

Pricing Swaption

FinPricing Product

Pricing Swaption

Swaption Overview

- ◆ A swaption is a contract that grants its owner the right but not the obligation to enter the underlying swap.
- ◆ Swaptions provide clients with a guarantee that the fixed rate of interest they will pay or receive at some of future time will not exceed certain level.
- ◆ There are two types of swaptions: a payer swaption and a receiver swaption.
- ◆ A payer swaption is also called a right-to-pay swaption that allows its holder to exercise into a swap where the holder pays fixed rates and receives floating rates
- ◆ A receiver swaption is also called right-to-receive swaption that allows its holders to exercise into a swap where the holder receives fixed rates and pays floating rates.

Pricing Swaption

Swaption Overview (Cont.)

- ◆ Market participants might buy a payer swaption if it wants protection from rising interest rates.
- ◆ A corporation holding a mortgage portfolio might buy a receiver swaption to protect against decreasing interest rates that might lead to mortgage prepayment.
- ◆ A company believing that interest rates will not increase much might sell a payer swaption to earn the premium.
- ◆ An institution believing that interest rates will not decrease much might sell a receiver swaption to earn the premium.

Pricing Swaption

Swaption Payoff

- ◆ For a payer swaption, the payoff at payment date T is given by

$$Payoff_{payer} = \max(0, NA(S_T - S_0))$$

where

N - the notional;

A - the annuity or forward basis point value

S_0 - the fixed rate or contract swap rate at inception

S_T - the swap rate at time T

- ◆ From a receiver swaption, the payoff at payment date T is given by

$$Payoff_{payer} = \max(0, NA(S_0 - S_T))$$

Pricing Swaption

Pricing

- ◆ The present value of a payer swaption is given by

$$PV_{payer}(t) = NA[S\Phi(d_1) - K\Phi(d_2)]$$

where

t - the valuation date

N - the notational principal amount

$A = \sum_{i=1}^n \tau_i D_i$ - the annuity factor or forward basis point value

$S = [D_1 - D_n]/A$ - the forward swap rate

Φ - the cumulative standard normal distribution function

i - the i^{th} cash flow (swaplet) of the underlying swap from 1 to n

$\tau_i = \tau(T_{i-1}, T_i)$ - the accrual period (,) of the i^{th} cash flow.

$D_i = D(t, T_i)$ - the discount factor

Pricing Swaption

Pricing (Cont.)

- ◆ The present value of a receiver swaption can be expressed as

$$PV_{payer}(t) = NA[K\Phi(-d_2) - S\Phi(-d_1)]$$

where all notations are the same as (1)

Pricing Swaption

Practical Notes

- ◆ A swaption contract contains terms and conditions of the swaption and the underlying swap. For example, it specifies two maturities: swaption maturity and underlying swap maturity.
- ◆ The valuation model for pricing a swaption is the Black formula that assumes the underlying swap rate follows a log-normal process.
- ◆ First, one needs to generate the cash flows of the underlying swap. The generation is based on the start time, end time and payment frequency of each leg, plus calendar, and business convention.

Pricing Swaption

Practical Notes (Cont.)

- ◆ The accrual period is calculated according to the start date and end date of a cash flow plus day count convention
- ◆ Any compounded interest zero rate curves can be used to compute discount factor, of course the formulas will be slightly different. The most common used one is continuously compounded zero rates.
- ◆ The other key for accurately pricing an outstanding swaption is to construct an arbitrage-free volatility surface. Unlike a cap/floor volatility surface that is 3 dimensional, a swaption volatility surface is 4 dimensional.

Pricing Swaption

A Trade Example

| Swaption Specification | | Underlying Swap Specification | | | |
|------------------------|-----------|-------------------------------|----------|---------------------|----------|
| Buy Sell | Buy | Leg 1 Specification | | Leg 2 Specification | |
| Pay Receive | Pay | Currency | USD | Currency | USD |
| Notification Lag | 2 | Day Count | dc30360 | Day Count | dcAct360 |
| Settlement | Cash | Leg Type | Fixed | Leg Type | Float |
| Exercise Type | Call | Notional | 25000000 | Notional | 25000000 |
| Notification Date | 4/30/2020 | Pay Receive | Pay | Pay Receive | Receive |
| Settlement Date | 5/5/2020 | Payment Freq | 6 | Payment Freq | 3 |
| Forward Premium Amount | 3375000 | Start Date | 5/5/2020 | Start Date | 5/5/2020 |
| Premium Pay Receive | Pay | End Date | 5/5/2030 | End Date | 5/5/2030 |
| Forward Premium Date | 5/5/2020 | Fixed Rate | 0.02855 | Spread | 0 |
| | | | | Index Specification | |
| | | | | Type | LIBOR |
| | | | | Tenor | 3M |
| | | | | Day Count | dcAct360 |

Thanks!
