Barševskis A., Vorobjova I. 2011. Materials on fauna of Oedemeridae (Hexapoda: Coleoptera) in Latvia. 2. *Oedemera flavipes* (Fabricius, 1792), *Oedemera virescens* (Linnaeus, 1767) & *Oedemera femorata* (Scopoli, 1763). *Acta Biol. Univ. Daugavp.*, 11 (1): 1 – 4.

The article content the information on the occurrence and distribution of *Oedemera flavipes* (Fabricius, 1792), *Oedemera virescens* (Linnaeus, 1767) and *Oedemera femorata* (Scopoli, 1763) (Hexapoda: Coleoptera, Oedemeridae) in Latvia. The information is based on the results of the review of the materials deposited in the beetle collection of Institute of Systematic Biology of Daugavpils University. Overall, 218 specimens of these species have been examined: *Oedemera flavipes* (F.) – 1 specimen, *Oedemera virescens* (L.) – 192 specimen and *Oedemera femorata* (Scop.) – 25 specimen. All three species have been found in the whole territory of Latvia: *Oedemera flavipes* (F.) known from 1 finding, *Oedemera virescens* (L.) – from 37 findings and *Oedemera femorata* (Scop.) – from 11 findings. The article continue the series of publications concerning the species of the Oedemeridae family in the fauna of Latvia.

INTRODUCTION

The family of Oedemeridae (Hexapoda: Coleoptera) is represented in the fauna of Latvia by 15 species. The small number of species and rather wide distribution of several species have not favoured the investigation of this family in Latvia.

This paper continue the series of articles devoted to the fauna of Oedemeridae in Latvia. The goal of this series of articles is to summarize the faunistic data on the Oedemeridae beetles deposited in DUBC and to specify the composition of the existing species and their distribution in Latvia.

The first article presented the summary of information on two *Oedemera* Olivier, 1798 species of *Oe. subrobusta* (Nakane, 1954) & *Oe. lurida* (Marsham, 1802) (Barševskis 2009). This article devoted to next three species of genus *Oedemera* Oliv.: *Oedemera flavipes* (Fabricius, 1792), *Oedemera virescens* (Linnaeus, 1767) and *Oedemera femorata* (Scopoli, 1763)

MATERIAL AND METHODS

In the result of the research 218 specimens of three species of the genus *Oedemera* Oliv. have been examined. All species were collected in the whole territory of Latvia from 1999 to 2010 and

now are kept in the beetle collection of Institute of Systematic Biology of Daugavpils University (DUBC).

Males were determined by the structural peculiarities of beetles' genitalia. To determine the species the determination key presented in the monograph by X.A.Vazquez (2002) was applied.

The laboratory research and measurements have been done using *Nikon AZ100* and *Nikon SMZ745T* digital stereomicroscope and NIS-Elements 6D software.

The faunistics data concerning the findings of three the species present the following information: place and time of collecting, the collector's surname and the initial of his/her name, but in some cases, also the information on the biotope is included. All the findings are grouped according to the administrative districts of Latvia (before to the 2007 administrative reform).

FAUNISTICS

Oedemera (Oedemera) flavipes (Fabricius, 1792) – Talsi Distr.: Slītere National Park, Mazirbe, dunes of Baltic Sea, 21.07.2004., (1F, A.Barševskis leg.). Materials: 1 specimen. Map of distribution in Latvia (Fig. 1).

Oedemera (Oedemera) virescens virescens (Linnaeus, 1767) – Aizkraukle Distr.: Aizkraukle bog, Nature protection area „Aizkraukles purvs”, 06.08.2008., (1F, A.Bukejs & M.Balalaikins leg.), Skrīveri, Daugava river valley, 21.06.2006. CONCLUSIONS

This article content the information on the occurrence and distribution of *Oedemera flavipes* (F.), *Oedemera virescens* (L.) and *Oedemera femorata* (Scop.) (Hexapoda: Coleoptera, Oedemeridae) in Latvia. The information is based on the results of the study of the materials deposited in the beetle collection of Institute of Systematic Biology of Daugavpils University. Of the three species, only *Oedemera virescens* (L.) is the most prevalent throughout the territory of Republic of Latvia. In present moment *Oedemera flavipes* (F.) is known only from one finding in NE part of Latvia,

but *Oedemera femorata* (Scop.) is very rare in E part of Latvia.

ACKNOWLEDGEMENTS

The authors expresses his gratitude to all the people who participated in collecting the materials: M.Balalaikins, K.Barševska, A.Bukejs, R.Cibulskis, A.Čuļina, J.Daņilova, M.Janovska (Murd), I.Leiskina, R.Orlovskis, A.Pankjāns, E.Rudāns, A.Soldāns, U.Valainis. The authors expresses his gratitude to M.Nitcīs for the assistance in preparation of cartographic material.
