MOTIVATION To take advantage of recent and ongoing advances in intensive and large-scale computational methods, and to preserve the scientific data created by publicly funded research projects, public data archives must be created as well as standards for specifying, identifying, and annotating the deposited data. The value of and interest in such archives among researchers can be greatly increased by connecting them to active computational capabilities and a framework of analysis and search tools that support further analysis as well as larger scale meta-analysis and data mining.

NEMAR, the NeuroElectroMagnetic Archive for Research, serves as a gateway to BIDS-formatted NEM (EEG, MEG, iEEG) imaging data uploaded and shared on OpenNeuro.org. NEMAR offers a range of functions, including data search and visualization, and operates as a freely accessible integrated resource known as DATCOR (Data, Tools, and Compute Resource) dedicated to human NeuroElectroMagnetic brain imaging data. The construction of NEMAR leverages the HubZero framework, an open-source software platform renowned for empowering gateway development, data publication, resource sharing, collaboration, and community-building within a unified web-based ecosystem.

Identified NEMAR datasets can be processed using high-performance computing (HPC) resources via the Neuroscience Gateway (www.nsgportal.org), a freely available, easy-to-access portal to HPC resources that serves several computational environments and packages (MATLAB, Python, R, EEGLAB, Freesurfer, etc.). Users can submit custom analysis scripts operating on NEMAR data with no need for inefficient data downloads and reuploads.

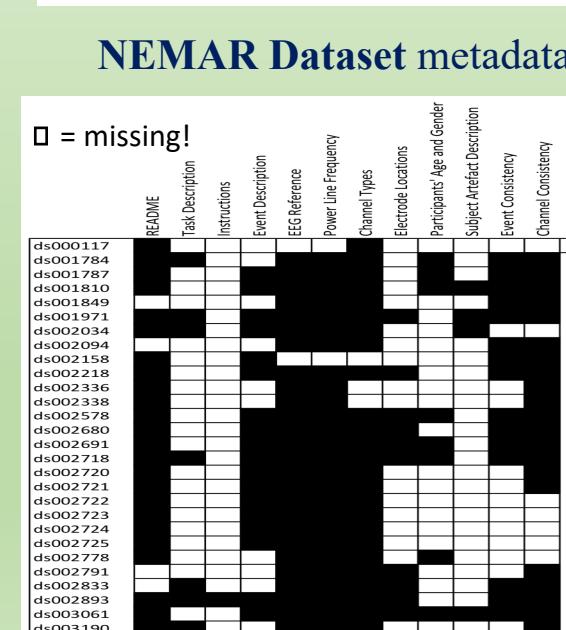

Search and visualize available EEG, MEG, and iEEG (NEM) data

An integrated data, tools and compute resource

Sample MATLAB script

```
egelib; % start EEGLAB and add path  
[~,FEG] = pop_imprehd('explore/projects/nemar/openneuro/ds003645');  
% duration and number of events for FEG dataset  
duration = round([FEG.length], [FEG.event]);  
nEvents = ceil(duration*[FEG.length], [FEG.event]);  
% display some statistics about the RAW EEG data  
% FEG is a sparse matrix, w/ k non-zero entries per row  
fidName = 'fid.dat';  
fidName = 'fid_channels' ,length(FEG));  
fidName{1} = fidName{1} + 'fid_channels1';%fidName{1} = fidName{1} + 'fid_channels1';  
fidName{2} = fidName{2} + 'fid_second';%fidName{2} = fidName{2} + 'fid_second';  
fidName{3} = fidName{3} + 'fid_minsecond';%fidName{3} = fidName{3} + 'fid_minsecond';  
fidName{4} = fidName{4} + 'fid_events';%fidName{4} = fidName{4} + 'fid_events';  
fidName{5} = fidName{5} + 'fid_minevents';%fidName{5} = fidName{5} + 'fid_minevents';  
fidName{6} = fidName{6} + 'fid_maxevents';%fidName{6} = fidName{6} + 'fid_maxevents';
```

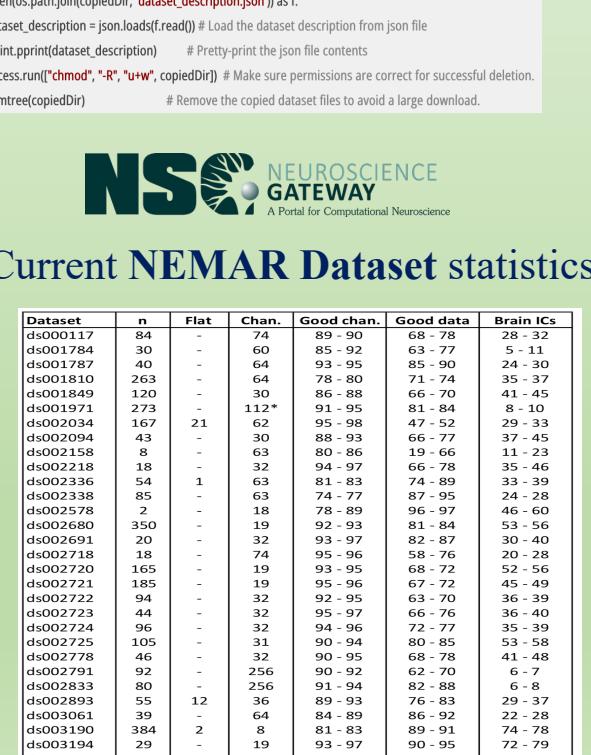

Sample Python script

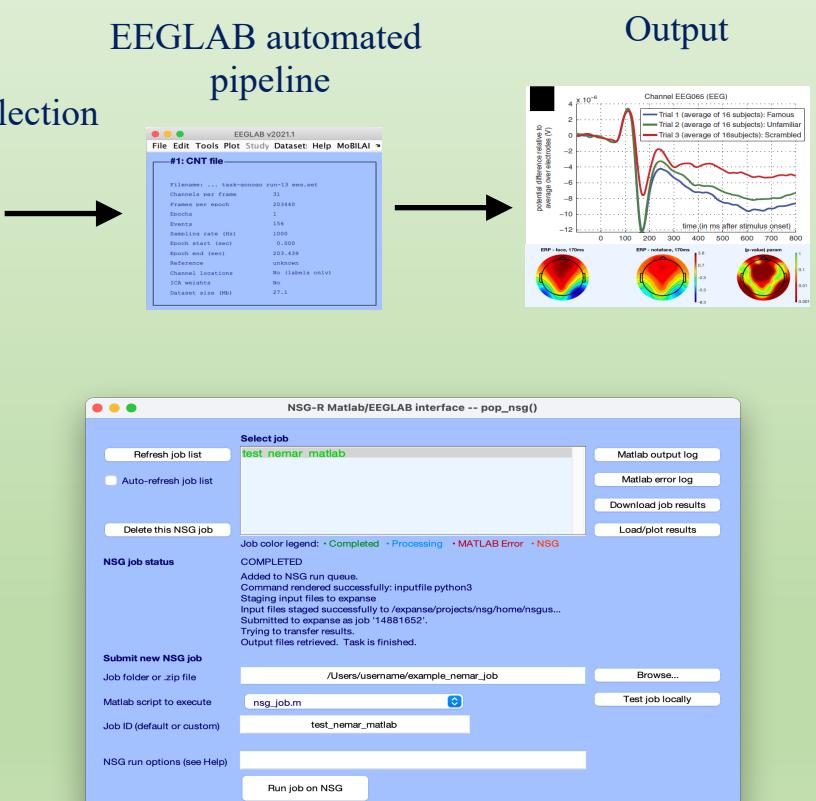

```
import os  
import json  
import print  
import Readfile  
  
# specify the NSG dataset ID  
#DSTARIID = 'ds002718'  
#DATASOURCES = 'nemar'  
#DBNAME = 'nemardb'  
# Create a copy of the dataset in current working directory before processing  
# with open('path_to_NSG_dataset', 'r') as f:  
#     dataset = f.read()  
#     dataset = dataset.replace('DBNAME', DBNAME)  
#     dataset = dataset.replace('DATASOURCES', DATASOURCES)  
#     dataset = dataset.replace('DSTARIID', DSTARIID)  
#     dataset = dataset.replace('DBNAME', DBNAME)  
#     dataset = dataset.replace('DATASOURCES', DATASOURCES)  
#     dataset = dataset.replace('DSTARIID', DSTARIID)  
#     dataset = dataset.replace('DBNAME', DBNAME)  
#     dataset = dataset.replace('DATASOURCES', DATASOURCES)  
#     dataset = dataset.replace('DSTARIID', DSTARIID)  
#     dataset = dataset.replace('DBNAME', DBNAME)  
#     dataset = dataset.replace('DATASOURCES', DATASOURCES)  
#     dataset = dataset.replace('DSTARIID', DSTARIID)  
#     dataset = dataset.replace('DBNAME', DBNAME)  
#     dataset = dataset.replace('DATASOURCES', DATASOURCES)  
#     dataset = dataset.replace('DSTARIID', DSTARIID)  
#     dataset = dataset.replace('DBNAME', DBNAME)  
#     dataset = dataset.replace('DATASOURCES', DATASOURCES)  
#     dataset = dataset.replace('DSTARIID', DSTARIID)
```

Data analysis pipeline for BIDS-format data (bids.neuroimaging.io)

Users first format their NEM data to BIDS specifications and then upload their data to the [OpenNeuro.org](https://openneuro.org) web interface, which stores it on its AWS back end. The NEMAR SDSC Data Storage back-end then periodically copies and updates the data from OpenNeuro. Data statistics and visualizations are precomputed for display using NSG computing. The [NEMAR.org](https://nemar.org) web interface (bottom box) serves the data to NEMAR users. Dataset identifiers discovered using NEMAR or OpenNeuro can then be used in any custom analysis script the user uploads to the Neuroscience Gateway (www.nsgportal.org), which retrieves and processes the selected data without need for data download and subsequent re-upload.
