfactory.

My attention, while in New Holland, having been much engaged

gaged by the plants of this family, the species in that continent being both numerous and with difficulty reducible to established genera: I there observed the following facts concerning them, all of which I have, since my return to England, confirmed by the examination of different species of the same tribe.

The observations of Jacquin on this subject being generally known, it must be unnecessary to enter into a minute description of those organs which are well exhibited by his figures in every respect, except as to the origin of the supposed antheræ.

If a flower bud of any plant of this family, while scarcely half the size it attains immediately before expansion, be carefully examined, it will be found that the polleniferous sacs, as they are termed by Jacquin and his followers, in which they suppose the antheræ to be merely immersed, are really the organs by which the foecundating matter is secreted: for at this period they are perfectly closed, and consequently all communication cut off between the stigma and their contents now consisting of a turbid fluid or pulpy mass. If the stigma be at the same time observed, the gland-like bodies which originate in its grooved angles are already visible; but, instead of having the cartilaginous or horny texture which they at length acquire, are as yet semi-fluid, and of hardly a determinate form. Near the base of each side of these grooves a more superficial depression is observable, which, though in some cases extremely short, is in others of considerable length, and generally forms a right angle with the corresponding groove. In these depressions, the processes by which, at a more advanced stage, the contents of the antheræ are connected with the stigma, are immersed, and at this period they are found to be semi-fluid. By degrees the glands, as well as their lateral processes, acquire a firmer consistence, and the inferior or outer extremity of each of the processes, being extended beyond its depression

pression or furrow, on the bursting of the opposite cell of the corresponding anthera, firmly attaches itself to its contents, now become a regular mass of a waxy consistence.

If the accuracy of this statement be admitted, it will probably be allowed that the *Asclepiadeæ* cannot be regarded as gynandrous, especially in the sense in which they are so considered by botanists; but lest it should not be thought completely satisfactory, it may be added, that in a still earlier stage of the flower bud I have found the fœcundating matter already secreted in the cells of the antheræ, while the glands of the stigma, as well as their processes, were absolutely invisible.

As to the question of their being pentandrous or decandrous, every analogy must lead us to refer them to the former class; nor indeed have they, when not considered as gynandrous, been ever supposed to belong to Decandria.

An œconomy, in many respects similar to that now described, obtains also in Orchideæ, in which, however, the processes connecting the antheræ with the stigma, where they exist, are in many cases derived from the masses of pollen themselves; but in others they as certainly originate from the stigma, or its glandular appendage.

The result of my examination of these two interesting orders of plants, I hope hereafter to submit to the Society; and I now proceed to the proper subject of the present paper.

The natural order of PROTEÆ, or, as it is less exceptionably called, PROTEACEÆ, was first established in the Genera Plantarum of the celebrated Jussieu; and the description there prefixed to it will, with a few alterations, still apply to the order, now that it has received so many additions, not only in species, but in very distinct genera, several of which were first published by

Dr. Smith, in the 4th vol. of the Society's Transactions, and others are in the present paper submitted to the consideration of botanists.

The general description and definition of the order will be most advantageously placed at the head of its systematic arrangement; before entering upon which, I shall offer some remarks on its geographical distribution, and likewise on such modifications of structure in the different organs as appear to be of the greatest importance in indicating or characterizing genera.

The geography of plants being as yet in its infancy, the smallest addition to our knowledge of a subject which promises to become of considerable importance, will probably be received with indulgence; and in this persuasion I venture to make the following observations on the order before us. In the first place, it is remarkable that the PROTEACEÆ are almost entirely confined to the southern hemisphere. This observation originated with Mr. Dryander, and the few exceptions hitherto known to it, occur considerably within the tropic. The fact is the more deserving of notice, as their diffusion is very extensive in the southern hemisphere, not merely in latitude and longitude, but also in elevation; for they are not only found to exist in all the great southern continents, but seem to be generally, though very unequally, spread over their different regions: they have been observed also in the larger islands of New Zealand and New Caledonia; but hitherto neither in any of the lesser ones, nor in Madagascar. As in America, they have been found in Terra del Fuego, in Chili, Peru, and even Guiana, it is reasonable to conclude that the intermediate regions are not entirely destitute of them. But with respect to this continent, it may be observed, that the number of species seems to be comparatively small, their organization but little varied; and further, that they have a much

much greater affinity with those of New Holland than of Africa.

Of the botany of South Africa, scarce any thing is known, except that of the Cape of Good Hope, where this family occurs in the greatest abundance and variety; but even from the single fact of a genuine species of *Protea* having been found in Abyssinia by Bruce, it may be presumed, that in some degree they are also spread over this continent.

With the shores, at least, of New Holland, under which I include Van Diemen's Island, we are now somewhat better acquainted, and in every known part of these, *Proteaceæ* have been met with.

But it appears that, both in Africa and New Holland, the great mass of the order exists about the latitude of the Cape of Good Hope; in which parallel it forms a striking feature in the vegetation of both continents.

What I am about to advance respecting the probable distribution of this family in New Holland, must be very cautiously received; as it is in fact chiefly deduced from the remarks I have myself made in Captain Flinders's Voyage, and subsequently during my short stay in the settlements of New South Wales and Van Diemen's Island, aided by what was long ago ascertained by Sir Joseph Banks, and by a very transitory inspection of an herbarium collected on the west coast, chiefly in the neighbourhood of Shark's Bay, by the botanists attached to the expedition of Captain Baudin.

From knowledge so acquired I am inclined to hazard the following observations.

The mass of the order, though extending through the whole of the parallel already mentioned, is by no means equal in every part of it; but on the south-west coast forms a more decided feature

feature in the vegetation of the country, and contains a far greater number of species than on the east:—and in that part of the south coast, which was first examined by captain Flinders, it seems to be more scanty than at either of the extremes.

On the west coast also, the species upon the whole are more similar to those of Africa than on the east, where they bear a somewhat greater resemblance to the American portion of the order.

From the parallel of the mass, the order diminishes in both directions; but the diminution towards the north is probably more rapid on the east than on the west coast.

Within the tropic, on the east coast, no genera have hitherto been observed, which are not also found beyond it; unless that section of *Grevillea*, which I have called *Cyclopterae*, be considered as a genus. Whereas at the southern limit of the order several genera make their appearance, which do not occur in its chief parallel.

The most numerous genera are also the most widely diffused. Thus *Grevillea*, *Hakea*, *Banksia*, and *Persoonia*, extensive in species in the order in which they are here mentioned, are spread nearly in the same proportion; and they are likewise the only genera that have as yet been observed within the tropic.

Of such of the remaining genera, as consist of several species, some, as *Isopogon*, *Petrophila*, *Conospermum*, and *Lambertia*, are found in every part of the principal parallel, but hardly exist beyond it. Others, as *Josephia* and *Synaphea*, equally limited to this parallel, have been observed only towards its western extremity; while *Embothrium* (comprehending for the present under this name all the many-seeded plants of the order), which is chiefly found on the east coast, and makes very little progress towards the west, advances to the utmost limit of south latitude, and there ascends to the summits of the highest mountains.

Genera

Genera consisting of one or very few species, and which exhibit generally the most remarkable deviations from the usual structure of the order, are the most local, and are found either in the principal parallel, or in the highest latitude.

The range of species in the whole of the order seems to be very limited ; and the few cases which may be considered as exceptions to this, occur in the most extensive genera, and in such of their species as are most strictly natives of the shores. Thus *Banksia integrifolia*, which grows more within the influence of the sea than any plant of the order, is probably also the most widely extended, at least in one direction, being found within the tropic, and in as high a latitude as 40° . It is remarkable, however, that with so considerable a range in latitude, its extension in longitude is comparatively small : and it is still more worthy of notice, that no species of this family has been found common to the eastern and western shores of New Holland.

The celebrated traveller Humboldt is the first who has expressly pointed out a remarkable difference in the distribution of the species of plants.

He observes that, while the greater number grow irregularly scattered and mixed with each other, there are some which form considerable masses, or even extensive tracts, to the nearly absolute exclusion of other species. Of plants growing thus in society, the greater number occur in the temperate zones ; and of these, the most decided instances will readily present themselves to every botanist. I venture to add, that such as exist within the tropic, are found, either at considerable heights or on the sea-shores.

To this class very few of the Proteaceæ can be said to belong. *Protea argentea* of Linnæus is the most striking example among the

the African species; and my friend Mr. Ferdinand Bauer has observed a similar tendency in *Protea mellifera*.

Among the New Holland species, *Banksia speciosa* is the sole instance, and even that only in certain circumstances, of this manner of growth.

The favourite station of Proteaceæ is in dry stony exposed places, especially near the shores, where they occur also, though more rarely, in loose sand. Scarcely any of them require shelter, and none a good soil. A few are found in wet bogs, or even in shallow pools of fresh water; and one, the *Embothrium ferrugineum* of Cavanilles, grows, according to him, in salt marshes.

Respecting the height to which plants of this order ascend, a few facts are already known. The authors of the Flora Peruviana mention, in general terms, several species as being alpine; and Humboldt, in his valuable Chart of Aequinoctial Botany, has given the mean height of *Embothrium emarginatum* about 9300 feet, assigning it a range of only 300 feet. On the summits of the mountains of Van Diemen's Island, in about 43° south latitude, at the computed height of about 4000 feet, I have found species of *Embothrium*, as well as other genera hitherto observed in no other situation. *Embothrium*, however, as it is the most southern genus of any extent, so it is also, as might have been presumed, the most alpine of the family.

Two genera only of this order are found in more than one continent: *Rhopala*, the most northern genus, which, though chiefly occurring in America, is to be met with also in Cochin-china and in the Malay Archipelago; and *Embothrium*, the most southern genus of any extent, is common to New Holland and America.

From this account of the geographical distribution of the Proteaceæ, I proceed to make some general remarks on the structure and modifications of their different parts. The order, which consists of shrubs of the most rigid nature, or of trees of moderate size, contains also one herbaceous plant, my *Sympnio-nema paludosum*, which however, except in this respect and in the union of the tops of its filaments, does not remarkably differ from the usual structure of the family.

The pubescence, which is very general in the order, consists either of a short and in many cases nearly impalpable tomentum, or of soft hairs which are either spreading, close pressed, or somewhat crisped, generally simple, but in some genera fixed by the middle, and in a very few cases glandular.

The existence or absence of pubescence in the adult leaves cannot always be depended upon in distinguishing species; but the short tomentum, especially of their under surface, is of greater consequence than the spreading hairs. In the bractæ more reliance may be placed on it, and in the different parts of the flower I have never hesitated to employ it in my specific characters. In the calyx I have even derived the greatest advantage in some difficult genera, especially *Serruria*, from attending to its differences in direction.

Mr. Salisbury has introduced the pubescence of fruit into several of his generic characters, and in some I think with evident advantage, but in such only as where from its abundance and length it performs a function of manifest importance in assisting dissemination: hence I conceive it may be safely admitted into the characters of *Protea* and *Isopogon*; but I can perceive no advantage whatever in employing it in those of *Serruria* and *Spatalla*. For this reason too it ought not to be used in the capsular or drupaceous genera, in which indeed experience

proves it to be of no further moment than in distinguishing species.

Dr. Smith has given it as his opinion, that from the disposition of leaves in New Holland plants no conclusion can safely be drawn as to their genera. This remark however appears to me only applicable to certain families, or rather genera; for in many tribes the plants of that country are altogether as constant in their leaves as in any other part of the world. In proof of this, it may be sufficient to mention the order Rubiaceæ; and there are many others in which I find nothing at all remarkable in this respect.

As to Proteaceæ, it must be acknowledged that in *Banksia* both verticillated and scattered leaves occur; but the leaves constantly in threes in *Lambertia* seems to me a circumstance of even greater importance than the number of flowers in the involucrum; and the opposite leaves of *Xylomelum* distinguish it at once both from *Rhopala* and *Hakea*.

Although the form and divisions of leaves in the order are variable in no common degree, yet there are certain genera, both among those of Africa and New Holland, which the leaves even in these respects assist in indicating. Thus, in that genus to which I have applied the name of *Protea* (the Erodendrum of Mr. Salisbury), and I believe also in my *Leucadendron*, there is no instance of a divided or toothed leaf; thus also the leaves of *Spatalla* are filiform and undivided, and those of *Serruria* filiform and almost always pinnatifid. Their dichotomous divisions in *Simsia* and *Franklandia* are still more characteristic; and their division and remarkable reticulation readily distinguish *Synaphea* from *Conospermum*.

The inflorescence in Proteaceæ, whatever use botanists may think proper to make of it in their generic characters, is of undoubtedly

doubted importance in determining genera, and even in the primary division of the order it appears to be of nearly equal consequence with the fruit itself; for, in dividing the order into two sections from the structure of the ovary, it will be found that while all the single-seeded genera have each flower subtended by a proper bractea, or more rarely are without one, those with two or more seeds have, with very few exceptions, the flowers of their spikes or clusters disposed in pairs, each pair being furnished with only one bractea common to both flowers: it may also be observed that all the American and two thirds of the New Holland species have this mode of inflorescence, while only one instance of it occurs in Africa.

The single envelope of the stamens and pistillum in Proteaceæ I have, with Jussieu, denominated CALYX, chiefly because the stamens, of equal number with its laciniæ, are constantly opposite to them, and from the close analogy subsisting between this family and that of Thymeleæ, in which I believe the greater number of botanists will allow that this envelope is really calyx: and as this latter argument may be considered as the stronger, I shall endeavour to establish the identity of this organ in these two families. In several of the *Thymeleæ*, especially in *Pimelea*, the lower part of the tube of the calyx is, as it were, jointed with the upper; after the falling off of which, it remains surrounding the fruit: this is also the case in several genera of Proteaceæ, as in *Adenanthes* of Labillardiere, in *Isopogon*, in *Grevillea Chrysodendron*, and still more remarkably in *Franklandia*, in which the persistent tube becomes indurated and even nearly woody, a change surely not likely to take place in a genuine corolla. But though I have thus adopted the language of Jussieu, I am decidedly of opinion that, in all families having a single envelope,

velope, it will be still better to call it perianthium or perigonium, which latter term was proposed by Ehrhart, and is adopted by Decandolle.

A circumstance meriting the attention of the theoretical botanist, respecting the calyx in this order, is its invariable division into four leaves or segments; for the single exception noted by Linnaeus in his description of the male flowers of *Brabejum*, he himself seems afterwards to have distrusted, from the manner in which he has introduced it into the amended generic character given in the *Mantissa*; and I may add, that in nearly 400 species of the order, which I have examined, I have not met with a single exception to this rule.

With this uncommon constancy in point of number, it is remarkable that there is, in the whole order, a strong tendency to irregularity in form, the various kinds of which are of great importance in characterizing genera.

Before the expansion of the calyx the margins of its segments are applied to each other; and from the unequal degrees of cohesion in many cases subsisting among them after expansion, several kinds of irregularity arise. I am not sure that any term has been contrived for this manner of aestivation, except it be the *aestivatio valvata* of Linnaeus; but as he has not defined it, and as his commentator Reuss has given the very different aestivation of grasses as an example, I have, in introducing this circumstance into the general description of the order, specified it at length.

From the colour of the calyx, many genera of Proteaceæ are indicated with tolerable certainty. Thus *Synaphea* is distinguished from *Conospermum* by its yellow flowers; and no instance of yellow flowers has been met with in the numerous genera *Serruria* and *Spatalla*, nor any of purple in *Leucadendron*. In some genera

nera however, as in *Banksia* and *Isopogon*, it is evidently of very little importance.

The fleshy or scale-like bodies, which surround the ovary in the greater number of plants of this family, are in many cases so manifestly secreting organs, that it is surprising Mr. Salisbury should hesitate in considering them as nectaria, and denominate them calli; a term which excludes the idea of secretion. But whatever their functions may be, great assistance may certainly be derived from their various modifications, in distinguishing genera. Their importance however in this respect, like that of all other parts, not only in this, but, as I apprehend, in every natural family, is very unequal, and in some cases seems to be entirely lost. Thus, in the genus *Leucadendron* as it is here constituted, they are wanting in several species, and in some I am inclined to think exist only in the males.

In most of the regular-flowered genera they are four in number, and alternate with the leaves or laciniae of the calyx. In these genera they are also generally in the form of succulent scales, distinct, or more rarely cohering at their base, and in a very few instances adhering to the calyx; but in *Persononia* they are nearly round and fleshy, and in *Bellendena*, *Sympionema*, *Simsia*, *Agastachya*, *Petrophila*, and *Isopogon*, they are entirely wanting.

In the irregular-flowered genera with two or many seeds their number is less than four, in most cases only one exists, in a few others three, and in some none.

Varieties in the structure or apparent origin of the STAMINA, afford, as might be expected, important generic characters. Their usual insertion in the order is in the concave tops of the laciniae of the calyx; all considerable deviations from which may safely be employed in characterizing genera. In this way *Rho-*
pala,

pala, *Xylomelum*, and *Lambertia* are readily distinguished from *Embothrium*, *Grevillea*, and *Hakea*; and thus also *Persoonia* and *Brabejum* remarkably differ from *Grevillea*; while *Bellendena* differs from all others in having its stamens distinct from the calyx, affording however an indication of the real origin of these organs in the whole family.

The deviations from the usual structure of ANTHERÆ in this order are not many; but some of them are of so singular a nature as to constitute the essential characters of the genera in which they take place. These genera are *Simsia*, *Conospermum*, and *Synaphea*, all of which are most truly syngenesious; for not only do their antheræ firmly cohere together, but the corresponding lobes of these being, when considered separately, entirely open, are so applied to each other as to form but one cell, without a trace of any intermediate membrane. In *Simsia* the four antheræ are perfect, each consisting, as in the rest of the order, of two lobes, and therefore the whole before bursting constitute four cells. Whereas in *Conospermum* and *Synaphea* one filament is entirely barren, the two lateral ones have each a single-lobed anthera, and the fourth alone is perfect: hence before bursting the whole form only two cells.

This remarkable structure, which can only be ascertained before the opening of the calyx, necessarily escaped Dr. Smith in describing his *Conospermum*, for I conclude he had only the expanded flower before him, and the appearance of the antheræ in this state after their separation justifies him in referring the genus to Tetrandria: but according to the view now given of its structure, it can have no other pretension to a place in this class than its belonging to Proteaceæ; and the order Syngenesia Monogamia being abolished, it must be referred to Triandria.

The only remaining anomaly in these parts occurs in *Franklandia*,

landia, and consists in the anthera, or rather that portion of the filament on which it is fixed, adhering to the calyx through its whole length.

The figure of the **POLLEN** has been attended to by a few theoretical, but by hardly any practical botanists; yet I am inclined to think, not only from its consideration in this family, but in many others, that it may be consulted with advantage in fixing our notions of the limits of genera: and though its minuteness may perhaps always exclude it from a place in generic characters, yet it well deserves, to use the words of Linnæus when speaking of habit, to be “occulte consulendus.”

Its usual figure in the order is triangular with secreting angles, a beautiful contrivance for insuring impregnation in a tribe, in which, from the very scanty, or in many cases apparent want of secretion by the stigma, it must otherwise have been very uncertain; for by this form and secretion, as well as by the singular œconomy of the calyx, it remains so long in contact with the stigma, as probably to compensate for the somewhat defective structure of that organ.

From this figure the principal deviation is in the extensive genera *Banksia* and *Josephia*, in all of which it is elliptical or oblong, and either straight or bent into a semilunar form; and in *Franklandia* and *Aulax*, where it is spherical. The only remaining exception with which I am acquainted is the original *Embothrium* of Forster, his *E. coccineum*, in which, as in *Banksia*, it is oblong; a circumstance that, together with the more important character of a regular club-shaped stigma, and some other differences, has determined me to separate it from all the other species of *Embothrium*, except *E. lanceolatum* of Flora Peruviana, whose pollen however remains to be examined.

The external modifications of the **OVARIUM** must be very cautiously

cautiously used in the generic characters of this family; even its being sessile or pedicellated is not always of sufficient importance, though I think Mr. Salisbury has done well in introducing it into his characters of *Serruria* and *Spatalla*, in both which genera I had overlooked it before the publication of his Essay.

Its internal structure, which ought always to be ascertained, will be found of the greatest importance in most cases, but fails in *Persoonia*, the species of which differ in having one or two seeds: it would seem however, in this case, that an irregularity in a point of such importance could not take place unaccompanied with other anomalies in the same organ, and accordingly such are found to exist in this genus, and will be mentioned when treating of the fruit.

Besides number, the insertion of the ovula is also to be attended to; for though this may generally be presumed from the situation of the radicula in the ripe seed, yet to this criterion there are several exceptions, even in the present order: thus, while the radicula constantly points downward in the whole of the order, the insertion of the ovulum is in many cases at the top or side of the cell of the ovarium. My observations on this subject are as yet incomplete; but, from those that I have made, I am inclined to think such differences will be connected with genera, or rather perhaps with particular kinds of fruit. Thus I conjecture, in *Leucospermum*, *Mimetes*, *Nivenia*, and *Spatalla*, the insertion to be uniformly lateral.

The style, though not subject to much variety in this family, will be found in a few cases to furnish generic characters. Thus in *Protea*, strictly so called, the persistent subulate style forms an important part of its character: and the persistency of the whole of the style in the greater number of species of *Grevillea* will probably be used by future botanists in distinguishing them

them from that remarkable section of the genus, which I have at present united with them and called *Cyclopterae*. Its length also, when compared with that of the calyx, seems in some cases to be of importance, as in distinguishing *Adenanthes* from *Spatalla*; but in general this circumstance can hardly be had recourse to except in specific characters.

The form of the STIGMA is in many cases of considerable importance in characterizing genera, a fact which could not escape the penetration of Dr. Smith when establishing his new genera of this order: thus its conical papilla in his *Conchium* (the *Hakea* of Schrader) will in many, though certainly not in all cases, distinguish it from *Grevillea*: but its form in both these genera will readily serve to separate them from *Xylomelum* and *Rhopala*; and thus also *Spatalla* remarkably differs from *Adenanthes*. Upon the whole, however, it seems that its obliquity is of greater importance than its form; for this, when existing in any great degree, is generally accompanied with a corresponding irregularity in the calyx: but as this irregularity is produced for the purpose of bringing all the antheræ into contact with the stigma, so its obliquity in the dioicous genera *Leucadendron* and *Aulax* is not attended with so great a degree of irregularity, which would here serve no end, impregnation depending on the pollen of different individuals, to insure which the surface of the stigma in these genera is rough with papulæ; a circumstance that, together with its form, readily distinguishes them from all others of the order.

In *Synaphea*, the stigma or summit of the style inosculates with the divisions of the barren filament, which in some species appear beyond it in horn-like processes, but in others are entirely lost in its substance. I am acquainted with nothing like this in the whole vegetable kingdom; and such a singularity

alone, when occurring in several species, would have determined me to separate these plants from *Conospermum*: but being also accompanied by other remarkable differences, both of structure and appearance, no genus, I apprehend, can be better founded than this.

That the opinion of Christian Knaut and Vaillant respecting the non-existence of naked seeds is correct when anatomically considered, there can be no doubt; but the practical utility of deviating in this subject from the common language of botanists may still be questioned: and accordingly Gærtner, who was fully aware of the truth of their position, has nevertheless continued to describe the seeds of many plants as naked. I confess however I am inclined to adopt the opposite decision of the French botanists, at the head of whom is Richard, who has also proposed terms for distinguishing the various species hitherto confounded under the name of naked seeds. The fruit of the monospermous genera of Proteaceæ might probably be with advantage referred to that which he has termed *Ahena*; but as I am unwilling in the present paper to adopt any term not more generally sanctioned and understood than this, I shall content myself with calling those *nuces*, which are either not at all or but slightly compressed and not bordered; and apply the term *samara* to such as are either very much compressed, or with a less remarkable compression are surrounded or terminated by a membranaceous border: that I regard these distinctions however as in some cases of very little importance, may be inferred from this, that my genus *Leucadendron* includes both these kinds of fruit.

The first observation I have to offer on the fruits of Proteaceæ is, that there is no really bivalvular capsule in the order; a truth which was not perceived by Gærtner in describing his

Banksia

Banksia dactyloides (the *Conchium dactyloides* of Dr. Smith), and which has equally escaped Cavanilles and Labillardiere in their characters of *Hakea*. Dr. Smith has more cautiously omitted this consideration in his character of that genus, and Professor Schrader has accurately described the suture as only existing on one side: such fruits then are as truly folliculi as those of *Grevillea*, *Rhopala*, or *Embothrium*; and that the existence of a distinct placenta is by no means necessary to constitute this kind of fruit, is proved even by some genera of Apocynæ, to which family this term was first applied.

A circumstance occurs in some species of *Persoonia* to which I have met with nothing similar in any other plant: the ovarium in this genus, whether it contain one or two ovula, has never more than one cell; but in several of the two-seeded species a cellular substance is after foecundation interposed between the ovula; and this gradually indurating acquires in the ripe fruit the same consistence as the putamen itself, from whose substance it cannot be distinguished; and thus a fruit originally of one cell becomes bilocular: the cells however are not parallel, as in all those cases where they exist in the unimpregnated ovarium, but diverge more or less upwards.

In all the seeds of this order there is a very manifest CHALAZA, which, whatever may be the point of insertion of the seed, is always situated at its upper extremity; and I have not been able to observe any fasciculus of vessels connecting it with the umbilicus in cases where this latter is placed in a different part of the seed.

I am not aware of any function being ascribed to the CHALAZA of seeds, except the nutrition of their proper membrane: but it appears to me too remarkable a part to be destined for this purpose only; and some observations I have made induce

me to suppose that it is the organ secreting the liquor amnios. This opinion I was first led to form by observing in some species of *Persoonia*, in which the inspissated remains of this fluid are visible in the ripe fruit, that it evidently originated in the *chalaza* and continued to adhere to it: nothing has hitherto occurred to invalidate this opinion, which is here however hazarded merely as a conjecture, requiring for its confirmation more numerous and decisive facts than I can at present adduce.

That the ALBUMEN of seeds is merely that condensed portion of the liquor amnios which remains unabsorbed by the embryo, seems to me very satisfactorily established; and as this fluid is in the early stage never wanting, all seeds may in one sense be said to have albumen: but while in some tribes this unabsorbed part in the ripe seed many times exceeds the size of the embryo, so there are others in which not a vestige of it remains; and such has hitherto been supposed to be the case with Proteaceæ: nor are the few exceptions with which I am at present acquainted of so decisive a nature as to invalidate this character of the order; for they occur only in some species of *Persoonia*, where the semi-fluid remains of this substance are observable between the cotyledons; and in *Bellendena*, in which it continues to form a thin fleshy coat on the inner surface of the proper membrane of the seed. From such instances however we may expect to find plants with a more copious albumen, which nevertheless it may be necessary from the whole of their organization to refer to this family.

The RADICULA pointing towards the base of the fruit in all Proteaceæ is a circumstance of the greatest importance in distinguishing the order from the most nearly related tribes; and its constancy is more remarkable, as it is not accompanied by the usual position or even uniformity in the situation of the external umbilicus.

If Gærtner had not described the PLUMULA of *Protea argentea*, I should not have hesitated to assert that it was inconspicuous in the whole order.

The number of COTYLEDONS when more than two is a circumstance of little importance. In *Persoonia*, the only genus of the order in which a plurality of cotyledons has been observed, I am not even certain that their number is constant in those species in which this anomaly occurs.

In the following part of this essay it may be observed, that the genera into which I have subdivided the great African family *Protea*, are in most cases similar to those already proposed by Mr. Salisbury in the *Paradisus Londinensis*: from that essay however they are certainly not derived, but before its publication were formed and submitted to the judgment of Mr. Dryander, at whose suggestion they are now offered to the Society. That the results of an examination conducted by two observers wholly independent of each other, are so similar, will probably be considered as some proof of their correctness.

As Mr. Salisbury's generic names have the unquestionable right of priority of publication, I have in most cases adopted them, though I wish some of them had been differently constructed. But as I cannot accede to his application of the Linnæan names *Protea* and *Leucadendron*, I shall here, that I may not disturb the following arrangement, assign my reasons for differing from him in this respect; and as in so doing I am obliged to trace the progress of Linnæus's knowledge of the family, I persuade myself that this will in some degree compensate for the otherwise unwarrantable length of the discussion.

The name PROTEA, which originated with Linnæus, first occurs in the folio edition of his *Systema Naturæ* published in 1735;

1735; no generic characters are there given, but from the references to Boerhaave's figures it is evident that the genus is to be understood in the same extensive sense which he at length gave it in the second Mantissa. In 1737 appeared the Genera Plantarum, and in it for the first time the natural generic character of *Protea*: as in this work he only cites *Lepidocarpodendron* and *Hypophyllocarpodendron* of Boerhaave, it follows that here the genus is more limited, though its character is not peculiarly applicable to either of Boerhaave's genera referred to; and the description of antheræ and germen is not reconcilable to any plant whatever of the family. In the same year Hortus Cliffortianus was published, in which he resumes his first opinion of *Protea*, reducing to it all Boerhaave's genera, but referring to the character given in his own Genera Plantarum. It does not appear on what ground this change of opinion was formed; for in Clifford's garden, according to Viridarium Cliffortianum, there had only been two species, *Protea argentea* and *saligna*, neither of which had flowered, and the former was already lost; while in his Herbarium, now in the collection of Sir Joseph Banks, the specimens of all the three species given in the body of the work are without fructification, and of *Protea racemosa* added in the appendix there is no specimen whatever.

If Linnæus is to be considered in a great degree the author of the Prodromus Floræ Leydensis, published by A. Van Royen in 1740, as has been asserted by some of his pupils, and may be inferred from a passage in his Diary published by Dr. Maton, it must be noticed as his next work in the order of time; for from the same Diary it appears that he could only have been employed in its composition in 1738. In this work the genus *Protea* is given in the same extensive sense as in Hortus Cliffortianus, and no fewer than 21 species are characterized, of which however

however only two were in the Leyden garden, the rest being described from specimens in Van Royen's Herbarium.

In 1738 he also published his *Classes Plantarum*, in which, notwithstanding he appears to have composed it while engaged in the arrangement of Van Royen's collection, another fluctuation of opinion occurs, *Protea* being limited as in the first edition of the *Genera Plantarum*, and to *Leucadendros*, which here for the first time occurs, he refers the *Conocarpodendron* of Boerhaave.

In 1740 he published the second edition of *Systema Naturæ*, where the names *Protea* and *Leucadendron* are both given; but the references to Boerhaave are reversed, *Protea* being confined to his *Conocarpodendron*, and *Leucadendron* comprehending his other two genera. In this sense they also appear in the second edition of the *Genera Plantarum* published in 1742, in which the character of *Leucadendron* is first given, some of whose species he must, from the annexed asterisk, have seen recent: his description of corolla and pistillum is only applicable to *Lepidocarpodendron*.

In 1745 Linnæus received the Herbarium of Herman, from which he composed his *Flora Zeylanica*: the fourth volume of this collection containing a mixture of Ceylon and African plants, the latter are not noticed in this work; but from an inspection of the Herbarium itself, now in the Banksian collection, it appears that he had added generic names to most of them: of *Proteæ* only three species exist in the volume, of which *Protea conocarpa* is one: of this there are on the same page two specimens, whose heads of flowers are separately pasted; under one of these specimens he has written *Leucadendron*, and under the second *Protea*; to a specimen of *Protea Serraria* on a different

page

page he has given the name of *Santolina*. These facts are mentioned to prove, that at this period his knowledge of the family must have been chiefly derived from Boerhaave's figures, and perhaps from specimens which he had casually seen.

In 1748 the sixth edition of *Systema Naturæ* appeared, where the essential characters of *Protea* and *Leucadendron* first occur, both of them evidently derived from the natural characters previously given.

In 1753 the *Species Plantarum*, the most accurate of all his works, was given to the world; both genera are found in it, their species characterized, and trivial names for the first time applied to them: of *Protea* there are only two species, *P. argentea* and *fusca*; to the former however he referred as varieties *P. saligna*, *conifera*, and three others; to the whole adding the following observation, which may be supposed to contain his chief reason for applying his name *Protea* to this genus rather than to that for which in his *Classes Plantarum* he had first intended it.
“*Planta naturalis in patria argentea excellit fronde inter arbores nitidissima omnium; at culta et captiva extra patriam exuit decus; variat dein etiam domi mille modis verè Protea.*”

At this time he had in his Herbarium a specimen without fructification of *Protea argentea* properly so called; but of its supposed varieties or of *P. fusca* none whatever. Of his genus *Leucadendron* he had only one species, *L. proteoides*, afterwards called *Protea purpurea*, a plant differing in many respects from the tribe to which he had, though not without hesitation, referred it.

In 1754 the fifth edition of *Genera Plantarum* appeared, in which the characters of both genera remain exactly as in the second.

In 1759 was publishd the tenth edition of *Systema Naturæ*, where

where the essential generic characters are nearly the same as in the sixth, and the specific characters are copied from the Species Plantarum.

Of this latter work the second edition appeared in 1762: it contains two additional species of *Leucadendron* described from Burmannus's Collection and *Plantæ Africanæ*: *Protea argentea* of the first edition is here divided into two species; the first *Protea argentea* now so called, the second comprehending *P. saligna*, *conifera*, and three other nearly related species: to this latter the greater part of the observation added to *P. argentea* of the first edition is annexed, though evidently less applicable to the species thus divided.

In the sixth edition of *Genera Plantarum* printed in 1764 no alterations are made in the characters of these two genera.

In *Mantissa prima* published in 1767, two new species of *Leucadendron* are described: neither of these, however, he had in his Herbarium: the first, *Leucadendron speciosum*, he had probably accidentally seen, the antheræ of which are described as filaments, and their callous apices alone as true antheræ: the description of the second, *L. pinifolium*, is by Van Royen.

In the twelfth edition of *Systema Naturæ* published in the same year, the species of *Leucadendron* are arranged in a different, and, as the author intended, a more natural order; from which it may be concluded that at this time considerable additions had been made to his Herbarium: but *L. glomeratum* is unaccountably omitted. *Protea* here receives again *P. Levisanus*, the *P. fusca* of the first edition of the Species Plantarum, which in the second had been referred to *Brunia*.

In *Mantissa altera* published in 1771, the two genera are united under the name of *Protea*; new characters are given to

the species, and most of them are described from specimens then in his Herbarium; five species are added which had already been published by the accurate Bergius; and three, *P. totta*, *strobilina* and *parviflora*, are here first met with: in his description of the last, he seems to suspect it to be a male plant, which we now certainly know to be the case. *P. glomerata* is here again taken up; but *Protea acaulis*, *cancellata* and *conocarpa* are omitted; and *Protea conifera* of the second edition of the Species Plantarum is subdivided into three species, *P. conifera*, *pallens* and *saligna*.

In the thirteenth edition of the *Systema Vegetabilium* published in 1774, the essential character of the genus is adapted to its present state, and no alteration occurs among the species, except that *P. speciosa* is considered as a variety of *P. Lepido-carpodendron*.

From this statement it appears, that Linnæus in his earlier works had not sufficient materials for obtaining an accurate notion of this family; and hence that perpetual fluctuation of opinion concerning it, which has been now pointed out, and may in few words be recapitulated.

1st, He gave the genus *Protea* the same extent which he at length assigned to it in the *Mantissa*.

2dly, He limited it, leaving unnoticed that part to which at a latter period he exclusively applied the name.

3dly, He resumed his first opinion.

4thly, He subdivided it into two genera, giving them the same names which are adopted in the present paper.

5thly, He continued the subdivision but reversed the names, and for a reason, as it would seem, which is now known to be founded in error.

And

And lastly, Having acquired more perfect materials and perceiving the insufficiency of his characters, he united them together, thus ending exactly where he commenced.

But, as in this he has been universally followed for nearly forty years, *Protea* can no longer be considered as more strongly associated with any one species of the genus than another; and therefore this name so familiar to botanists, if the necessity of again subdividing the genus be allowed, ought certainly to be given to that part which is best known, and which contains the greatest number of published species, especially if the name be at least as applicable to this as to any other subdivision: now this part unquestionably is the *Lepidocarpodendron* of Boerhaave, the *Protea* of the first edition of the *Genera Plantarum* and *Classes Plantarum*, and of the present Essay.

The question respecting the application of the name *Leucadendron* is reducible to a smaller compass. Mr. Salisbury is aware that the Linnæan character of the genus is only applicable to *Lepidocarpodendron* of Boerhaave; and therefore, consistently with the reasons which determined him in his application of the name *Protea*, *Leucadendron* ought to have been retained for that which he has called *Erodendrum* in *Paradisus Londinensis*; and this it seems he would have done, had it not been differently used by Plukenet, whom he professes to follow in this respect. But as rejecting Linnæan names when accompanied by characters, for those of Plukenet who never published a single character, is somewhat unusual, it must be supposed to have arisen from the latter author's more appropriate use of this significant name, while it may also be presumed that Linnæus's application of it is wholly unsuitable; and it is at least to be expected that in his own application he is consistent with Plukenet, whom he means to follow.

To determine how far this is the case, I have examined the figures published by Plukenet under the name of *Leucadendros*, and also his Herbarium, which forms part of the Sloanean collection in the British Museum. Of his three species so named the first is *Protea argentea*, his “*Leucadendros africana arbor tota argentea sericea foliis integris, Atlas Tree, D. Herman.*” of which the figure represents a branch without fructification, and a separate fruit possibly of the same plant, but rather, as I suspect, belonging to a different species of the same genus.

On the same plate is figured a single leaf, in all probability belonging to *P. conocarpa*, with the following name, “*Leucadendro similis africana arbor argentea folio summo crenaturis florida, an Leucadendros africana foliis serratis D. Herman.?*” The separate fruit accompanying this probably does not belong to it, but to some species of that division of Leucadendron which Mr. Salisbury has called *Euryspermum*.

The third species, his “*Leucadendros africana, seu Scolymocephalus angustiori folio apicibus tridentatis,*” is a good figure of a flowering branch of *Protea cucullata*.

It could not certainly from his publications alone be understood why the name *Leucadendros* is applied to these three plants so little alike, while different names are given to species much more nearly related to some of them than they are to each other: of this however the solution is to be found in his Herbarium; on consulting which I find, that after the publication of *Protea argentea*, with whose flowers he was unacquainted, he had acquired flowering specimens of *Protea hirta*, and had supposed these two species to be the same, pasting between two leaves of *argentea* four loose heads of *hirta*, and under the whole copying in his own hand the name *Leucadendros*, &c. at full length from his *Phytographia*. This satisfactorily explains why he referred

P. cucullata

P. cucullata to Leucadendros, its flowers being very similar to those of *Protea hirta*. As to his application of this name to *P. conocarpa*, it could only proceed from his total ignorance of its fructification; for, as he has figured a nearly related species, *P. hypophylla*, under the very different name of *Thymelea*, &c., it is reasonable to conclude, that had he seen the flower of *P. conocarpa* he would have given it the same generic name. This *P. conocarpa* however, of which it may truly be said he knew nothing, and concerning which at least no information is to be derived from his works, is the only species of the three which belongs to Mr. Salisbury's genus Leucadendron.

But the original *Leucadendros* of Herman, of Plukenet, and of Linnæus himself, is *Protea argentea*, the only plant of the family to which the name can properly be applied; to this therefore I have assigned it in the following arrangement.

Before proceeding to this arrangement, I am happy in having an opportunity of acknowledging that assistance which has so liberally been afforded me.

To the invaluable Herbarium and Library of Sir Joseph Banks I have on this, as on all other occasions, enjoyed the freest access; an advantage which has been greatly enhanced by the opportunity it has given me of consulting my friend Mr. Dryander, both as to the formation of genera and respecting synonyms, on which points his sound judgment and unrivalled erudition so well enable him to decide.

To Dr. Smith I am indebted for the permission of inspecting the Linnæan Collection, and for the most friendly and satisfactory answers to the queries on this subject which he allowed me to put to him.

Mr. Lambert, whose Herbarium in this tribe is only surpassed by

by that of Sir Joseph Banks, has, with his accustomed liberality, submitted it without reserve to my examination.

Mr. Hibbert, who for many years possessed the most extensive collection of living Proteas that has ever been formed, and who also received from his intelligent collector Mr. Niven a valuable Herbarium of native specimens, most obligingly permitted me to examine these, and even to dissect such as were new. For the like privilege I am indebted to the friendship of Mr. Aiton of Kew, who sent me his whole collection, peculiarly valuable as containing many of the original specimens of Mr. Masson: and lastly, I have to acknowledge the great assistance I have derived from the extensive collection presented to this Society by my friend Dr. Roxburgh, who during his short residence at the Cape appears to have paid particular attention to this tribe of plants, and who, besides the many new species discovered by him, has given a greater value to his Herbarium by numerous observations on the sexes, the size, and places of growth, which I have every where inserted on his authority.

PROTEACEÆ.

DIAGNOSIS.

Calyx tetraphyllus v. quadrifidus, aestivatione valvatâ.

Corolla nulla.

Stamina quatuor, (altero nunc sterili,) laciñiis calycis opposita.

Ovarium unicum, liberum. *Stylus* simplex.

Stigma subindivisum.

Semen (pericarpii varii) exalbuminosum.

Embryo dicotyledoneus, (raro polycotyledoneus,) rectus. *Radicula* infera.

DESCRIPTIO.

DESCRIPTIO.

Frutices v. Arbores vix excelsæ ; rarissimè Herbæ.

Rami in plerisque annotino-umbellati.

Folia sparsa, nunc verticillata v. opposita, persistentia, exstipulata, indivisa v. variè dentata, seu incisa profundiùsve laci-niata, rarissimè verè composita.

Inflorescentia subspicata, modò laxius, in racemum v. corymbum floribus sæpè geminatis, nunc densiùs congesta in capitulum, vel aggregata supra receptaculum planiusculum, involucro per-sistenti, sæpiùs imbricato, subtensum : in quibusdam quasi abortione, uniflorum, indicante involucro calyculum tunc æmulante. *Bractæ* dum flores geminati singulis paribus com-munes ; in capitatis persistentes, sæpiùsque auctæ et indu-ratæ, raro connatæ ; in aggregatis nanæ, plerumque deciduæ, quandoque nullæ.

Flores in plerisque hermaphroditi perfecti, nunc organorum vicio diclines.

Calyx tetraphyllus, foliolis distinctis v. sæpiùs plùs minùs arctè cohærentibus tubulosus ; *limbo* quadrifido, æquali, laciniis subspathulatis ; nunc irregulari sive ex earum cohæsione ra-riùsve inæqualitate : coloratus, subcoriaceus, avenius, extùs sæpè pubescens, intùs glaber rariùsve barbâ ut plurimùm partiali instructus, valvatîm aperiens, ante expansionem mar-ginibus subtruncatis mutuò cohærentibus : deciduus v. mar-cescens, dum tubulosus sæpiùs a basi tandem quadrifidâ abscedens, quandoque basi integrâ diutiùs persistente.

Corolla nulla.

Stamina quatuor, (altero nunc sterili,) foliolis calycis opposita, iisdemque sæpissimè inserta, in plerisque juxta apicem, quan-doque prope medium v. basin ; raro hypogyna ; calycem nun-quam superantia.

Filamenta brevissima v. mediocria, rarissimè partim cohærentia. *Antheræ* adnatæ, biloculares, lineares, loculis per axin longitudinaliter dehiscentibus; raro bipartitæ lobis respondentibus vicinarum connatis loculumque unicum tandem bivalvem efformantibus, altero lobo in quibusdam deficiente.

Pollen triangulare, angulis subsecernentibus, quandoque ellipsum v. lunatum, raro sphæricum.

Squamulæ Glandulæve hypogynæ v. quatuor foliolis calycis alternantes, distinctæ seu connatæ; v. pauciores et intùs secundæ, interdum nullæ, rarissimè staminuliformes.

Ovarium unicum, liberum, sæpè pedicellatum, pedicello rarissimè articulato, mono-di-poly-spermum quandoque bilocular: ovulis apice, basi v. latere ovarii affixis.

Stylus simplex, terminalis.

Stigma in plerisque indivisum, modò emarginatum rariùsve bifidum; sæpè obliquum, figurâ varium, plerumque glabrum, quandoque papulosum, hispidulum v. tomentosum.

Pericarpium; Nux, Samara v. *Drupa* monosperma raro disperma, vel *Folliculus* coriaceus seu ligneus, di-poly-spermus basi, marginibusve suturæ seminifer; raro bilocularis, dissepsimento libero parallelo bipartibili!

Semen sessile, ventricosum, v. sæpiùs compressum, in folliculatis sæpè alatum; exalbuminosum, apice *Chalazâ* venosâ insignitum, *Rhaphi* nullâ.

Embryo dicotyledoneus, raro polycotyledoneus, rectus, albus.

Radicula infera, brevis.

Plumula vix conspicua.

OBS. The separation of sexes in the genus *Protea* of authors, obscurely suspected by Linnæus himself in his *Protea parviflora*, and afterwards more expressly by Lamarck in *P. pinifolia*, was first ascertained in *Aulax* and the present genus (as Mr. Dryander informs me) by our countryman Masson, during his last residence at the Cape of Good Hope, and is beautifully illustrated by that eminent botanical painter Mr. Francis Bauer, in his unpublished drawings preserved in the Banksian collection. Numerous observations on the same subject have also more recently been made by Dr. Roxburgh and Mr. Niven, who have bestowed much pains in ascertaining its limits, of which, as far as regards the African part of the family, Mr. Salisbury has given an accurate account in his Essay already quoted. The Dissertation of Thunberg, who was wholly unacquainted with this separation of sexes in these plants, is necessarily imperfect, and he has, in several cases, described the different sexes as distinct species; and thus also Bergius has founded his genus *Aulax* on the male of a species, whose female he had previously published as a *Leucadendron*. On the other hand, Jussieu, deceived by the resemblance in inflorescence, between *Brabejum* and the spiked species of *Protea*, has erroneously suspected these to be monoicous, while he has totally overlooked the truly dioicous nature of the present genus.

OBS. Quam maximè affine præcedenti.

- *36. *L. ericifolium*, foliis acerosis glabris semiunguicularibus, capitulis corymbosis paucifloris, calycibus tomentosis.

HAB. In Africâ Australi. *Dom. J. Roxburgh.* (v. s. in Herb. Lambert. et Soc. Linn.)

DESC. *Frutex* erectus, ramosissimus, ramis rubicundis, ramulis tenuissimè tomentosis. *Folia* frequentia, erecta, imbricata, mutica, concaviuscula. *Capitula* breviter pedunculata, *Involucro* breviore sericeo subtensa. *Calyx* tubo gracili. *Ovarium* nullum. *Stylus* glaber. *Stigma* clavatum. *Squamulæ* nullæ intra calycem.

- *37. *L. crassifolium*, foliis cuneato-ovatis obtusissimis glaberrimis crassis aveniis (3-uncialibus) basi attenuatis, capitulis globosis, bracteis propriis lanatis, calycibus glabris.

HAB. In Africâ Australi. *D. Masson.* (v. s. in Herb. Banks.)

OBS. *Rami* glaberrimi, glauci, crassitie digitii minimi. *Folia* frequentia, glauca, rigida, sesquiunciam lata, callo subrotundo, acutiusculo,

acutiusculo, marginibus subsimplicibus per lentem minutè crenulatis, novellis ciliatis. *Capitulum* magnitudine cerasi maximi. *Calycis Tubus* cylindraceus. *Laminæ* lineares, planiusculæ, unguesque recurvæ. *Stylus* glaber. *Stigma* oblongo-clavatum.

An hujus generis?

*38. L. *cartilagineum*, foliis ovali-spathulatis obtusissimis: callo subtruncato: aeniis cartilagineis glaberrimis; basi attenuatâ lineari, capitulis globosis subpedunculatis, bracteis calycibusque tomentosis.

HAB. In Africâ Australi. (v. s. in Herb. Soc. Linn. et D. Hibbert.)

DESC. *Frutex* erectus, ramulis tenuissimè tomentosis. *Folia* vix uncialia, siccatione venis obsoletis depressis. *Capitulum* magnitudine cerasi minoris, pedunculo brevissimo bracteisque villosis. *Calyx* quadrifidus. *Stylus* glaber. *Stigma* oblongo-clavatum.

An hujus generis?

3. PETROPHILA.

ATYLI species. Salisb. Parad.

GEN. CHAR. *Calyx* quadrifidus, totus simul deciduus. *Stylus* basi persistenti. *Stigma* fusiforme, apice attenuato. *Squamulae* nullæ hypogynæ. *Strobilus* ovatus. *Nux* lenticularis, hinc comosa, v. *Samara* basi barbata.

HABITUS. Frutices rigidi. Folia *glabra*, *varia*, *filiformia* v. *plana*, *indivisa*, *lobata* v. *pinnatifida*, quandoque in eodem frutice *diversiformia*. Amenta *ovata* v. *oblonga*, *terminalia* et *axillaria*, nunc aggregata. Genus, posthac, speciebus incrementibus,

dividendum, phalangibus infra propositis genera futura indicantibus.

ΕΤΥΜ. Περγος et φιλεω. Hi frutices enim semper in saxosis apricis proveniunt.

OBS. Mr. Salisbury has united such of the New Holland Proteæ as he had seen, into one genus, which he calls *Atylus*; a name meant to express the want of those bodies that usually surround the ovary, in this order, and which he chooses to term *calli*: but as I conceive they are certainly secreting organs, the name on this ground would be exceptionable: my chief reason however for not adopting it, either for the present or the following genus, is, that the whole of his essential character does not apply to either of them. In his secondary character, he has also considered them as monoicous, a mistake into which he has probably been led, not only from the striking similarity between the strobili of *Petrophila* and *Leucadendron*, but also from the style of the former remaining for some time unwithered after the calyx has fallen off. In one species he has even described the relative situation of the sexes; regarding the terminating amentum of *P. pulchella* as female, and the lesser ones, which frequently though not always surround it, as male; but that this is not the case is proved by Cavanilles' figure of the species, in which all the amenta are in fruit, and a specimen in the same state may be seen in Sir Joseph Banks's Herbarium.

† *Stigma articulatum, articulo inferiore angulato, glabro, superiore tomentoso. Nux lenticulari-compressa, intùs marginibusque comosa. Folia filiformia indivisa.*

*1. *P. teretifolia*, foliis teretibus exsulcis, squamis strobili eneribus, stigmatis articulo superiore stuposo triplo longiore.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land. (ubi v. v.)

*2. *P. filifolia*, foliis teretibus exsulcis, squamis strobili nervosis orbiculatis, stigmatis articulo superiore barbato vix duplo longiore.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land ; in collibus saxosis. (ubi v. v.)

*3. *P. acicularis*, foliis filiformibus suprà obsoletè sulcatis, squamis strobili nervosis ovatis.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land ; in campis collibusque sterilibus. (ubi v. v.)

†† *Stigma inarticulatum, hispidiusculum.* Nux *lenticulari-compressa, intùs marginibusque comosa.* Strobilus *squamis distinctis.* Folia *filiformia bipinnatifida.*

*4. *P. rigida*, foliis triternatis : laciniis divaricatis, calycibus barbatis : laminarum apiculis glabris.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land ; in collibus saxosis. (ubi v. v.)

5. *P. pulchella*, foliis trifido-bipinnatis : laciniis erectis, calycibus sericeis : laminarum apicibus tomentosis.

Protea pulchella. Schrad. Sert. Hanov. ii. p. 15.* t. 7. Willd. Sp. Pl. 1. p. 507. Cavan. Anal. 1. p. 237.* Ic. 6. p. 33. t. 550. Sims, Bot. Mag. 796.

Protea fucifolia. Salisb. Prod. 48.

Protea dichotoma. Cavan. Anal. 1. p. 239.* Ic. 6. p. 34.* t. 551.

HAB. In Novæ Hollandiæ orâ orientali, prope Port Jackson; in arenosis inter saxa. (ubi v. v.)

*6. *P. fas-*

- *6. *P. fastigiata*, foliis trifido-bipinnatis : laciniis erectis fastigiatis teretiusculis muticis, calycibus glabris, strobilis terminalibus sessilibus : squamis lanatis.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land ; in ericetis aridis elevationibus. (ubi v. v.)

- *7. *P. pedunculata*, foliis tripinnatifidis : laciniis canaliculatis divaricato-patulis, calycibus glabriusculis, strobilis pedunculatis : squamis glabris.

HAB. In Novæ Hollandiæ orâ orientali, prope Port Jackson ; in montibus saxosis. (ubi v. v.)

††† Strobilus *squamis connatis*. Samara *foliacea*, *dilatata*. Stigma *inarticulatum*, *hispidiusculum*. Folia *plana*, *bipinnatifida*.

- *8. *P. diversifolia*, foliis bi- tripinnatifidis planis : laciniis mucronatis, calycibus barbatis, strobilis axillaribus pedunculatis : squamis lanatis cohærentibus.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land ; in collibus saxosis. (ubi v. v.)

†††† Strobilus *squamis distinctis*. Samara *planiuscula*. Folia *plana*, *ternatim divisa*.

- *9. *P. squamata*, foliis trifidis : lobis linear-lanceolatis ; lateribus sæpiùs bi-trifidis, strobilis axillaribus sessilibus : squamis apice scariosis glabris.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land ; in ericetis collibusque aridis. (ubi v. v.)

- *10. *P. trifida*, foliis trifidis : lobis spathulato-lanceolatis sæpissimè indivisis, strobilis axillaribus sessilibus : squamis apice sericeis.

HAB.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land ; in collibus apricis sterilibus. (ubi v. v.)

4. ISOPOGON.

ATYLI species. *Salisb. Parad.*

GEN. CHAR. *Calyx* quadrifidus, tubo gracili, diutiùs persistente. *Stylus* totus deciduus. *Stigma* fusiforme, v. cylindraceum. *Squamæ* nullæ hypogynæ. *Nux* sessilis, ventricosa, undique comosa.

HABITUS. Frutices *rigidi*. Folia *glabra*, *plana* v. *filiformia*, *divisa* v. *integerrima*. Capitula *terminalia*, raro *axillaria*. Floribus modò *densissimè imbricatis strobilo globoso*; modò *fastigiatis receptaculo communi planiusculo subinvolucrato*, paleis *deciduis congestis*. Genus distinctum, præcedenti proximum, posthac forsitan in duo dividendum, ratione inflorescentiæ secundum quam species infrà distributæ sunt, in duas phalanges habitu parùm diversas.

ETYM. Ιτος et πογον, ob nuces undique æqualiter barbatas; quâ notâ a *Petrophilâ* facilè distinguendus.

† *Strobilus globosus*; *squamis densissimè imbricatis*, *tardiùs deciduus*.

*1. I. *teretifolius*, foliis bi- v. tritemnatis filiformibus exsulcis, ramulis tomentosis, calycis tubo sericeo: laminis longitudinaleiter barbatis.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land; in ericetis collibusque saxosis. (ubi v. v.)

2. I. *anethifolius*, foliis pinnatifidis bipinnatifidisque filiformibus suprà sulcatis: laciniis erectiusculis, ramis glabris, calycis tubo pubescente: laminis infrà glabris apice barbato.

Protea

Protea anethifolia. *Salisb. Prod.* 48.

Protea acufera. *Cavan. Anal.* 1. p. 236.* *Ic.* 6. p. 33.
t. 549.

HAB. In Novæ Hollandiæ orâ orientali, prope Port Jackson ;
in ericetis. (ubi v. v.)

*3. I. *formosus*, foliis bipinnatifidis subtriternatis filiformibus su-
prâ canaliculatis : laciniis divaricatis, ramulis tomentosis,
calycibus glabris : laminis apice pilosiusculis.

HAB. In Novæ Hollandiæ orâ australi, Lewin's Land ; in col-
libus saxosis. (ubi v. v.)

4. I. *anemonifolius*, foliis trifido-pinnatifidis bipinnatifidisve : la-
ciniis linearibus planis patenti-erectis subtûs lævibus, stro-
bili squamis stuposis.

Protea anemonifolia. *Salisb. Prod.* 48. *Sims, Bot. Mag.* 697.
And. Repos. 332.

Protea tridactylides. *Cavan. Anal.* 1. p. 235.* *Ic.* 6. t. 33.*
t. 548.

HAB. In Africâ Australi. *D. Masson.* (v. s. in *Herb. Banks.*)

DESC. *Caulis* brevis. *Rami* erecti, glabri. *Folia* laevia. *Involucra* ramea, subaggregata, breviter pedunculata; *Bracteis* obtusis, interioribus pube diutiū persistenti subsericeis. *Calyx* muticus, apice barbato. *Receptaculi* paleæ connatæ. *Squamulae hypogynæ* subulatæ.

OBS. Varietas? Foliis longioribus (sesquiuncialibus) semitertibus in Herbario et Hort. D. Hibbert vidi, quæ secundum *D. Niven.* 3—4 pedes alta in montosis solo fertiliori prope Zonder End. lecta. Hæc *Protea virgata*. *And. Repos.* 577.

6. LEUCOSPERMUM.

LEUCADENDRUM. *Salisb. Parad.* Proteæ sect. 3. *Linn. Mant.*

CONOCARPODENDRA (*spuria* 196 et 198). *Boerh. Lugd.*

CHAR.

CHAR. GEN. *Calyx* irregularis, labiatus, unguibus tribus (raro omnibus) cohærentibus, laminis staminiferis distinctis. *Stylus* filiformis, deciduus. *Stigma* incrassatum, glabrum (nunc inaequilaterale). *Nux* ventricosa, sessilis, lævis. *Capitulum* indefinite multiflorum : *Involucro* polyphyllo imbricato.

HABITUS. Frutices sæpe humiles, quandoque arborescentes, plerique tomentosi v. hirsuti. Folia integra v. apice calloso-dentata. Capitula terminalia; Floribus flavis, modò imbricatis bracteis distinguenter persistentibus induratis ; modò fastigiatis receptaculo planiusculo, paleis angustis; non mutatis, subdeciduis.

† *Capitulum amentaceum*; *Bracteis propriis persistentibus subinduratis*.

1. *L. lineare*, stylo calycem hirsutum superante, stigmate hinc gibboso, involucro tomentoso, foliis linearibus integris ; callo apicis subbarbato, ramis glabris.

Protea linearis. Thunb. Diss. n. 35.* tab. 4. pedunculo insolite elongato stylisque apice nimis arcuatis. Thunb. Prod. 26. Lam. Illust. Gen. 1. p. 237. n. 1241. Willd. Sp. Pl. 1. p. 521. Poiret. Encyc. Botan. 5. p. 650.

HAB. In Africæ Australis arenosis. Paarl, Drakenstein, Stellenboch. (v. s. in Herb. Banks. Lambert. Soc. Linn.)

OBS. Folia sæpiùs canaliculata marginibus inflexis, nunquam reflexis, callo apicis villis albis diu tecto ; dum plana obsoletè striata marginibus scabriusculis ; rarissimè 2—3-dentata.

- *2. *L. attenuatum*, stylo calycem hirsutum superante, stigmate subæquilaterali, foliis cuneato-linearibus tridentatis aeniis basi attenuata, involucris ramisque tomentosis.

HAB. In Africæ Australis arenosis elevatoriibus inter saxa ; Zwellendam.

Zwellendam. *D. Niven.* (v. s. in Herb. Banks. Lambert. Hibbert.)

DESC. *Frutex* erectus, tripedalis. *Rami* stricti, crassitie pén-næ anserinæ, incani. *Folia* glaberrima, lævia, basi uninervi vix tortâ, crassa, raro 5-dentata, sesquiancialia, biuncialia. *Capitula* solitaria v. gemina, breviter pedunculata, obovata, magnitudine pruni majoris. *Bractææ involucri* ovatæ, acuminatæ, arctè imbricatæ; *pedunculi* patulæ. *Stylus* calyce unam quartam longior. *Stigma* conico-ovatum.

OBS. Hujus Varietas? insignis. Foliis latioribus, apice pro-fundè tridentatis, dentibus lateralibus sæpissimè bi- interme-dio tri-dentatis. Ramulis præter tomentum incanum villis patulis brevibus. (v. s. in Herb. Hibbert.)

3. L. *Tottum*, stylo calycem hirsutum $\frac{1}{4}$ superante, stigmate hinc gibboso, foliis linearis-oblongis sub-integris venosis basi obtusâ, bracteis involucri glabris ciliatis.

Protea Totta. *Linn. Mant.* 191.* fide spec. in illius Herb. *Thunb.* *Diss. n. 54.* Prod. 27. Lam. Illust. Gen.* 1. p. 235. n. 1224. *Willd. Sp. Pl.* 1. p. 532. *Poiret. Encyc. Botan.* 5. p. 644.

HAB. In Africæ Australis montosis; Roode Zant Cascade. (v. s. in Herb. Linn., Banks., &c.)

OBS. *Frutex* subdecumbens (secund. D. Niven.) *Rami* sæpiùs hirsuti, quandoque glabri. *Folia* interdum 2—3-dentata, venis obsoletis. *Calyces* bracteis triplo longiores. *Stigma* indivisum.

- *4. L. *medium*, stylo calycem hirsutum ferè bis superante, stigmate hinc gibboso, foliis linearis-oblongis integris passimque 2—3-dentatis: callis acutis; basi obtusâ, bracteis involucri tenuissimè pubescentibus ciliatis, capitulis cernuis.

Protea formosa. *And. Repos.* 17? quæ differt tamen, Foliis longioribus, Calycibus unilabiatis unguibus omnibus longitudinaliter cohærentibus, Bracteis involucri sphacelatis, Stigmate ovato-oblongo vix gibboso.

HAB. In Africæ Australis montibus. (v. s. in Herb. Soc. Linn.)

OBS. Species inter *L. Tottum* et *ellipticum* media, illo foliis, hoc floribus ferè exactè conveniens.

5. *L. ellipticum*, stylo calycem hirsutum ferè bis superante, stigmate conico-ovato hinc gibboso, foliis oblongis 3—4-dentatis; basi obtusis; biuncialibus: bracteis involucri tenuissimè pubescentibus ciliatis, capitulis erectis.

Protea elliptica. *Thunb. Diss. n. 15.* Prod. 26. Willd. Sp. Pl. 1. p. 512.*

This genus is published by Mr. Salisbury: his primary generic character does not indeed at all differ from that which he has given to *Mimetes*; in his account of Inflorescence, however, it is evident he understood the genus nearly as I have here proposed it: I should therefore have adopted his name had it appeared to me tenable; but I am disposed to believe that he will, on reconsidering the subject, see the propriety of relinquishing it; for the irregularity or unusual structure, which (if I understand him) he says exists “tot partibus diversis,” only takes place in the leaves of a small number

number of species; on the other hand, the flowers of all are perfectly regular, and that too in opposition to some of the most nearly related genera, while the great uniformity and regularity of inflorescence forms an essential part of its character. I have therefore named it in honour of Mr. James Niven, an intelligent observer and indefatigable collector, to whom botanists are indebted for the discovery of many new species, especially in the two extensive South-African families of Erica and Proteaceæ.

OBS. Nimis affinis *P. spicato*, et fortè haud distincta species: differt tamen foliis divaricatis, lacinulis latioribus, sursum paulò dilatatis; bracteis pedunculi paucioribus parùmque angustioribus; spicis pedunculo vix longioribus; involucris magis distinctis, foliolis obtusioribus tomento arctè adpresso; styli dimidio superiore glabro.

7. *N. media*, spicis cylindraceis pedunculo quater longioribus, bracteis subtendentibus capitulorum lanceolato-subulatis, involueris inferioribus subdistinctis: foliolis ovatis acutis apice imberibus, stylo infra medium pubescenti, foliis glabris, ramis tomentosis.

Protea spicata. *And. Repos.* 234?

HAB. In Africæ Australis montibus, frequens. *D. Niven.* (v. s. in *Herb. Hibbert.*)

DESC. *Frutex* 6—8 pedes altus (*Niven*). *Rami* umbellati, stricti, tomento tenuissimo cinerascentes. *Folia* erecta, sesquiuncialia; inferiora biternata et subtriternata; superiora trifida, laciñis lateralibus subsimplicibus. *Pedunculi* terminales, solitarii, vix unciales, villosi, bracteis lanceolatis, sparsis, erectis, tomentosis. *Spicæ* 3—5 uncias longæ, involucris distinctis, tamen approximatis, foliolis acutissimis, tomento arctè adpresso. *Calyx* tubo tomentoso, involucro ferè ter longiore; laminis villis brevibus, sericeis, subdecumbentibus, barbatis. *Stylus* vix ultra unam tertiam a basi pubescens. *Stigma* gracile, clavatum.

8. *N. Lagopus*, spicis subsessilibus cylindraceis, capitulis imbricatis: bracteis subtendentibus lanceolato-subulatis: inven-

lacri subrotundis apice acuto barbato, stylo infra medium pubescente, foliis adultis glabris: junioribus ramulisque pilosis.

Protea Lagopus. *Thunb. Diss. n. 10.* Willd. Sp. Pl. 1. p. 510.*
HAB. In Africæ Australis montibus. *Gul. Roxburgh M. D.*
 (v. s.)

DESC. *Frutex* erectus. *Rami* umbellati. *Folia* vix sesquiuncialia, modicè patentia, bitemnata. *Spicæ* solitariæ, densæ, 2—4 unciales, pedunculo quandoque semunciali, saepè brevissimo v. nullo. *Bracteæ* subtendentes apice barbatæ. *Calyx* unguibus tomentosis, laminis barbatis, villis longis, numerosis, patulis. *Stylus* vix ad medium pubescens. *Stigma* ovali-clavatum.

*9. *N. mollissima*, spicis pedunculos vix æquantibus, foliis sericeis triternatis (uncialibus), calycis unguibus tomentosis: laminis barbatis.

HAB. In Africæ Australis montibus. *D. Joh. Roxburgh.* (v. s. in Herb. Banks., Lambert., Linn. Soc.)

DESC. *Frutex* erectus, tomentosus, incanus. *Rami* ramulique tomento arctè adpresso. *Folia* mollissima, profundè trifida, lacinulis fastigiatis. *Pedunculi* terminales, subsolitarii, foliis breviores. *Spicæ* subovatæ, capitulis inferioribus distinctis, bracteis ovatis acutis, involuci similibus, utrisque tomentosis, imberibus. *Calycis* unguis involucro ferè ter longiores. *Stylus* infra medium pubescens. *Stigma* gracie. *Nux* ovata, cuticulâ albâ nitente tenuissimè pubescente, basi incrassatâ styli diu coronata; involuci foliolis coriaceo-induratis, parumque auctis, demùm patulis cincta.

*10. *N. capitata*, capitulo communi globoso subsessili, unguibus laminisque

laminisque calycis barbatis, foliis semuncialibus : ramulorum inferioribus glabris.

HAB. In Africæ Australis montosis, near Brant-fly's Hill. *Gul. Roxburgh M. D.* (v. s. in Herb. Banks., Lambert., Soc. Linn.)

DESC. *Frutex* erectus, tripedalis et ultrà. *Rami* umbellati, ultimi tomentosi. *Folia* biternata, canaliculata, superiora ramulorum sericea. *Capitula* communia vix magnitudine cerasi nigri, pauciflora, quandoque aggregata breviterque pedunculata. *Involucrum* foliolis lanceolato-ovatis, acutis. *Stylus* medio pubescens, utroque fine glaber. *Stigma* ovali-clavatum.

10. SOROCEPHALUS.

Spatallæ sp. *Salisb. Parad.*

CHAR. GEN. *Calyx* quadrifidus, æqualis, totus deciduus. *Stigma* verticale, clavatum. *Nux* ventricosa, brevissimè pedicellata v. basi emarginata. *Involucrum* subsimplici serie 3—6-phyl-lum, definitè pauciflorum v. uniflorum : fructiferum non mutatum. *Receptaculum* epaleatum.

HABITUS. Frutices. *Ramis* *virgatis*. *Folia* *sparsa*, *filiformia* v. *plana*, *indivisa*, *infima* *rariùs bipinnatifida*. *Involucra* *sub-sessilia*, *unibracteata*, *in spicam capituliformem* basi nunc brac-teis imbricatis subtensam, congesta. Flores purpurascentes.

ETYM. σωρός cumulus, et κεφαλή caput ; ob capitula congesta.

OBS. Genus complectens phalanges duas facie et structurâ pa-rùm diversas, quarum *prima* habitu et inflorescentiâ *Spatallæ* proxima, diversa tamen stigmate verticali, calyceque semper regulari : *secunda* e speciebus inter se convenientibus capitulo communi involucrato, sed discrepantibus numero florum foliorumque involucri partialis, nec non foliis in quibusdam filiformibus, in aliis planis, et in unicâ dimor-

phis instar Niveniæ: fructus in hujus sectionis duabus speciebus tantummodo observatus, in alterâ (foliis filiformibus) brevissimè pedicellatus, basi obsoletè emarginatâ, tenuissimè pubescens; in alterâ (foliis planis) glaberrimus, sessilis, basi angustatâ, profundè emarginatâ.

† *Spica nudiuscula*. Involucra 1—3-flora. *Nux brevissimè pedicellata, basi integrâ. Folia filiformia, indivisa.*

*1. *S. setaceus*, involucris unifloris, foliis setaceis incurvis (uncialibus) ramulisque hirsutis.

HAB. In Africâ Australi. *Gul. Roxburgh M. D.* (v. s. in Herb. Soc. Linn.)

DESC. *Frutex* erectus. *Rami* virgati, stricti, umbellati. *Folia* frequentia, vix sesquiuncialia, mucrone setaceo, sphacelato: inferiora minùs incurva. *Capitulum* terminale, sessile, ovatum, magnitudine cerasi nigri. *Calyx* unguibus laxiùs tomentosis; laminis barbatis. *Stigma* conico-ovatum.

*2. *S. salsolooides*, involucris unifloris, foliis triquetro-filiformibus incurvis (semuncialibus) glabris.

HAB. In Africâ Australi. *Gul. Roxburgh M. D.* (v. s. in Herb. Soc. Linn.)

DESC. *Frutex* erectus, ramosissimus. *Rami* glabri, ramuli tenuissimè pubescentes. *Folia* frequentia, semiteretia, suprà sulcata, mucrone acuto subconcolori. *Capitulum* terminale, sessile, ovatum, vix magnitudine cerasi nigri, bracteolis paucis, brevissimis, lanceato-linearibus, subtensum. *Calyx* barbatus, villis brevibus. *Stigma* erectum v. parùm inclinans.

*3. *S. imberbis*, involucris trifloris, laminis calycis acuminibusque bractearum glabris.

HAB.

HAB. In Africâ Australi. D. Niven. (v. s. in Herb. Hibbert.)

DESC. *Frutex* erectus, ramosissimus. *Ramuli* pubescentes. *Folia* glabra, uncialia, modicè patentia, parùm incurva, suprà sulcata, acutè mucronata. *Capitulum* terminale, breviter pedunculatum, subglobosum, magnitudine cerasi nigri. *Bracteæ* lanceolatæ, ciliatæ, acumine subulato, glabro. *Calycis* unguis barbati. *Stylus* strictus. *Stigma* ovato-clavatum; æquale.

*4. *S. spatalloides*, involucris trifloris subpedicellatis, calycis laminis barbatis.

HAB. In Africâ Australi; prope Franche-hoek. D. Niven. (v. s. in Herb. Soc. Linn., et D. Hibbert.)

DESC. *Frutex* erectus. *Rami* umbellati, tenuissimè pubescentes. *Folia* modicè patentia, parùm incurva, vix uncialia, juniora pilosa. *Capitula* solitaria v. 2—3 aggregata, breviter pedunculata, ovata v. oblonga, magnitudine avellanæ. *Bracteæ* lanceolatæ, acutæ, pubescentes, apice quandoque glabriuscuso. *Calycis* laminæ longius barbatæ. *Stylus* apice saepius incurvo, modò rectiusculo. *Stigma* styli hamati parùm inæquale; rectiusculi æquilaterale, ovatum.

†† *Spica subinvolucrata*. Involucra 4—6-flora. Nux basi emarginatâ.

*5. *S. tenuifolia*, foliis filiformibus (semunciam brevioribus), capitulis paucifloris, calycis laminis plumoso-barbatis: interiori nudiusculâ.

HAB. In Africæ Australis montosis; in humidis prope Breede River. D. Niven. (v. s. in Herb. Hibbert.)

DESC. *Frutex* 3—4 pedes altus (Niven), facie *Spatallæ* proliferæ. *Rami* glabri, rubicundi, vestiti; ramuli villosiusculi. *Folia* imbricata,

imbricata, scabriuscula, mucrone acuto; juniora hirsuta. *Capitulum commune* terminale, sessile, magnitudine pisi, e partialibus 2—4 compositum. *Involucra partialia* subimbricata, foliolis lanceolatis, barbatis, apice glabriuscule. *Calyx* profundè quadrifidus, æqualis. *Stylus* strictus. *Stigma* æquilaterale, erectum, ovatum.

6. *S. lanatus*, foliis triquetro-filiformibus (semunciâ longioribus) suprà sulcatis, capitulis multifloris, calycis laminis omnibus plumoso-barbatis.

Protea lanata. *Thunb. Diss. n. 30.* t. 3. Prod. 26. Willd. Sp. Pl. 1. p. 519. Poiret. Encyc. Botan. 5. p. 653.*

HAB. In Africæ Australis montosis. Swartland. (v. s. in Herb. Banks.)

DESC. *Frutex* erectus. *Rami* subumbellati, stricti, vestiti, tenuissimè pubescentes. *Folia* imbricata, 5—8 lineas longa. *Capitulum* terminale, solitarium, sessile, globosum, magnitudine avellanæ majoris: *partialia* densissimè congesta, 5—8-flora: *Involucris* 5—7-phyllis, foliolis augusto-lanceolatis, barbatis. *Calyx* profundè 4-fidus, æqualis. *Stylus* strictus. *Stigma* ovatum, æquilaterale, stylo ferè duplò crassius. *Nux* brevissimè pedicellata basique leviter emarginata, tenuissimè pubescens, cortice tenui, rugosiusculo, fusco.

OBS. Variat foliis subtùs triquetris teretibusque, scabriusculis et lœvibus.

7. *S. imbricatus*, foliis lanceolatis subtùs scabris, unguibus calycis glanduloso-pilosis, stigmate clavato.

- *15. *S. brevifolia*, foliis calyce brevioribus obtusiusculis subsericeis triquetris, spicis densis, bracteis involucrisque pubescentibus.

HAB. In Africæ Australis montosis. *D. Masson.* (v. s. in Herb. Banks. et D. Aiton.)

DESC. *Frutex* erectus, ramis umbellatis, virgatis, pubescentibus. *Folia* subtriquetra, suprà canaliculata, patenti-erecta, villosiuscula, subtrilinearia. *Spica* solitaria, sessilis, uncialis, sesquiuncialis, rachi pedicellis bracteisque pubescentibus. *Bracteæ* e basi membranaceâ, lanceolatâ, subulatæ. *Involucra* brevissimè pedicellata, 2—3-flora. *Calyx* æqualis. *Stigma* convexum, papillâ elevatiore. *Squamulæ hypogynæ* quatuor subulatæ.

12. ADENANTHOS.

Labill. Nov. Holl. 1. p. 28.

CHAR. GEN. *Calyx* quadrifidus, infrà circumscissus. *Squamulae* quatuor hypogynæ, basi persistenti calycis adnatæ. *Pistillum* calyce longius. *Stigma* verticale. *Nux* ventricosa. *Involucrum* uniflorum, imbricatum, 4—8-phyllum.

HABITUS. Frutices. *Folia* sparsa, in diversis varia. Flores axillares, solitarii, rubicundi; raro terminales, subaggregati, lutescentes.

1. *A. obovata*, foliis obovatis integerrimis glabris.

Adenanthes obovata. *Labillard. Nov. Holl.* 1. p. 29.* tab. 37.

HAB. In collibus saxosis oræ australis Novæ Hollandiæ; Lewins Land. (ubi v. v.)

2. *A. cu-*

2. *A. cuneata*, foliis cuneatis sericeis apice dentato-crenato.
Adenanthon cuneata. *Labillard. Nov. Holl.* 1. p. 28.* tab. 36.
HAB. In Novæ Hollandiæ oræ australi; Lewins Land: prope littora. (ubi v. v.)
3. *A. sericea*, foliis filiformibus binternatis sericeis, floribus axillaribus solitariis, stylo glabro.
Adenanthon sericea. *Labillard. Nov. Holl.* 1. p. 29.* tab. 38.
HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in arenosis prope littora. (ubi v. v.)
4. *A. terminalis*, foliis filiformibus trifidis: laciniis lateralibus bifidis intermediâ indivisâ, floribus terminalibus solitariis ternisve, stylo villoso.
HAB. In Novæ Hollandiæ orâ australi. Flinders' Land: in depressis prope littora. (ubi v. v.)

13. SIMSIA.

CHAR. GEN. *Calyx* tetrphyllus, regularis, laminis reflexis.
Stamina exserta. *Antheræ* tandem liberæ, primò cohærentes, lobis proximis vicinarum loculum constituentibus. *Stigma* dilatum, concavum. *Nux* obconica.

HABITUS. Frutices *humiles*, *glabri*. Folia *alterna*, *filiformia*, *dichotoma*, *petioli basi dilatata*. Capitula *globosa*, *parva*, *terminalia*, *racemosa*, *v. paniculata*, *involucro brevi v. nullo*. Flosculi *flavi*, *glabri*, *unibracteati*.

I have named this genus in honour of Dr. John Sims the respectable editor of the Botanical Magazine.

- *1. *S. tenuifolia*, capitulis nudis, paniculæ ramis subunifloris bracteolatis.

HAB.

HAB. In Novæ Hollandiæ orâ australi : Lewins Land ; ad latera saxosa collum. (ubi v. v.)

*2. *S. anethifolia*, capitulis involucratis bracteolis imbricatis, paniculæ ramis multifloris : ramulis capitula subæquantibus.

HAB. In Novæ Hollandiæ orâ australi : Lewins Land ; in arenosis prope littora. (ubi v. v.)

14. CONOSPERMUM.

Smith, Linn. Trans. vol. 4. Exot. Bot. Gært. Carp. 3. p. 193. t. 215.

CHAR. GEN. *Calyx* tubulosus, ringens, laciniâ supremâ basi forniciatâ. *Antheræ* tres, inclusæ, laterales dimidiatae, superior biloba : primò cohærentes, lobis proximis vicinarum loculum constituentibus. *Stigma* liberum. *Nux* obconica, papposa.

HABITUS. Frutices. Folia sparsa, integerrima, plana, rariūsve filiformia. Spicæ axillares v. terminales, compositæ, sensim florentes, hinc corymbosæ. Flores solitarii, sessiles, unibracteati, albi v. cærulescentes ; Calyce deciduo ; Bracteâ cucullatâ persistenti.

OBS. Jussieu and Ventenat have referred this genus to the natural order Thymeleæ ; but that it is a genuine Proteacea, as Dr. Smith has considered it, is proved by the erect embryo, the terminal style, and the aestivation of the Calyx ; and is rendered evident by its affinity to Simsia, which, with the more usual appearance of this order, agrees with Conospermum in the structure of its Antheræ.

† *Calycis laciniæ acutæ, tubo vix longiores.* Conosperma vera.

1. *C. ellipticum*, foliis ovali-oblongis obtusis mucronulatis aveniis, pedunculis axillaribus.

Conospermum ellipticum. *Smith in Rees. Cyclop.*

HAB. In Novæ Hollandiæ orâ orientali, prope Port Jackson ;
in ericetis aridis. (ubi v. v.)

2. C. *taxifolium*, foliis lanceolato-linearibus acutis mucronatis tenuissimè pubescentibus verticalibus, basi tortis, pedunculis axillaribus.

Conospermum taxifolium. *Smith in Rees. Cyclop.*

HAB. In Novæ Hollandiæ orâ orientali, prope Port Jackson ;
in ericetis. (ubi v. v.)

3. C. *ericifolium*, foliis subulato-filiformibus imbricatis, spicis axillaribus pedunculo brevioribus.

Conospermum ericifolium. *Smith in Rees. Cyclop.*

HAB. In Novæ Hollandiæ orâ orientali, prope Port Jackson ;
in ericetis. (ubi v. v.)

4. C. *longifolium*, foliis oblongis linearibusve planis venosis, pedunculisque elongatis scapiformibus, corymbis decompositis, calycis limbo extùs pubescenti tubum vix æquante.

Conospermum longifolium. *Smith Exot. Bot. 2. p. 45. t. 82.*

HAB. In Novæ Hollandiæ orâ orientali, prope Port Jackson ;
in ericetis collibusque saxosis. (ubi v. v.)

- *5. C. *tenuifolium*, foliis linear-filiformibus subcanaliculatis aveniis, pedunculisque elongatis scapiformibus, corymbis subsimplicibus, calycis limbo extùs pubescenti tubo longiore.

HAB. In Novæ Hollandiæ orâ orientali, prope Port Jackson ;
in collibus arenosis prope littora. (ubi v. v.)

- *6. C. *ceruleum*, foliis oblongis lanceolatisve planis venosis, pedunculisque

culisque elongatis scapiformibus, corymbis compositis, calycis limbo glaberrimo tubo longiore.

HAB. In Novæ Hollandiæ, orâ australi : Lewins Land. (ubi v. v.)

†† *Calycis laciniæ caudatæ*. Chilurus.

*7. *C. teretifolium*, foliis teretibus pedunculisque elongatis, corymbis compositis.

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in collibus saxosis. (ubi v. v.)

*8. *C. capitatum*, foliis linearibus elongatis tortilibus, capitulis sessilibus e spiculis paucifloris congestis.

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in collibus apricis graminosis. (ubi v. v.)

††† *Incertæ tribus.*

*9. *C. distichum*, foliis filiformibus subdistichis curvatis, spicis axillaribus indivisis.

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in ericetis. (ubi v. v. flor. delaps.)

15. SYNAPHEA.

CHAR. GEN. *Calyx* tubulosus, ringens, laciniâ supremâ latiore. *Antheræ* tres, inclusæ, laterales dimidiatae, inferior biloba : primò cohærentes, lobis proximis vicinarum loculum constituentibus ! *Stigma* filamento superiori sterili connatum ! *Nux* obovata.

HABITUS. Frutices humiles. Folia sparsa, plana, pulcherrimè reticulata, circumscriptione cuneiformia, lobata, inferiora ejusdem fruticis sæpiùs indivisa : petioli basi dilatatâ semivaginanti.

Spicæ axillares v. terminales, simplices v. ramosæ. Flores alterni, solitarii, sessiles, unibracteati. Calyx flavus, deciduus, quadripartibilis. Bractea cucullata, persistens.

ETYM. $\sigma\pi\pi\alpha\phi\eta$ connectio, ob peculiarem cohærentiam stigmatis v. apicis styli cum filamento sterili.

*1. *S. favosa*, foliis oblongo-cuneiformibus indivisis trilobisque : lobis integris, petiolis spicisque glabris, stigmate bicorni.

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in collibus saxosis. (ubi v. v.)

2 *S. dilatata*, foliis apice dilatatis trilobis : lobis inciso-dentatis, petiolis spicisque villosis, stigmate bicorni.

Conospermum reticulatum. Smith in Rees. Cyclop.

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in collibus saxosis. (ubi v. v.)

*3. *S. petiolaris*, foliis rameis petiolos subæquantibus tripartitis : lobis divisis planis ; infimis trilobis integrisque, spicis elongatis ramosis, stigmate acuto.

Polypodium spinulosum. Burm. Ind. p. 233. t. 67. f. 1. vel ad hanc v. ad plantam congenerem pertinere videtur.

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in collibus saxosis. (ubi v. v.)

*4. *S. polymorpha*, foliis rameis brevissimè petiolatis tripartitis canaliculatis : lobis subdivisis ; infimis indivisis trilobisque, spicis simplicibus pedunculo longioribus, stigmate acuto.

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in collibus saxosis. (ubi v. v.)

16. FRANKLANDIA.

CHAR. GEN. *Calyx* hypocrateriformis, limbo quadripartito, piano, deciduo, tubo persistenti. *Antheræ* inclusæ, calyce adnatæ ! *Squamæ* hypogynæ, in vaginam connatæ. *Nux* fusiformis, pedicellata, apice dilatato papposo.

HABITUS. Frutex *glaber*. Folia alterna, filiformia, dichotoma. Spicæ axillares, indivisæ, floribus alternis, unibracteatis, sor-didè flavis. Pollen sphæricum. Cotyledones brevissimæ !

This genus is named in honour of Sir Thomas Frankland, baronet, to whom English botany is much indebted, and whose valuable observations and excellent figures of submarine plants it is hoped he may be induced to communicate to the public.

* **FRANKLANDIA fucifolia.**

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in ericetis humidis. (ubi v. v.)

17. SYMPHIONEMA.

CHAR. GEN. *Calyx* regularis, tetraphyllus, basi cohærens, medio staminifer. *Filamenta* apice cohærentia ! *Antheræ* distinctæ. *Glandulæ* nullæ hypogynæ. *Ovarium* dispermum. *Stigma* subtruncatum. *Nux* monosperma, cylindracea.

HABITUS. Suffrutes v. Herbæ glabré, pilisve raris glandulosis. Folia tripartita, lobis divisæ ; inferiora opposita ! Spicæ terminales et e summis alis, simplices. Flores alterni, sessiles, unibracteati. *Calyx* flavus, deciduus. Bracteæ cucullatæ, persistentes.

*1. *S. palu-*

*1. *S. paludosum*, laciniis foliorum subulatis semiteretibus, rachibus bracteisque glaberrimis.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in ericetis paludosis. (ubi v. v.)

*2. *S. montanum*, laciniis foliorum planis linearibus uninervibus, rachibus bracteisque pubescentibus pilis glandulosis brevissimis.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in rupibus humidis. (ubi v. v.)

18. AGASTACHYS.

CHAR. GEN. *Calyx* regularis, tetraphyllus, basi cohærens, medio staminifer. *Filamenta* distincta. *Glandulæ* nullæ hypogynæ.

Ovarium sessile, monospermum, trigonum. *Stigma* unilaterale.

HABITUS. Frutex *glaberrimus*. Folia *sparsa*, *integerrima*, *plana*.

Spicæ numerosæ, *terminales et e summis alis, simplices*. Flores *alterni, sessiles, unibracteati*. *Calyx flavescens, deciduus*. Pistillum *staminibus brevius*. Bracteæ *cucullatæ, persistentes*.

ETYM. *αγασταχυς* spicis abundans.

AGASTACHYS odorata.

HAB. In Insulæ Diemen plagis australioribus; prope Adventure Bay: ubi primùm a *D. Nelson* detecta, nuperiùs lecta a *D. G. Caley*. (v. s. in Herb. Banks.)

19. CENARRHENES. *Labill. Nov. Holl. 1. p. 36. t. 50.*

CHAR. GEN. *Calyx* tetraphyllus, regularis, foliolis suprà angustatis, deciduus. *Stamina* basi calycis inserta. *Glandulæ quatuor*

quatuor hypogynæ, staminiformes. Ovarium sessile, monospermum. Stigma simplex. Drupa baccata.

HABITUS. Arbor glabra. Folia alterna; plana, dentato-serrata, nitida. Spicæ axillares, simplices. Flores alterni, sessiles, unibracteati.

OBS. Labillardiere considers this genus as most nearly related to Lauri. Jussieu, however, has (*in Annales du Museum*, v. 5 p. 224.) stated sufficient reasons for excluding it from that order, but has not attempted to determine its affinity. I have ventured to place it in Proteaceæ, from the structure of its fruit, stamens and calyx, and the only circumstance in which it differs from them, consists in its having (according to Labillardiere) four barren stamens; but even these occupy the place of the glands or scales usually found in the order, and the resemblance they bear to stamens in this genus, may assist in explaining their nature in all: nor does their being in most cases secreting organs render this view of their origin improbable; for the function of secretion, which, as it is far from universal, must be considered as only of secondary importance in assisting impregnation, is more frequently accomplished by the modification of some of the usual parts of the flower than by the production of an additional organ.

CENARRHENES *nitida*. *Labill. Nov. Holl.* 1. p. 36.* t. 50.

Antheræ immersæ. *Glandulæ* nullæ hypogynæ. *Ovarium*
dispermum. *Stigma* conicum. *Folliculus* unilocularis, abor-
tione monospermus. *Semen* apterum.

HABITUS. Frutices. (*Grevilleis* affines:) pube dum adsit medio
affixâ. Folia pinnatifida v. lobata, circumscriptione cuneiformia.
Spicæ

Spicæ terminales, v. laterales, florilus geminatis, paribus unibracteatis, summis quandoque præcocioribus !

ETYM. α priv. et $\alpha\delta\eta\gamma$ glandula.

- *1. A. *pulchella*, foliis pinnatifidis pilosiusculis : lobis cuneiformibus apice trifidis v. inciso-pinnatifidis, folliculis viscidis.

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in collibus saxosis. (ubi v. v.)

- *2. A. *trifida*, foliis cuneiformibus triplinervibus aeniis trifidis (unguicularibus) subtùs argenteis : lobis integerrimis lateralibusve 2—3-dentatis.

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in sylvis solo arenoso. (ubi v. v.)

OBS. Forte generis distincti, ob calycem irregularem, stigma paullò diversum, et folliculum ligneum bipartibilem.

- *3. A. *ilicifolia*, foliis cuneiformibus (uncialibus) venosis subtùs argenteis basi attenuatis extra medium pinnatido-incisis.

HAB. In Novæ Hollandiæ orâ australi ; Flinders' Land : in arenosis prope littora. (ubi v. v. floribus inexpansis absque fructu.)

25. GREVILLEA.

CHAR. GEN. *Calyx* irregularis foliolis laciniisve secundis, apicibus cavis staminiferis. *Antheræ* immersæ. *Glandula* unica hypogyna, dimidiata. *Ovarium* dispermum. *Stigma* obliquum, depresso (rarò subverticale, conicum). *Folliculus* unilocularis, dispermus, loculo centrali. *Semina* marginata v. apice brevissimè alata.

HABITUS. Frutices rarò Arbores, pube dum adsit medio affixæ. Folia alterna, indivisa v. pinnatifida. Spicæ modò elongatæ racemosæ, modò abbreviatæ corymbosæ v. fasciculiformes, involucro nullo,

nullo, pedicellis geminatis, raro pluribus fasciculisve unibracteatis. Calyces saepissimè rubicundi, nunc flavi; in quibusdam obliquè inserti. Folliculi vel coriacei, ovati, stylo toto coronati; seminibus ovalibus angustissimè marginatis et apice brevissimè alatis: lignei, vel subrotundi, pseudo-bivalves basi tantum styli mucronati; seminibus undique alatis.

This extensive genus, of which a few of the least remarkable species have been already published as *Embothriums* by Dr. Smith, Cavanilles, and others, I have dedicated to the right honourable CHARLES FRANCIS GREVILLE, one of the Vice-Presidents of the Royal Society; a gentleman eminently distinguished for his acquirements in natural history, and to whom the botanists of this country are indebted for the introduction and successful cultivation of many rare and interesting plants.

Grevillea is probably the most extensive genus of *Proteaceæ* in New Holland, and admits of division into several very natural sections, most of which are readily distinguishable by more than one character, existing either in the parts of fructification or in habit; notwithstanding which, I have not ventured to separate them into distinct genera, as I probably should have done, had I been acquainted with fewer species; but have given to each section a proper name, a practice that may perhaps be advantageously adopted in all large genera, where they are thus capable of natural subdivision. It must be unnecessary to add that proper names can in this manner be given only where the sections are perfectly natural, and not in those cases where genera have been subdivided from single characters, and those too of but little importance, as in Thunberg's division of *Protea*, from the form and division of the leaves; to which may be opposed the

the masterly subdivision of the same genus previously given by Linneus in the Mantissa, whose sections, though apparently depending on single characters, are evidently formed from a contemplation of the whole structure, as far as it was then understood ; and it is remarkable that, with the exception of the first species, with whose real structure he was necessarily unacquainted, the rest are arranged, and even divided into sections, in most cases corresponding with the genera proposed in the present essay.

† *Folliculi coriacei, stylo toto stigmatoque depresso coronati. Semina ovalia, angustissimè marginata, apiceque brevissimè alata.*

A. LYSSOSTYLIS.

Folia omnia integerrima (in plerisque marginibus refractis v. replicatis pseudo-3-nervia).

Flores fasciculati v. in racemo abbreviato. Stylus glaber. Folliculus ecostatus.

1. *G. punicea*, foliis elliptico-oblongis basi subattenuatis marginibus refractis, ramulis floriferis racemoque abbreviato recurvis, pistillis uncialibus, barbâ interiore calycis oblongâ dimidium inferiorem unguium æquante.

Embothrium sericeum β. Smith. *New Holl.* 27. t. 9. f. 5. β.

HAB. In Novæ Hollandiæ orâ orientali ; prope Port Jackson : in ericetis subhumidis. (ubi v. v.)

- *2. *G. dubia*, foliis ellipticis marginibus refractis, ramis ramulisque tomentosis, floriferis racemoque abbreviato recurvis, pistillis unciâ brevioribus.

HAB. In Novæ Hollandiæ orâ orientali ; prope Port Jackson : in saxosis subhumidis prope littora. (ubi v. v.)

OBS. Nimis affinis præcedenti.

3. *G. sericea*, foliis ellipticis oblongisve obtusis mucronatis marginibus refractis, ramulis floriferis erectis, racemis abbreviatis recurvis, pistillis semuncialibus, barbâ interiori calycis dimidio inferiore unguium breviore.

Embothrium sericeum. *Smith. New Holl.* 25. t. 9. f. 1, 2, 3, 4.
Willd. Sp. Pl. 1. p. 539. *And. Repos.* 100. *Sims. in Bot. Mag.* 862.

Embothrium cytisoides. *Cav. Ic.* 4. p. 60. t. 386. f. 2.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in saxosis prope littora marina et ad rivulorum ripas.
(ubi v. v.)

4. *G. linearis*, foliis linear-lanceolatis acutis mucronatis marginibus refractis, racemis abbreviatis erectiusculis, stylis apice glaberrimis.

Embothrium linearifolium. *Cavan. Ic.* 4. p. 59. t. 386. f. 1.

Embothrium lineare. *And. Repos.* 272.

Embothrium sericeum γ. *Smith. New Holl.* 27. t. 9. f. 6.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in saxosis præsertim prope littora. (ubi v. v.)

- *5. *G. stricta*, foliis lanceolato-linearibus acutis mucronatis marginibus refractis costâque denticulato-scabris, stylis apice sericeis.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: ad ripas saxosas fluviorum. (ubi v. v.)

- *6. *G. riparia*, foliis elongato-linearibus marginibus refractis costâque laevibus, stylis apice glaberrimis, pistillis quadrilinearibus: pedicello ovarium superante, barbâ interiori calycis densâ.

HAB.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: ad ripas fluviorum. (ubi v. v.)

*7. *G. parviflora*, foliis subulato-linearibus marginibus refractis costâque lævibus, ramulis glabriusculis, calycibus ferrugineis barbâ interiori obsoletâ, pistillis bilinearibus: pedicello ovarium vix æquante.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in fruticetis a littore remotis. (ubi v. v.)

*8. *G. juniperina*, foliis subulatis fasciculatis divaricatis marginibus refractis, ramulis villosis teretiusculis, pistillis semuncinalibus pedunculo partiali quadruplicè longioribus.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in ericetis rariùs. *D. G. Caley, & A. Gordon.* (v. s.)

*9. *G. australis*, foliis lanceolato-subulatis unciâ brevioribus margine subrecurvis, suprà pube deciduâ conspersis subtùs sericeis, ramis ramulisque tomentosis teretibus.

HAB. In Insulâ Diemen; plagiis australioribus: ad fluviorum ripas. (v. v. absque flor. v. fruct.)

*10. *G. tenuifolia*, foliis subulatis margine revolutis unciâ breviribus, fasciculis sessilibus, pistillis bilinearibus.

HAB. In Insulâ Diemen; prope Port Dalrymple: ad ripas saxosas fluviorum. (ubi v. v.)

*11. *G. pauciflora*, foliis linear-i-oblongis planiusculis obtusis mucronulatis suprà lævibus subtùs subsericeis: inferioribus glabriusculis, fasciculis 2-4-floris erectis, calycibus nudiusculis pistillum subæquantibus.

HAB. In Novæ Hollandiæ orâ australi; Flinders' Land: in depressis apricis prope littora. (ubi v. v.)

*12. *G. aspera*, foliis linear-i-oblongis obtusis mucronulatis suprà punctato-asperis subtùs argenteis, racemis abbreviatis recurvis, stylis brevissimis, stigmate cochleariformi.

HAB. In Novæ Hollandiæ orâ australi; Flinders' Land: in ericetis aridis. (v. v. flor. delaps. fruct. matur.)

*13. *G. concinna*, foliis linearibus margine revolutis lævibus erectis, racemis recurvis secundis multifloris, ovariis lanatis, stylis glaberrimis calyce subsericeo duplò longioribus.

OBS. A reliquis sectionis facie differt.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in sterilibus prope littora marina. (ubi v. v.)

† B. PTYCHOCARPA.

Folia omnia integrerima. Flores fasciculati v. in racemo abbreviato, floribus superioribus præcocioribus! Stylus hirsutus v. tomentosus. Ovarium subsessile. Folliculus costatus!

*14. *G. arenaria*, foliis oblongis obtusis mucronulatis, racemis recurvis paucifloris: pistillis tomentosis.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: ad ripas arenosas fluviorum. (ubi v. v.)

*15. *G. montana*, foliis lanceolatis acutis suprà læviusculis subtùs sericeis, floribus geminatis, pedunculis glabris calyces nudiusculos subæquantibus, pistillis hirsutis, tomento ramulorum arctè adpresso.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in montosis. (v. s.)

*16. *G. acu-*

*16. *G. acuminata*, foliis lanceolatis subacuminatis mucronatis suprà punctato-scabris subtùs cinereo-tomentosis, racemis paucifloris porrectis recurvisve, pistillis hirsutis, calycibus demùm glabriusculis, ramulis pubescentibus.

HAB. In Novæ Hollandiæ orâ orientali ; prope Port Jackson : in montosis. (v. s.)

4. *G. cinerea*, foliis ellipticis obovatisve mucronatis suprà scabriusculis subtùs cinereo-tomentosis, racemis paucifloris recurvis, pistillis hirsutis, calycibus pedunculisque lanatis.

HAB. In Novæ Hollandiæ orâ orientali ; prope Port Jackson : in montosis ad ripas saxosas fluviorum. (ubi v. v.)

*18. *G. mucronulata*, foliis obovatis obtusis mucronulatis suprà scabris nitentibus subtùs parùm sericeis, racemis abbreviatis, pistillis hirsutis, calycibus pilosiusculis pube adpressâ.

HAB. In Novæ Hollandiæ orâ orientali ; prope Port Jackson : in ericetis. (ubi v. v.)

*19. *G. Baueri*, foliis oblongis obtusis mucronulatis utrinque glabris lœvibus, racemis abbreviatis, pistillis hirsutis, calycibus pedunculisque glaberrimis.

HAB. In Novæ Hollandiæ orâ orientali ; prope Port Jackson : in depressis a littore remotis. (ubi v. v.)

† C. ERIOSTYLIS.

Folia omnia integerrima. Flores fasciculati, subumbellati. Pistillum lanatum, pedicellatum. Folliculus eostatus.

*20. *G. occidentalis*, foliis lanceolatis suprà punctatis scabris subtùs sericeis, fasciculis axillaribus terminalibusque, calycibus

cibus utrinque stylisque lanâ patulâ cinereis, stigmate mutico.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in sylvis solo sterili. (ubi v. v.)

*21. *G. sphacelata*, foliis oblongis lanceolatisve suprà punctis minutis scabriusculis subtùs sericeis, fasciculis terminalibus, calycibus extùs ferrugineo-tomentosis intùs stylisque cinereo lanatis, stigmate mutico.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in saxosis. (ubi v. v.)

*22. *G. phyllicoides*, foliis linear-lanceolatis: suprà punctato-scabris superioribus villosis; subtùs pubescentibus cinereis, stigmatibus ovalibus appendice duplò longioribus.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: in montibus saxosis. (ubi v. v.)

23. *G. buxifolia*, foliis ellipticis suprà punctatis scabris subtùs tomento adpresso cinereis, stigmatibus orbiculatis appendicem recurvum vix æquantibus.

Embothrium buxifolium. *Smith. New. Holl.* 29. t. 10. *Willd. Sp. Pl.* 1. p. 538. *And. Repos.* 218.

Embothrium genianthum. *Cav. Ic.* 4. p. 60. t. 387.

HAB. In Novæ Hollandiæ orâ australi; prope Port Jackson: in ericetis saxosis. (ubi v. v.)

† D. PLAGIOPODA.

Folia integerrima v. divisa. *Racemus thyrsiformis*. *Pedicellus ovarii accretus apice obliquo pedunculi, cui utrinque foliola duo calycis unum supra alterum inserta!*

*24. *G. Goodii*, foliis integerrimis oblongis undulatis venosis utrinque

utrinque glabris, racemis elongatis pedunculatis, caulis prostratis.

HAB. In Novæ Hollandiæ orâ septentrionali; Carpentaria, et Arnhem's Land: in depressis arenosis, prope littora. (ubi v. v.)

*25. *G. venusta*, foliis pinnatifidis, v. trifidis passimque indivisis subtûs sericeis, racemis erectis, calycibus glaberrimis, stylis hirsutissimis.

HAB. In Novæ Hollandiæ orâ orientali; prope Cape Townsend: in umbrosis, ad radices montium. (ubi v. v.)

† E. CALOTHYRSUS. (GREVILLIA strictè sic dicta.)

Racemus thrysiformis. Folia pinnatifida (raro passim indivisa).

*26. *G. pungens*, foliis pinnatifidis suprà glabris subtûs argenteis: laciñiis subulato-linearibus mucronatis pungentibus, racemis refractis, calycibus pistillisque glaberrimis.

HAB. In Novæ Hollandiæ orâ septentrionali; Carpentaria: prope littora. (ubi v. v.)

*27. *G. Dryandri*, foliis pinnatis subtûs sericeis: foliolis elongato-linearibus, racemis pedunculatis porrectis longissimis, calycibus insertione subobliquis pistillisque glaberrimis, caule patulo.

HAB. In Novæ Hollandiæ orâ septentrionali; Carpentaria, Arnhem's Land: prope littora. (ubi v. v.)

*28. *G. aspleniiifolia*, foliis elongatis linearibus pinnatifido-incisis integerrimisque subtûs tomentosis, racemis folio ter brevioribus, calycibus pubescentibus, stylis glabris.

HAB.

HAB. In Novæ Hollandiæ orâ orientali; prope Port Jackson: rariùs. (v. s. in Herb. Banks.)

*29. *G. Banksii*, foliis pinnatifidis subtùs sericeis: laciniis elongato-lanceolatis, racemis erectis æqualibus, calycibus tomentosis, stylis glabris, ovariis sessilibus.

HAB. In Novæ Hollandiæ orâ orientali; Keppel Bay, Pine Port, &c.: in collibus saxosis. (ubi v. v.)

*30. *G. Chrysodendrum*, foliis pinnatifidis bipinnatifidisque: laciniis angusto-linearibus elongatis, racemis cylindraceis: floribus semiverticillatis, calycibus tomentosis basi persistenti! ovariis subsessilibus, stylis glabris.

HAB. In Novæ Hollandiæ orâ septentrionali; Carpentaria: prope littora. (ubi v. v.)

†† CYCLOPTERA.

Folliculi lignei, subrotundi, basi styli mucronati. Semina undique alata.

*31. *G. heliosperma*, foliis pinnatis subbipinnatisque glabris: pinnis oblongo-linearibus v. oblongis: inferioribus petiolatis, racemis divisis erectis, calycibus pistillisque glaberrimis.

HAB. In Novæ Hollandiæ orâ septentrionali; Carpentaria: prope littora. (ubi v. v.)

*32. *G. refracta*, foliis pinnatis passim indivisis: foliolis elongato-linearibus subtùs argenteis, racemis refractis divisis, calycibus sericeis, pistillis glaberrimis.

HAB. In Novæ Hollandiæ orâ septentrionali; Carpentaria: prope littora. (ubi v. v.)

*33. *G. ce-*

*33. *G. ceratophylla*, foliis 2-3-fidis indivisisque subtus nervosis sericeis : laciniis elongato-linearibus, folliculis glaberrimis ovalibus.

HAB. In Novæ Hollandiæ orâ septentrionali; Carpentaria: prope littora. (ubi v. v. sine flor.)

*34. *G. mimosoides*, foliis integerrimis ensiformibus planis nervosis ramisque glabris, folliculis obovatis viscidis.

HAB. In Novæ Hollandiæ orâ septentrionali; Carpentaria: prope littora. (ubi v. v. sine flor.)

*35. *G. polystachya*, foliis linear-i-ensiformibus integerrimis laxis subtus nervosis sericeis, racemis terminalibus alternis, pistillis semunciâ longioribus, stigmate obliquo concavo papillâ centrali.

HAB. In Novæ Hollandiæ orâ orientali, intra tropicum. (ubi v. v.)

*36. *G. striata*, foliis linear-i-ensiformibus integerrimis strictis subtus multinervibus sericeis, racemis terminalibus alternis, pistillis semunciâ brevioribus, stigmate verticali depresso-conico.

HAB. In Novæ Hollandiæ orâ septentrionali; Carpentaria: prope littora. (ubi v. v. sine fructu.)

*37. *G. lorea*, foliis teretibus ! pendulis longissimis, stigmate truncato-pyramidalato.

HAB. In Novæ Hollandiæ orâ orientali, prope littora; Shoalwater Bay. (ubi v. v. sine fructu.)

*38. *G. gibbosa*, foliis elongato-lanceolatis integerrimis pubescen-

tulis uninervibus venosis, racemis clongatis, stigmate conico, folliculis gibboso-incrassatis.

HAB. In Novæ Hollandiæ orâ orientali, intra tropicum; prope Endeavour River. *J. Banks, bart.* (v. s.)

Conchium trifurcatum. *Smith in Linn. Trans.* 9. p. 122.*

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in campis sterilibus. (ubi v. v.)

17. *H. varia*, foliis superioribus filiformibus divisis simplicibusque : inferioribus planis pinnatifidis laciniis linearibus subulatisve, capsulis bicalcaratis.

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in campis sterilibus. (ubi v. v. sine flor.)

††† *Folia omnia plana.*

A. *Folia aliqua v. omnia dentata v. incisa.*

*18. *H. attenuata*, foliis cuneatis apice dentatis pinnatifidisve : passim lanceolatis integerrinis basi attenuatis, capsulis bicalcaratis.

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in collibus saxosis. (ubi v. v. sine flor.)

*19. *H. linearis*, foliis lanceolato-linearibus spinuloso-paucidentatis integerrimisque aeniis impunctatis, ramulis pedunculoque communi glabris, fasciculis terminalibus axillariibusque, capsulis bicalcaratis compressiusculis.

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land ; in campis sterilibus. (ubi v. v.)

*20. *H. florida*, foliis angusto-lanceolatis spinuloso-dentatis, minutissime punctatis marginibus scabriusculis, ramulis pedunculoque communi brevissimo pubescentibus, capsulis bicalcaratis convexiusculis.

HAB.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: ad latera collum. (ubi v. v.)

21. *H. ilicifolia*, foliis circumscriptione ovalibus opacis sinuato-dentatis spinulosis subpetiolatis, ramis tomentosis, capsulis bicalcaratis ovatis gibbosis apice compressis intùs scrobiculatis.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in collibus sterilibus. (ubi v. v.)

- *22. *H. nitida*, foliis lanceolatis oblongisve basi attenuatis spinuloso-paucidentatis integrisque nitidis subvenosis ramulisque glaberrimis, capsulis bicalcaratis gibbosiusculis intùs læviusculis.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in collibus saxosis. (ubi v. v. absque flor.)

- *23. *H. amplexicaulis*, foliis sinuato-dentatis nitidis subvenosis: basi dilatatâ cordatâ amplexicauli, caule prostrato, ramis glabris, capsulis ecalcaratis.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in collibus sterilibus. (ubi v. v. sine flor.)

- *24. *H. prostrata*, foliis angulato-dentatis apice dilatatis cuneatis: basi cordatâ amplexicauli, caule prostrato, ramis pubescentibus, capsulis ecalcaratis.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in collibus sterilibus. (ubi v. v.)

25. *H. ceratophylla*, foliis pinnatifidis bipinnatifidis linearibus planis, calycibus ferrugineo-tomentosis, capsulis ecalcaratis.

Conchium

Conchium ceratophyllum. *Smith. Linn. Trans.* 9. p. 124.*

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in campis collibusque. (ubi v. v.)

*26. *H. undulata*, foliis obovatis trinervibus reticulato-venosis undulatis spinoso-dentatis, capsulis ecalcaratis tumidis.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in collibus saxosis. (ubi v. v. sine flor.)

††† B. *Polia omnia integerrima*.

27. *H. oleifolia*, foliis lanceolatis integerrimis uninervibus obsoletè venosis mucronulo spinoso: superioribus pubescentibus, ramulis tomentosis, capsulis terminalibus bicalcaratis gibbosis.

Conchium oleifolium. *Smith. Linn. Trans.* 9. p. 124.*

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in campis et collibus (ubi v. v.)

28. *H. saligna*, foliis elongato-lanceolatis integerrimis uninervibus acutis apiculo sphacelato; omnibus ramulisque glaberrimis, capsulis axillaribus gibbosis: apice compresso utrinque carinato.

Embothrium salignum. *And. Repos.* t. 215.

Conchium salignum. *Smith. Linn. Trans.* 9. p. 124.*

Conchium salicifolium. *Gært. Carp.* 3. p. 217. t. 219.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in ericetis elevationibus. (ubi v. v. sine flor.)

*29. *H. marginata*, foliis lanceolatis integerrimis marginatis uninervibus (unciâ brevioribus) mucrone spinoso: summis pubescentibus, capsulis ecalcaratis acuminatis nitidis subsessilibus.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in ericetis elevationibus. (ubi v. v. sine flor.)

30. H. *ruscifolia*, foliis ellipticis obovatisve petiolatis integerrimis spinoso-cuspidatis suprà punctato-scabris subtùs tomentosis, ramulis hirsutis, capsulis ecalcaratis punctatis scabriusculis.

β . *Hakea ruscifolia*. *Labill. Nov. Holl.* 1. p. 30.* t. 39.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: ad latera collium. (ubi v. v. sine flor.)

*31. H. *cinerea*, foliis linear-i-lanceolatis elongatis integerrimis trinervibus obsoletè venosis scabriusculis apiculo sphacelato, ramulis squamisque involueri tomentosis, capsulis lanceolatis acuminatis subcompressis ecalcaratis.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in arenosis prope littora. (ubi v. v. sine flor.)

32. H. *dactyloides*, foliis integerrimis triplinervibus venosis obovato-oblongis v. linear-i-lanceolatis aversis, ramulis angulatis, pedicellis pilosis, calycibus glabris, capsulis ecalcaratis: cortice verrucoso.

α . Folia obovato-oblonga, passim lanceolata, venis anastomozantibus.

31. KNIGHTIA.

CHAR. GEN. *Calyx* tetraphyllus, regularis, foliolis revolutis. *Stamina* calyci extra medium inserta. *Glandulæ* hypogynæ quatuor. *Ovarium* tetraspermum, sessile. *Stigma* verticale subclavatum. *Folliculus* coriaceus, styligerus, unilocularis. *Semina* apice alata.

HABITUS. Arbor *excelsa*. Folia *sparsa*, *serrata*. Racemi *axillares*, *floribus* *geminatis*, *paribus* *unibracteatis*. Folliculi *oblongi*, *tomentosi*.

Genus proximum Rhopalæ, distinctum, Seminibus quaternis, apice solùm alatis.

This genus, which was discovered by Sir Joseph Banks, is with his approbation, named in honour of his friend Thomas Andrew Knight, esq. the author of many valuable essays on Vegetable Physiology, published in the Philosophical Transactions.

For the figure here given I am also indebted to the liberality of the illustrious President of the Royal Society, who has enabled me to complete the account of this remarkable plant, by permitting me to copy Dr. Solander's description, which I was the more desirous to give, as it exhibits a specimen of the accuracy with which subjects of natural history were investigated in that celebrated voyage; of whose important results it is to be lamented so little is known to foreign naturalists, though in this country they have ever been open to the public, and in the most advantageous manner.

KNIGHTIA excelsa. Tab. II.

HAB. In Novâ Zelandiâ; prope Tolaga et Opuragi. *Josephus Banks* baronetus. (v. s. folliculis vacuis sed impressionibus seminum insignitis.)

DESC. *Arbor* sylvestris, magna, sæpè 80 pedalis. *Caudex* strictissimus. *Rami* erecti, teretes, glabri. *Ramuli* ultimi parùm compressi, villosiusculi. *Coma* pyramidalis. *Folia* numerosa, densè sparsa, erecta, petiolata, lanceolato-oblonga, (v. oblonga,) acutiuscula, profundè serrata, serraturis remotis obtusis, plana, coriacea, rigida: supernè glabra, nitida, lævia, subtùs venosa venuisque numerosissimis subreticulata, villis copiosissimis brevissimis densissimis cinerascentia: 4-5 uncias longa. *Petioli* foliis sexies breviores. *Racemi* sessiles, axillares, simplices, multiflori, ovato-oblongi, foliis duplò breviores, sæpè in ramis nudis collocati, ubi ante decessum foliorum axillares fuerunt, unde primo intuitu videntur quasi lateribus ramorum erumpentes. *Rachis* ruberrima. *Pedicelli* holosericei,

Knightia excelsa.

sericei, ruberrimi, crassiusculi, patentissimi, semunciales, bipartiti, unde biflori. *Calyx* tetraphyllus, foliola ante expansionem arctè in tubum connata, linearia, acutijusecula, sesquiuncialia, coriacea, extùs villosa holosericea, ruberrima, usque ad basin revoluta, æqualia, in medio paulò angustiora. *Glandulæ* quatuor, receptaculo inter basin foliorum insertæ, e latâ basi acutæ, virescentes, apice rubicundæ, semilineam longæ. *Filamenta* quatuor, unguibus petalorum adnata, suprà medium per spatum lineare libera, filiformia, plana, erecta, rubicunda. *Antheræ* lineares, longitudine foliorum, supernè parùm incurvæ, flavæ, ipso apice casso lanceolato. *Ovarium* conicum, subangulatum, villosiusculum, rubrum. *Stylus* filiformis, crassiusculus, strictus, persistens, longitudine filamentorum, rubicundus. *Stigma* cylindraceo-angulatum, incrassatum, apice attenuatum, longitudine antherarum, virescens. *Folliculus* oblongo-lanceolatus, stylo persistenti coronatus, coriaceus, crassus, durus, unilocularis, sesquiuncialis v. paulò longior, extùs sericeus. *Hactenus* SOLANDER.
 OBS. Pollen triangulare, angulis per lentem pelluentioribus, flavum. *Ovarium* tetraspermum, ovulis apice alatis.

32. EMBOTHRIOUM.

Embothrii species. *Forst. Gen.* 15. t. 8. *litt. g. et seq.*

CHAR. GEN. *Calyx* irregularis, hinc longitudinaliter fissus, inde quadrifidus. *Stamina* apicibus concavis calycis immersa. *Glandula* hypogyna unica, semiannularis. *Ovarium* pedicellatum, polyspermum. *Stylus* persistens. *Stigma* verticale, clavatum. *Folliculus* oblongus. *Semina* apice alata.

HABITUS. Frutices. v. *Arbusculæ glabræ*. Ramuli squamis persistentibus gemmarum quandoque obsiti. Folia sparsa, integerrima. Racemi terminales, corymbosi, paribus pedicellorum,

unibracteatis : Involucro communi nullo. Flores coccinei, glaberrimi.

HABITUS. Frutices *ramis determinatis*. Folia *sparsa*, *dentata* v. *integra*. Racemi *terminales*, *corymbosi*, *paribus pedicellorum unibracteatis*. Flores *coccinei*.

ETYM. *τηλωπος* qui e longinquo cernitur, quod de his fruticibus, floribus coccineis speciosis valet.

In this genus, as well as in Lomatia, and perhaps in all those with an indefinite number of seeds, an extremely thin black-brown crust is interposed between the ripe seeds, exactly corresponding with them in size and form, and which is probably the remains of a fluid matter that had separated them in the unripe state.

The most important characters distinguishing this genus from Lomatia, seem to be the single semiannular or nearly circular gland, the cohering calyx, and the vascular wing of the

the seed ; for the Involucrum, which at first seems to afford so excellent a distinction, considerably loses its importance in *Telopea truncata*, in which it almost always includes the rudiments of branches, as in *Hakea*. In natural affinity *Telopea* approaches much more nearly to *Oreocallis*, which differs principally in having no gland at the base of the foot-stalk of its ovary, and in the want of an Involucrum : the wing of the seed seems (from the figure in the *Flora Peruviana*) to be in like manner vascular. *Embothrium* itself, which is also very near akin to *Telopea*, is distinguishable by its vertical stigma, oval pollen, and naked corymbi.

1. *T. speciosissima*, foliis cuneato-oblongis inciso-dentatis venosis cum ramulis involucrisque glaberrimis.

Embothrium speciosissimum. *Smith New Holl.* 19. t. 7. *Sims Bot. Mag.* 1128.

Embothrium speciosum. *Salisb. Parad.* 111.

Embothrium spathulatum. *Cav. Ic.* 4. p. 60. t. 388. *Gært. Carp.* 3. p. 214. t. 218.

HAB. In Novæ Hollandiæ orâ orientali ; prope Port Jackson : locis saxosis, præsertim subumbrosis. (ubi v. v.)

2. *T. truncata*, foliis lanceolato-oblongis integerrimis passimque paudentatis subtûs ramulisque pubescentulis, involucris extûs tomentosis.

Embothrium truncatum. *Labill. Nov. Holl.* 1. p. 32. t. 44.

OBS. Ala seminis in hâc apice semper rotundata in præcedenti sæpiùs truncata observavimus.

HAB. In Insulæ Diemen montibus australioribus. (ubi v. v.)

35. LOMATIA.

Embothrii species. *Smith. Cavan.*

CHAR. GEN. *Calyx* irregularis, foliolis distinctis secundis. *Stamina* apicibus concavis calycis immersa. *Glandulæ hypogynæ* tres, secundæ. *Ovarium* pedicellatum, polyspermum. *Stylus* persistens. *Stigma* obliquum, dilatatum, subrotundum, planiusculum. *Folliculus* ovali-oblongus. *Semina* apice alata; alâ marginatâ disco evasculo.

HABITUS. Frutices. Folia alterna, in plerisque divisa, v. dentata, rariùs integerrima, quandoque in eodem frutice varia. Racemi terminales, interdum axillares, elongati, laxi, nunc abbreviati, corymbosi, paribus pedicellorum unibracteatis. Flores ochroleuci. Involucrum nullum. Seminis nucleus farinâ sulphureâ conspersus.

ETYM. λωμα, margo, ob seminum alam marginatam.

1. *L. silaifolia*, foliis bipinnatifidis glaberrimis : pinnulis cuneato-linearibus lanceolatisve incisis acutis mucronatis reticulato-venosis, racemis glaberrimis elongatis divisis simplicibusve. *Embothrium silaifolium.* *Smith New Holl.* 23. t. 8. *Willd. Sp. Pl.* 1. p. 537.

Embothrium herbaceum. *Cav. Ic.* 4. p. 60. t. 388.

HAB. In Novæ Hollandiæ orâ orientali ; prope Port Jackson : in campis et ericetis. (ubi v. v.)

2. *L. tinctoria*, foliis pinnatifidis bipinnatifidisve (raro indivisis) glabris : pinnulis linearibus distichis uninervibus subaveniis obtusiusculis mucronulatis, racemis elongatis glabris indivisis. *Embothrium tinctorium.* *Labill. Nov. Holl.* 1. p. 31. tab. 42. et 43.

HAB. In Insulæ Diemen campis et collibus. (ubi v. v.)

3. *L. fer-*

3. *L. ferruginea*, foliis bipinnatifidis tomentosis : pinnulis ovatis lanceolatisve, racemo terminali foliis breviore.

Embothrium ferrugineum. *Cavan. Ic.* 4. p. 59.* t. 385.

HAB. In Americæ Australis “San Carlos de Chiloc in solo aquâ marinâ quandoque inundato.” *Cavan. l. c.*

*4. *L. polymorpha*, foliis linear-lanceolatis integerrimis v. dentatis pinnatifidisve subtus cum ramulis pedicellisque tomentosis, racemis terminalibus corymbosis, calycibus pilosusculis, pistillis glaberrimis.

$\alpha.$ *cinerea.* Folia linear-lanceolata integerrima, marginibus recurvis, subtus cinereo-tomentosa ; folliculi semunciales.

$\beta.$ *rufa.* Folia lanceolata v. linear-lanceolata, incisa v. pinnatifida, passim integerrima, subtus ferrugineo-tomentosa ; folliculi subunciales.

Embothrii tinctorii var. *Labill. Nov. Holl. l. c.*

HAB. In Insulæ Diemen montibus australioribus. (ubi v. v.)

*5. *ilicifolia*, foliis oblongo-ovatis acutis spinuloso-dentatis reticulatis petiolisque glaberrimis, racemis terminalibus elongatis.

HAB. In Novæ Hollandiæ orâ australi ; prope Port Phillip : in campis sterilibus lateribusque montium. (ubi v. v. flor. delaps.)

*6. *L. longifolia*, foliis linear-lanceolatis elongatis glabris remotè serratis, racemis axillaribus, pedunculis calycibusque pilosusculis, pistillis glaberrimis.

Embothrium myricoides. *Gært. Carp.* 3. p. 215. t. 218.?

HAB. In Novæ Hollandiæ orâ orientali ; prope Port Jackson : ad ripas saxosas fluviorum et rivulorum. (ubi v. v.)

7. *L. dentata*, foliis ovalibus serrato-dentatis petiolisque glaberrimis, racemis lateralibus abbreviatis, calycibus pilosis, ovario tomentoso. †
Embothrium dentatum. *Flor. Peruv. & Chil.* 1. p. 62. t. 94 a.

OBS. Species tam singularis ut ferè proprii generis, transitum ad Dryandas facilem reddit.

38. DRYANDRA.

CHAR. GEN. *Calyx* quadripártitus v. quadrifidus. *Stamina* apicibus concavis laciniarum immersa. *Squamulæ hypogynæ* quatuor. *Ovarium* biloculare, loculis monospermis. *Follculus* bilocularis, ligneus: *Dissepimento* libero, bifido. *Receptaculum commune* planum, floribus indeterminatim confertis, paleis angustis, raro nullis. *Involucrum commune* imbricatum.

HABITUS. Frutices plerumque humiles. Rami dum adsint sparsi vel umbellati. Folia sparsa, pinnatifida v. incisa, plantæ juvenilis conformia. Involucra solitaria, terminalia, raro lateralia sessilia, foliis confertis interioribus quandoque nanis obvallata, hemisphærica, bracteis adpressis, in quibusdam apice appendiculatis.

OBS. Dryandra of Thunberg, first published in Flora Japonica, being not generically different from Aleurites, which was previously established by Forster, I have peculiar satisfaction in giving the name of my respected friend, Mr. DRYANDER, to a genus so nearly related to Banksia, from which indeed it differs chiefly in Inflorescence, but in that respect so widely as to be at once distinguishable : there is also something in the habit, especially in the leaves of the greater number of species, by which, independent of the parts of fructification, the genus is pretty certainly indicated ; and it is worthy of notice, that, while Banksia is generally spread over all the coasts of New Holland and of Van Diemen's Island, Dryandra has hitherto been observed only on that part of the south coast called Lewins Land, where, however, its species are nearly as numerous and abundant as those of Banksia itself.

- *1. *D. florilunda*, foliis cuneiformibus inciso-serratis, involucri bracteis exterioribus glabriusculis, calycis laminis glabris, stigmate subclavato obtuso.

HAB. In Novæ Hollandiæ orâ australi ; Lewins Land : in collibus saxosis. (v. v.)

Variat receptaculo epaleato.

- *2. *D. cuneata*, foliis cuneiformibus sinuato-dentatis spinosis petiolatis, involucri bracteis omnibus sericeis, calycis laminis barbatis, stigmate subulato-filiformi acuto.

a. Folia vix sesquiunciam longa, dentibus terminalibus subæqualibus.

β. Folia biuncialia, apicis dilatati denticulo medio breviore sinubus latioribus. Forsan species distincta.

HAB.

3 *Dryandra formosa*

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in collibus saxosis. (ubi v. v.)

- *3. *D. armata*, foliis pinnatifidis: lobis triangularibus planis divaricatis rectis spinoso-mucronatis: terminali proximis longiore; subtûs reticulatis venulis nudis, ramis calycisque laminis glabris, stylo basi pubescenti, stigmate subulato sulcato.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in collibus saxosis. (ubi v. v.)

- *4. *D. falcata*, foliis pinnatifidis: lobis subulato-triangularibus divaricatis falcato-recurvis spinoso-mucronatis: terminali proximis breviore; subtûs reticulatis venulis nudis, ramis pubescentibus, laminis calycis styloque longitudinaliter glabris, stigmate clavato exsulco.

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in collibus saxosis. (ubi v. v.)

- *5. *D. formosa*, foliis elongato-linearibus pinnatifidis: lobis scaleno-triangularibus muticis planis subtûs niveis, involucris tomentosis: foliolis interioribus linear-i-oblongis, receptaculo paleaceo. *Tab. III.*

HAB. In Novæ Hollandiæ orâ australi; Lewins Land: in sterilibus prope littora. (ubi v. v.)

6. *D. mucronulata*, foliis elongato-linearibus pinnatifidis: lobis isoscelo-triangularibus mucronulatis planis subtûs niveis, involucris tomentosis: foliolis interioribus linearibus mucronatis, receptaculo paleaceo, caule subsimplici.

OBS. Ad hoc genus retuli, ob summam affinitatem cum *Dryandra pteridifolia*, cuius vix varietas.

To RENDER this essay as complete as I am able, I proceed to notice such plants, as either belong or have been referred to Proteaceæ, but from my imperfect acquaintance with which, or from the unsatisfactory accounts hitherto given of them, could not with certainty be referred to any of the genera described, or, if referable to any of them, I could not with confidence propose as distinct species; and shall conclude with the addition of a few synonyms to the species described, from Ray's Historia Plantarum, which had escaped me when the paper was first read to the Society.

LEUCADENDRON *linifolium*, foliis linearispathulatis aversis basi attenuatis ramisque glabris, capitulo masculo sessili foliis circumvallantibus longiore, calycis tubo barbato: laminis stylisque imberbibus.

Protea linifolia. *Jacq. Hort. Schœnb.* 1. p. 11. t. 26.

OBS. There can be no doubt of the genus of this plant, or of the individual figured by Jacquin being a male. From the same figure, by which alone I am acquainted with it, it seems to be very nearly related to *Leucadendron tortum*, from which it differs in having the male heads sessile, and in the laminæ of the calyx being quite smooth.

LEUCADENDRON *fusciflorum*, foliis linearis lanceolatis glabris junioribus rectis basi attenuatis, capitulo femineo foliis circumvallantibus breviore, calycis laminis plumoso-barbatis: tubo pilosiusculo.

Protea fusciflora. *Jacq. Hort. Schœnb.* 1. p. 11. t. 27.

This

This also is known to me only from Jacquin's figure, from which it is unquestionably a Leucadendron, and a female plant; it can hardly however be supposed the female of the preceding species; and though I have here constructed a specific character for it, I think it is not improbably a variety of *Leucadendron angustatum*.

LEUCADENDRON.

Protea linearis. *Houtt. Nat. Hist. par. 2. vol. 4. p. 116. t. 19. f. 2. ed. Germ. vol. 3. p. 84. t. 19.*

This is undoubtedly a Leucadendron, and probably a female plant; but from the figure alone its species cannot be determined.

LEUCADENDRON.

Protea stellaris. *Sims Bot. Mag. 881.*

Seems to be a male plant, and apparently different from anything I have seen. From the form of the leaves and the length of those surrounding the capitulum, I am inclined to consider it as the male of Jacquin's *Protea fusciflora* already noticed.

LEUCADENDRON.

Conocarpodendron; folio tenuissimo, angustissimo, saligno; cono calyculato. *Boerh. Lugd. Bat. 2. p. 203. c. tab.*

This is probably a male plant, notwithstanding the figure of a ripe cone is given at the bottom of the plate; the separate fruits of some of Boerhaave's figures belonging decidedly to very different species. It may be the male of *Leucadendron adscendens*.

LEUCADENDRON²

Protea odorata. *Thunb. Prod. Append. 187.*

There is no means of determining the genus of this plant, but it is rather more probably a Leucadendron than belonging to any other.

LEUCADENDRON ??

Conocarpodendron ; acaulon ; folio rigido, nervoso, oblongo, latiōri ; cono fusco ; semine oblongo, in mediō quasi excavato. *Boerh. Lugd. Bat. 2. p. 201. c. tab.*

I know not what to make of this. If the strobilus and nuces at the bottom of the plate really belong to it, it must be referred to Leucadendron, and will stand near *L. retusum* or *L. plumosum* ; but there are some circumstances both in the figure and description which render this very doubtful. Thunberg refers it to his *P. strobilina*, but the descriptions by no means agree.

LEUCADENDRON ??

Scolymocephalus Oleæ folio. *Sherard. in Raj. Hist. 3. Dendr. p. 10.*

This, according to Boerhaave, is his *Conocarpodendron*, &c. *2. p. 197. c. tab.* which I have considered as the female of *Leucadendron squarrosum*.

LEUCADENDRON ??

Protea glabra. *Thunb. Diss. n. 52.*

From the very short and unsatisfactory description of Thunberg, the genus of this plant cannot be determined, or even with much probability guessed at.

ISOPOGON.

Protea divaricata. *And. Repos. 465.*

Can this be a variety of *Isopogon anemonifolius*? The yellow flowers

flowers satisfy me that it is not a species of *Serruria*, and prevent me at the same time from referring it to *Isopogon anethifolius*, whose leaves are not unlike, but whose flowers are of a very different colour.

PROTEA.

Protea venosa. *Lam. Illust. Gen.* 1. p. 234. *n.* 1212. *Poiret. Encyc. Botan.* 5. p. 640.

Said by Poiret to resemble in most respects *Protea longiflora*; it must therefore be a genuine Protea.

PROTEA.

Scolymodendros Africanus ex Monte Tabulari. Pluk. Mant. 168. *t.* 442. *f.* 4.

This is manifestly a Protea, which it appears Plukenet had seen only in the possession of Woodward. The head, especially in the form of the bracteæ, bears a great resemblance to that of *Protea cynaroides*; but the leaves are so very different, that, unless we suppose they were drawn from memory and disproportionately reduced, it cannot be referred to this species. It is probably however one of the more common kinds, and I know not what else to suppose it may be, except *Protea grandiflora*. The figure itself has never, so far as I know, been noticed by any author.

LEUCOSPERMUM.

Scolymocephalus Africanus, foliis in summitate profundius crenatis, intercreniis majoribus florum staminulis longis recurvis. *Raj. Hist.* 3. *Dendr.* p. 10.

This is probably a Leucospermum, and perhaps *L. ellipticum*.

MIMETES?

Protea dichotoma. *Lam. Illust. Gen.* 1. *p. 235. n. 1219. Poiret.*

Encyc. Botan. 5. *p. 643.*

Probably a spurious Mimetes.

SERRURIA *Bergii*, capitulis simplicibus solitariis subpedunculatis, bracteis cuneiformibus truncatis cum acumine villosis: inferioribus glabris, calycibus curvatis sericeis, stigmate turbinato-capitato, ramulis foliisque glabris.

Leucadendron sphærocephalum. *Berg. cap. 26.**

This I have no hesitation in referring to Serruria; and from the description of the accurate Bergius I am disposed to think it distinct from any I am acquainted with. It seems most nearly related to *Serruria acrocarpa*, differing chiefly in the smoothness of its branches, and in having terminal heads.

SERRURIA.

Protea sphærocephala. *Houtt. Nat. Hist. par. 2. vol. 4. p. 99. t. 19. f. 1. ed. Germ. vol. 3. p. 72. t. 19.*

Unquestionably a Serruria, and probably referable either to *S. hirsuta* or *pedunculata*.

SERRURIA.

Protea villosa. *Thunb. Prod. Append.* 186.

A Serruria whose characters cannot be made out from the specific difference given by Thunberg.

SERRURIA.

Protea triternata. *And. Repos.* 337.

This may be intended for *S. congesta*, but I cannot with confidence refer to it as such.

SERRURIAE.

Protea abrotanifolia minor. *And. Repos.* 536.

Protea abrotanifolia hirta. *And. Repos.* 522.

Protea abrotanifolia odorata. *And. Repos.* 545.

These are manifestly Serruriæ, but I do not venture to refer them to any of the species I have described; nor are there sufficient materials from which they may be characterized as distinct species.

NIVENIA.

Protea concava. *Lam. Illust. Gen.* 1. p. 234. n. 1217: *Poiret.*

Encyc. Botan. 5. p. 642.

A species of Nivenia, and perhaps one of those described.

NIVENIA?

Protea candicans. *Thunb. Prod. Append.* 186.

Probably a Nivenia, and perhaps not different from *N. molissima*: it may however be a species of *Serruria*, in which case it is probably *S. candicans*.

PROTEA prostrata. *Thunb. Prod.* 27.

I know not to what genus this may belong; but from the species near which Thunberg has placed it, it may be supposed to be either a *Protea* or a *Leucadendron*: if the latter, it is probably not very different from *L. retusum*.

HAKEA.

Conchium drupaceum. *Gært. Carp.* 3. p. 217. t. 219.

I cannot refer this fruit to any of the species I have described.

EMBOTHRIUM chaparro. *Humb. Æquin. Bot.*

Of this I know nothing but the name, which occurs in Humboldt's Chart of Æquinoctial Botany, and is placed there at the height of about 1600 feet.

EMBOTHRIUM sirobilinum. *Labill. Nov. Holl.* 2. p. 116. t. 265.

The seeds of this remarkable plant, which I am acquainted with only from Labillardiere's figure and description, being unknown, and the internal structure of its ovary not having been examined, its genus cannot be determined. Its regular and deeply divided calyx, the four glands at the base of the ovary, and its vertical equilateral stigma, point out its near affinity to *Knightia*, from which it differs in the style being deciduous, and perhaps also in the number and form of its seeds. If these are but two in number, it would be still more nearly related to *Orites*; but something in its whole appearance, and especially its uncommonly large bracteæ, indicates its being a distinct genus.

According to Labillardiere, it is a native both of New Caledonia and the south-west coast of New Holland: but as I am acquainted with no plant of the order, which has so wide a range as this, and as it may be presumed the specimens from New Holland were very imperfect, otherwise so remarkable a plant would surely have found a place in the body of his work, I may be permitted to question the accuracy of the statement. I confess however that I know no plant of Lewin's Land with which this could be confounded.

ROUPALA pinnata. *Lam. Illust. Gen.* 1. p. 243. n. 1282. *Poiret. Encyc. Botan.* 6. p. 317. *Rudg. Pl. Guian.* 25. t. 38.

There can be little doubt of this plant constituting a distinct genus; but its fruit being entirely unknown, it is better to place it among those which require a further examination. It was referred to *Rhopala* at a time when that genus was not at all understood. In its compound leaves, its irregular calyx,

calyx, and even in some degree in the glands subtending the ovary, it seems to approach more nearly to Gevuina ; and I am therefore inclined to think its fruit will be found to be a drupa, and not a folliculus as that of Rhopala. The whole plant however is so remarkable, that I here add a description taken from an excellent specimen, in Mr. Lambert's Herbarium, collected by the unfortunate Martin in Guiana, where it seems to have been first found by Richard.

Frutex? v. *Arbor.* *Ramuli* teretes, tomento minuto cinerascentes. *Folia* alterna, abruptè pinnata, 3-4-juga. *Foliola* opposita, petiolata, latè ovata, obtusa quandoque acutiuscula, integerrima, glaberrima, super nitida, subter ferè opaca, venulis anastomozantibus parùm emersis reticulata : dum $3\frac{1}{2}$ uncias longa 2 uncias lata. *Petoli* partiales semunciales, semiteretes, cum rachi teretiusculâ articulati. *Spica* terminalis, pedunculata, erecta, folio brevior, pedunculo longior, racemosa : *Pedunculo* rachique teretibus, pube brevissimâ cinereo-ferrugineis (in sicco). *Pedicelli* geminati, teretes, calyce breviore. *Calyx* tetrphyllus. *Foliola* ante expansionem in tubum curvatum cylindraceum clausum utrinque ampliatum cohærentia, mox ad basin distincta, decidua, linearia, extùs pube tenuissimâ arctè appressâ (in sicco) cinereo-ferrugineâ ; intùs glabra : *Unguis* linearibus, basi dilatatis : *Laminis* ovatis, acutis, concavis. *Stamina* 4. *Filamenta* brevissima, basi laminarum imposita. *Antherarum* lobi (connectivo) adnati, distincti, basi parùm divergentes, longitudinaliter dehiscentes. *Pollen* flavum. *Ovarium* brevè pedicellatum, parvum, uniloculare, dispermum, ovulis collateralibus : *Pedicello* basi cincto *Squamâ* latâ, glabrâ, adnatâ, (in sicco) corrugatâ, posticè subdeficiente, intersticiâ angustissimâ. *Stylus* cylindraceus, crassiusculus, glaber, longitudine unguium calycis. *Stigma* obliquum, convexum, stylo crassius, papillâ centrali.

Obs. Singularis, Foliis verè compositis, petiolellis cum rachi articulatis ; et Squamâ hypogynâ pedicello ovarii adnatâ, nec ipso receptaculo connexa.

ORITINA acicularis. *Append. Flor. Nov. Holl. ined.*

This is a perfectly smooth erect shrub ; with alternate cylindrical leaves, furrowed on the upper surface and terminated by a pungent mucro. I observed it only on the summit of the Table Mountain, at the southern extremity of Van Diemen's Island. The perfect flowers I have not seen, but have examined the ovary so soon after fœcundation, that I have no doubt of its containing originally only two ovula ; and as its base is surrounded by four glands, the calyx is probably regular. Hence its near affinity to Orites, with which it also agrees in inflorescence and apparently in stigma. The fruit is a smooth compressed coriaceous follicule, containing two seeds, which are winged at both ends ; on which account I have not absolutely referred it to Orites, but, until its flowers are discovered, have given it a temporary name, indicating its affinity to that genus.

BANKSIA musculiformis. *Gært. Sem. 1. p. 221. Lam. Illust. Gen. 1. p. 242. n. 1280.*

Fructus musculiformis. *Rumph. Amb. 2. p. 184. t. 60.*

Gærtner has taken up this plant entirely from Rumpf's figure, and referred it to Banksia on account of its fruit containing according to that author two winged seeds. But from Rumpf's description, it appears that the whole plant is lactescent ; hence it probably does not belong to this family, but rather to Apociniæ, as Burmannus has already conjectured.

CYLINDRIA. *Lour. Cochin. ed. Willd. 1. p. 86.*

Both

Both Willdenow and Ventenat have considered this genus as belonging to Proteaceæ, with whose structure indeed the description of Loureiro in most respects well agrees. Mr. Konig, however, (Ann. of Bot. 1. p. 392.) assures us, on the authority of original specimens, that it is scarcely different from Olea; though Loureiro has characterized it as having four bilocular antheræ, included in the concave apices of the segments of the corolla; two circumstances altogether incompatible with Oleinæ, and which render it not improbable that the specimen sent to Sir Joseph Banks by the author was very different from that which he described.

LEUCOSPERMUM *Conocarpum.*

Scolymocephalus Africanus, latifolius, lanuginosus, foliis in summitate crenatis, comâ sericeâ. *Raj. Hist. 3. Dend. p. 9.*

MIMETES *Hartogii.*

Scolymocephalus Africanus lanuginosus humilis, foliis in summo tridentatis, flore dilutè purpureo, carinulâ albulâ *Oldenlandii*. *Raj. Hist. 3. Dend. p. 10.* fide characteris et descriptionis.

MIMETES *cucullatus.* (*Raj. Hist. 3. Dend. p. 10. n. 10.*)

MIMETES *hirtus.*

Scolymocephalus Africanus, foliis brevioribus acuminatis, floribus rubentibus, summis surculis foliis intermistis. *Raj. Hist. 3. Dend. p. 10.*

Besides the Proteaceæ described or noticed in this paper, I am acquainted with several very beautiful species, chiefly of *Grevillea* and *Persoonia*, discovered in New Holland by Mr. *George Caley*, a most assiduous and accurate botanist, who, under the patronage of Sir JOSEPH BANKS, has for upwards of eight years been engaged in examining the plants of New South Wales, and whose numerous discoveries will, it is hoped, be soon given to the public, either by himself, or in such a manner as to obtain for him that reputation among botanists to which he is well entitled.

TABULARUM EXPLICATIO.

FIG.

TAB. II. KNIGHTIA EXCELSA.

1. Flos expansus, parùm auctus.
2. Idem longitudinaliter apertus, magnitudine naturali.
3. Ejusdem basis cum glandulis hypogynis.
4. Pistillum austum, ovario longitudinaliter secto ovulis quatuor.
5. Ovulorum insertiones et relativas positiones ostendens.
6. Ovulum paulò magis austum.
7. Pollen plurimùm austum.

TAB. III. DRYANDRA FORMOSA.

1. Ramus magnitudine naturali.
2. Flos magnitudine naturali.
3. Idem auctus.
4. Receptaculum communc magnitudine naturali et austum.
5. Idem verticaliter sectum.
6. Paleæ receptaculi.
7. Folliculus.
8. Dissepimentum cum seminibus.
9. Semina.
10. Dissepimentum.
11. Pollen ad lentem austum.
