At the same place were collected a few sub-imagoes of Ephemerina, probably belonging to the group of Potamanthus; wings and body are blackish.

As far as I know, this is the highest elevation in the U. S. from which Phryganid larvae and Ephemerina are reported to live. From South America I have Phryganid cases out of Lake Titicaca.

CORRESPONDENCE.

Dear Sir: In the July No. of the CANADIAN ENTOMOLOGIST for this year, is a list of the North American Sphingidæ, by A. R. Grote, A. M., in which, amongst other valuable matter, there is a paragraph which reads thus: "We have in South Florida a West Indian colony, the extent of which is not yet known. Stragglers from the south, as *Ello*, *Titan*, *Labruscæ*, invade even New England. How far north these breed with us is not known. They seem hardly to belong to the North American fauna, but are all included here so far as they have been reported to me as being taken within the political limits of the United States." I have now to report that *Dilophonota Ello* Linn. has reached this locality, four specimens having been taken this fall, three by Mr. Johnston in the city, and one by Mr. Kyle in Dundas. Mr. Grote's remarks seem naturally to suggest the question, Did these specimens fly to us from a distance, or were they bred here? If they were bred in this locality, then the next thing in order will be information about its food plant. It seems to appear somewhat late in the season, one being taken on 1st of October.

In June last I took a beetle seldom seen in Canadian collections, *Anthophila viridis* Lec., which I identified by a specimen in the fine collection of Mr. Reinecke, of Buffalo, the attractive, sparkling golden-green of its elytra giving it far more the appearance of a South American species, than one to be got in the North. Some information about its habits would be very acceptable. I captured my specimen on the wing.

J. ALSTON MOFFAT.

A RARE MOTH.

On the 23rd of August last, I had the gratification of capturing a female *Erebus odora* at Niagara Falls, Ont. The specimen, which was fresh and perfect, evidently just emerged from the chrysalis, was resting on an awning close to an electric light, on the verandah of the Clifton House. It was about 11 p. m. when I made the capture; the evening was warm, and a gentle rain had been falling for some hours. Close to it I also obtained a beautiful specimen of *Catocala relictæ*, a moth that I have rarely taken of late years.

C. J. S. BETHUNE, Port Hope.

A few days ago Professor Ropes, Andover, Mass., had the kindness to show me the library of the Theological Seminary. The books of the library, i. e., the back of the binding, as the Professor wrote to me some time ago, are injured to a very large extent by *Lepisma*. Most of the bindings were from Germany, covered with varnished paper, but some bindings were from England and from the U. S. Some loose sheets of printed paper are eaten on the margins and have many holes besides. The Professor believes that Turkish-Morocco bindings stand best against these pests.

H. A. HAGEN, Cambridge, Mass.

DATES OF PUBLICATION.

The numbers of this current volume xviii. of the CANADIAN ENTOMOLOGIST, were published at the following dates:—

January number, March 6.	May number, July 22.
February " " 16.	June " August 16.
March " " 23.	July " October 7.
April " April 21.	August " " 29.
