LESTRIS PARASITICUS.

A mature individual of the *Lestris parasiticus*, Tem., was shot near Whitburn in the county of Durham, about the 24th Oct. 1837, and is now in my possession.—J. HANCOCK.

OCCURRENCE OF COPPER IN PLANTS.

M. Wiegmann, senr., has lately announced that Prof. Sprengel of Brunswick had found in the cinders of *Trifolium pratense* 3 per cent. of copper, and that he had also found the same quantity of this metal in those of *Trifolium pannonicum*, cultivated in his garden, the soil of which is very different from that whence the *Trif. pratense* had been obtained. M. Sprengel subsequently examined some trefoils grown in a field, the soil of which did not indicate any traces of this metal in its composition; and was convinced that its existence in the two former was owing to its presence in the ground where the plants were cultivated. The fact affirmed by M. Sprengel proves that a small quantity of a noxious substance may be absorbed by plants without any prejudice to their development.—*Flora*.

OCCURRENCE OF *FALCO ISLANDICUS* IN ENGLAND.

A specimen of the Iceland Falcon (*Falco Islandicus*) in first plumage was shot at Normanby, Yorkshire, March 1837; and another individual in the Newcastle Museum, which is a female and in the mature plumage, was shot in Northumberland a few years ago. These two instances are sufficient to rank the Iceland species as a British bird.—J. HANCOCK.
