

Pricing Amortizing Swap

FinPricing Product

Amortizing Swap

Amortizing Swap Introduction

- ◆ An amortizing swap is a swap whose notional principal amount declines during the life of the contract
- ◆ An accreting swap is a swap whose notional principal amount increases instead.
- ◆ The notional principal is tied to an underlying financial instrument with a declining principal, such as a mortgage or an increasing principal, such as a construction fund.

Amortizing Swap

Amortizing Swap Introduction (Cont.)

- ◆ The notional principal of an amortizing swap is tied to an underlying financial instrument with a declining principal, such as a mortgage.
- ◆ On the other hand, the notional amount of an accreting swap is tied to an underlying instrument with an increasing principal, such as a construction fund.
- ◆ The notional principal schedule of an amortizing or an accreting swap may decrease or increase at the same rate as the underlying instrument.

Amortizing Swap

Valuation

- ◆ The present value of a fixed rate leg is given by

$$PV_{fixed}(t) = R \sum_{i=1}^n N_i \tau_i D_i$$

where t is the valuation date and $D_i = D(t, T_i)$ is the discount factor.

- ◆ The present value of a floating leg is given by

$$PV_{float}(t) = \sum_{i=1}^n N_i (F_i + s) \tau_i D_i$$

where $F_i = \left(\frac{D_{i-1}}{D_i} - 1 \right) / \tau_i$ is the simply compounded forward rate and s is the floating spread.

Amortizing Swap

Valuation (Cont.)

- ◆ The present value of an interest rate swap can be expressed as
 - ◆ From the fixed rate payer perspective, $PV = PV_{float} - PV_{fixed}$
 - ◆ From the fixed rate receiver perspective, $PV = PV_{fixed} - PV_{float}$

Amortizing Swap

Practical Guide

- ◆ First of all, you need to generate accurate cash flows for each leg. The cash flow generation is based on the start time, end time and payment frequency of the leg, plus calendar (holidays), business convention (e.g., modified following, following, etc.) and whether sticky month end.
- ◆ We assume that accrual periods are the same as reset periods and payment dates are the same as accrual end dates in the above formulas for brevity. But in fact, they are different due to different market conventions. For example, index periods can overlap each other but swap cash flows are not allowed to overlap.
- ◆ The accrual period is calculated according to the start date and end date of a cash flow plus day count convention

Amortizing Swap

Practical Guide (Cont)

- ◆ The forward rate should be computed based on the reset period (index reset date, index start date, index end date) that are determined by index definition, such as index tenor and convention. it is simply compounded.
- ◆ Sometimes there is a floating spread added on the top of the floating rate in the floating leg.
- ◆ The formula above doesn't contain the last live reset cash flow whose reset date is less than valuation date but payment date is greater than valuation date. The reset value is

$$PV_{reset} = r_0 N \tau_0 D_0$$

where r_0 is the reset rate.

Amortizing Swap

Practical Guide (Cont)

- ◆ The present value of the reset cash flow should be added into the present value of the floating leg.
- ◆ Some dealers take bid-offer spreads into account. In this case, one should use the bid curve constructed from bid quotes for forwarding and the offer curve built from offer quotes for discounting.

Amortizing Swap

A Trade Example

Fixed Leg Specification		Floating Leg Specification		Notional Schedule	
Currency	USD	Currency	USD	6100520	9/1/2015
Day Count	dcAct360	Day Count	dcAct360	6075492	10/1/2015
