Den Rechip; but so well concealed were the habitats by the natural configuration of the ground, that many botanists have failed to obtain it in both localities; and it has even been affirmed, of the latter place especially, that it had been completely extirpated. It, however, still exists in both places. I observed it in the Craighall grounds in the beginning of August last, and I have been informed of its existence in the Den of Rechip by a gentleman who saw it in the course of last summer. Within the last few years it has been found in the den of Airlie, and in two new* situations near Blairgowrie. *Mercurialis perennis* and *Paris quadrifolia* generally grow in profusion about it, and it seems to thrive best in sheltered situations beneath dense brushwood.

"In one of the new Blairgowrie stations† there are no less than six distinct habitats known; and probably more exist, as the grounds have not been completely explored. From this place the specimen in fruit now exhibited, as well as the four roots, which are in the Edinburgh Botanic Garden, were taken. It grows very luxuriantly, some of the plants being above three feet in height, with almost perfectly whorled leaves. This is by far the most abundant station for it. It was discovered by the Rev. Mr Herdman, parish minister of Rattray.

"The larger of the two barren specimens was taken from Craighall. Here, I believe, the plant was first discovered, but at a different part of the grounds, by Dr Balfour.

"Of the other habitat, near Blairgowrie, and the one at Airlie Castle, I can say nothing, except that they are not abundant, and that they were discovered by the Rev. Dr Barty, parish minister of Bendochy."

VIII. *Notice of the Occurrence of Asplenium viride on a wall near Arno's Grove, Southgate, Middlesex.* By V. EDWARD WALKER, Esq. Communicated by Professor BALFOUR. Specimens were shown.

* These are the grounds of Glen Ericht Cottage, and the Strone of Cally, near Bridge of Cally.
