Association at the meeting held April 28 to May 1, 1886, together with a report of the discussions upon these papers. The address of the president, Prof. Moses Gunn, on the union of nerves of different function considered in its pathological and surgical relations, opens the volume. This is followed by Dr. Christopher Johnston, on Diagnostic Laparotomy; by Dr. Harold C. Ernst, on the Bacteria of Surgical Diseases; by Dr. N. Senn, on the Surgery of the Pancreas; by Dr. T. F. Prewitt, on Traumatic Aneurism of Internal Carotid Artery following Gunshot Injury; by Dr. Roswell Park, on Lipoma Testis, and also a report of a Successful Nephrectomy on a patient of twenty-three months; by Dr. W. W. Keen, on Stretching of the Facial Nerve; by Dr. C. T. Parkes, on Two Cases of Cholecystotomy; by Dr. C. H. Mastin, on Subcutaneous Division of Urethral Stricture; by Dr. Roswell Park, on An Improved Tracheotomy Tube. The readers of the ANNALS OF SURGERY have already been familiarized with the contents of these papers either by their publication in full in this journal, or in abstract in its editorial or index departments. They form a series of papers of great value, which testify to the high character of the association by which they were called out. The range of subjects presented, and the widely separated points of residence of the authors, correspond with the national character of the association. Each annual addition to the series of volumes, in which the transactions of this society are preserved, increases the value of the whole series.

L. S. PILCHER.

HANDBUCH DER CHIRURGISCHEN TECHNIK, BEI OPERATIONEN UND VERBAENDEN, VON DR. ALBERT VON MOSETIG-MOORHOF, A. O. Professor an der Wiener Univ. etc., mit vielen Abbildungen. X-XII, Lief, Vienna, 1886: Toeplitz and Deuticke. (New York: G. E. Stechert). [*Handbook of Surgical Technique Pertaining to Operations, Wound-dressings and Bandaging*].

The final portions of this work, which has been in press since March, 1885, are now at hand, treating of operations upon the trunk and on the extremities.

The complete work comprises nearly 900 large octavo pages, and is handsomely printed on fine paper. Two hundred and thirty woodcuts, illustrating methods of operating and of bandaging, as well as instruments and appliances, are interspersed in the text.

The object of the author was to provide a book for the use of students and those beginning the practice of surgery, which should present in as concise a form as possible, a description of all operations

and manipulations which are likely to occur in surgical practice. He points out what discrepancies are frequently found between acquired theoretical knowledge and real practical skill in the case of young surgeons just commencing their term of service in the wards of hospitals. And it is professedly to meet the requirements of these that the book has been written.

For this reason only the technical side of the subject has been treated—although short notices of the indications and contraindications, as well as of certain mishaps and complications, and a few anatomical notes have been admitted in the text; and some critical notes upon the relative value of different operations are also occasionally inserted.

The contents of the book embraces chapters on anæsthetics, treatment of wounds, elementary operations, operations touching the different tissue-systems, bandaging, and all the major operations—the latter arranged according to the anatomical regions.

The book is well up to date, and in view of the eminence of the author and his activity in advancing modern surgery cannot be too highly recommended to all those who desire a German book of this kind for reference.

W. W. VAN ARSDALE.

CHIRURGISCH ANATOMISCHES VADEMECUM FUER STUDIERENDE UND AERTZTE VON W. ROSER, Professor der Chirurgie an der Univ. Marburg. 7 Aufl. Leipzig, Veit & Co., 1886. (New York: G. E. Stechert). [*Vademecum of Surgical Anatomy*].

This handy little volume, giving the main anatomical data in their typographical relations from a surgical point of view, and illustrated by 133 wood-cuts, is now before us in its seventh edition, which sufficiently shows what a favorite it has become.

The majority of the wood-cuts represent topographical dissections made after removal of portions of the integument—so-called fenestrated sections; and the text contains many notes of a clinical character and applications of the anatomy to practical surgery.

Each anatomical region is separately treated, the different tissues of each being reviewed in turn. A table of muscles with their nervous supplies, giving the insertions, etc., is appended. The whole book contains 270 small octavo pages.

In the preface the author remarks that the object of the book is not to enable the student to do away with anatomical dissections on the cadaver, but to guide him in making fenestrated sections.
