## Supplementary Methods

## Data collection

Detailed information on sociodemographic factors, lifestyle factors, personal and family medical history, and current medications was obtained using a laptop-based questionnaire at baseline survey. Inquiry on tobacco smoking included current and past smoking status. Smoking frequency, type, and amount were asked for ever smokers, and the main reason for cessation was asked for former smokers. Questions about alcohol consumption included drinking frequency, beverage types, and the amount consumed on a typical drinking day. The amount of pure alcohol consumed in grams was converted according to the beverage types and volume of alcohol drunk (1). The physical activity questionnaire covered questions on type and time spent on occupational and nonoccupational activities (commuting, household, and leisure-time) during the past year. The metabolic equivalent task (MET) hours per day (MET-h/day) was calculated by multiplying the number of hours spent per day on each activity and the MET of that activity (2). Dietary intakes were assessed via a validated qualitative food frequency questionnaire, which covered 12 major food groups, such as fruits, vegetables, meat, and dairy products (3). Each food group was assessed with five frequency levels on habitual consumption during the past 12 months (daily, 4-6 days/week, 1-3 days/week, monthly, or never/rarely).

Trained staff measured weight, height, waist and hip circumference, and blood pressure (BP) and collected 10 ml of blood sample for storage and onsite testing of random blood glucose (RBG), with the time since last meal recorded. Blood mass index (BMI) was calculated as weight in kilograms divided by height in meters squared. Waist-to-hip ratio (WHR) was the ratio of waist circumference to hip circumference. BP was measured twice using a digital sphygmomanometer (Omron UA-779; Live Source) after participants had remained at rest in the seated position for at least 5 minutes. The mean of the two recorded values was used in the analyses. Prevalent hypertension was defined as measured systolic blood pressure (SBP) $\geq 140$ mmHg or diastolic blood pressure (DBP) $\geq 90 \mathrm{mmHg}$, or self-reported diagnosis of hypertension or use of antihypertensive medication at baseline. RBG level was measured following sample collection using the SureStep Plus System (Johnson \& Johnson). Participants with RBG levels between 7.8 and $11.1 \mathrm{mmol} / \mathrm{L}$ were invited for an FBG test the following day. All devices were regularly maintained and calibrated to ensure consistency of the measurements.

Supplementary Table 1. ICD-10 codes for study outcomes.

| Outcomes | ICD-10 codes |
| :--- | :--- |
| Cancer | C00-C97 |
| Macrovascular complications |  |
| $\quad$ Total cardiovascular disease | I00-I25, I27-I88, I95-I99 |
| Ischemic heart disease | I20-I25 |
| Myocardial infarction | I21-I23 |
| Stroke | I60, I61, I63, I64 |
| Ischemic stroke | I63 |
| $\quad$ Hemorrhagic stroke | I61 |
| Microvascular complications |  |
| $\quad$ Diabetic nephropathy | E10.2, E11.2, E12.2, E13.2, E14.2 |
| Diabetic retinopathy | E10.4, E11.3, E12.3, E12.4, E13.3, E14.3 E14.4 |
| Diabetic neuropathy |  |

Supplementary Table 2. Changes in lifestyle factors between baseline survey at 2004-08 and resurvey at 2013-14 according to detection methods for diabetes at baseline.

|  | Screen-detected diabetes | Self-reported diabetes | Total |
| :--- | ---: | ---: | ---: |
| No. of participants, n | 503 | 534 | 1037 |
| Tobacco smoking |  |  |  |
| Stable | $92.8(90.5-95.0)$ | $91.6(89.4-93.8)$ | 92.1 |
| Worse | $2.0(0.7-3.3)$ | $0.9(0.1-1.7)$ | 1.5 |
| Better | $5.2(3.3-7.2)$ | $7.5(5.4-9.6)$ | 6.5 |
| Alcohol drinking |  |  |  |
| $\quad$ Stable | $90.3(87.7-92.8)$ | $91.0(88.6-93.3)$ | 90.7 |
| $\quad$ Worse | $5.3(3.3-7.3)$ | $4.4(2.8-6.1)$ | 4.8 |
| Better | $4.5(2.7-6.2)$ | $4.6(2.9-6.3)$ | 4.5 |
| Eating fruits and vegetables |  |  |  |
| Stable | $74.8(71.0-78.5)$ | $70.7(67.0-74.4)$ | 72.7 |
| Worse | $9.1(6.5-11.7)$ | $3.9(2.3-5.5)$ | 6.3 |
| Better | $16.2(12.9-19.4)$ | $25.4(21.8-29.0)$ | 21.0 |
| Physical activity, | $-3.0(14.3)$ | $-3.1(12.2)$ | $-3.0(13.3)$ |
| MET-h/d (SD) |  |  |  |
| Waist-to-hip ratio | $82.4(79.0-85.8)$ | $78.9(755.5-82.3)$ | 80.5 |
| Stable | $9.7(7.1-12.4)$ | $12.8(10.0-15.7)$ | 11.4 |
| Worse | $7.9(5.5-10.3)$ | $8.3(6.0-10.6)$ | 8.1 |
| Better |  |  |  |

Values are adjusted for age at baseline (years), sex, and study area, where appropriate.
Participants were classified into three states: stable (maintaining low-risk or high-risk lifestyle), worse (from low-risk to high risk lifestyle) and better (from high-risk to low-risk lifestyle) according to their lifestyle change between baseline and the resurvey. Low-risk lifestyle factors were defined as: never smoking or having stopped for reasons other than illness; never drinking or current drinking $<30 \mathrm{~g} / \mathrm{d}$ of pure alcohol in men or $<15 \mathrm{~g} / \mathrm{d}$ in women (former drinkers not included); eating fruits and vegetables every day; engaging in a sex-specific median or higher level of physical activity; and having a WHR $<0.90$ in men and $<0.85$ in women.

Supplementary Table 3. Adjusted hazard ratios (95\% CIs) for mortality and diabetes complications.

|  | All-cause mortality |  |  | Cancer mortality |  |  | Macrovascular complications |  |  | Microvascular complications |  |  |

CI, confidence interval; PY, person-year; HR, hazard ratio; MET, metabolic equivalent task.
The multivariable model was adjusted for age (years), sex, education (no formal school, primary school, middle school, high school, college/ university or higher), body mass index ( $\mathrm{kg} / \mathrm{m}^{2}$ ), family history of diabetes (yes or no), family histories of heart attack and stroke (yes or no, only in the analyses of all-cause mortality and macrovascular complications), family history of cancer (yes or no, only in the analyses of all-cause and cancer mortality), diabetes duration (years), diabetic treatment (yes or no), statin use (yes or no) and aspirin use (yes or no). All lifestyle and health factors were included simultaneously in the same model.
${ }^{a}$ Former smoker refers to those who had stopped smoking for reasons other than illness. Those who had stopped smoking due to illness were included in daily smokers.

Supplementary Table 4. Adjusted hazard ratios (95\% CIs) for mortality and diabetes complications according to detection methods for diabetes at baseline.

$\mathrm{mmol} / \mathrm{L}$
CI, confidence interval; PY, person-year; HR, hazard ratio; WHR, waist-to-hip ratio.
The multivariable model was adjusted for age (years), sex, education (no formal school, primary school, middle school, high school, college/ university or higher), body mass index ( $\mathrm{kg} / \mathrm{m}^{2}$ ), family history of diabetes (yes or no), family histories of heart attack and stroke (yes or no, only in the analyses of all-cause mortality and macrovascular complications), family history of cancer (yes or no, only in the analyses of all-cause and cancer mortality), diabetes duration (years), diabetic treatment (yes or no), statin use (yes or no) and aspirin use (yes or no). All lifestyle and health factors were included simultaneously in the same model.
Low-risk lifestyle factors were defined as: never smoking or having stopped for reasons other than illness; never drinking or current drinking $<30 \mathrm{~g} / \mathrm{d}$ of pure alcohol in men or $<15 \mathrm{~g} / \mathrm{d}$ in women (former drinkers not included); eating fruits and vegetables every day; engaging in a sex-specific median or higher level of physical activity; and having a WHR $<0.90$ in men and $<0.85$ in women.
Low-risk health factors were defined as: systolic blood pressure $<130 \mathrm{mmHg}$ and diastolic blood pressure $<80 \mathrm{mmHg}$; and random blood glucose $<10.0 \mathrm{mmol} / \mathrm{L}$ (fasting for $<8 \mathrm{hours}$ ) or $<7.0 \mathrm{mmol} / \mathrm{L}$ (fasting for $\geq 8$ hours).

CI, confidence interval; PY, person-year; HR, hazard ratio.
Please refer to Supplementary Table 4 for the definitions of low-risk health factors and covariates adjusted in the models. Models were further adjusted for tobacco smoking (non-smokers, former smokers who quit smoking for a non-illness reason, current smokers and former smokers who quit smoking due to illness: 1-14, 15-24, or $\geq 25$ cigarettes or equivalent per day), alcohol consumption (never drinkers, former drinkers, current drinkers: less than daily or drinking $<30 \mathrm{~g} / \mathrm{d}$ of pure alcohol in men or $<15 \mathrm{~g} / \mathrm{d}$ in women, drinking $\geq 30 \mathrm{~g} / \mathrm{d}$ of pure alcohol in men or $\geq 15 \mathrm{~g} / \mathrm{d}$ in women), intake frequency of fresh fruits and vegetables (days/week: calculated by assigning participants to the midpoint of their consumption category), physical activity (MET-hours/day), and waist-hip ratio.

Supplementary Table 10. Adjusted hazard ratios ( $\mathbf{9 5 \%} \% \mathrm{CIs}$ ) for mortality and diabetes complications according to number of low-risk factors.

HR, hazard ratio; CI, confidence interval. Models were adjusted for the same variables in Supplementary Table 4, as appropriate.
${ }^{a}$ Excluding prevalent hypertension participants.

Supplementary Figure 1. Relative importance of lifestyle and health factors for risks of mortality and diabetes complications according to sex categories.
The relative importance of each low-risk factors was measured by estimating explained log-likelihood, with larger proportion of overall chi-square indicating greater importance. Please refer to Supplementary Table 4 for the definitions of low-risk factors and covariates adjusted in the models.

50-65 y

$>65 \mathrm{y}$

Macrovascular complications

Microvascular complications

Supplementary Figure 2. Relative importance of lifestyle and health factors for risks of mortality and diabetes complications according to age categories.
Please refer to Supplementary Table 4 for the definitions of low-risk factors and covariates adjusted in the models.

Supplementary Figure 3. Relative importance of lifestyle and health factors for risks of mortality and diabetes complications according to region categories.
Please refer to Supplementary Table 4 for the definitions of low-risk factors and covariates adjusted in the model

[^0]:    CI, confidence interval; PY, person-year; HR, hazard ratio; WHR, waist-to-hip ratio.

[^1]:    CI, confidence interval; PY, person-year; HR, hazard ratio.
    Please refer to Supplementary Table 4 for the definitions of low-risk factors and covariates adjusted in the models.
