# Codebook for df

Autogenerated data summary from dataMaid

# 2024-02-01 12:18:22

# Data report overview

The dataset examined has the following dimensions:

| Feature                | Result |
|------------------------|--------|
| Number of observations | 29     |
| Number of variables    | 121    |

| Mode      | "Artificial intelligence in oral health refers to the use of computer |
|           | algorithms and machine learning techniques to analyze data and make   |

decisions related to oral health care."

 Observed factor levels: "Artificial intelligence in oral health refers to the use of computer algorithms and machine learning techniques to analyze data and make decisions related to oral health care.", "Artificial intelligence is the output/knowledge created by machine learning technology, not the technology itself. The rest of the definition (In the field of...) is correct.", "Could be better described", "For me this definition could be more concrete. It's a technology, but most definitions refer to the word intelligence/'science'. Maybe we could add something, like "Al leverages computers and machines to mimic human's intelligence processes, like problem-solving and decisionmaking capabilities of the human mind. (IBM) or AI combines computer science and robust datasets, to enable problem-solving.", "I think that this bit"it is also integrated into dental laboratory practices." should be changed to "it can also integrated into dental laboratory practices." This is because AI in oral health can be integrated into other systems like Public health systems where specific oral health systems do not exist.", "I think there are better and more precise definitions out there. I can't understand the concrete purpose of the first sentence. The definition itself does not mention applications like assistance in clinical decision making or automation of administrative workflows. However I am not an expert in the field of AI and dont have a good overview of the current literature.", "I would like to suggest do replace "normal and abnormal structures" with "anatomical and pathological structures"", "In addition to the tasks described, AI in oral health is also used for dental care services management and administration and to support decision not only in clinics, but also in dental public health", "Just an editing matter: in the last portion of the statement- It should be .....prediction of treatment outcomes, and also integrated into dental laboratory practices.", "looks good to me, but I don't have much experience in AI so I do not feel that my opinion holds much value.", "No.", "Planning of treatment may also be completed by an AI system.", "The explanation seems incomplete. From my understanding- AI can be defined as: AI is a field that deals with theory and development of computer systems with an ability to perform tasks on par with human intelligence. In oral health AI can support oral health specialists (and connected domains) in early identification of oral diseases, clinical decision making, rapid and reliable data interpretation, improve process and workflow automation of clinical and administrative tasks, treatment monitoring, predict disease and treatment outcomes and overall improve care quality and patient experience. | Number of unique values | 9                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Mode                    | "Can be better described" | 0.00 -<br>organ to survey in the start of the |

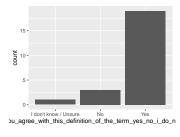

Observed factor levels: "Can be better described", "CNN is a type of ANN and deep learning algorithms which are designed for the processing of images (pixel data) and commonly used for image recognition and processing. (https: //www.linkedin.com/in/arunakiry-natarajan/)/", "Could add a diagram to illustrate the meanings of different terminology. The term needs some brief details in another line such as its components (e.g., feature extraction, classification..)", "I understand this is the definition on Pubmed. It does not, however, clarify things a lot. What I know beyond this is limited: I understand it is a series of models that build on each other to generate a logarithm to identify things.", "I would add CHH is particularly well-suited for image recognition and processing tasks.", "In terms of definition, it needs some detail: Suggestion- 'Convoluted Neural Network (CNN) is a class of artificial neural networks in deep learning and has applications medical oral radiographic analysis.'", "No.", "Not only medical image", "To my understanding, CNNs can also be used in other areas that do not use images for diagnosis, such as psychiatry and speech language (in speech recognition, for example).".

Observed factor levels: "I don't know / Unsure", "No", "Yes".

## do\_you\_agree\_with\_this\_definition\_of\_the\_term\_yes\_no\_i\_do\_not\_know\_any\_additional\_comm

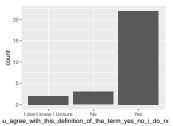

Observed factor levels: "deep learning incorporates hidden layers and outperforms machine learning. Well-developed deep learning models used imaging data for disease detection", "I believe the definition is too general, and is more about DL instead of DL in health. Maybe should talk about the use of patient data to train healthcare model", "Is it possible to supplement this with what it is not... like "it is different from x where y is used .....", "No.", "Personally, I would add oral to health, as this is specific to dentistry", "Simple definitions to the point. Yet, again with diagrams, the glossary would be useful rather than defining words in a text. A diagram can show the input, feature extraction/classification, and output.", "The definition is correct but not conclusive. The difference between machine learning and deep learning is not clear. It might become a little bit technical, but the many layers and self-learning aspect may be an addition that highlights the difference between machine learning and deep learning.".

## digital\_health\_umbrella\_term\_that\_comprises\_e\_health\_which\_includes\_mobile\_health\_and\_th

• The variable only takes one (non-missing) value: "Yes". The variable contains 0 % missing observations.

#### do\_you\_agree\_with\_this\_definition\_of\_the\_term\_yes\_no\_i\_do\_not\_know\_any\_additional\_comm

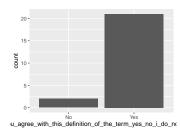

because I don' t know what it was."
Observed factor levels: "Deep learning in health and the CNN are outside of my range. I do not agree nor disagree as this is also not my area of expertise. As for digital health, I am not sure what the "internet of things" is. It sounds odd, but that may be because I don' t know what it was.", "Does digital health need to reduce costs of services? I think it aims it, but in my opinion it doesn't need to be included in the definition. It can also increase the costs, but improve the quality of healthcare, can't it?", "I agree with some parts of the definition. In my opinion, it limits the definition of digital health to using equipment, technologies, etc only. I came across a broader definition by Dr. Bertalan Mesko. It states that "Digital Health is the cultural transformation of how disruptive technologies that provide digital and objective data accessible to both caregivers and patients leads to an equal level doctor-patient relationship with shared decision-making and the democratization of care" The key components of definition 1) its is a cultural transformation of care 2) it uses technologies that provide data to Both patients and medical professionals 3) it leads to an equal-level partnership between them Reference: Meskó B, Drobni Z, Bényei É, Gergely B, Győrffy Z. Digital health is a cultural transformation of traditional healthcare. mHealth 2017;3:38. This can be adapted to digital health in dental medicine.", "I probably would include telehealth as an important brunch of Digital Health. / e-health.", "It could be better described", "Same as above".

|                            | to really emphasize the difference"                                                                                            |

 Observed factor levels: "I feel like e-health and digital health are close enough that we need to really emphasize the difference", "I have doubts about the real scope of e-health, as we started using in a more global perspective the term digital health. If it is true that digital health comprises e-health, where exactly are the boundaries between one and the other? In other words, what is digital health but not e-health?", "I think the term ehealth has developed since 2004 and has to be integrated / distinguished with terms like digital health and healthtech. i like this one from the who more: eHealth is the transfer of health resources and healthcare by electronic means. It includes a broad range of technologies vital to the operation of the health system, such as electronic health records, systems supporting clinical treatment, standards for the exchange of health information, and mobile health (mHealth).", "In addition to the statement, it would be great to add the purpose of e-health in the definition. I came across this definition of eHealth by the European Society of Cardiology. e-Health "is the use of information and communication technology to support health and healthcare."", "Simple internet-based applications are part of e-health, and it misses the health component. The WHO (2023) defines eHealth as the cost-effective and secure use of information and communications technologies in support of health and health-related fields, including health-care services, health surveillance, health literature, and health education, knowledge and research. Not sure about the cost-effective and secure part of the definition (see previous comment)", "The definition indicates it goes beyonf internet based apps but does not in the second half mention anything about "e-".", "The definition is narrow.".

achieve their goals."

Observed factor levels: "Gamification is the process of using game design elements and mechanics in non-game contexts to engage and motivate people to achieve their goals.", "I also suggest checking this book, Actionable Gamification, by Yu-Kai Chou, a pioneer in this field, analyzing over 90 examples of gamification from different industries. He defined the term as "the craft of deriving fun and engaging elements found typically in games and thoughtfully applying them to real-world or productive activities. A process called"Human-Focused Design." optimizes for human motivation in a system instead of optimizing for pure functional efficiency within the system." I highly suggest checking his gamification framework as well, Octalysis.", "I believe more elaborations, especially in

terms of relationship with healthcare, may be needed", "I do agree with the first part, but I do not agree with the second part: Gamification is "the application of the characteristics and benefits of games to real-world processes or problems".", "I understand gamification and agree. I don't understand the serious Games", "maybe keep the term singular gamification is a more common term.", "No", "Please split the two definitions.Gamification can and is used in non technology systems. The definition above actually is divided into two. They are not synonyms.".

## store\_and\_forward\_asynchronous\_transmission\_of\_recorded\_health\_information\_for\_example\_r

• Observed factor levels: "No", "Yes".

# do\_you\_agree\_with\_this\_definition\_of\_the\_term\_yes\_no\_i\_do\_not\_know\_72

• The variable only takes one (non-missing) value: "Yes". The variable contains 20.69 % missing observations.

Observed factor levels: "add examples of what type of clinical information and images (e.g.,..) Why not adding prevention and follow up as well as in the definition of telemedicine. Teledentistry has a major role in public health such as providing preventive screening in school-based programs. Also following up and monitoring the symptoms for patients in a TMD or a surgery clinics (and further examples existed!) Add the term for the ICT: Information and Communications Technology Suggested definition: "Teledentistry Represents the uses of Information and Communications Technology to provide dental care services between an oral health professional and patient or between two health professionals, including at least one oral health professional, who are separated by distance. It involved the secure transmission of clinical information, and images, through text, interactive audio, video, or other forms needed for dental prevention, consultations, diagnosis, treatment planning and follow-up of patients (WHO 2021 & Commission of the European Communities 2008).", "Define acronyms (ICT)", "e.g precedent comment", "It is a bit more broad as defined by the ADA. the ADA also includes education in this.", "No", "Spell out ICT as information and communication technology", "Teledentistry is the usage of telecommunication systems (same

as ICT??) to provide remote oral healthcare. It also includes screening, therapeutic oral health interventions, and oral health prevention.", "The difference between these definitions of teleconsultation and teledentistry does not emerge clearly.".
