Oïdes maculata, Oliv.*Oïdes subhemisphærica*, Guér.*Oïdes indica*, Baly.

Judging from the description and figure given by Olivier and from the description given by Guérin, the two species indicated above are, I think, identical with Baly's *Oïdes indica*, the type of which is before me. I am unable to find any definite characters by which to separate specimens from Java from those coming from other localities, such as Tringano, Siam, Burmah, and Assam.

LI.—*Descriptions of two new Species of Sandwich-Island Birds.* By SCOTT B. WILSON, F.Z.S.

Himatione mana, sp. n.

Male. Head ashy olive, shading into dull olive-green on the back; beneath dull greenish buff, except the chin and throat, which are whitish; wings and tail brown, edged outwardly with olive-green.

Female. Duller on the upper parts, while beneath the chin and throat are nearly white, the rest of the underparts more buff than in the male.

Dimensions. Total length 4.45 inches, wing 2.50, culmen .45, tarsus .70, tail 1.40.

Hab. Hawaii.

Obs. The bill is nearly straight, being almost similar to that of *Oreomyza*, while the plumage of the underparts, especially of the female, bears some resemblance to that species. It has not, however, the rounded wing and very short tail of *Oreomyza*.

Phœornis lanaiensis, sp. n.

This species closely resembles *Ph. obscura* and *Ph. myiastina*, but is smaller in dimensions than either; while the bill is distinctly intermediate in size between those two species. The outer pair of tail-feathers only have very slight white markings at the tip, but the abdomen and under tail-coverts are nearly pure white.

The length of the wing from the carpal joint is only 3.65, as against 4 of *Ph. obscura*.

Hab. Lanai.

Obs. The species found on Molokai seems to be identical with the bird from Lanai here described.
