

# Low-Income Data Diaries

How '**Low-Tech**' Data Experiences Can Inspire  
**Accessible Data** Skills & Tool Design

---

*Just in case you didn't know what I looked like (after showing my video), here's a blurry picture with half of my face in darkness.*

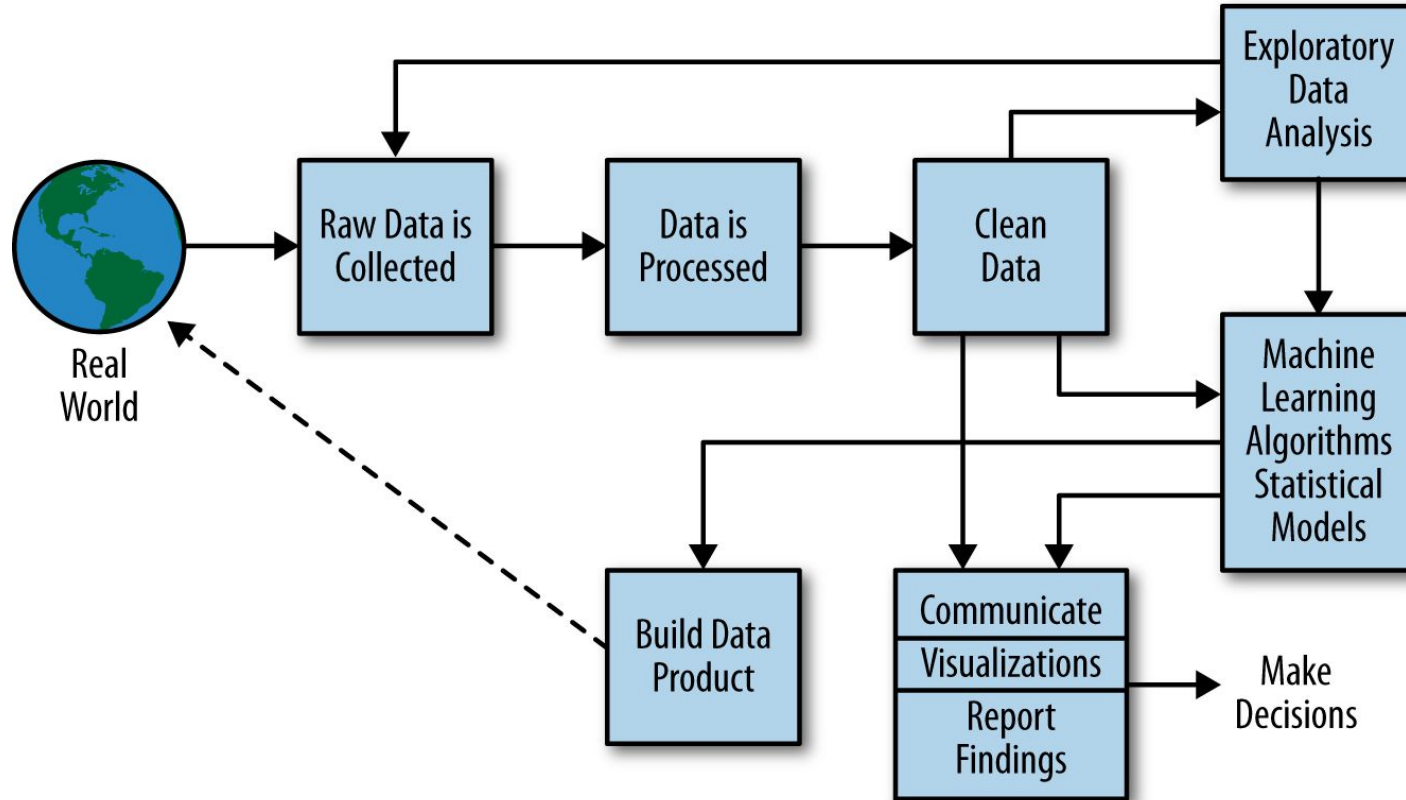

David Selassie Opoku  
Tema, Ghana

**Background:** Biology, Computer Science Education

**Experience:** Software development, data science, training design, data strategy

**Past affiliations:** Meltwater Entrepreneurial School of Technology (2014-2016), School of Data (2015 - 2018), Open Knowledge Foundation (2016 - 2018), Open Contracting Partnership (2018-2019)

**Stakeholders:** Governments, researchers, journalists, advocacy groups, entrepreneurs, farmers, international development organisations

If data is the  
new oxygen of  
the digital  
age...

Photo by [Samuel Ramos](#) on [Unsplash](#)

...we need to move  
from a data-choked  
society...

...to one of  
data-enabled action

# DATA LITERACY

We  
from  
er  
ment...

...to  
of  
dat  
tion

“Data literacy is a comfort and fluency in terms and concepts related to data – how you get, clean, analyze, use data. It includes the ability to ask the right questions, even if you are not doing the analysis.”

[We Are All Data People: Insights From The Data Literacy Survey](#), The Centre for Humanitarian Data

“Data literacy includes the ability to read, work with, analyze and argue with data.”

**Data Literacy = Data Skills + Data Tools**

Traditional  
data literacy  
efforts usually  
try **moving**  
**stakeholders**  
**to existing**  
**levels of data**  
**skills and**  
**tools**

### **Upskilling:**

Where an data stakeholder is given skills that allow her to access existing data literacy paradigms

**Ex: teaching a journalist how to scrape PDF data using Tabula**

### **Uptooling:**

Where a data stakeholder is encouraged or supported to access existing data tools

**Ex: requiring a civic technologist to sign up for a bank card/account to access cloud services**

**When traditional data literacy  
plans meet low-tech reality...**

*Dear [Data] Diary,*

*This week, we run a data journalism training for 30 radio journalists. All was well until we got to the end of the data visualisation module, and one participant ask me:*

***“How would you communicate a data visualisation through radio?”***

*Dear [Data] Diary,*

*My team has been working with a **US City Mayor's Office** to implement the Open Contracting Data Standard (OCDS) to improve public contracting. Significant technical effort is required to kick this off, which the Mayor's Office does not have the personnel and budget for this.*

***“How do we demonstrate the full potential of the OCDS with these constraints? ”***

*Dear [Data] Diary,*

*We are about to kick off a 3-month virtual data journalism training for 6 freelance journalists in Kenya. My goal for today's call was to agree on the dates, and the curriculum I'd designed. I quickly learned that:*

- ***Only one journalist had a laptop with a 4GB RAM and i3 processor***
- ***The internet kept cutting out on their end***
- ***There was a lot of background noise because of the open-shared space they used***
- ***They worried about how much income they will be losing from not being on the field for stories***

*Dear [Data] Diary,*

*At today introduction to data science meetup, only 5 (out of 30) participants were able to use the Amazon Web Services or Google Cloud Platform option for their model deployments. The rest did not have a bank card to create a cloud account.*

***“How do we increase access to such critical data resources for such participants”?***

The traditional  
data literacy  
approaches  
**do not work**  
in these  
**[low-income]**  
contexts

Historic and current income constraints limit the ability of stakeholders in low-income context from accessing current data literacy approaches

Current approaches sell a promise of long-term benefits of data literacy, and are not sensitive to the short-term realities of stakeholders in low-income contexts

# Low-tech data gaps are prevalent in low-income contexts

## **Low technical** data skills or knowledge

- Little or no exposure to non-smartphone operating systems (Windows, MacOS, Ubuntu)
- Low English (and other “popular” language) proficiency
- No programming background

## **Low access to technological** tools or processes

- No formal bank account
- Limited internet connectivity
- No or slow computing device
- Manual data processes or systems

**No! These are not edge cases**

Low-tech  
contexts **do  
not only exist  
in low-income  
countries.**

A high-income country can have a low-tech context

Limited access to high computing power due  
emergencies

Limited budgets due to prioritisation of other goals

Reduced access to high-tech tools or resources due  
to increased demand

# **Lessons & Thoughts**

Our current approach to data literacy education is largely inaccessible to a large population of data stakeholders...

...and tend to function in limited context and with limited resources

New data literacy  
efforts benefit  
from designing  
for low-tech  
contexts

Increased access to more data stakeholders

Increased contextual innovation and affordability

Increased resilience and simplicity

Medical delivery drones designed, built and operated for robust contexts in Rwanda and Ghana may now **have applications in rural US communities during the COVID-19 pandemic.**

# Zipline

# Shout Outs!

# Thank you.

[david@adoore.org](mailto:david@adoore.org)  
@sdopoku

So how would you  
communicate a data  
visualisation through  
radio?

I left my job at the end  
of 2019 to find out...
