Bibliography of General Science

W. L. EIKENBERRY, School of Education, University of Kansas.

The large number of inquiries regarding the literature of general science indicates a widespread interest in the subject. There has been no guide to the growing literature of the subject excepting occasional references by one author to the papers of another. It is in the hope of assisting to make the literature of general science more readily available to students of the movement that the annexed list of citations is published.

The compiler has attempted to include in the list every paper dealing with the general science movement and those cited by writers on general science to the end of 1916. It is doubtless true, however, that many papers which have received only local publication, as in state teachers' magazines, have not come to his attention. It is equally possible that papers which have been published in widely circulated journals and are well known to the compiler may have been inadvertently omitted. Corrections and additions will be welcomed and incorporated in a list of additional citations to be published later.

Citations have been verified so far as possible, but in some cases the original publication was not available. Notice of errors will be appreciated.

A number of papers which are concerned primarily with collateral movements in other subjects have been included on account of their bearing upon the general science movement. It is believed to be important for the student of the general science movement to become familiar with efforts at unification of other subjects, as mathematics.

No books are included in this bibliography, whether textbooks on general science or general educational works in which general science may be discussed. Neither of these sources should be neglected, but they are not within the scope of the present paper.

Atwood, W. W. The first year general science course in the high school. S. Rev. 19: 119-127, 1911.
