A **Fitness tracker** which acquires photoplethysmography (PPG) and accelerometry (Accel.) signals

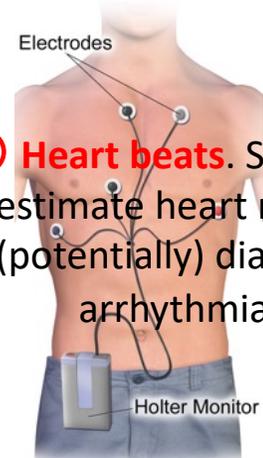

- **Pulse waves** used to:
 - estimate heart rate
 - identify an irregular pulse
 - assess pulse rate variability

- **Steps** used to:
 - estimate step count

- **Heart beats**. Signal used to:
 - estimate heart rate
 - (potentially) diagnose arrhythmias

A **Smartwatch** which acquires electrocardiography (ECG) and accelerometry (Accel.) signals

heart rate**

**Sleep
duration**

**Step
count**

**Heart rate
to steps
ratio**

Mishra, T. *et al.* Pre-symptomatic detection of COVID-19 from smartwatch data. *Nat. Biomed. Eng.* **2020**, *4*, 1208–1220, doi:[10.1038/s41551-020-00640-6](https://doi.org/10.1038/s41551-020-00640-6)

Quer, G. *et al.* Wearable sensor data and self-reported symptoms for COVID-19 detection. *Nat. Med.* **2020**, *27*, doi:[10.1038/s41591-020-1123-x](https://doi.org/10.1038/s41591-020-1123-x)

Additional Potential Applications

- Identifying obstructive sleep apnea
- Assessing stress levels
- Assessing vascular age
- Identifying clinical deteriorations
- Cardiovascular risk prediction
- Assessing response to exercise
- Identifying sepsis
- Identifying heart failure
- Identifying pre-eclampsia
- Menstrual cycle monitoring
- Identifying orthostatic hypotension
- Seizure detection in epilepsy
- Chronic kidney disease monitoring
- Biometric authentication
- Health insurance

Consumer wearables now have a wide functionality

Clinical applications are emerging, including detecting atrial fibrillation

When used clinically, wearables should be like a harness:

- highly reliable
- for specified purposes
