    Pre-Processing  
Plotting  
**CORDEX** projections  
Downloading  
    Pre-Processing  
Plotting

# Introduction

Models need observed data to be initialized. These data are registered, processed and distributed in grid points (initial conditions) → reanalysis.

To simulate regional features of the climate, models need to have high resolution. It is expensive with GCMs but relatively cheaper with RCMs, which simulate a small part of the globe.

GCMs simulate the global atmosphere. Coarse resolution.

Model A: 40-km Resolution

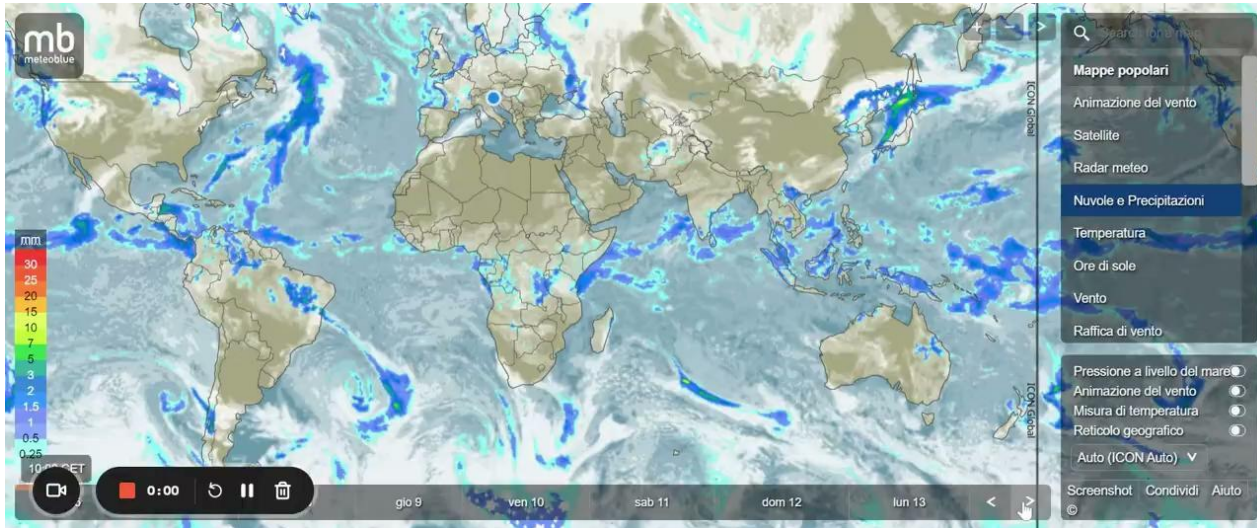

Model B: 20-km Resolution

Coastal Region within the Models

# Introduction

Note that the atmospheric systems are not stationary, traveling in the atmosphere

But how will RCMs know that the atmospheric systems are reaching or leaving a small domain?

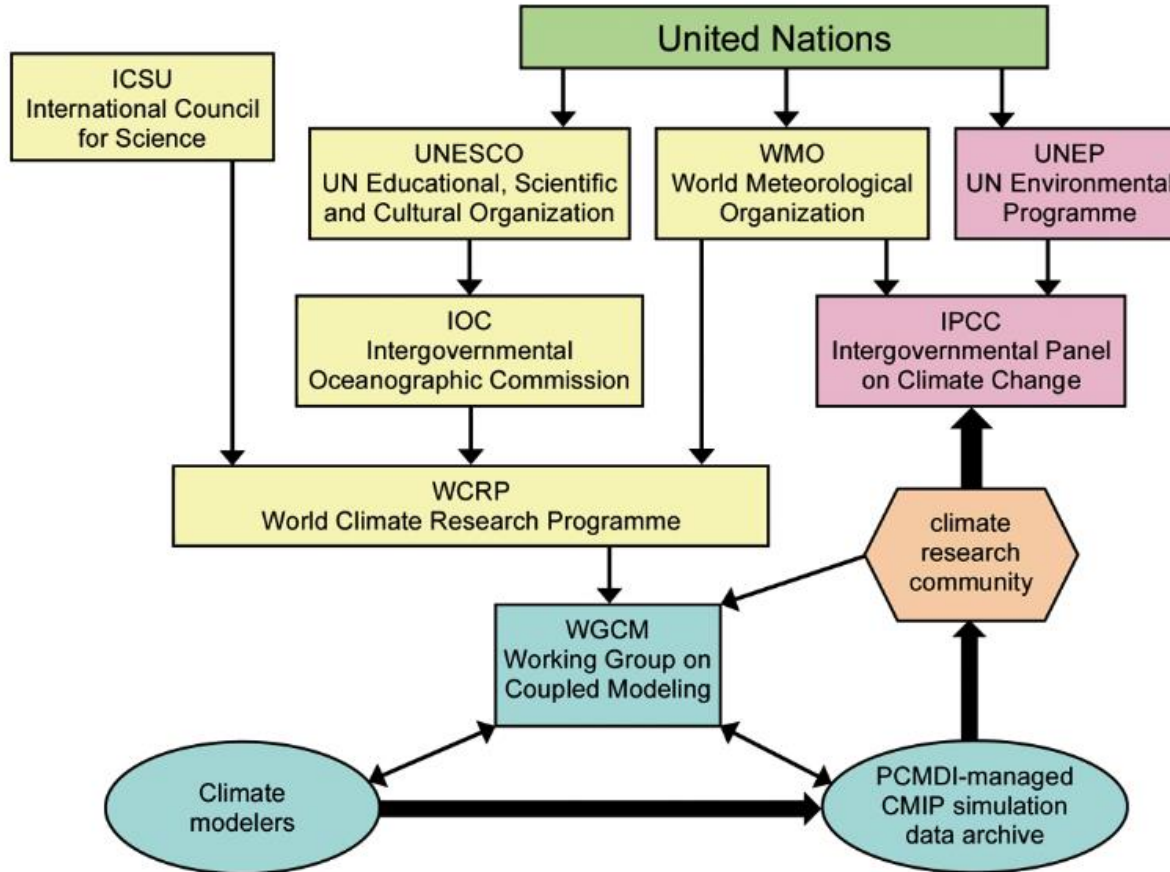

GCMs or reanalyses provide the initial and boundary conditions for RCMs

# Introduction

There are institutions that organize the protocols for the models' executions.

Organizational structure

Understanding why there are CMIP and CORDEX programmes

# Introduction

Understanding why there are CMIP and CORDEX programmes

- Created in 1988 by the United Nations Environment Programme (UN Environment) and the World Meteorological Organization (WMO);

- 195 Member countries;

- Objective: systematic review of all relevant published literature to provide policymakers with regular scientific assessments on climate change

<https://www.ipcc.ch/>

- Created in 1995;

- Objectives: understand past, present and future climate changes; create protocols for numerical experiments and to make the multi-model output publically available in a standardized format

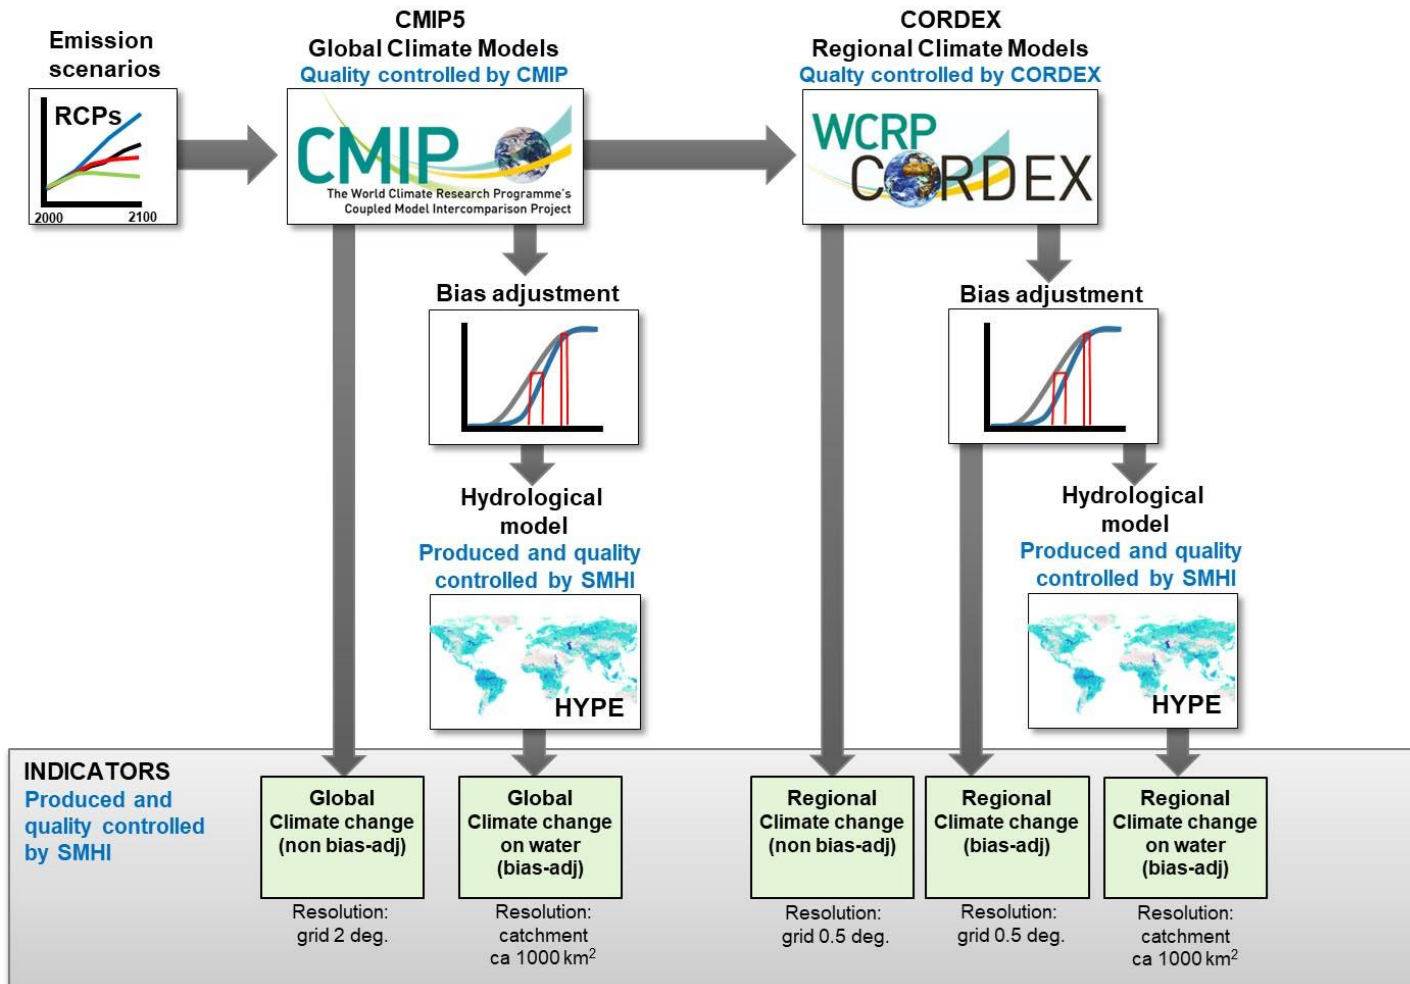

<https://www.wcrp-climate.org/wgcm-cmip>

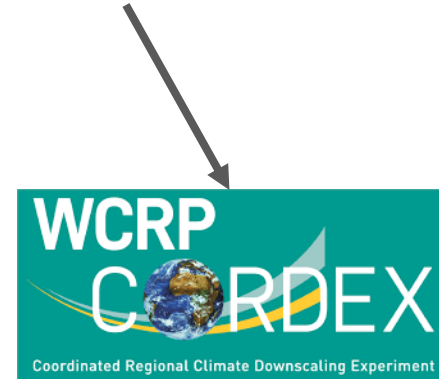

- Created in 2009;

- Objective: a coordinated framework for evaluating and improving regional climate downscaling techniques and bridging the gap between the climate modelling community and end users of climate information across the globe.

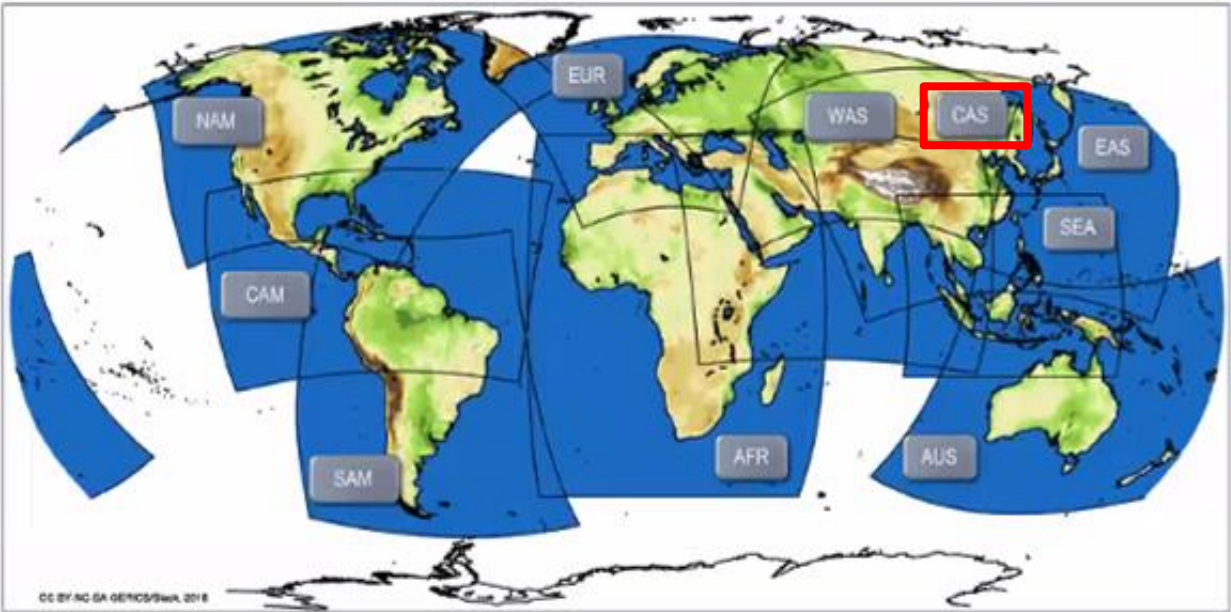

<https://www.icrc-cordex2016.org/index.php/about/what-is-cordex>

# Introduction

CORDEX domains

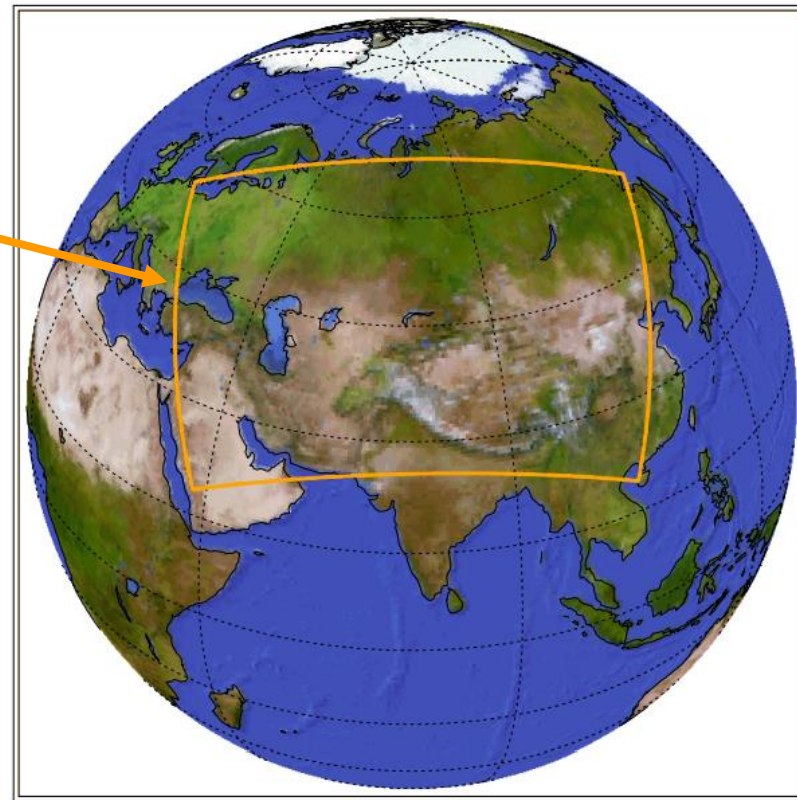

# CORDEX

## Central Asia domain

<https://www.ipcc.ch/report/ar6/wg1/figures/atlas/figure-atlas-6>

<https://cordex.org/domains/region-8-central-asia/>

# Introduction

## Definitions

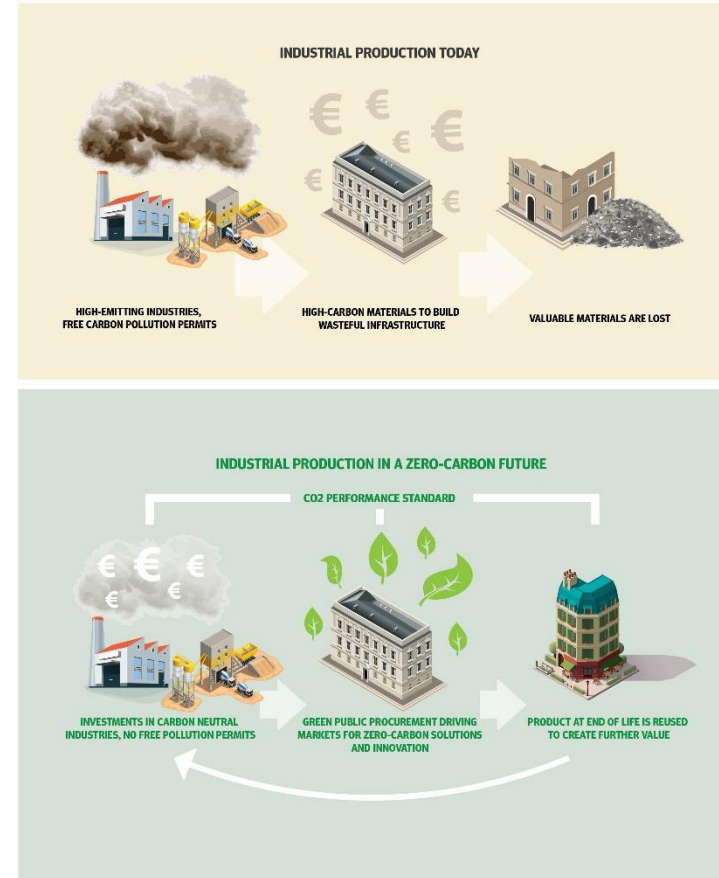

**Baseline/Reference:** present-day conditions.

**Forecast:** predict the future based on initial conditions applied in the numerical models (it does not include scenarios).

**Projection:** term that can be regarded as any description of the future and the **pathway (scenario)** leading to it.

**Scenario:** description of a possible future state of the world.

## INDUSTRIAL CLIMATE STRATEGY IN PRACTICE

# Introduction

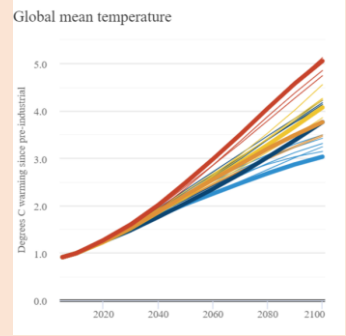

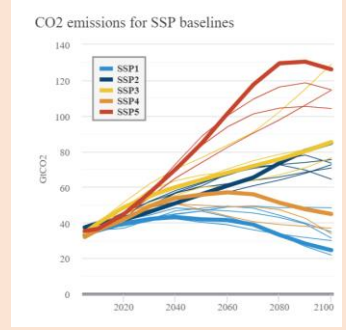

## Scenarios

### RCPs

<https://open.oregonstate.edu/climatechange/chapter/impacts/>

### SSPs

<https://www.carbonbrief.org/explainer-how-shared-socioeconomic-pathways-explore-future-climate-change>

### Representative Concentration Pathways (RCPs)

- describe different levels of greenhouse gases and other radiative forcings that might occur in the future
- 4 pathways, spanning a broad range of forcing in 2100 (2.6, 4.5, 6.0, and 8.5 W m<sup>-2</sup>)
- they do not include any socioeconomic “narratives” to go alongside them.

### Shared Socioeconomic Pathways (SSPs)

- include socioeconomic factors (population, economic growth, education, urbanization and the rate of technological development)
- 5 socioeconomic development trajectories defined in terms of challenges to adaptation and mitigation

### RCPs and SSPs are complementary

The RCPs set pathways for greenhouse gas concentrations and, effectively, the amount of warming that could occur by the end of the century. Whereas the SSPs set the stage on which reductions in emissions will – or will not – be achieved.

# Introduction

SSP scenarios are described by Riahi et al. (2017).

## Global Environmental Change

Volume 42, January 2017, Pages 153-168

### The Shared Socioeconomic Pathways and their energy, land use, and greenhouse gas emissions implications: An overview

## Create User Profile

You will receive a password by email.

Please provide the information below to request a CoG account.

Required fields are in **bold**.

Upon submission, an OpenID will be automatically assigned to you: you will need that OpenID to login.

The following characters are not allowed: < > & # % { } [ ] \$

Please note that if you are logging in with a previously granted ESGF OpenID, CoG requires that Institution, City, and Country be added to your account.

### User Information

**User Name**

*[ 5 to 30 characters, letters, digits and @./-/\_ only. Please note that the username is used to build a unique OpenID that you will use to login. If your chosen username is not available, you will be automatically assigned a similar one. ]*

**First Name**

**Last Name**

**Email**

**Password**

*[ At least 8 characters, including one lower case letter, one upper case letter, one number, and one special symbol. All characters are allowed EXCEPT for ( ) ". ]*

**Confirm Password**

*[ Must match the password above. ]*

## Experiment Configuration

## Variant Label

*ripf* index denotes the ensemble member (realization *r*), initialization methods (*i*), physics versions (*p*), and forcing data set (*f*)

In each **model output file** the “**ripf**” identifier is used to uniquely distinguish each member of an ensemble, but the differences between members may not always be clearly (or correctly) recorded in the “variant\_info” global attribute inside the netcdf file.

ES-DOC will therefore serve as the reference source for understanding differences between ensemble members.

Modeling groups will record in ES-DOC the key to interpreting the differences between simulations identified by different indices. In particular for each forcing index, the list of forcing data sets applied in the simulation will be recorded.

<https://pcmdi.llnl.gov/CMIP6/Guide/dataUsers.html>

Some details are provided in [https://docs.google.com/document/d/1h0r8RZr\\_f3-8egBMMh7aqLwy3snpD6\\_MrDz1q8n5XUk/e/dit#](https://docs.google.com/document/d/1h0r8RZr_f3-8egBMMh7aqLwy3snpD6_MrDz1q8n5XUk/e/dit#)

**Initialization method** is as follows:

1: Initial conditions taken from a prior simulation, as indicated by the branch-date attribute.

2: As 1, but with an additional random perturbation applied to the initial state of the atmosphere.

<https://ukesm.ac.uk/cmip6/variant-id/>

**Forcing configuration** (example for HadGEM3-GC3.1):

1: Input4MIPs version v6.1.1; no ozone remapping

2: Input4MIPs version v6.2.0; no ozone remapping

3: Input4MIPs version v6.2.0; with ozone remapping

***ripf*** index denotes the  
ensemble member (realization  $r$ ),  
initialization methods ( $i$ ),  
physics versions ( $p$ ), and  
forcing data set ( $f$ )

# Tutorial

## CMIP6: Pre-Processing

# Softwares

Climate Data Operators

Objective: Manipulate data

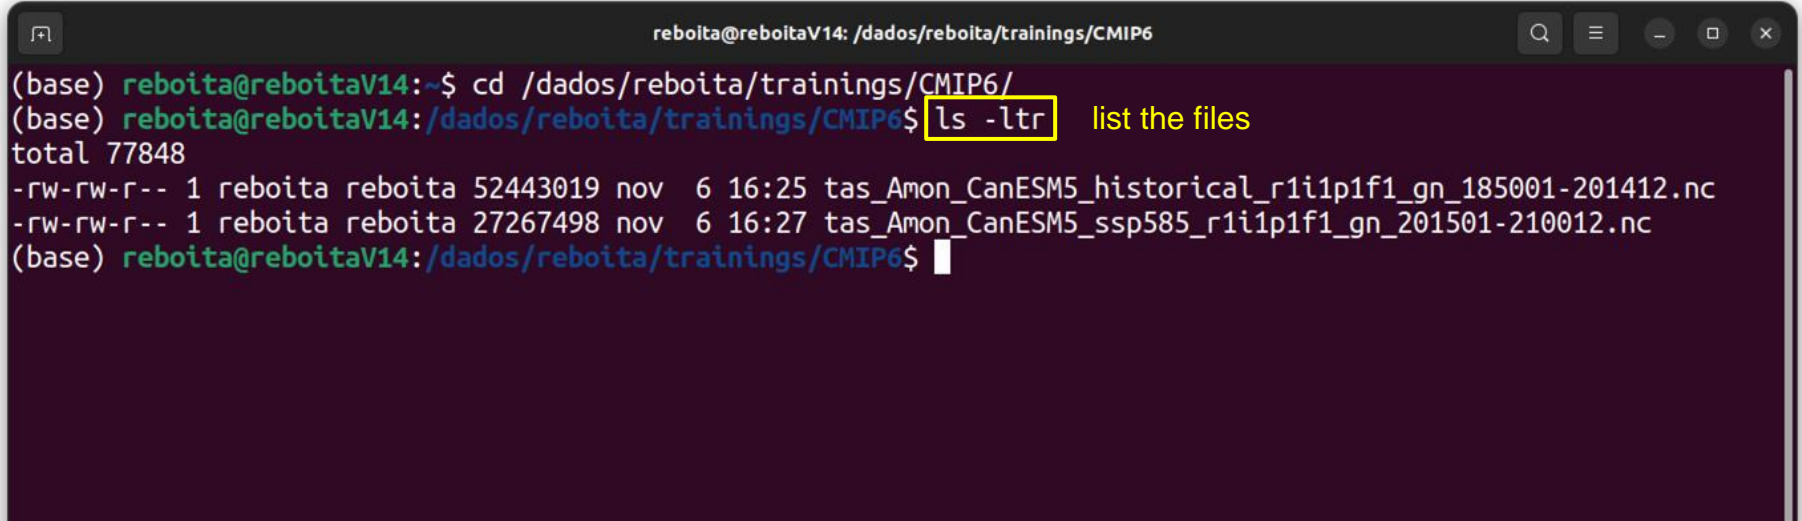

*OpenGrADS*

*"Opening GrADS to a World of Extensions"*

Grid Analysis and Display System

Objective: Visualization of data

Downloaded data were stored at /trainings/CMIP6

A terminal window with a dark background and light text. The title bar shows the user 'reboita@reboitaV14' and the current directory '/dados/reboita/trainings/CMIP6'. The terminal shows a sequence of commands and their outputs. The first command is 'cd /dados/reboita/trainings/CMIP6/'. The second command is 'ls -ltr', which is highlighted with a yellow box, followed by the text 'list the files'. The output shows two files with their permissions, owner, group, size, date, time, and filename. The prompt '(base) reboita@reboitaV14:~/...' is visible at the start of each line.

```
reboita@reboitaV14: /dados/reboita/trainings/CMIP6
(base) reboita@reboitaV14:~$ cd /dados/reboita/trainings/CMIP6/

SDF Error: 365 day calendars are no longer supported by sdfopen.

To open this file with GrADS, use a descriptor file with  
a complete TDEF entry and OPTIONS 365\_day\_calendar.

Documentation is at <http://iges.org/grads/gadoc/SDFdescriptorfile.html>

ga->

Obs: the examples are in the Linux system. If you are using Windows, it is necessary to provide the **path** of the files  
sdfopen C:\trainings\CMIP6\tas\_Amon\_CanESM5\_historical\_r1i1p1f1\_gn\_185001-201412.nc

Netcdf file was not opened!  
Calendar problem???

Model outputs are a challenge because they have:

Netcdf file was not opened!  
Calendar problem???

→ different calendars

- standard
- 360 days
- 365 days
- 366 days

→ grid type

- regular space
- non-regular space

→ horizontal resolution

We need to standardize the model data.

Examples of horizontal resolution

CMIP6 model name	Country	Horizontal resolution (lon. by lat. in degrees)	Variant label	Key references
ACCESS-CM2	Australia	1.9° × 1.3°	r1i1p1f1	Bi et al. (2012)
ACCESS-ESM1-5	Australia	1.9° × 1.2°	r1i1p1f1	Law et al. (2017)
BCC-CSM2-MR	China	1.1° × 1.1°	r1i1p1f1	Wu et al. (2019)
CAMS-CSM1-0	China	1.1° × 1.1°	r1i1p1f1	Rong et al. (2019)
CanESM5	Canada	2.8° × 2.8°	r1i1p1f1	Swart et al. (2019) Our example
CESM2	USA	1.3° × 0.9°	r1i1p1f1	Lauritzen et al. (2018)
CESM2-WACCM	USA	1.3° × 0.9°	r1i1p1f1	Li et al. (2019)
CNRM-CM6-1	France	1.4° × 1.4°	r1i1p1f2	Voldoire et al. (2019)
CNRM-CM6-1-HR	France	0.5° × 0.5°	r1i1p1f2	Voldoire et al. (2019)

```

GrADS does not understand **365 day calendar**.

Grid coordinate is **Gaussian** (regular in longitude and almost regular in latitude). GrADS understands this type of grid but as GCMs have different horizontal resolution, we can interpolate all of them to the same regular grid (equally spaced).

We will use **CDO** to adapt the file.

Fig 1 The distribution of grid-points for the conventional T106 Gaussian grid.

168

TECHNICAL MEMORANDUM

Use of reduced Gaussian grids in spectral models

M. Hortal and A.J. Simmons

Research Department

June 1990

# Grid coordinate

Before executing the command

```
cdo remapbil,grid.txt infile.nc  
outfile.nc
```

it is necessary to construct a txt file with the grid information.

This information can be obtained using  
**cdo sinfo infile.nc**

```

```

Defining 2.5° x 2.5° as horizontal resolution. So, the number of grid points is obtained as:  
lon = 360° / 2.5° = 144 + 1 = 145  
lat = 180° / 2.5° = 72 + 1 = 73

```
gridtype = latlon
xsize = 145
ysize = 73
xfirst = 0
xinc = 2.5
yfirst = -90
yinc = 2.5
```

Open a text editor and type the grid information  
**gedit gridWorld.txt &**

New files

We still have the problem with the calendar if we want to work with GrADS software

# Calendar

Data can have a

**standard calendar** (years with 365 and 366 days)

**360 days** (all years with 360 days – months with 30 days)

**365 days** (all years with 365 days – not include February

29)

**366 days** (all years with 366 days)

GrADS only supports standard calendar

We can perform a **trick with cdo** for loading and visualizing the data in GrADS, but **“the date the GrADS will show is not correct”** because it considers a standard calendar

# Calendar

cdo setcalendar,standar  
infile.nc outfile.nc

```
reboita@reboitaV14: /dados/reboita/trainings/CMIP6

```

Let's do it in a GrADS script?

\*Script to compute the climatological means from **1950 to 2014** and plot  
'reinit'

\*Graphical window with white background  
'set display color white'  
'c'

\*Loading the file: sdfopen /path/file.nc **Type all in the same line**  
'sdfopen /dados/reboita/trainings/CMIP6/  
tas\_Amon\_CanESM5\_historical\_r1i1p1f1\_gn\_185001-201412\_remap\_cal.nc'

\*Monthly means

```
'define m1=ave(tas,t=1,t=1980,12)'  
'define m2=ave(tas,t=2,t=1980,12)'  
'define m3=ave(tas,t=3,t=1980,12)'  
'define m4=ave(tas,t=4,t=1980,12)'  
'define m5=ave(tas,t=5,t=1980,12)'  
'define m6=ave(tas,t=6,t=1980,12)'  
'define m7=ave(tas,t=7,t=1980,12)'  
'define m8=ave(tas,t=8,t=1980,12)'  
'define m9=ave(tas,t=9,t=1980,12)'  
'define m10=ave(tas,t=10,t=1980,12)'  
'define m11=ave(tas,t=11,t=1980,12)'  
'define m12=ave(tas,t=12,t=1980,12)'
```

*OpenGrADS*

*OpenGrADS*

*"Opening GrADS to a World of Extensions"*

Save the previous script with the name `do_difference.gs`

In this script, load the historical file and future file and compute the monthly and seasonal means

Historical period: 1995-2014

Future period: 2080-2099

Plot the seasonal difference between future (2080-2099) and historical period (1995-2014).

# Air temperature 2-m (°C)

## Future (2080-2099) - Historical (1995-2014)

*OpenGrADS*  
"Opening GrADS to a World of Extensions"

## Extracting a time series

Using **CDO**: merge the files of historical and future periods

```
cdo mergetime in_01.nc in_02.nc out.nc
```

Using **GrADS**: compute the monthly mean of the air temperature for each time step for the whole globe and for an area covering Uzbekistan, convert the unit from K to °C and save the results in a text file with the configuration:

Month	Year	Globe	UZ
-------	------	-------	----

Using **Excel**: plot the monthly time series.  
Compute the annual mean and make a new plot.

Uzbekistan coordinates  
lon1 = 56  
lon2 = 73  
lat1 = 37  
lat2 = 45.5

```

# CORDEX-CORE (Coordinated Regional Climate Downscaling Experiments - Coordinated Output for Regional Evaluations)

- set of simulations for most CORDEX domains
- scenarios **RCPs 2.6** and **8.5**, and
- 25 km of horizontal resolution

## Coordination of Regional Downscaling

William Joseph Gutowski and Filippo Giorgi

<https://doi.org/10.1093/acrefore/9780190228620.013.658>

**Published online:** 28 February 2020

### Summary

Regional climate downscaling has been motivated by the objective to understand how climate processes not resolved by global models can influence the evolution of a region's climate and by the need to provide climate change information to other sectors, such as water resources, agriculture, and human health, on scales poorly resolved by global models but where impacts are felt. There are four primary approaches to regional downscaling: regional climate models (RCMs), empirical statistical downscaling (ESD), variable resolution global models (VARGCM), and "time-slice" simulations with high-resolution global atmospheric models (HIRGCM). Downscaling using RCMs is often referred to as dynamical downscaling to contrast it with statistical downscaling. Although there have been efforts to coordinate each of these approaches, the predominant effort to coordinate regional downscaling activities has involved RCMs.

Climate Dynamics Journal has a special issue focusing on the CORDEX-CORE

### The CORDEX-CORE initiative

---

The Coordinated Regional Downscaling Experiment (CORDEX, Giorgi et al. [2009](#); Jones et al. [2011a](#)) is the main reference program for the climate downscaling community. During its first activities, CORDEX has resulted in the production of ensembles of projections over continental scale domains covering most land areas of the globe at an intermediate resolution of ~ 50 km (e.g. Giorgi and Gutowski [2015](#)), with the exception of the EURO-CORDEX (Jacob et al. [2013](#); Jacob et al. [2020](#)) and MED-CORDEX (Ruti et al. [2016](#)) programs for which higher resolution projections have been completed. However, one of the weaknesses of this first set of CORDEX projections is the heterogeneity in size and simulation protocol (e.g. choice of driving global

## WEBPAGE

**RCMs** currently contributing to the CORDEX CORE framework simulate at least nine domains (Figure 1) with horizontal resolution of  $0.22^\circ$  (about 25 km, see Figure 1a and 1b):

- REMO model (contribution by GERICS)
- RegCM model (Italy, with the participation of Institute of Atmospheric Physics, Chinese Academy of Sciences (IAP/CAS), Oak Ridge National Laboratory, Tennessee, National Center for Atmospheric Research, NCAR, The Hong Kong University of Science and Technology)
- 

### Experiments:

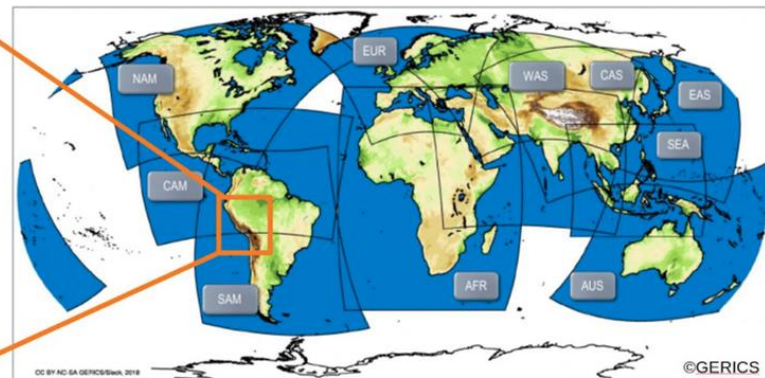

- evaluation: reanalysis, 1979 to 2017
- historical, RCP2.6 and RCP8.5: GCMs, 1950 (1970) to 2100

**Forcings:** ERA-Interim re-analysis, GCMs representing the range of low, medium, and high global equilibrium climate sensitivity (ECS) (in addition, there are three backup GCMs, as alternative forcing). The driving GCMs selected for the CORDEX-CORE ensemble offer a broad spread of ECS and were based on the suitability for the dynamical downscaling (McSweeney et al, 2015):

- NCC-NOESM (low ECS, backup: GFDL-ESM2M)
- MPI-ESM-LR/MPI-ESM-MR (medium ECS, backup: EC-Earth)
- HadGEM-ES (high ECS, backup: MIROC-MIROCS)

**Figure 1b:** Orographically structured area at CORDEX-CORE resolution of  $0.22^\circ$ .

**Figure 1a:** CORDEX-CORE model domains used in the simulations. From top-left to bottom right: North America (NAM), Central America (CAM), South America (SAM), Europe (EUR), Africa (AFR), South Asia (WAS), East Asia (EAS), Southeast Asia (SEA), and Australasia (AUS). The domain

In this selection we obtained the air temperature at 200 and 850 hPa. But we are interested in near-surface air temperature. Let's do a new selection.

```

GrADS does not understand a **360 day calendar**.

Grid coordinate is **curvilinear**.

We will use **CDO** to adapt the file.

But before, we will merge the historical files.

# Grid coordinate

Before executing the command

**cdo remapbil,grid.txt infile.nc  
outfile.nc**

it is necessary to construct a txt file  
with the grid information.

This information can be obtained  
using  
**cdo sinfo infile.nc**

```

(base) reboita@reboitaV14: /dados/reboita/trainings/CORDEX_CAS$ cdo sinfo tas_CAS-22_MOHC-HadGEM2-ES_historical_r1i1p1_GERICS-REMO2015_v1_mon_199101-200512.nc

```

Defining 0.25° x 0.25° as horizontal resolution. So, the number of grid points is obtained as:  
lon = 130° / 0.25° = 520 + 1 = 521  
lat = 51° / 0.25° = 204 + 1 = 205

gridtype = latlon  
xsize = 521  
ysize = 205  
xfirst = 10.8  
xinc = 0.25  
yfirst = 18.0  
yinc = 0.25

Open a text editor and type the  
grid information  
**gedit gridCAS.txt &**

Suggesting of editor for Windows: notepad++

```
reboita@reboitaV14: /dados/reboita/trainings/CORDEX_CAS
(base) reboita@reboitaV14:/dados/reboita/trainings/CORDEX_CAS$ gedit gridCAS.txt
```

**gedit** is a text editor of Linux

```
gridCAS.txt
1 gridtype = latlon
2 xsize = 521
3 ysize = 205
4 xfirst = 10.8
5 xinc = 0.25
6 yfirst = 18
7 yinc = 0.25
