invite comparison; and if that comparison is unfavourable to the Colleges' degree, is it not possible that even our master, the public, shall note the difference and signify it by some epithet of inferiority? Other Doctorates of other universities are what they are. There is the degree of this city and of that, each with its own reputation; but the degree you now propose is a degree for London. Its rank is determined by its locality; it is settled beforehand, and you can neither exalt nor degrade it. "People," it is said—and most truly it is the source of half our troubles—"people do not go behind names." But here, with two London degrees side by side, they *must* go behind. Rival practitioners will invite them behind. And if, upon this inspection, they find the one title demonstrably inferior to the other, your whole plan fails, and the similarity of title goes very near to suggest what lawyers call "a colourable imitation." Such dangers and difficulties can only be overcome by making the two degrees equal—equal, that is to say, from the point of view of the public, and regarded as professional tests. It is often complained that the Preliminary Scientific Examination of the present London medical graduates is unduly severe, and that thus the door is shut upon candidates who would gladly accept and be easily able to satisfy the later requirements of the degree. But where is the Council or the Government that would consent to a double set of medical degrees in London on the ground that one of the two made its own entrance too narrow? That would obviously be a case for reconstruction, not new creation. No. We must base our demands upon one of two grounds: either, first, that we desire a degree for London which shall be more accessible all round—that is to say cheaper than the present degree; or, secondly, that we desire not merely the form of a university degree, but the substance of a real university training. In the one case, the very terms of your demand are fatal to the repute of the new degree; in the other, it is not the scheme of the Colleges that you favour, but that of the proposed Teaching University.

And when the matter is fairly faced, I do not know that those who favour the creation of a real University of London as the best solution of the difficulty, impressed as they are with the unequalled resources of the metropolis and the unequalled benefit of that college comradeship which is the special ornament of our higher national training—I do not know that these have any reason for despair. Ours is a conservative country. Our university system is old, yet vigorous. It is an integral part of our social life, and must grow and develop along with it. It was never, in our long history, so active, so wide-reaching, or so popular as at the present moment. It is true that this new degree, at present undefined, is much belauded beforehand. It has all the perfections of the unborn (like the offspring of old maids and bachelors), yet it certainly involves an anomaly, its future status is at the best precarious, and it is not easy to deny that its main design is to meet and overcome a prejudice, and, indeed, a misconception on the part of the public. At any rate, let us know where we are. We are at least entitled to ask that this scheme of the Colleges should be presented in its entirety, and that its precise intention, as regards those branches of education which are not purely technical, should be plainly declared. Is it proposed that these new graduates, provided they show themselves well instructed as medical men, shall thereupon be deemed eligible without regard to the higher education? Or if that is *not* intended, then (inasmuch as the two corporations concerned have no art or literature departments of their own, as universities have), give us some express assurance—not by mere rhetoric or rhapsody (we have had more than enough of that)—tell us in precise phrase how much or how little of that general knowledge which just now goes by the objectionable name of "culture," how much of literature and of reading, it is proposed to include in the new qualification. And indeed, without being captious, we might go further and ask by what external aid the Colleges propose to conduct their examinations in art and literature, subjects outside their own scope. For if that be not provided for, we may be in danger of making the confusion worse rather than better, and adding to a university that does not teach a second that cannot examine.

I have detained you too long and hasten to conclude. It seems strange, indeed, that a profession like ours (which in respect of producing names has no parallel for fecundity) should be baffled by a question which is mainly nominal. Let us take courage from what we have, and be circumspect in our search for more. The joint diploma of

the two greatest medical corporations of Great Britain, name it as you will, must have its own value, and may be trusted to stand alone for a little while without meretricious adornment. As for the degree that is one day to supplement it, it will not come the quicker for our present disputes, or the sanguine expectations of those who assert that it is already at the door. With or without our help, a teaching, that is a real London University is at hand, and, as I firmly believe, our own interests lie not in opposition, but in cordial co-operation with those who are now labouring to promote it. Whatever the issue, and with all our differences, there is but one purpose inspiring us—the progress and the honour of a great profession.

One word in conclusion, which shall be addressed to those new comers to whom the details that have occupied us may seem wearisome, and who thought to hear some higher discourse. But, in fact, these matters concern you nearly. For when, according to the common lot, you come to appear at the examination tables of your country, the questions which now vex us will have reached some wise and definite settlement. "The mills of the Lord grind slow; but they grind exceeding small." Your time of preparation will be also the time when the tests to be applied are being made fair, equal, and sufficient; and your examination reward will be of that form which is finally decided to be the best.

Introductory Lecture

DELIVERED AT

ST. MARY'S HOSPITAL

At the Opening of the Winter Session, 1887-88,

By ANDERSON CRITCHETT, M.A. CANTAB.,

OPHTHALMIC SURGEON TO, AND LECTURER ON OPHTHALMIC SURGERY AT, ST. MARY'S HOSPITAL.

GENTLEMEN,—Had Dante written in the nineteenth century, his magic pen might have done justice to the sufferings of those unfortunate members of our profession who, possibly by way of atonement for errors in diagnosis and faults in treatment, are condemned to pass their short vacation in a vain endeavour to infuse some interest and originality into an introductory lecture. I readily acknowledge, however, that for my own poor part, although for some weeks past I have languished under this cloud of work, it has not been without a silver lining, for I am enabled on my own behalf and on that of my colleagues to offer a cordial and hearty welcome at the opening of our winter session alike to those who have already borne with us the heat and burden of the day and to the new recruits who now join our ranks for the first time. I know that I rightly interpret the feelings of the staff when I express an earnest hope that you will always regard us as your sincere friends, for, believe me, we are actuated by a single desire to promote your welfare and happiness. In return we ask, and I believe we shall not ask in vain, for your confidence and your co-operation. There must be none of the innate distrust with which a pupil too often regards his pedagogue, for we are here *all* students, and though some of us have been pursuing the steep path of knowledge for more years than we care to remember, we all have the same goal in view, we are all striving to compass the same end—the relief of human suffering.

It seems hard that those gentlemen who appear amongst us for the first time should at once be lectured, for as yet they have done nothing to deserve such an infliction, and I feel somewhat in the same position as the stern parent who invariably gave his children a sound thrashing before breakfast on the ground that they might possibly need it later on in the day when he would not be there to administer the correction. I cannot, however, too strongly impress upon you the wisdom of adopting a methodical mode of work. Doubtless "distance lends enchantment to the view" as far as the College examinations are concerned, but that student alone can regard their approach with confidence and equanimity who begins to work steadily and with method from the commencement of his career.

Anatomy and physiology should at first occupy your

almost exclusive attention, and your knowledge of these subjects must be sound and practical. Begin by studying the skeleton thoroughly, and be constantly in the dissecting room. Here I would offer a word of advice which may perhaps surprise you—it is this: do not occupy too much time in making elaborate and ornamental dissections. It is, of course, essential that you should acquire manual dexterity and neatness, but I am convinced that the most reliable anatomists are those who relentlessly pursue each muscle and nerve, and investigate each hidden bony cavity, as opposed to others who hesitate to be thorough because they might spoil the appearance of their dissections.

I may, perhaps, shock the feelings of our officers of health by advising you to live as much as possible in an anatomical atmosphere; but I mean by this expression that you should so far allow anatomy and physiology to absorb your attention that they may almost enter into the pores of your skin, and that they should form the chief subject of discussion with your fellow-students, for whose delectation and instruction you should at all times be ready to produce some hidden treasure, such as a carpus or a special cervical vertebra. In the evening you should, by study, not only consolidate the practical knowledge which has been gained during the day, but anticipate the work which lies before you on the morrow, so that, scalpel in hand, you may know what to look for, and where the object of your search is to be found. To those happy beings who have successfully passed the dread ordeal of the first examination, I would offer a few words of friendly warning—"Labuntur anni." In less than three years you must have put on such an armour of knowledge and experience as will enable you to face those terrible opponents—disease and death. Within the walls of hospitals you can witness the daily conflict, and even there, where the weapons of modern science and treatment are wielded by experienced hands, the foe too often gains the victory. But the time is coming when you must each of you and *alone* commence the struggle. The time is coming when the life of a fellow-creature will, humanly speaking, be given into your hands, as

"When that voice, in feeble moans of sickness and of pain,
But mocks the anxious ear that strives to catch its sound in vain;"

when the firstborn is in danger, and the mother's eye is turned to you appealingly for help; when the life-blood is flowing fast from the wounded artery, and all depends on your knowledge, precision, and resource. What will be your feelings if at such times you are found wanting because the bitter memory of your student's life shows nothing but a barren record of ill-spent time and wasted opportunities? I cannot, I will not believe that any of those whom I am now addressing will be found in the ranks of the ignorant and the unready. You would prove false to the standard of St. Mary's and its noble past; for as the soldier looks with pride upon the banner that bears the scroll of bygone victories, so we in our turn cherish the names of Alderson, Sibson, White Cooper, Wiltshire, and Meadows—of men who, though their sun has set, still light our pathway with a lingering after-glow of golden memories.

I would once more impress on you the importance of dividing your time into regular intervals of work; but I should also be amongst the first to acknowledge that he will labour most successfully who is ready in due course to relax his mental strings, and promote his physical welfare by healthy and manly recreation. My ideal of a model worker was realised in an old college friend at Cambridge who rowed in the first boat, was the best bowler in our eleven, and came out high enough, amongst the Wranglers, to obtain his Fellowship. You must, I know, accomplish a considerable amount of reading, and become during the long winter evenings slaves of the lamp, but your favourite fields of study should be in the wards, and in the out-patient rooms. There, and there alone, can you gain a sound practical knowledge of medicine and surgery, and I may perhaps be pardoned for the suggestion that you might do worse than devote the scraps of your spare time to the special departments. Later on in your student's career you will become dressers, clinical clerks, and finally, if you are found worthy of high office, house surgeons. In these several posts you will taste the sweets and bitters which pertain to personal responsibility, and I would venture to make a special appeal to you concerning your treatment of the patients who may be placed under your care.

There is a vague impression on the minds of many of the general public that constant familiarity with scenes of suffering begets a callous feeling in members of our profession.

I cannot for a moment allow that such is the case; but I earnestly hope you will one and all remember that the accusation of needless cruelty is occasionally, though quite unjustifiably, hurled against us, both in poetry and prose, and it is by deeds, not by words, that we must refute the charge. The divine injunction that we shall "Do unto others as we would they should do unto us" can never be more perfectly carried out than in our treatment of our patients; while the helplessness, and too often hopelessness, of suffering and disease should stir the better feelings of our nature, and stifle harshness with their mute appeal. We should endeavour to combine with a gentle bearing calm judgment and unfaltering decision where prompt action is necessary; there should be the iron gauntlet in the velvet glove. Special care is needed in our treatment of children. A child's confidence is easily won, and a few moments devoted to the accomplishment of that end will not be wasted. Nothing is more touching than a child's implicit faith in our efforts for its relief, or more complete than its gratitude for results achieved.

And now for a few words of counsel as to the best method of utilising the first few years after you have emerged from the condition of student to that of qualified practitioner. There may, of course, be special reasons why some of you must plunge at once into the vortex of practical work; and it is a natural, and I may add a healthy, impulse which makes a young man desire to transfer the burden of expense and responsibility from other shoulders to his own. But I would earnestly advise such of you as have time and opportunity for additional study to pass some of the higher examinations, and, if possible, to acquire a university degree. Believe me, you should thus utilise those few invaluable years when the seed of knowledge is received and germinates in a pure mental soil, and when youthful energy and confidence are as yet unchecked by the cares and responsibilities which must inevitably accompany advancing age. Use, therefore, this priceless time.

"It will not last for ever,
Still ebbing from our gaze;
The waves of life will never
Bring back those golden days."

I strongly advise you to apply for resident appointments either here at St. Mary's, where, I am glad to say, they are freely open to our students; or, if there be not room for you at home (for with the best desire to do so, we cannot provide in that direction for all our *alumni*), then you must seek "fresh fields and pastures new," at some of our excellent provincial hospitals, where you will find physicians and surgeons from whom you may acquire much valuable knowledge, for the country contains many men who are more than able to hold their own with their metropolitan brethren. After devoting some time in the manner I have indicated, the most serious work of your life will commence. You will now realise more fully that life is real, earnest, and laborious. You will feel that your frail bark has at length quitted its safe anchorage and must sail on unknown seas, where there may be under-currents of jealousy, quicksands of professional rivalry, and sunken rocks of unforeseen disaster and discredit. In spite of prejudice and competition, you must slowly but surely win your way into that hardly-won fortress—the confidence of the public. The struggle will be severe, but let the work be loyally done. Let there be nothing mean or underhand, no attempt to gain credit at the expense of another practitioner, no trafficking with cant or hypocrisy: better to accept an honourable failure than stoop to such miserable expedients, which can but result in complete mental and moral degradation. Remember that material prosperity and wealth are only to be valued as they minister to refinement, to moral and intellectual progress, to the promotion of science, and to the furtherance of that broad and holy charity which elevates mankind. You must be ready to offer upon the altar of public duty that most precious and sacred of all virtues—self-sacrifice. A far abler pen than mine, and one which I may be pardoned for regarding with filial veneration, has thus described the life that is before you:—

"Picture to yourself for a brief moment the life of a medical man in the full tide of his professional career; what a stormy, anxious unrest it is; what exorbitant exactions are made upon his resources; what exaggerated expectations are formed of his powers; what unthinking demands are made upon his vital energies. By day and by night, for rich and for poor, with or without recompense, he must obey the summons of suffering humanity. How many

anxious complicated unfortunate cases he meets—cases where great confidence is placed, where great interests are at stake, where the feelings are strongly enlisted—cases where life may be just quivering in the balance, and one slight error of judgment may snap the slender thread; when every eye is turned in anxious trusting faith and eager hope upon him, and he must sustain their drooping hopes by a fictitious calmness and assume a confidence that his judgment belies, until his over-taxed mind and over-wrought feelings are wellnigh exhausted with the effort. Again, he must be ever ready to encounter accidents, disease, and death in all their most appalling forms; when friends are paralysed with fear, and when contagion carries panic to the stoutest hearts, he must be there calm and unmoved. The blanched mother may be fluttering out her own life at the moment when she has given birth to another, the victims of cholera may present all the hideous features of death whilst yet writhing in vital agony, delirium and tetanus may compress the energies of a life in a few brief racking fatal hours, and still he must be there to gaze on sufferings he cannot relieve, and to feel that science is impotent and humbled in the presence of indomitable death."

Such is the picture painted by one who was himself a member of our profession, and who knew the hardships and anxieties of our toilsome life. Are there any now listening to me who hesitate to enter upon the thorny path that lies before them? I have been told that in the Latin Church each candidate for holy orders is required to pass many days in solemn prayer and solitude before presenting himself for ordination. When at length the fateful day has arrived, and they appear before God's altar, the bishop, after pointing out the nature of the sacrifice which must be made in the complete surrender of personal will, of wealth, and of the many attractions of the world, makes a lengthy pause, during which any who may still doubt the depth and sincerity of their convictions may at the last moment reconsider their position, and retire ere it be too late. In like manner, I would not have you enter lightly or unwarned upon the arduous duties and responsibilities which can never be dissociated from our career. Remember that, as in the case of the priest, the sacrifice must be complete and thorough, and that you must give the whole man for the whole time.

Although we feel a justifiable pride in our hospital, in our growing school, and in the number and character of the recruits who now flock around our banner, we would not willingly enlist one soldier of medicine who will not be true to his colours, or who will falter in the presence of the enemy, for we must present a serried and unflinching phalanx, firmly united by the bonds of mutual confidence and by the knowledge that those who fall will not have died in vain. But before you make your final decision, let me turn to the brighter and more sunny side of the medical landscape. "The old order changeth, yielding place to new," and the onward march of time has brought with it so many beneficial innovations in our method of work, and has made such large additions to our instruments of precision, that we go forth to the fray more fully equipped than were our forefathers; indeed, the advance in medicine and surgery has been proportionately rapid as the importance of physiology and pathology came to be recognised, and the phenomenal growth of these two giants has been of comparatively recent date. The early history of our profession is surrounded by an atmosphere of mist and haze, which not unfrequently accompanies the dawn alike of day and of scientific truth, and our brethren in the middle ages seem to have thought that a cloak of mysticism and necromancy would suffice to cover a multitude of medical sins. According to the chroniclers of the time, a visit to the doctor's cavernous sanctum must have demanded a mixture of courage and confidence to which many modern patients cannot lay claim. The dim light of a taper served to throw the contents of the chamber into unpleasant relief. A large stuffed lizard, apparently an indispensable companion, was suspended from the ceiling, while the walls were artistically decorated with toads, snakes, newts, and other slimy creatures; a large crucible occupied a prominent position, and the sulphurous odours which pervaded the room unpleasantly suggested the possibility of the doctor's having entered into an illicit partnership with the gentleman who lured Faustus to his ruin. We are not told whether as much importance was at that time attached to the possession of a good professional manner as is now the case, but the doctor evidently relied not a little upon the

impression which a flowing robe, liberally garnished with cabalistic signs, would create upon the mind of his patient, and he was always ready to call astrology to his aid if he found himself face to face with any unusually tough matter for diagnosis. The remedies used in those days appear to have been extremely powerful, and, if history may be trusted, the drugs that obtained the greatest popularity were strong and reliable poisons, which were by no means devoted by the purchasers to the salvation of human life. The treatment of wounds did not err on the negative side, for the immediate application of boiling oil was considered an infallible specific until the practice received a salutary shock after one of the sanguinary battles. The stock of oil was unequal to the demand for it, and the unhappy surgeon, having no better substitute, treated a portion of his cases with cold water, and was much surprised to find that his new and involuntary remedy left the old one completely in the shade. Simplicity is not the least amongst the virtues. A few more revolutions of the wheel of time bring us to the period of the Barber Surgeons, the sign of whose calling showed that their fame for bleeding spread from pole to pole. Then in the sixteenth century came that pioneer of scientific research, the immortal Harvey, and we are proud in the knowledge that St. Mary's men are numbered amongst the most loyal and constant supporters of the Society which bears his name. Time would fail me were I to mention all those who have left the stamp of their genius upon the seal of their time, but the memory of such men as Sydenham, Cheselden, Jenner, and John Hunter makes us recognise with grateful admiration that "there were giants in those days."

And now we come within measurable distance of our own time, and are able to draw our records from living men. Wonderful indeed are the stories we hear of the capacity for disposing of heavy meals and unlimited port which English stomachs possessed at the commencement of this century, and equally wonderful were the heroic means adopted by our professional brethren to remedy the results of gastronomic indiscretion. Periodic bleeding and cupping, with the administration of strong purgatives, were deemed matter of necessity, and there was a constant supply of that which Ingoldsby has well described as

"That nasty green fluid they so often send us
Labelled, 'Haustus catharticus mane sumendus.'"

It must have been as a mild protest against this system that a patient, when asked by the doctor whether he had followed his prescription, replied, "Certainly not; if I had I should have broken my neck, for I threw it out of the window." It was a matter of certainty that there would be a reaction from such a system, and the recoil took us so far in the opposite direction that I am amongst those who think with our respected friend, Dr. Hare, that we sometimes fail to take advantage of old and valuable remedies because their indiscriminate employment has brought them into deserved discredit.

Now let me turn from the period where I must rely upon the memory of others to that which comes within the circle of my own experience. In how many directions the sappers and miners have been successfully striving to compass the overthrow of suffering and disease, and in regions which had previously been deemed impregnable. I have only to allude to the extraordinary advances made in abdominal surgery, and in the treatment of stone both in the kidney and bladder, and to the brilliant results of ovariectomy with which the honoured name of Sir Spencer Wells must ever be associated, to prove the truth of my assertion. Then, again, even the opponents of Sir Joseph Lister must allow that the introduction of his system has taught us the incalculable advantages which accrue from extreme care, cleanliness, and attention to sanitary laws. The progress in medicine may not have altogether kept pace with the recent rapid strides made in the field of surgery, but the advance has nevertheless been sure and steady, especially in our knowledge of the pathology and treatment of diseases of the nervous system; while the comparatively new discoveries in bacteriology open out an almost illimitable area for researches, and may, I trust, lead to the downfall of many of those terrible diseases which have hitherto baffled their pursuers. We are proud to know that British physicians and surgeons can claim a sufficient share in the advance of science, but we must readily and gratefully acknowledge the heroic self-sacrificing and successful labours of our professional brethren both on the Continent and in America.

And now, before I conclude, I trust that my friendly

audience will pardon me if I stray for a few moments into those Elysian ophthalmic fields where I have passed my happiest days, and which, though small in area by comparison with the vast tracts of surgery and medicine, possess a soil that yields some of the sweetest flowers of human gratitude.

I am old enough to remember the introduction of the ophthalmoscope by that great teacher and thinker, Helmholtz, who, I rejoice to say, yet lives to witness the priceless boon which his discovery has conferred upon the human race. It is difficult for those who are now familiar with its use—and their name, I trust, is legion—to conceive the wondering eagerness with which the original workers sought by the aid of their new weapon to bring to light those numerous hidden diseases of the eye which had till then been only partially and most imperfectly recognised. Many modifications of the instrument have since been introduced, and amongst the most recent and most useful improvements has been the ingenious adaptation of the electric light to the ophthalmoscope by my colleague, Mr. Juler.

Then, again, I remember the introduction of the subconjunctival operation for strabismus with hook and scissors, and the present method of enucleation of the globe, and with each of these operations the name of my honoured father must be associated. In the latter case the improvement on the previous rough and almost brutal method was so marked that the new plan was freely practised, and as there was a rather large stock in hand of eyes which needed removal, our witty friend and colleague, Monsieur Warlomont of Brussels, had perhaps at that time some slight justification for his suggestion that unless an oculist had enucleated at least one eye during the day he could not sleep well at night. About this period the venerated Nestor of English ophthalmic surgery, Sir William Bowman, inaugurated a new mode of dealing with epiphora and obstruction of the lacrymal duct by slitting the canaliculus and passing probes of various sizes; and he has been followed by Weber, Stilling, and other intelligent workers, who have grafted many ingenious additions to the parent stem. In 1856 came the remarkable discovery by our beloved von Graefe that the dread disease glaucoma, which had till then defied all the efforts of ophthalmic surgeons, might be successfully subdued in the greater number of cases by that safe and simple operation, iridectomy. He met the usual fate of great inventors, and encountered in many directions an opposition which was doubtless honest, but by no means unprejudiced; and I cannot but remember with pride that he received most loyal, and, as he gratefully owned, most valuable support from Sir William Bowman and my father, and from the large majority of English ophthalmic surgeons. The fact that iridectomy was too readily assumed to be a universal remedy, and that the iris seemed to act upon the minds of some oculists in the same manner that a red rag does upon a bull, by no means detracts from the merit of von Graefe's brilliant discovery. It has stood the severe test of the experience of thirty years, during which time it has been exposed to the searching rays of professional opinion, and its merits and demerits have been repeatedly and exhaustively canvassed; and although its efficiency in certain forms of chronic glaucoma is doubted by some, all must now admit that it is of inestimable value in the acute and subacute conditions of the disease. To von Graefe also belongs the credit of having introduced an operation for extraction of cataract, which, with certain slight modifications, remains to this hour the most successful and the most generally adopted method.

To our countryman, Mr. Jonathan Hutchinson, we are indebted for the discovery that certain forms of eye disease may be directly traced to hereditary causes.

We must not forget that amongst the numerous improvements in our art which have come from our distinguished *confrère*, Dr. De Wecker, of Paris, we have sclerotomy, the handmaid of iridectomy, being sometimes used as its efficient substitute, and sometimes as its successful supplement. From him also comes the treatment by jequirity in cases of pannus, and the application of the tattoo to dense and disfiguring leucomata. I can but glance briefly at the great progress made in the introduction of peritomy, of inoculation, of improved plastic operations on the eyelids, of evisceration, and of the methods of dealing with conical cornea; but I must not omit to make grateful allusion to that valuable local anæsthetic, cocaine, which, though a boon to all humanity, renders such exceptional service to the ophthalmic surgeon.

At the risk of taxing your patience unduly by dwelling too long upon this special subject, I must remind you of the colossal work achieved by the illustrious Professor Donders, who has opened out a new world for thought and investigation, and has elevated the study of practical optics to the dignity of a science. He has taught us that strabismus, headache, some forms of diplopia, ciliary spasm, and many other evils frequently depend upon some uncorrected error of refraction, and by placing it in our power to give the required relief, he has proved himself one of the greatest benefactors to humanity which the century has known.

You will acknowledge that the record of the last forty years is one upon which the ophthalmic surgeon can look back with mingled feelings of pride and thankfulness; but much remains yet to be done, and I trust that the time is not far distant when the spread of knowledge amongst us will alter those terrible statistics of sight lost in infancy through ignorant or wilful neglect of necessary care and treatment, and will also arouse the instructors of our children to a sense of their duties, and induce them to make that essential provision of light which is now too frequently absent.

You will, I am sure, desire that I should express the great regret which we all feel in losing the valued services of Sir Edward Sieveking, who joined St. Mary's Hospital when it began its struggle for existence, and has remained to see the fertile fruition of his labours. I must also, on your behalf and on my own, allude with grateful pride to the good work which has been accomplished, both for hospital and school, by our Dean, Mr. Field.

For the rest, gentlemen, I would entreat you to be ever mindful of the dignity of your calling. Regard not that calling from a commercial point of view, but rather from the high standpoint of philanthropic science. In manly emulation you may well engage—it is the soul of scientific as of all other enterprise; but, oh, beware those jealous feuds and petty rivalries which degrade a glorious contest to the level of a mean and merely personal competition. Let no sordid, selfish aims ever tempt you into courses derogatory to the true motive and purpose of your pursuits—the alleviation of human suffering. Never forget the saying of a famous surgeon, "Ours is the noblest of professions, but the vilest of trades." A due sense of the honour of your art will make you nicely observant of your own. Nor will you fail to remember that, even in the case of the most gifted student, industry is the indispensable handmaid of success. The mental, as the material, soil needs for the yielding of an abundant harvest careful culture, only to be achieved by thorough hard work and anxious observation. "Pater ipse colendi haud facilem esse viam voluit."

It is given to few members of our profession to achieve undying fame. The artist leaves the record of his genius on the painted canvas, and wondering ages worship at his shrine; the poet lives again in words of song that hang upon the lips of countless generations; and the musician breathes his soul into the enchanting melodies that echo for all time. Such fame is not for you. Yours is the priceless luxury of doing good; and in the gratitude of those whose pains you mitigate, whose sorrows you assuage, there lies a richer and a nobler recompense than "proudest record 'mid the tombs of kings." Be therefore of good heart. Rest assured that the reward which waits on diligence will in the fulness of time fall to your lot. As Hamlet says, "If it be not now, yet it will come: the readiness is all."

THE VALUE OF SHORTHAND TO THE STUDENT AND TO THE PRACTITIONER OF MEDICINE.¹

By W. R. GOWERS, M.D., F.R.S.

AMONG the miscellaneous uses of shorthand, not the least important is its value to the student of every kind. First to the student who learns by listening to oral lectures. Many students take notes of lectures in longhand. The process, however, interferes much with the thorough comprehension of the lecture, and so some students prefer simply to listen, to "take in" all they can, and trust to "reading up" the subject afterwards in books, to supplement their recol-

¹ Read before the International Shorthand Congress.
