Mekan, algıya bağlı bir deneyimdir; sayısız farklı biçimde algılanabilir. Her deneyim ise farklı olsa da temelde ortak bir noktası bulunur. Bu nokta da “ilişkisel varoluş”tur. Denetim sürekli oluşmaktadır. Çünkü canlı varlık ile çevresel koşulların etkileşimi “denetim” sürecinde var olmaktadır. Mekanın algılanmasında kişisel denetim ve beceriler ile gözlem yapma, algılama, ayrıntıyı fark etme ve hayal gücünü kullanma gibi temel gereksinimler bulunmaktadır. bu gereksinimler ile mekana dair bilgiler, algılayan bireyin biriktirdiği her türlü deneyim ile bilişsel bir süreçte işlenerek anlamlandırılır (Nayeb ve Ark., 2021.; Asar, 2013).Ergonomi, insanlar arasındaki etkileşim ve sistemin diğer öğelerini anlama ile ilişkili bilimsel disiplin, kişilerin mutluluğunu ve tüm sistemin performansını en iyi hale getirmek için teori, ilke, veri ve metotlar uygulayan bir meslektir (Dul ve Weerdmeester, 2003).Bir mekânın ergonomik olması, kullanıcıların o mekânı sağlıklı bir şekilde kullanmasını sağlamaktadır. İç mekânı şekillendiren donatı ve mobilyaların ergonomik tasarımı kullanıcının antropometrik boyutları önem taşımaktadır. Bu da antropometrik ölçüleri, en çok kullanılan ergonomik verilen haline getirmektedir. (Kayış ve Özok, 1991). Mimari tasarım kullanıcısı “insandır.” Bir mekânın boyutu; içinde bulunacak insan sayısına, eşyalara, kullanım amacına ve içinde yapılacak eylem türüne göre, eylemin gerçekleştirilmesi için gerekli eşya, donatı ve makineler gibi sabit ya da hareketli eşyanın boyutlarına, bunların bakım ve işletilmesi için gerekli alanlara, çalışma koşullarının gerektirdiği cihaz ve tesisat için gerekli olan ve hacimlere ve benzer gereksinimlerin gerektirdiği genişlik, uzunluk ve yüksekliklere bağlı olarak saptanır. Tüm bu

unsurlar saptanmasındaki temel kaynak ortalama insan ölçüleridir (Nayeb ve Ark., 2021). Bu bilgiler ışığında iç mimarlık ve ergonomi tasarımının tam anlamıyla insan için olması için önemli kriterlerdir.

### **Eğitim Mekanlarında Ergonomi**

Ergonomi kavramı uyumu, uygunluğu simgelediği gibi okul öncesi eğitim mekanlarında da ergonomi okul ve kullanıcılar arasındaki uyumu ifade etmektedir. Okulda verilen eğitim öğretim faaliyetleri öğrencilerin özelliklerine uygun şekilde tasarlanan yapılarda verilmesi gerekmektedir. Yani yapının ergonomik olması verilen eğitimin kalitesini artırmakta ve öğrencinin eğitim-öğretim sürecine önemli katkılar sağlamaktadır. Yine okul öncesi eğitim kurumlarındaki öğrencilerin, yapıdaki mekanlarda geçirdiği zamanın kalitesi ve memnuniyeti, yapıdaki ergonomik tasarımlarla doğru orantılıdır. Okul öncesi verilen eğitim ve öğretimde, gerçek hayatın taşıdığı önemi ve yaklaşımın temel ilkelerinin, çocuk ergonomisine uygun olarak eğitim mekanlarına nasıl yansıtılacağı konusu, mimari disiplini yakından ilgilendirmektedir. Sınıf ortamında ortak kullanım alanlarına, hatta okulun bir bütün olarak tasarlanmasında iç-dış mekan iletişiminin oluşturulmasında, mekanlardaki öğrenci-öğretmen iletişimini destekleyici donatıların tasarlanmasında mimari disiplininin varlığı gerekmektedir (Kelpekçi Yetkin, 2021).Okul öncesi eğitim kurumlarında ergonomi bilimi, kullanıcılarının fiziksel ve ruhsal açıdan problemlerini belirlemek ve çözüm getirmek amacıyla da kullanılmaktadır. Bir öğrenme ortamı planlandığında fiziksel çevre koşullarının göz önünde bulundurulması ergonominin bir gerekliliğidir. Öğrencilerin başarısına doğrudan etki eden fiziki ortamları; mekanın büyüklüğü, öğrenci sayısı, mekandaki donatıların örgütlenme biçimi, esnek kullanım imkanının olup olmaması, öğrencilerin kullandıkları mobilyaların onların antropometrik boyutlarına uygunlu, görsel, işitsel ve ısısal konfor koşulları, renk ve doku özellikleri, ortamın temizliği gibi birçok faktör göz önüne alınarak okul öncesi eğitim kurumlarında ergonomi kapsamında değerlendirilmektedir (İsmailoğlu, 2016.; Kepekçi Yetkin, 2021).

### **Materyal ve Metot**

Çalışmanın bu bölümünde materyal ve metot hakkında bilgi verilmiştir. Materyal kısmında çalışma alanının genel tanıtımı verilmiştir. Metot kısmında ise çalışmada uygulanan bilimsel araştırma teknikleri anlatılmıştır.

## **Materyal**

Çalışmada değerlendirmelerin yapıldığı mekanlarda bulunan mobilyaların tanıtımı yapılmıştır. Çalışma kapsamında değerlendirilen mekanlar, İstanbul ilinde bulunmaktadır. İstanbul Türkiye'nin Marmara bölgesinde bulunan önemli bir şehirdir. İstanbul ilinde kamu ve özel yüzlerce okul öncesi eğitim kurumu bulunmaktadır. Çalışmamızda İstanbul ilinde bulunan okul öncesi eğitim mekanlarından iki tanesi örnek seçilmiştir. Bunlardan ilki Özel Başakşehir Final Okulları Anaokulu Hakkında okuludur. Özel Başakşehir Final Okulları Anaokulu

**Özel Başakşehir Final Okulları Anaokulu**, çağdaş ve modern eğitim imkanlarının sağlandığı bir kurum olarak İstanbul'da hizmet vermektedir. Öğrencilerin keşfedilmeyi bekleyen ayrı bireyler olduğunu benimseyen, toplumsal ve duysal gelişimleri destekleyen, keşfetmeye dayalı bir eğitim modeli yürütülmektedir. Öğrencilerin ilkokula adaptasyonunu hızlandıracak okul öncesi etkinlikler yapılmaktadır. Öğrenciler; beden eğitimi, görsel sanatlar, drama, müzik, satranç, dans, seramik gibi uygulamalı dersler sayesinde ilgi ve yetenekleri dahilinde kendilerini geliştirme imkanı bulmaktadır. Uygulamalı dersler sayesinde öğrencilerin dayanıklılık, koordinasyon, iletişim, yaratıcılık, takım çalışması ve gözlem yeteneği gelişmektedir.

**Özel Başakşehir Final Okulları Anaokulu**, “FinaLingual” adı verilen çift dilli eğitim programı ile İngilizce yabancı dil eğitimi vermektedir. İngilizce derslerini, yabancı ve Türk öğretmenler beraber yürütmektedir. Bu program sayesinde öğrenciler; oyunlar oynayarak, yaparak, yaşayarak, sürekli tekrar ederek ve maruz kalarak erken yaşta yabancı dil edinmektedir. Kurumda; sanat, sosyal bilimler, fen, tasarım, matematik gibi derslere ait kavram ve terimler de İngilizce dilinde öğretilmektedir. İngilizce okuma, dinleme, yazma ve konuşma becerilerinin ana dil düzeyinde olması hedeflenmektedir.

**Özel Başakşehir Final Okulları Anaokulu**; “FinalMaker” programı dahilinde, öğrencilerin gereksinim duyduğu becerileri oyun temelli bir modelleme ile sunmaktadır. Öğrenciler; adım adım problem çözme ve algoritmik düşünme yetenekleri edinmektedir. Öğrenciler küçük yaşta kodlama dünyası ile tanışmakta, küçük yaştan itibaren dijital dünyaya hazırlanmaktadır.

Bunlardan ikincisi İvat Turhan Anaokulu okuludur.

İvat Turhan Anaokulu

İvat Turhan Anaokulu İstanbul İli Sultangazi İlçesinde bulunan İvat Turhan İlkokulu ile aynı binada yer almaktadır. Çocukların gelişim düzeyleri, ilgi alanları ve ihtiyaçlarına göre hazırlanan eğitim programı, bilimsel bilgiyi ön plana çıkaran, sanatsal ve kültürel etkinliklere önem veren, yaratıcılığı destekleyen eğitim anlayışı ve aile katılımına olan desteği ile ulusal ve uluslararası düzeyde bilinen ve tercih edilen bir kurum olmaktadır.

İvat Turhan Anaokulu’nda, öğrenciler, bilgiyi ezbere dayalı olarak değil, araştırarak, sorgulayarak, yaparak ve yaşayarak edinirler. Çocuklar, özdisiplini ve benlik saygısı gelişmiş, toplumda birey olarak yer aldığının farkında olan, paylaşımcı, kendini ifade edebilen, sorumluluk sahibi, kendi haklarını korurken başkalarının haklarına saygı gösteren, gelenek ve göreneklerimize karşı duyarlı, doğayı koruyan ve Atatürk ilke ve devrimlerine bağlı bireyler olmak üzere eğitim alırlar.

### **Metot**

Çalışma kapsamında öncelikle konuyla alakalı literatür taraması yapılmıştır. Yapılan araştırmada elde edilen bilgilere göre belirlenen; ergonomi, iç mimarlık ergonomi ilişkisi, eğitim mekanlarında bulunan mobilyaların ergonomik açıdan incelenmesi amaçlanmıştır. Çalışma alanı olarak belirlenen İstanbul İlinde bulunan okul öncesi eğitim kurumlarda yapılan gözlemler sonucunda Okullarda uygulanan plan şemalarının benzerlikleri göz önüne alınarak iki farklı plan şemasına sahip biri özel diğeri kamuya bağlı okul seçilmiştir. Belirlenen okulların, mekan tasarımında kullanılan mobilyaların ergonomik tasarımları incelenmiş ve analiz edilmiştir. Yapılan araştırmalar, gözlemler, incelemeler ve ölçümler sonucunda elde edilen veriler sistematik bir şekilde çalışmada yer almıştır. Çalışma kapsamında ortaya konulan sonuçlar doğrultusunda değerlendirmeler yapılarak, seçilen okul öncesi eğitim mekanlarındaki mobilyalarda belirlenen olumlu ve olumsuz uygulamalar ifade edilmiş, olması gereken kriterlerin yürürlükteki mevcut tasarım kriterlerine nasıl entegre edileceği konusunda değerlendirilmelerde bulunulmuştur.

### **Bulgular ve Tartışma**

#### **Sınıflar**

Araştırma kapsamında incelediğimiz Özel Başakşehir Final Okulları Anaokulu bünyesinde bir İngilizce sınıfı, bir ilkokul hazırlık sınıfı ve iki anasınıf olmak üzere toplam dört sınıf bulunmaktadır. Sınıflar ana giriş kapısının karşısına zeminin sağ ve sol taraflarına konumlandırılmıştır. Zemin katta konumlandırılmış alanda bir yemekhane, oyun alanı, İngilizce ve ilkokula hazırlık derslikleri, Psikolojik danışmanlık ve rehberlik bölümü, öğretmenler odası, kız erkek öğrenci lavaboları, malzeme odası, çamaşır odası ve bir adet depo bulunmaktadır. Ayrıca bahçeye açılan bir kapıda bulunmaktadır. Araştırma kapsamında incelediğimiz İvat Turhan Anaokulu bünyesinde üç adet ana sınıfı bulunmaktadır. Sınıflar ana giriş kapısının sol tarafındaki bölüme karşılıklı yerleştirilmiştir. Sınıfların bulunduğu alanda mutfaz, hizmetli odası, revir, 2 adet lavabo, yangın çıkışı ve bina yan girişi bulunmaktadır.

#### **Mobilyaların Ergonomik Açıdan İncelenmesi**

#### **Masalar ve Sandalyeler**

Her iki okul içerisinde farklı modellerde ve farklı sayılarda masa ve sandalyeler bulunmaktadır.

**Şekil 1. Özel Başakşehir Final Okulları Anaokulu masa (Akbayır, arşiv 2024).**

**Şekil 2. Sultangazi İvat Turhan Anaokulu masa.**

Yapılan ölçümler ve incelemeler doğrultusunda Final anaokulundaki sıra/masanın boyutları yuvarlak olarak dizayn edilmiş yapı itibari ile masanın çapı 78 cm'dir. Ayrıca 52 cm yüksekliğe sahiptir (Şekil 1). Ergonomik açıdan bakıldığında 4-5 yaş grubu öğrencilerinin oturma göğüs hizası olan 41-9-54,3 cm aralığı ölçülerine uygun olduğu görülmektedir. Ahşap malzemeden yapılmış olan yuvarlak masa çeşitli etkilerde öğrencilerin ortak çalışma yapmaları için elverişli olduğu görülmüştür. Yapılan ölçümler ve incelemeler neticesinde İvat Turhan anaokulundaki sıra/masanın boyutları 4 kişilik olarak dizayn edilmiş, yapı itibari ile kullanım alanı 0,72 cm<sup>2</sup>'dir. Ayrıca yerden yüksekliği 58 cm yüksekliğe sahiptir (Şekil 2). Ergonomik açıdan bakıldığında 4-5 yaş grubu öğrencilerinin oturma göğüs hizası olan 41,9-54,3 cm aralığı ölçülerine uygun olmadığı görülmektedir. Ancak mevcut sıra/ masa öğrencinin kullanımına yeterlidir. Bunun yanında sıra/masanın 4 kişilik olduğu göz önünde bulundurulduğunda 0,18 cm<sup>2</sup> alan düşmektedir. Bu da her etkinlik için uygun bir alan olmadığını göstermektedir. Ayrıca sıra/masanın yerden yüksekliği de ergonomik açıdan gerekli üst sınır olan 54,3 cm'nin üzerindedir. Bu da öğrencinin masa kullanımı açısından antropetrik ölçümler açısından uygun değildir (Tablo 1).

**Tablo 2. Yaşlarına göre çocukların ortalama antropometrik ölçüleri**

	4 Yaş	5 Yaş
h (Boy Ölçüsü)	$92 \text{ cm} \leq h \leq 114 \text{ cm}$	$97 \leq h \leq 121$
9/10 h (Göz Hizası)	$82.8 \text{ cm} \leq 9/10 h \leq 102.6 \text{ cm}$	$87.3 \text{ cm} \leq 9/10 h \leq 108.9 \text{ cm}$
4/5 h (Omuz Hizası)	$73.6 \text{ cm} \leq 4/5 h \leq 91.2 \text{ cm}$	$77.6 \text{ cm} \leq 4/5 h \leq 96.8 \text{ cm}$
1/3 h (Bacak Boyu)	$30.6 \text{ cm} \leq 1/3 h \leq 38 \text{ cm}$	$32.3 \text{ cm} \leq 1/3 h \leq 40.3 \text{ cm}$
h (Kollar Açık Genişlik)	$92 \text{ cm} \leq h \leq 114 \text{ cm}$	$97 \text{ cm} \leq h \leq 121 \text{ cm}$
1/4 h (Omuz Genişlik)	$23 \text{ cm} \leq 1/4 h \leq 28.5 \text{ cm}$	$24.2 \text{ cm} \leq 1/4 h \leq 30.2 \text{ cm}$
2/7 h (Oturma Bacak Boyu)	$26.2 \text{ cm} \leq 2/7 h \leq 32.5 \text{ cm}$	$27.7 \text{ cm} \leq 2/7 h \leq 34.5 \text{ cm}$
3/7 h+1' (1 inch= 2.54 cm) (Oturma Göğüs Hizası)	$41.9 \text{ cm} \leq 3/7 h+1' \leq 51.3 \text{ cm}$	$44.1 \text{ cm} \leq 3/7 h+1' \leq 54.3 \text{ cm}$
1/3 h (Ayakta El Hizası)	$30.6 \text{ cm} \leq 1/3 h \leq 38 \text{ cm}$	$32.3 \text{ cm} \leq 1/3 h \leq 40.3 \text{ cm}$
6/5 h (Ayakta El Uzanma Mesafesi)	$110.4 \text{ cm} \leq 6/5 h \leq 136.8 \text{ cm}$	$116.4 \text{ cm} \leq 6/5 h \leq 145.2 \text{ cm}$

**Kaynak:** Kepekçi Yetkin, 2021.

**Şekil 3. İvat Turhan Anaokulu sandalye**

Yapılan ölçümler ve incelemeler doğrultusunda Final anaokulundaki sandalyelerin ölçüleri oturma alanı  $0,0841 \text{ m}^2$ 'dir. Ahşap malzemeden yapılmış sandalyeler antropometrik açıdan standart oturma bacak boyu ölçüsü  $26,2-32,5 \text{ cm}$  ölçülerine uygun olduğu görülmüştür. Yapılan ölçümler ve incelemeler doğrultusunda İvat Turhan anaokulundaki sandalyelerin ölçüleri oturma yüksekliği  $30 \text{ cm}$ , oturma alanı ise  $25*25 \text{ cm} / 0,0625 \text{ m}^2$ 'dir. Plastik malzemeden yapılmış sandalye antropometrik açıdan standart oturma bacak boyu ölçüsü  $26,2-32,5 \text{ cm}$

ölçülerine uygun olduğu görülmüştür. Her iki okulda da kullanılan sandalyeler ergonomik açıdan birbirine yakın olup, Final okullarındaki ahşap sandalyelerin oturma alanları daha geniştir. Buna karşın İvat Turhan anaokulundaki plastik sandalyelerin tasarımı daha vücut yapısına göre daha rahat bir oturma sağlamaktadır.

### **Dolaplar**

Sınıf içerisinde bulunan dolaplar öğrencilerin eğitim sürecinde farklı zaman dilimlerinde kullanabilecekleri malzemelerin saklandığı, kişisel eşyalarının konulduğu genel olarak sınıfın duvarlarının olduğu bölümlere yerleştirilmiş mobilyalardır. Ergonomik açıdan antropometrik ölçüler göz önüne alındığında bu dolapların tasarımları çocuklara özel hazırlanmalıdır.

Her iki okulda da farklı boyutlarda birçok dolaplar bulunmaktadır. Bu dolapların bazıları kapaklı bazıları ise kapaksız şekilde dizayn edilmiştir. Her bir öğrencinin kendisine ait bir dolap kullanım alanı mevcuttur.

**Şekil 4. Final Anaokulu Öğrenci Dolapları**

**Şekil 5. İvat Turhan Anaokulu**

Yapılan inceleme ve ölçümler sonucunda Final Anaokullarında bulunan sınıf içerisindeki dolaplar 62 cm yüksekliğe 122 cm genişliğe ve 37 cm derinliğe sahiptir. Dolaplar genel olarak 24 yüksekliğinde ve 48 cm en genişliğine sahiptir. Her öğrenciye ait dolap fotoğraf ve isimlik ile belirlenmiştir. Dolaplar kapaksız şekilde tasarlanmıştır. Dolaplar ergonomik açıdan incelendiğinde 4-6 yaş grubundaki çocukların boy ölçüsü olan 92-114 cm'nin biraz altında olduğu görülmektedir. Nitekim bu boy aralığında olan çocuklarındaki eşyalarını alacakları

zaman dolabın içerisinde görmeleri için eğilerek bakmaları gerekmektedir. Bunun yanında dolapların ahşap malzemeden yapılmıştır. Her dolap bulunduğu duvara sabitlenerek gerçekleşebilecek kazaların önüne geçilmiştir. Yapılan inceleme ve ölçümler neticesinde İvar Turhan Anaokulu'ndaki dolapların yüksekliği 120 cm, 30 cm genişliğe ve 35 cm derinliğe sahiptir. Dolaplar genel olarak 30\*30 cm kullanım alanına sahiptir. Her öğrenciye ait dolaplar kapakların üzerine resim ve isimlik şeklinde etiketlenmiştir. Dolaplar ergonomik açıdan incelendiğinde 4-6 yaş grubundaki çocukların boy ölçüsü olan 92-114 cm uygun bir tasarım olduğu tespit edilmiştir. Aynı zamanda 4-6 yaş grubundaki çocukların ayakta el uzama mesafesi 110,4-136,8 cm ölçülerine göre kullanımı uygundur. Her iki okuldaki dolap tasarımları birbirinden farklı olarak tasarlanmıştır. İncelenen dolaplardan Final Anaokulunda bulunan ahşap dolaplar, İvat Turan Anaokulu'daki MDF malzemeden yapılan dolaplara göre daha az kullanışlı olduğu tespit edilmiştir.

### **Sınıflar**

Her iki anaokulu mevcut ilkokul binasının giriş katında yer almaktadır. Final Ana Okulu'nda 4 adet ana sınıfı, İvat Turhan Ana Okulu'nda 3 adet sınıf bulunmaktadır. Her iki okulda da sınıflar çok amaçlı salon olarak kullanım özelliğine sahiptir. Her iki okulunda bulunan sınıflar doğal havalandırma ve aydınlatma sağlayan pencerelere sahiptir.

**Şekil 6. Final Anaokulu Sınıf Ölçüleri**

**Şekil 7. İvat Turhan Anaokulu sınıf ölçüleri**

Yapılan inceleme ve ölçümler neticesinde Final Anaokulu'nda sınıf ölçüleri ortalama 10 m<sup>2</sup> ölçülerindedir (Şekil 6). MEB tarafından belirlenen standartlar incelendiğinde anaokullarında sınıflar ortalama 15 m<sup>2</sup> ve kişi başına 1,5 m<sup>2</sup> düşecek şekilde tasarlanması uygun görülmüştür. Final okullarındaki mevcut sınıflar 10 m<sup>2</sup> olup sınıflar 20 kişiliktir. Bu da standartların aşıldığını göstermektedir. Sınıfların mevcut yükseklikleri ise 3.8 m'dir. Standartlara uygundur. Ayrıca sınıfta doğal aydınlatma ve havalandırmayı sağlayan 2.163 cm x 1.852 cm ölçülere sahip iki tane pencere bulunmaktadır (Şekil, 8).

**Şekil 8. Final Anaokulu sınıf pencereleri**

Yapılan inceleme ve ölçümler neticesinde İvat Turab Anaokulu sınıf ölçüleri ortalama 13 m<sup>2</sup> ölçülerindedir (Şekil 7). MEB tarafından belirlenen standartlar incelendiğinde anaokullarında sınıflar ortalama 15 m<sup>2</sup> ve kişi başına 1,5 m<sup>2</sup> düşecek şekilde tasarlanması uygun görülmüştür. Sınıfın tavan yüksekliği 3.7 m olup standartlara uygundur. İvat Turhan Anaokulundaki mevcut sınıflar ortalama 13 m<sup>2</sup> olup sınıflar 12 kişiliktir. Bu da standartların uygun olduğunu göstermektedir. Ayrıca sınıfta doğal aydınlatma ve havalandırmayı sağlayan 100 cm x 200 cm

ölçülere sahip dört tane pencere bulunmaktadır (Şekil, 9).Yapılan incelemeler doğrultusunda Final anaokulunun sınıfları öğrenci sayısına göre uygun değilken, İvat Turhan anaokulunda bu oran öğrenci sayısına göre daha uygundur. Ayrıca her iki kurumdaki sınıfların tavan yükseklikleri 3 m'nin üzerindedir.

## **SONUÇ**

Çocuklar, insanlığın geleceğinin teminatıdır. Onların yetişmesinde ve eğitilmesinde tüm insanlık için büyük önem taşımaktadır. Eğitim hayatlarının bir kısmını okul kurumlarında geçiren çocukların, en uygun şartlarda eğitim almasını sağlamak yetişkinlerin temel görevleri arasındadır. Uygun koşulların sağlanması çocukların aldığı, alacağı eğitim kalitesi ve verimi açısından çok değerlidir. Çalışma kapsamında İstanbul ilinde bulunan Bahçeşehir Final Anakolu ve Sultangazi Avit Turhan Anaokulu sınıfları ve mobilyaları ergonomik açıdan incelenmiştir. Çalışmanın sınırlılığı kapsamında biri özel diğeri devlet olmak üzere farklı özelliklere sahip iki anaokulu yapısı incelenmesinde; çocukların kullandıkları sınıflar, masa, sandalye ve dolaplar ergonomik açıdan ele alınmıştır.Çalışma kapsamında iki anaokulu sınıfları ve mobilyaları incelenerek ölçümleri yapılmıştır. Elde edilen veriler verilere ve literatür taraması sonucunda ulaşılan; olması gereken standartlara, çalışmanın içerisinde sistematik bir şekilde yer verilmiştir.Her iki okulda yapılan incelemeler sonucu sınıfların boyutları standartlara uygun olmadığı tespit edilmiştir. Ancak İvat Turhan Anaokulunda bu denge öğrenci sayısının az tutulması ile ideal kullanım sağlanmıştır. Final anaokulunda ise standartlara göre daha küçük olan sınıf öğrenci sayısının 20 olması ile daha az kullanım alanı sunmaktadır.Her iki okulda da kullanılan masa, sandalye ve dolaplar antropometrik açıdan incelendiğinde 4-6 yaş grubundaki çocuklara uygun tasarlandığı, ancak Final Anaokulunda kullanılan dolapların standartların altında bir yüksekliğe sahip olduğu tespit edilmiştir. Bu bağlamda, yapılan araştırmalar ve çalışmalar sonucunda, anaokulu yapılarının tasarımında; çocukların ergonomik konforunun önemsenerek yapılmasının bir zorunluluk olduğu tespit edilmiştir. Ancak çocuklara yönelik ergonomik konforun önemsenerek tasarım yapılmasının yetkili merciler tarafından zorunlu tutulmadığı tespit edilmiştir.Çalışma sonucunda; yapılan araştırmalar ve incelemeler ışığında, anaokulu yapıları için kullanıcı memnuniyeti ve ergonomik kriterler gözetilerek yapılan tasarımlarda olması gereken, eksikliğinin ise yaptırım sonucunu beraberinde getirmesi gereken tasarım kriterleri önerilmiştir.

\*Plan tasarımlarında tek katlı yapılar tercih edilmeli, çok katlı yapıların çözümünde kullanılan merdivenler çocukların antropometrik özelliklerine göre tasarlanmalıdır.

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

***April 09-16, 2024 / Lisbon, Portugal***

\*Mekânların büyüklükleri okulun en üst düzey öğrenci kapasitesine hizmet verecek şekilde planlanmalıdır.

\*Plan şemaları doğal aydınlatmadan en üst seviyede yararlanacak şekilde tasarlanmalıdır.

\*Yapıların tefriş elemanları çocukların antropometrik özelliklerine uygun seçilmez.

\*Tasarımlar bölgenin coğrafi ve kültürel şartları gözeticilerle yapılmalıdır.

\*Yapıların tasarım aşamasından önce o bölgede bulunan örnek okullar incelenmeli, kullanıcılarla görüşmeler yapılarak mevcut durumlarda meydana gelen sıkıntılar saptanmalı ve tekrarlanmamasına önem verilmelidir.

**Özet**

Kavram karikatürleri, günlük yaşamdan alınan bilimsel olayların farklı bakış açıları ve görsel desteğiyle ifade eden araçlardır. Kavram karikatürleri, öğrencilerin bir kavram hakkındaki düşüncelerini ortaya çıkarmak, tartışmaya teşvik etmek, zihinsel belirsizlikleri ve yanlış anlamaları tespit etmek, farklı görüş ve düşünceleri ortaya çıkarmak amacıyla kullanılabilir. Kavram karikatürleri, kâğıt kalem gibi klasik yöntemlerle geliştirilebileceği gibi, bilgisayar ortamında ya da kavram karikatürü oluşturmaya yardımcı web 2.0 araçlarıyla da hazırlanabilmektedir. Bu çalışmanın amacı, Fen Bilgisi öğretmen adaylarına Tübitak 2237 eğitimi kapsamında verilen bilgisayar destekli kavram karikatürü geliştirme eğitim programı sonunda ortaya çıkan ürünlerin değerlendirilmesidir. Çevrimiçi toplamda 24 saat süreli bu eğitime Türkiye'deki 13 farklı üniversiteden 24 öğretmen adayı aktif katılım sağlamıştır. Eğitim kapsamında Storyboardthat, Pixton ve Cartoon Animator olmak üzere iki farklı web 2.0 aracı ve bir masaüstü uygulama kullanılarak fen bilgisi eğitimi alanında bilgisayar destekli kavram karikatürleri oluşturulmuştur. Geliştirilmesi sürecinde fen bilgisi ve eğitim teknolojileri alan uzmanları tarafından rehberlik sağlanan ürünler süreç sonunda yine alan uzmanları tarafından değerlendirilmiştir. Araştırmada veri toplama aracı olarak "Kavram Karikatürü Değerlendirme Formu" kullanılmıştır. Form "yeterli", "kısmen yeterli" ya da "yetersiz" düzey göstergelerinden oluşmaktadır. Araştırma sonuçları, hazırlanan kavram karikatürlerinin geliştirildikleri alanlar ve yeterlilikleri açısından değerlendirilmiştir. Bu değerlendirme temelinde, gelecek eğitimlere yönelik önerilerde bulunulmuştur. Araştırma, bilgisayar destekli kavram karikatürleri geliştirme sürecinin etkili bir öğretim aracı olarak kullanılabilirliği konusunda önemli bilgiler sunmaktadır.

## **CONCEPT CARTOON DEVELOPMENT PROCESS of TEACHER CANDIDATES**

### **Abstract**

Concept cartoons are instruments that articulate scientific events derived from daily life through different perspectives and visual support. They serve the purpose of eliciting students' thoughts on a given concept, fostering discussions, identifying cognitive uncertainties, detecting misconceptions, and revealing diverse perspectives and ideas. Concept cartoons can be developed through conventional methods such as pen and paper, as well as with the aid of web 2.0 tools designed to assist in creating concept cartoons in a digital environment. The aim of this study is to evaluate the outcomes of a computer-supported concept cartoon development training program provided to prospective science teachers as part of the Tübitak 2237 Training Project. A total of 24 prospective teachers from 13 different universities in Türkiye actively participated in this online training, which lasted a total of 24 hours. In the scope of the training, computer-supported concept cartoons in the field of science education were created using two different web 2.0 tools and an application: storyboardthat, pixton, and cartoon animator. Throughout the development process, guidance was provided by experts in science education and educational technologies, and the products were subsequently evaluated by these field experts at the end of the process. The data collection tool employed in the research was the "Concept Cartoon Evaluation Form," comprising indicators for "adequate," "partially adequate," or "inadequate" levels. Research results were scrutinized in terms of the areas and competencies in which concept cartoons were developed. Based on this evaluation, recommendations were formulated for future training programs. The study contributes significant insights into the effectiveness of computer-supported concept cartoon development as an instructional tool.

**Keywords:** Computer-supported Concept Cartoon, Web 2.0, Teacher Training

## **Introduction**

During primary school, students are introduced to concepts related to science and technology for the first time in science classes. This period is important for the attitude that students will develop towards science, the profession they will choose in the future, their interest in science, self-confidence and motivation. Accordingly, one of the teaching materials that will make science and technology lessons more fun and interesting are concept cartoons (Eroğlu, 2010, Şenocak, 2018). Concept cartoons are tools that can convey a scientific event taken from daily life, from different perspectives, with various visuals (Atasoy, 2017; Kara, 2017). These tools can be used to reveal students' thoughts about a concept, to encourage discussion, to detect ambiguities and misunderstandings in their minds, and to enable different views and thoughts to emerge (Balım et al., 2015; Erdoğan and Özsevgeç, 2012). Visuals in concept cartoons increase students' interest in the course and helps create a comfortable learning environment for them to express themselves more easily. Concept cartoons related to science teaching can be prepared in three ways: with pen and paper in hand, by rearranging ready-made images and with computer aid. The fact that hand drawings require skill and the ethical issues in the use of ready-made images are difficulties in creating such concept cartoons. On the other hand, it is said that computer-aided cartoons offer richer content (Pınarkaya, 2017). While preparing computer-aided concept cartoons, web 2.0 technologies and animation creation applications are frequently used (Aydın, 2015; Can and Usta, 2021; Kruit and Bredeweg, 2020; Tatlı et al., 2016). It is known that the use of Web 2.0 and its tools increases students' interest and motivation in the course, positively affects course achievement, and contributes to the development of 21st century skills and the elimination of misconceptions (Akbaba and Ertaş Kılıç, 2022, Arslan and Yıldırım, 2021; Can, 2021; Gürleroğlu and Yıldırım, 2022; Karakuzu, B., Saraçoğlu and Bektas, 2023; Urooj, and Farooq, 2023). For this reason, web 2.0 tools appear as an effective alternative in the development of concept cartoons. These tools, which do not require much technical infrastructure in the computer environment, can be used for educational purposes and have a user-friendly interface (Arıcı, 2023). Content prepared with these tools, which help to easily create concept cartoons online without drawing skills, can be easily turned into a material and shared (Lornsen, 2010; Gürsoy and Göksun, 2019). Science teacher candidates will be able to prepare concept cartoons of their choice whenever needed, using web 2.0 tools. This will contribute to the development of their professional competence and self-confidence (Timur et al., 2021).

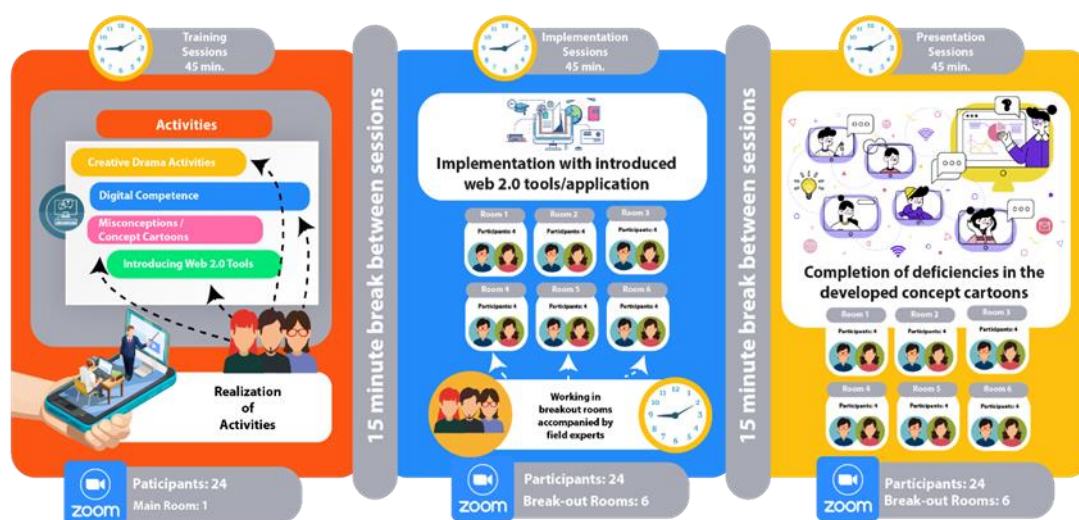

In this study, the process of developing computer-aided concept cartoons using web 2.0 tools is explained. The purpose of the study is to share the computer-aided concept cartoon development process given to science teacher candidates within the scope of Tübitak 2237 training and to evaluate the products that emerged as the results of the training program.

### **Method**

In this study, the concept cartoon development process of science teacher candidates is presented in detail. Additionally, the data collection tool and data analysis process used to evaluate the products resulting from the training are explained.

### **Process**

The “Computer-aided concept cartoon development course for science teacher candidates”, which was offered within the scope of the research and supported within the scope of Tübitak 2237 activities, was held online. During the event, which lasted a total of three days, a total of 24 hours of training was provided, eight hours each day. Operation of the training program is shown in Figure 1.

**Figure 1.** Operation of the training program

As seen in Figure 1, the training was carried out online via a videoconference application. Education was carried out in a single room for group events where all participants were in the same environment, and in lower rooms for events to be held in groups. The planned activity consists of 4 basic stages. The aim of the first stage was to create a theoretical infrastructure on information technologies basic competencies, misconceptions in science education and concept cartoons. In the second stage, web 2.0 tools for assessment purposes determined within the scope of the project will be introduced by CEIT field experts in the environment where all participants are present simultaneously. At this stage, CEIT field experts will provide

introductions to the relevant tools through interfaces, purpose of use and sample applications. In the third stage, using web 2.0 tools introduced by CEIT field experts, participants will be asked to develop content that can be used in assessment specific to their fields. At this stage, participants will be sent to four sub-rooms on the Zoom platform. Each subroom will include two science education experts and two CEIT field experts. In this process, a total of 4 experts working in 4 sub-rooms will carry out the process. In the fourth and final stage, the contents produced will be evaluated by relevant field experts and the contents will be improved by providing feedback to the participants. On the first day of the event, after the opening ceremony and project introduction, the teacher candidates were introduced to the program accompanied by creative drama. Then, prospective teachers were instructed about digital competence and finally, sessions were held on concepts, misconceptions and concept cartoons in science. At the end of the first day, the participants were divided into groups and each group was given misconceptions to work on by experts in the field. On the second day of the event, StoryboardThat and Pixton, web 2.0 tools used to create two-dimensional concept cartoons, were introduced, respectively. First, the StoryboardThat tool was introduced by CEIT field expert. After the interface, elements, and product creation features were explained, the participants were sent to the previously determined sub-rooms with their groups. Each sub-room can be considered as independent virtual workspaces. In these subrooms, groups developed concept cartoons using StoryboardThat on the identified misconceptions. During this process, the participants were accompanied by both IT field experts and science field experts. Afterwards, the same process was completed for the Padlet tool. At the end of the day, a free time activity was created for the participants to complete their work, and the completed concept cartoons were shared with the whole group at the end of the day and evaluated by field experts. On the third day of the event, Cartoon Animator software, which can be used to prepare concept cartoons based on animation, was introduced to the participants, followed by sound editing software for voice-over. The process of developing concept cartoons took longer with this software, which is more complex than Web 2.0 tools. Participants working in the sub-rooms completed their concept cartoons during free time activities and the products were shared with the whole group. As on the second day, the developed products were evaluated by field experts. At the end of the training, each group developed concept cartoons with StoryboardThat, Pixton and Cartoon Animator. A total of eighteen concept cartoons were created.

## **Participants**

In this study, where six Computer and Instructional Technologies (CEIT) field experts and five Science (FB) field experts participated as instructors, 24 volunteer teacher candidates received training. The university where the participants studied is given in Table 1.

**Table 1.** Universities where the participants studied

Universities	Participant (f)
Akdeniz University	4
Aksaray University	1
Amasya University	1
Dokuz Eylül University	1
Ege University	1
Gazi University	4
Giresun University	3
Kahramanmaraş Sütçü İmam University	1
Mersin University	1
Middle East Technical University	1
Muş Alparslan Akdeniz University	1
Recep Tayyip Erdoğan University	3
Trabzon University	1

The teacher candidates participating in the study were enrolled in the Science Education programs of 13 different universities. The characteristics of the participants are given in Table 2.

**Table 2.** Characteristics of the participants

Gender	Female	Male	
	19	5	
Year	Second	Third	Fourth
	5	10	9

As seen in Table 2, nineteen of the participants are women and five are men. It is seen that the participants who participated in the Online Training were mostly third ( $n = 10$ ) and fourth ( $n = 9$ ) year teacher candidates.

## **Data collection tools**

The Concept Cartoon Evaluation Form developed by Atasoy et al. (2022) was used in the study. This tool, prepared as a graded form, includes five dimensions (Presentation of the problem,

Language use, Attractiveness, Layout, and Visual Design). Any size; It is rated as 3 (adequate), 2 (partially adequate) and 1 (inadequate). Problem presentation dimension and indicators included in the data collection tool are presented in Table 3.

**Table 3.** Example of concept cartoon evaluation form dimensions and indicators

Dimension	Adequate: 3 points	Partially Adequate Level: 2 points	Inadequate	Explanation
<b>Presentation of the Problem</b>	The problem situation is clearly understood from the conversations in the concept cartoon. All dialogues are related to the problem situation.	The problem situation in the concept cartoon is partially understood from the conversations. But not all dialogues are related to the problem situation. ( )	The problem situation in the concept cartoon is not understood from the mutual conversations. Dialogues are not related to the problem situation. ( )	

### **Data Analysis**

Eighteen cartoons created at the end of the training were evaluated by 4 Science and 3 other field experts through the Concept Cartoon Evaluation Form. The evaluator is coded as FEx, and the field experts are coded as BTx. Table 3 shows FE2's evaluation of the cartoon made by Group 1 with the Pixton tool.

**Table 4.** Sample evaluation

Dimensions	Presentation of the Problem	Language Use	Attractiveness	Layout	Visual Design	Average
<b>FE2'nin puanları (Pixton)</b>	2	2	3	2	2	2,2

As seen in Table 4, each cartoon was scored by field experts on the five dimensions included in the form. If the relevant dimension is adequate, 3 (three) points are given, if it is partially adequate, 2 (two) points are given, and if it is inadequate, 1 (one) score is given. At the end of the evaluations in all dimensions, the average score of that cartoon was calculated. In this regard, cartoons with scores in the range of 1.0-1.6 were considered inadequate, cartoons with scores in the range of 1.7-2.3 were considered partially adequate, and cartoons with scores in the range of 2.4-3.0 were considered adequate.

### **Findings and Discussion**

The evaluation findings regarding the 18 concept cartoons that emerged at the end of the online Tübitak 2237 training are presented in Table 5.

**Table 5.** Average scores of the concept cartoons

Web.2.0 tool/ applicaiton	Groups	FB1	FB2	FB3	FB4	BT1	BT2	BT3	Average
<b>Pixton</b>	1.Group	2,2	2,2	2,0	1,6	2,6	2,2	2,6	<b>2,2</b>
	2.Group	2,6	2,0	1,8	1,8	2,4	2,4	2,8	<b>2,3</b>
	3.Group	2,4	1,8	1,8	1,8	2,8	2,2	2,6	<b>2,2</b>
	4.Group	2,0	2,0	2,4	2,4	3,0	2,2	3,0	<b>2,4</b>
	5.Group	2,4	2,2	2,4	2,2	2,8	2,4	3,0	<b>2,5</b>
	6.Group	2,0	2,0	2,4	2,0	2,6	2,4	3,0	<b>2,3</b>
<b>StoryboardThat</b>	1.Group	2,0	2,8	2,2	1,6	2,6	2,6	2,8	<b>2,4</b>
	2.Group	3,0	2,8	2,4	2,8	3,0	3,0	2,8	<b>2,8</b>
	3.Group	2,8	2,0	2,0	2,2	2,8	2,6	2,8	<b>2,5</b>
	4.Group	1,8	2,0	2,2	2,2	2,6	2,2	2,2	<b>2,2</b>
	5.Group	2,4	2,6	2,0	2,2	2,8	2,4	2,6	<b>2,4</b>
	6.Group	2,2	1,6	2,0	2,0	2,6	2,2	2,8	<b>2,2</b>
<b>Cartoon Animator</b>	1.Group	2,2	2,6	2,0	2,3	2,8	2,4	2,6	<b>2,4</b>
	2.Group	3,0	3,0	2,4	2,8	3,0	3,0	3,0	<b>2,9</b>
	3.Group	3,0	2,8	1,8	2,5	2,6	2,4	2,5	<b>2,5</b>
	4.Group	2,4	2,8	2,6	2,6	2,6	2,6	2,6	<b>2,5</b>
	5.Group	2,0	2,0	1,8	1,9	2,8	2,0	2,4	<b>2,3</b>
	6.Group	2,0	1,2	2,0	1,7	3,0	2,2	2,6	<b>2,2</b>

All of the prepared cartoons received adequate (n=10) or partially adequate (n=8) scores. It is noteworthy that the cartoon scores, which are partially adequate, are 2.2 or 2.3. When evaluated in terms of web 2.0 tools and application used four of the concept cartoons prepared with the Cartoon Animator application were in the “adequate” category, two in the “partially adequate” category, four of the concept cartoons prepared with the StoryboardThat tool are in the “adequate” category, two in the “partially adequate” category, and two of the concept cartoons prepared with the Pixton tool are in the “partially adequate” category. When examined in terms of the scores received, it is seen that the concept cartoons prepared with the Cartoon Animator application received the highest scores. The second group, in particular, received a full score of 3.0 from five field experts. This group is followed by the third (x=2.5), fourth (x=2.5) and first (x=2.4) groups, respectively, with sufficient scores. The screenshot of the concept cartoon prepared by the second group is presented in Figure 2.

**Figure 2.** Screenshot of the concept cartoon prepared with the Cartoon Animator application

In this research, it is seen that animated concept cartoons received higher scores. This may be because the participants enjoyed preparing a material containing animation more. In their study with pre-service teachers (2019), Gürsoy and Göksun stated that web 2.0 tools with animations are more liked by pre-service teachers. Tatlı et al. (2016) also found similar findings.

The fifth group ( $x = 2.5$ ) received the highest score in concept cartoons prepared with the Pixton tool. This group is followed by the fourth group ( $x=2.4$ ). Figure 3 shows the concept cartoon prepared by the fifth group with this tool.

Aşağıdaki çocuklardan hangisinin fikrine katılıyorsunuz?

..... katılıyorum çünkü.....

**Figure 3.** Concept cartoon made with Pixton tool Concept cartoons made by the participants with the Pixton tool were the cartoons that received the lowest scores.

During the development of these cartoons, it was observed that the participants had difficulty in placing the characters and speech bubbles. This may have caused them to reflect the problem situation and experience negativities in the visual design. Research in the literature indicates that the process of concept cartoons developed using the Pixton tool is entertaining and motivational (Yağcı, 2019; Bay&Bademci, 2022). The second group received the highest score in the concept cartoons prepared by the participants using the StoryboardThat tool ( $x = 2.8$ ). This group was followed by the third group ( $x=2.5$ ), the first and fifth groups ( $x=2.4$ ), respectively. The concept cartoon prepared by the second group is presented in Figure 4.

Astronotlar sesin uzay boşluğunda yayılıp yayılmadığını denemiş ve görüşlerini belirtmişlerdir. Siz hangi astronotun bu konu hakkındaki düşüncesine katılıyorsunuz? Nedeni ile açıklayınız.

ALİ

METE

BURAK

Çünkü, \_\_\_\_\_

**Figure 4.** Concept cartoon made with StoryboardThat tool

In general, it can be considered as an important success that the concept cartoons prepared received scores in the "sufficient" and "partially sufficient" categories. Because the participants developed all the cartoons in a few hours on an online platform with group friends they had never met before. In cartoons with low scores, participants may not have been able to create the backgrounds or characters they wanted in this short time. Additionally, they may have had difficulty reflecting the problem situation presented in the concept cartoon. It is known that computer-aided concept cartoons attract students' attention and motivate them (Göksu, 2014; Yamık, 2015; Yürekli, 2020). Preparing computer-aided concept cartoons was a new experience for the participants. It is possible that teacher candidates with this experience will benefit from these materials in their professional lives.

### **Conclusion and Recommendations**

This study was carried out within the scope of Tübitak 2237 Training. A total of 24 science teacher candidates working in the groups of four took part in the training. Trainings were given online by science field experts and other field experts. While the introduction of theoretical sections and applications in educational planning was carried out in a single virtual classroom, the concept cartoon development process took place in six sub-rooms under the guidance of field experts. Concept cartoons were made on the second and third days of the training. Using the tools introduced in this process, each group developed a concept cartoon. At the end of the training, a total of 18 concept cartoons were prepared for science achievements. These developed concept cartoons were evaluated by four science and three field experts. It was observed that the computer-aided concept cartoons developed by the participants in a short time were at an "adequate" level. The training is limited to 3 days. Concept cartoons were prepared during the training. By preparing with a longer-term training, the time for participants to develop computer-aided concept cartoons can also be increased. These concept cartoons can be evaluated. Trainings can be restructured by taking participants' opinions and suggestions regarding the process. It was observed that the prepared computer-aided concept cartoons received low scores in the problem presentation dimension. This issue can be emphasized more in theoretical presentations. It has been observed that the Cartoon Animator application has a complex structure. In the trainings animated concept cartoons can be created with another easier-to-use tool and evaluated.

### **Özet**

Bu araştırmanın amacı bireysel ve takım sporlarında kuvvet ölçüm testlerini incelemektir. Bu kapsamda ulusal düzeyde son 10 yılda yapılmış çalışmalar incelenmiştir. Araştırmamız derleme bir çalışma olup, google akademik, pubmed ve web of science veri tabanlarında yayınlanmış tam metnine ulaşılabilen çalışmalar dahil edilmiştir. Bireysel spor davranışı çağdaş tarihsel bir perspektiften inceleyerek, sporda öne sürülen gelişmelerin sporla uğraşanların mikro düzeyinde ne ölçüde gözlemlenebileceğini incelemektedir. Takım sporları karmaşık spor disiplinlerine aittir ve karmaşıklıkları, hareketlerin ve durumların zorlu yapısında, antrenman ve müsabaka sırasında başarılı olabilmek için oyuncuların sahip olması gereken birçok özellikte kendini göstermektedir. Bireysel ve takım sporlarında kuvvet antrenmanının yetişkinler için güvenli ve etkili bir kondisyon yöntemi olduğu kanıtlanmıştır ve artık giderek daha fazla sayıda çocuk ve ergenin de sağlıklarını, kondisyonlarını ve spor performanslarını geliştirmek için antrenman yaptıkları görülmektedir. Kuvvet antrenmanı vücut kütlelerini arttırmak, yumuşak doku yaralanma riskini azaltmak ve core stabilitesini geliştirmek amacıyla potansiyel olarak faydalıdır. Kuvvet antrenmanı, koşmaya dayalı aktivitelere göre atlama hareketlerinde daha fazla performans artışı sağlar ve bu başarılar motor göreve göre değişiklik gösterir. Uygun antrenman kuralları takip edilirse, gençlere yönelik kuvvet antrenmanı programına düzenli katılım, kemik mineral yoğunluğunu artırma, motor performans becerilerini geliştirme, spor performansını geliştirme ve genç sporcularımızı antrenman ve rekabet taleplerine daha iyi hazırlama potansiyeline sahiptir. Literatüre bakıldığında bireysel ve takım sporlarında kuvvet ölçüm testleri en fazla el pençe kuvveti, dikey sıçrama, mekik, şnav, sırt kuvveti, bacak kuvveti, durarak uzun atlama gibi ölçümler yapılarak ölçülmüştür.

**Anahtar Kelimeler:** Bireysel sporlar, takım sporları, kuvvet, kuvvet ölçüm yöntemleri

## **STRENGTH MEASUREMENT TESTS IN INDIVIDUAL AND TEAM SPORTS**

### **Abstract**

The purpose of this research is to examine strength measurement tests in individual and team sports. In this context, studies conducted at the national level in the last 10 years were examined. Our research is a compilation study, and studies with full text published in Google Scholar, Pubmed and Web of Science databases are included. By examining individual sports behavior from a contemporary historical perspective, it examines to what extent the proposed developments in sports can be observed at the micro level of those involved in sports. Team sports belong to complex sports disciplines, and their complexity is reflected in the challenging nature of movements and situations, as well as in the many characteristics that players must possess in order to be successful during training and competition. Strength training in individual and team sports has proven to be a safe and effective form of conditioning for adults, and more and more children and adolescents are now also training to improve their health, fitness and sports performance. Strength training is potentially beneficial for increasing body mass, reducing the risk of soft tissue injury, and improving core stability. Strength training provides greater performance improvements in jumping movements than in running-based activities, and these achievements vary by motor task. If proper training guidelines are followed, regular participation in a youth strength training program has the potential to increase bone mineral density, improve motor performance skills, enhance sports performance and better prepare our young athletes for the demands of training and competition. When we look at the literature, strength measurement tests in individual and team sports are mostly measured by measuring hand claw strength, vertical jump, sit-ups, push-ups, back strength, leg strength, standing long jump.

**Keywords:** Individual sports, team sports, strength, strength measurement methods

## **Giriş**

Çoğu spor dalında başarı, kuvvet ve güç dahil olmak üzere fiziksel uygunluk özelliklerine büyük ölçüde bağlıdır. Antrenman programlarını tasarlarken, uygularken ve izlerken hangi mekanik değişkenlerin performansı belirlediğini tespit etmek de önemlidir. Gençleri fiziksel olarak aktif olmaya teşvik etmek önemlidir. Yaşamın erken dönemlerinde hareketsiz bir yaşam tarzının yetişkinliğe kadar uzandığı görülmekle birlikte, çocukluk ve ergenlik döneminde fiziksel olarak aktif bir yaşam tarzı, yaşamın ilerleyen dönemlerinde bazı kronik hastalıkların önlenmesine de yardımcı olabilir. Çocuk ve ergenlerin oyun, spor, iş, ulaşım, rekreasyon, beden eğitimi veya planlı egzersizin bir parçası olarak haftanın tüm günlerinde veya çoğu günlerinde fiziksel olarak aktif olmaları önerilmektedir (1, 2). Bireysel spor müsabakalarında fizyolojik izlemenin uygulanmasına büyük değer verilmektedir. Fizyolojik izleme, egzersiz dozu-yanıt, egzersiz yoğunluğu ve egzersiz performansı hakkında geri bildirim sağlar. Sporcular genellikle uygun antrenman yükünü tahmin etmek, aşırı antrenmanı taramak ve antrenörlerin antrenmanı sporun fizyolojik talepleriyle eşleştirmesini sağlamak için çeşitli fizyolojik ve performans izleme yöntemleri kullanılarak değerlendirilir (3-5). Yaş, ırk, cinsiyet ve kondisyon düzeyindeki benzerliklere rağmen, bireyler aynı antrenman veya müsabakaya farklı tepkiler verebilir. Bu nedenle, antrenman ve müsabakaların bireysel olarak izlenmesi çok önemlidir (6). Takım sporları karmaşık spor disiplinleri arasında yer alır ve karmaşıklığı, hareketlerin ve durumların zorlu doğasına ve oyuncuların antrenman ve müsabaka sırasında başarılı olmak için sahip olması gereken birçok özelliğe yansır. Dahası, tüm bu özellikler oyuncuların rekabetçi verimliliklerinden sorumlu olan bütünsel hazırlıklarının bir parçası olmalıdır. Takımın sahada daha etkili olabilmesi ve olumlu sportif sonuçlar elde edebilmesi için takımdaki tüm bireylerin birbiriyle uyum içinde olması gerekir. Bu temel nedenlerden dolayı takım sporlarında spora hazırlık sistemi son derece karmaşık ve zahmetlidir (7). Literatürü değerlendirdiğimizde birçok bilim insanının kuvvet kavramını aynı anlama gelen farklı ifadelerle tanımladığı görülmektedir. Fizyolojik yaklaşım açısından kuvvet, kas kasılması sırasında meydana gelen gerilimi ifade etmektedir. Kuvvet kavramı fizikte cisimlerin konumunu, hareketini ve şeklini değiştiren etki olarak tanımlanırken, biyomekanikte hareket ve dengeyi sağlayan etkiler olarak tanımlanmaktadır (8, 9).

## **2. Materyal Yöntem**

Derleme çalışmamızda; Google akademik veri tabanından 2014-2024 yılları arasında yapılan çalışmalar, el pençe kuvveti, bacak kuvveti testi, mekik, şınav, dikey sıçrama, durarak uzun atlama, sırt kuvveti, relatif kol kuvveti, relatif bacak kuvveti, takım sporları, bireysel sporlar,

spor, fizyolojik ve motorik özellikler anahtar kelimeleri ile ulaşılan ulusal çalışmalar incelenerek gerçekleştirilmiştir.

### **3. Bireysel ve Takım Sporlarında Kuvvet Ölçüm Yöntemleri**

Literatür incelendiğinde, el pençe kuvveti, dikey sıçrama, mekik, şınav, sırt kuvveti, bacak kuvveti, durarak uzun atlama, 1RM metodu, sırt kuvveti, relatif kuvvet gibi birçok testin sıklıkla kullanıldığı görülmektedir.

#### **3.1. Kuvvet Ölçüm Yöntemlerinde Sık Kullanılan Yöntemler**

##### **3.1.1. El Pençe Kuvveti**

El kavrama kuvveti olarak bilinen el pençe kuvveti hem ayakta hem de oturarak yapılabilen bir testtir. El dinomametresi kullanılarak yapılan bu ölçüm de dinamometre deneğin el ölçüsüne göre ayarlanır. Deneğin kolu düz ve omuzdan 10-15 derecelik bir açı yaparak yan tarafta öncelikle sağ elden maksimum pençe kuvveti ölçümü yapılır. Test, çalışma grubunda dönüşümlü olarak her iki el ile 4 tekrar yapılacak şekilde tekrarlanır. Her denemeden sonra ibre sıfırlanır. Deneme sonuçları kaydedilir ve en iyi dereceleri karşılaştırma yapmak için sonuçlar kısmına dahil edilir (10-26).

##### **3.1.2. Dikey Sıçrama Testi**

Dikey sıçrama testleri kalça, diz ve kalça ekstansör kaslarının gücünü veya patlayıcı kuvvetini ölçmek için kullanılır. Seçilen düz bir duvar üzerinde santimetre cinsinden bir işaretleme yapılır. Ayaklar omuz genişliğinde açılır ve gövde işaretli duvara yan olacak şekilde durarak uzanabildikleri mesafe işaretlenir. Ardından deneğe aynı pozisyonda üç deneme hakkı verilerek bunların en iyisi değerlendirmeye alınır. Deneğin ayakta uzanabildiği mesafe ile zıplayıp dokunduğu mesafe arası metre cinsinden belirlenir (11-13, 15, 27-35).

##### **3.1.3. Mekik Hareketi Testi (Curl Up)**

Karın kaslarının kuvvet gelişimini sağlamak için abdominal bölgede bulunan kasları çalıştıran en iyi egzersiz şekli mekik hareketidir. Bu hareket sırt üstü yatar pozisyonda gerçekleştirilir. Mindere uzanan sporcu ellerini arkada birleştirir ve dizleri bükülü ayağını yerden kaldırmadan egzersize başlar. Karın fleksiyonu yaparken dirsekleri dizlere kadar gelir ve tekrar sırt üstü uzanır. Egzersiz sırasında ayakların yerle temasının kesilmesi hata olarak değerlendirilir. Kontrol amaçlı egzersizin üç defa yapılmasına izin verilir. Sporcuların tükenme noktasına ulaşana kadar yapabildikleri mekik sayısı kaydedilir (11, 12, 14, 27, 36-41).

##### **3.1.4. Şınav Testi**

Bu testin amacı sporcuların üst ekstremita kas grubunun dayanıklılığını belirlemektir. Düz bir yüzeye bir mat yerleştirilir. Eller omuz genişliğinde açık ve gergin olacak şekilde matın üzerine

yüz üstü uzanılır. Dirsekler 90 derece açıda olacak şekilde vücut yere yaklaştırılır. Kollar gergin bir şekilde başlangıç pozisyonuna geri dönlür. Şınav hareketine dinlenmeden devam edilir ve 1 dk da kaç tekrar yapıldığı kaydedilir (11, 24, 27, 36, 41, 42).

### **3.1.5. Bacak Kuvveti Testi**

Bu testin amacı sporcularda elastik bacak kuvvetinin gelişimini takip etmektir. Bir çizgi üzerinde 2 koni ile 25 metrelik bir alan belirlenir. Sporcu başlama çizgisinin 10-15 m gerisinde başlar. Uyarı sesiyle birlikte sporcu koşmaya başlar, sporcu ilk koniden dominant bacağı üzerinde sıçrayarak başlar. İki koni arasındaki sıçramada geçen süre kaydedilir. Bu test daha sonra diğer bacak ile tekrar edilir. Sonuçlar önceki testlerin sonuçları ile karşılaştırılarak analiz edilir. Her iki test arasındaki uygun antrenman analizin iyileştiğini göstermesi beklenir (20, 21, 33, 43, 44). İzokinetik Kuvvet: İzokinetik kuvvetin belirlenmesinde, dinamometre, deneğin ayak uzunluğuna göre ayarlanır, ardından denekler dizleri bükülü, kolları gergin, sırtı düz ve gövdesi hafifçe öne eğik olarak ayaklarını dinamometre sehpasına yerleştirir ve elleriyle kavradıkları dinamometre çubuğunu bacaklarını kullanarak maksimum hızda dikey olarak yukarı çekerler. Denekler tarafından iki deneme sonucunda elde edilen en iyi sonuç en yüksek değer olarak kabul edilir (12, 14, 15, 17, 20, 21, 30, 31, 33, 40, 44-47).

### **3.1.6. Durarak Uzun Atlama**

Bu testin amacı, atletlerin elastik bacak kuvvetinin gelişimini göstermektedir. Herhangi bir ekipman gerektirmeyen basit ve zaman kazandıran bir uygulama olması nedeniyle birçok spor dalının antrenörleri tarafından yetenek seçimi ve potansiyel tahmini için rutin olarak kullanılmaktadır. Bu testte sporcu sporcu yere çizilen bir çizginin arkasında hazır pozisyonda durur. Bacaklarının omuz genişliğinde açık olması istenir. Kollarının yardımı ile sallanarak sıçramayı gerçekleştirir. Yere yapıştırılan metre ile sporcunun ilk düştüğü yer topuk kısmından ölçülmek şartıyla ölçüm alınır (29, 30, 35-39, 48).

## **3.2. Kuvvet Ölçüm Yöntemlerinde Az Kullanılan Yöntemler**

### **3.2.1. 1RM (1 Maksimal Tekrar)**

Dinamik yöntemle kas gücünü ölçmek için 1-maksimum tekrar yöntemi kullanılır. Tek tekrarlı maksimum (1RM) testi, laboratuvar dışı durumlarda kas kuvvetinin değerlendirilmesinde altın standart olarak kabul edilir. Bu yöntem ağırlık kaldırma egzersiz sırasında, bir seferde kaldırılan maksimum ağırlık performansıdır. Herhangi bir kas grubunda (ön el fleksörü, ayak ekstansörleri ya da omuz gibi) deneğin maksimum kaldırma kapasitesine yakın, ancak altında olan uygun bir başlangıç ağırlığı seçilerek yapılır. İlk tekrar yapıldıktan sonra maksimum kaldırma kuvvetine erişene kadar ağırlık eklenir. Ağırlık artırılması genellikle 5.2 ve 1 kg'dır.

1 RM tekniđi genellikle barbell ya da dambıl kullanılarak gerekleřtirilir (14, 15, 34, 40, 49-51).

### **3.2.2. Sırt Kuvveti**

Sırt kuvveti bir sırt dinamometresi kullanılarak gerekleřtirilir. Sporcular dizleri gergin olacak řekilde ayaklarını dinamometre sehpasına yerleřtirir. Kollar gergin, sırt dız ve gvde hafife ne eđikken, elleri ile kavradıkları dinamometre ubuđunu dikey olarak yukarı dođru maksimum lde ekerler. ekme iřlemi  kez tekrarlanır ve en iyi sonu kaydedilir (15, 30, 44, 52).

### **3.2.3. Relatif Kuvvet**

"Relatif kuvvet" terimi, bir kiřinin vcut ađırlıđına gre kuvvetinin lldđ bir kavramı ifade eder. Bu terim, bir sporcu veya bireyin, vcut ađırlıđına gre ne kadar kuvvetli olduđunu belirlemek iin kullanılır. rneđin, bir kiřinin kendi vcut ađırlıđını kaldırma yeteneđi, relatif kuvvetinin bir ls olabilir. Bu, sporcunun veya bireyin vcut ktlesi gz nne alındıđında ne kadar gl olduđunu gsterir (22, 53).

## **3.3. Son Yıllarda Kullanılmaya Bařlayan Yeni Yntemler**

### **3.3.1. Relatif Kol Kuvvetinin Belirlenmesi**

Kol (st kol, alt kol ve el) llr. Kol ktle hesaplama programında kol ktle toplamı hesaplanır. El pene kuvveti llr. El pene kuvveti (kg) hesaplanan kolun toplam ktlesine (kg) blnerek kolun relatif kuvveti tespit edilir (23).

### **3.3.2. Relatif Bacak Kuvvetinin Belirlenmesi**

Bacak hacim ve ktlesi uyluk, baldır ve ayaktan lmler alınarak yapılır. Uyluk hacim belirlemesinde inguinal nokta ile tibial nokta arası llr. Deneđin baldır hacmi iin, tibial nokta ile medial malleolus noktası arasındaki mesafe belirlenir. Bu mesafeler %10 aralıklarla belirlendikten sonra nce %10 aralıklarla alınan paraların hacimleri daha sonra tm paraların hacimleri Frustum iřaret modeli yntemine gre mesura ile llrek kaydedilir (54).

## **4. Sonu**

Literatr incelendiđinde, el pene kuvveti, dikey sırama, mekik, řınav, sırt kuvveti, bacak kuvveti, durarak uzun atlama, 1RM metodu, sırt kuvveti, relatif kuvvet gibi birok testin sıklıkla kullanıldıđı grlmektedir. Yapılan arařtırmalar sonucunda literatre yeni eklenen lm yntemleri olan relatif kol kuvveti lm, relatif bacak kuvveti lm gibi yntemlerin son yıllarda kullanılmaya bařlandıđı grlmřtr.

**Özet**

Bu araştırmanın amacı sporcuların aerobik kapasitelerinin belirlenmesinde sık kullanılan yöntemlerinin incelenmesidir. Bu kapsamda son on yılda yapılmış ulusal ve uluslararası çalışmalar incelenmiştir. Araştırmamız derleme bir çalışma olup Google Akademik veri tabanında yayınlanmış tam metnine ulaşılabilen çalışmalar dahil edilmiştir. Maksimal oksijen tüketimi (MaxVO<sub>2</sub>), vücut ağırlığının kilogramı başına dakikada tükettiği maksimum oksijen miktarını ifade eder. Maksimum oksijen tüketimi kardiyorespiratuar gelişimin bir kriteri olan maksimum aerobik kapasitenin tayini için kullanılan en güvenilir testtir. Kişinin birim zamanda kullanabildiği oksijen miktarı ne kadar fazla ise kişinin aerobik kapasitesi de o oranda yüksek demektir. Aerobik güç dayanıklılık sporlarında performansa etkili en önemli faktördür. Maksimum oksijen tüketimi aerobik kapasitenin en iyi, kolay uygulanabilir ve güvenilir bir göstergesidir. Aerobik kapasite sadece antrenman için değil, toparlanmayı kolaylaştırmak ve hızlandırmak için de önem taşır. MaxVO<sub>2</sub>, hala kardiyovasküler direnç azalmasını ölçen en önemli test olarak kabul edilmektedir. MaxVO<sub>2</sub>, aerobik kapasite ölçümü için altın standart olarak kabul edilmektedir. Literatür incelendiğinde aerobik kapasitenin belirlenmesinde direkt ve indirekt olmak üzere birçok yöntem kullanılmaktadır. Aerobik kapasitenin direkt ölçülmesi oldukça güvenilir sonuçlar verir fakat pahalı, ulaşımı kolay olmayan ekipmanların kullanımı ve bu yöntemlerin tecrübeli kişilerce uygulanması gerektiğinden uygulanması sınırlı yöntemlerdir. Bu nedenle indirekt yöntemler olan; bisiklet testleri, koşu bandı testleri, basamak testleri ve saha testleri daha sık kullanılmaktadır. Bu indirekt yöntemler kendi içerisinde incelendiğinde ise Astrand Ryhming Bisiklet Testi, Bruce Protokolü, Balke Testi, Cooper Testi, 20m. Mekik Testi, Yo-Yo Testi gibi testlerin sık kullanıldığı göze çarpmaktadır. Ayrıca sporcuların aerobik kapasitelerinin belirlenmesinde saha testlerinin, bisiklet testleri, koşu bandı testleri ve basamak testlerine göre daha sık kullanıldığı tespit edilmiştir.

**Anahtar Kelimeler:** Dayanıklılık, Aerobik Kapasite, MaksVO<sub>2</sub>, Aerobik Kapasite Ölçüm Testleri

**FREQUENTLY USED METHODS IN DETERMINING THE AEROBIC  
CAPACITIES OF ATHLETES**

**Abstract**

The aim of this study was to examine the commonly used methods in determining the aerobic capacity of athletes. In this context, national and international studies conducted in the last decade were analyzed. Our research is a review study and the studies published in the Google Scholar database, the full text of which can be accessed, were included. Maximal oxygen consumption (MaxVO<sub>2</sub>) refers to the maximum amount of oxygen consumed per minute per kilogram of body weight. Maximal oxygen consumption is the most reliable test used to determine maximal aerobic capacity, a criterion of cardiorespiratory development. The more oxygen a person can use per unit time, the higher the aerobic capacity of the person. Aerobic power is the most important factor affecting performance in endurance sports. Maximum oxygen consumption is the best, easily applicable and reliable indicator of aerobic capacity. Aerobic capacity is important not only for training but also for facilitating and accelerating recovery. MaxVO<sub>2</sub> is still recognized as the most important test to measure cardiovascular resistance reduction. MaxVO<sub>2</sub> is considered the gold standard for measuring aerobic capacity. In the literature, many direct and indirect methods are used to determine aerobic capacity. Direct measurement of aerobic capacity gives very reliable results, but they are limited methods because they require the use of expensive, inaccessible equipment and these methods should be applied by experienced people. For this reason, indirect methods such as bicycle tests, treadmill tests, step tests and field tests are used more frequently. When these indirect methods are examined within themselves, Astrand Ryhming Bicycle Test, Bruce Protocol, Balke Test, Cooper Test, 20m. Shuttle Test, Yo-yo Test are used frequently. In addition, it was detected more frequently in the field than in field tests, bicycle tests, treadmill tests and step tests in determining the aerobic capacities of athletes.

**Keywords:** Endurance, Aerobic Capacity, MaxVO<sub>2</sub>, Aerobic Capacity Measurement Tests

## **Giriş**

Kuvvet, dayanıklılık, sürat, hareketlilik ve beceri gibi kavramlar insan yaşamını işlevsel hale getiren temel motorik özelliklerdir (1). Kişinin özellikle yoğun tempolu sportif faaliyetlere uzun süre karşı koyabilme yeteneği ve bu faaliyetlerde yorgunluğa karşı gösterdiği direnç dayanıklılık olarak adlandırılmaktadır (2). Dayanıklılığın en önemli fizyolojik ölçütü Maksimal Oksijen Tüketimi (MaxVO<sub>2</sub>) yani aerobik kapasitedir. Maksimal oksijen tüketimi (MaxVO<sub>2</sub>), vücut ağırlığının kilogramı başına dakikada tükettiği maksimum oksijen miktarını ifade eder. Maksimum oksijen tüketimi kardiyorespiratuar gelişimin bir kriteri olan maksimal aerobik kapasitenin tayini için kullanılan en güvenilir testtir. Kişinin birim zamanda kullanabildiği oksijen miktarı ne kadar fazla ise kişinin aerobik kapasitesi de o oranda yüksek demektir. Aerobik kapasite, dayanıklılık sporlarında bireyin performansına etki eden en önemli faktördür. Maksimum oksijen tüketimi aerobik kapasitenin en iyi, kolay uygulanabilir ve güvenilir bir göstergesidir. Aerobik kapasite sadece antrenman için değil aynı zamanda toparlanmayı kolaylaştırmak ve hızlandırmak için de önem taşır. MaxVO<sub>2</sub>, hala kardiyovasküler direnç azalmasını ölçen en önemli test olarak kabul edilmektedir. MaxVO<sub>2</sub>, aerobik kapasite ölçümü için altın standart olarak kabul edilmektedir (44). Aerobik kapasite, egzersiz test protokolüne bağlı kalarak gerçekleştirilen birtakım egzersizler ile kişinin oksijen tüketiminin en yüksek değeri olarak tanımlanabilmektedir. Bu egzersiz testleri kademeli bir şekilde artırılarak uygulanmaktadır. Egzersiz testleri sırasında yapılan kademeli yükleme, kişi adına maksimum noktaya ulaştığında kişinin aerobik kapasitesi (MaxVO<sub>2</sub>) değeri elde edilmektedir (4). MaxVO<sub>2</sub> değerinin yüksek olması kişinin iş yapabilme kapasitesinin daha fazla olması ya da yapılan egzersizin uzun soluklu ve yorgunluk hissiyatına daha geç ulaşması anlamına gelir (3). Aerobik kapasitenin belirlenmesinde direkt ve indirekt olmak üzere maksimal veya submaksimal yöntemler kullanılarak tespit edilebilir. Aerobik kapasitenin direkt ölçülmesi oldukça güvenilir sonuçlar verir fakat pahalı, ulaşımı kolay olmayan ekipmanların kullanımı ve bu yöntemlerin tecrübeli kişilerce uygulanması gerektiğinden kesin sonuçlar vermese de indirekt yöntemlerin kullanıldığını daha sık görürüz (8). Aerobik kapasitenin belirlenmesinde kullanılan egzersiz şiddeti kademeli olarak artarken ortaya çıkan sonuçlara göre kişinin oksijen kullanım eğilimi lineer bir grafik çizmektedir. Oksijen kullanımındaki bu lineer artış belirli bir noktadan sonra stady state olarak adlandırılan ve oksijen seviyesinin sabit noktada devam ettiği bölgeye ulaşmaktadır. Bu nokta maksimum oksijen tüketiminin gerçekleştiği değerdir ve iş yükü artmaya devam ederken oksijen kullanımı sabit bir şekilde devam etmektedir (7). Elit sporcularda MaxVO<sub>2</sub> değerinin, 70-85 ml/kg/dk olduğu ifade edilmektedir. Bu MaxVO<sub>2</sub>

değerinin kadın sporcularda yaklaşık %10 daha az olduğu belirtilmektedir. Bunun nedeni ise kadınların vücut yağ yüzdelerinin erkeklere göre daha yüksek olması ve kadınların hemoglobin yoğunluklarının yine erkeklere göre daha düşük düzeylerde olmasından kaynaklandığı ifade edilmektedir (5). Genellikle yüksek düzeydeki MaxVO<sub>2</sub> değeri yaş, maksimum kalp hacmi, solunum sisteminin katkısı, oksijeni taşıma kapasitesi ve iskelet kası ile ilişkilidir (6).

## **2. Materyal ve Yöntem**

Çalışmamız derleme bir çalışmadır. Bu çalışma; Google akademik veri tabanından (dayanıklılık, aerobik, aerobik kapasite, VO<sub>2</sub>max, Aerobik kapasite ölçüm testleri) anahtar kelimeler kullanılarak son on yıl içerisinde yayınlanmış ulusal ve uluslararası çalışmalar incelenerek yapılmıştır.

## **3. Aerobik Kapasitenin Belirlenme Yöntemleri**

MaxVO<sub>2</sub>, Egzersiz Test Protokolleri kapsamında kademeleri yoğunluk artışları ile gerçekleştirilen direkt ve indirekt yöntemlerle ölçülmektedir. (4).

### **3.1. Direkt Yöntem**

Laboratuvar şartlarında maksimal yüklenme sırasında ekspirasyondaki O<sub>2</sub> ve CO<sub>2</sub> miktarının gaz analizörleriyle tespit edildiği yöntemdir. Douglas torbaları ve Breath by Breath yöntemleri direkt yöntemlere örnek olarak gösterilebilmektedir (9). MaxVO<sub>2</sub>'nin direkt ölçüm yöntemi son derece geçerli ve güvenilir bir yöntemdir fakat pahalı, ulaşımı kolay olmayan ekipmanların kullanımı ve bu yöntemlerin tecrübeli kişilerce uygulanması gerektiğinden kullanımı sınırlıdır (8).

#### **3.1.1. Breath by Breath**

Her nefes alışverişteki gaz miktarının ölçümüdür. Ölçümlerde tüm gazların yoğunluğunu belirlemek amacıyla kullanılan kütle spektrometreler ve gazların ayrı ayrı belirlenmesini sağlayan analizörlerin bulunduğu sistemler olarak iki farklı sistem kullanılmaktadır. Maksimum egzersiz testi esnasında açık devre spirometri kullanımı, anaerobik eşiğin belirlenmesinde daha doğru sonuçlar elde edilmesini sağlamaktadır MaxVO<sub>2</sub> ve VO<sub>2</sub> zirve değerinin direkt ölçümünü sağlar.

#### **3.1.2. Douglas Torbaları**

Ekspirasyondaki solunum gazlarının belirli süre torbada toplanmasıyla ölçüm yapılır. Ölçümdeki hata payının yüksek olması nedeniyle günümüzde pek kullanılmamaktadır (19).

### **3.2. İndirekt Yöntem**

İndirekt yöntemlerde ekspirasyondaki O<sub>2</sub> ve CO<sub>2</sub> miktarının gaz analizörleriyle belirlenmesi yerine kalp atım hızı kullanılmaktadır. Kalp atım hızı ile oksijen tüketimi arasında doğrusal bir

ilişki vardır ilkesinden yola çıkılarak maksimal veya submaksimal egzersiz protokolleriyle aerobik kapasite tahmin edilebilir (42). Aerobik Kapasite Ölçüm Testleri incelendiğinde bisiklet ergometresi testleri, koşu bandı testleri, saha ve basamak testleri olarak gruplandırıldığını görmekteyiz (Tablo 1) (43,11). Bu testlerin içinden de en sık kullanılan testler aşağıda açıklanmıştır.

**Tablo 3. Aerobik Kapasite Ölçüm Testleri**

Bisiklet Testleri	Ergometresi	Koşu Bandı Testleri	Saha Testleri	Basamak Testleri
Astrand Bisiklet Testi	Rhyning	Bruce Yöntemi	20m Mekik Testi	Hardvard Basamak Testi
Ex-10 Test		Balke Protokolü	Yo-Yo Test	Queens Kolej Basamak Testi
Fox Denklemi		Bonen Koşu Bandı Testi	Cooper Test	Astrand Basamak Testi
3 Basamak Test		Submaksimal Koşu Bandı Testi	Balke Testi	McArdle Basamak Testi
PWC170 Test			1 mil Koş/Yürü Test	
Giessen Test			Rockport Yürüyüş Testi	
YMCA				

### 3.2.1. Bisiklet Metotları

Bisiklet testleri, genellikle tanı testi olarak kullanılan, özellikle Avrupa’da kullanılan bir test yöntemidir. Submaksimal veya maksimal testler şeklinde uygulanması mümkündür (31).

#### 3.2.1.1. Astrand Rhyning Bisiklet Testi

Astrand Test uygun klinik ortamlarda en yaygın olarak kullanılan submaksimal bisiklet ergometri testlerinden biridir (22, 24). Yaygın olarak kullanılan tek etaplı bu test Astrand ve Rhyning tarafından geliştirilmiştir. Astrand-Rhyning test sporcuların submaksimal performansıyla MaxVO<sub>2</sub> değerlerinin tahmin edilmesi için geliştirilmiştir. Bu testin uygulanışında öncelikle oturma yüksekliği her bir sporcu için ayarlanır. Sporcuların ısınması için iş yükü olmaksızın pedala 50rpm hızla çevirmesi istenir. Testin başlangıcında aktif bireyler için iş yükü 100-150 watt sedanterler için ise iş yükü 75 watt olarak belirlenmiştir. İş yükü 6 dakika boyunca devam ettirilir. Testin 5. ve 6. dakikalarının sonunda sporcuların kalp atım sayıları not edilir. Eğer 5. Ve 6. Dakikanın sonunda oluşan kalp atım sayısı farkı 5 veya daha fazla değilse ve ortalama 130-170 KAS arasında ise test sonlandırılır. Eğer kalp atım sayısı

130'un altındaysa iş yükü 50-100watt artırılarak devam edilir. Eğer 5.ve 6. Dakikalar arasındaki kalp atım sayısı farkı 5 ten fazla ise test birbirini izleyen iki dakika arasında kalp atım sayısı 5 ten az oluncaya kadar devam ettirilir. Test sonlandığında ise direnç azaltılarak venöz birikimi önlemek amacıyla pedalın 3-5 dakika çevirilmesi istenir (10). Astrand-Ryhming Test (26):  $VO_{2max} = (0.00212 \times W + 0.299) / (0.769 \times HR_{max} - 48.5) \times 100$  Bisiklet ergometresi testleri incelendiğinde Astrand Ryhming Bisiklet Testi'nin diğerlerine göre daha sık kullanıldığı görülmektedir (45-57,33,34)

### **3.2.2. Koşu Bandı Metotları**

#### **3.2.2.1. Bruce Yöntemi**

Koroner kalp rahatsızlığının tanısında sık kullanılan bir yöntemdir. Aynı zamanda maksimal performanstan MaxVO<sub>2</sub>'nin belirlenmesinde, diğer yöntemlerle karşılaştırıldığında geçerliliği en yüksek yöntem olarak kabul edilmektedir (58-70, 21, 33, 36). Bruce yöntemi başlangıçta düşük seviyelerde ve kişinin ısınması için zaman tanınarak uygulanmaktadır. Bu yöntemde iş yükü artışı diğer yöntemlere göre fazladır bu yüzden test çabucak tamamlanır (10).

Test, 2.7 km/s hızla ve %10 eğim ile başlamaktadır. Koşu bandı hızı ve eğimi her üç dakikada bir arttırılır. Kişi tükenene kadar teste devam eder (11).

Aktif ve sedanter erkeklerde hesaplama; (13)

$$MaxVO_2 = 14,8 - (1,379 \times T) + (0,451 \times T^2) - (0,012 \times T^3)$$

Aktif ve sedanter kadınlarda hesaplama; (12)

$$MaxVO_2 = 4,38 \times T - 3,9$$

“T”: Testin toplam zamanıdır (11).

#### **3.2.2.2. Balke Protokolü**

Bu test tıp ve fizyoloji laboratuvarında yapılan işin kapasitesini belirlemede veya maksimum oksijen tüketiminin belirlenmesinde yaygın bir şekilde kullanılmaktadır ve geçerliliği kabul görmektedir (71-76, 33.). Koşu bandında eğim %0, hız ise erkeklerde 5,5km hızda kadınlarda ise 4,8km hızda yürümeye başlarlar. Test boyunca hız sabit kalır. Koşu bandı ilk dakikadan sonra %2 seviyesine getirilir ve ondan sonra geçen her bir dakikada %1 arttırılır. Her dakikanın son 15 saniyesinde kalp atım sayısı kontrol edilir kalp dakikada 180 atıma ulaşınca kadar test devam ettirilir (11).

Aktif ve sedanter erkeklerde hesaplama; (14)

$$MaxVO_2 = 1,444 \times T + 14,99$$

$$R = 0,92, SEE = 2,50ml/kg/dk$$

Aktif ve sedanter kadınlarda hesaplama; (12)

$$\text{MaxVO}_2 = 1,38 \times T + 5,22$$

$$R=0,94, \text{ SEE}=2,20 \text{ ml/kg/dk}$$

### **3.2.3. Basamak Testleri**

Basamak testleri zamanın kısıtlı olduğu, laboratuvar ekipmanı olmadığı veya yoğunluğu yüksek olan egzersizlerin güvenliği olmadığı durumlarda uygulanan submaksimal testlerdir. MaxVO<sub>2</sub>'nin tahmin edilmesinde kullanılan bu testlerin uygulanması kolay, ucuz, taşınabilir. Aynı zamanda yaygın olarak da kullanılır (77-88, 27).

#### **3.2.3.1. Queens College Steps Test**

McArddle ve arkadaşları aerobik kapasiteyi belirlemek için 3 dakikalık adım testini geliştirdiler. Deneğe platforma nasıl inip çıkacağı gösterilir. Daha sonra denek eğer kadınsa platforma dakikada 22, eğer denek erkekse platforma 24 inme ve çıkma yapacak şekilde testi 3 dakika boyunca sürdürür. Test sonlandığında denek ayaktaiken 5. ve 20. saniyeler arasında 15 saniye boyunca sayılan kalp atım sayısı ölçülüp not edilir. Not edilen değer dakika değerine çevrilir (4xKAS) (10).

Kadınlarda;

$$\text{MaxVO}_2 = 65,81 - (0,1847 \times \text{KAS})$$

Erkeklerde;

$$\text{MaxVO}_2 = 111,3 - (0,42 \times \text{KAS}) (10).$$

#### **3.2.3.2. Harvard Basamak Testi**

Bu teste deneklerin maksimal performansını tahmin edebilmek için egzersizden sonraki toparlanma kalp atım sayısı kullanılmaktadır (28). Denekler belirli yükseklikteki platforma iniş ve çıkış yaparlar. Bu platformun yüksekliği erkek denekler için 50 cm kadın denekler için 40 cmdir. Denekler dakikada 30 iniş çıkış yaparlar (29). Bu iniş çıkışlar 5 dakika süreyle veya tükeninceye kadar devam eder. İnış çıkışların düzenli yapılması için metronom kullanılabilir ve 120 vuruşa ayarlanabilir. Test sırasında düzenli inip çıkmanın yapılabilmesi için dakikada 120 vuruşa ayarlanmış bir metronom kullanılabilir. Deneğin dinlenme sırasındaki kalp atım sayısı 1-1.5, 2-2.5 ve 3-3.5 dakikalar arası baz alınarak sayılır. Baz alınan süreler 30 saniyedir ve bu süreler içerisinde nabız değerleri not edilir (30).

$$\text{MaxVO}_2 = (100 \times \text{test süresi (sn)}) / 2 \times (\text{toparlanmadaki sayılan toplam kalp atımların toplamı}) (11).$$

### **3.2.4. Saha Testleri**

#### **3.2.4.1. 20 metre mekik testi (Shuttle Run)**

Leger ve Lambert tarafından (1982) geliştirilen bu test ortaya çıkmasından bu yana yaygın olarak kullanılmaktadır. Shuttle Run testi 20 metre uzunluğunda bir parkur içerisinde gerçekleştirilir. Kişi hızını her dakika 0,5 km/saat olacak şekilde düzenli olarak artırır. 23 bölümden oluşan bu testin uygulamasında dinlenme zamanı bulunmamaktadır. Testin uygulamasında sporcular 20 metre uzunluğundaki parkuru uçtan uca gidip gelmektedirler. Hız kontrolü ortama verilen sinyal sesi ile kontrol edilmektedir. Bu sinyal sesi 20 metrelik parkurun başında ve sonunda bulunmayı hedefler. Sporcular sinyal sesi her çalındığında 20 metrelik mesafeyi tamamlamalıdır. Eğer sporcu sinyal sesinden önce 20 metrelik koşusunu tamamlamışsa bir sonraki sinyal sesini beklemeli ve sinyalden sonra koşuya devam etmelidir. Sporcu, çalınan sinyal sesi ile 20m mesafeyi üst üste üç sefer tamamlayamazsa sporcunun testi sonlandırılır ve sporcu diskalifiye edilir. Testin sonucu, sporcunun geldiği seviye kullanılarak aşağıdaki bağıntılar yardımıyla hesaplanmaktadır.  $(16).MaxVo2(ml.kg^{-1}.dk^{-1}) = 31.025+3.238X-3.248A+0.1536AX$  X= koşu hızı (km.sa-1), A= yaş (yıl) (15).Saha testi olan 20 metre mekik testi “Shuttle Run” aerobik kapasitenin belirlenmesinde sıkça kullanıldığı görülmektedir (89-108).

#### **3.2.4.2. Yo-Yo Aralıklı Toparlanma Testi IRT1**

MaxVO<sub>2</sub>'nin belirlenmesinde Bangsbo tarafından geliştirilmiş en sık kullanılan saha testidir (9). Bu testin iki farklı biçimi vardır ve her ikisinin uygulanışı da shuttle run testine benzemektedir. Yoyo testi 20 metrelik (20m x 2) başlama, dönüş ve bitirme çizgilerinin bulunduğu toplamda 40 metrelik bir alanda uygulanmaktadır. Test sinyal sesiyle ve belirtilen çizgiler arasında sporcuların 10 km/s hızda koşmasıyla başlar. Koşu hızının aşamalı olarak artırıldığı bu test birbirini takip eden tekrarlı testlerden oluşur. Bu testte her bir tur yani 40 metrelik koşu tamamlandığında sporcular 2x5 metreden oluşan 10 saniyelik aktif toparlanma yaparlar. Test 10-13km/s'de 4 koşu, 13,5-14 km/s'de 7 koşu ve sonrasında her 8 turdan sonra hız 0,5 km/s artırılarak devam eder. 12 ve 13 km/s' hızla birer tur, 13.5 km/s hızla 3 tur, 14 km/s hızla 4 tur, 14.5 km/s hızla 8 tur ve ardından 0.5 km/s hız artışları ile 19.5 km/s hıza kadar sekizer tur şeklinde uygulanmaktadır. Sporcu bitkin düştüğünde veya art arda üç sinyal sesini kaçırdığında Yo-Yo testi sonlandırılır (18).Yo-Yo Aralıklı Toparlanma Testi Seviye 1:

$MaxVO_2 (ml/kg/dk) = IR_1 \text{ mesafe (m)} \times 0,0084 + 36,4$  şeklinde formüle edilmiştir. (18).

Saha testlerinden Yo-YoIR<sub>1</sub> testi aerobik kapasitenin belirlenmesinde sıkça kullanıldığı görülmektedir (109-124).

### **3.2.4.3. Cooper Test**

Cooper testi, Kenneth Cooper tarafından geliştirilen ve aerobik kapasitenin belirlenmesinde kullanılan testler arasında en yaygın kullanılan testlerden biridir. Cooper testi Amerika Birleşik Devletleri'ne bağlı askeri faaliyetlerinde, askerlerin aerobik kapasitesinin belirlemek amacıyla düzenli olarak uygulanmaktadır. Cooper testi iki farklı versiyon olarak karşımıza çıkmaktadır. Bunlardan biri 1.5 mil mesafe baz alınarak gerçekleştirilen ölçümdür. Bir diğer versiyonu ise 12 dakikalık koşudan oluşmaktadır. Testin popüleritesi ölçümün pratik ve maliyetinin düşük olmasına dayanmaktadır. Cooper'ın koşu testi 12 dakika sürmektedir. Kat edilen mesafenin belirlenmesi için bir ölçüm bandı gerekmektedir. Cooper testi ile VO<sub>2</sub>max belirlenirken; VO<sub>2</sub>maks: (Katedilen mesafe (m) -504,9) / 44,73 bağıntısı kullanılmaktadır. Aerobik kapasitenin Cooper'ın koşu testi ile arasındaki korelasyon ilişkisi r=0,9 olarak belirtilmiştir (20, 21). Saha testlerinden Cooper testinin aerobik kapasiteyi belirlemede sıkça kullanıldığı görülmektedir (125-133, 23,47).

### **3.2.4.4. Bir Mil Koşma/Yürüme Testi**

Bir mil koşma/yürüme testi uygulanabilirliği kolay, araç, gereci ucuz ve çok sayıda çocuğun aynı anda ölçülmesine olanak sağlayan bir yöntemdir. Bu nedenle bu test birçok okulun bataryasında yer almaktadır (10). Bir mil koşma/yürüme testi çocuğa uygulanırken ilk olarak gerekli açıklamalar yapılır. Çocuktan tüm mesafe yani 1mil (1,609 km) koşması istenir. Eğer çocuk bu mesafeyi koşarak tamamlayamıyorsa yürümesi istenir. Testin sonunda koşulan süre kayıt altına alınır. Test bitirildiğinde çocukların soğuması için 3-5 dakika yavaş tempoda yürümesi unutulmamalıdır. Bu test için literatürde yer alan fitnessgram ve AAHPERD (American Alliance For Health, Physical Education, Recreation and Dance) standartları tavsiye edilmektedir (10).

### **3.2.5. Maksimal Kol Ergometresi**

Hareket etme yeteneği olmayan ve bacaklarını egzersizde kullanamayan kişilerin MaxVO<sub>2</sub> lerinin belirlenmesi için çok uygun bir yöntemdir. Bu ergometrede denek bacaklarını uzatarak oturtulmalı ve krankın orta noktası omuz genişliğine göre ayarlanmalıdır. Denek kollarını bu ergometrede maksimal şekilde germelidir. Başlangıç yükü 75-150 kgm ve artışta 75-150 kgm olacak şekilde bacak ergometresindeki yöntem devam ettirilir. Denek bu artışlara yetişemediğinde test sonlandırılır (10, 41). MaxVO<sub>2</sub> = kgm/dk x 3ml/kgm + (3,5ml/kg.dk x ağırlık)

#### **4.Sonuç**

Sonuç olarak literatür incelendiğinde aerobik kapasitenin belirlenmesinde direkt ve indirekt olmak üzere birçok yöntem kullanılmaktadır. Aerobik kapasitenin direkt ölçülmesi oldukça güvenilir sonuçlar verir fakat pahalı, ulaşımı kolay olmayan ekipmanların kullanımı ve bu yöntemlerin tecrübeli kişilerce uygulanması gerektiğinden uygulanması sınırlı yöntemlerdir. Bu nedenle indirekt yöntemler olan; bisiklet testleri, koşu bandı testleri, basamak testleri ve saha testleri daha sık kullanılmaktadır. Bu indirekt yöntemler kendi içerisinde incelendiğinde ise Astrand Ryhming Bisiklet Testi, Bruce Protokolü, Balke Testi, Cooper Testi, 20 metre Mekik Testi, Yo-Yo Testi gibi testlerin sık kullanıldığı göze çarpmaktadır. Ayrıca sporcuların aerobik kapasitelerinin belirlenmesinde saha testlerinin, bisiklet testleri, koşu bandı testleri ve basamak testlerine göre daha sık kullanıldığı tespit edilmiştir.

**ÖZET**

Kurumsal kimlik tasarımı, bir markanın piyasada nasıl var olmak istediğini, nasıl algılanmak istediğini ve hangi özelliklerini, değerlerini tanıtmak istediğini belirlemek için oluşturulan bir grafik ve görsel kimlik sistemidir. Bu görsel kimlik sistemi, markanın birliğini ve zamansal süreçteki profesyonel olarak ilerlemesini sağlar. Tüketici ve rakip markalar arasında marka algısının yapılandırılmasına katkıda bulunur. Kurumun benliğini, vizyon ve misyonunu, hedeflerini, özgün kişiliğini yansıtan bir marka kimliği ve görsel çözümlemesini oluşturmak için tasarlanır. Tıpkı her bireyin farklı benliğinin olması gibi, her markanın da kurumsal kimlik tasarımının görsel betimlemesi karakteristik olarak marka hakkında bilgi verir. Kurumsal kimlik tasarımı; logo tasarımı, ambalaj tasarımı, web sitesi tasarımı, tipografi, görsel iletişim, kurumsal dokümanlar, renk paleti unsurlarını içerebilir. Kurumsal kimliğin ana üretim kanallarının dışında birçok tanıtıcı malzemeler vardır ve bu kanallardan biri de promosyon ürünleridir. Promosyon ürünleri, markanın kurumsal kimliğinin bir taşıyıcısı olarak; markanın bilinirliğini artırma, itibar ve güven inşası, pazarlama ve tanıtım, rekabet üstünlüğünü sağlama açısından büyük bir öneme sahiptir. Promosyon ürünü olarak tasarlanan, tarihsel süreçte geçmişten günümüze kadar uygulama alanlarından biri de kibrit kutusu tasarımlarıdır. Bu araştırmanın amacı; kurumsal kimlik tasarımlarının önemli bir taşıyıcısı olarak var olan kibrit kutusu tasarımlarındaki 20. yüzyıl sanat akımlarının yansımalarını açığa çıkarmaktır. Araştırmada kibrit kutularının içinde bulunduğu dönemin popüler kültürünün hafızalara kazınan imgesel izleğinden yansımaları nasıl taşıdığı incelenecektir. Nitel araştırma yöntemlerinden betimsel tarama modelinin kullanıldığı bu çalışmada; kibrit kutusu ambalaj tasarımlarının zaman içerisindeki biçimsel ve tasarımsal gelişimi, değişimi irdelenecektir.

CARRIER REFLECTIONS OF 20TH CENTURY ART MOVEMENTS**

**Abstract**

Corporate identity design is a graphic and visual identity system created to determine how a brand wants to exist in the market, how it wants to be perceived and what features and values it wants to promote. This visual identity system ensures the unity of the brand and its professional progress in the temporal process. It contributes to the structuring of brand perception among consumers and competing brands. It is designed to create a brand identity and visual analysis that reflects the organization's identity, vision and mission, goals and unique personality. Just as each individual has a different self, the visual description of the corporate identity design of each brand characteristically provides information about the brand. Corporate identity design can include logo design, packaging design, website design, typography, visual communication, corporate documents, color palette. There are many promotional materials outside the main production channels of corporate identity and one of these channels is promotional products. Promotional products, as a carrier of the brand's corporate identity, have a great importance in terms of increasing brand awareness, building reputation and trust, marketing and promotion, and ensuring competitive advantage. Matchbox designs are one of the application areas that have been designed as promotional products from the past to the present. The aim of this research is to reveal the reflections of 20th century art movements in matchbox designs that exist as a carrier of corporate identity designs. In the research, it will be examined how matchboxes carry reflections from the imaginary trace of the popular culture of the period in which they are located. In this study, in which the descriptive survey model, one of the qualitative research methods, is used; the formal and design development and change of matchbox packaging designs over time will be examined.

**Keywords:** Graphic Design, Corporate Identity Design, Illustration, Promotional Product, Matchbox Design;

## **GİRİŞ**

Benlik kavramı, var olmanın başlıca konularından biridir. Bu kavram ile birlikte, insanların yaşam biçimlerinin şekillenmesi gibi kurumların da görsel kimliği şekillenmektedir. Bu nitelikte insanlar benliklerini kimlik algısıyla tarif edebilirler. “Değerlerin oluşumunun kaynağı nedir?”, “Temsil edilen ve yansıtılan özellikler nelerdir?” gibi sorular kimlik algısının oluşumuna katkı sağlar. Kimlik algısı, kurumlarda vizyon-misyonu, değer, anlam ve hedeflerini yansıtmaktadır. Kimlik kavramı kendi içinde bireysel, kolektif ve kurumsal kimlik olmak üzere üç şekilde oluşabilir. Literatürde gelmiş geçmiş ilk ve en büyük endüstriyel tasarımcı ve kurumsal kimlik olgusunun duayeni sayılan Peter Behrens, “Tasarım, işlevsel formları dekore etmek değildir; nesnenin karakterine uygun ve yeni teknolojileri avantajlı gösteren formlar yaratmaktır” diyerek kimlik kavramının, kurumsal kimlik çerçevesinde markalar için tasarlanırken, tıpkı bireylerde gelişen benlik kavramında olduğu gibi, spesifik olarak tasarlanması gerektiğine atıfta bulunmuştur (Georgia Cheirchanteri, 2016). Behrens’in, endüstri alanında bütünleştirici düzeyde yaptığı; markanın algı standartlarını yükseltmenin ancak tasarımla sağlanabileceğine dair olan çalışmaları geçmişten günümüze, kimlik kavramının gelişmesine ve ilerlemesine ışık tutmuştur. Her marka, kendi benliğini ifade etmek ve rekabet avantajı elde etmek için özel bir kurumsal kimlik tasarımına ihtiyaç duyar. Kurumsal kimlik tasarımı, genellikle logo tasarımı, ambalaj tasarımı, web sitesi tasarımı, tipografi, renk paleti, görsel iletişim ve kurumsal dokümanlar gibi farklı öğeleri içerir. Bunlar, markanın tutarlı bir şekilde tanıtılmasını ve tüketiciye güçlü bir marka izlenimi sunmasını sağlar. Ayrıca, promosyon ürünleri gibi farklı kanallarda da markanın kimliğini taşır. Promosyon ürünleri, markanın bilinirliğini artırma, itibar oluşturma, pazarlama ve rekabet üstünlüğü sağlama amacıyla kullanılır. Kibrit kutusu tasarımları da bu promosyon ürünlerinin örneklerindedir. Bu araştırmanın amacı, 20. yüzyıl sanat akımlarının kibrit kutusu tasarımlarına nasıl yansıdığını incelemektir. Promosyon ürünlerinden biri olan kibrit kutusu tasarımlarının; süslemeden oldukça uzakta, yalın bir görsel üslupta illüstre edilerek tasarlanmasının nedeni; işlevin güzellik kavramı ile kolektif çalışmasıdır. Kibrit kutuları, içerdikleri dönemin popüler kültürünü ve görsel unsurlarını yansıtarak tarihsel bir iz bırakır. Bu çalışma, kibrit kutusu ambalajlarının biçimsel ve tasarımsal evrimini ve dönemsel değişimlerini detaylı bir şekilde ele alarak bu yansımaları analiz edecektir.

## **1. KURUMSAL KİMLİK TASARIMI**

“Kimlik” kelimesi, “bir ‘kişi’ ya da ‘şey’i tanıtan tekil karakteristikler” şeklinde bütünsel olarak tanımlanmıştır. Bu çerçeveden bakılınca kimlik olgusu, diğerinden farklılaştıran özellikler ile bireyselliğe atıfta bulunur. Kurumsal kimlik için tanımlanmış evrensel bir tanım bulunmamakla birlikte literatürde kurumsal kimlik kavramının geniş ve dar yelpazede tanımları vardır. Kurumsal kimliğin temasta bulunduğu multidisipliner yapı sebebiyle tanımı ile ilgili tarihsel süreçte değişkenlik göstermiştir (Collins English Dictionary, 2002, s.482). Tüm bu süreçteki en nihai bulgu; bir markanın tanımında ifade biçimi olarak tercih edilen üslup, iletişim yöntemi olarak kurgulanan ifade öbekleridir. Kimlik olgusu, genel olarak bir bireyin benzersiz özelliklerini, karakterini ve tanımlayıcı unsurlarını ifade eder (Erikson, 1959, s.18-26). Bu kavram, bir kişinin kendini tanımlama, aidiyet duygusu, kim olduğunu anlama ve diğer insanlarla ilişkiler kurma sürecini içerir. Kimlik, sosyal, kültürel, cinsel, etnik, dini ve kişisel faktörlerin bir kombinasyonu olarak ortaya çıkabilir (Keyman, 2007, s.217-230). “Guichaoua’ya göre (1998); “Bütün diğer toplumsal olgular gibi etnik, dini, kültürel vd. kimlikler de mevcut ve kabul gören değil, kurulan, inşa edilen olgulardır.”” (Günay, 2010, s.144) Kimlik, bireyin sahip olduğu özelliklerle şekillenir ve genellikle şu unsurları içerir: kişisel kimlik, sosyal kimlik, kültürel kimlik, cinsel kimlik ve etik kimlik. Aynı zamanda kimlik olgusunda, bireyin içsel algısıyla dış dünyadaki algılar arasında farklılıklar olabilir. Bu açıdan bakılınca kimlik, kişinin kendisini ve başkalarını anlaması, kabul etmesi ve iletişimde denge yaratması açısından önemlidir. Markanın görsel kimliğinde öncelikle kimlik olgusunun inşası kurulur; hangi duyguyu vereceği ve eylem ayağının nasıl ön planda oluşacağı gibi sorular çerçevesinde şekillenir. 19. Yüzyılın başlarında sadece logo tasarımı ile kurulmaya başlanan kimlik inşası, 1970’lerden itibaren kimlik üzerine markayı kurgulamak daha bilinçli bir şekilde ele alınmıştır (Karsak, 2008). Kurumsal kimlik, iletişim kanalında markanın benzersiz ve tanınabilir bir karaktere sahip olmasını sağlayan görsel ve sözlü unsurların bütünüdür. Bu unsurlar arasında logo, renk paleti, tipografi, dil ve iletişim tarzı, kurumsal misyon ve vizyon gibi öğeler bulunur. Kurumsal kimlik, bir şirketin hedef kitlesi ile iletişim kurmasını, güvenilir bir imaj oluşturmasını ve marka değerini artırmasını amaçlar. Bu durumda kurumsal iletişim, kurumsal dil, mesajlar, ton ve tarz gibi unsurların bir bütünüdür ve böylece kurumun hedef kitlesiyle nasıl iletişim kuracağını belirler. Alman sanatçı, mimar ve endüstriyel tasarımcı Peter Behrens; endüstri alanında, Alman Jugendstil ve Alman Ekspresyonist akımlarında önemli ve öncü bir figürdür. Behrens; 19. Yüzyılın başında, Alman sanayi devi olarak görülen AEG (Allgemeine Elektrizitäts-Gesellschaft) isimli firmada genel sanat yönetmeni olarak aktif rol

aldığı periyotta, mimarlık ve tasarım dünyasında büyük izler bırakmıştır. Behrens, kurumsal kimlik tasarımı sürecinde; toplum ve sanatın birleşimi, kurumsal kimliğin bütünselliği, özgün ve tanınabilir tasarımlar gibi özellikleri prensip olarak ele almıştır. Bu sebeple, AEG markası için tasarlamak için giriştiği logo ve ürün tasarımları, markanın güçlü bir kimlik oluşturmasını sağlamıştır. (Anderson, 2002). Peter Behrens'in tasarımları ve kurumsal kimlik anlayışı, modern endüstriyel tasarım ve kurumsal kimlik oluşturma süreçlerine önemli adımlar olmuştur. Bu dönemde; Walter Gropius gibi, Behrens ile birlikte çalışan bazı genç yetenekler, Bauhaus'un öğrenci ve öğretmenleri olacak isimlerdir. En nihai sonuç olarak; Gropius'un disiplinde Behrens'in etkisi olarak, sanat ve endüstriyi birleştirme vizyonu görülmektedir. Bauhaus'un en baş prensiplerinden biri, sanatı ve zanaatı bir bütün olarak ele alıp, endüstriyel tasarımı öne çıkarmaktır (Droste,1994, s.22-34). Bu prensipler, Behrens'in öncüsü olduğu endüstriyel tasarım ekolünün etkisi altında kalmış olabilir. Bu açıdan bakılınca, Behrens ile Bauhaus disiplini arasındaki köklü bağ, tasarım tarihindeki önemli bir geçiş dönemine ve modern tasarımın evrimine ışık tutan bir etkileşim örneği olarak görülebilir.19. Yüzyılın birinci yarısının erken döneminde, kurumsal kimliği tasarlanmak üzere profesyonel süreçten geçen ilk marka, Bass Ale olmuştur. 1876'da İngiltere merkezli bir bira üreticisi olan Bass & Company, firmanın birası olan Bass Ale için dünyada tanınan bir marka oluşturma amacıyla, kırmızı üçgen şeklindeki logo ve diğer marka öğelerini kullanmaya başlamıştır (Bass&Company, 2001). Bu, marka ve ürün arasında bir bağlantı yaratmak ve tüketicilerin zihinlerinde markanın kalıcı bir imajını oluşturmak amacıyla yapılan erken bir girişimdir. Ancak, kurumsal kimliğin tam anlamıyla tasarlanması ve yönetilmesi konsepti daha sonraki yıllarda gelişmiştir. Modern anlamda kurumsal kimlik tasarımı, markanın görsel öğeleri, mesajları ve diğer unsurlarıyla bütünlüğünü sürdürme çabalarından gelmektedir. 19.Yüzyıl sonlarında, birinci sanayi devrimi ile birlikte; tüketim toplumu oluşmuş, seri üretim ve markalaşmada rekabetin artması nedeniyle kurumsal kimlik yapılaşmaya başlamıştır. Bu çağda endüstrileşme ve ticaretin artmasıyla birlikte şirketlerin rekabeti artmış, bu da kurumsal kimliğin önemini ortaya çıkarmıştır. İlk başlarda, kurumsal kimlik unsurları sadece logoları içermiş, ancak zamanla bu unsurlar da gelişmiştir. 1920'ler ve 1930'lar, marka kimliği ve tasarım alanında önemli gelişmelerin yaşandığı dönemlerdir. Bu aralıkta, şirketler alıcı ile bağ kurmak ve ürünlerini diğerlerinden ayırmak için markalaşma ve kurumsal kimlik unsurlarını kullanma eğilimine girmiştir. 1950'ler ve 1960'lar, kurumsal kimlik alanında daha fazla standardizasyon ve bilinçli strateji dönemleridir. Öyle ki bu dönemde, renk seçimi, tipografi ve logoların kullanımı daha bilinçli bir şekilde ele alınmıştır. 1970'lerde kurumsal kimlik alanında; tasarım ve tasarlamak bilincinin

gelişmesiyle birlikte, kurumsal düzeydeki bir tasarım sorunu olarak yoğunlaşmıştır (Meral, 2011). Bu var olma durumu, kurumsal kimliğin sistematik düzende stratejik bir kazanım ve rakip markalar arasında avantaj niteliğinde bir adım olarak görülmesidir. Kurumsal kimlik tasarımı markaların, itibarının artırması ile birlikte kurumsal paydaşlarının yatırım planlarını ve marka ürünlerinin tercih edilmesini önemli ölçüde etkilediği izlenilmektedir. Bununla birlikte, çalışanların kurumsal aidiyetinde kimlik olgusunun gelişmesi, vizyon ve misyonunu benimsemesi; yaratılan kimlik olgusuna daha duyarlı olmalarını sağlamış ve entegrasyonunu pratik hale getirmiştir. Geçmişten günümüze etkileri çığ gibi büyüyen markalaşma hali, marka yönetimi stratejilerinin ayrılmaz bir parçası olmuştur ve markaların başarı adımlarında önemli bir rol oynamıştır. David Aaker, kurumsal kimlik konusunda önemli katkılarda bulunan akademisyen ve yazarlardan biridir. Aaker, “Building Strong Brands” (Güçlü Markalar İnşa Etmek) adlı kitabında, marka yönetimi ve kurumsal kimlik konularına değinerek bu alanda öncü bir figür olarak kabul edilmiştir. Bu alandaki diğer önemli figürler arasında Wally Olins, Paul Rand, Saul Bass gibi isimler de bulunmaktadır. Ancak, kurumsal kimlik kavramının evrimi birçok farklı faktör ve etkenle şekillendiği için, tek bir öncü belirlemek oldukça güçtür. Bu sebeple öncü isimleri dönemsel olarak, gelişen ve genişleyen unsurlar çerçevesinde incelemekte fayda vardır. (Aaker, 1996 s.41). Kurumsal kimlik tasarımı, bir şirketin veya kurumun görsel olarak temsil edildiği ve tanındığı bir dizi grafik öğeyi içerir. Bu öğeler, kurumsal kimlik tasarımının yapısal ve biçimsel özelliklerini oluşturur. Bu sebeple kurumsal kimlik tasarımı; kurumun değerlerini, kültürünü ve kimliğini yansıtarak genel bir birlik ve tanıma sağlar. Tarihsel süreç içindeki bu olgunun gelişimi, hem kimlik algısının tam olarak oturması hem de tasarım çözümlemesi açısından çeşitlenmesi ile farklı üsluplar ve yeniliklerle evrimleşmiştir. Bu evrim, kurumsal kimlik tasarımının yapısında biçimsel değişikliklere yol açmıştır. Bu noktada, yapısal ve biçimsel özelliklerin neler olduğunu açıklığa kavuşturmadan önce; bu değişimin, araştırmanın doğru bir şekilde iletilmesi ve anlaşılabilirliğinin artması açısından önemini vurgulamak gerekmektedir.

## **2. KURUMSAL KİMLİK TASARIMININ YAPISAL VE BİÇİMSEL ÖZELLİKLERİ**

Görsel kimlik tasarımının inşasında; kurumsal kimliğin iletişimsel, işlevsel ve etken yönlerinin belirlenmesi, paydaşlar ve alıcılar arasında algı gücünü arttırmaktadır. Bu sebeple; kurumsal kimlik tasarımının yapısal ve biçimsel özellikleri belirlenirken; markanın karakter oluşumunu, vizyon-misyonunu ve tanımlayıcı unsurlarını kapsar. Bu unsurlar sayesinde kurumsal kimlik tasarımının en temel oluşum özellikleri şekillenir. Logo, renk paleti, tipografi, illüstrasyon, fotoğraf, görsel iletişim kuralları, kurumsal belge şablonları, kurumsal iletişim stili; slogan ve

iletiřim tonu, ambalaj tasarımı ile promosyon ürünleri bu unsurları oluşturur ve görsel kimlięi belirler (Olins, 1989, s.464-467). Bir markanın kaliteli ve prestijli duruş sergileyebilmesi için kimlik olgusu üzerine bir görsel çözümleme oluşturması gerekmektedir. Bu görsel çözümleme de yapısal ve biçimsel özelliklerinin tespit edilip, bu üslupta inşa edilmesi ile mümkün olmaktadır. Biçimsel özellikler, kurumsal kimlięi oluşturan öğelerin formunu, ergonomik biçimini kapsar. Yapısal özellikler ise antetli kağıt, kartvizit, afiş, flyer, zarf ve dosya çeşitleri, bigilendirme grafikleri, isimlikler vb. ürünleri kapsamaktadır. Bu ürünlerin yanında da promosyon ürünleri olarak belirlenen kurumsal kimlięin en belirgin taşıyıcı ürünleri vardır. Kurumsal kimlik ürünlerinin aynı üsluba ait bir şekilde mutabık kalarak tasarlanması; markanın akılda kalıcılıęını ve bu sayede bilinirliğini artırır. Tercih edilen renk skalası, markanın karakteristik olarak oluşturulan kimlik inşasının duyu ve atmosferini yansıtarak tüketiciyle duygusal baę kurmasını elverişli kılar. Renk paletinin tutarlı kullanımı da marka algısının güçlenmesine fayda sağlar. Bununla birlikte, markanın kimlik olgusuyla bütünleşen yazı karakterleri ve tipografi tercihleri; markanın yazılı iletiřiminin bütünü oluşturur. Tasarlanan tipografik görselleştirme, markanın profesyonel ve güvenilir bir imaj sergilemesini destekler. Tipografi unsurunun güçlü ifadesi; fotoğraf ve imgelere senkronize bir şekilde, görsel kimlięin genel estetięini belirler. Bir dięer unsurlardan biri de markanın reklam sloganı ve iletiřim kanalını oluşturan iletiřim tonudur. İletiřim tonu; markanın kiřilięi ile birlikte sesini ifade eder. Bu sebeple; bir üslubu biçimsel olarak marka ile eşleřtirmek, markanın tutarlı bir duruşa sahip olmasına katkı sağlar. Bunun yanında, kurumsal kimlik oluşumu için tasarlanan promosyon ürünleri ve dięer iletiřim araçları üzerinde kullanılan kurumsal belirteçler, markanın yekpare bir üslupta algılanmasına katkıda bulunur. Promosyon ürünleri: Kimlięin taşıyıcı rolünü üstlenmesi ile birlikte tüketiciyle en yaygın ve pratik şekilde etkileşim kuran grafik ürünlerdir. Promosyon ürünlerine kimlik algısını aktaran tipografi, imge, renk, fotoğraf, illüstrasyon gibi unsurlar; logo ile birlikte nokta, çizgi, renk, biçim, yön, ölçü, aralık ve doku gibi tasarım prensiplerinin çerçevesinde kurgulanır. Kurumsal kimlik tasarımının, tasarım prensiplerinin kullanım kolaylıęının ve birlięinin sağlanması açısından kılavuzları oluşturulur. Oluşturulan kılavuzlarda; grafik ürünlerin kullanım kuralları ve standartları mevcuttur. Bu standartlar, materyallerin ve iletiřim araçlarının bir bütünlük içinde olmasını, iletinin net ve etkili bir şekilde aktarılmasını sağlar. Başarılı bir tasarım ortaya çıkabilmesi için kurumun kimlięini yansıtan yapısal ve biçimsel özelliklerin ön planda olması gerekmektedir. Örneğin; kullanılan kırmızı renginin tonu, fontun sans veya serifli tercih edilmesi, minimal çizgilerin görsel öğelere eşlikçi olması, imgenin güçlü ifadesi ve kimlik olgusuyla şekillenen illüstratif çözümleme gibi

yapıların spesifik oluşu; tarihte birçok markanın ikonik hale gelmesine katkı sağlayan unsurlara örnektir. Bu yapısal ve biçimsel özelliklerin şekillenmesi ilk olarak Bauhaus öğretisi ile başlamıştır.1920’li yıllarda Almanya’da kurulan Bauhaus okulu, estetik olgusu ile tasarımın işlevselliğini birleştiren bir ekol ile eğitim vermiştir. Kurumsal kimliğin babası olarak anılan Behrens’in öğretilerinin etkisinde olan Bauhaus disiplini, modern kurumsal kimlik tasarımının temellerine katkıda bulunan minimalist ve fonksiyonel tasarım prensiplerini benimsemiştir (Chakraborty and Forgas, 1997, s.15-30). Kurumsal kimlik tasarımının yapısal ve biçimsel özellikleri tarihsel süreçte, birçok markanın gelişimi ve pazar lideri oluşumu nedeniyle evrilerek günümüze kadar aktarılmıştır. IBM (International Business Machines) markası, bu süreç içerisinde önemli bir örnektir. IBM, 1950’li yıllardan beri kurumsal kimlik tasarımı alanında öncü markalardan biri olmuştur. 1956’da Paul Rand, 1956 yılında ünlü “IBM” logosunu tasarlamıştır (Rand, 1993, s.113). Bu logonun tasarım tercihi olarak, sade ve modern oluşu ile döneme damga vurmuş, dikkat çekmiştir. Minimal yapısıyla öncü olan bu logo, mavi renk kullanımı ile markanın güvenilirliğine atıfta bulunarak profesyonelliğine vurgu yapmış ve ikonik hale gelmiştir. Geniş ürün yelpazesi ile karmaşık bir teknoloji markası olmasına tezat, yalın ve açıklayıcı bir dil ile inşa edilmiş kurumsal kimlik tasarımı onu döneminde spesifik kılmıştır. Bu kronolojik düzende aktarılan ve döneminde elde ettiği başarı ile kalıcı olan örnekler, kurumsal kimlik tasarımının zaman kavramı ile nasıl evrildiğini ve tasarımsal prensipleri nasıl benimsediğini göstermektedir. Her örnek, döneminin sosyo-kültürel ve tasarım trendlerine uygun bir şekilde, markanın kimlik inşasına göre nasıl oluştuğunu; yapısal ve biçimsel özelliklerinin belirleyici unsurlarını yansıtmaktadır. Kurumsal kimlik tasarımının; marka logosu, renk paleti, tipografi, ambalaj tasarımı gibi unsurları, promosyon ürünlerinde kimliğin taşıyıcısı olarak rol üstlenmektedir. Promosyon ürünleri; bir markanın değerlerini, kalitesini yansıtarak hedef kitlesine tutarlı ve bütünsel bir izlenim sunar. Günümüzde, dijital pazarlama ve sosyal medya gibi faktörlerin etkisiyle kurumsal kimlik tasarımı daha da önemli hale gelmiş ve bu sayede markaların sektörlerinde rekabet avantajı kazanmalarını sağlamıştır. Böylece kurumsal kimlik tasarımı sadece bir estetik tercih değil, aynı zamanda stratejik bir iletişim aracı haline gelmiştir.

### **3. KURUMSAL KİMLİK TAŞIYICISI OLARAK PROMOSYON ÜRÜNLERİ**

Kurumsal kimlik taşıyıcısı olarak tasarlanan promosyon ürünleri, bir markanın veya kurumun pazarda pozitif algısını desteklemek için kullanılan etkili bir stratejik araçtır. Promosyon ürünleri; fiziksel olarak temsil edilen, markanın kimlik olgusunu doğrudan aktaran ve bir taşıyıcı olarak genellikle logonun öne çıktığı tasarımlarla şekillenmektedir. Tanınabilirlik ve

marka imajı, müşteri sadakati ve memnuniyeti, reklam ve pazarlama etkisi, çeşitlilik ve kişiselleştirme, etkileşim ve iletişim promosyon ürünlerinin etki alanlarıdır (Mullin, 2010, s.35-43).Promosyon ürünleri, kurumun kimliğini oluşturan görsel elemanlardan; logo, renk paleti, illüstrasyon, fotoğraf, tipografi, gibi özgün unsurlarını içerdiği için markanın bilinirliğini arttıran en önemli taşıyıcılardır. Promosyon ürünlerinin aktarımı ile paydaşlar, alıcılar ve marka çalışanları aidiyet duygusu ile güçlü bir bağ kurar ve bu marka imajına olumlu şekilde yansır (Airey, 2019, s. 14-19). Ücretsiz olarak verilen veya uygun fiyatlı satılan promosyon ürünleri, alıcılar için değerli bir hediyeyi temsil eder. Bu durum, paydaşlara kıyasla memnuniyet yaratır ve marka sadakatini kazandırır. Promosyon ürünleri, taşıyıcısı olduğu marka üslubunu farklı kategorilerdeki küçük ürünler ile alıcılara sürekli bir hatırlatma sağlar. Özellikle günlük kullanımda bu ürünler, rutinlerinde markanın varlığını sürekli kılar, böylece çok etkili bir reklam ve organik kanallarla iletilen bir pazarlama aracı haline gelir. Promosyon ürünlerinin geniş bir yelpazesi vardır. Bu çeşitlilik, markanın hedef kitesine uygun olarak seçilebilir. Ürünlerin çeşitliliği arttırılabilir ve potansiyel taşıyan alıcılara veya hedef gruplara istinaden özelleştirilmesi mümkündür. Promosyon ürünleri, marka ile potansiyel alıcılar arasında doğrudan bir etkileşim kanalıdır. Etkin bir promosyon stratejisi planlanırsa, alıcı ile marka arasında iletişim doğru bir şekilde kurulabilir, güçlendirilebilir ve böylece markanın geniş kitlelere ulaşmasını sağlanabilir.Kurumsal kimliğin taşıyıcısı olarak kullanılan promosyon ürünleri: kalem, defter, ajanda, bardak, termos anahtarlık, rozet; şapka, tişört, çorap, havlu, önlük ve kanvas çanta gibi tekstil ürünleri; usb bellek ve teknoloji ürünleri, fuar stand ürünleri ile kristal ürünler gibi geniş bir ürün yelpazesine sahiptir. Markanın sektörüne göre de spesifik olarak çeşitlilik gösterebilir (Airey, 2019, s.235-240). Markayı taşıyan etkili iletişim araçları, promosyon ürünleri, fiziksel nesnelere aracılığıyla marka mesajını iletmek ve alıcı ile doğrudan etkileşim kurmak amacıyla kullanılan güçlü bir araçtır. İyi planlanmış bir promosyon ürün stratejisi, markanın tanınabilirliğini arttırıp, hedef kitleyle güçlü bir bağ kurabilir. Bu nedenle, işletmelerin promosyon ürünlerini etkili bir şekilde kullanmaları, marka yönetimi ve pazarlama stratejilerini destekleyerek prestij sağlar ve başarıya giden yolda önemli bir adımdır. Kibrit kutusu tasarımı da promosyon ürünleri içerisinde görsel üslubu ve işlevselliği bir arada yansıtarak marka imajını güçlendirebilecek önemli bir üründür.Markanın kimliğini yansıtan bir tasarım, kibrit kutusunu sadece bir tasarım çözümü olarak değil, aynı zamanda markanın özünü yansıtan bir taşıyıcı haline getirir. Örneğin, kibrit kutusunun ambalaj tasarımında; yumuşak tonlarda bir yüzey üzerine yerleştirilmiş marka logosu, markanın öne çıkan renklerini ve sembollerini vurgular. Aynı zamanda, kutunun üzerindeki minimalist tasarım veya çizim ile

tercih edilen yazı karakterleri, modern ve sofistike bir imaj yaratır. Kibrit kutusunun tasarımı kadar formu da markanın bir taşıyıcısı olarak kabul edilir. Genellikle dikdörtgen formda kullanılan biçim, markanın tasarım üslubuna göre; kare, iki kanatlı, çekmeceli, diyagonal açılı sağ-sol bitişli gibi farklı fonksiyonellikte tasarlanabilir. Böylece, kullanıcılar günlük hayatta kibritleri kullanırken markayı hatırlayacak ve marka sadakati oluşturacaktır. Kibrit kutusu tasarımı, küçük boyutuna rağmen marka etkileşimini ve tanıtımını maksimum seviyeye çıkarmak için güçlü bir araçtır.

#### **4. KİBRİT KUTUSU TASARIMI**

Kibrit kutusu tasarımı, kibritin icadından başlayarak zaman içindeki evrimi ve tasarımındaki değişiklikleri içerir. Kibritin İcadı, Kimyager John Walker tarafından 1826'da tesadüfen kibritin ilk formülünü keşfedilmiştir (Stone, 2014). Ancak, bu kibritler zamanla güvenlik sorunlarına neden olduğu için pek popüler olmamıştır. 1830 yılında ise fosforlu kibrit icat edilmiştir. İsveçli kimyager Jöns Jakob Berzelius ve İngiliz mucit Charles Sauria, güvenli ve kullanışlı bir kibrit formülü olarak bu kibriti geliştirmişlerdir. Bu yeni kibrit türü, sülfür ve fosfor içeren başlığı sayesinde sürtüşmeyle ateşlenmektedir. 1836 yılında üretilen kibritlerin kullanımının fonksiyonel olması açısından İngiliz kâğıt üreticisi olan Joshua Pusey, ilk pratik kibrit kutusunu tasarlamıştır (Jones, 2004, s.7-12.) Bu tasarım, günümüzdeki en yaygın kullanımı olan; kibritleri içeren bir kutunun yan tarafındaki sürtüşme yüzeyi ile kibritleri ateşleme prensibine dayanmaktadır. 19. yüzyılın sonlarına doğru gelişen ve değişen kibrit kutusu tasarımları; materyal ve yüzey kullanımı açısından da zenginleşmiştir. O dönemlerde metal, karton, tahta dokularında üretilen kutular, çeşitli konulardaki illüstratif anlatımlarla oluşturulmuştur. 20. yüzyılda kibrit kutusu tasarımları, marka tanıtımı ve pazarlaması amacıyla promosyon ürünü olarak kullanılmaya başlanmıştır. Reklam ve marka bilincini kazandırmak amacıyla 20. yüzyıl sanat akımlarının izleriyle renkli baskı teknolojisinin de gelişimi ile birlikte dikkat çekici illüstrasyon ve tipografi kullanımları kibrit kutularına entegre edilmiştir. 20. yüzyıl ortalarında, 1930-1960'lı yıllar arasında; ikinci Dünya Savaşı sonrasında, Amerika ve Avrupa'da Midcentury tasarım öne çıkan bir stil olmuştur. Bu dönemde tasarımcılar, modernlik ve işlevselliği ön planda tutmuşlardır. Savaş sonrası döneminin adaptasyonunu kolaylaştırmak için modern tasarımcılar, yeni bir kimlik oluşturma yolunda ilerlerken; güzellik kavramına basitlik, rahatlık ve konfor katmak için tamamen yenilikçiliğe yönelmiştir. 1980'ler sonrası post modernizmin hakimiyeti ile birlikte karmaşıklığı, ironiyi, parodi ve referansları içeren bir renkli bir estetik ile bilinir. Nonkonformist yaklaşımlar ve sembolizm ile öne çıkan Postmodernizm dönemi; grafik tasarımın ve reklam stratejilerinin yükselişte olması sebebiyle, kibrit kutusu

tasarımlarının da daha çeşitli ve çarpıcı olmasına olanak tanımıştır (Antmen, 2003, s.30-33-s.112) 2000'ler ve daha sonrası: Diğer ambalaj tasarımlarında olduğu gibi, kibrit kutusu ambalaj tasarımlarında da çevre dostu materyaller ile yenilikçi tasarımlar daha çok ön planda tutulmuştur. Son yıllarda, geri dönüşüm bilincinin de artmasıyla birlikte; çevre dostu malzemelerin ve sıfır atık ambalajlarının önem kazanması, kibrit kutusu tasarımlarında da çevreci tasarımsal tercihler odak haline gelmiştir. Bu doğa dostu tasarımlar ve geri dönüştürülebilir materyaller, tüketicilerin dikkatini çekmeye başladı. Bugün, kibrit kutusu ambalaj tasarımları, markanın kimlik olgusu, hedef kitle beklentileri ve çevresel farkındalık gibi faktörlerle paralel olarak çeşitli ve özgün tasarlanabilmektedir. Estetik, ergonomik tasarım ve popüler tüketim kaygılarıyla kurumsal kimliğin bir taşıyıcısı olarak tasarlanan kibrit kutusu tasarımlarının her biri, kendi içinde benzersiz özelliklere sahip ve farklı hedef kitleler üzerine etki etmektedir. Kurumsal kimlik tasarımının yapısal ve biçimsel özellikleri bölümünde bahsedilen, marka sloganı ve ileti tonu da tasarımların dönemsel olarak etkisindeki önemli bir unsur olmuştur.

## **5. 20.YÜZYIL SANAT AKIMLARI ÇERÇEVESİNDE KİBRİT KUTUSU TASARIMLARININ İLLÜSTRATİF ÇÖZÜMLEMESİ**

20. yüzyıl sanat akımlarının geniş yelpazesinde; promosyon ürünlerinden biri olan, kurumsal kimlik taşıyıcısı kibrit kutusu tasarımları, dönemine ait birçok farklı estetik üslubun ve tasarım anlayışının izlerini taşımaktadır. 20. Yüzyıl sanat akımlarının etkisiyle kibrit kutusu ambalaj tasarımlarında görülen illüstratif betimlemelerin, etkisinin görüldüğü bazı sanat akımları arasında; Bauhaus, Art Deco, Pop Art, Minimalizm ve Postmodernizm vardır (Denvir, 1992). Bu akımların kibrit kutusu tasarımlarındaki kurumsal kimliğin olası etkilerini kronolojik olarak dönemine göre incelenmesi araştırmanın amacını oluşturmaktadır.

Naftagas Promet isimli petrol markası Sırbistan'ın Voyvodina yerleşkesini mesken tutmuş, 19. Yüzyılın erken döneminin ilk yarısında kurulmuştur. Kibrit kutusu tasarımında, diagonal

kompozisyon ve dengeli dağılmış unsurlar kullanılmıştır. Bu özellikler, Bauhaus tarzının genel kurumsal kimlik özelliklerini yansıtmaktadır. 1933'te sanat okulu kapanmasına rağmen etkisini çok uzun yıllar farklı disiplinler üzerinde de gösteren Bauhaus ekolü; kibrit kutusu tasarımında da kullanılan display ve stencil fontun, Bauhaus dönemindeki Joost yazı biçimine atıfta bulunmaktadır. "Joost type adını, Bauhaus'ta eğitmen olan tipografi tasarımcısı Joost Schmidt'ten almıştır" (Akitera, 2019). José Manuel Urós, 1995'teki ilk tasarımlarında Schmidt'in "bauhaus im gewerbemuseum basel" posterini ve Bauhaus'un farklı stilleri üzerinden yazı biçimini geliştirmiştir. Bauhaus, 20. yüzyılın ilk döneminde, Almanya'da bir sanat okulu ve tasarım akımı olarak, fonksiyonelliği ve estetiği birleştiren bir tasarım anlayışını benimsemiştir (Grapius, 1997, s.231-237). Kibrit kutusu tasarımında bu etki; linear espaslar, geometrik formlar ve kullanım öncelikleriyle kendini göstermektedir. Bauhaus'un minimalizmi, kurumsal kimlik tasarımında sade ve işlevsel unsurların önemini vurgular. Bu dönemde kullanılan; kırmızı, mavi, sarı gibi canlı renkler yalın ve dengeli kullanımı ile öne çıkaran bir estetik, birçok kurumsal markanın kimlik tasarımında etkili olmuştur.

Jupiter Markası: 1960'lı yıllarda etkisinin görüldüğü Minimalizm akımının etkisinde, kibrit kutusu tasarımlarında dönemini yansıtan kutu üzerinde basit geometrik desenler ve düz hatlar kullanılmıştır. Renk paleti nötr tonlara ve belirgin kontrastlara odaklanmıştır. Logo ve marka adı, Bauhaus tarzında minimalist bir yazı tipiyle tasarlanmıştır. Minimalizm akımı (ABC sanatı), gereksiz detaylardan kaçınarak sadeliği vurgulamaktadır. Kibrit kutusu tasarımında da bu yaklaşım; karmaşıklıktan uzak, yalın anlatım ve dengeli espas kullanımı ile işlevselliği ön plana çıkarmaktadır. Bu anlatım, sadelik, temizlik ve azaltılma prensibine dayanmaktadır. Bu marka, kutunun yüzeyinde tek bir renk tonu kullanarak bu anlatım dilini pekiştirmektedir. Marka logosu, display yazı karakteri ile light kullanımda tercih edilmiş, küçük ve zarif bir şekilde boyutlandırılarak kutunun alt kısmında yer almış böylece illüstratif form ile bütünleşmiştir.

Minimalizm'in en önemli belirleyici tasarım ilkesi; negatif-pozitif alan kullanımı ve dengesidir. Tasarlanan boşluklar, tasarımın odaklanılmasını ve anlaşılmasını kolaylaştırır. Aktarılan Kurumsal kimlik olgusu imge ile birlikte en yalın haliyle tasarımda yerini almıştır. Minimalist tasarımın bir diğer temel prensiplerinden biri de fonksiyonelliktir. Bu sebeple kibrit kutusu tasarımı, kullanıcıya pratik ve ergonomik bir kullanım sunacak şekilde tasarlanmıştır. Minimalist tasarım, tasarımın özüne odaklanmayı ve detaylardan kaçınmayı amaçlayan bir yaklaşım olduğu için kurumsal kimlikte de sadelik, şıklık ve anlaşılabilirlik öne çıkar. Bu prensipler ile tasarlanan kibrit kutusu tasarımı marka kimliğini güçlendirmiş ve tüketicilerle etkileşimini arttırmıştır.

Mann Mobilia, Art Deco akımının etkisinde Alman asıllı bir endüstriyel ürün tasarımı markasıdır. 1920'lerin sonlarına doğru ortaya çıkan Art Deco akımı; kontrastı yüksek parlak renkler, geometrik desen ve formlar, lüks detaylar ve modernizmin etkilerini içermektedir. Bu akım, lüks ve süslemenin önemli olduğu bir stil olarak bilinir (Benton, 2015). Bu sebeple dönemde, özellikle de lüks markaların kimlik tasarımında etkili olmuştur. Kibrit kutusu tasarımında bu etki, detaylı desenler, parlak renkler ve simetrik düzenlemelerle ifade bulmuştur. Şık ve lüks bir üslup ile kullanılan geometrik desenler ve zarif süslemeler ve organik formların geometrik çözümlenmesi ile kullanılmıştır. Art Deco'nun belirgin özelliklerinden biri, jeoformik (geometrik) desenlerin ve çizgilerin kullanımınıdır. Kare, dikdörtgen, üçgenler gibi şekiller ile kullanılan tasarım unsurları akımın belirleyici özelliklerindedir. Kibrit kutusu tasarımlarında bu tarz öğeler, düzenli ve estetik bir görünüm sağlayabilir. Art Deco, simetriye ve dengeye önem veren bir tarzıdır. Kibrit kutusu tasarımlarında simetrik düzenlemeler ve dengeli kompozisyonlar, kurumsal kimliğin düzenli ve profesyonel bir izlenim bırakmasına katkı sağlamaktadır. Art Deco, dekoratif unsurları vurgular; kibrit kutusu tasarımlarında zenginleştirilmiş detaylar, markanın dikkat çekici ve özgün bir görsel kimliği aktarmada rol

oynamıştır. Art Deco'nun, 1930'ların orta dönemlerine kadar uzanan dönemde, sandalye ve mobilya tasarımına belirgin bir yansıması görülmektedir. Bu akımın; geometrik desenler, simetrik hatlar ve lüks malzemelerin öne çıktığı bir estetikle özdeşleşmesi sebebiyle, sandalye tasarımlarında da sıklıkla görülen dikdörtgen hatlar, zarif süslemeler ve cilalı ahşap gibi öğeler Art Deco'nun imzası niteliğindedir (VAM, 2015). Canlı renk kontrastları, sürrealist motifler ve egzotik detaylar da bu tarzın mobilya tasarımına kattığı karakteristik özellikler arasındadır. Art Deco'nun mobilya tasarımına getirdiği modern ve çağının ötesindeki hatları, günümüzde bile popülerliğini koruyan şık ve çağdaş tasarımların ilham kaynağını oluşturmuştur. Bu akım, işlevsellik ve konforu kollektif bir şekilde kullanarak, mobilya dünyasında da estetik açıdan çarpıcı ve zamansız eserlere imza atmıştır. Mann Mobilia isimli marka, Art Deco tarzı mobilya tasarımlarını, kibrit kutusunun içinde konumlandırırken, canlı, kontrastı yüksek ve simetrik logo tasarımını kurumsal kimlik rengi olan “fire engine red” ile kibrit kutusunun ambalaj tasarımını kurgulamıştır.

Pop Art, günlük tüketilen nesnelere ve tüketim kültürünü sanat ile yorumlayan bir akımdır. Kibrit kutusu tasarımında, kullanılan canlı renkler, büyük grafikler ve popüler kültürü referans eden unsurlar ile bu etki net bir şekilde görülmektedir. 1950'lerin sonlarından itibaren ortaya çıkan Pop Art, popüler kültürden beslenir ve sıkça solid parlak renkleri, grafik desenleri ve büyük ölçekli imgeler içerir. Pop Art'ın enerjik ve canlı görsel inşası, döneminde bazı markaların dinamik kurumsal kimlik tasarımlarına ilham olmuştur (Restany, 1997, s. 344-349). Bu sanat hareketi; basitletirilmiş, net, vurgulu ve kontürlü şekiller, desenler ve tekrarlanan öğeleri görselleştirir. Kibrit kutusu tasarımlarında, ikonik pop art öğeleri; şeritler, yıldızlar, noktalar kullanılmıştır. Pop art, mizah ve esprili unsurlarını görselleştirmede kullanırken, dönemindeki tasarım ve sanatçılara esneklik kazandırmıştır. İllüstratif anlatımda, sıklıkla ünlü

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

**April 09-16, 2024 / Lisbon, Portugal**

kişilikleri, markaları ve simgeleri içermektedir. Pop art, enerji, dinamizm ve hareketi yansıtan bir stildir. Alman asıllı marka, Knalleinlagen; “Knalleinlagen für Zigaretten” isimli kampanyası için tasarladığı kibrit kutularını satışı olmadan, ücretsiz promosyon ürünü olarak ortaya çıkarmıştır. “Sigara dolu patlayan havaifışekler” mottosuyla pop art sanat hareketinin anlatım dilini benimsemişlerdir. Genellikle görselleştirilen kadın imgesi, ikonik olan patlangaç formu ile sigaraya vurgu yapar nitelikte illüstre edilmiştir. Tercih edilen parlak pembe tonu ile siyah-beyaz kontrastı nötr dengesini sağlamak için tasarlanmıştır.

De Stijl hareketi, 20. yüzyılın erken döneminde Hollandalı sanatçı ve tasarımcıların bir araya gelerek oluşturduğu kolektif bir sanat ve tasarım akımıdır. Bu akım, soyut geometrik biçimleri ve temel renkleri, onların üst üste gelişinden oluşan katmanlı bir anlatımı vurgulayan estetik anlayışa sahiptir. De Stijl'in öncülerinden biri olan Theo Van Doesburg'un görselleştirdiği geometrik grid imgelemi, bu akımın en önemli temsillerini taşımaktadır. De Stijl prensipleri, geometrik yapılanmaya ve simetrik düzenlemeye büyük önem vermektedir (Doesburg, 1992, s. 270-281). Kibrit kutusu tasarımında da düzenli ve geometrik desenler, simetrik düzenlemeler ve net hatlar kullanılmıştır. De Stijl akımının temel temsil renkleri: kırmızı, sarı ve mavi vurgulardır. Genellikle düz beyaz veya kontrastı düşük zemin tercih edilir. Bu sayede tasarım, sade ve modern bir görünüme kavuşur. Kibrit kutusu tasarımında da sade ve minimalist bir

yaklaşım izlenerek, fazla detaydan kaçınılmıştır. Die Einrichtung isimli marka; tasarladığı renk blokları ile tasarımın görsel ihtişamını arttırmış, tasarladığı modüler yapılar ile birimleri kullanılarak, bütünsel bir uyum ve denge sağlamıştır. Kibrit kutusu tasarımları alternatifli olarak üretilmiş fakat aynı üsluba mutabık kalınmıştır. Marka, kibrit kutularının formları farklı olsa bile kendi içerisinde De stil akımının tasarım prensiplerini sürdürmüştür. Birinci kibrit kutusu tasarımında, gri solid bir yüzey üzerine beyaz lekeleri ve siyah yarım çerçevesi ile dinamik bir anlatıya sahip olan bir görselleştirme tercih edilmiştir. Logo, dönemin tipografik diline atıfta bulunan serifli ve kapalı espas yazı karakteri ile tasarlanmıştır. Kibrit kutusunun kurumsal kimlik tasarımı ile bütünsel olarak ele alındığı birinci kibritte; kutunun iç bölümünün arka yüzeyi daha parlak bir materyalden seçilirken, kibritlerin de kimlik inşasının bir parçası olarak o renklerde çeşitlenmesi promosyon ürünlerinin kurumsal kimliğin en başarılı ve işlevsel taşıyıcısı olduğuna örnek niteliğindedir. İkinci kibrit kutusu tasarımında, biçimsel olarak daha ergonomik bir form tercih edilmiştir. Katlanır yapısı ve inceliği sayesinde 20. Yüzyılın ikinci yarısında en çok tercih edilen kibrit kutusu formlarından biridir. Beyaz alanların denge kurduğu, logo kullanımı ve kimlik bilgilerinin büyük bir titizlikte; minimal bir estetikle tasarlandığı kibrit kutusunda da kibritlerin renk seçimi ve kırmızı fosfor, cam tozu ve bağlayıcı maddeden oluşan ateşleme yüzeyi tasarıma uygun, linear çizgiyi takip etmektedir.

Sürrealizm; “rüya” kavramının uçsuz bucaksızlığı gibi soyut ve düşsel öğeler ile imgelerin olduğu bir sanat akımıdır. Bu akımın etkileri, dönemindeki bazı markaların kimlik olgularında yaratıcı ve çağrışımsal inşaların kurulmasına şekil vermiştir. Sürrealizm, temsili olan soyut desenler ve renklerle birlikte gerçeküstü duygusal bir anlatımda, rasyonel bir hayal gücünü vurgular. Tasarıma gerçeküstü öğelerin, hayali figürlerin, fantastik unsurların eklenmesi, canlı, kontrastlı ve sıra dışı renklerin kullanılması; gerçeküstü atmosferini vurgulamaktadır (Chirico,

## VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY SCIENTIFIC STUDIES

April 09-16, 2024 / Lisbon, Portugal

1992, s.59-63). Sürrealist tarza uygun olarak, dışbükey ve içbükey formların kullanılması; şekillerin normalde beklenmeyen biçimlerde metamorfoz ve deforme oluşu ile birlikte absürd bir anlatım dili, kompozisyonlarda rüya gibi bir atmosfer yaratmak için soyut ve akışkan formların kullanılması ile ilintilidir. Sürrealist bakış açısı; sanatın “rüya” kavramındaki izdüşümüne, dünyanın yansıyan unsurlarına entegrasyonudur. Mekansal ilizyonlar, hava perspektifiyle oluşan derinlik algısını için kullanılan görsel teknikleri ve duygusal etkileri vurgular. Hereinspaziert isimli marka, tarihi1907 yıllarına dayanan köklü bir restaurant işletmesi ve bira üreticisidir. “Gasthaus zum fischmeister” (balık ustasının misafirhanesi) mottosuyla, kurumsal kimliğinin bir taşıyıcısı olarak sürrealist tarzda illüstre edilmiş kibrit kutusunu tasarlamıştır. Balık formu, anlam bulanıklaştırmaya yönelik ele alındığı gerçeküstü bir anlatım ile görselleştirilmiştir. Döneminde, olağanüstü imgelemi ile kurumsal kimliği ilgi çekici hale getirmiş, alıcıya mesajı ve marka kimliğini pratik bir şekilde taşımıştır.

Fütürizm, 20. yüzyılın erken döneminde etkili olan bir sanat ve tasarım akımıdır. Bu akım, endüstrileşme dalgasının yaygınlaştığı ve teknolojinin hızlı bir ivmeyle yükselişe geçtiği dönemde varlığını sürdürmüştür. Fütürist tarzda üretilen tasarımlar; hareket, enerji, hız ve dinamizmi vurgular (Carra, 1997, s.97-100). Kimlik taşıyıcısı promosyon ürünlerinden biri olan kibrit kutusu tasarımında; akıcı çizgiler, hareket izlenimi veren desenler ve enerjiyi yansıtan grafik öğelerle bu akımın yansımaları görülmektedir. Fütürist tasarımlar genellikle keskin hatlar ile geometrik şekillerden oluşur. Bu oluşum, Fütürizm’in yapıtaşları olan dinamizm ve hareket kavramları ile birlikte görülmektedir. Kibrit kutusu tasarımında da bu özellikler, modern ve teknolojik bir üslupta ele alınmıştır. Kullanılan canlı ve kontrastlı renkler, Fütürizm tarzında üretilen tasarımların vazgeçilmez özelliklerindedir. Fütürist tarz, teknoloji ve endüstriyel

gelişmelere olan ilgiyi yansıtarak metalik yüzeyler, dişli çarklar, dijital öğeler gibi unsurları içerirerek akımın spesifik görsel inşasını kapsamaktadır. Bu unsurlar, Kroplin Schnelltaster markasının inovasyon ve moderniteye vurgu yapmasına yardımcı olmuştur. Kroplin Schnelltaster, “Pur schnelles messen” mottosu ile saf hızlı ölçüm vaadi veren bir ölçü ekipmanları markasıdır. Ölçüm cihazı, horoz figürünün başı ve gagası ile dijital ve soyut öğeler kullanılarak illüstre edilmiştir. Kullanılan renkler ve geometrik parçalanmalar; soyut imgenin teknolojik ve dinamik üslup ile fütüristik bir algıda tasarlanması ile akımın temel prensiplerine gönderme yapmaktadır. Kullanılan tipografinin görsel öğe olarak diyagonal kompoze edilmesi, illüstrasyonun ölçüm cihazına atıfta bulunan formu ile paralellik göstermektedir. Tüm bu tasarım çözümlenmesi ile marka, geleceğe yönelik bir bakış açısını yansıtarak inovasyonu vurgulamıştır (Marinetti, 1997, s.75-81).

Dadaizm, diğer adıyla başkaldırı. 20. yüzyılın ilk yarısında, Edebiyat ve sanatta etkisini göstermiştir. Dadaizm akımı, folklorik sanat ve kültür normlarına karşı bir duruş sergileyerek; rasyonalite, mantık ve anlamın geleneksel nizama tezatlık olarak ortaya çıkmıştır. Bu akımın etkisi altında tasarlanan Ostmann kibrit kutusu tasarımı; absürd, ironik ve çelişki uyandıran imgelere sahiptir. Dadaizm, kaotik düzende rasgelelik nosyonuyla varolmuştur. Tasarımlar anlamın dışında, beklenmedik şekilde düzenlenmiş, rastgele öğeler içermektedir. Dadaist tasarımlar, geleneksel tasarım prensiplerine başkaldırı niteliğindedir. Bu sebeple; simetri, düzen ve diğer geleneksel tasarım ilkelerini bilinçli bir şekilde ihlal eder. Böylece Dadaizm, anlamsızlığa ve çelişkiye vurgu yapmaktadır. Bunun sonucunda Tasarımlar, birbiriyle çelişen öğelerin kombinasyonu ve zaman-mekan uyumsuzluğu çerçevesinde, anlamsız bağlantılar kurarak izleyiciyi düşündürmeyi amaçlar. Bu tasarımlar, toplumsal normlara, siyasi yapıya

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

*April 09-16, 2024 / Lisbon, Portugal*

veya sanatsal konvansiyonlara karşı bir eleştiri içerir (Dempsey, 2007). Dadaizm, yaratıcılığı teşvik eder ve geleneksel kalıplardan çıkarak yenilikçi ve özgün tasarımları destekler. Ostmann markası, çelişkisi ile ilgi çeken imgesel anlatımına eşlikçi olarak tasarladığı; diyagonal ve el yazısı ile özensizce oluşturulmuş, harf anatomisi ve üslup olmaksızın kurgulanan tipografisi ile “Vergessen sie nicht das gehackte dazu” (Doğranmış malzemeleri unutmayın) yazarak, imge ile tipografinin absürd algısına destek vermiştir. Kutunun arka yüzeyi, illüstratif imgenin lekesel değerine uygun; logoyu öne çıkaran nitelikte, daha solid yüzeylerle tasarlanmıştır.

"Post izlenimcilik", 19. yüzyıl sonu, 20. yüzyıl ilk yıllarına doğru etkisini sürdüren bir sanat akımıdır. Henri de Toulouse-Lautrec, Post-İzlenimcilik akımının en önemli temsilcisidir. Paris'in gece hayatını konu alan eserlerinde; canlı ve cesur renkleri, dans sahnelerini, tiyatro ve kafe kültürünü kullanmıştır. Afiş tasarımlarını üstlendiği Moulin Rouge pavyonunun renkli sahnelerini büyük bir ihtişamlı çalışmalarına yansıtmıştır. Bu tasarımlardaki tipografi kullanımı; büyük, dikkat çekici başlıklar ve elle yazılmış tarzda harf anatomileri Toulouse-Lautrec'in stili ile özdeşleşmiştir. Tasarımlardaki karakteristik duruşlar ve kompozisyonlar, dinamizm ve özgünlük döneminde üretilen bazı tasarımlara esneklik kazandırmıştır. Kibrit kutusu tasarımı, markanın kimliğini ve değerlerini yansıtmak için önemli bir araçtır. Paris merkezli, Stardust isimli Hotel ve Gasino markası; döneminde etkisini gösteren Post izlenimci akımın öncüsü, H. Toulouse -Lautrec'in kullandığı tipografi ile kontrastı yüksek, parlak renkler ve kadın imgesinin dans figürü olarak illüstre edilmesine atıfta bulunmaktadır. Kibrit kutusu tasarımı; ergonomik olarak kolay açılan ve inceliği yapısı ile taşınabilirliği pratik biçimde tercih edilmiş, kibritlerin renk seçimi logoya atıfta bulunan beyaz tonda oluşturulmuştur (Kolektif, 2005).

Art Nouveau

## 6. SONUÇ

Bu araştırma, kimlik olgusunun gelişimi ile birlikte kurumsal kimlik tasarımının taşıyıcısı kibrit kutusu tasarımlarının, 20. yüzyıl sanat akımlarının etkisiyle nasıl şekillendiği ve evrildiğini; bununla beraber markanın kimlik inşasını oluşturan unsurlarının da irdelenerek incelemesini amaçlamıştır. Markaların kimlik olgusunu güçlendirmek, algı oluşturmak ve hedef kitleye güçlü bir mesaj vermek amacıyla kullanılan kibrit kutusu tasarımları; sade ve işlevsel yapılarıyla birlikte dönemin sanat ve kültür akımlarını başarıyla yansıtırken estetik anlamda da birer zaman kapsülü gibidir. Her bir tasarımın içerdiği sanatsal öğeler ve dönemin estetik zevkleri, o döneme ait bir görsel dilin izlerini taşımaktadır. Kibrit kutusu tasarımlarının sadece günlük kullanım ürünleri olmanın ötesinde, aynı zamanda sanatsal ve kültürel birer ifade aracı olarak işlev gördüğü açığa kavuşturulmuştur. Araştırma aynı zamanda, kibrit kutusu tasarımlarının zaman içerisindeki değişimiyle beraber; teknolojik, toplumsal, sosyo-kültürel değişimleri ve sanatsal hareketlenmelerin tasarımları nasıl etkilediğini incelemiştir. Tasarımların evriminde, kurumsal kimlik tasarımındaki kimlik olgusunun adaptasyon kabiliyetini ve zamanla değişen kültürel etkileşimlere olan duyarlılığını vurgulamaktadır. Sonuç olarak, kibrit kutusu tasarımları üzerinden yapılan bu kapsamlı analiz, kurumsal kimlik tasarımının sadece marka tanıtımı değil, aynı zamanda kültürel ve sanatsal birer belge olarak nasıl değerlendirilebileceğini göstermektedir. Tasarımcılar, pazarlamacılar ve araştırmacılar için bu çalışma, kurumsal kimlik tasarımının geçmişten günümüze olan evrimini anlamak ve gelecekteki tasarım stratejilerini biçimlendirmek adına derinlemesine bir kaynak niteliği taşımaktadır.

**Abstract**

With the development of technology and the increasing interest in esthetic restorations, a high level of esthetics is sought in dentistry today. This situation is bringing new metal-free restorative materials to the fore every day in place of dentures with metal substructures. Polyetheretherketone (PEEK) is preferred in dentistry as a denture base material, particularly because of its esthetic similarity to the natural tooth structure, its biocompatibility and its good physical and mechanical properties. PEEK belongs to the polyaryletherketone (PAEK) family and is widely used in dentistry due to its mechanical and thermal resistance, ease of sterilization, resistance to radiation, fatigue resistance and strong bond strength in restorations where it is used. PEEK is widely used as implant material, orthodontic wires, CAD/CAM (Computer Aided Design/Computer Aided Manufacturing) material, substructure in fixed prostheses, precision fittings in removable prostheses, hook and obturator prostheses. Due to their biocompatibility and excellent mechanical properties, these materials are ideal for rapid 3D design and prototyping of patient-specific implants and other specialty devices. Studies show that these materials are important in many clinical and biomedical applications such as orthopedics, oral and maxillofacial surgery, cardiovascular and cardiothoracic applications, dental applications and tissue engineering. However, there are important aspects to consider when working with these materials. First of all, exposure of PEEK to concentrated nitric acid and some halogen elements (such as chlorine and bromine) compromises its resistance to ionizing radiation and other important properties. Despite their desirable properties as an alternative to conventional metal compounds for use in drug delivery, clinical and surgical medicine, dentistry, etc., the use of materials such as PEEK in their pure form in surgical applications poses a challenge due to their suboptimal strength and stiffness or slight deviations from the elastic modulus of bone. This review describes how such observed drawbacks can be overcome with materials that are/can be doped into polymers (carbon fibers, other biocompatible polymers and nanotechnology products), thereby improving their mechanical and chemical properties and ultimately reducing the patient's immune response.

**Keywords:** Biocompatible polymers, dental prosthesis, restoration material, biomedical application

**A CURRENT DENTURE BASE MATERIALS: POLYETHERETHERKETONE  
(PEEK)**

**Özet**

Gelişen teknoloji ile beraber günümüzde estetik restorasyonlara artan ilgi ile diş hekimliğinde yüksek seviyede estetik arayışına gidilmektedir. Bu durum gün geçtikçe metal alt yapılı protezlerin yerine metal içermeyen yeni restorasyon malzemelerini ön plana çıkarmaktadır. Özellikle estetik açıdan doğal diş yapısına benzerliği, biyouyumlu olması, fiziksel ve mekanik özelliklerinin iyi olması nedenleri ile polietereketon (PEEK) protez kaide materyali olarak diş hekimliğinde tercih sebebi olmaktadır. PEEK materyali poliarileterketon (PAEK) ailesinin bir üyesidir ve bu özelliklerinin yanı sıra mekanik ve termal dayanıklılığı, sterilizasyon kolaylığı, ışınlarla karşı dayanıklılığı, yorulma direnci, kullanıldığı restorasyonlarda bağlantı dayanıklılığının güçlü olması gibi özelliklerinden dolayı diş hekimliğinde geniş bir alanda kullanılmaktadır. İmplant materyali, ortodontik teller, CAD/CAM (Bilgisayar Destekli Tasarım/Bilgisayar Destekli Üretim) materyali, sabit protezlerde alt yapı, hareketli protezlerde hassas bağlantı parçası, kroşe ve obtüratör protez yapımında PEEK kullanımı yaygındır. Bu materyallerin biyouyumlu olması ve üstün mekanik özellikler göstermesi hasta özelinde implantların ve diğer özel cihazların hızlı 3D tasarımında prototiplenmesi için bu malzemeleri ideal hale getirmiştir. Yapılan çalışmalar bu malzemelerin ortopedi, ağız-çene-yüz ve kraniofasial cerrahi, kardiyovasküler ve kardiyotorasik uygulamalar, diş uygulamaları ve doku mühendisliği gibi daha birçok klinik ve biyomedikal uygulamalar için önemli uygulamaları olduğunu göstermektedir. Ancak bu malzemelerle çalışmalarda dikkat edilmesi gereken önemli başlıklar bulunmaktadır. Öncelikle PEEK'in konsantre nitrik asite ek olarak bazı halojen elementlere (klor ve brom gibi) maruziyeti iyonlaştırıcı radyasyon direncini ve diğer önemli özelliklerini bozmaktadır. İlaç dağıtımı, klinik ve cerrahi tıpta, diş hekimliğinde kullanım için geleneksel metalik bileşiklere alternatif istenen özelliklere rağmen PEEK gibi malzemelerin saf halde kullanımı optimal olmayan güç ve sertlik veya kemiğin elastik modülünden hafif sapmalar gibi özellikler gösterdiği için cerrahi uygulamalarda zorluklara neden olmaktadır. Bu derlemede gözlenen bu tür dezavantajların polimerlere katkılanan/katkılanabilecek materyallerle (karbon fiberler, diğer biyouyumlu polimerler ve nanoteknolojik ürünler) nasıl aşıldığı, mekanik özelliklerin ve kimyasal özelliklerinin iyileştirilmesi ve son olarak hasta bağışıklık sistemi tepkisinin nasıl azaltılabileceği açıklanmıştır.

**Anahtar Kelimeler:** Biyouyumlu polimerler, diş protez, restorasyon malzemesi, biyomedikal uygulama

## **Giriş**

Gelişen teknoloji ve endüstrideki hızlı değişim diş hekimliğinde kullanılan materyallerin de değişimine sebep olmuştur. Günümüzde tercih edilen protez materyaller için estetik özelliğinin yanı sıra kullanımda yüksek sıcaklık dayanımı (300 °C'yi aşan) ve kimyasal ve mekanik direncinin yüksek olması bakımından Poliarileterketon (PAEK) polimer ailesinin bir üyesi olan polietereterketon (PEEK) tercih edilmektedir (Chen et al., 2016). Mükemmel fiziksel özelliklere sahip bu organik polimerler üzerine yapılan araştırmalar 1960'lı yıllara dayanmaktadır (Hearle, 2001). Tarihçesi 1962 yılında Amerikalı bilim insanı Robert Bonner Polimer tarafından tanıtımının yapılması ile başlamış olan PEEK, ilk olarak 1978 yılında İngiliz bilim insanı tarafından polimer olarak geliştirilmiştir (Najeeb et al., 2016). 1980'li yıllardan itibaren ticari olarak endüstri, mühendislik ve askeri alanlarda kullanılmaya başlanmıştır (Mark et al., 1987). Elastikiyet modülünün kemiğe yakın olması, aşınma ve kırılma direncinin yüksek olması, cilalanabilir özelliği, şok absorpsiyonu ve metal restorasyonlara göre daha hafif bir materyal olması özellikleri sayesinde tıpta kullanımı özellikle travma ve ortopedi vakalarında son derece yaygın bir hal almış ve titanyum materyaliyle rekabet sürecine dahil olmuştur (Kurtz & Devine, 2007). Diş hekimliğinde metal altyapıyı gizlemek amacı ile metal alaşımli kuronlar, köprüler ve hareketli protezlerde birçok katman içeren restorasyonlar yapılmaktaydı ancak metal alaşımların açık gri rengi tam olarak kompanse edilememekteydi (Najeeb et al., 2016). Bu nedenle metal altyapılı restorasyonlar zamanla yerini alternatif materyallere bırakmıştır. Özellikle estetik restorasyonlarda krom kobalt altyapılı protetik restorasyonlarla kıyaslandığında zirkonyumun yüksek maliyetli oluşu bilim insanlarını polimerler üstünde çalışmalar yapmaya itmiştir (Serenio et al., 2015). Teknolojik gelişmelerle konvansiyonel yöntem ile yapılan uygulamaların yerini PEEK ve PEKK materyalleri ile yapılan uygulamalar almaya başlamıştır. Firmaların da bu alandaki gelişimleriyle kuron ve köprü restorasyonların üretimi için freze makineleri geliştirilmiş ve yüksek performans polimer blokları üretilmiştir (Kewekordes et al., 2018). İnsan kemiğiyle benzer mekanik mukavemete ve elastik modüle sahip olması PEEK materyallere ilgiyi artırmaktadır. PAEK ailesinden olan PEEK'lerin bu özelliği metal bazlı implantlara uygun bir alternatif olmasını sağlamıştır. Üç boyutlu baskı yoluyla özel ve hızlı bir şekilde üretilebilme özellikleri dikkate alındığında biyomedikal ve malzeme mühendisliği alanlarına ek olarak medikal uygulamalarda PEEK ürünlerinin önemi artmakta ve bu alanda yapılacak olan çalışmalar önem arz edecektir (Sacks et al., 2024). Bu çalışma PEEK'in mekanik, fiziksel ve kimyasal özelliklerinin yanı sıra modern tıptaki çeşitli uygulamalarını özetlemektedir. Ayrıca PEEK uygulamalarında gözlenen dezavantajların

polimerlere katkılanan/katkılanabilecek materyallerle (karbon fiberler, diğer biyoyumlu polimerler ve nanoteknolojik ürünler) aşılabileceği, mekanik özelliklerin ve kimyasal özelliklerinin iyileştirilmesi de vurgulanmıştır.

### **PEEK'in Genel Özellikleri**

Yüksek performanslı bir termoplastik polimer ailesinin üyesi olan polietereterketon (PEEK); yüksek mukavemet, aşınma ve yorulma direnci gibi özelliklerinden dolayı biyomedikal uygulamalar için ilgi görmektedir. Biyoyumluluğu ve üstün mekanik özellikleriyle son yıllarda dental uygulamalarda da kullanılmaktadır (Henriques et al., 2018).

**Şekil 1.** PEEK'in kimyasal yapısı (Staniland et al., 1992)

PEEK materyali birçok dental uygulamada abutmentler, implantlar, kroşeler, hareketli protezlerin alt yapıları ve sabit protezler dâhil alternatif materyal olarak kullanımı gün geçtikçe artmaktadır (Tekin et al., 2018).

**Şekil 2.** Diş Hekimliğinde PEEK (Sarot et al., 2010)

PEEK materyali yüksek ısıya karşı dirençlidir ve erime sıcaklığı 334 °C'dir. Ayrıca kendine özgü aromatik kimyasal yapısı nedeniyle tıbbi cihazları sterilize etmek için kullanılan gama ve elektron ışınları gibi bir çok sterilizasyon yöntemine uygundur. Termal özelliklerinden dolayı insan vücudunda stabil kalmaktadır (Tekin et al., 2018). Kimyasal olarak inert özelliktedir ve diğer materyallerle düşük reaksiyon gösterir ve birçok geleneksel çözeltilerde çözünmemektedir (Simsiriwong et al., 2015). Bu özelliklerinden dolayı metal içermeyen diş restorasyonlarında tercih edilmiştir ve metal alerjisine karşı da iyi bir alternatif olmaktadır

(Zoidis & Papathanasiou, 2016).PEEK çoğu dental uygulama için yeterli olan düşük bir yarı saydamlığa sahip olmasına rağmen diş hekimliğinde estetik gereklilikler için rezin materyaller ile kombine kullanılması önerilmektedir (Rosentritt et al., 2015). Bununla birlikte, opaklığı ve grimsi beyaz rengi, monolitik ve anatomik kontürlü restorasyonların üretiminde PEEK'in kullanımını sınırlandırmaktadır (Stawarczyk et al., 2013). Estetik görüntünün sağlanabilmesi için veneer kompozit rezinler kullanılmaktadır. Ancak PEEK'in mekanik ve kimyasal işlemlere olan direnci ve hidrofobik yapısından dolayı diş hekimliğindeki kullanımı kısıtlanmıştır (Adem et al., 2022). PEEK'in dental uygulamalarda etkin ve başarılı kullanımı için PEEK ve veneer kompozit rezinler arasındaki bağlantı dayanıklılığının sağlanmasına yönelik yöntemler geliştirilmelidir. PEEK ile beraber hem rezin simanların hem de kompozit rezinlerin diş hekimliğinde kullanılması için aralarındaki bağlanmanın biyomekanik kuvvetlere karşı dayanıklı olması gerekmektedir (Henriques et al., 2018). Bağlantı tipi kimyasal, (mikro) mekanik tutunma veya bunların bir birleşimi ile oluşturulabilir. Bu durum kullanılan malzemelerin bileşimine ve etkileşimine göre değişmektedir (Piwowarczyk et al., 2004).PEEK'in yüzey enerjisini değiştirmek ve hem rezin simanlar hem de kompozit rezinler ile olan bağlantısını geliştirmek için birçok teknik ve yüzey işlemleri üzerinde çalışmalar yapılmıştır. Araştırmalar herhangi bir yüzey işlemi yapılmayan inert PEEK yüzeyi ile rezin materyaller arasında bağlanmanın gerçekleşmediğini ortaya koymuştur. Bağlantının geliştirilmesi için ıslanabilirliğin ve yüzey alanının pürüzlendirilerek artırılması kullanılan yöntemlerdendir. Asitle aşındırma, lazer, plazma teknikleri bunlardan bazılarıdır (Henriques et al., 2018). PEEK'in yüzey alanını modifiye etmek için %98 sülfürik asit (H<sub>2</sub>SO<sub>4</sub>) kullanımının gözenekli ve geçirgen bir yüzey oluşturduğu sonucuna varmıştır (Hallmann et al., 2012; Keul et al., 2014; Rosentritt et al., 2015). Bununla birlikte alüminyum oksit (Al<sub>2</sub>O<sub>3</sub>) ile kumlama, silika kaplama ve bunların kombine uygulanması PEEK yüzeyindeki pürüzlülükte artış sağlamıştır (Ates et al., 2018).Ultraviyole ışık (UV ) lazer uygulaması, polimer yüzeylerin temizlenmesi ve fonksiyonellik kazanması için kullanılan başka bir yöntemdir (Sham et al., 2009). Literatürde, %98 sülfürik asit ile pürüzlendirme (Hallmann et al., 2012; Keul et al., 2014; Rosentritt et al., 2015) Al<sub>2</sub>O<sub>3</sub> ile kumlama (Fokas et al., 2019), adhesive uygulaması (Schmidlin et al., 2010), UV ışığa maruz bırakma (Shi et al., 2017) gibi işlemlerin PEEK'in bağlantı dayanımını artırdığı ile ilgili çalışmalar yer almaktadır. Ancak bu yöntemlerin birbirleriyle kombinasyonlu şekilde uygulandığı sınırlı sayıda çalışma vardır. Literatürde, UV ışık uygulamasından sonra bağlantı dayanımının ölçüldüğü sadece bir araştırma bulunmaktadır (Okawa et al., 2020).

### **PEEK'in Üretim Yöntemleri**

Laboratuvarlarda yüksek performans polimerleri kullanılarak protetik altyapı ve restorasyonlar üretmek için enjeksiyon kalıplama, bilgisayar destekli tasarım ve bilgisayar destekli üretim (CAD/CAM) ve 3 boyutlu yazıcı olmak üzere üç yöntem mevcuttur (Han et al., 2019).

### **CAD/CAM ile Üretim Yöntemi**

CAD-CAM, bilgisayar destekli üretim/tasarım manasına gelmektedir (Palin & Burke, 2005). Üretim yolu CAD/CAM teknolojisidir. CAD/CAM sistemleri daha kısa sürede daha yüksek kalitede üretim yapılmasına olanak tanımaktadır. CAD/CAM sistemleri üç bileşenden oluşmaktadır:1. Dijital tarayıcı: Dental CAD/CAM sistemlerinin en önemli komponentlerinden biridir. Ağız içinde veya ağız dışında modellerden, prepare edilen dişlerin yapıların ve karşıt dişlerin üç boyutlu bilgisini toplayarak elde ettiği geometriyi bilgisayar tarafından işlenebilecek dijital verilere dönüştüren bir dijitalleştirme aracı/tarayıcı sistemidir. Elde edilen görüntülerin verileri, restorasyonların hasta başında üretiminde veya laboratuvara transferinde kullanılır (Beuer et al., 2009). Bu işlem esnasında ağız içi tarama kalitesini arttırmak için oksit tozu püskürtülmektedir. (Sakaguchi & Powers, 2011).2. Tasarım yazılımı: Verileri işleyen ve uygulamaya bağlı olarak, üretilecek ürün için bir veri seti üreten yazılım sistemidir. Tarama yöntemiyle elde edilen verinin görselleştirilmesi, dental restorasyonun üç boyutlu tasarımının ve planlamasının yapılabilmesi için yazılım programlarını kullanan bir bilgisayar birimidir (Fasbinder, 2012). Hareketli ve sabit protezler, veneer tasarımları ve implant cerrahisinde kullanılan stentler gibi çeşitli dental restorasyonların tasarımı yapılabilir (Beuer et al., 2009; Strub et al., 2006).3. Verileri istenilen restorasyona dönüştüren bir üretim teknolojisi CAD yazılımıyla elde edilen veriler, CAM süreci için freze cihazına aktarılır (Beuer et al., 2009). Seramik, kompozit ve metal gibi çeşitli prefabrike bloklar farklı eksenlerde freze edilerek istenilen restorasyon elde edilir (Sakaguchi & Powers, 2011). Bu üretim yolu, polimerin yeniden eritilmesi için enjeksiyon kalıplama yöntemindeki tüm riskleri ortadan kaldırır. Malzeme özellikleri stabil kalır ve altyapı üretimi, dijital bir iş akışı içerisinde gerçekleşeceği için kesinliğin artmasıyla beraber tekrarlanabilirlikten de yararlanır. PAEK malzemeleri, frezlerde daha az aşınmaya neden olmalarıyla birlikte daha hızlı frezeleme süreleri olduğundan ve frezelemek için gerekli olan ekipmanının metal altyapıları frezelemek için kullanılan makineler kadar pahalı olmadığından, metal altyapıların frezelenmesine kıyasla CAD/CAM verimliliklerini daha da artırır (Han et al., 2019).

**Şekil 3.** CAD/CAM ile PEEK üretimi (Tipton, 2015)

### **Enjeksiyon Kalıplama Yöntemi**

Endüstriyel enjeksiyon kalıplama makineleri; polimeri, diş laboratuvarlarında bulunan örneğin 10 bar basınç ile çalışan klasik tezgah üstü presleme makineleriyle kıyaslandığında çok daha yüksek basınç (1000 bar) ve hız altında işler. PAEK'in küçük ölçekli enjeksiyon kalıplaması, tasarım sınırlamaları nedeniyle zor bir işlemdir. Ayrıca PAEK'lerin yeniden eritilmesi, altyapı doğru bir şekilde soğutulmamış ve yeniden kristalleştirilmemişse, öngörülebilir olmayan; renk, kırılma ve esneklik gibi mekanik ve fiziksel özelliklerin bozulmasına sebep olabilir.

Ayrıca, ekipmanın hatalı kullanıldığı ya da çok iyi kontrol edilemediği durumlarda, PAEK malzemelerinin yeniden eritilmesi de fenol oluşumuyla beraber polimerin bozulmasına yol açabilir. Bu nedenle, bu malzemelerin eritilerek işlenmesi yalnızca yetkili bir laboratuvar tarafından ve tedarikçi tarafından önerilen ekipman kullanılarak yapılmalıdır (Tipton, 2015).

**Şekil 4.** Enjeksiyon kalıplama yöntemiyle PEEK üretimi (Türkkal)

### **Üç Boyutlu (3D) Yazıcı ile Üretim Yöntemi**

Düşük maliyet, kullanım kolaylığı, malzeme bozulması ve kontaminasyonunun minimuma indiği bir yöntem olan 3 boyutlu yazıcılar ile üretim son yıllarda PEEK polimer için de sıklıkla kullanılmaya başlanmıştır (Han et al., 2019).

### **PEEK'in Kullanım Alanları**

Mekanik özelliklerinden dolayı PEEK, ortodontik teller, implant materyali, CAD/CAM materyali, dayanak materyali olarak ve protetik alanlarda kullanılmaktadır (Kaleli et al., 2018).

### **İmplant Materyali**

PEEK implant materyali olarak, bruksizm veya metallere karşı alerjik reaksiyonları olan hastalar için bir alternatif olarak ortaya çıkmıştır (Elawadly et al., 2017). Üstün mekanik özellikleri, biyouyumluluğu ve kemik benzeri sertliğe sahip yapısı ile ortopedik implant uygulamaları için umut verici bir biyomateryal haline gelmiştir (Mishra & Chowdhary, 2019). Bununla birlikte, PEEK tarafından üretilen dental implantlar, ortopedik implantlarla karşılaştırıldığında klinik kullanımda henüz yaygın değildir (Najeeb et al., 2016; Wang et al., 2019). Anguiano-Sanchez ve arkadaşlarının yaptığı bir çalışmada, PEEK malzemesinin düşük stres koruyucu etkilerinin implant ömrünü uzatmak için faydalı olduğunu gösterilmiştir (Anguiano-Sanchez et al., 2016). PEEK, son zamanlarda implant dayanak materyali olarak da kullanılmaya başlanmıştır (Sacks et al., 2024). Hahnel ve arkadaşlarının (2015), titanyum, zirkonyum ve PEEK implant dayanak materyallerinde biyofilm oluşumunu analiz ettikleri çalışmalarında; PEEK'in, titanyum ve zirkonyumdan üretilen geleneksel dayanak materyallerine göre yüzeyinde daha düşük biyofilm oluşumuna ve olumlu özelliklere sahip bir dayanak materyali olduğu bulunmuştur (Hahnel et al., 2015). Geçmiş çalışmalarda, termomekanik yaşlandırmanın ardından, güçlendirilmiş PEEK dayanaklar, zirkonya dayanaklara benzer kırılma direnci sergilemiştir (Atsü et al., 2019). Titanyumla güçlendirilmiş PEEK, mükemmel biyouyumluluğu göz önüne alındığında geleneksel dayanaklara etkili bir alternatif olmakla birlikte kemik yüksekliğini koruyabilir.

### **PEEK Ortodontik Teller**

Hastaların estetik taleplerinin gün geçtikçe artması nedeniyle metalik olmayan ortodontik teller daha popüler hale gelmektedir. PEEK, metal alaşımlarına mükemmel bir alternatif olarak karşımıza çıkmaktadır. Dental uygulamalar için PEEK, ağız ortamında korozyon, metal iyonlarının salınması, metal alerjileri ve estetik olmayan görünüm gibi metal alaşımlarının bazı temel eksikliklerini giderir (Shirakawa et al., 2018). PEEK tellerin yük-eğilme ve sürtünme özelliklerini değerlendirdiği bir çalışmada, PEEK tellerin ortodontik apareyler olarak kullanıma uygun olduğu sonucuna varılmıştır (Tada et al., 2017). Yük-eğilme eğrileri, test edilen teller arasında benzerlikler göstermiş bununla beraber, tüm malzemelerin kalıcı deformasyonu ve statik sürtünmesi arasındaki farklar önemsiz bulunmuştur. PEEK, nikel-titanyum (Ni-Ti) teller üzerinde korozyon direncini arttırmak ve mekanik özellikleri iyileştirmek için kaplama materyali olarak kullanılabilir (Rokaya et al., 2018). Bununla birlikte, uzun süreli oral kullanım, PEEK kaplamanın stabilitesinde bozulmaya neden olabilir (da Silva et al., 2013).

### **PEEK'in Protetik Kullanımı**

PEEK polimerinin, hareketli ve sabit protezlerde kullanımının yanı sıra implant destekli sabit ve hareketli bölümlü protezlerde kullanımı da giderek artmaktadır. Bu durum, elastik modülünün kemik ve dişe yakın olması, şok absorbe etme özelliği, üstün biyouyumluluğu, yüksek termal ve kimyasal direnci ve mekanik özelliklerinin iyi olması gibi avantajlarından kaynaklanmaktadır (Türksayar & Atsü, 2021).

### **PEEK'in Hareketli Bölümlü Protezlerde Kullanımı**

Günümüzde diş eksikliği olan hastalar, implant restorasyonlarını seçme eğilimindedir. Bununla birlikte, sistemik durum, mevcut anatomik yapı, psikolojik veya finansal nedenlerle implant için uygun aday olmayan birçok hasta hala vardır. Bu hastalar, kaybedilen dişlerin restorasyonu için konservatif ve ucuz bir yaklaşım olan hareketli bölümlü protezleri (HBP) tercih ederler (Saeed et al., 2020). Harb ve arkadaşları (2019), Kennedy Sınıf I bölümlü protezin PEEK altyapısının CAD/CAM frezeleme teknolojisiyle üretilmesi ile ilgili klinik bir rapor yayınlamıştır (Harb et al., 2019). CAD/CAM veya geleneksel kayıp mum tekniği kullanılarak, PEEK ile üretilen protez altyapısı, geleneksel malzemelere alerjisi olan veya tat duyusu daha hassas olan hastalar için Co-Cr altyapının yerini alabilir (Zoidis & Papathanasiou, 2016). PEEK gibi elastik bir materyal, dayanak dişlerde devrilme kuvveti ve gerilimi azaltabileceğinden, dayanak dişlerin periodontal sağlığına faydalı olduğu gösterilmiştir (Negm et al., 2019). Bir başka klinik çalışma, PEEK altyapılar için ağız sağlığı ile ilgili yaşam kalitesi, hasta memnuniyeti ve periodontal sağlık gibi durumlar Co-Cr altyapılar ile karşılaştırıldığında benzer sonuçlar bulmuştur (Ali et al., 2020). Tannous ve arkadaşları (2012), PEEK ile üretilen kroşelerinin Co-Cr kroşelerden daha düşük retansiyon sergilediğini bulmuştur (Tannous et al., 2012). Ayrıca çıkarma esnasında undercut bölgesinde oluşan stresin PEEK'in dayanımından daha yüksek olması, kroşeler için uygun bir materyal olmadığı sonucunu ortaya koymuştur (Tribst et al., 2020).

### **PEEK'in Sınırlılığı**

PEEK üstünde uzun dönem klinik takiplerin yetersiz olması ile birlikte yapılan araştırma ve geliştirme çalışmalarının sunduğu bazı bilgiler şu şekildedir:

- PEEK artan klinik ilgisine rağmen, zayıf entegrasyonu ve biyolojik inertliğinden dolayı çevre kemik dokulara girmesi sorun olmaktadır. Bu özellikle bakteri enfeksiyonlu operasyon bölgelerinde yapılan PEEK implantlar uygulamaları için geçerlidir. Dolayısı ile enfeksiyon direncini ve osseintegrasyonu artırmak için daha fazla çalışmaya ihtiyaç vardır.

- PEEK implantların alternatif olarak kullanılması için klinik öncesi ve klinik vakalarda tatmin edici osseintegrasyon sonuçları göstermesi gereklidir
- Düşük su emme kapasitesi, iyi sürtünme direnci ve kemiğe yakın mukavemet gücünden dolayı tercih edilen PEEK 'e uzun vadeli oral maruz kalma sonucu zamanla PEEK kaplamaların stabilitesinde bozulmalar meydana geldiği gözlenmiştir. Bu nedenle PEEK kaplama stabilitesini değerlendirmek için yeterli klinik çalışmaya ihtiyaç vardır. Özellikle PEEK ortodontik telleri ile ilgili pral kavitedeki uzun vadeli maruz kalımı, yük dayanımı, statik-karakteristik sürtünmesi gibi kullanıma bağlı durum değerlendirici ve diş fırçalamadan, gıda renklenmeleri ve bu renklenmenin çıkarımı, yemek yeme alışkanlıklarından etkilenmesi ile ilgili yeterli klinik çalışmalara ihtiyaç vardır.
- Tannous ve arkadaşları PEEK kroşeler ile kobalt-krom kroşeleri karşılaştırmış ve PEEK kroşelerin yeterli retansiyonu göstermediğini öne sürmüştür. Bu nedenle klinik kullanımda PEEK kroşelerin retansiyon kuvvetinin değerlendirilmesi ile ilgili vaka analizlerine ihtiyaç vardır.

### **İleri PEEK Çalışmalarına Yönelik Öneriler**

PEEK, diş hekimliğinde metal alaşımlara alternatif yüksek performans polimer materyal olarak görülmektedir. Dayanıklılığı, kırılma direnci, dentine ve kemiğe yakın elastikiyet modülü, şok absorpsiyon yeteneği ve biyouyumluluğu, korozyon direnci sayesinde diş hekimliğinde yaygın kullanım alanına sahip olmuştur. Ayrıca düşük ağırlığı ve estetiği kabul edilebilir oranda sağlayabildiği için kullanımı metallere oranla giderek artmaktadır. Özellikle protetik tedavide alt yapı materyali olarak kullanılmakla birlikte implantoloji, ortodonti, endodonti, restoratif restorasyonlar gibi çeşitli diş hekimliği alanlarında da kullanılmaktadır. CAD-CAM teknoloji ile kullanılması sayesinde hızlı, kolay ve daha az hatalı restorasyonlar üretilebilmektedir. PEEK üstünde uzun dönem klinik çalışmaların yetersiz olmasından dolayı polimerlerin, diş hekimliğinde kullanımını kısıtlamaktadır.. Bu nedenle daha fazla vaka çalışmasına, randomize klinik çalışmalara ve in vitro çalışmalara ihtiyaç olduğu görülmektedir. PEEK polimeri gelecek vadede de polimer esaslı materyallerin diş hekimliği ve protetik tedavide kullanımı için zamana ihtiyaç olduğu anlaşılmaktadır.

### **Sonuç**

PEEK mekanik, fiziksel ve kimyasal özelliklerinin yanı sıra modern tıptaki çeşitli uygulamaları yönüyle büyük umut vaat etmektedir. Ortopedi uygulamalarında omurga füzyonu, disk artroplastisi, laminektomi, travma ve onkolojik cerrahi, eklem artroplastisi ve artroskopik cerrahi alanlarında popüler bir seçimdir. Ayrıca ağız-çene-yüz ve kraniyofasiyal cerrahide

yörünge ve mandibular rekonstrüksiyonları, temporomandibular eklem deęişimi ve kraniyoplasti uygulamalarında komplikasyon ve hasta memnuniyeti açısından olumlu rapor edilmiştir. Kardiyovasküler ve kardiyotorasik uygulamalar açısından deęerlendirildięinde ise kalp damar cerrahisine yönelik implantlar, kalp kapak protezleri ve yaprakçık kalp kapakçıkları oluşturmada, kemik fiksasyon etkinlięi ve uygulama kolaylıęı yönüyle PEEK uygulamaları önerilmektedir. Ameliyat sonrası antibiyotik verilmesi, antimikrobiyal uygulamalar ve kansere karşı ilaç dağıtım sistemlerinde etkili bir şekilde kullanılmak üzere ilaç yüklü nanokapsül, nanopartikül veya misel sistemleri ile katkılanacak PEEK materyalleri geliştirilebilir.

**Özet**

Ni-Hard alaşımları arasında Ni-Hard 4, yüksek Cr ve Ni içeriği sebebiyle mekanik ve elektrokimyasal açıdan en iyi performansa sahip alaşım olarak bilinmektedir. Diğer bir adı yüksek Cr içeren beyaz dökme demir olan Ni-Hard 4 alaşımı aşınma ve korozyona maruz kalan parçaların kaplanması gibi çeşitli uygulama alanlarında yaygın bir şekilde tercih edilmektedir. Bu çalışmada konvansiyonel kaplama yöntemlerinden farklı olarak basınç destekli sinterleme ile saf demir üzerine Ni-Hard 4 kaplama yapılmış ve yüzey özelliklerine etkisi araştırılmıştır. Sinterleme ile kaplama işlemleri eş zamanlı olarak 950 °C'de 30 dakika süre boyunca uygulanmıştır. Karakterizasyon işlemlerine yoğunluk ölçümü ile başlanmıştır. Üretim yönteminin de etkisiyle %97 değerinde yüksek bir relatif yoğunluk elde edilmiştir. Mikroyapısal inceleme sonucunda altık ve kaplama arasında kuvvetli bir bağlantı oluşumu gözlemlenmiştir. Ayrıca Ni-Hard 4 kaplama, altlık malzemenin sertlik ve aşınma özelliklerinin gelişmesine yol açmıştır. Dolayısıyla Ni-Hard 4 kaplamanın yenilikçi bir yaklaşım olan sıcak pres ile uygulanması sonucunda altlık malzemeye üstün yüzey özellikleri kazandırılmıştır. Bu açıdan değerlendirildiğinde Ni-Hard 4 kaplama, saf demirin yüzey özelliklerini geliştirmiş ve yüksek performansa sahip kaplama elde edilmiştir.

## **HOT-PRESS COATING OF NI-HARD 4 ALLOY ON PURE IRON**

### **Abstract**

Ni-Hard 4 is well-known among the Ni-Hard alloys for its superior mechanical and electrochemical properties, mostly attributed to its higher chromium (Cr) and nickel (Ni) composition. Ni-Hard 4 alloy, also known as high-Cr white cast iron, is widely selected in many application areas, such as the coating of parts subject to wear and corrosion. In this work, unlike conventional coating methods, Ni-Hard 4 coating was applied on pure iron by pressure assisted sintering and its influence on surface features was examined. Sintering and coating processes were carried out simultaneously at 950 °C for 30 minutes. Characterization processes started with density measurement. With the influence of the production method, a high relative density of 97% was obtained in the Ni-Hard 4 alloy. Furthermore, the microstructural investigation showed strong bond formation between the substrate and the coating. In addition, Ni-Hard 4 coating led to an increase in hardness and wear properties of substrate. As a consequence of the production of Ni-Hard 4 coatings by hot pressing, improved surface properties were obtained. In this regard, the surface properties of pure iron were improved by Ni-Hard 4 coating and high performance coating was improved.

**Keywords:** White cast iron, Ni-Hard 4 alloy, powder metallurgy, surface properties, microstructural characterisation

## **Introduction**

Developing new methods and heat treatments for cast iron alloys allows new materials to show better mechanical properties and greater resistance to corrosion in various aggressive industrial environments (Abd El-Aziz et al., 2015; Banadkouki et al., 2018). High-alloyed cast irons are an important group of materials with an alloy content above 4%. High alloyed cast irons (450-850 HB) have superior wear, heat and corrosion resistance properties compared to other unalloyed or low alloyed cast irons. The main alloying elements used in high-alloy cast irons are nickel, chromium, molybdenum, copper and vanadium (Wei & Xu, 2019; Barutcuoglu et al., 2024). These materials are called Ni-Hard, Cr-Hard, etc. according to their alloy content. Ni-Hard is the name of highly alloyed white cast iron with very high wear resistance (Yücel & Günay, 2013). Among the Ni-hard alloys, Ni-Hard 4 is known as the hardest and most corrosion resistant alloy due to its high Cr and Ni content. Ni-Hard 4 alloy, also known as high Cr white cast iron, is frequently preferred in various application areas, such as mechanical parts exposed to wear and parts that will work in corrosive environments. In this alloy, depending on their chemical composition,  $M_{23}C_6$ ,  $M_7C_3$ ,  $M_6C$ , and  $M_3C$  type carbides can be seen in the microstructure (Çöl et al., 2016; Ruangchai et al., 2021). These carbides increase the hardness and wear resistance of the structure, enabling the material to be used as coatings in industry to improve the performance and life of cutting and drilling tools. Current coating technologies include thin film PVD and CVD coating techniques and thick coating types such as thermal spray and laser coating techniques (Sathish et al., 2023). Although the coating thickness to be applied varies according to the need, each method has its own advantages and disadvantages. Research for the development of coating methods continues. At this point in pressure-assisted sintering methods, applying pressure simultaneously with temperature to the powder compound during sintering creates the driving force for high density and leads to an increase in density kinetics. The external pressure increases the densification rate, allowing material production at lower sintering temperatures and times (Yamanoglu, 2019). However, coatings of Ni-hard alloys can be used as final parts after sintering. Such advantages make the application of industrial coatings by hot pressing attractive. In light of all this information, in this study, Ni-Hard 4 alloy was coated on pure Fe by pressure-assisted sintering technique. The surface properties of the coating and substrate materials were measured, and the applicability of the coating technique was evaluated.

## **Materials and Methods**

In the study, pure Fe (10  $\mu\text{m}$ ) powder produced by chemical methods was used as the substrate, and Ni-Hard 4 alloy powder produced by gas atomization was used as the coating. The chemical composition of Ni-Hard 4 powder is also given in Table 1. The coating powders were produced using the gas atomization device in the Metallurgical and Materials Engineering Department of Kocaeli University. In our previous study (Muratal et al., 2024), we detailed the production and powder characterization of Ni-Hard 4 alloy powders.

**Table 1.** Chemical composition of Ni-Hard 4 alloys

Elements	C	Si	Mn	S	P	Ni	Cr	Mo	Fe
<b>Amounts</b>	3.0-	0.3-	0.3-	$\leq$		3.3-			
<b>(wt. %)</b>	3.6	0.5	0.7	0.15	$\leq 0.3$	4.8	7-11	$\leq 1.5$	Rest

First, the base powder was laid in the graphite die, and then the coating powders were added to the die. The prepared die was placed in a DIEX VS50 brand hot press device. The coating process was carried out at 950  $^{\circ}\text{C}$  for 30 minutes under a constant pressure of 50 MPa. In addition, the production chamber was kept under vacuum with a pressure of 10<sup>-4</sup> mbar to avoid particle oxidation. Metallographic processing steps were performed before microstructural characterization. Firstly, the sample was sectioned using a METKON brand Microcut 150 precision cutting device. Then the cross-section surface was prepared by sanding and polishing. Finally, the samples were etched in 40 ml HCl and 20 ml HNO<sub>3</sub> solution at 40 $^{\circ}\text{C}$ . Optical microscope images were taken using an OLYMPUS BX41M-LED microscope. A JEOL JSM 6060 scanning electron microscope was used for SEM images. Hardness measurements were performed using a Zwick brand Roell ZHV model Vickers hardness tester with a 0.5 kgf loading for 10 s. A ball disc type TURKYUS POD/HT/WT brand abrasion device was used for the dry sliding wear test performed to evaluate the tribological properties of the samples. The wear tests were carried out at a 500 m distance, 20 N load, and 300 rpm rotational speed at room temperature using Si<sub>3</sub>N<sub>4</sub> balls.

## **Results and Discussion**

### **Microstructural Characterization**

Figure 1(a) shows the presence of tiny holes in both the Ni-Hard coating and the pure iron substrate. The pores were mostly localized at the interfaces between particles and exhibited a spherical morphology. Thus, these factors are not anticipated to provide significant drawbacks in terms of the material's strength. In Figure 1(b), the etched interfacial picture shows the production of pearlite in the interfacial area due to carbon diffusion. As it moved away from

the coating area, the ferrite phase became the dominant component in the microstructure. The optical images showed the presence of martensitic phase and the production of hard coarse  $M_7C_3$  type carbide in the coating area. The scanning electron microscope (SEM) image shown in Figure 1(c) reveals the presence of diffusion in the interfacial area between the substrate and the Ni-Hard coating. Consequently, carbon diffusion led to forming a pearlitic structure in the interfacial area, which was distinct from the matrix. carbon diffusion unlike the matrix.

**Figure 1.** Microstructure images of the sample: (a) polished, (b) etched, (c) SEM image

### **Hardness Results**

The interface Vickers hardness result of the sample obtained in the study is given in Figure 2. As can be observed, hardness testing was carried out in 3 separate regions: the substrate, the interfacial area and the coating. When results are evaluated, it is discovered that the hardness value of Ni-Hard 4 coating is higher than pure iron. The hardness increase is related to the unique microstructure of high-alloy cast iron. The microstructure is generally formed of three parts and two supporting elements. The three ingredients are Fe, C and a significant amount of Cr. Fe is the matrix element and forms the martensite phase with C, strengthening the material. The Cr and C presence increases the hardness and wear resistance of the structure by producing

$M_7C_3$  carbides. However, the size of these carbides should be kept under control in case of coarsening. Coarse-grained carbides adversely affect the impact strength of the structure. For this reason, Ni and Mo reinforcements in the alloy developed fine-grained carbides, resulting in high hardness and high impact strength. Therefore, the formation of  $M_7C_3$  carbide in Ni-Hard 4 coating and its uniform distribution in the structure led to a substantial hardness increase compared to the base material.

**Figure 2.** Vickers hardness test results from surface to centre

### **Wear Results**

The dry wear test results applied to the pure iron substrate and Ni-Hard 4 coating are given in Figure 3 in terms of wear rate. As can be observed, the Ni-Hard 4 alloy showed better wear resistance than pure iron. The increased wear performance was due to the significant hardness differences between the substrate and the coating. As a result of the improved hardness, the coating experienced a lower wear rate. The wear rate of Ni-Hard coating was measured at  $0.185 \text{ mm}^3\text{m}^{-1}\cdot 10^{-3}$  and that of pure iron at  $0.803 \text{ mm}^3\text{m}^{-1}\cdot 10^{-3}$ . On the other hand, microstructural differences in the substrate and coating caused the two regions to show different wear mechanisms. The Ni-Hard 4 alloy exhibited high abrasive wear with carbides, which increase hardness.

**Figure 3.** Wear rate values of materials

High plastic deformation zones were identified on the worn surface of pure iron. Furthermore, the wear of pure iron began with adhesive signs, followed by severe oxide growth due to friction and temperature. The oxide layers produced under load fractured and left abrasive markings in the system. This situation resulted in massive material losses. On the other hand, Figure 4 shows the friction coefficient values obtained as a result of the wear test. As can be observed, the coefficient of friction of the Ni-Hard 4 alloy was lower than that of pure iron. The low coefficient of friction could be shown as one of several factors leading to reduced material loss in the coating. The strong carbide structure prevented the abrasive tip from being embedded in the matrix, and reducing the contact area led to a reduction in the friction coefficient.

**Figure 4.** Friction coefficient graph of the materials

### **Conclusion**

Powder metallurgical coatings are a solution against system responses like abrasion and corrosion, which negatively influence industry sustainability and raise company expenses. They are increasingly preferred because of their easy adaptability, wide range of materials, and application regions. This work aims to coat Ni-Hard 4 alloy, which stands out with its strong wear resistance and excellent corrosion resistance in its own material family, on iron using pressure-assisted sintering. This study was motivated by the limited research on the application of the hot press technique to a coating strategy. When the results were examined, superior wear performance was noticed with the Ni-Hard 4 alloy coating due to the enhanced hardness compared to pure iron. Furthermore, it was determined that there was a strong connection between the coating and the basic material. As a result, the findings obtained with pressure-assisted sintering demonstrated that this method can be an alternative to common coating procedures used in industry.

### **Thanks and Information Note**

The production of the powders used in this study and the coating of these powders on the substrates by powder metallurgy were realized with the support of the Kocaeli University Scientific Research Projects Unit (Project No: FBA-2021-2629).

**Özet**

Akıllı Őehirler, bilgi ve iletişim teknolojilerinin entegrasyonuyla sürdürülebilirlik, verimlilik ve yaşam kalitesi açısından önemli fırsatlar sunmaktadır. Bunu; altyapı ve ulaşım, enerji yönetimi, bilgi ve iletişim teknolojileri, kamu hizmetleri, çevresel sürdürülebilirlik, toplumsal katılım ile veri analitiĐi ve yönetiminin bütün olarak gelişimi ve dönüşümüyle sağlamaktadır. Bu dönüşüm süreci karmaşık ve çok boyutlu olduğundan, etkili bir deĐişim yönetimi gerekmektedir. Bu çalışmada, geleneksel Őehirlerden akıllı Őehirlere geçişin zorlukları, fırsatları ve deĐişim yönetimi stratejileri incelenmektedir. İlk olarak, akıllı Őehirlerin tanımı, temel özellikleri ve bileşenleri açıklanmaktadır. Bu bileşenler arasında altyapı ve ulaşım, enerji yönetimi, kamu hizmetleri, çevresel sürdürülebilirlik, bilgi ve iletişim teknolojileri, toplumsal katılım ve veri analitiĐi yer almaktadır. Daha sonra, Őehirlerin dijital dönüşümü için önemli olan teknolojik altyapı, veri yönetimi ve güvenlik gibi konular ele alınmaktadır. Akıllı Őehirlerin sürdürülebilirlik, enerji yönetimi, vatandaş katılımı ve kamu hizmetleri gibi alanlardaki etkileri ve fırsatları da tartışılmaktadır. Bu deĐişim sürecinde, yerel yönetimler, paydaşlar ve vatandaşlar arasında etkili iletişim, işbirliĐi ve liderlik önemli rol oynamaktadır. DeĐişim yönetimi stratejileri, kaynakların etkili kullanımını ve sürdürülebilirlik ilkesine dayanan bir yaklaşımı gerektirir. Akıllı Őehirlerin geleceĐi için etkili bir deĐişim yönetimi stratejisi, teknolojik, sosyal ve kurumsal boyutları dikkate alan ve sürdürülebilirlik ilkesine dayanan bir yaklaşım gerektirmektedir. Sonuç olarak bu çalışma, Őehirlerin gelenekselden akıllıya dönüşümünde karşılaşılan zorlukları ve başarı faktörlerini anlamak için bir çerçeve sunmaktadır.

**FROM TRADITIONAL TO SMART: MANAGING CHANGE IN CITIES**

**Abstract**

Smart cities offer significant opportunities for sustainability, efficiency and quality of life through the integration of information and communication technologies. This is achieved through the development and transformation of infrastructure and transportation, energy management, information and communication technologies, public services, environmental sustainability, social participation and data analytics and management. As this transformation process is complex and multidimensional, effective change management is required. This study examines the challenges, opportunities and change management strategies for the transition from traditional cities to smart cities. First, the definition, main characteristics and components of smart cities are explained. These components include infrastructure and transportation, energy management, public services, environmental sustainability, ICT, civic engagement and data analytics. Then, issues such as technological infrastructure, data management and security, which are important for the digital transformation of cities, are discussed. The impacts and opportunities of smart cities in areas such as sustainability, energy management, citizen engagement and public services are also discussed. Effective communication, cooperation and leadership between local governments, stakeholders and citizens play an important role in this change process. Change management strategies require effective use of resources and an approach based on the principle of sustainability. An effective change management strategy for the future of smart cities requires an approach that takes into account technological, social and institutional dimensions and is based on the principle of sustainability. In conclusion, this study provides a framework for understanding the challenges and success factors in the transformation of cities from traditional to smart.

## **Introduction**

According to various definitions, change is a process that refers to the transition from one structure to another structure, which has no orientation and can take place in different directions. This process can occur suddenly or be initiated by people in a planned or unplanned manner. While the results of change can have positive effects when it occurs in the desired direction, negative results may occur when it occurs in an undesired way. In other words, change refers to a process of activities carried out to ensure that a situation is transformed into a new structure by differentiating over time. This process can take place in a planned or unplanned manner and can have positive or negative consequences (Helvacı, 2015). Today, organizations and formations are faced with the necessity of taking into account the changes that occur in order to achieve their goals. Because any change in environmental conditions directly affects the activities of organizations and forces them to change. For this reason, three main problems affecting change are emphasized meticulously: problems arising from the competitive market structure, problems arising from the workforce and problems arising from the social environment (Güçlü & Şehitoğlu, 2006). Smart cities are another structure affected by changes in the social and social environment. Smart cities are formations created mainly for data collection using various electronic methods and sensors in urban areas. This data collection process aims to utilize resources more efficiently and continuously improve the quality of services and operations. Data is collected from sources such as city dwellers, buildings, infrastructure and other amenities, and through the analysis of the collected data, it is used for purposes such as traffic and transportation systems, energy generation and distribution systems, public services, water supply, treatment and distribution systems, waste management, recycling and disposal, security and crime detection, monitoring and management of public spaces. Smart cities connect information technologies and various physical devices connected to the Internet of Things to improve the efficiency of services and operations and to interact with city residents. In this way, smart cities are able to dynamically monitor the state of the city by interacting with both city infrastructure and residents. The information obtained improves service quality, performance and interactivity, while at the same time reducing costs and resource consumption.

In the following sections of the study, the concept of change and types of change, the aims and benefits of change, change management and strategies are examined, followed by information on smart cities, their characteristics and framework. Finally, the challenges faced with smart cities from a change management perspective are examined.

### **The Concept and Types of Change**

Change is a concept in which the economic, social, cultural and political factors interacted with in existential processes are constantly changing along with the external environment, competitors and customer base. Capturing change is therefore a difficult challenge. Organizations have to change continuously to compete with the external environment, time and competitors (Tokat, 2012). Change refers to the process of moving an entity or situation from one level to another. The change process of organizations takes place through differentiation at individual and organizational level, production and implementation of innovative ideas (Koçel, 2015; Erdoğan, 2015). Change involves changes in the internal dynamics of the organization, business processes, structural values, authorities and responsibilities, production techniques, environmental regulations, competition policies and managerial strategies (Sabuncuoğlu & Tüz, 2016). Organizations evaluate over time and space to decide whether change is necessary. External causes include political factors, technology, competitors, customers, financial conditions, economic conditions, social conditions, natural conditions, public opinion and suppliers. Internal causes, on the other hand, are factors internal to the organization and include factors that force the organization to change, such as organizational inefficiencies, downsizing policy, change in organizational values, alternative working methods, change of senior managers, growth policy and mergers (Sabuncuoğlu & Tüz, 2016). Identifying and analyzing these factors helps organizations develop strategies to implement change and ensures successful management of change. With the increasing demand for change, organizations have started to implement various types of change. These types of change are divided into various categories such as continuous-root, planned-unplanned, pre-emptive-reactive, large-scale-small-scale, active-passive, individual, group and organizational change. Continuous change is a process of adaptation, restructuring and experimentation that organizations use to adapt to environmental conditions. Fundamental change is a type in which fundamental and in-depth changes take place in the structure or objectives of the organization. Individual change refers to changes in an individual's thinking and behavior, while group change refers to changes in the structure and relationships within a group. Institutional change refers to changes in behaviors, structures, procedures or outputs of certain units within an organization (Helvacı, 2015). Planned change is a type of change in which the change process is planned and implemented in advance, while in unplanned change, the purpose and stages of change are not determined in advance. While pre-emptive change enables the organization to anticipate and prepare for environmental changes, reactive change is a type of change that occurs by reacting to environmental conditions

when they occur. While large-scale change affects the overall structure of the organization, small-scale change refers to changes related to a specific issue. In active change, the organization actively changes, while in passive change, it accepts change within itself to adapt to the environment (Koçel, 2015).

### **Aims and Benefits of Change**

The main objective of change is to increase efficiency by combining the requirements of the work and the qualifications of the people doing the work, and to achieve more output using fewer resources. Thus, increasing efficiency is also an important goal of change. In addition, change also has goals such as increasing motivation, preparing for the future, developing trust and cooperation, finding solutions to problems, and improving communication (Sabuncuoğlu & Tüz, 2016). The rapid development and change in technology reveals the necessity for organizations to keep pace with change and follow technological innovations. In this context, change is directed towards the goal of organizations to provide innovation, and in certain cases, organizations may have goals that are compatible with their long-term plans and programs. In such cases, the purpose of change is to create a structure that makes it easier for organizations to enter new areas to achieve these goals (Tokat, 2012). While it is known that change is generally aimed at achieving these goals, there are also goals that prioritize human resources. Objectives such as developing the ability to establish empathy and humanistic relationships, increasing organizational knowledge and work performance, building mutual trust and support, developing behaviors that will ensure open communication, cooperation and independence, and gaining the ability to understand group work and group behavior reflect the human-oriented dimension of change (Tokat, 2012). These objectives focus on the development and effective use of human resources in organizations, thus aiming to improve the performance of employees by increasing their motivation. For organizations, change is both a necessity and an effective process that ensures the continuity and development of the organization. Beyond being a technical process, change also requires a change in mindset. New approaches should be adopted to solve problems instead of acting with old mindsets. In addition, change not only brings solutions to current problems, but also requires being prepared for potential problems that may be encountered in the future. Change supports the growth and development of organizations as well as ensuring the continuation of their activities. In addition, change shapes the future by creating a vision for the organization and provides many positive results and benefits (Güçlü & Şehitoğlu, 2006).

Positive outcomes of change include creating excitement and vitality in the organization, enabling employees to focus, providing new opportunities, developing and satisfying employees. Groups formed with change add dynamism to the organization and ensure that routine activities are reviewed and organized (Erdoğan, 2015). However, if change is handled incorrectly, it can lead to negative consequences such as the risk of not achieving goals, increased costs, lost benefits, decreased motivation and negative attitudes of employees (Helvacı, 2015). Therefore, the change process should be managed carefully and strategies should be determined in accordance with the needs and priorities of the organization.

### **Change Management and Strategies**

The fact that the environment is in a continuous process of change obliges organizations to change, whether they want to or not. Organizations that cannot adapt to change may lose their ability to compete and may even cease to exist. Therefore, organizations should be able to successfully manage change and exhibit a flexible attitude towards change. In order to manage change successfully, it is important to pay attention to the following factors. Creating a sense of urgency, building a strong guiding coalition, creating a vision, sharing the vision, empowering others to bring the vision to life, planning and creating short-term gains, consolidating progress and creating further change, institutionalizing new approaches play an important role in change management (Kotter, 1995). Change management involves a five-stage process. These stages are examining the factors that require change, diagnosing the change, creating a change program, implementation, and monitoring and evaluating the change. Effective use of factors such as leadership, communication, participation and training ensures the success of the change management process. In addition, dealing with resistance to change, increasing employee motivation and continuous improvement of the process are also important elements (Erdoğan, 2015). Different strategies are used for change management (Sabuncuoğlu & Tüz, 2016): Among these strategies are empirical-logical strategies. According to this strategy, people can be directed to change by persuading them with objective information. It is important for those who want to implement change to first convince the people who will be affected and benefit from the change about the advantages of change. By providing unbiased and solid information, people are made to understand the opportunities and improvements that change will bring. Use of force-coercion strategies are also an effective approach to change management. In this strategy, change is enforced through the use of political or economic sanctions and rules. While power strategies require people to be coerced if they do not dare to change, coercion strategies guide people to change through the incentives of power, law, reward

and punishment. These strategies aim to get individuals to respond to change out of fear of punishment or desire for reward rather than consent to change. Prescriptive-retraining strategies aim to support change by observing whether change occurs in behaviors, norms, relationships and skills. In this strategy, values and assumptions are clarified and based on participation. Power sharing is important to build consensus for change and foster collaboration. Prescriptive-retraining strategies take more time but allow for more internalization. In these strategies, individuals are encouraged to understand, accept and personally embrace change. In this way, different strategies for change management are used, aiming at effective management and acceptance of change. The choice of strategies may vary depending on the nature of the change, its objectives and the characteristics of the organization or community. What is important is that the strategies are carefully planned and implemented so that the change is successful and lasting.

### **Smart Cities**

There are many different definitions of smart cities in the literature (Partigöç, 2023). Factors used to define smart cities include the application of various electronic and digital technologies, transforming life and work environments within the city through the use of ICTs, integrating ICT applications into government and public systems, and developing innovations and knowledge regionally through applications that bring ICTs and people together (Deakin, 2013). Different researchers have defined smart cities as a process of researching and identifying smart solutions to improve the quality of services provided to citizens, a city that provides economic growth and high quality of life in a sustainable way, and systems that support city development and improve urban services using communication technologies (Caragliu et al., 2011; Law & Lynch, 2019). For a better understanding of the smart city concept, it is important to identify its basic components. Technology factors consist of physical infrastructure, smart, mobile and virtual technologies and virtual networks. Human factors are related to human infrastructure and social capital, while institutional factors consist of governance, policy, regulation and directives (Nam & Pardo, 2011). Smart city technologies are especially manifested in applications in areas such as transportation, environmental sustainability, energy and natural resource conservation, health and education. These applications contribute to making cities more efficient, sustainable and people-oriented. The journey of smart cities started in the 1970s with the Los Angeles Cluster Analysis project. The first smart city concept emerged in Amsterdam in 1994. Smart city studies gained momentum in the 2000s with the initiatives of IBM and Cisco. Later, many countries supported the development of smart cities by

implementing similar projects (Verdict, 2020). In the last two decades, rapid developments in information technologies, advances in sensor technologies, and exponential growth in computing power have led to an increase and expansion of technology applications in cities. Smart cities utilize IoT networked devices, various software, user interfaces and communication networks to make life easier. IoT is a network of connected devices such as vehicles, household appliances, traffic lights, street lights, etc. that communicate with each other and exchange data. The data from these devices is stored in the cloud or on servers, enabling efficiency gains in both the public and private sectors and helping citizens realize economic benefits and improvements in quality of life. Smart cities have many features. First of all, smart cities are a concept based on the idea of utilizing technology and digital tools to increase the smartness of a city (Hollands, 2008). In this concept, information technologies are used to increase economic and political efficiency and to ensure social, cultural and urban development. Key components of smart cities include informed, educated and engaged citizens, as they play an important role in creating a high quality of life and civic space (Deakin, 2013). Moreover, supporting sustainable business initiatives is of great importance for strategic planning (Angelidou & Psaltoglou, 2017). Therefore, it is important to monitor and cooperate with neighboring cities (Angelidou, 2017). Privacy and security are considered critical issues in smart cities and relate to how data is used (Kitchin, 2015). Smart city strategies are also characterized by their ability to take into account local challenges, needs and opportunities (Paskaleva, 2011). Stakeholder involvement is also an important feature in the planning and implementation of smart city initiatives (Angelidou & Psaltoglou, 2017). They are large and costly projects that require ethical and political considerations and should be carried out with a planning approach that takes into account long-term community interests (Watson, 2014). For these initiatives to succeed, a clear strategic framework and an architecture that pays attention to complementarities are needed (Angelidou, 2014). Moreover, the development of smart cities should be a product of interdisciplinary planning, as it covers a broad spectrum of development and tackles pressing urban challenges (Burger et al., 2013). This development aims to integrate different dimensions of intelligence, such as information systems, human intelligence, collective intelligence and artificial intelligence (Deakin, 2013). The intelligence of smart cities is realized through the effective combination of communication lines, sensors and software (Manshanden & Lambooy, 2007).

### **Smart City Framework**

Several frameworks should be used for the creation, consolidation and adoption of smart city capabilities (Govada et al., 2017). These frameworks can be divided into five key dimensions that include different categories related to smart city development (Sharifi, 2019): The technology framework includes the technological infrastructure and solutions used in smart cities. The effective use of technologies such as sensors, communication networks, artificial intelligence and automation are important elements of this framework. The people framework encompasses the residents, communities and users of smart cities. Factors such as human-centered design, participation, education and awareness form the basis of this framework. It is of great importance that smart cities are in line with the needs and expectations of people. The institutional structure dimension includes the institutions that manage and operate smart cities. The cooperation and coordination of public institutions, private sector companies, civil society organizations and other stakeholders form the basis of this framework. A good governance and policy framework ensures that smart cities operate in a sustainable and effective manner. The energy framework includes elements such as energy efficiency, renewable energy sources and smart energy management. Optimizing energy consumption and using sustainable energy sources is of utmost importance in smart cities. The data management framework includes the effective management and utilization of large amounts of data collected in smart cities. Issues such as data security, privacy, analysis and sharing are important components of this framework. These five key dimensions serve as guiding frameworks for the successful development and implementation of smart cities. Consideration of each dimension is crucial for smart cities to realize their full potential.

### **Assessing the Challenges of Smart Cities from a Change Management Perspective**

In smart city initiatives, creating a roadmap is the first step. The key elements of this roadmap are community analysis, smart city policy development and community engagement with e-government services and a strong city-wide Wi-Fi infrastructure. Research has identified common challenges of smart city initiatives. While budget constraints pose a key challenge to sustainability, social media and mobile communication technologies offer new opportunities for community engagement (Alawadhi et al., 2012). In addition, it has been stated that smart city applications change the organizational culture and increase the level of transparency and accountability through data-driven management. Integrating different technologies and existing infrastructure, ensuring data privacy and cybersecurity, promoting citizen participation and inclusion in decision-making, addressing the digital divide, managing sustainable and energy-

efficient practices, dealing with complex regulatory frameworks, securing adequate funding and investment, and developing flexible strategies to deal with potential disasters and emergencies are some of the challenges that need to be overcome in the process of implementing smart city initiatives. These challenges require collaborative efforts and innovative solutions and are important to achieve the goal of creating efficient, inclusive and sustainable urban environments in the future (Gupta, 2023). Organizations have to adapt to change in order to survive and adapt to environmental conditions. However, elements of resistance may emerge in the change process. Resistance is defined as forces that oppose change and prevent transformation. These elements of resistance may differ from organization to organization and may make it difficult for change to be successful. Therefore, it is important for organizations to remain robust, consistent and willing to change when faced with resistance to change. There are different reasons why people resist change. Work-related reasons include fear of technological unemployment, fear of increased workload, fear of lack of technical knowledge, fear of changes in the wage/reward relationship and high costs. Personal reasons include fear of the unknown, the need for security, the difficulty of giving up habits and the fear of failure, while social reasons include group norms and goals versus the goals of change, negative attitudes and mistrust towards change, unwillingness to give up existing social relationships and the perception that change is only in the interest of a particular group. Organizations use a variety of strategies to reduce or eliminate resistance to change. These strategies include participation, communication and education, negotiation, explicit or implicit coercion, manipulation and cooptation. Participation helps to reduce resistance by ensuring that those who are subject to or affected by the change are actively involved in the process. Communication and training are important for explaining the necessity of change, adopting new approaches and enabling individuals to adapt to change. Negotiation aims to gain the approval and support of those who will be affected by the change, while explicit or implicit coercion methods can be used to overcome resistance. Manipulation and cooptation can help reduce resistance by influencing those who are against change. However, if it is considered that the basic principles for change management can be applied to smart cities: Communication and Persuasion: Effective communication between stakeholders is crucial in the smart city transformation process. In this process, city residents need to be regularly and clearly informed about the reasons, benefits and process of change. In addition, transparent and participatory communication strategies should be used to gain public support.

**Leadership and Sponsorship:** The role of leaders and influential sponsors is crucial in smart city transformation. Leaders should define and support the smart city vision and guide the process. Sponsors should assume responsibilities such as providing financial resources, participating in decision-making processes and removing barriers.

**Participation and Stakeholder Management:** In smart city transformation, local communities, businesses, civil society organizations and other stakeholders should be actively involved in the process. This means understanding the expectations of the community, ensuring participation and taking into account the views of different stakeholders. Collaboration and partnership should be built to ensure stakeholder ownership and support.

**Vision and Goals of Change:** A clear vision and goals should be set for smart city transformation. This vision should include smart city goals such as sustainability, quality of life, efficiency and innovation. The vision should provide a roadmap to bring all stakeholders together and guide the process.

**Planning and Resource Management:** Smart city transformation requires comprehensive planning and resource management. This planning should meet the needs of technological infrastructure, data management, energy, transportation and other areas. Resources must be properly allocated to effectively meet the requirements, such as human, financial and technological resources.

**Dealing with Resistance:** The smart city transformation process may encounter resistance. It is important to understand resistance, identify its source and deal with it with effective strategies. At this point, resistance should be reduced and public trust should be gained through methods such as education, information and transparency.

**Improvement and Learning:** During the smart city transformation process, feedback should be continuously received and the process should be monitored. The experiences and learnings obtained in this way should be used to improve the process. In addition, the impacts and results of the change should be evaluated and lessons should be learned for future projects and initiatives.

### **Conclusion**

These principles provide a basic framework for effectively managing change in smart cities. However, as each city has different needs and circumstances, change management strategies should be customized to local conditions. Key principles such as communication and persuasion, leadership and sponsorship, participation and stakeholder management, vision and goals of change, planning and resource management, dealing with resistance, improvement and learning are crucial for smart city transformation. These principles provide a framework for effectively managing change in smart cities and ensuring the active participation of society. The

more cities that want to change can comply with these principles, the more they will be able to realize change and transformation.

**Özet**

Akıllı Őehirlerin bileŐenleri teknoloji, veri ve sürdürülebilirlik ilkelerini bir araya getirerek Őehirleri daha yaŐanabilir, sürdürülebilir ve etkin hale getirmektedir. Akıllı Őehirlerde altyapı ve ulaŐım, enerji yönetimi, bilgi ve iletiŐim teknolojileri, kamu hizmetleri, çevresel sürdürülebilirlik, toplumsal katılım, veri analitiĐi ve yönetim bileŐenlerinin bir bütün olarak geliŐtirilmesi önemlidir. Bu çalıŐma, yerel yönetimlerin akıllı Őehir olma yolunda attıkları adımları ve Őehirlerin dönüşüm sürecindeki ana adımları ele almaktadır. Büyük bir küresel metropol olan İstanbul, artan bir nüfus, karmaŐık bir ulaŐım aĐı ve çeŐitli altyapı ihtiyaçları ile karşı karşıyadır. Akıllı Őehir konsepti, bu zorlukların üstesinden gelmek için teknolojik yenilikleri ve sürdürülebilirlik hedeflerini bir araya getirerek İstanbul'un gelecekteki gelişimini şekillendirmektedir. ÇalıŐma, İstanbul'un akıllı Őehir olma yolunda attıĐı adımları inceleyerek teknolojik altyapı, veri yönetimi, ulaŐım, enerji ve sürdürülebilirlik gibi konulara dikkat çekmeye çalıŐmaktadır. İstanbul Büyükşehir Belediyesi'nin yönetiminde akıllı ulaŐım sistemleri, dijital altyapı projeleri ve enerji yönetimi gibi alanlarda birçok girişim yürütölmektedir. Bunlar arasında Őehir sakinlerinin yaŐam kalitesini artıran, çevresel sürdürülebilirliĐi destekleyen ve ekonomik kalkınmayı teşvik eden çözümler de yer almaktadır. Yerel toplum katılımı, liderlik ve yönetim desteĐi, kaynak yönetimi ve teknoloji entegrasyonu gibi temel ilkeler ise İstanbul'un akıllı Őehir hedeflerine ulaşmasında kritik öneme sahiptir. İstanbul'un akıllı Őehir vizyonu sürdürülebilirlik, yenilikçilik ve yaŐam kalitesi gibi önemli hedefler içermektedir. Ancak başarı için sürekli çaba, işbirliĐi ve toplum desteĐi gerekmektedir. Sonuç olarak bu çalıŐma, İstanbul'un akıllı Őehir olma yolunda attıĐı adımları ve bu dönüşümün getirdiĐi fırsatları tartışmaktadır. Akıllı Őehir dönüşümü ile İstanbul'un gelecekte daha yaŐanabilir, baĐlantılı ve sürdürülebilir bir Őehir olma yolunda önemli ilerlemeler kaydetmesi beklenmektedir.

**Anahtar Kelimeler:** Akıllı Őehirler, Yerel Yönetimler, Sürdürülebilirlik, Teknolojik yenilikler

**LOCAL GOVERNMENT ACTIVITIES TOWARDS BECOMING A SMART CITY:  
THE CASE OF ISTANBUL**

**Abstract**

The components of smart cities combine technology, data and sustainability principles to make cities more livable, sustainable and efficient. In smart cities, it is important to develop infrastructure and transportation, energy management, information and communication technologies, public services, environmental sustainability, social participation, data analytics and management components as a whole. This study examines the steps taken by local governments to become smart cities and the main steps in the transformation process of cities. As a major global metropolis, Istanbul faces a growing population, a complex transportation network and diverse infrastructure needs. The smart city concept is shaping Istanbul's future development by combining technological innovations and sustainability goals to address these challenges. The study examines Istanbul's steps towards becoming a smart city, highlighting issues such as technological infrastructure, data management, transportation, energy and sustainability. Under the Istanbul Metropolitan Municipality, many initiatives are underway in areas such as smart transportation systems, digital infrastructure projects and energy management. These include solutions that improve the quality of life of city residents, support environmental sustainability and promote economic development. Key principles such as local community engagement, leadership and management support, resource management and technology integration are critical to achieving Istanbul's smart city goals. Istanbul's smart city vision includes important goals such as sustainability, innovation and quality of life. However, success requires sustained effort, collaboration and community support. In conclusion, this study discusses the steps Istanbul has taken towards becoming a smart city and the opportunities that this transformation brings. With the smart city transformation, Istanbul is expected to make significant progress towards becoming a more livable, connected and sustainable city in the future.

## **Introduction**

The world's population has increased at an extraordinary rate throughout history, and much of this increase has taken place in cities. In the 21st century, the majority of the world's population now lives in urban areas and this trend is expected to continue. Rapid urbanization brings many opportunities as well as serious challenges. While cities offer attractive opportunities for economic growth, innovation, cultural diversity and social development, they also pose problems such as infrastructure deficiencies, environmental problems, traffic congestion and social inequalities. The solution to these problems and the future of urban areas are shaped around the concepts of urban transformation and smart cities (Komninos, 2008). Smart cities aim to make cities more efficient, sustainable and livable through the use of technology. Smart cities enable better management of cities through the use of various sensors, data analytics, internet connectivity and other digital technologies. These technologies support the development of cities in a range of areas, from optimizing transportation and reducing energy consumption to emergency management and environmental protection. Smart cities have the potential to transform not only physical infrastructure, but also community engagement and urban planning (Örselli & Can, 2019). Istanbul is the largest city in Turkey and is recognized worldwide for its historical and cultural heritage. As a bridge between the Anatolian and European continents, Istanbul is located at the junction of the Bosphorus and the Sea of Marmara. Thanks to this strategic location, Istanbul has been the center of many civilizations throughout history and has had a great influence in terms of trade, economy, culture and politics. In recent years, Istanbul has been undergoing a process of rapid urban development and change. The city is undergoing a major transformation due to factors such as population growth, economic growth and migration. High-rise housing, infrastructure projects, urban planning and social transformation efforts are changing the physical fabric and lifestyle of Istanbul. The steps taken and projects carried out by the Istanbul Metropolitan Municipality (IBB) within the scope of smart cities are among the determinants of this change and transformation. In the following sections of the study, information on smart cities is given first. Subsequently, IBB, as a local government, has provided information on the implementation of the Istanbul Smart City Strategic Plan and the activities carried out within the scope of the smart city perspective.

## **Smart Cities**

The smart cities journey started in the 1970s with the Los Angeles Cluster Analysis project. Later, many countries supported the development of smart cities by implementing similar projects (Verdict, 2020). Factors used to define smart cities include the application of various

electronic and digital technologies, the use of ICTs to transform life and work environments within cities, the integration of ICT applications into government and public systems, and the regional development of innovation and knowledge through applications that bring ICTs and people together (Deakin, 2013). For a better understanding of the smart city concept, it is important to identify its basic components. Technology factors consist of physical infrastructure, smart, mobile and virtual technologies and virtual networks. Human factors are related to human infrastructure and social capital, while institutional factors consist of governance, policy, regulation and directives (Nam & Pardo, 2011). Smart cities are a concept based on the idea of utilizing technology and digital tools to increase the smartness of a city (Hollands, 2008). In this concept, information technologies are used to increase economic and political efficiency and to ensure social, cultural and urban development. Moreover, supporting sustainable business initiatives is of great importance for strategic planning (Angelidou & Psaltoglou, 2017). Therefore, it is important to observe and cooperate with neighboring cities (Angelidou, 2017). Moreover, for these initiatives to be successful, a clear strategic framework and an architecture that pays attention to complementarities are needed (Angelidou, 2014). Moreover, the development of smart cities should be a product of interdisciplinary planning, as it covers a broad spectrum of development and tackles pressing urban challenges (Burger et al., 2013). A variety of frameworks should be used for the creation, combination and adoption of smart city capabilities. Technology, people, organizational structure, energy and data management serve as guiding frameworks for the successful development and implementation of smart cities. Consideration of each dimension is crucial for smart cities to realize their full potential (Sharifi, 2019).

### **Istanbul as a Smart City**

Istanbul Metropolitan Municipality (IBB) has prepared the Smart City Strategic Plan, a strategy that aims to improve the quality of life of its residents and use resources effectively and efficiently by taking advantage of the opportunities brought by the information age. This plan aims to utilize data and technology-based solutions to meet the needs and expectations of all Istanbulites. The Istanbul Smart City Strategic Plan (2021-2030) summarizes the process of the project, explains the project management principles, presents the findings obtained during the progress of the project, and includes smart city strategies, strategic objectives, initiatives and projects specific to Istanbul. This is the first Smart City Strategic Plan prepared at the local government level in Turkey and has been developed in line with Turkey's National Smart Cities Strategy and Action Plan (İstanbul Akıllı Şehir Stratejik Planı, 2021).

A basic vision, main strategies, thematic area strategies, initiatives and approximately 180 project plans to develop the city have been identified to ensure that Istanbul achieves its Smart City goals. These project plans, which are in line with IBB's strategy, are born out of real needs, can be realized by stakeholders in harmony, are in line with global trends, can be developed with a sustainable vision, and have a clear and understandable quality that can add "smart" elements to other projects. With the Roadmap, which is the final stage for planning Istanbul's Smart City journey, all the data obtained from the previous stages were combined and the priorities, resource requirements, governance principles, communication plan and performance indicators of the projects gradually targeting the years 2023, 2025 and 2030 were clarified. The whole process brought together different expertise, with the project being implemented within IBB (İstanbul Akıllı Şehir Stratejik Planı, 2021). On the other hand, there are many studies on smart cities. According to the IESE 2024 study, the top 10 smart cities are London, New York, Paris, Tokyo, Berlin, Singapore, Oslo, Amsterdam, San Francisco and Chicago, while Istanbul ranks 93rd among 183 cities (IESE, 2024). Many studies are being carried out within the scope of smart smart cities in Istanbul.

#### **Studies carried out in Istanbul within the scope of Smart City Studies**

This section provides information on the activities carried out by the Istanbul Metropolitan Municipality within the scope of the Istanbul Smart City Strategic Plan, the field strategies of these activities, the strategic goals and objectives in this direction, and the completed and not yet completed projects (Smart City Istanbul, 2024):

#### **Smart Mobility**

The Area Strategy envisages the use of dynamic and intelligent systems to ensure the most efficient use of available resources. Through these systems, the needs and demands of passengers will be identified and more comfortable, safe and environmentally friendly transportation services will continue to be provided. Istanbul stands out with its strengths in mobility. Factors such as the importance given to transportation by central and local governments and their openness to innovations, the implementation of many smart transportation systems in the city and the use of various modes of transportation support Istanbul's strengths in mobility. In addition, master plan studies and qualified human resources in the city also ensure that Istanbul has a strong position in terms of mobility. However, transportation demand has increased rapidly in recent years due to rapidly growing population and migration. However, despite accelerated transport investments after the 2000s, there are still infrastructure gaps and challenging expropriation processes for transport infrastructure in

urban planning. Moreover, the availability of different modes of transportation offers room for improvement in the integrated planning and operation of these modes. In the process of implementing the Area Strategy, a comfortable, safe, environmentally friendly, people-oriented and integrated transportation is targeted. An important step in this direction is to improve coordination and public transport, support sustainable modes of transport and make use of emerging information and communication technologies in the field of smart mobility to reduce traffic congestion. This strategy provides an important roadmap to find solutions to Istanbul's mobility problems and create a more sustainable transportation system in the future. Within the scope of Istanbul Smart City Strategic Plan, projects completed in the field of Smart Mobility include Public Transportation Control and Management Center Software, Dynamic Passenger Routing in Public Transportation, Real-Time Driver Analysis in Public Transportation and Real-Time Driver Analysis in IETT Vehicles. In addition, projects such as Artificial Intelligence Based Driver Behavior Analysis, Dynamic Asset Planning in Public Transport, Continuous Air Quality and Temperature Monitoring in Public Transport, Bification, 34 Minutes Istanbul and Walk Be Istanbul have also been completed. However, projects such as Istanbul Transportation Management Control Center (IUYKM), Public Transportation for All, Smart Transportation Mobile Application (Transportation Assistant), Use of Istanbulkart in Minibuses, E-TUHİM Mobile Application, Dynamic Monitoring System in Public Transportation Vehicles, Electric Bicycle Sharing System, Smart Pedestrian Crossing System, Mobility Map, Urban Warehouse and Logistics Management System and many other projects have not yet been completed.

### **Smart Environment**

In order to protect Istanbul's environmental resources, ensure sustainability and combat climate change, technological and environmental investments need to be realized in a timely and effective manner. In this direction, it is aimed to ensure that all organs and citizens of Istanbul are involved in the process so that the investments can be fully paid off. In addition, increasing environmental investments in public planning and the potential to cooperate with national and international organizations put Istanbul in a strong position in the field of environment. With the accumulation of knowledge in developed countries, the contribution of domestic researchers, financial support and increased environmental awareness, there are opportunities for progress in environmental issues. However, factors such as population growth, global economic contraction and consumption habits need to be taken into account.

Strategic objectives have been identified to realize Istanbul's environmental goals. The first strategic objective is to use environmental resources consciously. To this end, initiatives such as water management, wastewater management, smart waste management and zero waste program aim to ensure efficient use of environmental resources. The second strategic objective is to increase the use of technology in agriculture. Environmentally sensitive agricultural activities are encouraged through sustainable agricultural practices. The third strategic objective is to manage sustainability and climate change. To this end, sustainability and climate change are combated through initiatives such as combating environmental pollution, public awareness and climate-friendly green space management. These strategic objectives aim to advance Istanbul's environmental progress and create a sustainable future. In the field of Smart Environment, projects completed within the scope of the Istanbul Smart City Strategic Plan include Smart Water Spring and Electric Energy and Compost Production from Waste from the Market and Market Place. In addition, projects such as IoT Systems in Agriculture and Air-Cep Mobile Application have also been completed. However, Smart Water Network System, Loss-Leakage Management with Smart Sensors, Smart Irrigation Systems, Gray Water Recovery Systems in IBB Buildings, Zero Waste Project, Istanbul Environmental Protection and Pollution Management Center and many other projects have not yet been completed. In addition, Silent Istanbul, Istanbul Noise Maps and Noise Action Plan, Horizon 2020 EU Funded Pop Machina Project, Events to Raise Awareness on Environment and Develop Environmental Awareness, Information Training for Excavation Transporters, Renewal of Green Areas with Natural Plant Species, Green Roofs, Projects such as Development of Sustainable Energy and Climate Change Action Plan (SECAP), Artificial Intelligence Based Park, Garden and Green Areas Utilization Analysis, "Green and Carbon Neutral Building Transition Guide- Istanbul Model (Build4GreenIST)" and Istanbul Green City Action Plan are awaiting completion.

### **Smart Energy**

Efforts are underway in line with Istanbul's strategic goals in the field of energy. In this context, it is aimed to reduce greenhouse gas emissions and increase energy efficiency by supporting smart grids and renewable energy generation. Istanbul is advancing in the use of technological services such as air pollution monitoring systems, and projects fuel cell and Internet of Things technologies in cooperation with TÜBİTAK. It also stands out as a city with a high awareness of smart and renewable energy. While formulating energy strategies, practices in nearby geographies and the country's high energy potential were taken into account. However, challenges such as dependence on fossil fuels, inadequate renewable energy investment

strategy, lack of coordination and communication, weak electric vehicle incentives and infrastructure, and excessive external dependence were also taken into account. In this framework, Istanbul's energy strategy has been formulated taking into account factors such as climate change, depletion of natural resources, regional political uncertainties and population growth forcing infrastructure development. The strategic goals and objectives of Istanbul's energy strategy have also been identified. The first strategic objective is to use energy efficiently. For this purpose, it aims to achieve energy efficiency through initiatives such as energy efficiency in buildings, energy efficiency in lighting and raising awareness on energy efficiency. The second strategic objective is to use renewable energy. For this purpose, it is aimed to expand the use of renewable energy sources. The third strategic objective is to improve and develop energy infrastructure. This aims to strengthen energy infrastructure through initiatives such as electric vehicles and improving energy management infrastructure. These strategic objectives represent steps towards building a sustainable energy future for Istanbul.

In the field of Smart Energy, projects completed under the Istanbul Smart City Strategic Plan include Smart Energy Management in IBB Buildings and Monitoring and Management of Smart Lighting Systems. In addition, a project to convert one bus in the IETT fleet into an electric vehicle has also been completed. However, projects such as Incentives for Renewable Energy Use, Dissemination of Electric Vehicle Use in Public Sector, Establishment of Istanbul Smart Energy Management Platform and Creation of Smart Natural Gas Meter Infrastructure have not yet been completed.

### **Smart Governance**

Istanbul's spatial strategy aims to effectively manage the data collected from the city in order to adopt a holistic management approach and to include the urban ecosystem in the decision-making process. This will maximize the effectiveness of decision-making processes. Istanbul Metropolitan Municipality's establishment of the Smart City Branch Directorate and Smart City Governance structure, the existence of high awareness, the implementation of successful smart city initiatives, the current situation analysis, the existence of an e-Government initiative, a young population prone to technology, the support of competent universities, the existence of a technology startup ecosystem and the increase in the use of social media stand out as the points where Istanbul is advanced in governance. However, the lack of harmonization of legislation with the smart city, lack of a single e-service stop point, inadequate digital process management, difficulties in e-Government and smart city integration, institutional sensitivities regarding open data, lack of competent staff, management of smart city culture change,

immature smart city-oriented finance models, and low coordination and sharing in data collection and management represent the issues that Istanbul needs to improve in governance. Istanbul's strategic goals and objectives include increasing data-driven decision support mechanisms in city management and improving the effectiveness of city management through city governance modeling. The data-driven foresight initiative targets the use of data analytics and foresight models in city governance. The smart city management initiative aims to effectively manage and coordinate smart city applications. Improving citizen service quality initiative aims to provide more effective and faster solutions to citizens' needs. The initiative to bring participatory solutions to city needs aims to ensure the participation of city residents so that the city government can produce more democratic and diverse solutions. These strategic objectives reflect Istanbul's vision to create a smart city that is more advanced in governance. In the area of Smart Governance, projects completed under the Istanbul Smart City Strategic Plan include the Data Analytics Unit, Next Generation Data Driven Municipalism and IBB IT Enterprise Asset Management. In addition, projects such as Istanbul's Youth, Muhtardan Al Haberi and Söz Senin have also been completed. However, the Urban Management Center, e-Mahalle and many other projects are still pending.

### **Smart Economy**

In the context of the spatial strategy, Istanbul's economic development potential is strengthened as a new commodity, "data", becomes available for every economic activity. This enables Istanbul to chart a new development scenario with a supported entrepreneurial spirit, a culture of collaboration, opportunities to attract investment and the productivity enabled by digitalized business processes. Istanbul's economic diversity, Turkey's largest urban economy, the presence of global companies' offices in Turkey, regional ICT R&D centers and technoparks in Istanbul, high municipal budget, entrepreneurial culture, dynamic workforce and young population represent Istanbul's economic strengths. However, the lack of open data, increasing demands for transparency, the negative impact of uncertainties in existing regulations on new initiatives, low per capita income compared to other competitive cities, exaggerated perception of risk and ecopolitical predictability represent areas where Istanbul's economy needs to improve. In the implementation of the strategies, Istanbul's young, competitive workforce, strategic location and logistics advantage should be utilized, brain drain should be taken into consideration and measures should be taken against the rapid development of rival cities. In line with the current situation analysis and the analyses conducted, it has been determined that creating a smart economy based on data and information, supported by open data and public-

private sector cooperation, is the most important development area for Istanbul. Accordingly, strategic goals and targets were identified. Supporting the public-private sector-academia cluster culture, developing public-private sector-academia collaborations and facilitating public procurement represent the first strategic objective. The second strategic objective focuses on increasing entrepreneurship and attractiveness. In order to achieve this objective, it is aimed to improve the business and investment environment and strengthen the entrepreneurship, productivity and innovation ecosystem. The third strategic objective is to increase employment and competence. In order to realize this objective, the initiative to increase human resources and competencies in the city stands out. In the field of Smart Economy, projects completed under the Istanbul Smart City Strategic Plan include the Internship Program in Public Sector (IstanbulSenin StajSenin), Istanbul Smart City Test Site and Take Action with IBB. In addition, the Vocational Competence School has also been completed. However, projects such as Istanbul Innovative City Platform Portal, Istanbul Business Clusters (Creative Industries Platform), IBB Public Market Project (E-Commerce Sales Project) and System Graduation have not yet been completed.

### **Smart Living**

The area strategy aims to improve the quality of life through coordinated provision of technology-supported services and equal access for all. This strategy is supported by factors such as local governments taking life-oriented initiatives, integrating and coordinating the city's rich cultural and historical heritage with technology, and having a strong health and education infrastructure. In order to have a strong position in the living space, Istanbul aims to take advantage of opportunities such as increasing feedback mechanisms, conducting detailed feedback analyses, taking advantage of the conveniences provided by digital accessibility and evaluating active urban transformation projects. Strengthening the organizational structure, ensuring coordination and integration between units, improving emergency planning, improving data access infrastructure and focusing on innovation incentives are also among the strategic objectives. Within this framework, strategic goals and targets have been set. In order to ensure a high quality of life, various initiatives are planned to improve the urban experience, increase accessibility to services, provide integrated living spaces and ensure a healthy and barrier-free living environment. In order to expand smart applications in urban space management, initiatives to develop living spaces with smart technologies and to expand data-driven planning stand out. These strategic goals and targets support efforts to improve Istanbul's quality of life and urban space management. In the area of Smart Living, projects completed

under the Istanbul Smart City Strategic Plan include Tourism Information Bureaus, Istanbul is Yours, Insufficient Balance, Semtpati and Bayrampaşa Region City Digital Twin Pilot Project. In addition, the Istanbul is Renewing (Urban Transformation Support System) project has also been completed. However, projects such as Suspended Invoice Kiosk, Wet Area Button, Project Design of Mobile Sales Units throughout Istanbul, Smart City Boards (DOOH), Creation of Digital Neighborhood Marketplace and City Digital Twin have not yet been completed.

### **Smart Human**

The area strategy aims to achieve greater equality of opportunity in access to quality and modern educational opportunities and participation in urban life in Istanbul. Factors such as the widespread use of smart devices, the wide coverage of IBB Wi-Fi service, 12 years of compulsory education, government policies supporting asylum-seeking migrants and investments in knowledge-intensive sectors play an important role in achieving this goal. However, there is potential for improvement in areas such as increasing gender equality in education and business life, improving foreign language skills in the service sector, becoming a city preferred by foreign students, and increasing the number of university graduates in line with the young population. Factors such as the young population's openness to new technologies and the utilization of features such as mobile payments offered by smart devices, the presence of a migrant population, the persistence of economic difficulties, differences in digital literacy levels, and the low rate of university graduates should be taken into account when formulating a strategy. Within the framework of strategic goals and targets, it is aimed to develop individual competencies. In this regard, initiatives such as providing trainings tailored to the needs and aspirations of all segments and raising smart city awareness are among the prioritized targets. In addition, initiatives such as supporting participatory innovation to increase social inclusion and encouraging citizens' participation in urban life are also among the strategic objectives. These strategic goals and targets aim to identify the steps to be taken to increase the competencies of individuals and strengthen social inclusion in Istanbul. In the area of Smart People, projects completed under the Istanbul Smart City Strategic Plan include IBB Tech Future, Information Technologies School, Tech Istanbul and Barrier-Free Living Center. In addition, Safe and Accessible Schools, Women's Labour Shop-Production Workshop, Organizing Istanbul Smart City Awareness Trainings: "What's Happening in Istanbul Smart City?" Project, Barrier-Free 1 Istanbul and Age-Friendly Centers are not yet completed.

### **Smart Security**

The area strategy aims to use smart solutions to quickly assess potential security risks and make communication and coordination more effective. In determining this strategy, the opportunity to make maximum use of advances in connectivity, sensors, data storage, image processing technologies and IoT security standards was considered. The areas where Istanbul needs to improve in the area of security include the lack of coordination between different law enforcement agencies, the operation of the electricity grid under high load, and improvements in data analysis and forecasting processes. Accordingly, it is important to focus on strengths such as establishing comprehensive monitoring systems, increasing security know-how, adopting people-oriented management approaches and improving earthquake studies. Improved coordination and integration between law enforcement agencies, along with increased data sharing, and the effective use of this data through advanced analysis and forecasting systems will contribute to a safer city life. Factors such as Istanbul's location on an active fault line, the increase in global terrorist incidents and threats of cyber-attacks pose significant security risks. In addition, population growth and political fluctuations in neighboring countries can also affect Istanbul's ability to defend itself. Within the framework of the strategic goals and objectives, important targets have been identified as increasing the effectiveness of security activities, strengthening security, enhancing cyber security and ensuring the maintenance of quality of life in emergencies. In order to achieve these goals, initiatives such as increasing security coordination, rapidly detecting security incidents, establishing warning and deterrent systems, increasing the safety of life and property, strengthening cyber security coordination, and effectively carrying out emergency and disaster management are important. Projects completed within the scope of the Istanbul Smart City Strategic Plan in the field of Smart Security include Artificial Intelligence Based Parking Management System, Security Pole, Fire Smoke Detection with Image Processing, Modernization of Disaster Coordination Center (AKOM), Flood / Flood Detection and Early Warning System with Image Processing, Earthquake Risk Detection of Buildings with Rapid Scanning Methods and Building Inspection with Building Health Systems. In addition, projects such as Common Camera Platform, Smart Fire Alarm System, Emergency Response Planning and Routing System, Cyber Attack Warning and Prediction Systems, Fiber Optic Distributed Acoustic Detection System Based Early Warning and Monitoring System (FOTDES), Disaster and Earthquake Base - Mobile Earthquake Communication Centers and Inspection of IBB Owned Buildings have not yet been completed.

### **Smart Organization and Human Resources**

One of the basic principles of the area strategy is that all stakeholders in the smart city ecosystem contribute to increasing the capacities of relevant institutions by cooperating in line with the common goals of Istanbul. Factors such as the realization of smart city investments in Istanbul with state support, the ownership of smart city projects by the Istanbul Metropolitan Municipality and the establishment of the Smart City Branch Directorate show that Istanbul is strong in terms of organization and human resources. At this point, it is of utmost importance that all institutions adopt data sharing in line with the strategic goals, ensure coordination between units and increase interaction between the public-private sector and academia. Within the framework of strategic goals and targets, one of the primary objectives is to increase data-based decision support mechanisms in city management. In this direction, initiatives to efficiently manage smart city projects and to train and acquire qualified human resources for smart city applications in Istanbul stand out. In order for Istanbul to be successful in the smart city field, the effective management and supervision of projects, the training of qualified human resources, and the presence of experts who are familiar with smart city technologies are of great importance. In this way, data-based decision support mechanisms will be strengthened and Istanbul's goal of becoming a sustainable and smart city will be supported. Within the scope of the Smart City Strategic Plan, no project has been completed in the field of Organization and Human Resources, while the Smart City Project Tracking Dashboard (My Project Smart City Project), Competent Human Resources for Innovative Istanbul and Smart City Employer Branding projects have not yet been completed.

### **Smart Information and Communication Technologies**

For ICT applications to provide added value to services and for smart city solutions to be successfully implemented, it is important to adopt a holistic approach. This approach builds a structure that works together and enables integrated solutions by integrating the ICT perspective into investments and projects. Istanbul's strengths in the field of ICT include prioritization of ICT in the public sector, increased R&D support, increasing demand for ICT-based solutions from the young population, widespread ICT training, availability of cost-effective ICT human resources, strong mobile communication infrastructure and high public demand for ICT-based services. In line with the strategic goals and targets, the primary objectives are to anticipate and disseminate the benefits of emerging next generation technologies. In this context, the application of emerging next generation technologies to city services in Istanbul stands out as an initiative. In addition, in order to increase the level of smart city technology maturity and

ensure the sustainability of the city, initiatives such as the establishment of a smart city superstructure, the enrichment of smart city infrastructure and the establishment of a common communication backbone have been identified. By focusing on these strategic goals, Istanbul aims to progress towards becoming a smart city where next generation technologies are used effectively. Among the projects completed within the scope of the Istanbul Smart City Strategic Plan in the field of Information and Communication Technologies are RPA (Robotic Process Automation), 3D Mobile Robotic Concrete Printer, Digital Twin of Greek Orphanage and School building produced by Hybrid Methods, Architectural Design and Adaptation of Smart City Platform, Enrichment of Big Data Platform and IBB Wi-Fi. However, projects such as Blockchain - Digital Identity Management, ID Istanbul and API Istanbul have not yet been completed.

### **Smart Finance**

In addition to public financing, smart city investments in Istanbul should focus on creative PPP models, private financing solutions and EU funds. Istanbul is in a strong financial position due to factors such as having a well-developed banking sector, being open to foreign direct investments, the central government's target to increase the R&D budget, the PPP model for large infrastructure projects, hosting the head offices of global and local companies, and the e-Government system. In formulating the strategies, it was aimed to capitalize on EU funds, the increase in liquidity around the world, and the global flow of funds for technologies supporting smart cities. However, challenges such as slow and inflexible bureaucratic processes, insufficient support for innovative work, the informal economy, low levels of EU funding and limited venture capital are emerging as areas for improvement. In order for Istanbul to attract more FDI, it is important to change the perception of risk, to ensure macroeconomic stability, and to realize events and innovative practices in the city that will continuously raise the image of the city. In line with the strategic goals and targets, one of the primary objectives is to make smart city projects investable and manage them. In this context, making smart city projects eligible for alternative project financing and managing them effectively stands out as an initiative. By focusing on these strategic objectives, Istanbul aims to develop sustainable and profitable financing models for smart city projects. While there are no completed projects in the field of finance within the scope of the Istanbul Smart City Strategic Plan, projects such as Smart Fund Platform, Istanbul Our Fund and Smart City Project Finance are among the projects that have not yet been completed.

### **Conclusion**

Istanbul is recognized as an important metropolis with a large population and a dynamic economy. These characteristics of Istanbul have necessitated the launch of a series of projects within the scope of smart cities in order to find solutions to the city's various problems and ensure sustainable development. These projects aim to improve the city's physical infrastructure, services and quality of life. Smart cities aim to make cities more efficient, sustainable and livable through the use of technology and information systems. In this context, many smart city projects have been implemented in Istanbul. These projects include efforts to optimize transportation, reduce energy consumption, increase environmental sustainability and improve service quality. However, in addition to the projects that have been completed, there are many projects that have not yet been completed and are planned to take Istanbul further in the context of smart cities. These projects aim to further improve the city's infrastructure, utilize digital technologies more effectively and enhance quality of life. It is important to monitor the success of these projects during the implementation process and to conduct relevant audits and follow-ups. In this way, the effectiveness and efficiency of projects can be assessed and corrective measures can be taken where necessary. Further planning for Istanbul's smart city projects is also important. Areas that can be taken forward through the use of advanced technologies and innovative solutions should be identified and new projects should be developed accordingly. In addition, factors such as project financing, stakeholder collaboration and community involvement need to be considered. Istanbul's size, population and economic potential create a suitable ground for many projects within the scope of smart cities. Monitoring the success of these projects and conducting relevant audits and follow-ups are important steps for Istanbul to achieve maximum efficiency and transform into a sustainable smart city model. In addition, further planning and development of new projects in the future will enable Istanbul to move forward in the field of smart cities.

### **Özet**

Doğum indüksiyonu, gebelik ve doğum sürecinde hayati öneme sahip bir müdahale olup anne ile bebeğin sağlığını etkileyen pek çok faktörü içerir. Bu müdahalenin doğru zamanda, uygun endikasyon varlığında ve bireyselleştirilmiş yaklaşımlarla gerçekleştirilmesi son derece önemlidir. İndüksiyon yönteminin mevcut risk ve fayda dengesi göz önünde bulundurularak, ilerleyen teknoloji ve protokollerin rehberliğinde planlanması ve uygulanması, anne-bebek sağlığı açısından hayati öneme sahiptir. Günümüzde, doğum indüksiyonunda; farmakolojik, mekanik ve non-farmakolojik yöntemler olmak üzere çeşitli yaklaşımlar mevcuttur. Farmakolojik yöntemler arasında Prostaglandin E1 Analöğü- Misoprostol ve Prostaglandin E2- Analöğü Dinoprostol gibi ilaçlar bulunmaktadır. Mekanik yöntemler ise amniyotomi, transservikal foley kataterleri ve higroskopik dilatörleri içerir. Non-farmakolojik yöntemler ise meme ucu stimülasyonu, uterus stimülasyonu, membranların sıyrılması ve cinsel etkileşim gibi doğal yöntemleri içerir. Hangi yöntemin tercih edileceği, hastanın ve hekimin tercihinine bağlı olarak bütüncül bir yaklaşımla, gebe kadın ve ailesiyle iş birliği içinde planlanmalıdır. Gebe için en güvenli doğum sürecini; uygun tedavi basamakları ve kaliteli bakım hizmetleri ile sağlamak ebe ve doğum ekibi için temel sorumluluklar arasında yer almaktadır. Bu çalışma, güncel literatür incelenerek uygulanan indüksiyon yöntemlerinin intrapartum sürece etkisi konusunda sağlık profesyonellerini bilgilendirmek amaçlanmıştır.

**Anahtar Kelimeler:** Ebelik, intrapartum, doğum, indüksiyon

**THE EFFECT OF CURRENT INDUCTION METHODS ON THE INTRAPARTUM  
PROCESS**

**Abstract**

Inductions of labor are crucial interventions in pregnancy and childbirth, encompassing many factors that affect the health of both the mother and the baby. It is crucial that this intervention be performed at the right time, with appropriate indications, and through personalized approaches. Planning and implementing induction models in line with the existing balance of risks and benefits, guided by advancing technology and protocols, is one of the most critical steps for maternal and neonatal health. Today, the prevalence of labor inductions has increased, with various approaches available, including pharmacological, mechanical, and non-pharmacological methods. Among pharmacological methods are drugs such as Prostaglandin E1 Analog- Misoprostol and Prostaglandin E2 Analog- Dinoprostone. Mechanical methods include procedures like amniotomy, trans-cervical Foley catheters, and hygroscopic dilators. Non-pharmacological methods encompass natural techniques such as nipple stimulation, uterine stimulation, membrane stripping, and sexual intercourse. The choice of method should be based on the preferences of the patient and the physician, with a comprehensive approach involving collaboration with the pregnant woman and her family. Ensuring the safest childbirth process for the pregnant woman involves fundamental responsibilities for midwives and obstetric teams, including appropriate treatment steps and quality care services. This study evaluates the impact of current induction methods on the intrapartum process.

**Keywords:** Midwifery, intrapartum, labour, induction

## **GİRİŞ**

Tarihin her evresinde, kadın yaşamının doğal ve fizyolojik bir süreci olarak tanımlanan gebelik; son menstrual periyottan yaklaşık 38- 40 hafta sonra doğum eyleminin gerçekleşmesi ile tamamlanmaktadır. Bu süreç bireysel farklılıkların yanı sıra var olan risk katmanlarına göre çeşitli değişikliklere zemin hazırlamaktadır. Hedeflenen vajinal doğum eylemi; termde (38-42 hafta), tek ve canlı bir fetüs varlığıyla, kendiliğinden başlayan, verteks pozisyonda, baş- pelvis uyumsuzluğu olmadan sağlıklı bir fetüs ve annenin varlığı ile gerçekleşme sürecidir (Yılmaz ve Kaya, 2023). Bu sürecin kendiliğinden başlaması ve gereksiz müdahalelerden kaçınılarak gerçekleştirilmesi, Dünya Sağlık Örgütü (DSÖ) tarafından önerilen ve benimsenen kritik bir dönüşüm basamağıdır (Baran ve ark, 2023). Dolayısıyla doğum eylemini başlatan temel mekanizmaların değerlendirilmesi, gebede meydana gelen değişikliklerin tespit edilmesi sağlık profesyonelleri tarafından birincil veri kaynağını oluşturmaktadır. Bu bağlamda; kemik pelvis uygunluğu, fetüsün pozisyon, prezantasyon ve duruşu, fetal baş çapları, serviks uygunluğu, uterin aktivasyon, myometrial bağlantılarda artış gibi birçok nesnel ölçüt bütüncül yaklaşımlar doğrultusunda değerlendirilmelidir (Yeşiltaş, 2023).

### **1. DOĞUM İNDÜKSİYON YÖNTEMLERİ**

Doğum indüksiyonu; eyleminin spontan başlamadığı veya ilerlemediği durumlarda farmakolojik, non- farmakolojik ve mekanik ajanlar yardımıyla servikal olgunlaşmanın ve düzenli uterin kasılmaların desteklenmesi için kullanılan indüksiyon yöntemleridir (Yorulmaz, 2022). Günümüzde kullanım sıklığının giderek arttığı düşünülse de indüksiyon uygulamalarının, hasta bazında bireyselleştirilmesi ve uygun tedavi protokollerinin uygulanması, maternal- fetal mortalite ve morbidite açısından kritik önem taşımaktadır.

Doğum indüksiyon başarısını etkilen faktörler arasında birincil parametre; servikal olgunlaşmanın değerlendirildiği Bishop Skorlama Sistemidir. İndüksiyon uygulamaya başlamadan önce bu değerlendirmenin gerçekleştirilmesi uygulanacak indüksiyon yönteminin seçiminde ve başarı oranında uygulayıcıya yol göstermektedir (Yeşiltaş, 2023).

Skor	Dilatasyon (cm)	Serviksin pozisyonu	Effasman (%)	Seviye	Serviksin kıvamı
0	Yok	Posterior	0 - 30	- 3	Sert
1	1 - 2	Orta	40 - 50	- 2	Orta
2	3 - 4	Anterior	60 - 70	- 1, 0	Yumuşak
3	5 - 6		80	+ 1, +2	

Tablo 1: Bishop Skoru, 1964

Yeşiltaş tarafından 2023 yılında yayınlanan bir çalışmada; Bishop Skorlama sisteminin uygulayan bireylere göre değişkenlik göstermesi, sonografik ve demografik özelliklerden yoksun olması ve çok az değişken içermesi nedeniyle nesnel bir ölçüm aracı olmadığı dolayısıyla güncel bir skorlama sistemine ihtiyaç duyulduğu belirtilmiştir. Çalışmacının tasarladığı Yeni Skorlama Sisteminde, Bishop Skorlama Sistemine ek olarak; yaş, vücut kitle indeksi, gravida, funneling varlığı ve genişliği, serviksin pozisyonu, servikal uzunluk, oksiput pozisyonu, fetal başın external osa uzaklığı, uteroservikal açı, servikal dilatasyon, tahmini fetal ağırlık gibi ölçüm ve sonografik bulgular yer almıştır (Yeşiltaş, 2023).

Günümüzde kullanılan farmakolojik, mekanik ve non- farmakolojik doğum indüksiyon yöntemleri aşağıda yer almaktadır.

**Prostaglandin E1 Analöğü- Misoprostol:** Misoprotol 1988’li yıllardan bu yana peptik ülser tedavisinde kullanılmakla birlikte günümüzde obstetrik ve jinekoloji alanında; Postpartum kanama tedavi ve cerrahisinde, abortusların tıbbi tahliyesinde, servikal olgunlaşma ve doğum indüksiyonu yöntemlerinde aktif olarak kullanılmaktadır (Karaca, 2020). Etkin maaliyet, kolay ulaşılabilir ve özel saklama koşulları gerektirmemesi avantajları arasında yer almaktadır (Yorulmaz, 2020). Misoprotol’un 100 ve 200 mikrogram tablet formları bulunmaktadır, Wing ve ark. tarafından hazırlanan çalışmada 25 mcg doz aralığının güvenilir doz aralığında olduğu ileri sürülmüştür (Wing ve ark, 1992).

**Prostaglandin E2- Analöğü Dinoproston:** Gıda ve İlaç Dairesi (FDA) tarafından kullanılması önerilen ve 3 temel formda bulunan Dinoprostol; servikal olgunlaşma ve fundusta myometrial kontraksiyonların oluşumuna etki eden çeşitli mekanizmalara sahiptir. Jel, yavaş salınımlı vajinal ovül ve 10 mg’lık suppozatuar formları bulunmakla birlikte yan etkileri arasında; uterin hiperstimülasyon, fetal distres ve gastrointestinal etkiler arasında ise bulantı, kusma ve ateş yer almaktadır. Dolayısıyla uygulamanın sık gözlem ve takip altında gerçekleştirilmesi önerilmektedir (Yılmaz, 2020).

Benalcazar-Parra ve ark. tarafından 2019 yılında yayınlanan çalışmada Bishop Skoru 6 ve üzeri olan travay sürecindeki gebelere Misoprostol ve Dinoprostol indüksiyon uygulaması uygulanmıştır. Misoprostol uygulanan grupta uterin aktivite değişimlerinin 60. dakikadan sonra bazal değerden anlamlı derecede yüksek olduğu, Dinoprostol grubunda ise uterin kasılma süre ve sayısının 120. dakikadan sonra artış gösterdiği sonucu elde edilmiştir. Uygulanan iki doğum indüksiyon ajanının farklı farmakokinetik etkiye sahip olduğu ve farklı salınım süresine sahip olduğu düşünülebilmektedir (Benalcazar- Parra ve ark, 2019).

**Oksitosin:** Doğum indüksiyon yöntemleri arasında en sık kullanılan farmakolojik bir ajan olarak yer almaktadır. Birçok alanda etkinliği kanıtlanan oksitosin; doğumun başlatılması ve sürdürülmesinde, postpartum dönemde, terapötik ve missed abortus tahliyesinde, laktasyonun artırılmasında ve daha birçok alanda kullanılmaktadır (Yeşiltaş, 2023). 2-5-10 ünitelik ampüller şeklinde yer alır, yarılanma ömrü 3 ila 5 dakika arasında değişmektedir, etkinliği arasında myometrial aktivite ve hücreler arası bağlantının artırılması, kontraksiyon oluşumunun desteklenmesi, şiddet, frekans, süre ve yoğunluğunun artırılması yer almaktadır (Yeşiltaş, 2023).

Doz	Başlangıç Dozu mU/dk	Doz Artışı mU/dk	Dozaj Aralığı dk	Maksimum Doz mU/dk
Düşük doz	0,5- 2	1-2	15-60	20-40
Yüksek doz	4-6	4-6	15-30	40

Tablo 2: Oksitosin Protokolleri

**Amniyotomi:** Amniyon zarının ucu kancalı amnioper aracılığı ile rüptüre edilme işlemidir (Ekin, 2021). Her ne kadar doğum eylemini hızlandırdığı düşünülse de Dünya Sağlık Örgütü'nün 2018 yılında yayınladığı Pozitif Doğum Deneyim Rehberinde Amniyotominin tek başına indüksiyon yöntemi olarak kullanılmaması önerilmektedir (WHO, 2018). Transservikal Foley ve Balon Kataterler: Her iki indüksiyon yöntemi de mekanik bir etki göstererek servikal olgunlaşma üzerine etki etmektedir. Foley Kataterler internal os üzerinde, Çift Balonlu Katater ise vajen ve serviks üzerinde gerginlik ve basınç etkisi oluşturarak endojen prostoglandin artışını arttırmaktadır (Yorulmaz, 2020).

**Higroskopik Dilatörler:** Endoservikal alana yerleştirilen Higroskopik Dilatörler endoservikal alandaki sıvıyı absorbe ederek mekanik bir basınç ve gerginlik etkisi yaratmaktadır. Foley ve

Balon Kateterden farklı olarak bu indüksiyon yönteminde dışarıdan bir şişirilme işlemi uygulanmamaktadır (Yeşiltaş, 2023).

**Membranların Sıyırılması:** Koryoamniyotik zarların alt uterin segmentten ayrılması işlemi olarak tanımlanmaktadır. İşaret ve orta parmağın internal ostan içeriye geçirilmesi ile sıyırılan membran miktarına paralel prostoglandin miktarında artış gözlemlenmektedir (Yorulmaz, 2022).

**Meme Ucu Stimülasyonu:** Tüm yöntemler arasında uygulanması en basit, kolay ve hiçbir ek araca ihtiyaç duyulmadan gerçekleştirilebilecek olan meme ucu stimülasyonu; baş, işaret ve orta parmak kullanılarak meme ucu etrafında dairesel hareketlerle ve uca doğru nazikçe çekme eylemiyle uygulanabilmektedir (İbrahim ve ark, 2021). Uygulama esnasında hint yağı, ylan yağı gibi aromatik bileşenler kullanılabilir. 2021 yılında Mısırda benzer demografik özelliklere sahip 150 primipar gebe ile yürütülen çalışmada; meme ucu stimülasyonu, uterus stimülasyonu ve kontrol grubu ile uygulanan yöntemlerin etkinliği değerlendirilmiştir. Çalışma sonucunda müdahale gruplarında daha kısa aralıklı, daha uzun süren ve yüksek yoğunluktaki uterus kasılmaları ile ilişkili olduğu değerlendirilmiştir. Kontrol grubunda yer alan gebelerin yüksek oranda oksitosinlere ihtiyaç duyulduğu, C/S doğum oranını yükselttiği ve doğumun ilk evresinin müdahale grubuna kıyasla daha uzun sürdüğü kayıt altına alınmıştır. 2018 yılında Takahata ve ark. tarafından yayınlanan çalışmada bir ebe eşliğinde 16 gebeye meme ucu stimülasyonu uygulanmıştır. Müdahaleden 15 dakika öne ve müdahaleden 15-30-60-75-90 dakika sonra tükürük oksitosin seviyeleri 3 gün süresince immünsorbent tahlili ile ölçülmüştür. Çalışma sonucunda elde edilen verilerde meme ucu stimülasyonu ile 1. günde tükürük oksitosin düzeyinin artmadığı, 2. günde 15. dakikada artış göstermeye başladığı 3. Günde ise en yüksek tükürük oksitosin seviyesine meme ucu stimülasyonundan 30 dakika sonra ulaşıldığı bulgusu ortaya çıkmıştır (Takahata ve ark, 2018).

## **2. SONUÇ VE ÖNERİLER**

İndüksiyon uygulamaları, gebelik ve doğum sürecinde gebe ve fetus için hayati öneme sahip uygulamalar arasındadır. Tedavinin bireyselleştirilmesi, sık gözlem ve takibin tedavinin her basamağında uygun önlem ve protokoller doğrultusunda gerçekleştirilmesi, gebenin psikososyal durumu ve tedaviye uyumu ile oryante edilmelidir. Her kadın, eşsiz bir gebelik ve doğum deneyimi için desteklenmeli, eşit koşullar ve hizmet kalitesi ile korunmalıdır. İndüksiyon uygulamalarının gerekliliği hekim ve sağlık profesyonelleri ile değerlendirilmeli, gebenin onamı alınmalı ve holistik yaklaşımlar göz ardı edilmemelidir.

### **Özet**

Ortodontik tedavi, sadece estetik, fonasyon ve fonksiyonu iyileştirmeyi değil, aynı zamanda ağız sağlığını da iyileştirmeyi hedefler. Ortodontik tedavilerin mekanik yönleri yoğun bir şekilde araştırılmış ve geliştirilmiş olmasına rağmen, özellikle vitaminler gibi beslenme faktörlerinin ortodontik tedavi sonuçları üzerinde olası çok yönlü etkileri yeterince araştırılmamıştır. Bu sistematik derlemede, vitaminlerin ortodontik diş hareketleri, kök rezorbsiyonu, remodelling ve kemik turnover'ı üzerindeki etkilerini araştırmak amaçlanmıştır. Mevcut literatür vitaminler ve ortodontik tedavi arasındaki önemli ilişkiye ışık tutmaktadır. C vitamini, periodontal bağlar ve alveolar kemik bütünlüğünü destekleyerek, periodontal sağlığın korunmasına ve kök rezorbsiyonu riskinin azaltılmasına katkıda bulunabilir. Yeterli A vitamini seviyeleri, diş eti ve mukoza sağlığını iyileştirir ve periodontal dokuların ortodontik kuvvetlere yanıtını etkileyebilir. K vitamini, kemik metabolizmasına ve turnover'ına katkıda bulunur ve ortodontik tedavi sırasında diş hareketinin hızını ve alveolar kemiklerin yeniden şekillenmesini etkileyebilir. B6 (piridoksin), B12 (kobalamin) ve Folat (B9) gibi çeşitli B vitaminleri, enerji metabolizması, hücre çoğalması ve DNA sentezinde rol oynar. Ortodontiye özgü araştırmalar sınırlı olsa da, E vitamini, periodontal dokulardaki iltihabı ve oksidatif stresi azaltmada rol oynar ve böylece ortodontik tedaviye yanıtı etkileyebilir. Vitaminlerin ortodontik tedavi protokolleri üzerindeki etkisinin anlaşılması, hasta bakımını optimize etmek ve başarılı tedavi sonuçları elde etmek için önemlidir. Vitaminler ve metabolizma ilişkisiyle ilgili mevcut kanıtları sentezleyerek ve potansiyel etki mekanizmalarını keşfederek, vitaminlerin ortodontik tedavi açısından önemini açıklamayı ve bireysel beslenme ihtiyaçlarına uygun kişiselleştirilmiş ortodontik yaklaşımlara yönelik daha fazla araştırma teşvik edilmelidir.

**Anahtar Kelimeler:** Vitaminler, Ortodontik diş hareketi, Kök rezorbsiyonu, Kemik remodeling, Kemik turnover

## **EFFECTS OF VITAMINS ON ORTHODONTIC TOOTH MOVEMENT**

### **Abstract**

Orthodontic treatment aims not only to improve aesthetics, phonetics, and function but also to enhance oral health. Although the mechanical aspects of orthodontic treatments have been extensively researched and developed, the potential multifaceted effects of nutritional factors such as vitamins on orthodontic treatment outcomes have not been adequately investigated. The purpose of this systematic review was to investigate the effects of vitamins on orthodontic tooth movements, root resorption, remodeling, and bone turnover. The literature illuminates the effects of vitamins on orthodontic treatment. Vitamin C may contribute to the maintaining periodontal health and potentially reducing the root resorption risk by supporting the integrity of periodontal ligaments and alveolar bones. Adequate levels of vitamin A improve gum and mucosal health and may affect the reaction of periodontal structures to orthodontic forces. Vitamin K contributes to bone metabolism and remodeling, and it might influence speed of tooth movement and reshaping of alveolar bones during orthodontic treatment. Various B vitamins, such as B6 (pyridoxine), B12 (cobalamin), and Folate (B9), are involved in energy metabolism, cell proliferation, and DNA synthesis. Although research specific to orthodontics is limited, vitamin E plays a role in reducing inflammation and oxidative stress in periodontal tissues, thus potentially influencing the response to orthodontic treatment. Understanding the effect of vitamins on orthodontic treatment protocols is important for optimizing patient care and achieving successful treatment outcomes. By synthesizing the existing evidence on the relationship between vitamins and metabolism and exploring potential mechanisms of action, elucidating the importance of vitamins in orthodontic treatment and encouraging further research towards personalized orthodontic approaches tailored to individual nutritional needs should be promoted.

**Keywords:** Vitamins, Orthodontic tooth movement, Root resorption, Bone remodeling, Bone turnover

## **Introduction**

Orthodontic treatment involves a multifaceted and detailed procedure necessitating a deep comprehension of teeth migration within the alveolar bone and adjacent periodontal tissues. (Ong et al., 2002). The efficacy of this procedure hinges significantly on the integrity and quantity of the underlying bone support, which undergoes a complex remodeling process reacting to the exerted pressure (Becker et al., 2003; Topouzelis et al., 2012; Lopatiene et al., 2012). The bone remodeling process is governed by an array of factors, including genetics, age, and nutrition, which can be capable of significantly impacting the outcome of orthodontic procedures. (Terao et al., 2012; Hartsfield et al., 2012). This literature review aims to explore the current literature evidence concerning the influence of vitamins on teeth repositioning during orthodontic treatment. By synthesizing findings from relevant studies, we aim to explore the potential mechanisms through which vitamins may influence orthodontic treatment outcomes and discuss their clinical implications for optimizing patient care. There are some hypotheses that certain vitamins might affect the effectiveness of orthodontic treatment such as vitamin C, vitamin A and vitamin D (Krishnan et al., 2021). Research has examined how vitamin A affects bone metabolism and tooth movement, but the findings are inconclusive. Further investigation is necessary to understand the potential mechanisms through which vitamin A influences movement of teeth (Shi et al., 2023). Through a comprehensive analysis in existing researches, this review seeks to elucidate the role of vitamins as modulators of orthodontic tooth movement, paving the way for future investigations and informing clinical practices aimed at enhancing treatment effectiveness and patient satisfaction.

## **Materials and Methods**

Understanding the impact of vitamins on tooth movement in orthodontic treatment requires a systematic approach to reviewing the available literatures and synthesizing the findings. In this section, we outline the materials and methods employed in conducting this literature review.

The materials utilized in this literature review include peer-reviewed articles, clinical trials, and observational studies retrieved from electronic databases such as Web of Science, Google Scholar and PubMed.

The search strategy aimed to locate studies examining the effects of vitamins on movement of teeth, with a specific focus on their roles.

The criteria for selecting studies varied but generally encompassed randomized controlled trials, peer-reviewed quantitative studies, non-randomized controlled trials, cross-sectional studies, comparative cohort studies, and case-control studies published in English.

The outcome measures also varied across the studies and assessed different aspects of orthodontic treatment and movement of teeth such as bone metabolism, root resorption and tooth movement acceleration.

### **Findings and Discussion**

In this section, we outline the discoveries from the literature review, organized by specific vitamins that have been studied in relation to movement of teeth. By systematically reviewing the literature on various vitamins and their impact on orthodontic movement, we aim to provide insights into potential strategies for optimizing treatment outcomes and enhancing patient care in orthodontic practice. While the existing body of literature provides valuable insights into the potential effects of vitamins on orthodontic tooth movement, several limitations and knowledge gaps remain. By addressing these gaps in knowledge, future research endeavors have the potential to advance our comprehension of the intricate interaction among vitamins and orthodontic tooth movement, ultimately contributing to the optimization of orthodontic treatment outcomes and patient care.

#### **Vitamin D:**

Vitamin D plays a crucial role in calcium regulation and skeletal growth, impacting bone restructuring. Its active form, 1,25-dihydroxycholecalciferol, enhances tooth movement by promoting bone resorption and modulating osteoclast activity. However, further research is needed to assess the safety and efficacy of vitamin D supplementation in promoting movement of teeth, particularly in orthodontic patients. (Krishnan et al., 2021; Khalaf et al., 2021).

Additionally, a study by Kale et al. (2004) found that locally administered 1,25-dihydroxycholecalciferol and prostaglandin E2 both increased movement of teeth significantly compared to a control group, with 1,25-dihydroxycholecalciferol showing superior effectiveness in regulating bone turnover during tooth movement due to its balanced effects on bone formation and resorption. The study by Kawakami and Takano-Yamamoto et al. (2004) explored how 1,25-dihydroxycholecalciferol affects alveolar bone formation during orthodontic tooth movement in rats. They found that repeated injections of this substance led to increased mineral apposition and osteoblast activity on the tension side of the periodontal ligament, suggesting that localized administration of calcitriol could promote the regeneration of dental supporting tissues, particularly the alveolar bone, after orthodontic tooth movement.

**Vitamin C:**

Vitamin C, also known as ascorbic acid, plays a vital role in collagen synthesis by aiding in the hydroxylation of proline and lysine residues within collagen molecules. This process enhances the stability and tensile strength of collagen fibers, which are major components of both the periodontal ligament and the alveolar bone. These structures are crucial for orthodontic tooth movement. One suggested mechanism is that Vitamin C's involvement in collagen synthesis is essential for the remodeling of the periodontal ligament and alveolar bone required during orthodontic tooth movement (Krishnan et al., 2021; Miresmaeili et al., 2015). Numerous studies involving both animals and humans have explored how Vitamin C affects movement of teeth. One randomized controlled trial conducted on humans found that daily administration of 500 mg of Vitamin C during orthodontic treatment caused significantly less root resorption than the group who taking a placebo (Miresmaeili et al., 2015). Another investigation carried out on male Wistar rats revealed that Vitamin C supplementation enhanced orthodontic tooth movement by promoting bone formation on the tension side and bone resorption on the pressure side during movement of teeth (Bolat et al., 2020). However, a review concluded that the evidence regarding the effects of Vitamin C on tooth movement is inconclusive, leaving uncertainty about whether Vitamin C supplementation effectively accelerates movement of teeth (Krishnan et al., 2021). Further research is necessary to determine the potential effects of Vitamin C supplementation on movement of teeth in humans.

**Vitamin K:**

Scarce studies have explored the correlation between vitamin K and orthodontic teeth repositioning. One study delved into the impacts of Vitamin K2 on bone reaction surrounding orthodontic mini-screw implants. The findings suggested that Vitamin K2 might activate various Vitamin K-dependent proteins and enhance bone formation around the implants that facilitate orthodontic tooth movement (Khazaaal & Alzubaidi , 2019). Furthermore, further studies are needed to evaluate the possible impacts of Vitamin K supplementation or administration on the speed and effectiveness of orthodontic tooth movement.

**Vitamin A:**

Vitamin A is a crucial micronutrient that holds significance in numerous physiological processes, such as bone remodeling and growth.(Henning et al., 2015; Ribaya-Mercado et al., 2007). Research indicates that a deficiency in vitamin A can result in compromised bone formation, reduced bone density, and increased resorption of bone(Jackson et al., 2005; Crandall et al ., 2004).

Conversely, excessive intake of vitamin A can also detrimentally impact bone health and metabolism. Shi and colleagues (2023) conducted an experimental investigation to examine how vitamin A affects movement of teeth in male rats. The results showed that movement of teeth increased in a manner dependent on the dosage of vitamin A. However, the observed variances did not achieve statistical significance. There was also no significant difference in osteoclast numbers, lacunae presence, and root resorption between the study groups. The examination of serum alkaline phosphatase levels revealed no notable distinction among the groups receiving varying doses of vitamin A. In light of these results, it can be inferred that although vitamin A has a reported effect on bone metabolism and in this specific study, there was no elevation observed in alveolar bone restructuring and movement of teeth.

#### **Vitamin B:**

Research on the effects of Vitamin B on movement of teeth is still relatively limited. Vitamin B is a crucial nutrient involved in various bodily functions. Vogiatzoglou et al. (2009) found that consuming vitamin B-12 from dairy products led to the greatest rise in plasma vitamin B-12 levels in the general population, highlighting the importance of sufficient intake of this vitamin. Vitamin B complex is essential for maintaining healthy bone metabolism and can indirectly impact orthodontic tooth movement. It is involved in various physiological processes, including the metabolism of important nutrients like calcium, magnesium, and phosphorus necessary for bone balance. Additionally, it may contribute to preserving the health and robustness of the bones, which are integral to orthodontic tooth movements. Hence, ensuring adequate levels of Vitamin B complex may be crucial for promoting optimal bone health and facilitating orthodontic tooth movements. In summary, Vitamin B complex may contribute to maintaining proper bone metabolism, which is essential for optimal tooth movement during orthodontic treatment.

#### **Conclusion and Recommendations**

The findings of this study add to the expanding body of knowledge in the literature investigating the relationship between vitamins and orthodontic tooth movements. However, the findings are not conclusive and further research, particularly through human experiments, is needed to elucidate the exact mechanisms that determine the effects of vitamins on movement of teeth. However, additional research is needed to determine the specific effects of Vitamins B and A on orthodontic tooth movements and their impact on orthodontic treatment outcomes.

Future studies could investigate the potential benefits of combining different vitamin supplements to enhance tooth movement during orthodontic treatment. Clinicians may need to consider alternative methods for accelerating tooth movement to improve treatment outcomes. In conclusion, the existing literature presents inconclusive findings regarding the effects of vitamins on movement of teeth, underscoring the necessity for additional research to delve deeper into the relationship between vitamins and movement of teeth. Maintaining a healthy, balanced diet, including sufficient vitamin and mineral intake, may be beneficial for optimal orthodontic outcomes.

**Özet**

Günümüzde endüstrinin hızla gelişimi çevre kirliliği başta olmak üzere bir çok sorunu daha beraberinde getirmiştir. Doğal kaynakların tükenmesi ve ekosistemlerin zarar görmesi gibi sorunlar büyük bir endişe kaynağı oluşturmaktadır. Bu bağlamda, boyar maddelerin çevre kirliliği üzerindeki etkileri göz ardı edilmemelidir. Boyar maddeler çeşitli endüstriyel alanlarda kullanılan kimyasal bileşiklerdir. Tüketime sunulan tüm madde ve malzemelerin renklendirilmesinde, boyar maddeler yaygın olarak kullanılmaktadır. Boyar maddeler üretimleri ve tüketimleri sürecinde toprak ve su kirliliği oluşturmaktadır. Boyar maddeler atık oluşturması dolayısıyla doğrudan veya dolaylı olarak ekolojik dengenin bozulmasına yol açmaktadır. Boyar maddelerin gideriminde adsorpsiyon, koagülasyon-flokülasyon, oksidasyon, ozonlama, filtrasyon, elektrokimyasal işlemler gibi çeşitli fiziksel ve kimyasal yöntemler kullanılmaktadır. Adsorpsiyon atık sudan boyar madde gideriminde yaygın olarak kullanılan bir prosestir. Bu çalışmada atık su arıtma tesisinden çıkan arıtma çamuru çeşitli kimyasal ajanlarla aktive edilerek aktif karbon üretilmiştir. Arıtma çamurundan aktif karbon üretimi atıkların geri dönüşümünde verimli, uygun maliyetli, sürdürülebilir çözüm sunmaktadır. Arıtma çamurunun kimyasal aktivasyonunda potasyum hidroksit (KOH), çinko klorür ( $ZnCl_2$ ) ve fosforik asit ( $H_3PO_4$ ) aktivasyon ajanı olarak kullanılmıştır. Arıtma çamuru kütlece 1:1 oranında (biyokütle/impregnant) aktivasyon ajanı ile aktive edilmiştir. Aktive edilen arıtma çamuru  $600^{\circ}C$ ' de 1 saat süre ile azot gazı eşliğinde karbonizasyona tabii tutulmuştur. Farklı kimyasallarla aktive edilerek üretilen aktif karbon numunelerinin metilen mavi adsorpsiyon performansı incelenmiştir. Adsorpsiyon sonucunda 30 mL 20 mg  $L^{-1}$  konsantrasyondaki metilen mavi çözeltileri 0.01 g aktif karbon ile 24 saat, 140 rpm çalkalanmışlardır. Potasyum hidroksit (KOH), çinko klorür ( $ZnCl_2$ ) ve fosforik asit ( $H_3PO_4$ ) ile aktifleştirilmiş numunelerin metilen mavi giderim oranları sırası ile %97,43, %33,43 ve %55,74 olarak elde edilmiştir. En yüksek giderim performansını potasyum hidroksit (KOH) ile hazırlanan aktif karbon göstermiştir. Bu çalışmada hazırlanan aktif karbonlar başarı ile sentezlenmiş ve metilen mavi adsorpsiyonunda yüksek performans göstermiştir.

**Anahtar Kelimeler:** Arıtma çamuru, Aktif karbon, Adsorpsiyon

**INVESTIGATION OF ACTIVATED CARBON PRODUCTION AND DYESTATE  
REMOVAL FROM SURGERY SLUDGE**

**Abstract**

Nowadays, the rapid development of industry has brought many problems, especially environmental pollution. The problems such as depletion of natural resources and ecosystem damage are of great concern. In this context, the effects of organic dyes on environmental pollution should not be ignored. The organic dyes are widely used chemical compounds used in various industrial fields coloring of materials. The organic dyes results environmental pollution in production and consumption processes. As a result of organic dye contamination in the environment, it leads to the disruption of the ecological balance, directly or indirectly. Various physical and chemical methods such as adsorption, coagulation-flocculation, oxidation, ozonation, filtration and electrochemical method are utilized in waste water treatment. Adsorption is a widely used process for the removal of dyes from wastewater. In this study, activated carbon was produced by chemical activation of sewage sludge, resulted from wastewater treatment process. Activated carbon production from sewage sludge offers an efficient, cost-effective and sustainable solution for recovery of wastes. Potassium hydroxide (KOH), zinc chloride ( $ZnCl_2$ ) and phosphoric acid ( $H_3PO_4$ ) were used for chemical activation of sewage sludge. The sewage sludge was activated with chemicals at a ratio of 1:1 (biomass/impregnant). The activated sewage sludge was carbonized at  $600^{\circ}C$  for 1 hour in the presence of nitrogen gas. The methylene blue adsorption performance of as-obtained activated carbon samples was investigated. 30 mL of methylene blue solutions with a concentration of  $20\text{ mg L}^{-1}$  were shaken with 0.01 g activated carbon at 140 rpm for 24 hours. The methylene blue removal rates of the activated carbons activated with potassium hydroxide (KOH), zinc chloride ( $ZnCl_2$ ) and phosphoric acid ( $H_3PO_4$ ) were obtained as 97.43%, 33.43% and 55.74%, respectively. Activated carbon prepared with potassium hydroxide (KOH) presented the highest removal performance. The activated carbons prepared in this study were synthesized successfully and shown high potential in methylene blue adsorption.

## **Giriş**

Boyalar genellikle sentetik kökenlidir ve karmaşık aromatik moleküler yapılara sahiptir, bu da onları daha kararlı hale getirir ve biyolojik olarak parçalanmalarını daha zor hale getirir. Günümüzde ticari olarak 10.000'den fazla boya mevcuttur. (Gong vd., 2005) Boyama teknolojisi keşfedildiğinden beri, kauçuk, plastik, tekstil, kağıt, deri ve gıda gibi endüstriler için boya uygulamalarının sayısındaki artış, su ortamında bulunmalarına yol açmıştır. Bu atık su, bozunmaya karşı inatçı olan azo, metan, nitro ve karbonil dahil olmak üzere doğal ve sentetik boya karışımı içerir. Sadece estetik değeri etkilemez, aynı zamanda ışık nüfuzunu ve fotosentezi de azaltır. Ayrıca bazı boyalar ya toksik ya da mutajenik ve kanserojendir. (Gong vd., 2005) Metilen mavisi, renklendirici maddelerde, geçici saç renklendiricilerde, pamukluların, yünlerin boyanmasında, kağıt stoğu için kaplamada vb. yaygın olarak kullanılan yüksek hacimli üretim ticari boyasıdır. (Kristanti ve Hadibarata, 2016) Metilen mavinin toksisitesi ve düşük biyolojik olarak parçalanabilirliği yüksektir ve kusma, ishal, gastrit, göz yanıkları, baş ağrısı ve göğüs ağrısı gibi birçok olumsuz sağlık etkisi vardır. (Kristanti ve Hadibarata, 2016) Atık su içeren boyaların arıtılması için geleneksel yöntemler, flokülasyon, oksidasyon veya ozonlama, membran ayırma ve aktif karbon adsorpsiyonudur. (Gong vd., 2005) Ancak bu teknolojiler önemli bir etkinlik veya ekonomik avantaj göstermemektedir. (Gong vd., 2005) Çok sayıda araştırma, atıksudan adsorpsiyon prosesi ile boya giderimi işlemini ortaya koymuştur. Adsorpsiyon işlemi sırasında polimerik adsorbanlar, aktif karbon ve karbonlu adsorbanlar gibi üç yan ürün vardır. (Kristanti ve Hadibarata, 2016) Tüm alternatif adsorbanlardan, boyayı çıkarmak için yaygın olarak kullanılan uygulanabilir yöntem aktif karbondur. Bu nedenle, aktif karbon alternatifi olarak yeni adsorbanın taranmasına ihtiyaç vardır. Arıtma çamuru, yüksek organik içeriği ve tehlikeli maddeler salma kabiliyeti nedeniyle çevresel bir sorundur. (Giwa vd., 2023) Ayrıca atıksularda fiziksel ve kimyasal arıtma yöntemlerinin kullanılması önemli miktarda geri dönüştürülebilir organik maddelerin oluşmasına neden olmaktadır. Arıtma yöntemleri arasında depolama, ıslak oksidasyon, kompostlama, kurutma, stabilizasyon, yakma, piroliz, karbonizasyon, sıvılaştırma ve gazlaştırma yer alır. (Giwa vd., 2023) Bu arıtma çamuru arıtma yöntemlerinden bazıları ekosisteme zarar verir ve arıtma çamurunun potansiyel kaynak değerinin gereğinden az kullanılmasına neden olur. Bu çalışma arıtma çamurundan aktif karbon üreterek geri kazanılması ve metilen mavi giderimindeki rolünü araştırmayı amaçlamıştır.

## **Metod**

Arıtma çamuru ilk olarak 110 °C etüvde kurutulmuş ve nemi giderilmiştir. Arıtma çamurunun kimyasal aktivasyonunda potasyum hidroksit (KOH), çinko klorür (ZnCl<sub>2</sub>) ve fosforik asit

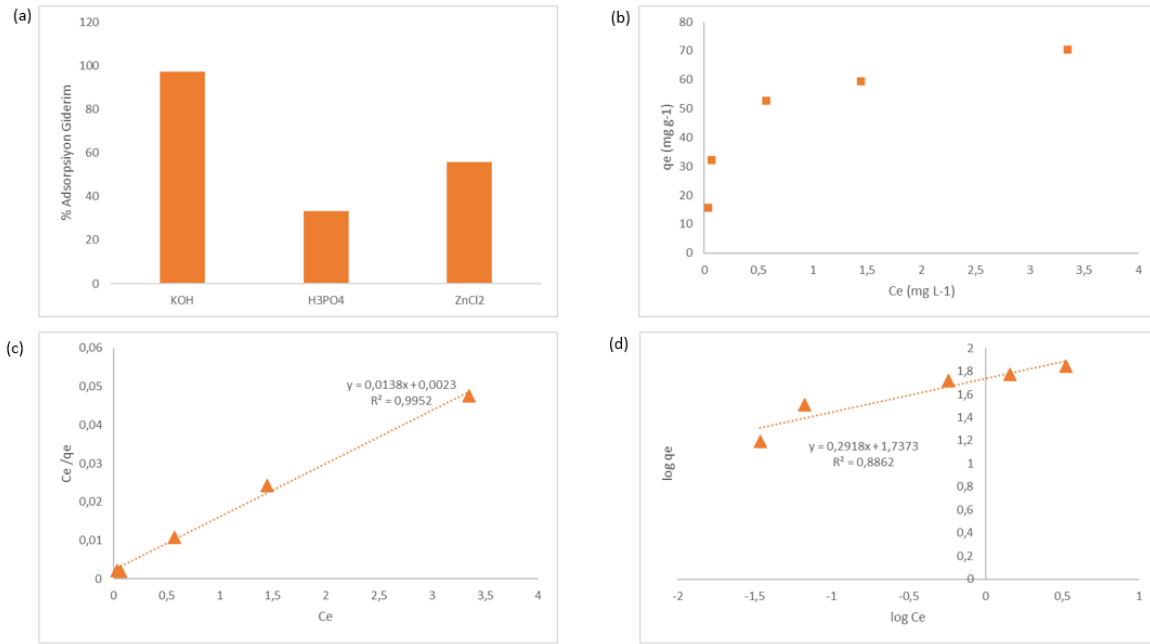

(H<sub>3</sub>PO<sub>4</sub>) aktivasyon ajanı olarak kullanılmıştır. Arıtma çamuru kütlege 1:1 oranında (biyokütle/impregnant) aktivasyon ajanı ile aktive edilmiştir. Aktive edilen arıtma çamuru 600<sup>0</sup>C' de 1 saat süre ile azot gazı eşliğinde karbonizasyona tabii tutulmuştur. Aktif karbon numunesi sırası ile 1 M HCl, kaynar su ve saf su ile yıkanmıştır. Yıkanan aktif karbon numunesi 110<sup>0</sup>C etüvde kurutulmuştur. Adsorban miktarının etkisini incelemek üzere 0,01 g aktif karbon numunelerinin üzerine 30 mL 20 mg L<sup>-1</sup> konsantrasyonundaki metilen mavi çözeltisi eklenmiştir, 140 rpm'de 24 saat çalkalanmıştır. Adsorpsiyon sonrasındaki metilen mavi çözeltisi konsantrasyonları 665 nm'de UV-Vis spektrofotometre kullanılarak tayin edilmiştir.

**Şekil 1.** Kurutulmuş arıtma çamuru

### **Bulgular**

Arıtma çamuru kütlege 1:1 oranında (biyokütle/impregnant) aktivasyon ajanı ile aktive edilmiştir. Aktive edilen arıtma çamurundan üretilen aktif karbon numunelerinin adsorpsiyon yüzdesi etkisine bakılmıştır. Sonuçlar Şekil 2 (a)'da sunulmuştur. En yüksek adsorpsiyon giderim yüzdesi potasyum hidroksit (KOH) aktivasyon ajanı ile elde edilmiştir. Aktivasyon ajanı olarak potasyum hidroksit (KOH) belirlenmiştir. Deneysel izoterm sonuçları Şekil 1 (b)' de verilmiştir. Deneysel olarak ulaşılabilen en yüksek adsorpsiyon kapasitesi 70,39 mg g<sup>-1</sup> olarak elde edilmiştir. Deneysel izoterm sonuçlarına lineer Langmuir ve Freundlich izoterm denklemleri uygulanmış ve sonuçlar Şekil 1(c) ve Şekil 1(d)' de verilmiştir. Langmuir denkleminde elde edilen R<sup>2</sup> değeri 0,99, Freundlich denkleminde elde edilen R<sup>2</sup> değeri 0,88 olarak bulunmuştur. Sonuçlardan gözlemlendiği üzere tek tabakalı adsorpsiyon profili olan Langmuir modeline uyumlu olduğu belirlenmiştir. Langmuir model denkleminde hesaplanan maksimum adsorpsiyon kapasitesi 72,46 mg g<sup>-1</sup> olarak bulunmuştur.

**Şekil 2.** (a) aktivasyon ajanının adsorpsiyon yüzdesine etkisi (b) izoterm eğrisi, (c) lineer Langmuir izoterm modeli eğrisi ve (d) lineer Freundlich izoterm modeli eğrisi

### Tartışma ve Sonuç

Boyarmaddelerin sulu çözeltilerden giderimi için çeşitli teknikler vardır. Adsorpsiyon atık su içerisindeki yabancı maddelerin gideriminde düşük maliyet ve yüksek performans özellikleriyle en etkili yöntem olarak kullanılmaktadır. Çalışma kapsamında arıtma çamurunun aktivasyon ajanları ile aktive edilerek üretilen aktif karbonun metilen mavi adsorpsiyonundaki giderimi incelenmiştir. En uygun aktivasyon ajanı %97,43 adsorpsiyon giderim yüzdesi ile potasyum hidroksit(KOH) olarak belirlenmiştir. Metilen mavi adsorpsiyon izoterm modeli incelenmiştir. En uygun adsorban miktarının  $72,46 \text{ mg g}^{-1}$  olduğu ve tek tabakalı Langmuir izoterm modeline uyum sağladığı görülmüştür. Atık olarak değerlendirilen arıtma çamurundan aktive edilerek aktif karbon üretilmesi atık yönetimi ve çevresel sürdürülebilirlik açısından verimli bir alternatif olarak görülmüştür.

**Özet**

Biyokütle günümüzde çeşitli endüstriyel süreçlerde ve enerji üretiminde yaygın bir şekilde kullanılmaktadır. Biyokütle, hayvansal ve bitkisel kaynaklı organik veya inorganik bileşiklerin doğal veya işlenmiş bir kompleksidir. Biyokütle rüzgar, güneş, su, jeotermal enerji kaynakları gibi yenilebilir ve alternatif bir enerji kaynağıdır. Tarım atıkları, orman endüstrisi atıkları, enerji tarımı ürünleri, her türlü bitki atıkları, evsel atıklar, hayvansal atıklar, endüstriyel atıklar ve ormansal atıklar, biyokütle atıklarını oluşturmaktadır. Biyokütle kaynakları, aktif karbon gibi değerli malzemelerin üretimi için de kullanılabilirler. Bu çalışmada biyokütle kaynağı olarak gilaburu ve hidrotermal karbonizasyon yöntemi kullanılmıştır. Hidrotermal karbonizasyon, sulu ortamda, düşük sıcaklıklarda ve kendiliğinden oluşan basınç altında gerçekleşen termokimyasal bir süreçtir. Gilaburu, Güneydoğu Anadolu bölgesinde yetişen bir bitki olarak bilinir ve geleneksel tıpta çeşitli amaçlarla kullanılmaktadır. Hidrotermal karbonizasyon deneylerinde 3 g gilaburu posası, 50 mL H<sub>2</sub>O ile paslanmaz çelik hidrotermal reaktör içerisinde karıştırılmış ve 210<sup>0</sup>C' ye ayarlanmış etüv içerisinde 24 saat süreyle ısıtılmıştır. Reaksiyon sonunda elde edilen hidroçar kurutulduktan sonra kütlece 1:2 oranında fosforik asit (H<sub>3</sub>PO<sub>4</sub>) ile impregne edilmiştir ve ardından 800<sup>0</sup>C' de 1 saat süre ile azot gazı eşliğinde karbonizasyona tabii tutulmuştur. Fosforik asit ile aktive edilerek üretilen aktifleştirilmiş hidroçar numunesinin kristal viole adsorpsiyon performansı incelenmiştir. Adsorpsiyon işleminde 30 mL 20 mg L<sup>-1</sup> konsantrasyondaki, kristal viole çözeltileri 0.01 g aktifleştirilmiş hidroçar ile 24 saat, 140 rpm' de çalkalanmıştır. Kütlece 2:1 oranında fosforik asit (H<sub>3</sub>PO<sub>4</sub>) ile aktifleştirilmiş numunenin kristal viole giderim oranı yaklaşık %98 olarak elde edilmiştir. Bu çalışmada hazırlanan aktifleştirilmiş hidroçar başarı ile sentezlenmiş ve kristal viole adsorpsiyonunda yüksek performans göstermiştir.

**Anahtar Kelimeler:** Hidrotermal karbonizasyon, Aktif karbon, Adsorpsiyon

**PRODUCTION OF ACTIVATED HYDROCHAR BY HYDROTHERMAL  
CARBONIZATION METHOD AND ITS EVALUATION IN CRYSTAL VIOLET  
ADSORPTION**

**Abstract**

Biomass is a natural or processed complex of organic or inorganic compounds derived from animal and plant source and widely used in various industrial processes and energy production. It is a renewable and alternative energy source such as wind, solar, water, and geothermal energy sources. Agricultural residues, forest industry residues, energy crops, all kinds of plant residues, household waste, animal waste, industrial waste, and forestry residues constitute biomass waste. Biomass resources can also be used for the production of valuable materials such as activated carbon. In this study, gilaburu pulp was hydrothermally activated. Hydrothermal carbonization is a thermochemical process that occurs in water as carbonization media at low temperature and under spontaneous pressure. The gilaburu pulp is known as a plant grown in the Southeast Anatolia region and is used for various purposes in traditional medicine. In hydrothermal carbonization experiments, 3 g of gilaburu pulp was placed in a stainless steel autoclave reactor with 50 mL of H<sub>2</sub>O, mixed in the hydrothermal reactor, and hydrothermally treated for 24 hours at 210°C in an oven. The hydrochar obtained at the end of the reaction was filtered and dried at 105°C for 24 hours. The as-obtained hydrochar was impregnated with phosphoric acid (H<sub>3</sub>PO<sub>4</sub>) at a mass ratio of 1:2 (biomass/impregnant). The impregnated hydrochar was carbonized at 800°C for 1 hour under nitrogen gas flow. The crystal violet removal performance of the activated hydrochar sample produced by activation with phosphoric acid was investigated in a batch adsorption system. In the adsorption process, 30 mL of crystal violet solutions with a concentration of 20 mg L<sup>-1</sup> were shaken with 0.01 g of activated hydrochar at 140 rpm for 24 hours. The removal efficiency of crystal violet obtained for the sample activated with phosphoric acid at a mass ratio of 1:2 was approximately 98%. The activated hydrochar prepared in this study was successfully synthesized and exhibited high performance in crystal violet adsorption.

**Keywords:** Hydrothermal carbonization, Activated carbon, Adsorption

## **Giriş**

Hidrotermal karbonizasyon yöntemi, son yıllarda çevresel sürdürülebilirlik ve alternatif enerji kaynakları arayışında önemli bir yer edinmiştir. Hidrotermal karbonizasyon süreci 20. Yüzyılın başlarında karbon açısından zengin katı yakıt üretmek için geliştirilen bir yöntemdir. (Evcil vd., 2020) Bu süreçte biyokütle, yüksek sıcaklık ve basınç altında birkaç saat boyunca karbon açısından zengin ürünlere dönüştürülür. (Evcil vd., 2020) Hidrotermal karbonizasyon prosesinde hidroliz, dehidrasyon, dekarboksilasyon, yoğunlaşma ve polimerizasyonu içeren bir dizi reaksiyon meydana gelir. (Salaudeen vd., 2021) Hidroçar olarak adlandırılan katı ürün, atık su kirliliğinin iyileştirilmesinde, kataliz, enerji depolama, adsorpsiyon gibi çok çeşitli uygulamalarda kullanılabilir. (Wang vd., 2018) Biyokütellerin hidrotermal karbonizasyonu, çeşitli avantajlar içermektedir. Biyokütle olarak genellikle tarımsal atıklar, odun artıkları, selülozik materyaller ve diğer organik kaynakların kullanımını içermektedir. Bu çalışmada biyokütle kaynağı olarak kullanılan gilaburu Güneydoğu Anadolu bölgesinde yetişen bir bitki olarak bilinir ve geleneksel tıpta çeşitli amaçlarla kullanılmaktadır. Kristal viole boyası suda çözünebilir, toksik, dirençli, ciddi sağlık sorunlarına ve çevre kirliliğine neden olan organik bir boyadır. (Cheruiyot vd., 2019) Genellikle mor renkli bir toz veya sıvı halde bulunurlar. Kristal viole bir tri-fenilmetan boyasıdır. (Cheruiyot vd., 2019) Kanserojen, mutajenik olarak bilinse de ticari tekstil proseslerinde, biyolojik boyamada ve dermatolojik ajan olarak hala yaygın bir şekilde kullanılmaktadır. Azo boyaların atık sularda arıtılması büyük bir zorluktur çünkü bu boyalar bozunmaya karşı dirençli karmaşık bir yapıya sahiptirler. (Cheruiyot vd., 2019) Biyolojik bozunma, fotokatalitik, çökeltme, adsorpsiyon, kimyasal oksidasyon, flokülasyon, çökeltme, ozonlama, iyon değişimi ve solvent ekstraksiyonu gibi geleneksel arıtma yöntemleri boya gideriminde kullanılmaktadır. (Cheruiyot vd., 2019) Adsorpsiyon düşük maliyetli oluşu ve etkinliği nedeniyle en yaygın arıtma yöntemlerinden biri olmaya devam etmektedir. (Cheruiyot vd., 2019) Bu çalışmada biyokütle olarak kullanılan gilaburu posasından hidrotermal karbonizasyon yöntemi ile hidroçar üretimi ve kristal viole adsorpsiyonunda incelenmesi amaçlanmıştır.

## **Metod**

Hidrotermal karbonizasyon deneylerinde 3 g gilaburu posası, 50 ml saf su ile paslanmaz çelik hidrotermal reaktör içerisinde karıştırılmıştır. Etüv içerisinde 210°C' de 24 saat süreyle ısıtılmıştır. Reaksiyon sonunda elde edilen hidroçar kurutulduktan sonra kütlece 1:2 oranında fosforik asit ile impregne edilmiştir ve ardından 800°C' de 1 saat süre ile azot gazı eşliğinde karbonizasyona tabii tutulmuştur. Hidroçar numunesi sırası ile HCl , kaynar su ve saf su ile

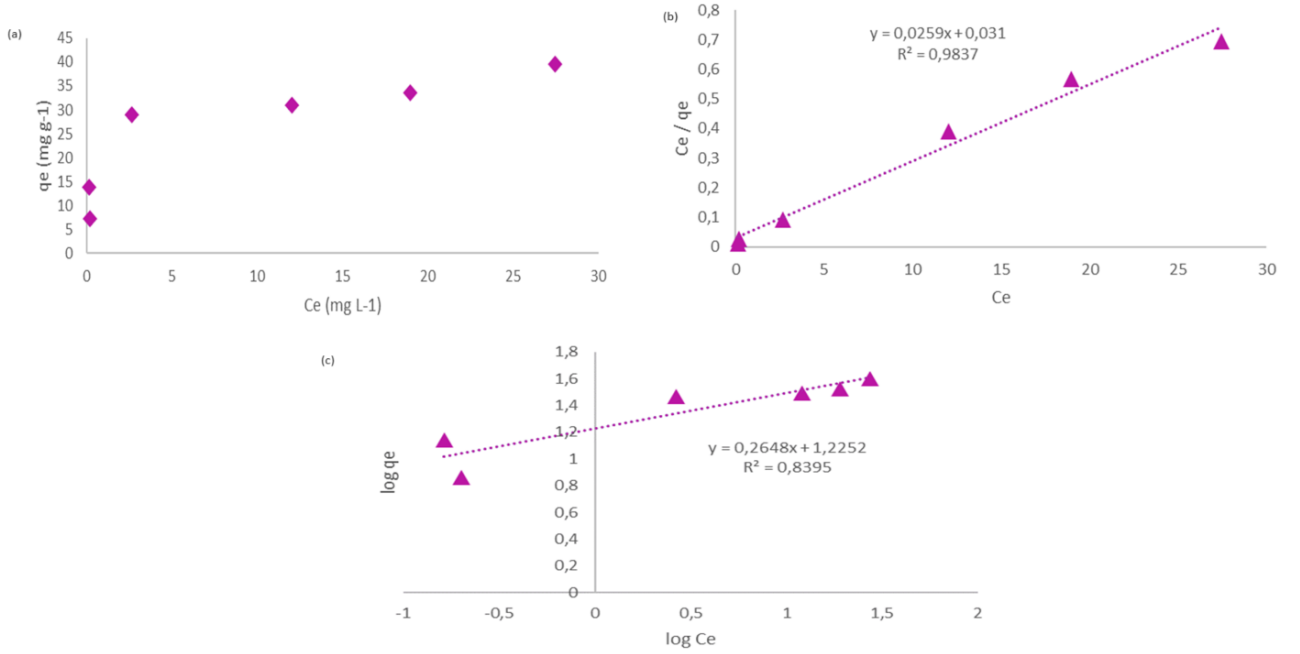

yıkanmıştır. Yıkanan hidroçar numunesi 110°C etüvde kurutulmuştur. Fosforik asit ile aktive edilerek üretilen aktifleştirilmiş hidroçar numunesinin kristal viole adsorpsiyon performansı incelenmiştir. Adsorpsiyon işleminde 30 mL 20 mg/L konsantrasyondaki, kristal viole çözeltileri 0.01 g aktifleştirilmiş hidroçar ile 24 saat, 140 rpm' de çalkalanmıştır. Süre sonunda çözeltiler şırınga filtrelerden süzülüp, gerekli seyreltmeler yapıp 590 nm'de UV cihazında okunmuştur.

**Şekil 1.** Öğütülmüş gilaburu posası

### **Bulgular**

Gilaburu posasından hidrotermal karbonizasyonla hidroçar üretilmiştir. Elde edilen hidroçar kütlece 1:2 oranında (biyokütle/impregnant) aktivasyon ajanı ile aktive edilmiştir. Aktive edilen hidroçar ile üretilen aktif karbon numunelerinin adsorpsiyon yüzdesi etkisine bakılmıştır. Deneysel izoterm sonuçları Şekil 2 (a)' de verilmiştir. Deneysel olarak ulaşılabilen en yüksek adsorpsiyon kapasitesi 39,61 mg g<sup>-1</sup> olarak elde edilmiştir. Deneysel izoterm sonuçlarına lineer Langmuir ve Freundlich izoterm denklemleri uygulanmış ve sonuçlar Şekil 2(b) ve Şekil 2(c)' de verilmiştir. Langmuir denkleminde elde edilen R<sup>2</sup> değeri 0,9837, Freundlich denkleminde elde edilen R<sup>2</sup> değeri 0,8395 olarak bulunmuştur. Sonuçlardan gözlemlendiği üzere tek tabakalı adsorpsiyon profili olan Langmuir modeline uyumlu olduğu belirlenmiştir. Langmuir model denkleminde hesaplanan maksimum adsorpsiyon kapasitesi 38,61 mg g<sup>-1</sup> olarak bulunmuştur.

**Şekil 2.** (a) izoterm eğrisi, (b) lineer Langmuir izoterm modeli eğrisi ve (c) lineer Freundlich izoterm modeli eğrisi

### Tartışma ve Sonuç

Çalışma kapsamında hidroçar aktivasyon ajanları ile aktive edilerek üretilen aktif karbonun kristal viole adsorpsiyonundaki giderimi incelenmiştir. Hidrotermal karbonizasyon yöntemi ile aktifleştirilmiş hidroçar üretimi ve kristal viole adsorpsiyonu başarılı bir şekilde gerçekleşmiştir. Kristal viole adsorpsiyon izoterm modeli incelenmiştir. En uygun adsorban miktarının  $38,61 \text{ mg g}^{-1}$  olduğu ve tek tabakalı Langmuir izoterm modeline uyum sağladığı görülmüştür. Hidroçar üretiminde etkili bir yöntem olan hidrotermal karbonizasyonun, aktifleştirme işlemi ile birlikte adsorpsiyon uygulamalarında kullanılabileceği görülmektedir. Bu çalışma hem hidroçar üretimi hem de adsorpsiyon alanında yeni uygulama alanları sunmaktadır.

**Özet**

Günümüzde dünya nüfusunun artması ve artan nüfus ile birlikte enerji ihtiyacının artması ile Tüklenen enerji kaynaklarının da arındırılması ve temizlenmesi büyük önem kazanmıştır. Ham petrol, günümüzde enerji ihtiyacının büyük bir kısmını karşılayan ve önemli bir enerji kaynağıdır. Ham petroldeki kükürt giderimi (desülfürizasyon) geçmişte olduğu gibi günümüzde yapılmaya devam edilmektedir. Çünkü sülfür bileşikleri, yanma sırasında egzoz gazlarında kükürt dioksit oluşturarak hava kirliliğine ve asit yağmurlarına yol açabilir. Ayrıca, sülfür bileşikleri, motorların ve katalizörlerin ömrünü kısaltabilir. Bu nedenle, ham petroldeki sülfür bileşiklerinin çıkarılması ve ürünlerin daha temiz hale getirilmesi önemlidir. Desülfürizasyon işlemi genellikle rafinasyon aşamasında gerçekleştirilir ve farklı yöntemler kullanılabilir. Kükürt gideriminin farklı yöntemleri bulunmakla birlikte bu çalışmada Adsorptif desülfürizasyon yöntemi kullanılmıştır. Bu yöntem için adsorbent olarak klinoptilolit kullanımı tercih edilmiştir. Volkanik kökenli bir alüminosilikat minerali olan klinoptilolit seçiciliğini iyileştirmek ve adsorpsiyon süreçlerini daha verimli hale getirmek amacıyla NaCl ile modifiye edilerek kullanılmıştır. Yapılan çalışmada partikül boyutu, süre, hız ve dozlama olarak 4 farklı parametre ile işlem yapılmıştır. Daha sonra petrol bazlı ürünlerin yapısal analizi, fraksiyon tanıma, yanma özellikleri ve yakıt verimliliği ile kalite denetimleri hakkında bilgi edinmek için Fourier Dönüşümlü Kızılötesi Spektroskopisi (FTIR) ile önce ham petrolün desülfürizasyon işlemi yapılmadan önceki hali daha sonra desülfürizasyon işleminden sonraki hali analiz edilerek çalışmadan verimli sonuç alınmıştır.

**MODIFICATION AND CHARACTERIZATION OF CLINOPHYLLOLINE FOR  
ADSORPTIVE DESULFURIZATION OF CRUDE OIL**

**Abstract**

In today's world, the increasing global population and the rising energy demand have made it crucial to deplete and purify energy resources. Crude oil, a significant energy source that currently meets a large portion of the energy demand, requires sulfur removal (desulfurization) as it has been historically practiced and continues to be done so today. Sulfur compounds in crude oil can produce sulfur dioxide in exhaust gases during combustion, leading to air pollution and acid rain. Additionally, these sulfur compounds can shorten the lifespan of engines and catalysts. Therefore, it is important to remove sulfur compounds from crude oil and clean up the resulting products. Desulfurization is usually carried out during the refining stage and various methods can be used. While there are different methods for sulfur removal, this study utilizes the Adsorptive desulfurization technique. clinoptilolite has been chosen as the preferred adsorbent for this method. To enhance the selectivity of clinoptilolite, a volcanic aluminosilicate mineral, and to optimize adsorption processes, it has been modified with NaCl. The study involved processes with four different parameters: particle size, duration, rate, and dosing. Subsequently, through the analysis of crude oil states pre and post-desulfurization process using Fourier Transform Infrared Spectroscopy (FTIR), efficient results were obtained.

**Keywords:** Clinoptilolite, Modification, Crude oil, Desulfurization, Characterization

## **Introduction**

Access to energy is crucial for a society's well-being, economic development and quality of life. Therefore, removing barriers to access to available energy can only be possible by increasing available energy. For this reason, researchers have increased their studies on energy in recent years and have made efforts to ensure that available energy resources do not harm the environment and human health (Kavak & Haspolat, 2022) Throughout history, energy systems have relied on fossil fuels (coal, oil and gas). The use of fossil fuels releases carbon dioxide and other greenhouse gases, which are considered to be the main cause of global climate change. The combustion of fossil fuels produces large amounts of carbon monoxide; oxides of sulphur, SO<sub>2</sub> and SO<sub>3</sub> (represented as SO<sub>x</sub>); oxides of nitrogen, NO and NO<sub>2</sub> (represented as NO<sub>x</sub>) and particulates, which have been proven to be harmful to human health and the environment (Sonel Aü Fen Fakültesi, 1997). Sulfur content in gasoline and diesel fuels has been limited, especially due to the harmful effects of SO<sub>x</sub> gases released as a result of combustion. Governments try to reduce the concentration of petroleum products such as gasoline and diesel below 15 ppm in accordance with existing rules. Adsorption desulfurization studies have recently gained importance due to their potential applications in desulfurization of various materials (Gupta et al., 2021; Salehi et al., 2020; Tuna et al., 2020). In this method, the sulfur and sulfur-containing compounds of the hydrocarbon adhere to the solid adsorbent surface. The effectiveness of the method is proportional to the effectiveness of the adsorbent (Blanco Brieva et al., 2010). History and formation of crude oil Petroleum is known as crude oil or crude oil. It is a dark liquid and has a color close to black. It has a pronounced viscosity and has an acceptable odor if it contains a low proportion of sulfur compounds. If it has high proportions of nitrogen compounds, or both, it has an unpleasant odor. Petroleum liquid is lighter than water and different types have different densities. It is also a flammable liquid. The most important sulfur compounds found in petroleum are (methylthio and thiophene compounds, as well as hydrogen sulfide gas H<sub>2</sub>S) and some sulfur compounds (Younis Muhammad Al-Hassan, 2019).

**Figure 1 (a) Tiyofen, (b)Mercaptan (Younis Muhammad Al-Hassan, 2019)**

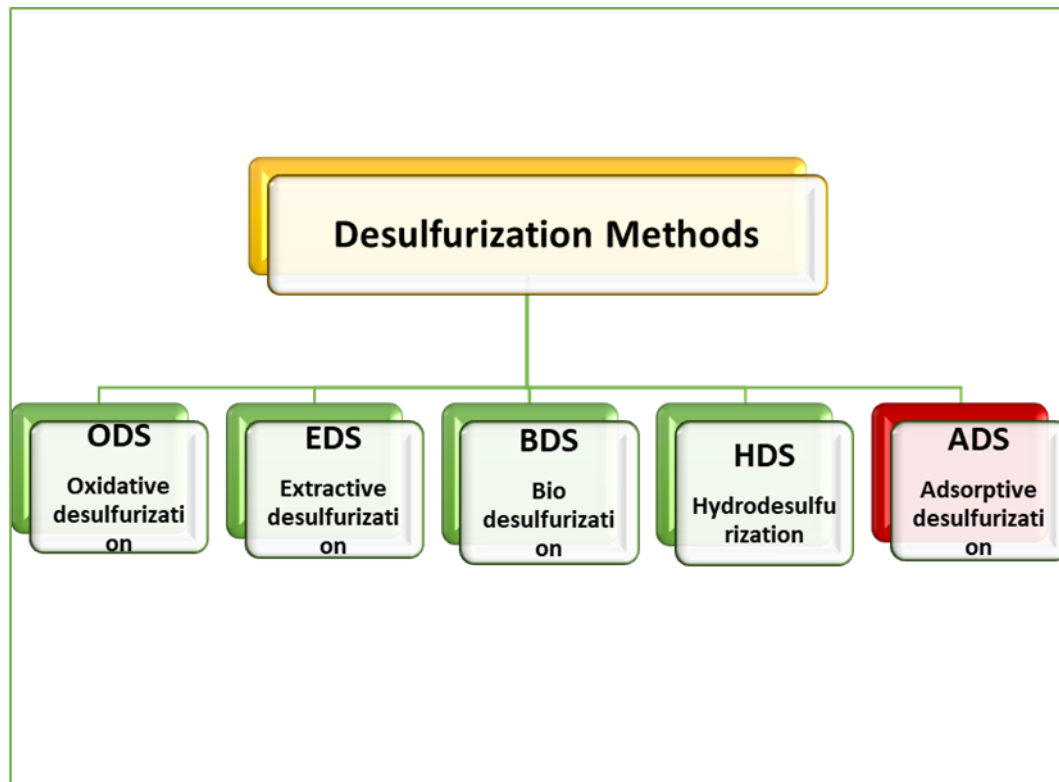

### **Production of Crude Oil**

Oil and gas production is the process of extracting hydrocarbons and separating the mixture of liquid hydrocarbons, gas, water and solids (Bahadori et al., 2013). Production facilities usually process crude oil from multiple wells. Oil is almost always processed at a refinery; natural gas may be processed to remove contaminants in the field or at a natural gas processing plant. Crude oil and natural gas are usually removed from the fields where they are produced and transported to refineries and gas processing plants, where they are either made into feedstock for another production process or processed into final products.

### **Desulfurization**

Given regulatory limits, the sulfur compounds or sulfur content in liquid fuels must be controlled. These controls require the application of various methods for the effective removal of sulfur from liquid fuels. (Crandall et al., 2019) These methods are used in a wide range of applications, from industrial applications to laboratory research. Figure 1.1 shows a schematic representation of various desulfurization techniques. (Khodadadi Dizaji et al., 2019; Nath Prajapati & Verma, 2018; Prajapati & Verma, 2017)

**Figure 2 Desulfurization Methods**

### **Adsorptive desulfurization (ADS)**

It is a relatively new technology for sulfur removal from fuel. It is quite popular among researchers due to its inexpensive nature and ease of adaptation to different fuel processors. It involves the process of contacting an activated/functionalized adsorbent to remove sulfur from fuel. The fact that it does not require hydrogen, operates under moderate temperature conditions (from room temperature to about 100°C) and adsorbent renewability make it an economical desulfurization method. To date, many different adsorbents have been focused and the process technology adapted for ultra-low desulfurization. Many of the reported materials and processes together with various mechanisms and process conditions will be extensively investigated. In the adsorption desulfurization technique, the active adsorbent is placed on a rough, non-reacting substrate providing a high surface area. Adsorption occurs when sulfur molecules adhere to the adsorbent and remain separated from the fuel. Different researchers have used this technique to remove sulfur from different types of fuel oils and model oils using various types of adsorbents (Hernández-Maldonado & Yang, 2004; Lee et al., 2002; Li et al., 2007; Ma, Sun, et al., 2002; Sano et al., 2005; Weitkamp et al., 1991; Yu et al., 2005).

### **Effects of Process Parameters on Adsorptive Desulfurization**

#### **Contact time**

Contact time has a great influence on the adsorption efficiency of any adsorbent. In general, with the increase in contact time, the adsorption capacity of an adsorbent increases until it reaches equilibrium.

#### **Adsorbent dosage**

In general, the percentage of adsorption or desulfurization increases with increasing adsorbent dosage due to the increased number of accessible active sites (Ganiyu et al., 2016; Saleh et al., 2017).

#### **Adsorption temperature**

Temperature is a critical process parameter in adsorption. It affects both the adsorption rate and the absorption capacity. With increasing temperature, the adsorption rate is expected to increase as sulfur compounds move faster through the pores of the adsorbents and overcome the activation energy barrier. The effect of temperature on adsorption capacity depends on whether the particular adsorption process is exothermic or endothermic.

### **Initial sulfur content of the feedstock**

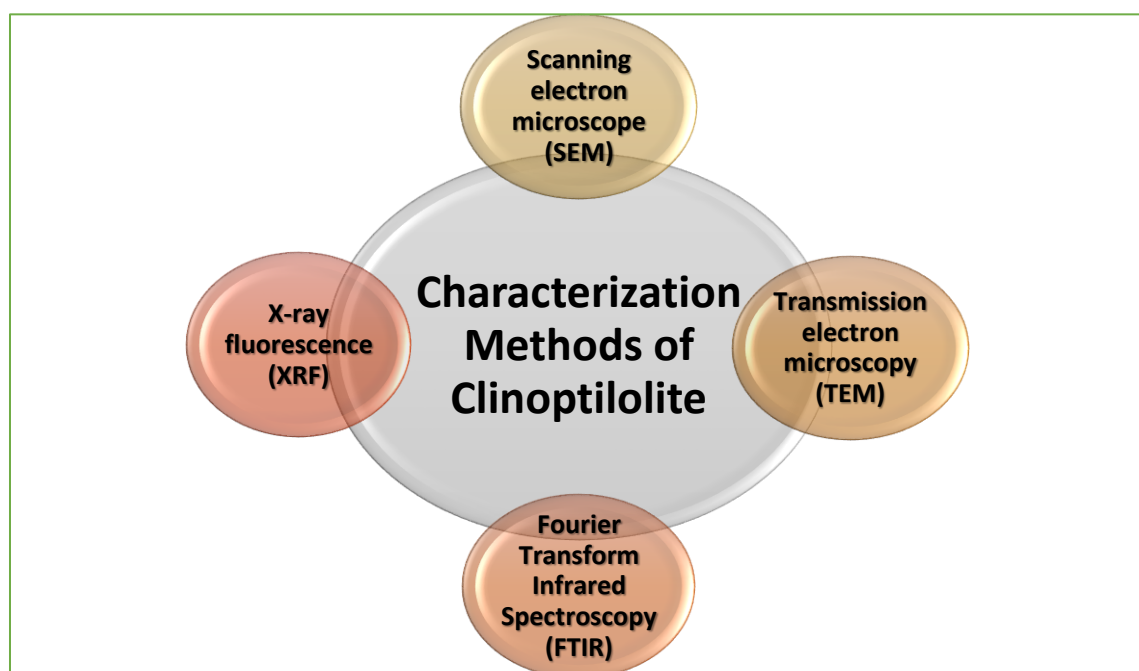

The Langmuir (1) and Freundlich (2) isotherms describe monolayer adsorption and heterogeneous adsorption, respectively. These isotherms relate the sulfur uptake per unit weight of adsorbent ( $q_e$ ) to the equilibrium sulfur concentration ( $C_e$ ) in the bulk liquid as shown below.  $C_e/q_e = 1/KQ_m + C/Q_m$  (1)  $\log q_e = \log KF + 1/n \log C_e$  (2) Where  $C_e$ ,  $K$ ,  $Q_m$ ,  $KF$  and  $n$  stand for the sulfur concentration in the fuel at equilibrium, Langmuir isotherm constant, Freundlich isotherm constants related to maximum monolayer coverage capacities, adsorption capacity and adsorption intensity, respectively.

### **Some Adsorbents Used in Adsorptive Desulfurization**

The selection of a suitable adsorbent is important for all adsorption processes including ADS. An efficient adsorbent should be porous, physically and chemically stable, environmentally friendly and suitable for recovery. ADS adsorbents are substances such as microporous EC, zeolites, alumina, mesoporous silica and recently MOFs, which are widely discussed in the literature. In this chapter, detailed descriptions of these adsorbents and various sulfur removal studies using these adsorbents are presented. Furthermore, (adsorptive) sulfur removal tests and the experimental conditions used in the tests are briefly presented. In the desulfurization process of sulfur-containing liquid fuels, conditions such as  $S$  exposure times of adsorbents,  $S$  concentrations, temperatures and durations are important factors to be taken into account when establishing recovery strategies.

### **Zeolite-based adsorbents**

Zeolites are microporous crystalline aluminosilicates with high external surface area (150-500  $m^2/g$ ) and three-dimensional structure. Due to their stable skeletal structure and ability to cation exchange, zeolites are more widely studied materials for ADS treatment. The adsorption capacity and selectivity of metal cation-exchanged zeolites towards sulfur compounds were found to be very high due to the presence of metal-based active sites on the surface (Dehghan & Anbia, 2017). Among different types of zeolites, Y-type zeolites such as Ag/Y, Cu/Y, Ce/Y, Na/Y, Ni/Y, La/Y are the most studied materials for ADS due to tunable porosity for size-selective adsorption, high ion exchange capacity and good thermal stability. Like metal oxide-type adsorbents, adsorptive desulfidation with zeolites involves  $\pi$  complexation, sulfur-metal and Lewis acid-base interactions. Selective adsorption of sulfur compounds in the presence of aromatic and nitrogenous compounds is a challenging process as they have similar structures and adsorption energies (Song et al., 2013), (Zu et al., 2020), (Ma, Song, et al., 2002).

**Figure 2 Characterization Methods of Clinoptilolite**

### **Fourier Transform Infrared Spectroscopy (FTIR)**

It is an extremely useful technique for confirming the identity of pure compounds, but of limited value when used for mixtures of compounds. The technique is based on the identification of functional groups within molecules, where these groups vibrate (stretch or bend in various ways) when irradiated with light of specific wavelengths (NicDaéid, 2019) Infrared spectroscopy is a field in which the electromagnetic field of matter interacts in the infrared radiation (IR) region as a function of photon frequency. First, a glowing blackbody light source emits a beam of infrared energy. Then, the infrared beam enters the interferometer, where it generates an interferogram signal. Next, the beam enters and passes through the sample chamber or reflects off the sample surface. When materials are exposed to infrared radiation, the sample molecules absorb certain wavelengths of radiation, causing a change in the dipole moment of the molecules. Some of the infrared radiation is transmitted by the sample, while some is absorbed. As a result, the vibrational energy levels of the sample molecules change from the ground state to the excited state. The resulting spectrum shows the transmission and absorption of the sample molecules and forms the molecular fingerprint of the sample. The absorption peak frequency determines the vibrational energy gap of the sample molecules and the absorption peak number corresponds to the vibrational freedom of the molecule. The absorption peak magnitude is a result of the probability of transition of energy levels and the

variation of the dipole moment. Finally, the infrared beam enters the detector for the final measurement. The measured signal is digitized and sent to the computer for Fourier transformation. The final infrared spectrum is then presented to the user for interpretation and further manipulation (McNaught & Wilkinson, 1997).

### **Materials and Methods**

The types of chemicals used in the thesis study and the purposes for which these chemicals were used are detailed in Table 3.1 of the study.

**Table 1 Chemicals used in the thesis study and their intended use**

<b>Name</b>	<b>Formula</b>	<b>Purpose of usage</b>
<b>Zeolite (Clinoptilolite)</b>	$(\text{Na}_2, \text{Ca}, \text{K}_2)_{2-3}\text{Al}_3(\text{Al}, \text{Si})_2\text{Si}_13\text{O}_36 \cdot 12\text{H}_2\text{O}$	Adsorbent
<b>Crude oil</b>	$\text{C}_n\text{H}_{2n+2}$	Desulphurization
<b>Sodium chloride</b>	$\text{NaCl}$	Modification
<b>Pure water</b>	$\text{H}_2\text{O}$	Washing process

### **Modification Method of Clinoptilolite**

Chemically or physically changing clinoptilolite, a natural zeolite mineral, is done in order to increase the reactivity of the mineral, increase surface insulation or determine specific properties.

**Figure 3 NaCl solution and two different sized clinoptilolite samples**

Modification of clinoptilolite further enhances the properties of naturally occurring clinoptilolite, allowing it to be used more effectively in various applications. In this thesis, NaCl solution is first prepared by following the steps below.

#### **Desulphurization of Crude Oil**

The desulphurization process of crude oil was carried out using NaCl modified clinoptilolite with different particle sizes. 50 $\mu$  and 200  $\mu$  sized modified clinoptilolite was used at room temperature for two different times (20, 60), two different speeds (300, 500) and two different dosages. As a result of the processes, sulfur measurement and characterization analysis of a total of 16 samples were carried out.

#### **Fourier Transform Infrared Spectroscopy (FTIR)**

Structural analysis of petroleum-based products is carried out to obtain information on fraction identification, combustion characteristics and fuel efficiency as well as quality controls. It also affects the quality of marketable products derived from crude oil products. Fourier transform infrared (FT-IR) spectroscopy has the advantage of being able to record spectra for solid and liquid samples without any pre-treatment. This makes FT-IR/ATR particularly attractive for easy and rapid characterization of natural and synthetic products (Griffiths & De Haseth, 2007). In the thesis study, FTIR spectroscopic analysis of the crude oil sample was performed using a Perkin Elmer Spectrum 2 FTIR Spectrophotometer. Each spectrum was taken at wavenumbers of 4000-650  $\text{cm}^{-1}$  at a scan rate of 4  $\text{cm}^{-1}$  and the data were evaluated using the software.

#### **Conclusion and Recommendation**

This thesis study was carried out in two stages. In the first stage, it was aimed to increase the adsorption capacity by modifying clinoptilolite. In the second stage, desulfurization of untreated crude oil was carried out with the modified clinoptilolite. FT-IR device was used as a characterization method to analyze the samples before and after the desulfurization process.

#### **Fourier Transform Infrared Spectroscopy (FTIR)**

Crude oil samples were firstly identified before desulphurization and then 16 samples after desulphurization were identified in the instrument. As shown in Figure 4.1, alkanes and carbonyl groups were found in the sample at certain frequency ranges and various intensities.

**Figure 4 FT-IR imaging of crude oil**

According to the information given in the identification, as shown in Table 4.1, it shows strong bands around  $2955\text{ cm}^{-1}$ ,  $2923\text{ cm}^{-1}$  and  $2854\text{ cm}^{-1}$ , which correspond to aromatic C-H, methyl C-H and methylene C-H. The weak absorption band at  $1611\text{ cm}^{-1}$  corresponds to aromatic C=C. A strong band located around  $1458\text{ cm}^{-1}$  represents methylene C-C, while an intense band appears at  $1377\text{ cm}^{-1}$ , which corresponds to the S=O of sulfones. The S-C of sulfides is also indicated by a weak absorption band around  $1267\text{ cm}^{-1}$  and  $1166\text{ cm}^{-1}$ . At  $1066\text{ cm}^{-1}$ , the S=O bond of sulfoxides is observed with moderate intensity. In the  $873\text{ cm}^{-1}$  and  $725\text{ cm}^{-1}$  bands, alkanes were again observed with medium intensity. Results of FT-IR analysis of crude oil before desulfurization and sulfur peaks and intensity levels

**Table 2 Results of FT-IR analysis of crude oil before desulfurization and sulfur peaks and intensity levels**

Observed wave number $\text{cm}^{-1}$	Bond	Compound type	Frequency range $\text{cm}^{-1}$	Intensity
2955	C-H	Alkanes	2850-2970	Strong
2923	C-H	Alkanes	2850-2970	Strong
2854	C-H	Alkanes	2850-2970	Strong
1611	C=C	Alkenes	1610-1680	Weak
1458	C-H	Alkanes	1350-1470	Strong
1377	C-H	Alkanes	1370-1390	Middle
1250	S=O	Carbonyls	1290-1415	Middle
	S-C	Carbonyls	1290-1415	Weak
1053	C=S	Carbonyls	1050-1080	Middle
873	C-H	Alkanes	690-900	Middle
725	CH <sub>2</sub>	Alkanes	720-725	Middle

When we consider one sample out of 16 samples (Sample 3), when we compare the FT-IR analysis of the crude oil and modified zeolite with a particle size of  $50\mu$  with 0.5 g of the modified zeolite at a speed of 500rpm for 60 minutes by increasing the time this time and the desulfurization treated sample and the untreated sample, it was seen that the amount of sulfur decreased more than the first sample in FT-IR imaging. At  $1290\text{ cm}^{-1}$  and  $1377\text{ cm}^{-1}$ , decreases in the amount of sulfur occurred as seen. It is seen in Figure 4.4 that a great decrease occurred around  $1066\text{ cm}^{-1}$ .

**Figure 5 3. Sample FT-IR imaging of crude oil after desulfurization**

### **Conclusion and Recommendations**

The desulfurization process has gained importance since the removal of sulfur from crude oil allows the use of crude oil in various applications.

In this study, positive results were obtained for desulphurization of crude oil. Adsorptive desulphurization method was used to remove sulfur. Clinoptilolite was selected as adsorbent for adsorptive desulphurization method. After the modification of clinoptilolite, adsorptive desulfurization process was carried out and Fourier Transform Infrared Spectroscopy (FTIR) characterization method was used in this study and the decrease in the amount of sulfur in the characterized samples, especially around the  $1066\text{ cm}^{-1}$  spectrum, indicates that the study has resulted positively.

### **Özet**

Vitamin B12, bazı besinlerde doğal olarak bulunan suda çözünebilen bir vitamindir. Kobalt minerali içeriğinden dolayı Vitamin B12 aktivitesine sahip bileşiklere topluca kobalamin adı verilmektedir. Vitamin B12 eksikliği insanları yaşam boyu etkileyen, hematolojik, nörolojik ve obstetrik sonuçları olan önemli bir halk sağlığı sorunudur. Yeni kanıtlar, Vitamin B12'nin bağırsak mikrobiyomunun bileşimi ve işlevi de dahil olmak üzere insan sağlığının diğer yönlerinde de önemli bir rol oynayabileceğini öne sürmektedir. Vitamin B12 bağırsakta pasif difüzyon ve reseptör aracılı endositoz yoluyla emilebilmektedir. Diyetle hayvansal kaynaklı gıdaların tüketilmesiyle elde edilen Vitamin B12; yalnızca bakteriler tarafından sentezlemekte ve bağırsak emilimi bağırsak mikrobiyotasından etkilenebilmektedir. *L.reuteri* ve *Enterococcus faecium* gibi birçok bakterinin Vitamin B12 ürettiği rapor edilmiştir. Vitamin B12 üreten bakterilerin takviyesinin, gastrointestinal kanalda Vitamin B12'nin kullanımını artırabileceği varsayılmaktadır. Böyle bir hipotez, Vitamin B12 eksikliği olan diyetlerle beslenen farelerde kanıtlanmıştır. Vitamin B12 üreten bir suş olan *L. reuteri* CRL1098'in diyetle eklenmesi ile Vitamin B12 eksikliği semptomlarının önlenildiği ve bağırsak bakterilerinin Vitamin B12 eksikliğinde tedavi edici etkisi olduğu gösterilmiştir. Gastrointestinal sistem mikrobiyotasının yaklaşık %80'inin Vitamin B12 tüketicileri olduğu düşünülmektedir. Bu nedenle bakteriyel aşırı büyüme, eksojen Vitamin B12 için konakçıyla rekabet edebilir ve ardından biyoyararlanımı azaltabilir. İnce bağırsakta anaerobik bakteri çoğalmasının artması nedeniyle Vitamin B12 eksikliğinin ve buna bağlı semptomların ana nedenlerinden biri olduğu bilinmektedir. Bazı bağırsak bakterileri, bağırsak geçirgenliğini normalleştirerek Vitamin B12 emilimini artırıcı ve inflamatuvar bağırsak hastalığı üzerinde iyileştirici bir etki göstermiştir. Bazı çalışmalarda Vitamin B12; intestinal mikrobiyomun beta çeşitliliğindeki değişikliklerle ilişkilendirilmiş olup intestinal mikrobiyomunun bileşimini modüle edebileceğini öne sürmektedir. Bir veya daha fazla besin eksikliği nedeniyle tek karbon metabolizmasındaki değişiklikler, Vitamin B12 ile etkileşime girebilir ve intestinal mikrobiyomun kompozisyonunu ve işlevini etkileyebilir. İnsan intestinal mikrobiyomunun önerilen günlük Vitamin B12 alımının yaklaşık üçte birini üretebildiği tahmin edilmektedir. Vitamin B12 takviyesi, bağırsak mikrobiyomu ile etkileşimler yoluyla malabsorbsiyonun neden olduğu Vitamin B12 eksikliğini tedavi etmenin ötesinde gastrointestinal koşullar için faydalı olabilir.

**Anahtar Kelimeler:** Vitamin B12, Gut mikrobiyotası, mikrobiyom

**RELATIONSHIP BETWEEN VITAMIN B-12 AND THE HUMAN GUT  
MICROBIOME**

**ABSTRACT**

Vitamin B12 is a water-soluble vitamin found naturally in some foods. Compounds with vitamin B12 activity due to their cobalt mineral content are collectively called cobalamin. Vitamin B12 deficiency is an important public health problem that affects people throughout life and has hematological, neurological, and obstetric consequences. New evidence suggests that vitamin B12 may also play an important role in other aspects of human health, including the composition and function of the gut microbiome. Vitamin B12 can be absorbed in the intestine by passive diffusion and receptor-mediated endocytosis. Vitamin B12 is obtained by consuming foods of animal origin in the diet. It is synthesized only by bacteria, and intestinal absorption can be affected by the intestinal microbiota. Many bacteria, such as *L. reuteri* and *Enterococcus faecium*, have been reported to produce vitamin B12. It is hypothesized that supplementation with vitamin B12-producing bacteria may increase the utilization of vitamin B12 in the gastrointestinal tract. Such a hypothesis has been proven in mice fed vitamin B12-deficient diets. It has been shown that adding *L. reuteri* CRL1098, a vitamin B12-producing strain, to the diet prevents the symptoms of vitamin B12 deficiency and that intestinal bacteria have a therapeutic effect on vitamin B12 deficiency. Approximately 80% of the gastrointestinal tract microbiota is thought to be a consumer of vitamin B12. Therefore, bacterial overgrowth may compete with the host for exogenous vitamin B12 and subsequently reduce bioavailability. It is known to be one of the main causes of vitamin B12 deficiency and its associated symptoms due to increased anaerobic bacterial proliferation in the small intestine. Some intestinal bacteria have shown an ameliorating effect on vitamin B12 absorption and inflammatory bowel disease by normalizing intestinal permeability. In some studies, vitamin B12 has been associated with changes in the beta diversity of the intestinal microbiome, suggesting that it may modulate the composition of the intestinal microbiome. Changes in one-carbon metabolism due to one or more nutrient deficiencies may interact with vitamin B12 and affect the composition and function of the intestinal microbiome. It is estimated that the human intestinal microbiome can produce approximately one-third of the recommended daily intake of vitamin B12. Vitamin B12 supplementation may be beneficial for gastrointestinal conditions beyond treating vitamin B12 deficiency caused by malabsorption through interactions with the gut microbiome.

## **GİRİŞ**

Vitaminler, vücudun fizyolojik işlevleri için gerekli olan, ancak vücut tarafından endojen olarak sentezlenmeyen ve bu nedenle diyetten alınması gereken bir grup organik bileşiklerdir. Toplamda insan vücudunun ihtiyaç duyduğu 13 adet vitamin bulunmaktadır. Bunların 4'ü yağda çözünen A,D,E ve K vitaminleriyken; 9'u suda çözünen C vitamini ve sekiz adet B vitamini grubunu içermektedir. B grubu vitaminleri arasında tiamin (B1), riboflavin (B2), niasin (B3), pantotenik asit (B5), piridoksin (B6), folat (B9) ve kobalamin (B12) vitaminleri yer almaktadır (1). B vitaminleri, çok sayıda enzim için vazgeçilmez kofaktörler olarak görev yapan veya konakçı metabolizmasına doğrudan katılan, hayati bir mikro besin grubunu temsil eder. Genel olarak, B vitaminleri tarafından üstlenilen çok sayıda fonksiyon genellikle enerji üretimine yol açan katabolik metabolizmadaki ve biyoaktif moleküllerin yapımı ve dönüşümüyle sonuçlanan anabolik metabolizmadaki rollerine bölünebilir (2).

## **B<sub>12</sub> VİTAMİNİ**

B<sub>12</sub> vitamini vücuttaki tüm hücrelerin ihtiyaç duyduğu suda çözünebilir temel bir mikro besindir. Kobalamin, kırmızı kan hücrelerinin gelişimi, büyümesi ve sinir sistemleri için gereklidir. Günlük gereksinimler yaşa bağlıdır: yetişkinler ve bebekler için önerilen diyet miktarları sırasıyla 1,5 µg ve 0,4 µg'dır (3). B<sub>12</sub> vitamini terminal ileum da emilir. Bu emilim neredeyse tamamen mide mukozasında yer alan paryetal hücreler tarafından salgılanan bir glikoprotein olan intrinsik faktöre bağlıdır. İçsel faktör B<sub>12</sub> vitaminine bağlanır ve kompleks, transkobalamin adı verilen başka bir glikoproteine bağlı olarak hücre zarı boyunca taşınır. B<sub>12</sub> vitamini eksikliğinin en yaygın nedeni, mide kanseri riskini artıran bir durum olan otoimmün pernisiyöz anemidir. Pernisiyöz anemide parietal hücrelerin otoimmün yıkımından kaynaklanan intrinsik faktör eksikliği nedeniyle emilim bozulur. B<sub>12</sub> vitamini eksikliğinin diğer yaygın nedenleri arasında gastrektomi, ileal rezeksiyon, pankreas yetmezliği, Crohn hastalığı ve çölyak hastalığı dahil malabsorbsiyon sendromları yer alır. B<sub>12</sub> vitamini eksikliğinin daha az yaygın nedenleri arasında biguanidler (metformin), antiasitler (proton pompa inhibitörleri ve H<sub>2</sub> reseptör antagonistleri), aminoglikozid, antibiyotikler ve kolşisinler gibi ilaçların kullanımı yer alır. Saf beslenme eksikliği nadirdir ve genellikle katı vegan beslenme şeklini benimsemiş kişilerde görülür (4). B<sub>12</sub> vitamini eksikliği kardiyovasküler hastalık için de bir risk faktörü olabilir (5). B<sub>12</sub> vitamini eksikliğinin tanısı temel olarak serum B<sub>12</sub> vitamini düzeyinin 200 pg/mL'den (148 pmol/L) düşük olduğu kan ölçümlerine dayanır ve metabolik göstergeler olan toplam homosistein ve metilmalonik asit düzeylerini içeren ikinci basamak testlerle tamamlanır (6). Dünya Sağlık Örgütü'ne (WHO)

göre, yetişkinlerde B<sub>12</sub> vitamini durumu, mikro besin öğelerinin serum seviyeleri ile aşağıdaki kesme ve tanımlamalarla belirlenir: >221 pmol/L, "B<sub>12</sub> vitamini yeterliliğidir"; 148 ile 221 pmol/L arası "düşük B<sub>12</sub> vitamini seviyesi", 148 pmol/L'den düşük ise "B<sub>12</sub> vitamini eksikliği"dir (7). B<sub>12</sub> vitamini yalnızca mikroorganizmalar tarafından sentezlenir ve et ve süt ürünleri de dahil olmak üzere hayvansal kaynaklı gıdaların tüketilmesi yoluyla diyetle elde edilir. Birçok çalışmada, kaynakların sınırlı olduğu ortamlarda, özellikle de diyetle hayvansal ürün alımının düşük olduğu popülasyonlarda, B<sub>12</sub> vitamini seviyesinin düşük olduğunu belirtilmiştir (8).

### **B<sub>12</sub> VİTAMİNİ METABOLİZMASI**

B<sub>12</sub> vitamini et, yumurta ve süt ürünleri gibi besin kaynaklarından elde edilir. Günlük yaklaşık 2,4 µg B<sub>12</sub> vitamini tüketiminde yalnızca %50-60'ı emilir. İnsan gastrointestinal (bağırsak) mikrobiyomunda bulunan bakteriler, B<sub>12</sub> vitaminini sentezler ve konakçıdan emilmemiş B<sub>12</sub> vitaminini kullanır ancak B<sub>12</sub> vitamininin bağırsak mikrobiyomu üzerindeki etkisi büyük ölçüde keşfedilmemiş durumdadır. İleumda 1 µg oral dozda B<sub>12</sub> vitamininin yaklaşık %50'si emilir ve artan dozla birlikte emilim oranı azalır. İleumda emilmeyen B<sub>12</sub> vitamini kalın bağırsağa ulaşabilir; burada bağırsak bakterileri metabolize olur ve B<sub>12</sub> vitamininin ~%80'ini B<sub>12</sub> vitamini analoglarına (yani bilinen B<sub>12</sub> vitamini aktivitesi olmayan kobamidlere) dönüştürürler. B<sub>12</sub> vitaminini (ve B<sub>12</sub> vitamini analoglarını) kullanma yeteneği, bazı bakteriler için rekabet avantajı olabilir. Ayrıca, bağırsak mikrobiyotasının bileşimi ve işlevi, B<sub>12</sub> vitamini açısından zengin olan ortamlarda, B<sub>12</sub> vitamininin yetersiz olduğu ortamlara göre farklılık gösterebilir (9). Diyetteki B<sub>12</sub> vitamini, gıda proteinleriyle birlikte bulunur ve ince bağırsakta emilimi kolaylaştırmak için mide lümeni içindeki düşük pH'a maruz kaldığında salınması gerekir. B<sub>12</sub> vitamini serbest kaldıktan sonra haptokorrin (transkobalamin I) ile bağlanır ve duodenumdaki kompleksin proteolitik bölünmesine kadar bağlı kalır. Burada mide mukozasının paryetal hücreleri tarafından sentezlenen ikinci bir taşıyıcı protein olan intrinsik faktörün (IF) bağlanması gerçekleşir. Terminal ileumda B<sub>12</sub> vitamininin alımı için IF gereklidir. Fırça kenarını geçerken B<sub>12</sub> vitamini IF'den ayrışır ve transkobalamin II veya haptokorrin'i bağlayacağı dolaşıma girer. Transkobalamin II ve haptokorrin, kobalaminin sırasıyla periferik dokulara ve karaciğere verilmesinden sorumludur. Emilimi takiben büyük miktarda B<sub>12</sub> vitamini karaciğerde depolanır; sonuç olarak B<sub>12</sub> vitamini alımındaki herhangi bir azalmanın klinik olarak kendini göstermesi 5-10 yılı bulabilir. Serbest B<sub>12</sub> vitamininin küçük bir kısmı (%1-5) bağırsaktan intrinsik faktörden (IF) bağımsız bir süreçte pasif difüzyonla emilir (10).

## **BAĞIRSAK MİKROBİYOTASI**

Mikrobiyom, genellikle insan/hayvan vücudunda veya derisinde yaşayan/yaşayan çeşitli mikroorganizmaların topluluğunu ifade eden bir terimdir. Trilyonlarca komensal, simbiyotik ve hatta patojen mikroorganizmayı içeren karmaşık bir ekosistemi oluşturur. Mikrobiyom çeşitli bakterilerden, arkelere, mantarlardan, protozoalardan ve hatta virüslerden meydana gelir. Sağlıklı insanların bağırsağından en az 800 farklı bakteri türü izole edilebilmiştir. Dış çevre, beslenme ve yaşam tarzı, mikrobiyomun kompozisyonunu ve canlılığını etkileyen başlıca belirleyicilerdir. Son araştırmalar mikrobiyomun sağlık ve hastalık üzerindeki muazzam etkisini göstermiştir. Sayıları, yapıları, çeşitleri ve yaşayabilirlikleri dinamiktir. Tüm bu unsurlar birçok sağlık bozukluğunun ortaya çıkmasından, gelişmesinden ve tedavisinden sorumludur. Kanser, metabolik bozukluklar, kalp-damar hastalıkları gibi ciddi hastalıklar ve hatta şizofreni gibi psikolojik bozukluklar da mikrobiyotadan doğrudan veya dolaylı olarak etkilenmektedir. Sağlığımıza etkileri ancak insan kaynaklı hücrelerin insan vücudundaki toplam canlı hücre sayısının yalnızca %10'unu oluşturduğunu bildiğimizde anlaşılabilir. Karşılaştırıldığında, mikrobiyota hücrelerin kalan %90'ını temsil eder. Benzer şekilde, vücudumuzdaki toplam benzersiz genlerin yalnızca %1'i insan kökenlidir ve geri kalan %99'u bağırsak ve ağız boşluğu mikrobiyotasına aittir. Bu nedenle insan mikrobiyomu ikinci genomumuz olarak kabul edilir. Mikrobiyota bağırsağın yanı sıra ağız boşluğu, burun delikleri, vajina, göğüs ve deride de kolonize olabilir. Bebeklerin GİS kanalının mikrobiyal içeriği, bifidobakterilerin hakim olduğu basit yapıya sahiptir. Çeşitli bakteri türlerinin bileşimi ve yaygınlığı, hamilelik sırasında annenin beslenmesi, doğum şekli (normal doğum vs. sezaryen) ve beslenme şekli (emzirme vs. süt ikameleri) gibi birçok faktörden etkilenir. Ancak mikrobiyomun bileşimi yaşla birlikte sürekli olarak değişmektedir. Mikrobiyal yapı, yaş, diyet, yaşam tarzı, obezite gibi metabolik hastalıklar ve çevresel etkileyici faktörlere bağlı olarak değişmektedir (11).

## **BAĞIRSAK MİKROBİYOTASI VE B<sub>12</sub> VİTAMİNİ**

Mikro besinler olarak adlandırılan vitaminler ve mineraller insan sağlığı için çok önemlidir. Mikro besinler, bağışıklık ve enerji fonksiyonlarının yanı sıra büyüme, kemik sağlığı, sıvı dengesi ve diğer biyolojik süreçler gibi temel biyosentetik hücrel reaksiyonların düzenleyicileridir. Mikro besin eksikliği, özellikle çocuklarda zayıf fiziksel veya zihinsel gelişime aynı zamanda patojen enfeksiyonlara, inflamatuvar hastalıklara karşı duyarlılığın artmasına neden olan ciddi sağlık sorunlarıyla ilişkili olduğundan küresel bir sağlık sorunu olarak kabul edilmektedir (12). İnsanlar gerekli tüm mikro besinleri sentezleyemez; bu nedenle

bunların (i) diyet bileşenleri, (ii) oral takviyeler veya (iii) ortak bağırsak bakterileri tarafından sentezi olmak üzere üç ana kaynaktan ekzojen olarak elde edilmesi gerekir. Nüfusun büyük bir yüzdesi önerilen mikro besin alımlarını karşılayamadığından, mikro besinlerin ağızdan takviyesi ve gıda takviye programları dünya çapında uygulanmıştır. Etkinliğine ve olumlu etkilerine rağmen, son zamanlarda önemli sayıda çalışma, bazı mikro besin takviyelerinin sağlık üzerindeki olumsuz sonuçlarına ilişkin ciddi kaygıları gündeme getirmiştir (13). Örneğin folik asit (B9 vitamini) takviyesi, bağırsakta emilimin bozulmasından kaynaklanan çinko eksikliği, B<sub>12</sub> (kobalamin) eksikliğinin belirtilerini maskeleyemedeki rolü nedeniyle nörolojik hasar ve kolorektal kanser riskinin artması gibi olumsuz sağlık sonuçlarıyla ilişkilendirilmiştir (14). Mikro besin biyoyararlılığı, vücutta kullanım ve depolama için mevcut olan bir mikro besin maddesinin fraksiyonudur. Mikro besinler çeşitli ve bazı durumlarda hem pasif hem de aktif olabilen spesifik emilim yolları ve mekanizmalarını kullanır. Örneğin, hem C vitamininin hem de B7 vitamininin (biyotin) emilimine Na<sup>+</sup>'ya bağımlı taşıyıcılar aracılık eder ve B9 vitamini (folat) folata özgü üç taşıyıcı kullanır (15). Kommensal bağırsak bakterileri, konakçılara gerekli besin maddelerini sağlar ve mikro besin maddelerini elde etmek için en az araştırılan kaynaktır. Bağırsak mikrobiyotası, çeşitli bileşikler faydalı veya zararlı metabolitlere dönüştüren, dolayısıyla bunların biyoyararlılığında önemli bir role sahip olan, insan bağırsak sisteminde etkili bir biyoreaktör olarak kabul edilir. Mikrobiyom araştırmalarındaki birçok çaba, mikrobiyomu sağlığı iyileştirmek amacıyla modüle etmek için etkili araçlar keşfetmeye yönelik olmasına rağmen, bağırsak mikroorganizmalarının mikro besinlerin biyosentezi, alımı, emilimi ve biyoyararlanımına katkısı daha az araştırılmıştır (16). Mikro besin-mikrobiyom eksenini çift yönlüdür. Bir yandan bağırsaktaki mikroorganizmalar, büyümeleri ve işleyişleri için mikro besinlerin tüketicileridir. Konakçının beslenmesi ve mikro besin takviyesi, bağırsak mikrobiyotasının kompozisyonunu ve fonksiyonunu büyük ölçüde etkiler. Özellikle A vitamini, C vitamini, B<sub>12</sub> vitamini ve D vitamini takviyesi *Bifidobacterium*'dan çeşitli faydalı türlerin kolonizasyonunu teşvik ederek bağırsak mikrobiyotasının bileşimindeki *Lactobacillus* ve *Roseburia* cinslerinde değişikliklere katkıda bulunur. Mineral eksikliğinin veya takviyesinin bağırsak mikrobiyotası üzerindeki etkisinin değerlendirilmesi yeni ortaya çıkan bir alandır (17). Öte yandan bağırsak mikrobiyotası, başta K vitamini ve B grubu vitaminleri olmak üzere çok çeşitli vitaminleri önemli miktarlarda üreterek demir, kalsiyum gibi minerallerin alımını ve emilimini kolaylaştırır (18).

Magnusdottir ve ark., sekiz B vitamini (biyotin, kobalamin, folat, niasin, pantotenat, piridoksin, riboflavin ve tiamin) için biyosentetik yolların varlığı açısından 256 yaygın bağırsak bakterisinin genomlarını sistematik olarak araştırmışlardır. Her bir vitaminin potansiyel üreticilerini içeren her filumun oranını tahmin etmeye olanak sağlayan bu çalışma sonucunda bazı genomların bu vitaminlerin tüm biyosentetik yollarını içerdiği, bazılarının ise hiçbirini içermediği belirlenmiştir. En yaygın olarak sentezlenen vitaminlerin riboflavin (166 potansiyel üretici) ve niasin (162 üretici) olduğu saptanmıştır. Riboflavin ve biyotin için, Bacteroidetes, Fusobacteria ve Proteobacteria filumlarındaki mikroorganizmaların neredeyse tamamı gerekli yollara sahipken Firmicutes ve Actinobacteria'ların ise çok daha küçük bir kısmının B vitamini biyosentezi potansiyeline sahip olduğu görülmüştür. B<sub>12</sub> vitamini örneğinde, tüm Fusobakterilerin, diğer dört filumun %10-50'sinin üretici olduğu tahmin edilmiştir. Genel olarak Bacteroidetes'in, en fazla B vitamini üreticisine sahip şube olduğu ortaya çıkmıştır (19). Bacteroides, Enterococcus ve Bifidobacterium türleri, K vitamini ve suda çözünen B vitaminlerinin çoğunu *de novo* olarak sentezleyebilir. İntestinal mikrobiyota bakterilerinin B vitamini üretimi için *in silico* biyosentetik kapasitesinin değerlendirildiği çalışmada bu vitaminlerin %40-65'inin incelenen intestinal mikroorganizmalar tarafından üretildiği gösterilmiştir. Bununla birlikte, konakçıya ulaşabilmek için, mikro besinlerin bakteriyel *de novo* sentezinin, kendilerine ayrılmış bağırsak emilim bölgesinin yukarısında gerçekleşmesi gerekmektedir. Örneğin, kobalamin yalnızca ileumda emildiğinden, B<sub>12</sub> üreten kolonik bakterilerin, kemirgenlerde ve insan olmayan primatlarda görülen koprofaji durumu dışında, bu vitaminin konakçı için biyoyararlanımını artırmaya katkıda bulunmaları olası değildir (20). Son *in vivo* çalışmalar ve klinik deneyler, mikrobiyotanın konakçının vitamin dengesindeki rolüne ışık tutmaktadır (Tablo 1). *C. elegans* kullanılarak *Escherichia coli*'nin, parçalanma ürününün (PABA-glu) alımı yoluyla ve tetrahidrofolatın *de novo* sentezi yoluyla biyoyararlılığını artırarak B9 vitamininin (folik asit) metabolizmasına yardımcı olduğu gösterilmiştir. Ek olarak *E. coli*, *tonB* siderofor yoluyla eksojen B<sub>12</sub> vitaminini (kobalamin) temizleyerek konakçı için vazgeçilmez bir B<sub>12</sub> vitamini kanalı görevi görebilir (21).

### B<sub>12</sub> TAKVİYESİ İLE ALFA – BETA ÇEŞİTLİLİĞİ VE BAKTERİ BOLLUĞU

B<sub>12</sub> vitamin takviyesinin alfa ve beta çeşitliliğine etkisini araştıran in vitro çalışmalar Tablo 2 de gösterilmiştir. In vitro çalışmalardan elde edilen bulgular, B<sub>12</sub> vitamini takviyesinin alfa çeşitliliğini artırabileceğini ve sonuçların uygulanan kobalaminin formuna, dozuna ve ortak müdahalelere göre değiştiğini göstermektedir. Adenosilkobalaminin, siyanokobalamin ile karşılaştırıldığında alfa çeşitliliğinin artmasına neden olduğu, ancak her ikisi de alfa-laktalbumin ile birleştirildiğinde çeşitliliğin daha düşük olduğu tespit edilmiştir. Aynı zamanda kolon modelinde kobalamin takviyesinin Firmicutes ve Bacteroidetes'in göreceli bolluğunu artırdığı, Proteobakteriler ve Pseudomonasi azalttığı belirtilmiştir (22). Peynir altı suyu proteinleri ile kombinasyon halinde siyanokobalamin veya adenosilkobalamin, tek başına beta-laktoglobulin ile karşılaştırıldığında alfa çeşitliliğinin artmasına neden olmuş, ancak tek başına alfa-laktalbumin ile sonuçlanmamıştır. 7 günlük metilkobalamin takviyesinden sonra, *Acinetobacter* oranında artış ve *Bacteroides*, *Enterobacteriaceae*, Ruminococcaceae oranında azalma gözlemlenmiştir (23). Farklı bir çalışmada, metilkobalamin, siyanokobalamin ve kontrol gruplarıyla karşılaştırıldığında, Chao1'e (zenginliğin ölçümü) dayalı olarak daha düşük alfa çeşitliliğe, ancak Shannon indeksine (zenginlik ve düzgünlüğün ölçümü) dayalı olarak daha yüksek çeşitliliğe neden olduğu belirlenmiştir. Siyanokobalamin grubu, kontrol grubuyla karşılaştırıldığında ise benzer bir Chao1 indeksine ancak kontrol grubuyla karşılaştırıldığında Shannon indeksine göre daha yüksek çeşitliliğe sahip olduğu gözlemlenmiştir (24). Üç in vitro çalışmada beta çeşitliliğinde değişiklikler bildirilmiştir: bulgular B<sub>12</sub> vitamininin mikrobiyom

kompozisyonunu deęiřtirdięi ynndedir. Peynir altı suyu proteini alıřmasında, temel bileřen analizleri (PCA) hiyerarřik kmelemeye dayalı olarak bu inceleme iin ilgili verileri saęlamasa da, tek bařına alfa-laktalbumin ve beta-laktoglobulin ile kombinasyon halinde siyanokobalamin alan grupların bir arada kmelendięi ortaya ıkmıřtır. Bařka bir alıřmada, dřk dozda siyanokobalamin takviyesi ve yksek dozda siyanokobalaminle zenginleřtirilmiř ıspanak alan grupların, PCA grafiklerine gre bařlangıtan ve dięer gruplardan daha uzakta kmelendięi grlmřtr (24). Aynı alıřmalarda B<sub>12</sub> vitamini takviyesi ile greceli bakteri bolluęu arasındaki iliřkiler bildirilmiřtir. Filum dzeyinde, tek bařına adenosilkobalamin veya siyanokobalamin takviyesi, tek bařına peynir altı suyu proteini veya B<sub>12</sub> vitamini ile kombinasyon halinde peynir altı suyu proteini alan oęu grupta karřılařtırıldıęında daha yksek Bacteroidetes:Firmicutes oranlarıyla sonulanmıř, ancak B<sub>12</sub> vitamininin 2 formu birinden nemli lde farklı olmadıęı belirlenmiřtir. Peynir altı suyu proteini ile kombinasyon halinde siyanokobalamin veya adenosilkobalamin alan gruplardaki Bacteroidetes:Firmicutes oranının birbirinden veya tek bařına peynir altı suyu proteininden farklı olmadıęı bildirilmiřtir. Bařka bir alıřma, 3 ana řubenin greceli bolluęunda grup ii deęiřiklikler olduęu; oęu grupta siyanokobalamin takviyesi veya siyanokobalaminle zenginleřtirilmiř ıspanaęın Proteobakterileri artırdıęı ve Firmicutes ve Bacteroidetes'i azalttıęı belirtilmiřtir. Ancak dřk doz siyanokobalamin ile zenginleřtirilmiř ıspanak grubunda Proteobakterilerin azaldıęı, Firmicutesin deęiřmedięi ve yksek doz siyanokobalamin ile zenginleřtirilmiř ıspanak grubunda Bacteroidetesin deęiřmedięi tespit edilmiřtir (22, 23, 24).Hayvanlarda yapılan alıřmalarda alfa eřitlilik aısından heterojen sonular bildirilmiřtir. Farelerde kontrol grubuyla karřılařtırıldıęında siyanokobalamin alan grupta alfa eřitlilięin (Chao1, Shannon indeksi, Simpson indeksi) nemli lde farklı olmadıęı bildirilmiřtir (25). Farelerde yapılan bařka bir alıřmada, Chao1 ve Shannon endekslerine dayalı alfa eřitlilik, siyanokobalamin dozuna (yem peletlerinde 0 mg/kg, 50 mg/kg veya 200 mg/kg) gre nemli lde farklılık gstermemiřtir (26). Dięer bir alıřmada, istatistiksel anlamlılık bildirilmemesine raęmen, kontrol grubuyla karřılařtırıldıęında siyanokobalamin ve metilkobalamin gruplarında alfa eřitlilięinin (Chao1, Shannon indeksi) daha dřk olduęu rapor edilmiřtir (27). Kazlar zerinde yapılan alıřmada yksek, orta ve dřk dozda B<sub>12</sub> takviyesine ek olarak yksek ve dřk dozda folik asit takviyesi verilen iki grup karřılařtırılmıřtır. B<sub>12</sub> vitamininin 0,018 mg/kg dozu ile kıyaslandıęında, dřk (0,009 mg/kg) ila yksek (0,036 mg/kg) B<sub>12</sub> vitamini dozları arasında Simpson ve Shannon endekslerine gre eřitlilięin arttıęı belirlenmiřtir (28). Aynı alıřmalarda farelerdeki beta eřitlilięi de deęerlendirilmiřtir. Siyanokobalamin takviyesi

öncesinde ve sonrasında cins düzeyinde ve siyanokobalamin ile kontrol grupları arasında önemli ölçüde fark saptanmıştır (25). Bunun tersine, farelerde yapılan diğer çalışmada beta çeşitliliğinde B<sub>12</sub> vitamini müdahalesiyle farklılık gözlenmemiştir (26). B<sub>12</sub> vitamini ve folik asit alan kazlar arasında, beta çeşitlilikte temel koordinat analizinde (PCoA) ve aritmetik ortalamalı ağırlıksız çift grup yönteminde (UPGMA), orta dozda B<sub>12</sub> vitamini alan grupların, gruplardan daha uzakta kümелendiği görülmüştür (28). Filum düzeyinde bakteri bolluğu değerlendirildiğinde, metilkobalamin ile karşılaştırıldığında siyanokobalamin alan farelerde Bacteroidetes ve Proteobacteria'nın göreceli bolluğunun daha yüksek, Firmicutesin ise daha düşük olduğu belirlenmiştir. Her iki kobalamin takviyesi alan grupta kontrol grubuyla karşılaştırıldığında daha düşük Bacteroidetes ve daha yüksek Firmicutes bolluğu gözlenmiştir (27).

Bağırsak mikrobiyotası bakterileri B<sub>12</sub> vitamininin ya üreticisi ya da tüketicisidir. Üstelik B<sub>12</sub> vitamininin bağırsaktan emilimi bağırsak mikrobiyotasından etkilenebilir. *L. reuteri* ve *Enterococcus faecium* gibi birçok bakterinin B<sub>12</sub> vitamini üreticisi olduğu rapor edilmiştir (29). B<sub>12</sub> vitamini üreten bakteri takviyesinin gastrointestinal kanalda B<sub>12</sub> vitamini kullanımını artırabileceği varsayılmaktadır. Böyle bir varsayım, B<sub>12</sub> vitamini eksikliği olan diyetlerle beslenen farelerde kanıtlanmıştır. B<sub>12</sub> vitamini üreten bir suş olan *L. reuteri* CRL1098'in takviyesinin, B<sub>12</sub> vitamini eksikliği belirtilerini önlediği, bu da bağırsak bakterilerinin B<sub>12</sub> vitamini eksikliğinde terapötik etkisini olabileceğini ortaya koymuştur (30). Bununla birlikte, bakteriler gerekli taşıyıcıların bulunmadığı kolonda kolonileşirse bu faydalı etkiler sınırlı olabilir. B<sub>12</sub> vitamini eksikliğine yönelik probiyotik tedavisi geliştirmek için bakteri kolonizasyonunun konumu dikkate alınmalıdır. Gastrointestinal sistemdeki mikrobiyotanın yaklaşık %80'inin B<sub>12</sub> vitamini tüketicileri olduğu düşünülmektedir (31). Bu nedenle, bakterilerin aşırı çoğalması, konakçıları ile eksojen B<sub>12</sub> vitamini ile rekabete girebilir ve ardından biyoyararlanımı azaltabilir. İnce bağırsakta bakteriyel aşırı çoğalmada, artan anaerobez nedeniyle B<sub>12</sub> vitamini tüketimi, B<sub>12</sub> vitamini eksikliği semptomlarının önemli bir nedeni olarak kabul edilmektedir. B<sub>12</sub> vitamini tüketen bakterilerin bolluğunun azaltılması, B<sub>12</sub> vitamini eksikliğine fayda sağlar. Örneğin, *Lactobacillus*'un günlük probiyotik tedavisi, hem bakteriyel aşırı çoğalma hem de B<sub>12</sub> vitamini emilimi üzerinde faydalı bir etki göstermiştir. Dolayısıyla bu probiyotik tedavisinin, B<sub>12</sub> vitamini tüketen bakterilerin aşırı çoğalmasını engelleyerek B<sub>12</sub> vitamini eksikliğini iyileştirebileceği düşünülmektedir (32). B<sub>12</sub> vitamininin üretimi veya tüketiminin yanı sıra bağırsak mikrobiyotası, emilimle ilişkili fizyolojik faktörler üzerinde etki yaparak B<sub>12</sub> vitamininin biyoyararlanımını dolaylı olarak değiştirebilir. Asit salgısının veya enzim içeriğinin azalmasıyla ilişkili gastrointestinal hastalıklar, B<sub>12</sub> vitamininin gıdalardan salınmasını veya B<sub>12</sub> vitamininin içsel faktörlere çevrilmesini engelleyebilir. Anormal bağırsak geçirgenliği ile karakterize edilen İnflamatuar bağırsak hastalığında (IBD) B<sub>12</sub> vitamini emiliminde azalma da gözlenir (33). Bir probiyotik olarak *Lacidofil* tedavisi, *H. pylori* ile enfekte olmuş Moğol gerbillerinde mide asidi salgısını önemli ölçüde iyileştirmiş ve bu da gıdalardan B<sub>12</sub> vitamininin salınmasına yol açmıştır (34). Bazı bağırsak bakterileri ayrıca bağırsak geçirgenliğini normalleştirerek B<sub>12</sub> vitamininin emilimini artırarak IBD üzerinde remisyon etkisi de göstermiştir. Ayrıca bağırsak mikrobiyotası ile konakçı arasındaki aşırı rekabet, B<sub>12</sub> vitamininin biyoyararlılığına müdahale edebilir. Örneğin *Bacteroides thetaiotaomicron*, BtuG adı verilen, B<sub>12</sub> vitamini taşınması için yüzeye maruz kalan temel bir lipoproteini eksprese eder. BtuG'nin daha yüksek bağlanma

afinitesi, B<sub>12</sub> vitaminini içsel faktörlerden uzaklaştırabilir ve B<sub>12</sub> vitamini emilimini azaltabilir (35). B<sub>12</sub> vitamini, nükleotid sentezi, amino asit metabolizması, karbon ve nitrojen metabolizması ve ikincil metabolit sentezi için insan bağırsak mikroorganizmalarındaki çeşitli enzimlerin kritik bir kofaktörü olarak görev yapar. B<sub>12</sub> vitamininin biyosentezi yaklaşık 30 enzim aracılı adımı içerir ve bakterilerin yalnızca küçük bir kısmı bu vitamini üretebilir. Bağırsak bakterilerinin çoğu, ileumdaki emilimden kaçan ve kalın bağırsağa ulaşan B<sub>12</sub> vitaminini kullanır. B<sub>12</sub> vitamininin bağırsak mikrobiyotasındaki rekabeti bunların büyümesini, kolonizasyonunu ve metabolik süreçlerini etkileyebilir (36). Kolon modeli üzerinde yapılan in vitro çalışma, B<sub>12</sub> vitamini takviyesinin  $\alpha$  çeşitliliği artırabileceğini, ancak sonuçların uygulanan kobalaminin formuna ve dozuna bağlı olduğunu öne sürülmüştür. Başka bir in vitro çalışmada, metilkobalamin takviyesi sonrasında  $\alpha$  çeşitliliği azalırken, siyanokobalamin tedavi grubunda bu azalma gözlenmemiştir (37). Bir çalışmada, siyanokobalamin takviyesinin  $\alpha$  çeşitliliğinde bir artışa neden olduğunu ve cins düzeyinde  $\beta$  çeşitliliğinde önemli bir farklılık ortaya çıkardığı öne sürülmüştür (38). Ancak bu sonucu desteklemeyen çalışmalarda mevcuttur (39). Farelerde yapılan çalışmalarda, B<sub>12</sub> vitamini takviyesi ile göreceli bakteri bolluğu arasındaki ilişkiler de rapor edilmiştir (40). Metilkobalamin ile karşılaştırıldığında, siyanokobalamin tedavisinin farelerde daha yüksek Bacteroidetes ve Proteobakteri seviyeleri ve daha düşük Firmicutes seviyelerine yol açtığı gözlenmiştir. İnsanlarda B<sub>12</sub> vitamini alımı Proteobakterilerin ve Verrucomicrobia'nın oranını artırabilir ve Bacteroidetes'in bolluğunu azaltabilir. Ancak bazı klinik çalışmalarda, B<sub>12</sub> vitamini alımının bakteri bolluğu üzerinde hiçbir etkisinin olmadığı da ileri sürülmektedir (41).

## **SONUÇ**

B<sub>12</sub> vitamini insanlar için gerekli mikro besin maddeleri olarak işlev görür. Çoklu diyet B<sub>12</sub> vitamininin emilim süreci, genellikle ince bağırsakta meydana gelen birçok taşıyıcının yardımını gerektirir. Aynı zamanda bağırsak mikrobiyotası, bağırsaktaki B<sub>12</sub> vitamini takviyesini değiştirmek için yalnızca üretici ve/veya tüketici olarak hareket etmez fakat aynı zamanda gastrointestinal sistemin fizyolojik veya patolojik faktörlerini değiştirerek B<sub>12</sub> vitamininin emilimini de etkiler. Çoklu enzimlerin kofaktörleri olan B<sub>12</sub> vitamini takviyesi, bağırsak mikrobiyotasının çeşitliliğini, bolluğunu ve fonksiyonlarını değiştirebilir. B<sub>12</sub> vitamini ile bağırsak mikrobiyotası arasındaki etkileşimi anlamak, B<sub>12</sub> vitamini eksikliğini önlememize yardımcı olabilir ve daha da önemlisi probiyotiklerin insan sağlığı üzerindeki faydalı potansiyelini fark etmemizi sağlayabilir.

**Özet**

Nikel esaslı süperalaşımlar, mükemmel korozyon direnci ve yüksek sıcaklıklarda gösterdiği mukavemetten dolayı birçok motor komponentinin imalatında tercihen kullanılmaktadır. Yüksek sıcaklıkta uzun sürede alaşımın yüzeyinde kimyasal bozunumun ve oksidasyonun ortaya çıkması alaşımın yapısal bütünlüğünü yitirerek erken ömürde hasarlanmasına neden olmaktadır. Geçmişten günümüze süperalaşımlara uygulanan yüzey işlemleri ile malzemenin oksidasyon direncinin artırılması ve böylece malzemelerin daha uzun ömürde çalıştırılması mümkündür. Bu çalışmada, Inconel 625 alaşım yüzeyine 700°C sıcaklıkta farklı sürelerde (2, 4 ve 6 saat) termo-reaktif difüzyon kaplamalar yapılarak farklı kalınlıkta aluminid tabakalar elde edilmiştir. Proses sonrası aluminid kaplanmış süperalaşım yüzey ve kesitinde meydana gelen metalurjik oluşumlar taramalı elektron mikroskobu, enerji dağılım spektrometresi ve x-ışını difraktometresi ile karakterize edilmiştir. Metalurjik karakterizasyon çalışmaları; (i) proseslenen alaşım yüzeyinde çeşitli Ni-Al fazlarının (NiAl, Ni<sub>2</sub>Al<sub>3</sub>, NiAl<sub>3</sub>) oluşabildiğini, (ii) artan proses süresi ile yüzeyde bu fazların daha yoğun bir dağılım gösterdiğini ve (iii) aluminid tabaka kalınlığını artan proses süresine bağlı olarak arttığını göstermiştir. Aluminid tabakası ile nikel esaslı alaşımına kıyasla yüzeyde daha yüksek bir sertlik değerine ulaşılmıştır. Yüzeyde sürekli, homojen kalınlıkta ve sert aluminid tabakasının başarılı bir şekilde oluşturulması alaşımın yüksek sıcaklık oksidasyonuna yönelik çalışmalara öncül data eldesini mümkün kılmıştır.

**Anahtar Kelimeler:** Inconel 625, termo-reaktif difüzyon kaplama, karakterizasyon.

**METALLURGICAL AND MECHANICAL CHARACTERIZATION OF ALUMINIDE  
COATED INCONEL 625 ALLOY BY THERMO-REACTIVE DIFFUSION METHOD**

**Abstract**

Nickel-based superalloys are preferably used in the manufacturing of many engine components due to their excellent corrosion resistance and strength at high temperatures. The occurrence of chemical decomposition and oxidation on the surface of the alloy at high temperatures over a long period of time causes the alloy to lose its structural integrity and be failed in early life. With the surface treatments applied to superalloys from past to present, it is possible to increase the oxidation resistance of the material and thus make the materials last longer. In this study, aluminide layers of different thicknesses are obtained by applying thermo-reactive diffusion coatings to the Inconel 625 alloy surface at 700°C for different periods of time (2, 4 and 6 h). The metallurgical formations occurring on the aluminide-coated superalloy surface and cross-section after the process are characterized by scanning electron microscopy, energy dispersion spectrometer and x-ray diffractometer. Metallurgical characterization studies show that (i) various Ni-Al phases (NiAl, Ni<sub>2</sub>Al<sub>3</sub>, NiAl<sub>3</sub>) can form on the processed alloy surface, (ii) these phases show a denser distribution on the surface with increasing process time, and (iii) the aluminide layer thickness increases depending on the increasing process time. With the aluminide layer, a higher hardness value is reached on the surface compared to the nickel-based alloy. The successful formation of a continuous, homogeneous thick and hard aluminide layer on the surface made it possible to obtain preliminary data for studies on high temperature oxidation of the alloy.

**Keywords:** Inconel 625, thermo-reactive coating, characterization.

## **Giriş**

Geçmişten günümüze teknolojinin gelişimi ile yüksek sıcaklık malzemelerine ihtiyacın ortaya çıkması ile süperalaşımalar geliştirilmiştir. Türbin motorları, petro-kimya, ısı aktarım elemanları ve reaktörler söz konusu iken yüksek sıcaklık malzemeleri çoğunlukla kullanılmaktadır (Liu vd., 2023; De Oliveira vd., 2019). Kompozisyonel bir yaklaşımla süperalaşımaları kobalt (Co), nikel (Ni) ve nikel-demir (Ni-Fe) esaslı olmak üzere üç ana gruba ayırmak mümkündür. Nikel esaslı süperalaşımaların yapısı birçok alaşıma göre daha karmaşık olup, mikroyapısında gama prime ( $\gamma'$ ), gama double prime ( $\gamma''$ ), eta ( $\eta$ ), sigma ( $\sigma$ ), mü ( $\mu$ ), R, Laves, TSP (topolojik sıkı paket) fazları ve çeşitli alaşım karbürleri bulunabilmektedir (Gencay, 2021; Campbell, 2006; Selvaraj vd., 2021). Çalışma koşullarında yüksek sıcaklığa maruz kalan malzemelerde zamanla oksidasyon, sülfürizasyon, sıcak korozyon, erozyonlu korozyon ve benzeri hasar mekanizmaları görülmektedir (Selvaraj vd., 2021, Jamnapara vd., 2016). Bu sebeple malzemelerin yüzey ve kimyasal özelliklerini geliştirmek için birçok konvansiyonel ve ileri yüzey modifikasyon yöntemleri geliştirilmiştir. Bu yöntemler arasında termo-reaktif difüzyon kaplama prosesi düşük maliyetle karmaşık geometriye parçaların kaplanmasına olanak sağlamaktadır. Ayrıca bu yöntem ile kuvvetli adhezif kaplamalar elde edilebilmektedir (Adamniak vd., 2016; Tong vd., 2010). Termo-reaktif difüzyon kaplama yönteminde altlık malzemenin yüzeyine aluminid kaplanabilmekte ve özellikle nikel esaslı süperalaşımaların yüzeylerinde alüminyumca zengin Ni-Al fazları ( $\text{NiAl}$ ,  $\text{Ni}_2\text{Al}_3$ ,  $\text{NiAl}_3$ ) oluşmaktadır (Tong vd., 2010; Goward vd., 1988; Zielińska vd., 2011). Yapılan çalışmalar, nikel esaslı malzeme yüzeyinde oluşturulan aluminid tabakanın altlık malzemeye kıyasla yüksek sıcaklık oksidasyon direncini, aşınma direncini ve sertlik değerini arttırdığını göstermiştir (Atapek vd., 2023; Khalid vd., 2002; Bölükbaşı vd., 2023). Döleker ve arkadaşları, kutu sementasyon yöntemi ile  $600^\circ\text{C}$  ve  $700^\circ\text{C}$  sıcaklıkta, 3 ve 5 saat süre boyunca Inconel 718 altlık malzeme üzerine aluminid kaplama yaparak  $700^\circ\text{C}$  sıcaklıkta ve 5 saat süre boyunca yapılan kaplama prosesi sonucunda altlık malzemenin sertlik değerini (260 HV) yüzeyde 900 HV seviyesine kadar arttırabilmiştir. Ayrıca aluminid kaplanmış numunenin işlem görmemiş numuneye kıyasla oksidasyon ve aşınma direncinin de eş zamanlı arttırılabildiği raporlanmıştır (Döleker vd., 2021). Bu çalışmada kutu sementasyon yöntemi ile nikel esaslı Inconel 625 alaşımı üzerine  $700^\circ\text{C}$  sıcaklıkta 2, 4 ve 6 saat boyunca termo-reaktif difüzyon kaplama gerçekleştirilmiştir. Proseslenen numunelerin kesit ve yüzeylerinde metalurjik analizler yapılarak yüzey sertliğinde prosese özgü değişimler izlenmiştir. Elde edilen bulgular homojen kaplamalar ile altlık malzemeye kıyasla daha sert tabakaların başarılı bir şekilde oluşabildiğini ortaya koymuştur.

### **Materyal ve Metod**

Bu çalışmada, normalize edilmiş Inconel 625 alaşımına (21.24 Cr, 9.38 Mo, 3.56 Nb+Ta, ağ.-%) farklı sürelerde termo-reaktif difüzyon koşullarının sağlanması ile aluminid kaplama işlemi gerçekleştirilmiştir. Bu işlem için öncelikle, plaka halinde bulunan Inconel 625 alaşımından hassas kesme (Mikrotest Multicut Sense) ile 10x10x2 mm boyutlarında numuneler elde edilmiştir. Numuneler 320, 600, 1000 ve 2500, 4000 mesh'lik zımparalar ile kaba zımparalanmıştır. Sonrasında 3 µm ve 1 µm elmas solüsyon ile parlatma işlemi yapılarak yüzey pürüzlülüğü indirgenmiştir. Metalografik işlem sonrası numunelerin ağırlıkları hassas terazi ile tartılıp kaplama öncesi ve sonrası ağırlıklar takip edilmiştir. Aluminid kaplanma işleminde, alüminyum kaynağı olarak saf Al (40-45 µm), inert malzeme olarak alumina (< 1 µm) ve aktivatör olarak NH<sub>4</sub>Cl tozları kullanılmıştır. Kaplama işleminde öncelikle toz karışımı (40 Al + 10 NH<sub>4</sub>Cl + 50 Al<sub>2</sub>O<sub>3</sub> ağ.-%) hazırlanmış olup mini rotor ile 2 saat mekanik olarak karıştırılmıştır. Toz karışımı hazırlandıktan sonra numuneler karışımın içine gömülerek 700°C sıcaklıkta 2, 4 ve 6 saat sürelerde proseslenmiştir. Yüzeyleri aluminid kaplanmış numunelerin yüzeyleri ve kesitleri, ışık mikroskobu (IM, Olympus BX41M-LED), taramaları elektron mikroskobu (SEM, Jeol JSM 6060), enerji dağılımlı x-ışın spektrometresi (EDS, IXRF) ve x-ışını difraktometresi (XRD, Rigaku Ultima+) ile karakterize edilmiştir. XRD analizi için Cu-K<sub>α</sub> radyasyonu kullanılmış ve tarama hızı 1.0 °/dak. olarak seçilmiştir. Kaplamalar sonrasında yüzey sertliğinde oluşan değişim ise Vickers sertlik cihazı (EmcoTest Durascan-70 G5) kullanılarak 10 g yüklenme koşulunda takip edilmiştir.

### **Bulgular ve Tartışma**

Inconel 625 alaşımına 700°C sıcaklıkta 2, 4 ve 6 saat süreyle uygulanmış olan aluminid kaplama prosesi sonrası kaplama kesitleri IM ile incelenmiş ve tabaka kalınlıkları ölçülerek Şekil 1'de verilmiştir. Kaplama süresinin artışına bağlı olarak tabaka kalınlıkları artış göstermiş, 2 saat süreyle yapılan proses sonrası 52.26±2.56 µm kalınlık elde edilirken, 4 saat proseslenmiş numunede 72.74±3.4 µm kalınlık değerine ulaşılmıştır. 4 saat ve 6 saat süreyle yapılan prosesler karşılaştırıldığında sürenin artması ile kaplama kalınlığı 1.2 kat artarak 88.42±4.2 µm kalınlığa ulaşmıştır. Artan proses süresi ile alüminyumun yüzeyden içeri doğru sürekli difüzyonu tabaka kalınlığında izlenebilir bir artışa neden olmuştur. Numunelerin kesitleri incelendiğinde, termo-reaktif difüzyon sonrası yüzeyde elde edilen aluminid tabakanın homojen, sürekli olduğu görülmektedir. Ayrıca numune yüzeyinden içeriye doğru herhangi bir oksit varlığı da tespit edilmemiştir. Bu durumda iç oksidasyon olmaksızın prosesin gerçekleştiği kabul edilmektedir.

Şekil 1. Aluminid kaplama sonrası alaşımların kesitlerine ait IM görüntüleri.

Kaplama sonrası alaşım yüzeylerinde SEM-EDS analizleri yapılmıştır ve elde edilen bulgular Şekil 2’de verilmiştir. EDS analizleri yüzeyde alüminyum ve nikel elementlerince zengin bir tabaka varlığına işaret etmektedir. Proses süresinin 2 saatten 4 saate artırılması ile alüminyumun sürekli içeri difüzyonunda yer alan boşyerlerin doldurulduğu ve böylece yüzeydeki alüminyum miktarının ağırlıkça % 78.6 seviyesinden % 65.42 seviyesine azalarak içeri difüzyonun süreyle azaldığı tespit edilmiştir. Bu azalma trendi 6 saatlik işlem sonrası yüzey karakterizasyonunda da izlenmiştir.

Şekil 2. Aluminid kaplama sonrası alaşımın kesitine ait SEM görüntüleri.

Kaplama prosesi sonrası yüzeyde oluşan fazlar XRD ile analiz edilerek elde edilen spektraller Şekil 3’te verilmiştir. Proses öncesi inceleme yapılan altlık malzemede sadece nikel katı ergiyine ait belirgin pikler görülmüştür. 700°C sıcaklıkta yapılan aluminid kaplama sonrası yapılan XRD incelemelerinde ise yüzeyde literatürle uyumlu Ni-Al (NiAl, NiAl<sub>3</sub>, Ni<sub>2</sub>Al<sub>3</sub>, Ni<sub>5</sub>Al<sub>3</sub>) fazlarının oluştuğu ve sürenin artmasıyla beraber oluşan fazlara ait pik şiddetlerinin artış gösterdiği tespit edilmiştir (Atapek vd., 2023; Döleker vd., 2021). Ayrıca yüzeyde reaksiyona giremeyen Al<sub>2</sub>O<sub>3</sub> toz varlığı da tespit edilmiştir.

Şekil 3. Aluminid kaplama sonrası alaşımın yüzeyine ait XRD datası.

Altık malzeme ve farklı sürelerde aluminid kaplanmış yüzeylerin sertlikleri ölçülerek elde edilen bulgular Şekil 4'te verilmiştir. Kaplama öncesi altık malzemeye ait sertlik değeri  $355 \pm 22$  HV iken 6 saat sürelik kaplama sonrası sertlik değeri  $1315 \pm 30$  HV değerine ulaşmıştır. Atapek ve arkadaşları kaba ve ince taneli alüminyum partikülleri kullanarak kutu sementasyon yöntemi ile Inconel 625 altlık malzeme yüzeyinde aluminid tabaka elde etmiş ve kaplama sonrası numune yüzey sertliğini  $1369 \pm 13.81$  HV<sub>0.5</sub> ölçmüştür (Atapek vd., 2023). Bu çalışmada da özellikle ince toz formu ile elde edilmiş kaplama sertlik değerine 6 saatlik bir prosesleme ile ulaşılabilmiştir.

Şekil 4. Kaplanmış yüzeylere ait sertlik değerleri.

### Sonuç

Aluminid kaplama çalışmaları sonrasında yapılan karakterizasyon çalışmalarda; (i) yüzeyde alüminyumca zengin NiAl, NiAl<sub>3</sub>, Ni<sub>2</sub>Al<sub>3</sub> ve Ni<sub>5</sub>Al<sub>3</sub> fazlarının oluştuğu, (ii) artan proses süresi ile kaplama kalınlığının arttığı tespit edilmiştir. Proses süresinin artması ile sertlik değerleri de artarak özellikle altık malzeme yüzey sertliğine kıyasla 6 saatlik bir prosesleme sonrasında

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

***April 09-16, 2024 / Lisbon, Portugal***

yüzey sertliđi yaklaşık 4 kat arttırılarak 1315 HV sertlik deđerine ulařılmıştır. Elde edilen tüm bu bulgular yüzey modifikasyonu sonrası nikel esaslı Inconel 625 alařımının kullanım alanına özgü bazı özelliklerinin izlenmesine katkı vermiştir.

**Özet**

Düşük yoğunluğa, üstün korozyon direncine ve yüksek sıcaklık mekanik kararlılığına sahip Ti6Al4V alaşımı havacılık ve uzay endüstrisinde kullanılan bir alaşımdır. Ancak alaşımın yüksek sıcaklıkta uzun sürede oksidasyona maruz kalması ve yapısal bütünlüğünü kaybetmesi alaşımın uzun ömürde kullanımını sınırlamaktadır. Alaşım üzerine yüzey mühendisliği uygulamaları ile çalışma koşullarına karşılık uzun ömür kazanımı sağlanabilmektedir. Bu çalışmada, 700 °C sıcaklıkta termo-reaktif difüzyon kaplama ile Ti6Al4V alaşım yüzeyinde bir aluminid tabakasının oluşumu sağlanmış ve özellikle proses süresine bağlı olarak yüzey/yüzeyaltı metalurjik oluşumlar karakterize edilmiştir. Metalurjik karakterizasyon çalışmaları kaplama yapısında çeşitli Ti-Al fazlarının (TiAl, TiAl<sub>2</sub> ve TiAl<sub>3</sub>) oluşabildiğine ve özellikle artan proses süresine bağlı olarak aluminid kaplama tabaka kalınlığında sürekli bir artışın meydana geldiğini ortaya koymuştur. Alaşım yüzeyinde yapılan sertlik taramaları ise çift faz ( $\alpha+\beta$ ) yapılı titanyum alaşımına kıyasla daha yüksek sertlik değerlerine ulaşabildiğini göstermiştir. Yüzeyde sürekli, homojen kalınlıkta ve sert aluminid tabakasının başarılı bir şekilde oluşturulması alaşımın yüksek sıcaklık oksidasyonuna yönelik çalışmalara öncül data eldesini mümkün kılmıştır.

**SURFACE MODIFICATION OF Ti6Al4V ALLOY BY THERMO-REACTIVE  
DIFFUSION COATINGS**

**Abstract**

Ti6Al4V alloy, which has low density, superior corrosion resistance and high temperature mechanical stability, is an alloy used in the aviation and space industry. However, the alloy's exposure to oxidation at high temperatures over a long period of time and its loss of structural integrity limits the long-life use of the alloy. With surface engineering applications on the alloy, long life can be achieved in response to operating conditions. In this study, the formation of an aluminide layer on the Ti6Al4V alloy surface is achieved by thermo-reactive diffusion coating at 700 °C and the surface/subsurface metallurgical formations are characterized, especially depending on the process time. Metallurgical characterization studies have revealed that various Ti-Al phases (TiAl, TiAl<sub>2</sub> and TiAl<sub>3</sub>) can be formed in the coating structure and there is a continuous increase in the aluminide coating layer thickness, especially due to increasing process time. Hardness scans performed on the alloy surface show that higher hardness values could be achieved compared to the dual phase ( $\alpha+\beta$ ) titanium alloy. The successful formation of a continuous, homogeneous thick and hard aluminide layer on the surface made it possible to obtain preliminary data for studies on high temperature oxidation of the alloy.

**Keywords:** Ti6Al4V, aluminide coating, microstructure, characterization.

## **Giriş**

Yüksek sürünme direnci, üstün korozyon dayanımı ve düşük yoğunluk özelliklerinden dolayı titanyum alaşımları havacılık ve uzay uygulamalarında tercih edilmektedir. Titanyum alaşımlarının kullanımının %50'sini oluşturan Ti6Al4V alaşımı metalurjik olarak bir  $\alpha+\beta$  alaşımıdır (Liu vd., 2021). Sahip olduğu fazlar sebebiyle yüksek mukavemet, tokluk, üstün korozyon direnci, şekillendirilebilme ve iyi sürünme direnci sergilemektedir (Donachie vd., 2000). Bütün bu kombinasyonlara rağmen Ti6Al4V alaşımı 420°C çalışma sıcaklığına kadar kullanılabilir. Yüksek sıcaklık uygulamalarında titanyumun oksijene karşı yüksek afinitesinden dolayı yüzeyde koruyucu olmayan gevrek oksit tabakası oluşmaktadır (Zhang vd., 2012; McKee vd., 1993; Wang vd., 2021). Bu da uzun vadede yapısal bütünlüğün bozulup alaşımın erken ömürde hasarlanmasına neden olmaktadır. Alaşımın yüzey işlemleri ile yüksek sıcaklık oksidasyon direncini geliştirerek servis ömrünün artırılması sağlanabilmektedir (McKee vd., 1993). Titanyum esaslı altlık malzeme yüzeyinde  $Al_2O_3$ ,  $Cr_2O_3$  ve  $SiO_2$  gibi oksijen geçirgenliği düşük ince tabakaların oluşturulması ile malzemenin oksidasyon direncinin artırılması mümkündür (McKee vd., 1993; Wang vd., 2021; Shafiri vd., 2019). Termal sprey, plazma sprey, sıcak daldırma, lazer kaplama ve kutu sementasyon yöntemleriyle yapılan yüzey modifikasyonları ile yüzeyde Ti-Al tabakası elde edilebilmektedir (Wang vd., 2021). Yüzey işlemleri arasında termo-reaktif difüzyon kaplama metodu pahalı ekipmanlara ihtiyaç duymadan kaplama ile altlık malzeme arayüzey bütünlüğünü sağlamasından dolayı tercih edilmektedir (Bianco vd., 1996). Bu tür bir yöntemin kullanımı ile özellikle titanyum alaşımı yüzeyine aluminid kaplamalarının yapılması ile alaşımın oksidasyon direncini önemli ölçüde artırılabilir (Ohnuma vd., 2000; Alam vd., 2009). Alüminyumun içeri difüzyonu sonrası numune yüzeyinde oluşan aluminid tabakada TiAl, TiAl<sub>2</sub>, TiAl<sub>3</sub> ve Ti<sub>3</sub>Al esaslı fazlar oluşmaktadır (Deinç vd., 2005). Termo-reaktif difüzyon kaplamada kullanılan toz karışımının içeriğine ve proses sıcaklığına/zamanına bağlı olarak yüzeyde değişken metalurjik yapıda ve kalınlıkta difüzyon tabakası elde edilmektedir. Xiang ve arkadaşları tarafından yapılan bir çalışmada, yüzeyde oluşturulan alüminyumca zengin  $\gamma$ -TiAl aluminid tabakasının yüzeyde oksidasyon koşullarında koruyucu bir tabaka olarak görev alan  $Al_2O_3$  tabakası oluşturabildiği izlenmiştir (Xiang vd., 2002). Yener ve arkadaşları, Ti6Al4V alaşımı yüzeyine kutu sementasyon yöntemi ile aluminid kaplayarak homojen, yoğun, porozite içermeyen ve yüzeye iyi tutunmuş  $\gamma$ -TiAl tabakasının alaşım yüzeyinde kristallenmesini sağlayarak yüzeyde altlık malzemeye göre sertliğin (~650 HV) artabildiğini ortaya koymuştur (Yener vd., 2023). Bu çalışmada, Ti6Al4V alaşımının kutu sementasyon metodu kullanılarak termo-reaktif difüzyon

koşulları iletilerek yüzeyler alüminyum ile kaplanmıştır. Seçilen proseste sabit sıcaklıkta (700°C) değişken sürelerle (2-6 saat) bağlı olarak elde edilen kaplanmanın metalurjik ve mekanik karakterizasyonu yapılmıştır.

### **Malzeme ve Yöntem**

Döküm konumunda bulunan Ti6Al4V alaşımından (89.9Ti- 6.14Al-3.96 V, ağırlık-%), hassas kesme cihazı (Mikrotest Multicut Sense) ile 10x10x10 mm boyutlarında numuneler alınmış ve yüzeyler metalografik olarak hazırlanmıştır. Metalografik hazırlık sürecinde numuneler 320, 600, 1000, 2500 ve 4000 mesh'lik SiC esaslı zımpara kağıtları ile zımparalanmış, 3µm ve 1µm elmas solüsyon ile parlatılmıştır. Metalografik işlem sonrası numunelerin ağırlıkları hassas terazi ile tartılarak kaplama öncesi ve sonrası ağırlıkları kayıt altına alınmıştır. Yüzeylerin alüminid kaplanmasında, alüminyum kaynağı olarak saf alüminyum tozu (40-45 µm), inert malzeme olarak alumina (< 1 µm) ve aktivatör olarak NH<sub>4</sub>Cl tozları kullanılmıştır. Kaplama işleminde 40 Al + 10 NH<sub>4</sub>Cl + 50 Al<sub>2</sub>O<sub>3</sub> (ağırlık-%) bileşimine sahip toz karışımı hazırlanarak tozların mini rotor ile 2 saat karıştırılması sağlanmıştır. Numuneler hazırlanan toz karışımı içerisine gömülerek 700°C sıcaklıkta, 2, 4 ve 6 saat süreyle alüminid kaplanmıştır. Kaplama işleminin ardından numunelerin yüzeylerinin karakterize edilmesi için ışık mikroskobu (IM, Olympus BX41M-LED), taramalı elektron mikroskobu (SEM, Jeol JSM 6060) ve enerji dağılımlı x-ışın spektrometresi (EDS, IXRF) kullanılmıştır. IM çalışmalarında, aydınlık alan kontrastı ile kaplama kalınlıkları çoklu olarak ölçülmüş olup, ortalama bir değer belirlenmiştir. Alüminid kaplamada oluşan fazların tayini X-ışın difraktometresi (XRD, Rigaku Ultima+) kullanılarak gerçekleştirilmiştir. XRD çalışmalarında Cu-K<sub>α</sub> radyasyonu kullanılmış ve tarama hızı 1.0 °/dak. olarak seçilmiştir. Kaplama işlemleri sonrası numune yüzeylerine ait sertlik değerleri Vickers sertlik cihazı ile 10 g yük altında çoklu kez ölçülmüş ve ortalama değer hesaplanmıştır.

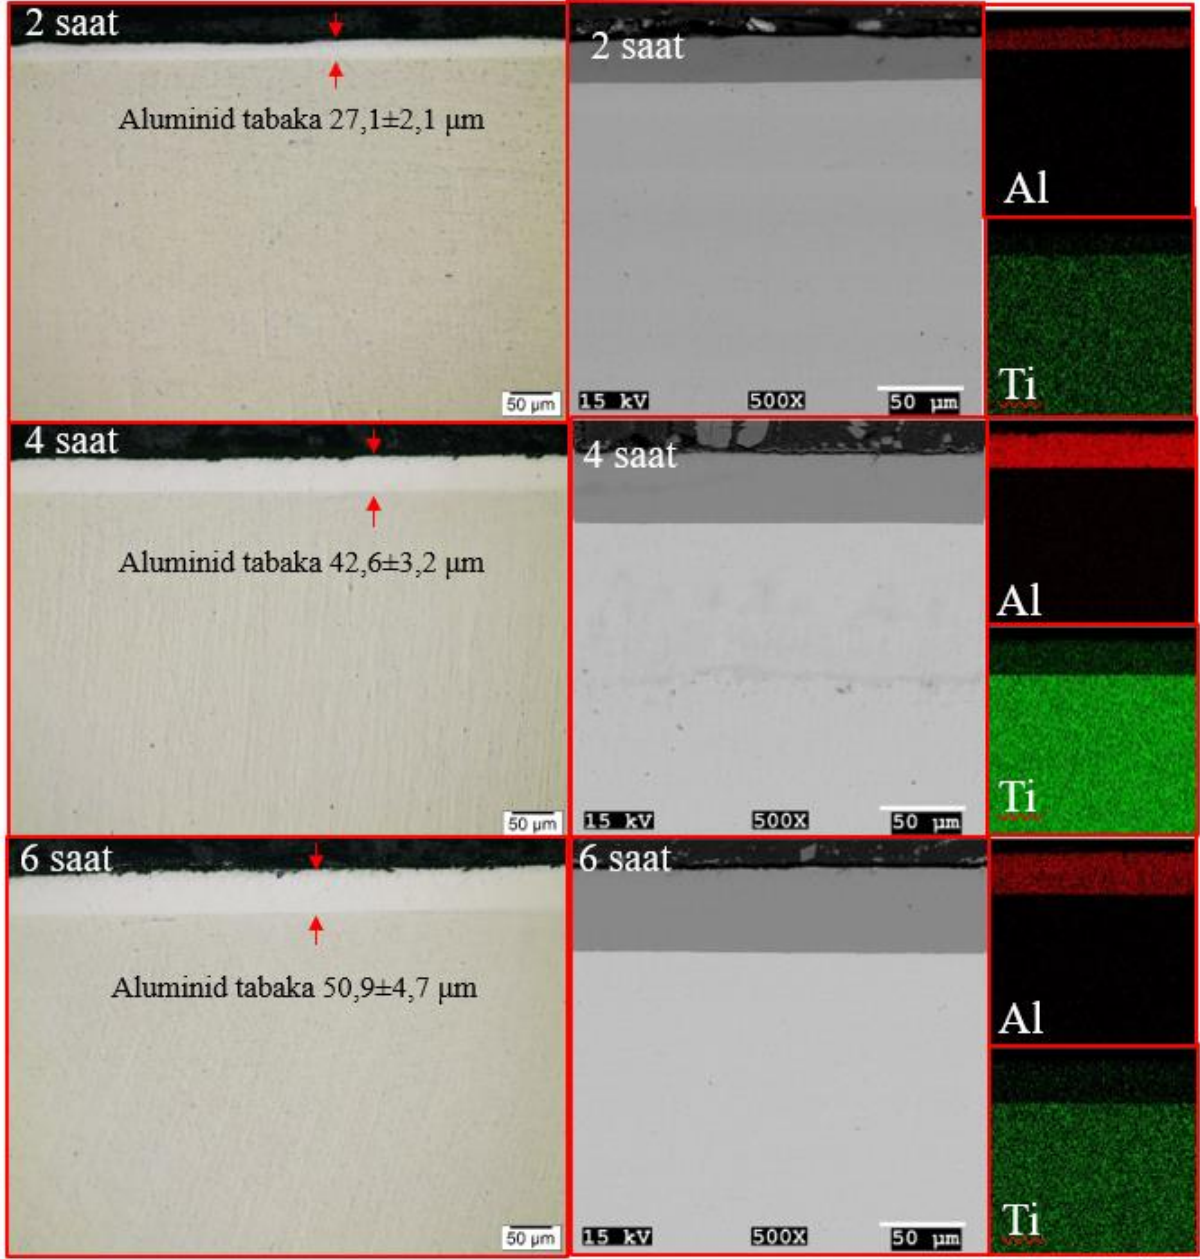

### **Bulgular ve Tartışma**

700°C sıcaklıkta farklı sürelerde (2, 4 ve 6 saat) alüminid kaplanmış Ti6Al4V altlık malzemesinde birim alan başına birikim miktarı hesaplanmış ve elde edilen data Şekil 1'de verilmiştir. Alüminid kaplama süresi 2 saatten 4 saate çıkarıldığında yüzeydeki birikim miktarının 59x10<sup>-4</sup> g/cm<sup>2</sup> değerinden ~1.5 kat artarak 86x10<sup>-4</sup> g/cm<sup>2</sup> değerine yükseldiği ve kaplama süresinin 4 saatten 6 saate çıktığı proseste kaplama miktarının ~1.2 kat artarak 103x10<sup>-4</sup> g/cm<sup>2</sup> değerine ulaştığı görülmüştür. Artan süre ile birlikte yüzeyden içeri doğru alüminyum difüzyonu artmakta ve böylece daha fazla birikim sağlanabilmiştir.

**Şekil 1.** Kaplama süresine bağlı olarak yüzeydeki birikim miktarının değişimi.

Farklı sürelerde termo-reaktif difüzyon kaplama uygulanmış atlık malzeme yüzeyinde oluşturulan aluminid tabaka kalınlığının zamana bağlı değişimini gösteren IM ve SEM kesit görüntüleri Şekil 2’de verilmiştir. Kaplama süresi 2 saatten 4 saate artırılması ile aluminid tabaka kalınlığı  $27.1 \pm 2.1$   $\mu\text{m}$ ’den  $42.6 \pm 3.2$   $\mu\text{m}$  değerine artarak 6 saatlik bir işlem ile tabaka kalınlığının  $50.9 \pm 4.7$   $\mu\text{m}$  değerine ulaştığı tespit edilmiştir. Proses süresi arttıkça birikim miktarındaki artışa benzer bir trend ile kaplama kalınlığında zamanla artış izlenmiştir. SEM-EDS çalışmaları ile elde edilen kesit görüntüleri tüm prosesler ile alaşım yüzeylerinde alüminyumca zengin homojen ve sürekli bir kaplama tabakasının oluştuğunu göstermiştir (Şekil 2).

Şekil 2. Kaplama sonrası alaşımanın kesitine ait IM ve SEM görüntüleri.

Aluminid kaplama sonrası alaşımanın yüzeyinde oluşan fazlar XRD analizleri ile tespit edilmiştir. Şekil 3'te işlem görmemiş Ti6Al4V altlık malzemeye ait XRD spektralleri incelendiğinde sadece  $\alpha$  ve  $\beta$  fazlarının varlığı tespit edilmiştir. 700°C sıcaklıkta 2, 4 ve 6 saat boyunca termo-reaktif difüzyon kaplamalar sonrasında altlık malzeme yüzeylerinde TiAl, TiAl<sub>2</sub> ve TiAl<sub>3</sub> ve fazlarının oluşabildiği gözlenmiştir. Yüzeide aynı zamanda karışım tozunun bir bileşeni olan ve reaksiyona giremeyen Al<sub>2</sub>O<sub>3</sub> toz varlığı da izlenmiştir. kaplama süresinin artmasına bağlı olarak Ti-Al fazlarına ait pik şiddeti daha da artmıştır.

Şekil 3. Aluminid kaplama sonrası alaşımın yüzeyine ait XRD datası.

Aluminid kaplama işlemi uygulanmamış alaşımın ve farklı sürelerde kaplama işlemi uygulanmış alaşımların yüzeylerine ait sertlik değerleri Şekil 4'te verilmiştir. İşlem görmemiş alaşım  $300 \pm 20$  HV sertliğe sahipken yüzey işlemleri sonrasında proses süresinin fonksiyonu olarak alaşıma ait yüzey sertliğinde önemli bir artış tespit edilmiştir. Yapılan çalışmalar aluminid kaplama ile alaşım yüzeyinde oluşan TiAl, TiAl<sub>2</sub> ve TiAl<sub>3</sub> fazlarının yüzey sertlik artışında önemli bir etken olduğunu ortaya koymuştur (Yılmaz vd., 2022; Patel vd., 2020).

Şekil 4. Kaplanmış alaşımların yüzey sertlik datası.

### **Sonuç**

Kaplamalar üzerine yapılan metalurjik ve mekanik karakterizasyon çalışmaları; (i) termo-reaktif difüzyon ile titanyum esaslı malzeme yüzeyinde alüminyumun içeri difüzyonu sağlanarak sürekli, homojen Ti-Al içerikli fazlarının (TiAl, TiAl<sub>2</sub> ve TiAl<sub>3</sub>) başarılı bir şekilde oluşturulabildiğini, (ii) proses süresine bağlı olarak Ti-Al tabakasında sürekli bir artışın sağlanabildiği ve 6 saat prosesleme ile yüzeyde ~ 50 µm tabaka kalınlığına ulaşabildiğini, (iii) kaplama ile birlikte altlık malzeme yüzeyinde 660 HV gibi bir yüksek sertlik değerine ulaşabileceğini ve altlık malzemeye (300±20 HV) kıyasla yaklaşık 2 kat sertliğin arttırılabildiğini göstermiştir.

**Özet**

Süt, düşük asitli ve yüksek su aktivitesine sahip bir gıda ürünüdür. Sütün raf ömrünü uzatmanın birçok yolu olup bunlardan birisi de peynir üretimidir. Peynir üretimi ısıtma (pastörizasyon), kültürleme, doğrudan asitleştirme, dehidrasyon, soğutma ve paketlenme gibi çeşitli teknikler yardımıyla yapılmaktadır. Doğal peynirler, sütün pıhtılaşmasıyla, genellikle kimozinin pıhtılaştırıcı bir çözültü içindeki enzimatik etkisiyle veya bazı durumlarda laktik asit bakteri kültürlerinin etkisiyle veya doğrudan asit ilavesiyle kazeinlerin izoelektrik çökmesi yoluyla üretilir. Peynirlerde genellikle *Lactococcus*, *Lactobacillus*, *Enterococcus*, *Streptococcus* ve *Leuconostoc* cinslerine ait laktik asit bakterilerine (LAB) rastlanmaktadır. Son dönemlerde bir mikro alg olan *Spirulina platensis* (*S. platensis*) diyet takviyesi olarak yaygın bir şekilde kullanılmaktadır. Alglerin özellikle *S. platensis*'in gıda endüstrisindeki uygulamalarından biri biyoaktif bileşikler sağlamak için fermente süt ürünlerine eklenmesidir. Bu nedenle peynir gibi fermente ürünlerin zenginleştirilmesinde *S. platensis* kullanılması durumunda starter kültürlere herhangi bir antimikrobiyal etkisinin olup olmadığı sorgulanmaktadır. Bu çalışmada, laktik asit bakterilerinin büyümesini teşvik edici yanını gösteren çalışmaların aksine *S. platensis*'in kuru ve metanol ekstraktlarının farklı konsantrasyonlarının (2.5 mg/ml, 5 mg/ml, 7.5 mg/ml ve 10 mg/ml) peynir üretiminde starter kültür olarak kullanılan laktik asit bakterileri (*Lactococcus lactis* subsp. *cremoris*, *Lactococcus lactis* subsp. *lactis* -R-704) üzerine herhangi bir antimikrobiyal etkisinin olup olmadığının araştırılması amaçlanmıştır. Bu çalışmada kullanılan *S. platensis* Çukurova Üniversitesi Su Ürünleri fakültesinden kuru olarak sağlanırken, starter kültür suşları Ch. Hansen's firmasından temin edilmiştir. Antimikrobiyal etkinin incelenmesinde Agar Difüzyon yöntemi kullanılmıştır. *In vitro* koşullarda 5 tekrarlı gerçekleştirilmiş bu çalışmada, peynir starter bakterileri üzerine *S. platensis*'in tüm çalışılan konsantrasyonlarında herhangi bir antibakteriyel etki tespit edilememiştir.

**Anahtar Kelimeler:** Laktik asit bakterileri, *Spirulina platensis*, peynir, antimikrobiyal etki

**EFFECT OF *Spirulina platensis* ON LACTIC ACID BACTERIA USED AS STARTER  
CULTURE IN CHEESE PRODUCTION**

**Abstract**

Milk is a food product with low acidity and high water activity. There are many ways to extend the shelf life of milk, and one of them is cheese production. Cheese production is done with the help of various techniques such as heating (pasteurization), culturing, direct acidification, dehydration, cooling and packaging. Natural cheeses are produced by coagulation of milk, usually by the enzymatic action of chymosin in a coagulant solution, or in some cases by isoelectric precipitation of caseins by the action of lactic acid bacterial cultures or by direct addition of acid. Lactic acid bacteria (LAB) belonging to the genera *Lactococcus*, *Lactobacillus*, *Enterococcus*, *Streptococcus* and *Leuconostoc* are generally found in cheese. Recently, *Spirulina platensis* (*S. platensis*), a microalgae, has been widely used as a dietary supplement. One of the applications of algae, especially *S. platensis*, in the food industry is the addition to fermented dairy products to provide bioactive compounds. Therefore, it is questioned whether *S. platensis* has any antimicrobial effect on starter cultures when used in the enrichment of fermented products such as cheese. In this study, it was aimed to investigate whether different concentrations (2.5 mg/ml, 5 mg/ml, 7.5 mg/ml ve 10 mg/ml) of dry and methanol extracts of *S. platensis* have any antimicrobial effects on lactic acid bacteria used as starter culture (*Lactococcus lactis* subsp. *cremoris*, *Lactococcus lactis* subsp. *lactis* -R-704) in cheese production, contrary to studies showing its ability to promote the growth of lactic acid bacteria. While *S. platensis* used in this study was provided dry from Çukurova University Faculty of Fisheries, these strains used as starter cultures were obtained from Ch. Hansen's company. Agar Diffusion method was used to examine the antimicrobial effect. In this study, which was carried out with 5 replicates under *in vitro* conditions, no antibacterial effect was detected on cheese starter bacteria at all studied concentrations of *S. platensis*.

**Keywords:** Lactic acid bacteria, *Spirulina platensis*, cheese, antimicrobial effect

## **GİRİŞ**

Milyonlarca insanın beslenme gereksinimlerini karşılamak için dünya çapında yaygın olarak tüketilen bir gıda olan süt, sağladığı önemli makro ve mikro besinler dolayısıyla oldukça önemlidir. Ayrıca, süt ve süt ürünleri, çeşitli gıda ürünlerinin üretiminde önemli bir bileşen olarak da kullanılmaktadır. Süt, protein, kalsiyum, fosfor, B vitaminleri ve diğer önemli besin öğelerini içermektedir (Park, 2009). Sütün raf ömrünü uzatmak için üretilen yoğurt, kefir ve peynir gibi fermente süt ürünleri binlerce yıldır tüketilmektedir. Fermente süt ürünleri, sütte bulunan doğal bakterilerin ve mayaların fermantasyon süreciyle oluşur (Zamfira vd., 2006; Visioli ve Strata, 2014). Bu süreç, sütteki karbonhidratların (genellikle laktoz) bakteriler veya mayalar tarafından fermantasyonu ve bunun sonucunda laktik asit gibi organik asitlerin oluşmasıyla gerçekleşir. Oluşan laktik asit, sütün pH'ını düşürerek asidik bir ortam yaratır (Zamfira vd., 2006). Asidik ortam, zararlı mikroorganizmaların büyümesini engellerken, üretilen laktik asit ve düşük pH, sütün dayanıklılığını artırır ve bozulmasını önler. Fermente sütlerde bulunan laktik asit bakterileri (LAB) çeşitli türlerden oluşur ve genellikle *Lactobacillus*, *Lactococcus*, *Leuconostoc*, *Pediococcus*, *Streptococcus* ve *Bifidobacterium* cinslerine ait bakterileri içerir. Bu bakterilerin her biri fermente süt ürünlerinin oluşumunda farklı roller üstlenir ve ürünlerin besleyici değerini artırırken, tat, koku ve doku özelliklerini belirleyebilirler. Fermentasyon sürecinde, laktik asit bakterilerinin metabolizması çeşitli aroma bileşenleri ve organik asitlerin oluşumuna yol açabilir. Bu bileşenler, fermente süt ürünlerinin karakteristik tat, koku ve dokusunu belirler. Bazı laktik asit bakterileri B vitaminleri gibi önemli besleyici bileşenleri de sentezleyebilir (Panesar, 2011). Süt, düşük asitli ve yüksek su aktivitesine sahip bir gıda ürünüdür. Sütün raf ömrünü uzatmanın birçok yolu olup bunlardan birisi de peynir üretimidir. Bir fermente süt ürünü olan peynir; Türk Gıda Kodeksi'nde "Hammaddenin uygun bir pıhtılaştırıcı kullanılarak pıhtılaştırılması ve pıhtıdan peyniraltı suyunun ayrılmasıyla ya da sütün permeatının ayrılmasından sonra pıhtılaştırılmasıyla elde edilen, farklı sertliklerde ve yağ içeriklerinde, salamura ile ya da kuru tuzlama ile tuzlanarak ya da tuzlanmadan, starter kültür kullanarak ya da kullanmadan, telemesi haşlanarak ya da haşlanmadan, çeşnili ya da çeşnisiz olarak, tekniğine uygun olarak üretilen, olgunlaştırılmadan ya da olgunlaştırıldıktan sonra tüketilen, çeşidine özgü karakteristik özellikleri gösteren süt ürünleri" şeklinde tanımlanmaktadır (Anonymous, 2015). Peynir birçok çeşidi olan ve en fazla tanınan süt ürünüdür. Dünyada 4000'den fazla, Türkiye'de 200'den fazla peynir çeşidi bulunmaktadır. Bu peynirlerin yapımında ortak işlemler olarak, süt temini, standardizasyon, pastörizasyon, starter kültür ilavesi, mayalama, oluşan pıhtının işlenmesi aşamalarını içerir.

Peynirler, sütün pıhtılaşmasıyla, genellikle kimozinin pıhtılaştırıcı bir çözelti içindeki enzimatik etkisiyle veya bazı durumlarda LAB kültürlerinin etkisiyle veya doğrudan asit ilavesiyle kazeinlerin izoelektrik çökmesi yoluyla üretilir (Park, 2009). Peynirlerde genellikle *Lactococcus*, *Lactobacillus*, *Enterococcus*, *Streptococcus* ve *Leuconostoc* cinslerine ait LAB'lere rastlanır. Laktik asit bakterilerinin (LAB) mikrobiyal metabolizması, sütün bileşenlerini, özellikle karbonhidratları ve proteinleri, diğer mikroorganizmaların büyümesi ve metabolizması için bir substrat olarak kullanılabilir ikincil ürünlere dönüştürür (Tilocca vd, 2020). Peynir üretimi sütün, peynir mayası ve bakteriler arasında karmaşık bir etkileşim içerir. Sütün bakteriyolojik kalitesi önemli ölçüde değiştiğinden, çoğu peynir pastörize sütün kullanılarak yapılır. Bu pastörizasyon işlemi, spontan asitlenme sağlayabilen LAB dahil olmak üzere sütte bulunan patojen ve saprofit bakterilerin %99'undan fazlasını ortadan kaldırır. Bu nedenle istenilen özelliklere sahip bir peynir yapmak için süte starter kültürler eklenmektedir. Starter kültürü, peynir yapımının tüm aşamalarında ve olgunlaşma sürecinde çok önemli bir rol oynar (Høier vd, 2010). Fermantasyon süreçlerinde merkezi bir rol oynayan LAB'lar, fermente yiyecek ve içeceklerin üretiminde uzun ve güvenli üretim ve tüketim geçmişine sahiptir. Peynir üretimi sırasında starter kültür olarak kullanılan laktik asit bakterileri laktozu laktik aside metabolize edebilmekte, olgunlaşma sırasında peynir lezzetinin gelişmesine katkıda bulunmakta ve oluşturdukları metabolitleri ile istenmeyen mikroorganizmaların inhibisyonunu sağlamaktadır. Başta laktik asit olmak üzere organik asitlerin üretimi yoluyla hammaddenin hızla asitlenmesine neden olurlar. Ayrıca, asetik asit, etanol, aroma bileşikleri, bakteriyosinler, ekzopolisakkaritler ve çeşitli enzimlerin LAB tarafından üretimi önemlidir. Bu şekilde fermente ürünün raf ömrünü ve mikrobiyal güvenliğini artırır, dokuyu iyileştirir ve son ürünün hoş duysal profiline katkıda bulunurlar (Leroy ve Vuyst, 2004). Peynir yapımı için başlangıç kültürünün iki ana işlevi vardır: Peynir yapımı sırasında asit üretmek ve peynirin olgunlaşmasına yardımcı olmaktır. Kültürlerin ürettiği asit, peynir yapımında önemli bir adım olan asitle pıhtılaşmış peynirlerde sütün pıhtılaşmasına yol açar. Peynir mayası ise pıhtılaşmış peynirlerde asit gelişimi ile pıhtılaşmayı hızlandırır. Birçok peynirin üretimi, asitlik gelişimi *Lactococcus lactis* alt türleri *lactis* ve *cremoris*'e bağlıdır. Ticari starter kültürlerinde esas olarak *Lactococcus*, *Lactobacillus*, *Streptococcus* ve *Bifidobacterium* suşları kullanılmaktadır. İyi asit üretici oldukları için en yaygın kullanılan mezofilik starter kültür *lactis* ve *cremoris* alt türlerini içeren *Lactococcus lactis*'tir. Karışık mezofilik kültürler genellikle %90 asit üreticisi ve %10 aroma üreticisidir. *Lactococcus lactis* subsp. *lactis* ve *L. lactis* subsp. *cremoris* sütün endüstrisinde büyük öneme sahiptir (Başaran vd, 2001).

*Lactococcus* cinsinin üyeleri Gram pozitif koklar, büyüme koşullarına bağlı olarak oval görünebilen ve tipik olarak 0.5-1.5 µm boyutlarındadır. Spor oluşturmeyen, hareketli olmayan ve fakültatif anaerob bakterilerdir. Laktokok türleri çiftler veya kısa zincirler halinde büyümektedir ve streptokok cinsinin birçok üyesinden farklı olarak bu organizmalar uzun zincirler halinde gelişmezler. Laktokoklar, pH 6.3-6.9 değerleri arasında ve optimum sıcaklık genellikle 30 °C'ye yakın olsa da 12 ila 40 °C arasında büyüebilmektedir. *L. lactis* subsp. *cremoris* lezzet bileşiği olarak taze peynir üretiminde esastır. *L. lactis* subsp. *lactis* ve *L. lactis* subsp. *cremoris* kombinasyonunun, beyaz salamura peynirdeki lezzet ve aroma söz konusu olduğunda en iyi kombinasyon olduğu kabul edilmektedir. Yumuşak, olgunlaşmış, kaşar ve taze peynirler gibi peynir çeşitlerinde kullanılmaktadır. Karışık laktokok kültürü (*L. lactis* subsp. *lactis* ve *L. lactis* subsp. *cremoris*) kullanılarak yapılan pıhtısı haşlanmamış beyaz salamura peynirlerde (Türk beyaz peyniri, feta, teleme vb.) olgunlaşma, mezofilik ve termofilik karışımı kültürlerle (*L. lactis* subsp. *lactis* ve *Streptococcus thermophilus*) yapılan peynirlerden daha hızlı gelişmektedir. *L. lactis* subsp. *lactis* ve *L. lactis* subsp. *cremoris* yüksek tuz konsantrasyonlarına tolerans göstermemekte ve genellikle %6.5 'in üzerinde büyümemektedir (Ivy ve Wiedmann, 2014; Büyükyörük, 2007). Laktik aside ilaveten, termofilik starter kültürler karakteristik olarak asetaldehit üretir. Peynir yapımında zaman zaman peynirin türüne göre özel işlevi olan ikincil kültürler kullanılır. Örneğin, *Propionibacterium freudenreichii* subsp. *shermanii* İsviçre peyniri çeşitlerinde peynirin (gözlerin) iç kısmında büyük delikler oluşturarak CO<sub>2</sub> üretir. Diğer kültürler olgunlaşmaya yardımcı olarak kullanılır. Başlangıç kültürlerine ilave olarak eklenirler. Bu bağlamda, peynir olgunlaşması sırasında büyüyen ve olgunlaşma enzimleri üreten bazı *Lactobacilli* ve *Pediococci* bakterileri de kullanılır. Sonuç olarak, bir peynirin temel karakteri starter türü, bileşimi, büyümesi ve metabolik özelliklerine göre yönetilir (Ivy ve Wiedmann, 2014). Fermente süt ürünlerine mikroalglerin eklenmesi, biyoaktif bileşiklerin sağlanmasını hedefleyen daha sağlıklı süt ürünleri oluşturmanın bir aracı olarak benimsenmektedir. Bu amaçla, *Arthrospira (Spirulina)* spp. ve *Chlorella vulgaris* gibi mikroalg türleri, fermente gıda takviyesi için yaygın olarak kullanılan iki ana türdür. Mikroalgler, mikroskopik canlılar olup çapı 2 µm'den küçük, siyanobakteriler (*Chloroxybacteria*) gibi prokaryot veya yeşil algler (*Chlorophyta*) gibi ökaryotik olabilmektedir (Sasa vd, 2020). Yaklaşık 50.000 türe sahip fotosentez yapabilen, tatlı ve tuzlu su ortamlarında yaşayabilen canlılar olup, hücre yapılarına, pigmentlerine ve yaşam döngülerine göre farklılık göstermektedir. Yeşil algler (*Chlorophyceae*), mavi-yeşil algler (*cyanopyta*), diatomlar (*Bacillariophyceae*) en önemli

mikroalglerdendir (Suna, 2020). Mikroalg zengin bir karbon kaynağıdır ve bu biyoyakıtlarda, sağlık takviyelerinde, ilaçlarda ve kozmetiklerde kullanılabilir (Alam vd, 2020). Mikroalgler, protein, karbonhidrat (özellikle  $\beta$  glukoz), lipit, esansiyel amino asit, çoklu doymamış yağ asitleri, vitamin, mineral ve kalorisiz diyet lifi gibi yüksek besin değerli bileşenleri sentezleme yetenekleri ile bilinmektedir (Sasa vd, 2020). Bunların nispi bileşimi türlere ve büyüme koşullarına bağlıdır. Kuru biyokütle ağırlıklarına göre ise %9-50 protein ve %7-50 karbonhidrat, %7-50 yağ içerebilmektedir. En önemli mikroalg türleri *Isochrysis*, *Dunaliella*, *Chaetoceros*, *Chlorella* ve *Spirulina*'dır (Nale, 2021). *Chlorella vulgaris*, *Arthrospira platensis*, *Haematococcus pluvialis* ve *Dunaliella salina* gibi bazı mikroalgler esas olarak gıda, yem ve nutrasötik sektörlerinde pazarlanmaktadır. Protein, karotenoidler, özellikle omega-6 ve omega-3 lipitleri üretme potansiyellerine dayanarak, hayvan yemi ve su ürünleri yetiştiriciliği, protein ve kozmetik gibi birçok pazarda yer alabilirler (Molino vd, 2018). *C. vulgaris* ve *A. platensis* gibi türler, US FDA (Food and Drug Administration) ve EFSA (European Food Safety Authority) tarafından güvenli olarak kabul edilmiştir. *C. vulgaris* ve *A. platensis*, vitamin, esansiyel amino asit ve çoklu doymamış yağ asitleri içeriği nedeniyle nutrasötik sektörde en yaygın olarak bilinen ve kullanılan mikroalglerdir. Ayrıca sakız, şeker ve bazı ürünlerde boya maddesi olarak kullanılmaktadır. *Spirulina* piyasada hap, tablet, kapsül, toz ve jel formlarında bulunduğu gibi *Spirulina* sirkesi, sandoloz sakızı olarak da ticari olarak satışa sunulmaktadır. Aynı zamanda *S. platensis*'in unlu mamuller, süt ürünleri, emülsiyon et ürünleri ve tatlılar gibi gıda sanayinin birçok dalında kullanılma potansiyeli de mevcuttur (Güler vd, 2021). Bunların yanı sıra Kozmetik sektöründe yaygın olarak kullanılan mikroalgler'den *C. vulgaris*, yaşlanma karşıtı özelliklere sahip bir ajan olarak kolajen sentezi için kullanılırken, karotenoid içerikleri nedeniyle renklendirici maddeler olarak ve UV koruması için *D. salina* ve *H. pluvialis* tercih edilmektedir (Molino vd, 2018). Uzun yıllardır bir mikro alg olan *Spirulina platensis* (*S. platensis*) diyet takviyesi olarak yaygın bir şekilde kullanılmaktadır (Kapoor ve Mehta, 1993). *S. platensis*, filamentli bir siyanobakteridir ve çok hücreli iplikli yapısı ile bilinmektedir. Bu organizmanın özelliklerinden biri de art arda sıralanmış silindirik trikomların heliks şeklinde dizilmesidir. *S. platensis*, yüksek oranda vitamin, mineral ve diğer besin bileşenlerini sağlamaktadır. Bu organizma, insanlarda metabolik aktiviteyi artırıcı etkilerinin yanı sıra, yüksek oranda protein içeriğine sahiptir ve yapısındaki proteinlerin %95'i sindirilebilir özelliktedir ve özellikle lizin, valin ve izolösin gibi esansiyel amino asitleri içerir (Suna, 2020; Akça, 2020). *Spirulina*, toksisite riski taşımayan ve anemi, tümör büyümesi ve yetersiz beslenme gibi durumlarda mükemmel bir gıda kaynağı

olarak da değerlendirilmektedir (Saranraj ve Sivasakthi, 2014). Son zamanlarda, *Spirulina*'nın terapötik etkileri daha fazla önem kazanmıştır. Özellikle ağır metallerin neden olduğu kolesterol ve nefrotoksisitenin azaltılması, antikanser özellikleri, radyasyona karşı koruma sağlama ve bağışıklık sisteminin güçlendirilmesi gibi yönleri üzerinde araştırmalar yoğunlaşmıştır. Bununla birlikte, *Spirulina*'nın antiviral, antibakteriyel, antifungal ve antiparaziter aktiviteler gibi çeşitli biyolojik fonksiyonlara da sahip olduğu belirtilmektedir (El-Baz vd., 2013). Tüm bu yararlı etkilerinden dolayı gıda endüstrisinde de değerlendirilmesi mümkün olabilmekte ve farklı ürün gruplarına yönelik çalışmalar sürdürülmektedir. *S. platensis*'in gıda endüstrisindeki uygulamalarından biri olarak, biyoaktif bileşikler sağlamak amacıyla peynir gibi fermente ürünlerin zenginleştirilmesinde kullanılması söz konusu olabilmektedir. Bu durumda starter kültürlerin *S. platensis*'in antimikrobiyal etkisine karşın nasıl bir tavır gösterdikleri sorgulanması gereken bir husus olarak ön plana çıkmaktadır. Bu çalışmada, laktik asit bakterilerinin (LAB) büyümesini teşvik eden etkilerinin aksine, *Spirulina platensis*'in kuru ve metanol ekstraktlarının farklı konsantrasyonlarının (2.5 mg/ml, 5 mg/ml, 7.5 mg/ml ve 10 mg/ml) peynir üretiminde kullanılan starter kültürler (*Lactococcus lactis subsp. cremoris*, *Lactococcus lactis subsp. lactis* -R-704) üzerindeki antimikrobiyal etkisinin araştırılması amaçlanmıştır.

## **1. ARAŞTIRMA ve BULGULAR**

### **1.1. MATERYAL**

Bu çalışmada kullanılan *Spirulina platensis*, Çukurova Üniversitesi Su Ürünleri Fakültesi'nden kuru olarak sağlanırken, starter kültür olarak kullanılan *Lactococcus lactis subsp. cremoris*, *Lactococcus lactis subsp. lactis* -R-704 suşları Ch. Hansen's firmasından temin edilmiştir. Ayrıca, çalışmada pozitif kontrol olarak kullanılan antibakteriyel kanamisin Çukurova Üniversitesi Gıda Mühendisliği bölümü mikrobiyoloji laboratuvarından temin edilmiştir.

### **1.2. YÖNTEM**

*Spirulina platensis*'in kuru formu ve metanol ekstraktının 4 farklı konsantrasyonu (2.5 mg/ml, 5 mg/ml, 7.5 mg/ml ve 10 mg/ml) *L. lactis subsp. cremoris* ve *L. lactis subsp. lactis* üzerindeki antimikrobiyal etkisinin araştırılmasında kullanılmış ve kuyucuk agar difüzyon yöntemi ile çalışılmıştır.

#### **1.2.1. Starter Kültürün Laktik Asit Bakterilerinin Aktive Edilmesi**

*Lactococcus lactis subsp. cremoris* ve *Lactococcus lactis subsp. lactis* (R-704) suşları 121°C'de 15 dakika sterilize edilen Tryptic Soy Broth besiyerine steril koşullarda ilave edilmiş ve 48 saat 30°C'de inkübe edilmiştir.

### **1.2.2. Spirulina platensis Preparatlarının ve Ekstraklarının Hazırlanması**

*Spirulina platensis*'in farklı konsantrasyonları (2.5 mg/ml, 5 mg/ml, 7.5 mg/ml ve 10 mg/ml) %75 metanol içinde çözülmüş ve oda sıcaklığında karanlık ortamda 24 saat bekletilmiştir. Elde edilen preparatların (metanol + *S. platensis*) pH değerleri saptanmıştır. 7 g kurutulmuş *S. platensis* 105 ml çözücü (%85 metanol) içinde karıştırılarak oda sıcaklığında 5 saat bekletilmiş ve 15 dakika sonikasyon işlemi uygulanarak hazırlanmıştır. Daha sonra Whatman filtre kağıdından süzümüştür. Solüsyon içerisindeki çözücü, basınç altında Rotary Evaporatör ile buharlaştırılmış ve elde edilen kalıntı (ham ekstrakt) hava geçirmez şişelerde -20° C'de saklanmıştır. Elde edilen ekstraktlar (2.5 mg/ml, 5 mg/ml, 7.5 mg/ml ve 10 mg/ml) farklı konsantrasyonlarda metanol içinde çözülmüştür ve pH değerleri ölçülerek kullanılmıştır.

### **Agar Difüzyon Yöntemi ile Spirulina platensis'in Lactococcus lactis ssp. lactis ve Lactococcus lactis ssp. cremoris Üzerine Etkinliğinin İncelenmesi**

M17 Agar besiyeri kalınlığı 4mm olacak şekilde 90 mm çaplı plastik petrilere hazırlanmıştır. Daha sonra canlandırılan starter kültürlerden 0.5 McFarland'a (yaklaşık 10<sup>8</sup> süspansiyon/ml) ayarlanmış bakteri süspansiyonlarından 100 µL petriye eklenmiş ve yayma ekim yöntemi ile ekimleri yapılmıştır. Agar yüzeyi kuruduktan sonra hazırlanmış petrilere 3 kuyucuk olacak şekilde agar delici (corkborer) ile 6 mm çaplı standart kuyucuklar açılmıştır. Her bir kuyucuğa 50 µl steril su (Negatif kontrol), antibakteriyel (0/015mg/ml kanamycin; Pozitif kontrol) ve *S. platensis*'in hem metanol solüsyonu hem de kuru formundaki farklı konsantrasyonda hazırlanmış preparatları koyulmuştur. Daha sonra ekim yapılan petrilere aerobik koşullar altında 48 saat boyunca 37 ° C'de inkübe edilmiştir.

### **BULGULAR**

Araştırmada kullanılan *S. platensis* kuru ve metanol ekstrakt çözeltilerinin dört farklı konsantrasyonda, test mikroorganizması olarak kullanılan laktik asit bakterileri (*L. lactis subsp. cremoris* ve *L. lactis subsp. lactis*) üzerine antimikrobiyal etkisinin 5 tekerrürlü çalışmasının ortalama sonuçları Çizelge 1 ve 2'de verilmiştir.

Çizelge 1. *S. platensis*'in kuru formunun *L. lactis* subsp. *cremoris* ve *L. lactis* subsp. *lactis* üzerine etkisinin 5 tekerrürlü çalışmasının ortalama sonuçları

Test mikroorganizması olarak kullanılan LAB	<i>S. platensis</i> Konsantrasyonu				Kanamisin (15 mg/ml)	Steril Su
	2.5mg/ml	5mg/ml	7.5mg/ml	10mg/ml		
<i>L. lactis</i> subsp. <i>cremoris</i> ve <i>L. lactis</i> subsp. <i>lactis</i>	--	--	--	--	23.00 mm	--

Çizelge 2. *S. platensis*'in metanol ekstraktının *L. Lactis* subsp. *cremoris* ve *L. Lactis* subsp. *lactis* üzerine etkisinin 5 tekerrürlü çalışmasının ortalama sonuçları

1 Test mikroorganizması olarak kullanılan LAB	<i>S. platensis</i> Konsantrasyonu				Kanamisin (15 mg/ml)	Steril Su
	2.5mg/ml	5mg/ml	7.5mg/ml	10mg/ml		
<i>L. lactis</i> subsp. <i>cremoris</i> ve <i>L. lactis</i> subsp. <i>lactis</i>	--	--	--	--	22.20 mm	--

Çalışmanın *in vitro* koşullarda gerçekleştirilen 5 tekrarı sonucunda, *S. platensis*'in kuru formu ve metanol ekstraktının incelenen tüm konsantrasyonlarında peynir starter bakterileri üzerinde herhangi bir antibakteriyel etkisi görülmemiştir. Danielsen ve Wind (2003) *Lactobacillus* spp. türlerinin çeşitli antimikrobiyal ajanlara karşı duyarlılık düzeylerini belirlemek için yaptıkları çalışmada, bazı *Lactobacillus* suşlarının basitrasin, sefoksitin, siprofloksasin, fusidik asit, kanamisin, gentamisin, metronidazol, nitrofurantoin, norfloksasin, streptomisin, sülfadiazin, teikoplanin, trimetoprim/sülfametoksazol ve vankomisine karşı yüksek doğal dirence sahip olduğunu göstermişlerdir.

Kumar vd. (2011) tarafından yapılan çalışmada, *S. platensis*'in metanol ve aseton ekstraktlarının *Staphylococcus aureus* ve *Salmonella Typhimurium*'a karşı antibakteriyel etkisi incelenmiştir.

Çalışma sonunda, farklı konsantrasyonlarda (250 ppm'den 7000 ppm'e kadar) çalışılan ekstraktların bakterilerin üremesini inhibe ettiğini göstermişler. Ayrıca, *S. platensis* ekstraktlarının antibakteriyel ajan olarak kullanılabilir aktif maddeleri ve kimyasal bileşimini belirlemek amacıyla gaz kromatografi kütle spektrometresi (GC-MS) kullanarak yaptıkları analizlerde, mevcut maksimum bileşik miktarının %42.11'lik oranda Eikosan adlı bir yağ asidi olduğu belirlenmiş ve bu yağ asidinin de antibakteriyel aktiviteden sorumlu olduğu tespit edilmiştir. Mazinani vd. (2015) tarafından yapılan çalışmada, soğutulmuş depolama sırasında *Lactobacillus acidophilus* içeren peynir üzerinde toz halindeki *S. platensis*'in etkisi incelenmiştir. Çalışma sonunda, peynirlerin depolanması sırasında *S. platensis*'in *L. acidophilus*'un gelişimini stimüle ettiği gösterilmiştir. Abd El-Monem vd. (2018) tarafında yapılan çalışmada, *S. platensis*'in antimikrobiyal aktivitesi %70'lik metanol, etanol ve aseton içerisinde farklı pH değerlerinde (8.0, 9.0, 10.0, 11.0 ve 12.0) hazırlanarak bazı patojen bakterilere karşı test edilmiştir. Çalışmanın sonuçlarına göre, *Staphylococcus aureus* NCTC-7447'nin maksimum inhibisyonu aseton ekstraktında pH 8 ve 10'da gözlenirken, *E. coli* NCTC-10418 için pH 8'de olduğu gösterilmiştir. Metanol ekstresi *S. aureus* NCTC-7447 üzerine pH 8'de maksimum 20.0 mm inhibisyon gösterirken, pH 8'de etanol ekstresi ile 17.00 mm olarak rapor edilmiştir.

## **SONUÇ**

Yapılan çalışmalara bakıldığında; *Spirulina platensis*'in farklı miktarlarda çeşitli alkol ekstraktları ve pH'larda patojen bazı bakteriler üzerine antibakteriyel etkileri gösterilmiş fakat starter kültür üzerine etkileri ya kültür bakterilerini stimüle ettiği ya da herhangi bir pozitif ve negatif etkiyle karşılaşmadıkları şeklinde sonuçlarla karşılaşılmıştır. Bu çalışmada, kuru formda *S. platensis* ile metanol ekstraktlarının çalışılan tüm konsantrasyonlarında test edilen peynir starterleri üzerinde etkili bir antibakteriyel aktivite göstermediği belirlenmiştir. Dolayısıyla, özellikle mikroalglerden biri olan *S. platensis*'in, fermente süt ürünlerinde biyoaktif bileşikler sağlamak amacıyla kullanılabilirliği görülmüştür.

**Özet**

El hijyeni, özellikle gıda sektöründe faaliyet gösteren firmalar için hayati bir öneme sahiptir. Bu sektörde çalışanların el hijyeninin yetersiz olması, potansiyel gıda kaynaklı hastalıkların yayılmasına ve müşteri güveninin zedelenmesine neden olabilir. Günümüzde gelişmiş endüstrilerden biri olan catering sektörü ve bu firmaların sunduğu yemek hizmetinin geniş kitlelere ulaşması, gıda hijyeninin özenle ele alınmasını gerektirmektedir. Ancak, tüketici sayısının arttığı ve servis süresinin kısıtlı olduğu durumlarda, catering firmaları gıda hijyenini göz ardı edebilmektedir. Her ne kadar catering çalışanları, gıda hijyeni konusunda uzmanlardan eğitim almış olsalar da catering sektöründeki gıda zehirlenmesi vakalarının çoğu personelin el hijyeni hataları ile ilişkilendirilmektedir. Bu çalışmada, Adana'da faaliyet gösteren bir catering firmasının çalışanlarının el hijyeni uygulamaları değerlendirilmiştir. Bu değerlendirmede, catering çalışanlarının eldivenli ve çıplak ellerinden alınan örneklerin mikrobiyal florası incelenmiştir. Bu amaçla, çalışmada, rastgele seçilen 2 catering çalışanının eldivenli ve çıplak ellerinden sürüntü yöntemiyle örnekler alınmıştır. Bu örnekler, toplam aerobik mezofilik bakteri yükü, koliform ve *E. coli* ile *Salmonella* spp., *Staphylococcus aureus* ve *Listeria* spp. açısından değerlendirilmiştir. Sonuç olarak, eldivenli elin aerobik mezofilik bakteri yükü ( $82 \times 10^4$  kob/cm<sup>2</sup>), çıplak elin aerobik mezofilik bakteri yükünden ( $50 \times 10^3$  kob/cm<sup>2</sup>) daha yüksek bulunmuştur. Koliform ve *E. coli* açısından incelendiğinde, eldivenli elin yüksek kontaminasyon gösterdiği ( $>1100$  EMS/cm<sup>2</sup>), çıplak elin ise düşük kontaminasyonda olduğu ( $<3$  EMS/cm<sup>2</sup>) belirlenmiştir. Örneklerin hiçbirinde *Salmonella* spp., *Staphylococcus aureus* ve *Listeria* spp. izole edilememiştir. Catering sektöründe çalışanların el hijyeninin değerlendirildiği bu çalışmada el hijyenindeki yetersizliğin, beklenenin aksine özellikle eldivenli ellerde daha belirgin olduğu görülmüş, bu da hijyen açısından eldiven kullanımının daha dikkat edilmesi gereken bir husus olduğunu göstermiştir. Sonuç olarak, eldiven kullanımı

kontrol edilmediđi takdirde potansiyel mikrobiyal kontaminasyon riskinin daha da artması muhtemel görünmektedir.

**EVALUATION OF EMPLOYEES IN A CATERING COMPANY IN TERMS OF  
HAND HYGIENE**

**Abstract**

Hand hygiene is of vital importance, especially for companies operating in the food industry. Inadequate hand hygiene of employees in this sector can lead to the spread of potential foodborne diseases and damage customer confidence. The catering industry, which is one of the developed industries today, and the fact that the food services offered by these industries reach large masses requires that food hygiene be handled carefully. However, in cases where the number of consumers increases and service time is limited, catering industries could ignore food hygiene. Even though catering employees receive training in food hygiene from hygiene experts, most cases of food poisoning in the catering sector are associated with personal hand hygiene errors. In this study, hand hygiene practices of employees of a catering company operating in Adana were evaluated. In this evaluation, the microbial flora of samples taken from the gloved and bare hands of catering employees were examined. For this purpose, in the study, samples were taken by swab method from the gloved and bare hands of 2 randomly selected catering employees. These samples were evaluated for total aerobic mesophilic bacterial load, coliform and *E. coli*, as well as *Salmonella* spp., *Staphylococcus aureus* and *Listeria* spp. As a result, the microbial load of gloved hands ( $82 \times 10^4$  cfu/cm<sup>2</sup>) was found to be higher than that of bare hands ( $50 \times 10^3$  cfu/cm<sup>2</sup>). When examined for coliforms and *E. coli*, it was determined that gloved hands showed high contamination ( $>1100$  MPN/cm<sup>2</sup>), while bare hands had low contamination ( $<3$  MPN/cm<sup>2</sup>). *Salmonella* spp, *Staphylococcus aureus* and *Listeria* spp could not be isolated in any of the samples. In this study evaluating hand hygiene among personnel in the catering industry, it was observed that inadequacies in hand hygiene were more pronounced, contrary to expectations, particularly in gloved hands. This indicates that the use of gloves requires more attention in terms of hygiene. Consequently, in the absence of controlled glove usage, the potential risk of microbial contamination is likely to increase further.

## **GİRİŞ**

Sanayileşme ile beraber ev dışında yemek yeme zorunluluğu son yıllarda artış göstermektedir. Artan taleple birlikte, toplu yiyecek hizmeti veren “catering” işletmelerinin sayısı ve verdikleri hizmet alanı da genişlemektedir (Bilgin ve Erkan, 2008). Köken itibari ile yabancı bir sözcük olan “catering”, yiyecek içecek hazırlama ve sunumu anlamına gelmektedir. Türk Dil Kurumu Yabancı Kelimeler Kurulu’nun “catering” sözcüğüne önerdiği Türkçe karşılık ise “yemek hizmeti”dir. Catering işletmeleri, sosyal amaçlı (evlilik törenleri, yıl dönümleri, doğum günleri, mezuniyet partileri gibi), iş amaçlı (toplantı ve kongreler, açılış törenleri ve kokteyller gibi) organizasyonları, endüstriyel tesisler, okul, hastane ve ulaşım birimlerinde talebe bağlı olarak toplu yemek hizmeti sunan ve ziyafet organizasyonlarını düzenleyen işletmelerdir (Altun Karadeniz ve Çetin, 2007). Dünyada catering sisteminin kökü milattan 4 bin yıl öncesine, Çin’e kadar uzanmaktadır. Catering sisteminin, Çin’in yanı sıra Antik Roma, Yunanistan ve Mısır’da da askerler için ve ticaret yollarında kullanıldığı görülmektedir. Orta Çağ’da catering sadece askerler ve ticaretle uğraşanlar için değil ayrıca maddi yönden varlıklı insanlar için eğlence sektöründe de kullanılmaya başlanmıştır. Almanya’nın belirli kurallar koyarak oluşturduğu catering sistemi 14. ve 15. Yüzyıllarda tüm Avrupa’da popülerleşmeye başlamıştır (Burgess, 2013). Ülkemizde ise hazır yemek sektörü ilk kez Osmanlı saray mutfaklarından yeniçeri ocağına devşirilmiştir. Son 20 yılda önce fabrika ve işyerlerine, sonra yemek sektörüne geçiş yapmıştır. 1960’lı yıllarda büyük şehirlerdeki fabrikaların yemekhane kurması, 1970-80’lerde tabldot firmalarının açılması ve 1990’larda yabancı sermaye yatırımlarıyla büyüyen hazır yemek sektörü, ülke ekonomisi ve turizmi açısından büyük bir öneme sahip olmuştur (Öndoğan, 2010). Tüketicinin sağlığının korunması açısından, çok sayıda insanın beslenme ihtiyacının karşılandığı toplu beslenme sistemleri hijyenik olmak zorundadır (Dündar vd., 2000). Gıda hijyeninin amacı gıdaların kalitesini olumsuz yönde etkileyecek faktörlerin ortadan kaldırılması ya da en aza indirilmesidir (Elverir ve Gönülalan, 2010). Gıda, üretimden tüketiciye ulaşana kadar olan süreçte, çeşitli kaynaklardan bulaşan mikroorganizmalarla kirlenebilmekte ve uygun koşullarda bu mikroorganizmalar hızla çoğalarak duyuşsal kalitenin bozulmasına, ekonomik kayıplara ve gıda kaynaklı hastalıkların ortaya çıkmasına neden olabilmektedir. Bulaşma kaynakları arasında, gıdaların işlenmesinde kullanılan kesme tahtaları, dilimleyici, karıştırıcı ve öğütücüler, işletme suyu, ortam havası, uygun olmayan koşullarda bekletilen çöpler, haşereler, kemiriciler ve hayvanların yer aldığı birçok faktör yer almaktadır (Bilici, 2008). Mikroorganizmaların gıdalara bulaşma yolları Şekil 1’de gösterilmiştir.

Şekil 9. Mikroorganizmaların Gıdalara Bulaşma Yolları (Van Schothorst, 1999).

Bulaşı kaynaklarının en tehlikeli olanları patojen mikroorganizmalardır. Patojenler, gıdalara bulaştıktan sonraki uygun koşul ve sürelerde üreyerek ya da gıdada çoğalmadan bulunmaları halinde bile hastalık yapmaktadırlar (Bilici, 2008). *Salmonella*, *E. coli*, *L. monocytogenes* ve *Staphylococcus aureus* gibi bakteriler en sık karşılaşılan gıda zehirlenmesine neden olan bakteriler arasında yer alırlar (Anonymous, 2011-a). Mikroorganizmaların kontaminasyonu ve yayılması ile bunların olumsuz etkilerinin önlenmesinde temizlik ve dezenfeksiyonun büyük bir rolü bulunmaktadır (Şener ve Temiz, 2004). Temizlik, bir yüzey üzerinde mekanik ya da kimyasal etki gösteren ve estetik yönden görünümü bozan her türlü kirin ortadan uzaklaştırılmasıdır (Bilici, 2008). Dezenfeksiyon ise; temizlik aşamasından sonra ortamdaki ürüne kontaminasyon kaynağı olabilecek mikroorganizmaların tümünün öldürülmesi ya da en düşük düzeye indirilmesidir. Bu işlemde kullanılan maddelere dezenfektan denilmektedir (Anonymous, 2011-b). Mutfak, araç-gereç ve çalışma yüzeyleri yeterli derecede temiz olmadığında, gıdalar patojenlerle tekrar kontamine olabilmektedir. Riski minimuma indirmek için yüksek riskli gruptaki araç-gereç (yiyeceklerle direk teması olan araç-gereç ve yüzeyler) ve çalışma yüzeylerinin temizliğinde sıcak su, deterjan ve dezenfektanların kullanılması gerekirken, düşük riskli gruptaki (yiyeceklerle direk temas etmeyen duvar, raf vb. yüzeyler) araç-gereç ve yüzey temizliğinde ise sıcak su ve deterjan kullanılması yeterli olabilmektedir (Göbel, 2008). Ama bazı işletmelerde gıda ile temas eden yüksek riskli araç-gereç ve yüksek riskli yüzey temizliğinde genellikle düşük riskli gruptaki araç-gereç ve yüzey temizliğinde kullanılan sıvı deterjanların kullanıldığı saptanmıştır (Çalışkan, 2006, Çelik ve Var, 2017).

Hatalı dezenfeksiyonun ve birçok gıda zehirlenmesinin ana nedeni, personelin dikkatsizliği ve bu konuda bilgi yetersizliğidir (Demirel, 2009). Hijyen uygulamaları konusundaki eğitimler; gıda bulaşmalarının önlenmesi için personelin gıda işletmelerindeki rolünün önemini anlamaları ve sorumluluklarının farkına varmaları açısından son derece önemlidir (Akbulut, 2010). İnsanın boğaz, burun, el, deri, bağırsak ve dışkı bakterilerle yüklüdür (Bilici vd. 2006). Bu kaynağın bulaşma aracı olan en önemli organı ellerdir. El temizliği kişisel hijyenin en önemli adımlarından birisi olup, bulaşmış ellerle gıdaların ve servis malzemesinin kirletilmesi, gıda zehirlenmelerinin en önemli nedenini oluşturmaktadır (Demirel, 2009). Gıda kaynaklı hastalıkların bulaşmasında en fazla katkıda bulunan faktörler; çıplak elle temas, işleme ve hazırlama ekipmanlarının yetersiz temizlenmesi, enfekte veya asemptomatik kişiler tarafından gıdaların işlenmesidir. Gıdaların ellerle kontaminasyonu, salgın araştırmalarında belirlenen en önemli faktördür (CDC, 2006). Ellerde çok sayıda bulunabilen düşük enfektif dozlarla sahip gıda kaynaklı patojenler gıdalara ve gıda dışındaki temas yüzeylerine kolayca aktarılabilir (Todd vd., 2008a; Todd vd., 2008b, Todd vd., 2010). Eller kontamine veya kirli olduğunda, geçici patojenlerin elden tüketime hazır gıdalara bulaşmasını önlemek için etkili el hijyeni uygulamalarının yeterli olmayacağı Amerika Birleşik Devletleri Gıda ve İlaç Dairesi tarafından bildirilmektedir (FDA, 2017). Özellikle tüketime hazır gıdalara çıplak elle temasın önlenmesi ve bu gıda maddelerini kullanırken uygun mutfak eşyaları, bezler, tek kullanımlık eldivenler veya maşa gibi ekipmanların kullanılması gerektiği önerilmektedir (FDA, 2017). Gıda işletmelerinde eldiven kullanılmasının amacı, gıdanın fiziksel, kimyasal ve mikrobiyolojik kontaminasyonunu en aza indirmektir (Green vd., 2007). Çalışanlar eğitilmediğinde ve eldiven kullanımı uygun şekilde denetlenmediğinde hem gıda çalışanları hem de gıda güvenliği yöneticileri için yanlış bir güvenlik hissi sunmakta ve çapraz kontaminasyona yol açarak daha yüksek riskli durumlara neden olmaktadır (Todd vd., 2010; Valero vd., 2016). Gıda işletmelerinde el yıkama ve eldiven kullanımının yaygınlığı üzerine yapılan araştırmalarda, el hijyeni uygulamalarının gerektiği kadar sık gerçekleşmediği bildirilmektedir. Örneğin, personellerin gerektiğinde ellerini yıkamadıkları ve/veya gerektiğinde eldiven giymedikleri, çiğ ete dokunduktan sonra her zaman ellerini yıkamadıkları ve çiğ ete dokunduktan sonra her zaman eldivenlerini değiştirmedikleri saptanmıştır (Clayton vd. 2002; Green ve Selman, 2005). Uygun eldiven kullanımı, patojenlerin elden gıdaya transferini azalttığı, ancak eldiven kullanımının yanlış bir hijyen hissi yaratarak daha az el yıkama uygulamalarına yol açabildiği de bildirilmiştir (Green vd., 2007).

Bu çalışma; Adana'da catering hizmeti veren bir firmanın, halk sağlığını tehdit eden gıda kaynaklı mikroorganizmalara karşı, çalışan personelin el hijyeni uygulamalarını incelemek amacıyla kurgulanmıştır.

## **2. ARAŞTIRMA ve BULGULAR**

### **2.1. MATERYAL**

Bu çalışmada, Adana'da faaliyet gösteren bir catering firmasının çalışanlarının el hijyeni uygulamalarını değerlendirmek amacıyla, rastgele seçilen 2 catering çalışanın eldivenli ve çıplak ellerinden sürüntü yöntemiyle alınan örnekler materyali oluşturmuştur.

### **2.2. YÖNTEM**

#### **2.2.1. Çalışanların Ellerinden Sürüntü Yöntemiyle Numune Alınması**

Bu çalışmada catering firmasından rastgele seçilen 2 personelin eldivenli ve çıplak elinden örnek almak için sürüntü yöntemi kullanılmıştır. Bu yöntemde, steril eküvyon çubuğu aseptik koşullarda tüpünden çıkarılarak uçtaki pamuk kısma değişik eğimler verdirilerek çalışanların eldivenli ve eldivensiz ellerine kuvvetlice bastırılmıştır. Bu sayede ellerdeki mikroorganizmaların pamuk ucunun tamamına geçmesi sağlanmıştır. Eküvyon çubuğu daha sonra hiçbir yere temas ettirilmeden içinde 5 ml dilüsyon sıvısı içeren tüpe yerleştirilerek tüp hızla laboratuvara ekim için götürülmüştür. Daha sonra aranan toplam aerobik mezofilik bakteri için Nutrient Agar, *E. coli* ve Koliform için Fluorocult® Lauryl Sulfate Broth, *Salmonella* spp. için Selenite Cystine Broth, Rappaport Vassiliadis Broth, Hektoen Enteric Agar, Xylose Lysine Deoxycholate Agar, *Staphylococcus aureus* için Egg Yolk Tellurite Emulsion içeren Baird Parker Agar, *Listeria* spp. için Buffered Listeria Enrichment Broth ve Palcam Agar besiyerleri kullanılarak ekim işlemleri gerçekleştirilmiştir (Anonymous, 2011-c).

### **2.3. BULGULAR**

Rastgele seçilen 2 çalışanın eldivenli ve çıplak ellerinden sürüntü yöntemiyle alınan örnekler, toplam aerobik mezofilik bakteri yükü, koliform ve *E. coli* ile *Salmonella* spp., *Staphylococcus aureus* ve *Listeria* spp. açısından değerlendirilmiştir. Sonuç olarak, örneklerin hiçbirinde *Salmonella* spp., *Staphylococcus aureus* ve *Listeria* spp. izole edilememiştir. Aerobik mezofilik bakteri yükü açısından değerlendirildiğinde, iki çalışanın eldivenli elinin aerobik mezofilik bakteri yükünün ortalaması ( $82 \times 10^4$  kob/cm<sup>2</sup>), çıplak elin aerobik mezofilik bakteri yükünün ortalamasından ( $50 \times 10^3$  kob/cm<sup>2</sup>) daha yüksek bulunmuştur (Çizelge 1). Koliform ve *E. coli* açısından incelendiğinde, eldivenli ellerin yüksek kontaminasyon gösterdiği ( $>1100$  EMS/cm<sup>2</sup>), çıplak ellerin ise düşük kontaminasyonda olduğu ( $<3$  EMS/cm<sup>2</sup>) belirlenmiştir (Çizelge 1).

Çizelge 1. Sürüntü yöntemiyle iki çalışanın elinden alınan örneklerin sonuçlarının ortalamaları

Çalışılan Mikroorganizmalar	Alınan Örnekler	
	Eldivenli ellerden alınan örneklerdeki sonuçlar	Çıplak ellerden alınan örneklerdeki sonuçlar
Toplam Aerobik Mezofilik Bakteri (kob/cm <sup>2</sup> )	82x10 <sup>4</sup>	50x10 <sup>3</sup>
Koliform (EMS/cm <sup>2</sup> )	>1100	< 3
<i>E. coli</i> (EMS /cm <sup>2</sup> )	>1100	< 3
<i>Salmonella</i> spp.	*TE	*TE
<i>Staphylococcus aureus</i> (kob/cm <sup>2</sup> )	*TE	*TE
<i>Listeria</i> spp.	*TE	*TE

\* TE: Tespit Edilemedi

Gıda güvenliği, tüketicilerin sağlığına zarar verebilecek tehlikelerin gıdalardan uzaklaştırılması ve çapraz bulaşmanın önlenmesi açısından kritik öneme sahiptir. Bu nedenle işletmelerde uygulanan hijyen gerekliliklerinin sorgulanması olası riskleri ortaya koyabilecektir. Hijyen gerekliliklerinden en önemlilerden birisi de personel ve daha da önemlisi el hijyenidir. El hijyeninde dikkat edilmesi gereken koşullardan biri ellerin uygun yöntemle yıkanmasıysa diğeri de yıkamanın yetersiz kalabileceği durumlarda eldiven kullanımınıdır. Ancak yapılan çalışmalar eldiven kullanımındaki hataların gıda güvenliğini daha çok tehdit edebildiğini göstermektedir. Valero vd. (2016), bu konuyla ilgili yaptıkları çalışmada eldiven kullanılmamanın, eldivenlerin düzensiz değişimi ve yanlış kullanımının çapraz kontaminasyonu artırabileceğini ve gıda zehirlenmesinin ana nedenlerinden biri olabileceğini bildirmişlerdir. Erdoğan ve Pamuk (2020) tarafından yapılan bir çalışmada, gıda endüstrisinde çalışanların eldivensiz elleri ve yüzeylerde yapılan mikrobiyolojik analizler, *Staphylococcus* spp. ve *Enterobacteriaceae* bakterileri ile kontaminasyonun yaygın olduğunu göstermektedir. İzolat sayıları dikkate alındığında, %52 oranda en yüksek kontaminasyonun gıda çalışanlarının ellerine ait olduğu tespit edilmiştir. Eldiven kullanımının etkinliğini artırmak için eldiven değişiminden önce ve sonra ellerin yıkanmasının önemi de vurgulanmaktadır (Michaels vd., 2004). Yapılan bir çalışmada, Paulson (1996), eldiven takmadan önce eller yıkanmadığında *E. coli* sayısının arttığını (1 ve 3 saat sonra belirlendiğinde), ancak eller eldiven giymeden önce yıkandığında ise, 3 saatlik devamlı eldiven kullanımından sonra, mikroorganizma sayısında anlamlı bir artış olmadığını gözlemlemiştir.

Bu nedenle eldiven kullanımında, eldivenleri çıkardıktan sonra ve her eldiven değişiminde eldiven giymeden önce el yıkama işleminin gerçekleştirilmesi gerektiği vurgulanmaktadır.

Eldiven kullanımında eldivenlerin bütünlüğünün korunması gerekliliği de oldukça önemlidir. Yapay tırnaklar ve takılar gibi faktörlerin eldivenlerin bütünlüğünü bozabileceği eldivenlerin yırtılmasına veya delinmesine yol açabileceği ve kontaminasyon kaynağı olabileceği belirtilmektedir (Gürel ve Taşçı, 2020). Tırnaklar ile ilgili yapılan bir çalışmada Dagnev vd. (2013), tırnaklarda antibiyotiklere dirençli *S. aureus* (%16) ve koagülaz negatif stafilkoklar (%33) tespit etmişler. Valero vd. (2016) yaptıkları çalışmada, eldivenlerin düzenli olarak değiştirilmesi gerektiğini ve kirli veya deforme olmuş eldivenlerin çıplak ellerden daha fazla kontaminasyon riski taşıdığını belirtmişlerdir. Perez-Rodriguez vd. (2006) yaptığı bir çalışmada, farklı gıdaların işlenmesi sırasında uzun süreli aynı eldiveni kullanmanın patojenlerin transfer riskini artırdığı bulunmuştur. Özellikle, *L. monocytogenes* gibi patojenlerin çiğ tavuktan pişmiş ete aktarılma riskinin bu şekilde arttığı tespit edilmiştir. Ancak, eldivenlerin düzenli olarak değiştirilmesinin ve kullanımının doğru şekilde yapılmasının bu riski azaltabileceği vurgulanmıştır. Birçok eldiven materyali aşırı nem birikmesine yol açmaktadır ve uzun süreli eldiven kullanımı da deride nem ve sıcaklık artışına neden olmaktadır. Bunun sonucu olarak da tırnakların içerisinde mikroorganizmaların birikmesine yol açarak mikrobiyal çoğalmayı teşvik edebileceği ve bu durumun çapraz kontaminasyon riskini artırabileceği vurgulanmaktadır. Bu durum aynı zamanda eldiven değiştirme işlemi sırasında da sorun yaratabilecek ve yine çapraz kontaminasyon riski söz konusu olabilecektir (Gürel ve Taşçı, 2020). Aynı zamanda eldiven kullanımının yanlış bir güvenlik duygusu yaratması ve çalışanların yeterince eğitilmemesi çapraz kontaminasyona sebep olabilecek daha yüksek riskli durumlara da yol açabilecektir (Todd vd., 2010). Bizim çalışmamızda da iki çalışanın elleri aerobik mezofilik bakteri, *E. coli* ve koliform bakteri açısından değerlendirildiğinde eldivenli ellerin yüksek kontaminasyon gösterdiği, çıplak ellerin ise düşük kontaminasyonda olduğu belirlenmiştir. Bu bağlamda, eldiven kullanımının gıda güvenliği üzerindeki etkilerini artırmak için çalışanların eldiven kullanımı konusunda yeterince eğitilmeleri ve bu önlemlerin doğru şekilde uygulanması, çapraz kontaminasyon riskini en aza indirmek için kritik öneme sahiptir.

### **3. SONUÇ**

Catering sektöründe çalışanların el hijyeninin değerlendirildiği bu çalışmada el hijyenindeki yetersizliğin, beklenenin aksine özellikle eldivenli ellerde daha belirgin olduğu görülmüş, bu da eldiven kullanımına daha dikkat edilmesi gereken bir husus olduğunu göstermiştir. Sonuç olarak, eldiven kullanımı kontrol edilmediği takdirde potansiyel mikrobiyal kontaminasyon

riskinin artmasına neden olabilecektir. Bir üretim yerinde her türlü hijyen gereklilikleri yerine getirilse bile bir personeldeki hijyen eksikliği üretimi riske sokabilecektir. Bu açıdan araştırma yapılan catering firmasında gıda kaynaklı halk sağlığını tehdit eden mikrobiyal kontaminasyon riski değerlendirildiğinde, özellikle el hijyeni açısından işletmenin yetersiz olduğu gözlenmiştir.

**Özet**

İşletmeler, dijitalleşmeden oldukça fazla etkilenmektedir ve bu etkiler bir işletmedeki iç ve dış paydaşların dahil olduğu tüm süreçler ile doğrudan ilişkilidir (Bajer vd., 2017). Dijitalleşmenin, müşterilerin satın alma davranışları (Kaya ve Okur, 2021), işletmelerin müşteri tercihleri, iş performansları üzerindeki etkileri (Uzkurt vd. 2022) ve işletmelerin iç süreçleri ve davranışları özellikle finansal açıdan nasıl etkilediği araştırılırken, insan kaynakları ile ilgili süreçlerin dijitalleşmesi ve bunun dijital pazarlama yönetimi ile olan ilişkisi çok fazla incelenmemiştir. İşletmelerin, dijitalleşmenin tüm kazanımlarından en iyi biçimde faydalanabilmeleri için tüm fonksiyonlarının bütünsel olarak dijitalleşmesi gerekmektedir. Pazarlamanın tarihsel gelişiminde müşteri odaklılığın modern dönemde oluşmaya başladığı görülmektedir. Modern pazarlama döneminde dijitalleşme ekonomik yapı üzerinde doğrudan etkiliyken, pazarlama üzerinde dolaylı olarak etkili olmuştur. Fakat internet teknolojilerinin gelişmesiyle günümüz dünyasında dijitalleşmenin doğrudan pazarlama üzerinde de etkili olduğu görülmektedir (Şengül, 2019). Dijital pazarlama literatürü incelendiğinde dijital pazarlama kanallarının müşteri ilişkileri, halkla ilişkiler ve insan kaynakları gibi departmanlarda kullanımının işletmeye sağlanacak toplam faydayı arttıracak yönünde yaklaşımlar göze çarpmaktadır (Rocha vd., 2013). Dijital pazarlama tekniklerinin insan kaynakları alanında kullanımı, işe alım fonksiyonunda eylem alanının genişlemesine ve farklı kanalların kullanılmasına, dış müşteri ve iç müşteri etkileşiminin dijital kanallar aracılığıyla artmasına, çalışan performans ölçümünde daha etkin ve objektif dijital teknolojilerin kullanılmasına, marka yönetimi teknikleriyle işveren markası kavramının oluşturulmasına olanak tanımıştır (Mihalcea, 2017). Müşteri odaklı yaklaşımın içsel pazarlama anlayışı ile örgüt içinde benimsenmesi örgütsel bağlılık üzerinde olumlu katkılar sağlamıştır (Collins ve Payne, 1991). Bu bağlamda bu araştırmanın amacı dijitalleşmenin pazarlama yönetimi ve insan kaynakları yönetimi üzerindeki etkisini yenilikçi ve bütünsel bir yaklaşımla ele alarak literature teorik bir katkı sağlamaktır.

**Anahtar Kelimeler:** dijital pazarlama yönetimi, dijital insan kaynakları yönetimi, dijital dönüşüm

**DIGITAL HUMAN RESOURCES MANAGEMENT AND DIGITAL MARKETING  
MANAGEMENT; INNOVATIVE COOPERATION**

**Abstract**

Businesses are highly affected by digitalization, and these effects are directly related to all processes involving internal and external stakeholders in a business (Bajer, 2017). While investigating how digitalization affects customers' purchasing behavior (Kaya and Okur, 2021), businesses' customer preferences, its effects on business performance (Uzkurt vd., 2022), and how it affects an organization's internal processes and behaviors, especially financially, human resources. The digitalization of processes related to digital marketing and its relationship with digital marketing management have not been examined much. To make the most of all the gains of digitalization, businesses must start dealing with the holistic digitalization of the entire business. It is seen that customer focus, one of the most important issues in the historical development of marketing, began to emerge in the modern period. In the modern marketing era, while digitalization has a direct impact on the economic structure, it has an indirect impact on marketing. However, with the development of internet technologies, it is seen that digitalization is also effective on direct marketing in today's world (Şengül, 2019). When the digital marketing literature is examined, approaches stand out that the use of digital marketing channels in departments such as customer relations, public relations and human resources will increase the total benefit to the business (Rocha et al., 2013). The use of digital marketing techniques in the field of human resources has enabled the expansion of the field of action and the use of different channels in the recruitment function, the increase of external and internal customer interaction through digital channels, the use of more effective and objective digital technologies in employee performance measurement, and the creation of the employer brand concept with brand management techniques. (Mihalcea, 2017). Adoption of the customer-oriented approach within the organization with the internal marketing approach has made positive contributions to organizational commitment (Collins and Payne, 1991). In this context, the aim of this research is to make a theoretical contribution to the literature by addressing the impact of digitalization on marketing management and human resources management with an innovative and holistic approach.

**Keywords:** digital marketing management, digital human resources management, digital transformation

## **GİRİŞ**

İşletmelerin dijitalleşmesi, günümüz rekabetçi iş ortamında avantaj sağlamak ve başarılı olabilmeleri için kaçınılmaz bir gerekliliktir. Başka bir deyişle, günümüz işletmeleri için dijitalleşme bir seçenekten ziyade hayati bir gereklilik haline gelmiştir. Dijitalleşme, işletmelerin geleneksel iş modellerini, süreçlerini ve yönetim yaklaşımlarını dijital teknolojilerle dönüştürerek daha verimli, esnek ve müşteri odaklı bir yapıya geçiş yapmalarını ifade etmektedir. Özellikle günümüzde hızla değişen iş ortamlarında, dijitalleşme sayesinde işletmeler daha hızlı kararlar alabilir, müşteri taleplerine daha çabuk yanıt verebilir ve pazardaki trendlere daha çabuk adapte olabilirler. Ayrıca dijitalleşme, işletmelerin veri analitiği ve yapay zekâ gibi alanlardan da faydalanarak daha stratejik alanlarda bilgiye dayalı kararlar almasını sağlar. Bu nedenle, işletmelerin dijitalleşme sürecine yatırım yapmaları ve bu alanda sürekli olarak kendilerini güncellemeleri başarılı olabilmeleri için kritik önem kazanmaktadır. Dijitalleşme sürecinde işletmelerin önemli fonksiyonlarından olan pazarlama yönetimi ve insan kaynakları yönetimini bütünsel olarak ele alması gerekmektedir. Bu çalışmada bu iki fonksiyonunun dijitalleşmeden nasıl etkilendikleri ve yenilikçi, işbirlikçi yaklaşımları teorik olarak ele alınmıştır.

### **1. DİJİTAL İNSAN KAYNAKLARI YÖNETİMİ**

İnsan kaynakları yönetimi, işletmelerin hedeflerine ulaşabilmesi için gerekli olan faaliyetleri gerçekleştirecek yeterli sayıda, kalifiye elemanın işe alımı, eğitimi, geliştirilmesi, motivasyonu ve değerlendirilmesi sürecidir (Aytaç, 1997). Başka bir tanıma göre, işletmeye çalışan tedariki sağlamasının (Bingöl, 2003) yanında işe alınan çalışanın eğitimi, geliştirilmesi, değerlendirilmesi ve işletmenin hedeflerine ulaşma doğrultusunda çalışanların yasalara da uyularak, etkin yönetilmesini sağlayan işlev ve çalışmaların tümüdür. Bu tanımlamalardan da anlaşılacağı üzere insan kaynakları yönetiminin başlıca fonksiyonu olarak işe alım gösterilirken, çalışanların değişen dünyaya uyum sağlayabilmeleri adına gerçekleştirilen diğer faaliyetler de insan kaynakları yönetiminin altında ele alınmaktadır. Dolayısıyla sürekli dijitalleşen ve teknolojinin önem kazandığı günümüz iş ortamında insan kaynaklarının dijitalleşmesi ve bu alana yatırım yapılması bir zorunluluk haline gelmiştir. İnsan kaynakları yönetiminin dijitalleşmesi süreci, adayın başvuru sürecinden başlamakta ve işletmedeki diğer çalışanların elde tutulmasına kadar giden birçok farklı alanda karşımıza çıkmaktadır. Özellikle de başvuran aday sayısının oldukça yüksek olduğu işletmelerde bu tür yeniliklerin kullanılması süreçlerin etkin ve verimli bir şekilde ilerlemesine katkı sağlamaktadır (Nivlouei, 2014). İnsan kaynakları yönetim süreçlerinin dijitalleştirilmesi, işletmelerin daha rekabetçi olmaları, çalışan

deneyimlerinin iyileştirilmesi ve işletme performansını artması beklenmektedir. Ancak bu süreçte güvenliğin ve gizliliğin korunması da önemlidir, bu yüzden dijitalleşme adımları dikkatlice planlanmalı ve uygulanmalıdır.

- Alım ve İşe Yerleştirme: Dijitalleşme, işe alım süreçlerini hızlandırır ve daha etkin hale getirir. Online başvuru formları, dijital CV değerlendirme sistemleri, video mülakatları gibi araçlar kullanılarak adaylar daha hızlı ve verimli bir şekilde değerlendirilebilir.
- Eğitim ve Gelişim: Dijital platformlar aracılığıyla çalışanlara çevrimiçi eğitimler sunulabilir. Bu eğitimler, çalışanların kariyerlerini geliştirmelerine ve yeni beceriler kazanmalarına olanak tanır.
- Performans Değerlendirme: Dijitalleşme, performans yönetimi süreçlerini otomatikleştirerek geri bildirimleri ve performans değerlendirmelerini daha objektif ve etkili hale getirir. Performans verileri, dijital platformlarda tutularak daha kolay erişilebilir hale gelir.
- Çalışan İlişkileri ve İletişim: İç iletişim araçları ve dijital platformlar, çalışanların birbirleriyle etkileşimini artırır ve şirket kültürünü güçlendirir. Ayrıca, uzaktan çalışma gibi esnek çalışma modellerini destekleyerek çalışan memnuniyetini artırabilir.
- İş Süreçlerinde Verimlilik: Otomatikleştirilmiş işlemler ve dijital platformlar, iş süreçlerinin daha verimli ve hatasız yürütülmesini sağlar. Bu da insan kaynakları departmanının daha stratejik görevlere odaklanmasına olanak tanır.

Elbette ki rekabet avantajı elde etmek isteyen işletmeler için yalnızca insan kaynakları yönetim alanının dijitalleşmesi yeterli olmayacaktır. İnsan kaynakları yönetimine ek olarak, işletmenin diğer fonksiyonlarının da özellikle pazarlama alanının bu değişime uyum sağlaması ve bu yönde stratejiler oluşturulması çok daha doğru olacaktır.

## **2. DİJİTAL PAZARLAMA YÖNETİMİ**

Dijitalleşme, bilgi, belge ve dokümanların tümünün bilgi işlem teknolojileri kullanılarak dijital ortamlara aktarılması sürecini ifade eder. Bu yeni ortamlar, dijital olarak adlandırılır ve bilgilerin daha kolay erişilebilir ve işlenebilir hale gelmesini sağlar (Erkan, 2020). Teknolojinin hızla ilerlemesiyle birlikte dijitalleşme sürekli olarak artmaktadır. Bu dijital dönüşüm, işletmelerin pazarlama faaliyetleri aracılığıyla hedef kitlelerini etkileme ve onlara daha hızlı erişim sağlama kapasitesini artırmaktadır. Dijital pazarlama, işletmelerin belirledikleri hedeflerine internet, sosyal medya, web siteleri, e-postalar gibi iletişim araçlarını kullanarak ulaşmalarını sağlayan bir pazarlama stratejisidir (Karahasan, 2012). Çevrimiçi platformlarda

uygulanan dijital pazarlama işletmenin diğer fonksiyonlarıyla bütünsel olarak ele alındığında ilişki pazarlaması, işletme yönetimi ve insan kaynakları yönetimine katkı sağlamaktadır. Dijital pazarlama işletmelerle tüketicilerin etkileşimlerine de önemli katkılar sağlamıştır. Bunların en önemlileri şöyle sıralanabilir (Bala, 2018):

- İşletme ve müşteriler arası artık çift yönlü ilişki kurulabilmektedir.
- Müşterilerin 7/24 hizmet alabilme ve pek çok ürünü karşılaştırabilme imkanı bulunmaktadır.
- Tüketicilerin ürünlerle ilgili kendi aralarında çevrimiçi bilgi paylaşma imkanı bulunmaktadır.
- Tüketiciler ürünlere daha kolay ulaşmakta ve daha hızlı satın alabilmektedirler.

Pazarlamanın dijitalleşmeden yoğun şekilde etkilenmesi işletmelerde yeni çalışan rollerinin de ortaya çıkmasına neden olmaktadır. İçerik sorumlusu, veri bilimcisi, çok kanallı pazarlama sorumlusu bu rollerden sadece bir kaçıdır. Oluşan yeni roller, insan kaynakları yönetiminin işe alım, eğitim ve performans ölçümü gibi fonksiyonlarıyla da yakından ilgili olduğundan, insan kaynakları yönetiminin de dijitalleşmeye uyum sağlaması beklenmektedir. Dolayısıyla işletmelerin dijitalleşme fırsatlarından faydalanmak için tüm fonksiyonlarının özellikle pazarlama ve insan kaynakları fonksiyonlarının bütünsel olarak ele alınması bir zorunluluk haline gelmiştir (Çetin, 2018).

### **3. DİJİTAL İNSAN KAYNAKLARI YÖNETİMİ VE DİJİTAL PAZARLAMA YÖNETİMİ**

Eskiden işletmeler rekabet avantajı sağlamak için belirli bir alanı dijitalleştirmeye odaklanabilirlerken, günümüzde bu durum değişmiştir. Artık işletmelerin sadece bir fonksiyonunun dijitalleştirilmesi yeterli değildir; tüm işletme fonksiyonlarının dijitalleştirilmesi gerekmektedir. Bunun başlıca sebepleri (Collins ve Payne, 1991).

- İşletme fonksiyonları arasında entegrasyon, verimlilik açısından kritiktir. Bir fonksiyon dijitalleştirilirken, diğerleriyle uyumlu olmalıdır. Tüm fonksiyonların dijitalleştirilmesi, süreçlerin daha iyi entegre edilmesine ve verimliliğin artmasına yardımcı olur.
- Veri Akışı ve Analitik Yetenekler: İşletmelerin başarısı giderek daha fazla veriye dayanmaktadır. Tüm fonksiyonların dijitalleştirilmesi, veri akışını sağlamakta ve işletmeye kritik kararlar için gerekli olan analitik yetenekleri sağlamaktadır.
- Operasyonel Esneklik ve Kriz Yönetimi: Dijitalleşmiş işletmeler, operasyonel esneklikleri sayesinde kriz zamanlarında daha iyi adapte olabilmektedirler. Uzaktan

çalışma, çevrimiçi satış ve diğer dijital süreçler, işletmelerin iş sürekliliğini sağlamalarına yardımcı olmaktadır.

- Müşteri Deneyimi ve Rekabet Gücü: Tüketici beklentileri hızla değişmekte ve müşteri deneyimi rekabet avantajı sağlamanın anahtarı haline gelmektedir. Sadece pazarlama veya satış değil, tüm işletme fonksiyonlarının dijitalleştirilmesi iç ve dış müşteri deneyimini geliştirmeye ve rekabet gücünü artırmaya yardımcı olmaktadır.

Dijital pazarlama stratejileri ve kanalları insan kaynakları yönetimi alanında da etkin araçlar olarak kullanılmaya başlanmıştır. Dijital pazarlama uygulamalarının insan kaynakları yönetiminde de kullanılabilmesi işe alım konusunda alanların genişlemesine, iç müşteri uygulamalarıyla çalışan bağlılıklarının ve performanslarının artmasına, iç ve dış müşteri etkileşiminin artmasına olanak sağlamıştır.

#### **4. SONUÇ**

İnternet teknolojilerinin gelişmesi ve kullanımının yaygınlaşması pek çok alanda etkili olduğu gibi pazarlama yönetimi ve insan kaynakları yönetimi alanında da etkili olmuştur. İşletmelerin sürdürülebilir rekabet avantajı sağlayabilmeleri için dijitalleşme stratejilerini pazarlama yönetimi ve insan kaynakları yönetimi alanında bütünsel olarak yürütmeleri gerekmektedir. Dijital pazarlama stratejilerinin insan kaynakları alanında da kullanılabilmesi, işe alım performans yönetimi, çalışan etkileşimi, dış müşteri etkileşimi ve iş veren markası yaratma gibi konularda etkinliğin ve verimliliğin artmasına olanak tanımıştır. Özellikle iç müşteri tarafından çalışılmak istenen bir işletme olmak, yüksek çalışan aidiyetlerinin yaratılması konusunda personel adaylarına doğru mesajı vermek konusunda da doğru dijital pazarlama stratejilerinin oluşturulması önem taşımaktadır. Bu çalışmanın amacı dijitalleşmenin pazarlama yönetimi ve insan kaynakları yönetimine etkisinde işbirlikçi bir yaklaşım olduğunu teorik olarak ortaya koymak ve bu alanda kısıtlı çalışma olduğundan literatüre katkı sağlayabilmektir.

**Özet**

Günümüz teknolojisinde imalatta düşük maliyet, hızlı üretim ve hassasiyet gibi faktörler göz önüne alınarak rekabet artmıştır. Bu teknolojiye ayak uydurmak için insan gücü ve universal tezgâhlardan uzaklaşılarak yerine bilgisayar kontrollü sistemler zorunlu hale gelmiştir. Cnc plazma tezgahları da bu teknolojiye yer edinmiştir. Plazma kesim teknolojisi ile kesme işlemi yaparken kesim kalitesini maksimum seviyeye ulaştırmak için malzemenin kalınlığına göre uygun hız ve amper verilmesi gerekmektedir. Uygun amper ve hız verilmediğinde malzemenin arka yüzeyinde çapaklar meydana gelmekte ve istenilen ölçüde kesim elde edilememektedir. Bu çalışmada 1500x3000 mm kesme alanına sahip 120 Amper güç kanağı kullanılarak hava ile 1-15 mm arasındaki malzemelerin istenilen ölçüde kesme işlemi için hız ve amper parametreleri oluşturulmuştur. Deneysel çalışmalar sonucunda malzemenin kalınlığı arttıkça kesme hızı azalırken kesme amperinin arttığı tespit edilmiştir.

**Anahtar Kelimeler:** Cnc Plazma Kesim, Kesme Amperi, Kesme Hızı

**DETERMINATION OF SPEED AND AMPERAGE PARAMETERS IN CNC  
PLASMA AIR CUTTING PROCESSES**

**Abstract**

In today's technology, competition in manufacturing has increased considering factors such as low cost, fast production and precision. In order to keep up with this technology, manpower and universal machines have been moved away from computer-controlled systems instead. Cnc plasma machines have also gained a place in this technology. When cutting with plasma cutting technology, the appropriate speed and amperage must be given according to the thickness of the material in order to maximize the cutting quality. When the appropriate amperage and speed are not given, burrs appear on the back surface of the material and the desired cut cannot be achieved. In this study, speed and amperage parameters were created for cutting materials between 1-15 mm with air to the desired size by using a 120 Ampere power supply with a cutting area of 1500x3000 mm. As a result of experimental studies, it was determined that as the thickness of the material increases, the cutting speed decreases and the cutting amperage increases.

**Keywords:** Cnc Plasma Cutting, Cutting Amperage, Cutting Speed

## **Giriş**

Computer Numerical Control (CNC), basit Numerical Control (NC) fonksiyonlarını sağlayarak bünyesinde bilgisayar sistemi bulunduran, parça programlarının tanımlanarak malzemelerin işlenmesinde kullanılan mekanik bir sistemdir. CNC plazma teknolojisi ise üç eksenle malzemeye temas etmeden belli bir yükseklikte gerçekleşen metal kesme işlemidir. CNC işleme; otomotiv, havacılık, inşaat ve tarım da dâhil olmak üzere çok çeşitli endüstrilere uygun olan otomobil çerçeveleri, cerrahi ekipmanlar, uçak motorları, dişliler, el ve bahçe gibi çeşitli ürünler üretebilen bir üretim sürecidir. Süreç, özel olarak tasarlanmış bir parça veya ürün üretmek için iş parçasından gerekli malzemeyi çıkaran, mekanik, kimyasal, elektrik ve termal süreçler de dâhil olmak üzere, birkaç farklı bilgisayar kontrollü işleme operasyonunu kapsar (Mamadjanov vd, 2021) Elektriksel olarak iletken hale gelen plazma, arkla ısıtılmış en azından kısmen iyonize olan bir gazdır. Plazma herhangi bir elektrik arkında oluşurken, plazma arkı bir torc sayesinde daraltılan bir yoğunlaşma etkisiyle oluşan patlamadır. Genel olarak malzemelerin kesiminde kullanılan geleneksel plazma sistemleri, yaygın olarak 20-150 mm kalınlık mesafesinde kesimi gerçekleştirmektedir. Günümüz hassas plazma sistemleri ise Hassas olarak kesim işlemini yerine getiren lazer kesim sistemleri, 1-12 mm kalınlığı mesafesindeki malzemeleri keserken; günümüzde kullanılan hassas plazma sistemleri lazer sistemlerine yaklaşık hassasiyette kesim yapabilme konusunda geliştirilmektedirler (Apay ve Egelioglu, 2018). İmalat ve sanayide yaygın olarak kullanım alanına sahip olan plazma ile kesim, otomasyon uygunluğu ile üretim hattı sahasına, düşük maliyet ile verimli yatırım oranlarına, kesim hızının yüksek oluşu ve kesim kalitesinin sürekli olarak iyileştirilmesi ile olanaklar sunmaktadır. İş makineleri, gemi inşası, basınçlı kapların üretimi, vagon yapımı gibi imalat sektöründe yoğun olarak plazma kesim metodu ile karşılaşılmaktadır (Kutlu vd, 2005). Kesim işlemi yapılacak iş parçası üzerinde lokal bir bölgenin eritilerek yok edilmesi, daraltılarak yoğunlaştırılan bir ark sayesinde gerçekleştirilir. Buna plazma arkı ile kesim işlemi adı verilir. Torc ağzından yüksek hızlarda çıkan iyonize gazlar tarafından yüksek sıcaklığa maruz kalmış ve hal değiştiren metal, kesim bölgesinden uzaklaştırılır. 10000 ve 14000 °C sıcaklıkta çalışan plazma arkı, iyonize hale gelen gazın dönüşümüdür (Karkın, 2006; Akşahin, 2009). Plazma ile kesimde önemli parametreler gaz, güç kaynağı ve kesme hızıdır. Şekil 1’de görüldüğü gibi torcun yüksekliği de önemlidir. Parametreler arasındaki ilişkiler kesimde elde edilecek kaliteyi tanımlar.

Gaz parametreleri; Plazma ile kesme işleminde 6-8 bar basıncında gaz kullanılmaktadır. Kesme işleminde kullanılan gazlar hava, karbon, hidrojen gibi gazlardır. Bu gazlara bağlı olarak kesme kalitesi değişim göstermektedir. (Kutlu, 2005)

**Şekil 1.** Plazma ile kesim parametreleri (Kutlu vd,2005)

### **Materyal ve Metot**

Tokat Niksar sanayi bölgesinde 1500x3000 mm kesim alanına sahip üç eksenli CNC plazma kesim tezgâhı kullanılarak farklı kalınlıktaki metal malzemelerin kesim işleminde minimum deformeler ile yüksek kalitede işlenmesi için uygun hız ve amper parametreleri belirlenmeye çalışılmıştır. 1500x3000 mm işleme alanına sahip tezgâhlarda hava ile 15 mm kalınlığına kadar metal malzeme kesebilmesi için 120 amper güç kaynağı kullanmak gerekmektedir. Hız ve amper parametrelerinin belirlenmesinde kullanılan Şekil 2'deki CNC plazma kesim tezgâhı 120 amper güç kaynağına sahiptir.

**Şekil 2.** St37 malzemesinin kesim işleminde kullanılan CNC plazma tezgâhı

Hız ve amper ayarı kesimin kalitesini belirleyen en önemli parametrelerdir. CNC plazma kesim tezgâhlarının en zor kestiği form daire şeklindeki çizimlerdir. Farklı çaplarda daireler keserek uygun kesme hızı-amper ayarı parametresi elde edilmiştir. Şekil 3’te görüldüğü gibi malzemenin kalınlığına göre düzgün amper ve hız belirlenmemesinden dolayı hatalı kesim işlemi olmuştur. Şekil 4’teki uygulamada hız 750 mm/dk, amper ayarı 85 amper olarak verilmiştir.

**Şekil 3.** Hız ve amper ayarının hatalı belirlenmesi

CNC plazma kesim tezgâhının imalatından sonra farklı kalınlıklarda malzemeler kesilerek en düzgün kesim kalitesini elde edilebilecek parametreler Tablo 1’de verilmiştir. Kesim işlemi malzeme türüne göre örneğin çelik, alüminyum ve St37 gibi malzemeler de hız-amper ayarı değişkenlik göstermektedir. Endüstriyel uygulamalarda yaygın olarak St37 malzemesi kullanılmaktadır. Bu nedenle deneysel çalışmada St37 malzemesi kullanılarak kesme parametresi oluşturulmuştur.

Tablo 1 CNC Plazma kesim tezgâhının kesme parametresi

Malzeme Kalınlığı (mm)	Amper (A)	Kesme Hızı (mm/dk)
1-2	65	2700
2,5-3-4	75	2200
5-6-7	80	1600
8-9-10	90	1000
11-12-13	95	750
14-15	100	500

Kesimin kalitesi sadece malzeme türüne, ampere ve kesme hızına bağlı değildir. Kesim esnasında oluşan titreşimler de kesim kalitesini etkilemektedir. Bu titreşimleri en aza indirmek için kutu profil yerine alüminyum ağır sigma profil kullanılmıştır. 15 mm kalınlığındaki parametre kullanılarak Şekil 4'teki kesim elde edilmiştir. Kesim işlemi tamamlandıktan sonra kesilen malzemenin ön ve arka yüzeyi kumpas ile ölçülmüştür. Ön yüzeyinde kesim istenilen ölçüdedir ancak arka yüzeyin ölçülerinin 1,5 mm az olduğu tespit edilmiştir.

**Şekil 4.** Hız ve amper ayarının doğru belirlenmesi

#### **Bulgular ve Tartışma**

CNC plazma kesim tezgâhında farklı kalınlığa sahip ve kullanım alanları farklı olan malzemeler kesilerek sonuçları gözlemlenmiştir. CNC plazma kesim tezgâhlarında görülen en büyük hatalardan biri de kesilen malzemenin arka yüzeyinde çapak oluşmasıdır. Kesim işlemi sonrasında 2-15 mm kalınlığa sahip malzemelerin arka yüzeylerinde çapak oluşumu olmadığı tespit edilmiştir. Kesilen malzemeler 65 amper ve 2700 mm/dk'da kesilmiştir. Malzemelerin kesme işlemini yaparken, kesim kalitesini ölçmek için basınç ayarları değiştirilmiştir. Şekil 5'te görüldüğü gibi lazer kesime yakın çapaksız temiz bir kesim elde edilmiştir.

**Şekil 5.** 2 mm kalınlığındaki St37 malzemenin kesim işlemi

4 mm kalınlığındaki St37 malzemesinden kesilen iş parçası Şekil 6'da verilmiştir. Kesilen iş parçası, 75 amper ve 2200 mm/dk'da kesilmiştir. Kesim esnasında malzemenin ısınmasından dolayı sacda esnemeler meydana gelmiştir. Bu esnemelerden kaynaklı, malzemenin arka yüzeyinde az miktarda çapak kaldığı gözlemlenmiştir.

**Şekil 6.** 4 mm kalınlığındaki St37 malzemenin kesim işlemi

5 mm kalınlığındaki St37 malzemesinden kesilen iş parçası Şekil 7’de verilmiştir. Seçilen iş parçası, 80 amper ve 1600 mm/dk’da kesilmiştir. Kesim herhangi bir hata olmadan başarılı bir şekilde tamamlanmıştır.

**Şekil 7.** 5 mm kalınlığındaki St37 malzemenin kesim işlemi

6 mm kalınlığındaki St37 malzemesinden kesilen iş parçası Şekil 8’de verilmiştir. Şekil 8’de verilen iş parçası, 80 amper ve 1600 mm/dk’da kesilmiştir. Kesme işlemi sonucunda, malzeme kumpas ile ölçüldüğünde arka yüzeyinde istenilen ölçüden 0,5 mm az olduğu tespit edilmiştir.

**Şekil 8.** 6 mm kalınlığındaki St37 malzemenin kesim işlemi

8 mm kalınlığındaki St37 malzemesinden kesilen iş parçası Şekil 9’da verilmiştir. Şekil 9’da verilen iş parçası, 90 amper ve 1000 mm/dk’da kesilmiştir. Kesme işlemi sonucunda, malzeme kumpas ile ölçüldüğünde arka yüzeyinde istenilen ölçüden 1 mm az olduğu tespit edilmiştir.

**Şekil 9.** 8 mm kalınlığındaki St37 malzemenin kesim işlemi

10 mm kalınlığındaki St37 malzemesinden kesilen iş parçası Şekil 10'da verilmiştir. Şekil 10'da verilen iş parçası, 90 amper ve 1000 mm/dk'da kesilmiştir. Torcun kesime başladığı yerde iz kaldığı tespit edilmiştir.

**Şekil 10.** 10 mm kalınlığındaki St37 malzemenin kesim işlemi

Deneyisel çalışmalar sonucunda malzemenin kalınlığı arttıkça plazmadaki güç kaynağı amperin arttığı elde edilmiştir. Şekil 11'de görüldüğü gibi amper değerleri 60-100 amper arasında değişim göstermektedir. Dolayısıyla malzeme kalınlığı ile amper arasında doğru orantılı bir ilişki vardır.

**Şekil 11.** Malzeme kalınlığı-amper ilişkisi Elde edilen diğer bir deneysel sonuçta ise malzeme kalınlığı arttıkça kesme hızının azaldığı tespit edilmiştir. Şekil 12’de görüldüğü gibi hız değerleri 500-2700 mm/dk arasında değişim göstermektedir. Sonuç olarak malzeme kalınlığı ile hız arasında ters orantılı bir ilişki vardır.

**Şekil 12.** Malzeme kalınlığı-hız ilişkisi

### Sonuç ve Öneriler

Sonuç olarak malzeme kalınlığına bağlı olarak amper miktarı arttıkça kesme hızının azaldığı gözlemlenmiştir. 1-5 mm kalınlık arasında kesilen St37 malzemelerde kesimler istenilen ölçü ve kalitede gerçekleştirilmiştir. 6 mm kalınlığındaki St37 malzemenin kesme işlemi sonucunda, kumpas ile gerçekleştirilen ölçümler neticesinde arka yüzeyinde istenilen ölçüden yaklaşık olarak 0,5 mm daha az olduğu tespit edilmiştir. Aynı şekilde 8 mm, 10 mm ve 15 mm kalınlığındaki St37 malzemelerin kesme işlemi sonucunda, tekrar ölçümler yapıldığında

malzeme arka yüzeylerindeki ölçümlerin istenilen ölçüden sırasıyla 1 mm, 1,2 mm ve 1,5 mm daha olduğu gözlemlenmiştir. Bulunan kesme hızı ve amper parametreleri, literatürde yapılan benzer çalışmalar ile uyumlu olduğu da tespit edilmiştir. Yapılan kesme işlemlerinde gaz olarak kuru hava kullanılmıştır. Hidrojen-argon veya Azot-Hava gibi karışım gazlar kullanılarak farklı değerler gözlemlenebilir. Belirlenen kesme hızı ve amper parametrelerinde kesilen farklı kalınlıktaki malzemelerin başka çalışmalarda yüzey pürüzlülük değerleri de çalışılabilir.

### **Özet**

Biyoloji, yaşam, doğa ya da hayat mimikri ise taklit kavramlarının birleşmesi ile elde edilen Biyomimikri, çocukların doğa ile bağlantı kurmasına katkı sağlamaktadır. Doğadan ilham alma, esinlenme anlamına gelen Biyomimikri kavramı farklı çalışma alanlarına katkı sağlamasının yanında çocuk ve doğa arasında köprü kurmaktadır. Dijitalleşen dünya gittikçe doğa yoksunluğuna sebep olmakta, modern yaşamın çıktıları çocukları doğal yaşamdan uzaklaştırmaktadır. Bu durumun bir sonucu olarak buluş yoluyla öğrenme, yaparak-yaşayarak öğrenme süreci olumsuz yönde etkilenen çocuklar, doğayla sınırlı etkileşimle gelişimlerini sürdürmektedirler. Rousseau, Froebel, Dewey, Montessori'ye göre doğa çocuk için etkin bir öğrenme ortamı sunarak onu destekler. Çocuk için en basit ve en etkin kaynakları içinde barındıran doğa; çocukların becerilerini fark etmesini sağlayarak aktivite temelli uygulamaları gerçekleştirerek flora ve fauna türlerine ilişkin bilgi ve beceri edinmesine katkı sağlar. Ayrıca canlıları keşfetmesi, gözlem yapabilmesi, doğal çevre ile bağlantı kurması, doğadan ilham alması, farklı ürünler ortaya koyması, doğayı taklit etmesi, çıkarımlar yaparak gelişimlerinin desteklenmesi noktasında önemlidir. Çocuğun doğal öğrenme akışı içerisinde biyomimikri stratejisinin kavranılması güç olmakla birlikte eğitimcilerin bu alandaki yetkinliği, çocukların yaş ve gelişim düzeylerine uygun etkinliklerin hazırlanması, uygulanması kavramının anlaşılmasını kolaylaştıracaktır. Bu gerekçeler ışığında derleme niteliğinde olan çalışmamızda biyomimikri stratejisini konu alan etkinlik örneklerine yer verilecektir.

**Anahtar Kelime:** Biyomimikri, Doğa, Çocuk Gelişimi

**SUPPORTING CHILDREN LEARNING WITH NATURE WITH BIOMIMICRY**

**Abstract**

Bio; life, nature or life mimicry, obtained by combining imitation concepts, Biomimicry contributes to the connection of children with nature. The concept of biomimicry, which means inspiration and inspiration from nature, contributes to different fields of study and builds a bridge between child and nature. The digitalizing world is increasingly causing nature deprivation, the outputs of modern life are distracting children from natural life. As a result of this situation, children who are adversely affected by the process of learning by invention, learning by doing and living, continue to develop with limited interaction with nature. According to Rousaeau, Frobel, Dewey, Montessori, nature supports it by providing an effective learning environment for the child. Nature, which contains the simplest and most effective resources for the child; it enables children to realize their skills and contributes to the knowledge and skills of the flora and fauna species by performing activity-based practices. In addition, it is important to explore living things, to be able to observe, to connect with the natural environment, to be inspired by nature, to produce different products, to imitate nature, to support their development by making inferences. While it is difficult to understand the biomimicry strategy in the natural learning flow of the child, the competence of educators in this field will facilitate the understanding of the concept of preparing and implementing activities appropriate to the age and development levels of children. In the light of these reasons, our work, which is a compilation, will include examples of activities related to biomimicry strategy.

**Keyword:** Biomimicry, Nature, Child Development

## **GİRİŞ**

Doğa, yüzyıllardır teknolojik gelişmelere ilham vererek hedeflenen amaçlar için taklit edilmiştir (Avcı, 2019). Doğa ile bütüncül bir iç içelik insanların yaşamını biçimlendirmiş, yeni ürünler, teknolojiler ortaya çıkarmasına da zemin hazırlamıştır. Böylece doğanın döngülerini ve sistemlerini merkeze alan aynı zamanda süreçleri, formlarını dikkate alarak doğanın kendi çözümlerini de gözlemleyen insanoğlu; doğanın sunduğu eşsiz olanaklardan beslenme fırsatı yakalamamıştır (Pekşen Akça& Arslan, 2022). Doğadaki canlılar karşılaştıkları problemlere ilişkin çeşitli çözümler üreterek pek çok bilim insanı ve tasarımcıya da ilham verip onları doğayı taklit etmeye yönlendirmiştir (Yıldız, 2012). Bu durum da yaşam, doğa, hayat anlamına gelen “biyo” ile taklit anlamına gelen “mimikri” kelimelerinin doğmasına (Shimomura, 2010) ve doğadan öğrenme hareketliliği olarak tanımlanan biyomimikri kavramını geliştirilmesine neden olmuştur (Van der Hout, 2016).Doğadan öğrenme çocuk için yaşamsal deneyimler sunarak onu biliş, duygusal gelişim olarak deneyimsel açıdan geliştirir ve öğrenmede entelektüel kökler oluşturarak, doğayı kapsamlı şekilde açıklamasını sağlar. Çocuk için harika bir deneyim sağlayan bu durum birkaç yinleme yoluyla daha nitelikli öğrenme deneyimlerine dönüşür. Kendi öğrenme kapasitesi ve hızı doğrultusunda öğrenmeyi gerçekleştiren, merak ettikleri konularda derinlemesine araştırma imkânı yakalayarak bilginin kalıcılığını arttıran çocuk öğrenme motivasyonunu da bu sayede artırır (Bakioğlu ve Karamustafaoğlu, 2020; Arslan, 2022).Çocukları, yenilikçi çözümler yaratmada doğadan ilham alan bir yaklaşım olan biyomimikri ile tanıştırmak, iş birliği ve problem çözmeye teşvik etmek adına önemlidir (Williams, Dolenc, Barber ve Lai,2016). Durum ve olayları somutlaştırarak deneyimleme fırsatı bulmasının sağlanması enek öğrenme olanakları sunulmasının yanında çocuğun çeşitli permütasyonları sınama fırsatı bulabilmesini de sağlar (Pekşen Akça, 2022). Dahası sanatsal açıdan da farklı bakış açıları geliştirerek görsel tasarım ürünlerine ilham vermek ve doğanın tamamlayıcılarını inceleme fırsatı yakalamak çocuk için destekleyicidir. Doğa güzel olduğu kadar işlevseldir, bu yönünün çocuklar tarafından keşfedilmesi, incelenmesi, yaşama dair bazı problemlere de çözümler bulmalarını da kolaylaştırır, çocuğu soru sormaya, araştırmaya, üretmeye, buluş yapmaya, ilgilerini ortaya koyabilme noktasında da destekler (Yıldırım, 2019).

## **Biyomimikri Etkinlik Örneği**

Doğadan ilham alarak biyomimikri’yi eğitim stratejisi olarak kullanmak çocukların yeni tasarımsal fikirler ortaya koymaları, doğada yer alan farklı türlere ait detaylı bilgi edinmelerini sağlar. Okul dışı öğrenme ortamlarında saha gözlemi yapma fırsatı yakalayan çocuk doğanın problem durumlarına ilişkin buldukları çözümleri detaylandırarak hayal gücünü de besler.

Mevcut uygulama örnekleri okul dışı ortamlarda doğa ile bütünleşerek gerçekleştirilebileceği gibi sınıf ortamında da biyomimikri temelli uygulamalarının yapılması mümkündür. Aşağıda sınıf ortamında biyomimikri uygulama sürecine ilişkin bir etkinlik örneği sunulmuştur.

**Süre:** Zaman sınırlaması yoktur.

**Etkinliğin Amacı:**

- ✓ Çocukların doğanın kendi problem durumlarına ilişkin bulduğu çözüm yollarını gözlemleyerek bir nesne tasarlamasını sağlamak (şemdiye, gözlük vb.)
- ✓ Canlı organizmaları tasarım ilhamı olarak görebilmek,
- ✓ Problem durumlarına ilişkin birden fazla çözüm geliştirmelerini sağlamak,

**Çocuklar için;**

- ✓ Biyomimikri'yi örneklendirerek somutlaştırın
- ✓ Biyomimikri çalışmalarını konu alan fotoğraf ve video görsellerinden yararlanarak onlara örnekler gösterin
- ✓ Bir türün özelliklerinin, türün hayatta kalması için nasıl avantaj ve dezavantaj sağlayabileceğini hakkında bilgi verin.

**Etkinlik:** Çocukları küçük gruplar haline ayırın ve kara- deniz hayvanlarının yer aldığı afişleri sınıftaki masalar üzerinde bırakın. Bu afişlerde yer alan canlıları yakından gözlemleyebilmeleri için sınıf ortamına bunları getirin. Örneğin solucan, tırtıl, karınca, kelebek ya da hamsi, Japon balığı vb. gibi. Çocuklarla canlıları incelemesi ve kendi aralarında afişlerdeki görselleri ile farklılıkların ve benzerliklerinin olup olmadığı hakkında konuşmalarını sağlayın. Sonrasında bu canlıları konu alan bazı sorular sorarak süreci oyunla destekleyin. Örneğin ben hem bir fanusta hem de denizde yaşarım, yüzgeçlerim ve solungaçlarım vardır? Sizce ben bir solucan olabilir miyim? Çocukları bu süreçte gözlemleyin ve çocuklara ipuçları verin. Beklenmedik ifadeler olduğunda gerekli açıklamaları yaparak başka açıdan bir ilişki varsa çocuğun yakalamasını sağlayın. Çocuklara afişte/ortamda yer alan canlıları incelemeleri, doğaya nasıl bir katkı sağladıklarını düşünerek ilham aldıkları yönlerini belirtmelerini isteyin. Çocukları herhangi bir canlıyı yapı ve işlev olarak incelemesini, iki/üç boyutlu bir ürün ortaya koymaları noktasında destekleyin. Bunun için farklı özelliklerde boyalar, artık materyaller, 3D yazıcıları kullanabilirsiniz.

**Etkinlik Çıktıları:**

- ✓ Sizi şaşırtan söylemler oldu mu?

- ✓ Çocuklarla doğadan ilham almanın yararlarının neler olacağı hakkında düşünmelerini sağlayın?
- ✓ Bilim insanlarının doğadan ilham alarak tasarladıkları nesnelere var mı?
- ✓ Doğanın bir ilham kaynağı olarak görülmesi bizim için neden önemlidir?

**Değerlendirme:** Çocuklar yaptıkları ürünleri ilişkin paylaşım yaparak doğadan ilham alarak hazırladıkları ürün ile organizma arasında nasıl bir bağ kurdular, tasarlamak istedikleri başka bir ürün var mı? Bu konu hakkında paylaşım yapılacaktır.

### **SONUÇ**

Çocukların doğa ile doğrudan etkileşim içerisinde olmalarını sağlayacak biyomimikri etkinlikleri ile desteklenmeleri, eğlenceli bir öğrenme ortamı olmasının yanında farklı olay ve durumları deneyimleme olasılığı taşıdığı için çocuk için oldukça destekleyicidir. Doğanın işlevsel yönünün çocuklar tarafından keşfedilmesini, incelenmesini sağlayacak, çocuğun yaşama ilişkin problem durumlarına yönelik çözümler bulmasını kolaylaştıracak çalışmalarının yapılması çocuğun çeşitli konularda bilgi ve beceri edinmesi olanağı da yakalar.

Biyomimikri çocuklarda yirmi birinci yüzyıl becerilerinden; yaratıcılık, eleştirel düşünme, problem çözme ve işbirlikçi olmayı desteklemektedir (Williams, Dolenc, Barber ve Lai,2016). Bu nedenle biyomimikri kavramı eğitimin her aşamasına entegre edilerek çocuklara sunulabilir, bir eğitim stratejisine dönüştürülebilir. Çocukların yaş ve gelişim düzeylerine uygun etkinliklerin alan uzmanlarınca planlanması, bireysel ve grup olarak canlıları anlamaları kolaylaştırır. Doğanın zarafetinden esinlenen, doğa ile güçlü bir ilişki kuran ve buluş yoluyla öğrenme fırsatı yakalayan çocuk sunacaktır. Doğanın kendi döngüsünün gözlemlenmesi, bir atığın başka bir canlı için kaynak olduğunun keşfedilmesi, sürdürülebilirlik, verimlilik, dengeyi yeniden sağlayabilme gibi konularda çocukların bilgi ve becerileri geliştirmesini sağlayacaktır. Kısacası doğaya karşı duyarlılığı gelişmiş çocukların yetişmesine zemin hazırlayacaktır.

### **Özet**

Bu araştırmada, Batman ilinde açıkta üretilen sebze ürünlerinin 2022-2023 üretim dönemi ekonomik analizi gerçekleştirilmiştir. Araştırmada Tarım ve Orman Bakanlığı Batman İl Müdürlüğü'nün verilerinden yararlanılmıştır. Ekonomik analiz kapsamında sebze üretimine ilişkin yapılan üretim masrafları, elde edilen brüt üretim değerleri, brüt karlar, net karlar ve nispi karlar tespit edilmiştir. Araştırmadan elde edilen sonuçlarına göre ortalama reel üretim masrafının en yüksek sivri biber üretiminde (3646.83 TL/da), en düşük kavun üretiminde (427.54 TL/da) yapıldığı belirlenmiştir. Ortalama brüt kar dolmalık biber üretiminde 3528.17 TL/da, sivri biber üretiminde 2306.72 TL/da, domates üretiminde 1949.72 TL/da, hıyar üretiminde 3397.62 TL/da, kabak üretiminde 2481.17 TL/da, karpuz üretiminde 2072.12 TL/da, kavun üretiminde 986.27 TL/da, beyaz lahana üretiminde 1526.65 TL/da, marul üretiminde 1977.29 TL/da, patlıcan üretiminde 3327.68 TL/da olarak hesaplanmıştır. Ortalama net kar açısından en yüksek değer patlıcan üretiminde (2813.48TL/da), en düşük değer kavun üretiminde (888.92 TL/da) elde edildiği saptanmıştır. Batman ili açıkta sebze üretiminde nispi karlar incelendiğinde en yüksek nispi karın karpuz üretiminde (4.98), en düşük nispi karın ise domates üretiminde (1.33) olduğu bulunmuştur.

**Anahtar Kelimeler:** sebze üretimi, brüt kar, net kar, nispi kar, ekonomik analiz

**ECONOMIC ANALYSIS OF OPEN VEGETABLE PRODUCTION IN BATMAN  
PROVINCE**

**Abstract**

In this research, an economic analysis of openly produced vegetable products in Batman province was carried out for the 2022-2023 production period. In the research, data from Batman Provincial Directorate of the Ministry of Agriculture and Forestry was used. Within the scope of economic analysis, production costs related to vegetable production, gross production values obtained, gross profits, net profits and relative profits were determined. According to the results obtained from the research, it was determined that the average real production cost was highest in green pepper production (3646.83 TL/da) and lowest in melon production (427.54 TL/da). Average gross profit is 3528.17 TL/da in bell pepper production, 2306.72 TL/da in green pepper production, 1949.72 TL/da in tomato production, 3397.62 TL/da in cucumber production, 2481.17 TL/da in zucchini production, 2072.12 TL/da in watermelon production, 986.27 TL/da in melon production. TL/da is calculated as 1526.65 TL/da in white cabbage production, 1977.29 TL/da in lettuce production, and 3327.68 TL/da in eggplant production. It was determined that the highest value in terms of average net profit was obtained in eggplant production (2813.48 TL/da) and the lowest value in melon production (888.92 TL/da). When the relative profits in open field vegetable production in Batman province were examined, it was found that the highest relative profit was in watermelon production (4.98) and the lowest relative profit was in tomato production (1.33).

**Keywords:** vegetable production, gross profit, net profit, relative profit, economic analysis

## **GİRİŞ**

Tarımda bitkisel üretim içerisinde önemli konumda bulunan sebzeler, bitkinin kendisinin veya meyvesinin pişmiş veya çiğ olarak tüketilebildiği gıda ürünleri olarak tanımlanmaktadır. Sebzeler insan ve hayvan beslenmesinde temel besin ürünleri olarak tüketilen kalori değeri yüksek gıdalardır. Bu nedenle Dünya çapında sebze üretimine önem verilmekte; ülkelerin ihracatında önemli bir yer almaktadır (Pirinç ve Akalp, 2023). Dengeli bir beslenme için vazgeçilmez bir gereklilik olan sebze üretiminde, kaynakların etkin kullanımının sağlanabilmesi hem tüketici hem üreticiler açısından önemlidir. Tarımsal verimliliği artırmak ve/veya girdi kullanımının optimizasyonu için kaynakların ne derece etkin kullanıldığının belirlenmesi gerekmektedir. Bu konuda yapılması gereken en önemli çalışmalardan biri ise, bölgelere göre üretim maliyetlerinin ve kârlılıklarının ortaya konulmasıdır (Hayran ve Gül, 2020). İşletmelerin üretimden sağlayacakları faydaya karşı oluşacak maliyetleri göz önünde bulundurmaları ve yönetim kararları alırken bu stratejik karşılaştırmaları hesaplamaları gerekmektedir. İşletmelerde etkin yönetimin sağlayabilmek için maliyetlerin doğru şekilde hesaplanmasına ihtiyaç duyulmaktadır (Bayramoğlu ve ark., 2021). Bugüne kadar birçok çalışmada ürünlerin maliyetleri hesaplanmıştır (Kadanalı ve ark., 2008; Bayraktar ve Saner, 2010; Engindeniz ve ark., 2010; Ağır ve Saner, 2014; Semerci ve Çelik, 2019; Örük ve Engindeniz, 2019). Literatürde ürünlerin üretim maliyetleri sıklıkla hesaplanmış olup üretim maliyetleri girdi maliyetleri ile ilişkili olarak sürekli değişmektedir. Bu nedenle çalışmaların zaman içinde tekrarlanarak tarımsal üretim maliyetlerinin hesaplanmasına ihtiyaç duyulmaktadır. Bu çalışmada Batman'da yaygın olarak üretimi yapılan biber (dolmalık), biber (sivri), domates, hıyar, kabak, karpuz, kavun, lahana, marul, patlıcanın üretim maliyetleri hesaplanmıştır.

## **2.MATERYAL VE YÖNTEM**

Çalışmanın materyalini ikincil nitelikli veriler oluşturmaktadır. Çalışmada Batman Tarım ve Orman İl Müdürlüğü Brifing Raporları, konu ile ilgili daha önce yapılmış tez, makale, kongre bildirileri, Türkiye İstatistik Kurumu (TÜİK) tarafından yayınlanmış kaynaklar ve istatistiksel kayıtlardan yararlanılmıştır. Çalışmada sebze üretim faaliyetinin karlılık durumunu ortaya koyabilmek için brüt kar, net kar ve nispi kar analizi yapılmıştır. Brüt karın hesaplanmasında, brüt üretim değerinden değişken masraflar çıkartılmıştır. Net karın hesaplanmasında brüt üretim değerinden üretim masrafları (değişken masraflar + sabit masraflar) çıkartılmıştır. Nispi kar ise brüt üretim değerinin üretim masraflarına bölünmesiyle hesaplanmıştır.

Çalışmada değişken masraflar: materyal masraflarını oluşturan fide/ tohum, gübre, zirai mücadele ilaı, elektrik (sulama) masrafları, işgücü masrafları ve diğere masraflar ile döner sermaye faiz karşılığında oluşmaktadır. Çalışmada sabit masraflar ise arazi kirası ve yönetim payından oluşmaktadır. Genel yönetim giderleri toplam değişken masrafların %3'ü olarak hesaplanmıştır.

### **3.ARAŞTIRMA BULGULARI**

Batman ilinde üretimi yapılan sebzelerin 2013 yılı itibariyle ekilen alan miktarları incelendiğinde, en yüksek ekilen alan büyüklüğü ve üretim miktarının karpuz ürününe ait olduğu belirlenmiştir. Karpuzun yıllar itibariyle ekilen alan miktarında meydana gelen değişim incelendiğinde ekilen alan miktarının 2019 yılından 2023 yılına gelindiğinde artış gösterdiği, 11690 da'dan 12224 da'a ulaştığı ortaya çıkmıştır. Ekilen alan miktarının artış gösteriyor olmasına karşın üretim miktarının azaldığı 26184 tondan 24562 tona gerilediğı belirlenmiştir. 2023 yılı itibariyle ekilen alan miktarı bakımından ikinci sırada yer alan ürün 8437 da ile kavun olurken, onu sırasıyla 4800 da alan ile domates, 1830 da ile hıyar, 1152 da ile patlıcan, 973 da ile biber (dolmalık), 695 da ile biber (sivri), 450 da ile marul, 400 da ile kabak, 300 da ile lahana izlemektedir (Çizelge 1).2023 yılı itibarıyla Batman ili sebze üretim miktarı bakımından ikinci sırada yer alan ürün 18750 ton ile domates olurken, onu sırasıyla 15726 ton ile hıyar, 8864 ton ile kavun, 5115 ton ile patlıcan, 3259 ton ile biber (dolmalık), 1689 ton ile biber (sivri), 1600 ton ile kabak, 1350 ton ile marul, 900 ton ile lahana izlemektedir (Çizelge 1).

Türkiye genelinde 2019 yılından 2023 yılına gelindiğinde biber ve lahana ekim alanlarının azalırken üretim miktarının arttığı, domates, hıyar, karpuz, kavun, marul, patlıcan ekim alanlarının ve üretim miktarlarının azaldığı, kabak üretim alanlarının ve üretim miktarının arttığı belirlenmiştir (Çizelge 1).

İncelenen sebze ürünlerinin üretim masraflarına ilişkin bulgular Çizelge 2’de verilmiştir. Batman ilinde üretilen sebze ürünlerinden en yüksek üretim masrafına sahip olan ürün 16621.02 TL/da ile biber (sivri) olarak belirlenmiştir. Bu ürünü sırasıyla 16494.57 TL/da ile domates, 15265.87 TL/da ile biber (dolmalık), 14336.21 TL/da ile marul, 14177.10 TL/da ile patlıcan izlemektedir. En düşük üretim maliyetine sahip ürün ise 1948.59 TL/da ile kavun olmuştur (Çizelge 2).Biber (dolmalık) üretim masraflarının %21.92’sini toplam sabit masrafların, %78.08’ini değişken masrafların, biber (sivri) üretim masraflarının %20.36’sını toplam sabit masrafların, %79.64’ünü değişken masrafların oluşturduğu belirlenmiştir. Domates üretim masraflarının ise %’20.50’si toplam sabit masraflardan, %79.50’si değişken masrafların oluşmaktadır. Hıyar üretim masraflarının %27.61’ini toplam sabit masraflar oluştururken, %72.39’unu değişken masrafların oluşturduğu belirlenmiştir. Kabak üretim masraflarının %27.23’ünü toplam sabit masraflar oluştururken, %72.77’sini değişken masrafların oluşturduğu belirlenmiştir. Karpuz üretim masraflarının %20.03’ünü toplam sabit masraflar oluştururken, %79.97’sini değişken masrafların oluşturduğu belirlenmiştir. Kavun üretim masraflarının %22.77’sini toplam sabit masraflar oluştururken, %77.23’ünü değişken masrafların oluşturduğu belirlenmiştir. Lahana üretim masraflarının %’19.27sini toplam sabit masraflar oluştururken, %80.73’ünü değişken masrafların oluşturduğu belirlenmiştir. Marul üretim masraflarının %16.38’ini toplam sabit masraflar oluştururken, %83.62’sini değişken masrafların oluşturduğu belirlenmiştir. Patlıcan üretim masraflarının %16.53’ünü toplam sabit masraflar oluştururken, %83.47’sini değişken masrafların oluşturduğu belirlenmiştir (Çizelge 2).Biber (dolmalık), biber (sivri), domates, hıyar, kabak, lahana, marul ve patlıcan ürünlerinde değişken masrafların içinde en yüksek payı alan kalemin materyal masraflarından olan fide ve tohum masrafı olduğu ortaya çıkmıştır. Karpuzda ve kavunda ise değişken masrafların içinde

İncelenen sebze ürünlerinin üretiminin ekonomik yönden başarısının değerlendirilmesi amacıyla elde edilen bulgular Çizelge 3 de verilmiştir. Batman ilinde üretilen sebze ürünlerinin üretim masrafları, brüt üretim değerleri, brüt karları, net karları ve nispi karları incelenmiştir.

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

**April 09-16, 2024 / Lisbon, Portugal**

Araştırmadan elde edilen sonuçlarına göre ortalama reel üretim masrafının en yüksek sivri biber üretiminde (3646.83 TL/da), en düşük kavun üretiminde (427.54 TL/da) yapıldığı belirlenmiştir. Ortalama brüt kar dolmalık biber üretiminde 3528.17 TL/da, sivri biber üretiminde 2306.72 TL/da, domates üretiminde 1949.72 TL/da, hıyar üretiminde 3397.62 TL/da, kabak üretiminde 2481.17 TL/da, karpuz üretiminde 2072.12 TL/da, kavun üretiminde 986.27 TL/da, beyaz lahana üretiminde 1526.65 TL/da, marul üretiminde 1977.29 TL/da, patlıcan üretiminde 3327.68 TL/da olarak hesaplanmıştır. Ortalama net kar açısından en yüksek değer patlıcan üretiminde (2813.48TL/da), en düşük değer kavun üretiminde (888.92 TL/da) elde edildiği saptanmıştır. Batman ili açıkta sebze üretiminde nispi karlar incelendiğinde en yüksek nispi karın karpuz üretiminde (4.98), en düşük nispi karın ise domates üretiminde (1.33) olduğu bulunmuştur (Çizelge 3).

Çizelge 3: 2023 yılı Biber (Dolmalık), Biber (Sivri), Domates, Hıyar, Kabak, Karpuz, Kavun, Lahana, Marul, Patlıcan Yıllık Faaliyet Sonuçları

#### 4.SONUÇ

Bu araştırmada, Batman ilinde açıkta üretilen sebze ürünlerinin 2022-2023 üretim dönemi ekonomik analizi gerçekleştirilmiştir. Araştırmada Tarım ve Orman Bakanlığı Batman İl Müdürlüğünün verilerinden yararlanılmıştır. Ekonomik analiz kapsamında sebze üretimine ilişkin yapılan üretim masrafları, elde edilen brüt üretim değerleri, brüt karlar, net karlar ve nispi karlar tespit edilmiştir. Araştırmadan elde edilen sonuçlarına göre ortalama reel üretim masrafının en yüksek sivri biber üretiminde (3646.83 TL/da), en düşük kavun üretiminde (427.54 TL/da) yapıldığı belirlenmiştir. Ortalama brüt kar dolmalık biber üretiminde 3528.17

TL/da, sivri biber üretiminde 2306.72 TL/da, domates üretiminde 1949.72 TL/da, hıyar üretiminde 3397.62 TL/da, kabak üretiminde 2481.17 TL/da, karpuz üretiminde 2072.12 TL/da, kavun üretiminde 986.27 TL/da, beyaz lahana üretiminde 1526.65 TL/da, marul üretiminde 1977.29 TL/da, patlıcan üretiminde 3327.68 TL/da olarak hesaplanmıştır. Ortalama net kar açısından en yüksek değer patlıcan üretiminde (2813.48TL/da), en düşük değer kavun üretiminde (888.92 TL/da) elde edildiği saptanmıştır. Batman ili açıkta sebze üretiminde nispi karlar incelendiğinde en yüksek nispi karın karpuz üretiminde (4.98), en düşük nispi karın ise domates üretiminde (1.33) olduğu bulunmuştur. Bölgede ve Türkiye genelinde maliyet ve kârlılık analizlerinin uygun üretim faaliyetleri arasında seçim yapmak ve kaynakları etkin kullanmak için yol gösterici olacağı düşünülmektedir. Ele alınan ürünlerin üretiminin plansız bir şekilde artması halinde ciddi fiyat dalgalanmaları yaşanabilir. Bu ürünlerin, üretim miktarlarının artırılmasına ve bu ürünlerin yetiştiriciliğinin yaygınlaştırılmasına yönelik alınacak önlemlerde, piyasa talebindeki olası değişiklikler, ilgili tarımsal ve gıda sanayinin durumu ve ihracat olanakları göz önüne alınmalıdır. Enflasyon ve ithalattan kaynaklı tarımsal girdi fiyatlarındaki değişikliklerden dolayı ürün maliyet ve kâr düzeyleri değişeceğinden akademik açıdan benzer çalışmaların yapılmasına devam edilmesi gerekmektedir.

**Özet**

Bu araştırmada, Batman ilinde üretilen tarla bitkileri ürünlerinin (buğday, arpa, kırmızı mercimek, mısır ve pamuk) karlılık durumu Tarım ve Orman Bakanlığı Batman İl Müdürlüğü'nün 2023 dönemi verileri ile analiz edilmiştir. Batman ilinde üretilen tarla bitkileri ürünlerinin üretim masrafları, brüt üretim değerleri, brüt karları, net karları ve nispi karları incelenmiştir. Araştırmadan elde edilen sonuçlarına göre, arpa üretiminin ortalama reel üretim masrafı 381.17 TL/da, kuru buğday üretiminin ortalama reel üretim masrafı 421.49 TL/da, sulu buğday üretiminin ortalama reel üretim masrafı 698.47 TL/da, kırmızı mercimek üretiminin ortalama reel üretim masrafı 389.85 TL/da, dane mısır üretiminin ortalama reel üretim masrafı 1516.06 TL/da, ikinci ürün silajlık mısır üretiminin ortalama reel üretim masrafı 1247.62 TL/da, nohut üretiminin ortalama reel üretim masrafı 453.61 TL/da ve pamuk üretiminin ortalama reel üretim masrafı 1750.12 TL/da olarak hesaplanmıştır. Ortalama brüt kar arpa üretiminde 459.62 TL/da, kuru buğday üretiminde 552.81 TL/da, sulu buğday üretiminde 744.89 TL/da, kırmızı mercimek üretiminde 507.51 TL/da, dane mısır üretiminde 1024.27 TL/da, ikinci ürün silajlık mısır üretiminde 789.76 TL/da, nohut üretiminde 447.01 TL/da, pamuk üretiminde 1024.92 TL/da olarak saptanmıştır. Ortalama net kar en yüksek sulu buğday üretiminden (511.53 TL/da), ikinci olarak ise kuru buğday üretiminden (455.32 TL/da) elde edilirken, en düşük ikinci ürün silajlık mısır üretiminden (327.38 TL/da) elde edilmiştir. Nispi kar açısından ele alındığında ise en yüksek değer kuru buğday (2.08) üretimindedir.

**Anahtar Kelimeler:** tarla bitkileri, brüt kar, net kar, nispi kar, karlılık

**PROFITABILITY ANALYSIS OF FIELD CROPS PRODUCTION IN BATMAN  
PROVINCE**

**Abstract**

In this research, the profitability of field crop products (wheat, barley, red lentils, corn and cotton) produced in Batman province was analyzed with the 2023 data of the Batman Provincial Directorate of the Ministry of Agriculture and Forestry. Production costs, gross production values, gross profits, net profits and relative profits of field crop products produced in Batman province were examined. According to the results obtained from the research, the average real production cost of barley production is 381.17 TL/da, the average real production cost of dry wheat production is 421.49 TL/da, the average real production cost of irrigated wheat production is 698.47 TL/da, the average real production cost of red lentil production is 389.85 TL /da, the average real production cost of grain corn production is 1516.06 TL/da, the average real production cost of silage corn production is 1247.62 TL/da, the average real production cost of chickpea production is 453.61 TL/da and the average real production cost of cotton production is 1750.12 TL/da. It was calculated as . average gross profit is 459.62 TL/da in barley production, 552.81 TL/da in dry wheat production, 744.89 TL/da in irrigated wheat production, 507.51 TL/da in red lentil production, 1024.27 TL/da in grain corn production, 789.76 TL/da in silage corn production, 447.01 TL/da in chickpea production and 1024.92 TL/da in cotton production. While the highest average net profit was obtained from irrigated wheat production (511.53 TL/da), the second from dry wheat production (455.32 TL/da), the lowest product was obtained from silage corn production (327.38 TL/da). When considered in terms of relative profit, the highest value is in dry wheat production (2.08).

**Keywords:** field crops, gross profit, net profit, relative profit, profitability

## **GİRİŞ**

Tarım insanoğlunun yaşayabilmesi için vazgeçilmez bir faaliyet alanıdır. Dünya tarımına yön veren ve dünya tarımsal üretiminde rol alan ülkelerin ulaştıkları etkinlik tarımın profesyonel bir sektör olduğunu göstermektedir. Tarımın temel amacı 8 milyara yaklaşan dünya nüfusunun beslenme, barınma, giyinme ve tedavi ihtiyaçlarını karşılamaktır. Tarla bitkileri içerisinde yer alan özellikle tahıllardan buğday, mısır ve çeltik dünya nüfusunun beslenmesi açısından stratejik ürünlerdir. Ülkemizde kişi başına buğday tüketimi Gıda ve Tarım Örgütü (FAO, 2022) beslenme verilerine göre gelişmiş ülkelerin ortalama 1.5-2 katına yakındır. Arpa ve mısır yem sanayiinin temel girdilerini oluşturmakla birlikte, mısır aynı zamanda katma değeri yüksek endüstriyel ürünlere dönüşür (Kıymaz 2023). Bahsi geçen ürünlerin hepsinde dönem dönem iç talep ya da işlenmiş ürün ihracatına da bağlı olarak ithalat artma eğilimindedir (Bursa Ticaret Borsası[BTB], 2021). Dünyada sürdürülebilir gıda güvenilirliğinin sağlanmasında ve açlığın önlenmesinde bu ürünlerin talebi karşılayacak miktarda üretilmesi önemlidir (Bağcı ve ark., 2020). Küreselleşme ve rekabet koşullarındaki değişim ile, işletmelerin üretimden sağlayacakları faydaya karşı oluşacak maliyetleri göz önünde bulundurmaları ve maliyetlerin doğru şekilde hesaplanmasına ihtiyaç duyulmaktadır (Bayramoğlu ve ark., 2021). Bugüne kadar birçok çalışmada tarla bitkilerinin üretim maliyetleri hesaplanmıştır. Özellikle buğday (Gündoğmuş, 1998; Karadaş, 2016), silajlık mısır (Tuvaç ve Dağdemir, 2009), pamuk (Yılmaz ve Gül, 2015), mercimek (Karadaş ve ark., 2018), nohut (Acar ve ark., 2009) gibi ürünlerin üretim maliyetlerini hesaplayan çalışmalar yapılmıştır. Bu çalışmada Batman ilinde tarla bitkilerinin üretimine yönelik ekonomik analizin yapılması ve maliyeti etkileyen faktörlerin tespiti amaçlanmaktadır.

## **2.MATERYAL VE YÖNTEM**

Çalışmanın materyalini ikincil nitelikli veriler oluşturmaktadır. Çalışmada Batman Tarım ve Orman İl Müdürlüğü Brifing Raporları, konu ile ilgili daha önce yapılmış tez, makale, kongre bildirileri, Türkiye İstatistik Kurumu (TÜİK) tarafından yayınlanmış kaynaklar ve istatistiksel kayıtlardan yararlanılmıştır.Çalışmada tarla bitkileri üretim faaliyetinin karlılık durumunu ortaya koyabilmek için brüt kar, net kar ve nispi kar analizi yapılmıştır. Brüt karın hesaplanmasında, brüt üretim değerinden değişken masraflar çıkartılmıştır. Net karın hesaplanmasında brüt üretim değerinden üretim masrafları (değişken masraflar + sabit masraflar) çıkartılmıştır. Nispi kar ise brüt üretim değerinin üretim masraflarına bölünmesiyle hesaplanmıştır.

Çalışmada değişken masraflar: materyal masraflarını oluşturan tohum, gübre, zirai mücadele ilaacı, su masrafları ve işgücü masrafları ile döner sermaye faiz karşılığında oluşmaktadır. Çalışmada sabit masraflar ise arazi kirası ve yönetim payından oluşmaktadır. Genel yönetim giderleri toplam değişken masrafların %3'ü olarak hesaplanmıştır.

### **3.ARAŞTIRMA BULGULARI**

2023 yılı Batman ili tarla bitkileri ürünlerinin ekilen alan miktarları incelendiğinde, en yüksek ekilen alan büyüklüğü ve üretim miktarının buğday ürününe ait olduğu belirlenmiştir. Buğday ürününün yıllar itibariyle ekilen alan miktarında meydana gelen değişim incelendiğinde ekilen alan miktarının 2019 yılından 2023 yılına gelindiğinde azalış gösterdiği, 485391 da'dan 377752 da'a gerilediği ortaya çıkmıştır. 2023 yılı itibariyle ekilen alan miktarı bakımından ikinci sırada yer alan ürün 157830 da ile kırmızı mercimek olurken, onu sırasıyla 71212 da alan ile arpa, 58160 da ile mısır, 11335 da ile pamuk, 6340 da ile silajlık mısır, 1973 da ile nohut izlemektedir (Çizelge 1).2023 yılı itibarıyla Batman ili tarla bitkileri üretim miktarı bakımından ikinci sırada yer alan ürün 65099 ton ile mısır olurken, onu sırasıyla, 29279 ton ile kırmızı mercimek, 28530 ton ile silajlık mısır, 21154 ton ile arpa, 5212 ton ile pamuk, 338 ton ile nohut izlemektedir (Çizelge 1).Türkiye genelinde 2019 yılından 2023 yılına gelindiğinde nohut ve pamuğun ekim alanları ile üretim miktarının azaldığı, buğday ekim alanlarının azalırken üretim miktarlarının arttığı, arpa, kırmızı mercimek, mısır ve silajlık mısırın üretim alanlarının artarken üretim miktarının da arttığı, belirlenmiştir (Çizelge 1).

İncelenen tarla bitkileri ürünlerinin üretim masraflarına ilişkin bulgular Çizelge 2’de verilmiştir. Batman ilinde üretilen tarla bitkileri ürünlerinden en yüksek üretim masrafına sahip olan ürün 7976.46 TL/da ile pamuk olarak belirlenmiştir. Bu ürünü sırasıyla 6909.70 TL/da ile mısır, 5686.24 TL/da ile silajlık mısır, 3183.41 TL/da ile buğday (sulu) izlemektedir. En düşük üretim maliyetine sahip ürün ise 1737.26 TL/da ile arpa olmuştur. Pamuk üretim masraflarının %39.43’ünü toplam sabit masraflar oluştururken, %60.57’sini değişken masrafların oluşturduğu belirlenmiştir. Değişken masrafların içinde en yüksek payı alan kalemin iş gücü masraflarından olan hasat ve nakliye olduğu ortaya çıkmıştır. Mısır üretim masraflarının %45.04’ünü toplam sabit masraflar oluştururken, % 54.96’sını değişken masrafların oluşturduğu belirlenmiştir. Değişken masrafların içinde en yüksek payı alan kalemin materyal masraflarından olan gübrenin olduğu ortaya çıkmıştır. Silajlık mısır üretim masraflarının %37.06’sını toplam sabit masraflar oluştururken, %62.94’ünü değişken masrafların oluşturduğu belirlenmiştir. Değişken masrafların içinde en yüksek payı alan kalemin iş gücü masraflarından olan hasat ve nakliye olduğu ortaya çıkmıştır. Buğday (sulu) üretim masraflarının %33.41’ini toplam sabit masraflar oluştururken, %66.59’unu değişken masrafların oluşturduğu belirlenmiştir. Değişken masrafların içinde en yüksek payı alan

kalemin materyal masraflarından olan gübre olduğu ortaya çıkmıştır. Nohut üretim masraflarının %21.70'ini toplam sabit masraflar oluştururken, %78.30'unu değişken masrafların oluşturduğu belirlenmiştir. Değişken masrafların içinde en yüksek payı alan kalemin materyal masraflarından olan tohumun olduğu ortaya çıkmıştır. Buğday (kuru) üretim masraflarının %23.19'unu toplam sabit masraflar oluştururken, %76.81'ini değişken masrafların oluşturduğu belirlenmiştir. Değişken masrafların içinde en yüksek payı alan kalemin materyal masraflarından olan gübrenin olduğu ortaya çıkmıştır. Kırmızı mercimek üretim masraflarının %24.77'sini toplam sabit masraflar oluştururken, %75.23'ünü değişken masrafların oluşturduğu belirlenmiştir. Değişken masrafların içinde en yüksek payı alan kalemin iş gücü masraflarından olan hasat ve nakliye olduğu ortaya çıkmıştır. Arpa üretim masraflarının %25.27'sini toplam sabit masraflar oluştururken, %74.73'ünü değişken masrafların oluşturduğu belirlenmiştir. Değişken masrafların içinde en yüksek payı alan kalemin materyal masraflarından olan gübrenin olduğu ortaya çıkmıştır (Çizelge 2).

İncelenen tarla bitkileri ürünlerinin üretiminin ekonomik yönden başarısının değerlendirilmesi amacıyla elde edilen bulgular Çizelge 3 de verilmiştir. Batman ilinde üretilen tarla bitkileri ürünlerinin üretim masrafları, brüt üretim değerleri, brüt karları, net karları ve nispi karları incelenmiştir. Arpa üretiminin ortalama reel üretim masrafı 381.17 TL/da, kuru buğday üretiminin ortalama reel üretim masrafı 421.49 TL/da, sulu buğday üretiminin ortalama reel üretim masrafı 698.47 TL/da, kırmızı mercimek üretiminin ortalama reel üretim masrafı 389.85 TL/da, dane mısır üretiminin ortalama reel üretim masrafı 1516.06 TL/da, ikinci ürün silajlık mısır üretiminin ortalama reel üretim masrafı 1247.62 TL/da, nohut üretiminin ortalama reel üretim masrafı 453.61 TL/da ve pamuk üretiminin ortalama reel üretim masrafı 1750.12 TL/da olarak hesaplanmıştır. Ortalama brüt kar arpa üretiminde 459.62 TL/da, kuru buğday üretiminde 552.81 TL/da, sulu buğday üretiminde 744.89 TL/da, kırmızı mercimek üretiminde 507.51 TL/da, dane mısır üretiminde 1024.27 TL/da, ikinci ürün silajlık mısır üretiminde 789.76 TL/da, nohut üretiminde 447.01 TL/da, pamuk üretiminde 1024.92 TL/da olarak saptanmıştır. Ortalama net kar en yüksek sulu buğday üretiminden (511.53 TL/da), ikinci olarak ise kuru buğday üretiminden (455.32 TL/da) elde edilirken, en düşük ikinci ürün silajlık mısır üretiminden (327.38 TL/da) elde edilmiştir. Nispi kar açısından ele alındığında ise en yüksek değer kuru buğday (2.08) üretimindedir (Çizelge 3).

**Çizelge 3: Nohut, Buğday, Arpa, Kırmızı Mercimek, Pamuk, Mısır ve Silajlık Mısırın Yıllık Faaliyet Sonuçları**

#### **4.SONUÇ**

Bu arařtırmada, Batman ilinde retilen tarla bitkileri rnlerinin (buğday, arpa, kırmızı mercimek, mısır ve pamuk) karlılık durumu Tarım ve Orman Bakanlığı Batman İl Mdrlğnn 2023 dnemi verileri ile analiz edilmiřtir. Batman ilinde retilen tarla bitkileri rnlerinin retim masrafları, brt retim deęerleri, brt karları, net karları ve nispi karları incelenmiřtir.Arařtırmadan elde edilen sonulara gre, arpa retiminin ortalama reel retim masrafı 381.17 TL/da, kuru buğday retiminin ortalama reel retim masrafı 421.49 TL/da, sulu buğday retiminin ortalama reel retim masrafı 698.47 TL/da, kırmızı mercimek retiminin ortalama reel retim masrafı 389.85 TL/da, dane mısır retiminin ortalama reel retim masrafı 1516.06 TL/da, ikinci rn silajlık mısır retiminin ortalama reel retim masrafı 1247.62 TL/da, nohut retiminin ortalama reel retim masrafı 453.61 TL/da ve pamuk retiminin ortalama reel retim masrafı 1750.12 TL/da olarak hesaplanmıřtır. Ortalama brt kar arpa retiminde 459.62 TL/da, kuru buğday retiminde 552.81 TL/da, sulu buğday retiminde 744.89 TL/da, kırmızı mercimek retiminde 507.51 TL/da, dane mısır retiminde 1024.27 TL/da, ikinci rn silajlık mısır retiminde 789.76 TL/da, nohut retiminde 447.01 TL/da, pamuk retiminde 1024.92 TL/da olarak saptanmıřtır. Ortalama net kar en yksek sulu buğday retiminden (511.53 TL/da), ikinci olarak ise kuru buğday retiminden (455.32 TL/da) elde edilirken, en dřk ikinci rn silajlık mısır retiminden (327.38 TL/da) elde edilmiřtir. Nispi kar aısından ele alındığında ise en yksek deęer kuru buğday (2.08) retimindedir.

rn kalitesinin artırılması iin yetiřtiricilik teknikleri ve ila ve gbre kullanımına ynelik iftilerin bilinlendirilmesi, girdilerin reeteli satılarak girdi kullanım etkinlięinin artırılması retim maliyetlerinin azalmasını saęlamak aısından nemlidir. Bununla birlikte, retim maliyetlerinin takibi aısından retim kayıt altına alınması ve iřletmelerde retim planlamasının yapılması gereklidir (Bayramoęlu ve ark., 2021). Sonu olarak bu bulgular ile nohut, buğday, arpa, kırmızı mercimek, pamuk, mısır ve silajlık mısır retimi yapan reticilere, reticileri birliklerine ve kooperatiflerine, konu ile ilgili dięer sivil toplum rgtlerine, politika yapıcılara retim stratejisi geliřtirme ařamasında katkıda bulunulması amalanmaktadır.

**Özet**

Kentsel ısı adası (UHI) etkisi, hızlı kentleşme ve iklim değişikliği nedeniyle büyük bir sorun haline gelmiştir. Son yıllarda bu olgu, ısının yüksek yoğunluklu binalar, beton yüzeyler ve bitki örtüsü eksikliği nedeniyle hapsediği kentsel dokunun ve yapılaşmanın yoğun olduğu alanlarda yoğunlaşmıştır. UHI yoğunluğundaki bu mekânsal değişkenlik, insan sağlığı, enerji tüketimi ve kentsel çevre üzerindeki etkileri konusunda endişelere yol açmaktadır. Bu sorunu ele almak için, kentsel dokunun yoğun olduğu alanlarda UHI'nin kapsamını ve değişkenliğini değerlendirmek ve etkilerini azaltacak stratejileri belirlemek çok önemlidir. Bu araştırma, uzaktan algılama, saha ölçümleri ve modelleme teknikleri aracılığıyla yapılaşma yoğunluğunun yüksek olduğu alanlardaki UHI'nin kapsamlı bir değerlendirmesini sağlamayı amaçlamaktadır. Bu alanlarda UHI etkisine katkıda bulunan faktörleri anlamak, şehir plancılarının ve politika yapıcıların daha sürdürülebilir ve dirençli şehirler yaratmak için etkili önlemler almalarını ve bunları uygulamalarını sağlamaya yardımcı olacaktır.

**Anahtar Kelimeler:** Kentsel Isı Adası, Kentsel Yutak Alanlar, İklim Değişikliği

**EVALUATION OF THE CONCEPT OF URBAN HEAT ISLAND IN TERMS OF  
URBAN SINK AREAS**

**Abstract**

Urban heat island (UHI) effect has become a pressing issue due to rapid urbanization and climate change. In recent years, the phenomenon has intensified in urban sink areas, where heat is trapped by high-density buildings, concrete surfaces, and lack of vegetation. This spatial variation in UHI intensity has raised concerns about its impacts on human health, energy consumption, and the urban environment. To address this issue, it is crucial to evaluate the extent and variability of UHI in urban sink areas and identify strategies to mitigate its effects. This research aims to provide a comprehensive assessment of UHI in urban sink areas through remote sensing, field measurements, and modeling techniques. By understanding the factors contributing to the UHI effect in these areas, urban planners and policymakers can implement effective measures to create more sustainable and resilient cities.

**Keywords:** Urban Heat Island, Urban Sink Areas, Climate Change

## **Introduction**

Urban Heat Island (UHI) is a growing concern in many developed and developing countries. The heat island is defined as a built-up area that is hotter than its rural surroundings. The annual mean air temperature of a city with 1 million people or more can be 1.8° - 5.4°F (1° - 3°C) warmer than its surroundings. On a clear, calm summer evening, the temperature difference can be as much as 22°F (12°C). Heat islands can affect communities by increasing summertime peak energy demand, air conditioning costs, air pollution and greenhouse gas emissions, heat-related illness and mortality, and water quality. They also have an impact on the environment, disrupting ecosystems and wildlife. This rise in air temperature is mainly due to the replacement of vegetative and soil surfaces with those of concrete, asphalt, buildings, and other infrastructure, as well as the waste heat generated by energy usage in the process. UHI is a complex phenomenon that is not only dependent on environmental and meteorological conditions but also influenced by land usage and management. UHI has been shown to increase the production of secondary pollutants, ground-level ozone, and smog. In many cities, peak air pollution due to UHI has public health implications. High air temperatures in UHI areas, particularly during the summer, can increase the concentration of air pollutants, including ground-level ozone, a harmful substance to people and the environment. This increased concentration of pollutants has many implications for public health. The urban heat island and the adverse effects associated with it may be offset through urban planning policy aimed at reducing UHI effects and cooling the microclimate. The hydrological cycle and energy balance of UHI areas can be mitigated by implementing 'cool' roofs and roadways, and increasing planted vegetation and trees. In order to reduce air temperatures and the energy usage associated with space conditioning in UHI areas, it is up to local and national government and policymakers to institute these mitigation measures through regulation and incentive.

## **Understanding Urban Heat Island Phenomenon**

Urbanization in rapidly growing urban areas like Chennai Metropolitan Area (CMA) and the National Capital Region of India has intensified the Urban Heat Island (UHI) effect, significantly impacting local climate and sustainability. Research studies have highlighted the crucial role of urban vegetation in mitigating UHI through shading, carbon sequestration, and temperature regulation. The analysis of Land Surface Temperature (LST) and Normalised Difference Vegetation Index (NDVI) dynamics using satellite imagery reveals the seasonal relationship between green cover and temperature fluctuations. It is evident that areas with high vegetation cover exhibit lower LST values, indicating their potential in moderating UHI in

urban sink areas. Moreover, empirical evidence establishes a correlation between city size and UHI intensity, suggesting that strategic urban planning and vegetation interventions can effectively alleviate the heat island effect and enhance outdoor comfort zones in densely populated urban environments. The importance of urban sink areas in the context of the urban heat island cannot be understated, as they are responsible for a multitude of effects that typify the urban heat island. Since urban sink areas are locales which have a lower temperature than the surrounding urban area, they can take many forms and can be classified by their causative factors. The simplest form of an urban sink area is a green space, which through shading and evapotranspiration from vegetation can remain significantly cooler than the urban area surrounding it. Vegetation has the potential to reduce local temperatures by 2-9°C through shading and evapotranspiration. Other forms of urban sink areas include bodies of water, air-conditioned buildings, and excavations. The latter forms, being anthropogenic in nature, are usually the result of land use change and are widespread in the urban environment. Any form of urban sink area is a valuable commodity in highly urbanized areas, as they provide a refuge from the heat of the surrounding urban area and thus can have a significant effect on the health and well-being of city residents.

#### **Factors Contributing to Urban Heat Island in Urban Sink Areas**

Urban heat island (UHI) refers to the phenomenon where cities experience higher temperatures compared to the surrounding rural areas. It is a result of the dense concentration of buildings, materials, and human activities that contribute to increased heat storage and limited cooling opportunities (Oke, 1982). However, recent research has suggested that the concept of UHI can be further evaluated by considering the role of urban sink areas.

Urban sink areas are defined as locations within cities that have a higher capacity to absorb and store heat. These are typically areas with high levels of impervious surfaces, such as parking lots, highways, and industrial areas. The presence of these urban sink areas can significantly impact the formation and intensity of UHI, as they act as heat sinks during the day and release stored heat during the night (Santamouris, 2015).

To evaluate the concept of UHI in terms of urban sink areas, several key considerations need to be examined:

1. **Spatial Distribution:** Analyzing the spatial distribution of urban sink areas within a city can provide insights into their contribution to UHI (Hebbert & Scott, 2003). High-resolution satellite imagery and thermal mapping techniques can assist in identifying

and quantifying these areas. By understanding where and how urban sink areas are distributed, urban planners can devise strategies to mitigate their heat-absorbing effects.

2. Microclimate Monitoring: Monitoring microclimates within urban sink areas can help in understanding their thermal behavior (Wong et al., 2015). Installing weather stations and sensors at different locations can provide data on temperature variations and help assess the magnitude of UHI. This information is essential for planners to identify areas with the highest heat absorption and plan for appropriate interventions.
3. Green Infrastructure Interventions: Incorporating green infrastructure, such as green roofs, parks, and trees, within urban sink areas can help mitigate UHI effects (Santamouris, 2015). Vegetation provides shade, evaporative cooling, and can reduce the overall heat storage capacity in these areas. Evaluating the effectiveness of various green infrastructure interventions in reducing UHI within urban sink areas is crucial for urban planners.
4. Urban Design and Land Use Planning: Urban design and land use planning play a significant role in the formation and intensity of UHI (Hebbert & Scott, 2003). Evaluating the design guidelines and regulations that influence the development of urban sink areas can help identify areas for improvement. Measures like encouraging mixed land use, reducing impervious surfaces, and promoting sustainable materials can help in reducing UHI.
5. Social Equity Considerations: Evaluating UHI in terms of urban sink areas necessitates a focus on social equity (Chakraborty et al., 2014). Certain neighborhoods and communities may be disproportionately affected by the heat island effect due to the presence of more urban sink areas. Identifying such vulnerable communities and implementing targeted interventions can ensure a fair and just approach in addressing UHI.

Factors contributing to the urban heat island effect in urban sink areas are multifaceted and dynamic, as evidenced by recent research on urbanization and its impacts on local climates. Remote-sensing studies, as highlighted in the cited literature, have underscored the importance of factors such as urban geometry, proximity to water bodies, and changes in land cover, including vegetation and impervious surfaces. Urban growth patterns, particularly the rate and form of expansion, have been linked to intensified urban heat sinks during the daytime, with variations in albedo, specific heat capacity of materials, and urban geometry playing crucial roles. Moreover, the interaction between urbanization and natural ecosystems, such as forests,

has revealed significant alterations in surface energy balance and temperature gradients, emphasizing the need for comprehensive assessments of land use changes and their implications for urban heat islands. This insight aligns with the broader context of evaluating urban heat islands in urban sink areas, highlighting the complex interplay between urban development, environmental factors, and climate dynamics.

### **Impacts of Urban Heat Island in Urban Sink Areas**

The impacts of Urban Heat Island (UHI) in urban sink areas are multifaceted and crucially affect the thermal dynamics of urban environments. Research findings from (Amit Kumar et al., 2023) demonstrate a significant increase in land surface temperature (LST) in urban and peri-urban regions due to rapid urbanization and land use changes, leading to the formation of urban heat islands. The study emphasizes the role of impervious surfaces, vegetation degradation, and environmental factors in exacerbating UHI effects. Furthermore, insights from (M. Kreitmair et al., 2020) highlight the underground heat island effect in densely populated city centers, underscoring the importance of understanding subsurface heat transfer for efficient heating and cooling of underground structures. This evidence underscores the urgent need for holistic approaches to mitigate UHI impacts in urban sink areas through nature-based solutions, sustainable land use practices, and enhanced geothermal assessments, ultimately contributing to the evaluation and management of UHI in urban settings.

### **Mitigation Strategies for Urban Heat Island in Urban Sink Areas**

Mitigation strategies for urban heat islands in urban sink areas are pivotal for sustainable urban development. Leveraging insights from studies on landscape patterns and land surface temperature, such as those in Haikou and Sichuan Basin, China, can inform effective interventions. By understanding the spatial distribution of heat islands and the contributing factors like land cover types and topographic features, tailored strategies can be devised. The identification of "sinking heat islands" near mountainous regions underscores the need for localized solutions. Factors like biophysical parameters, climate conditions, and human activities play significant roles in influencing land surface temperature, highlighting the multifaceted nature of urban heat islands. As interactions between these factors vary seasonally, mitigation efforts must adapt accordingly. Incorporating a regional landscape systems approach, informed by geospatial analysis and the relationship between drivers of heat islands, can guide the formulation of targeted and sustainable mitigation strategies for urban sink areas.

### **Conclusion and Recommendations**

In conclusion, the evaluation of urban heat islands in urban sink areas reveals the complex interplay between various factors that contribute to the phenomenon. Through a detailed analysis of land use, population density, building materials, and green spaces, it is evident that these factors play a significant role in exacerbating heat accumulation in these areas. This research underscores the importance of implementing sustainable urban planning strategies to mitigate the effects of urban heat islands. By incorporating green infrastructure, prioritizing the use of reflective materials, promoting vegetation cover, and enhancing natural ventilation systems, cities can effectively reduce the urban heat island effect and enhance the overall quality of life for residents in urban sink areas. Moving forward, continued research and implementation of innovative solutions will be essential in addressing this pressing environmental and public health concern.

Considering urban sink areas when evaluating UHI provides a more comprehensive understanding of the factors contributing to the heat island effect in cities. Analyzing the spatial distribution, monitoring microclimates, implementing green infrastructure interventions, reviewing urban design and land use planning regulations, and considering social equity aspects can guide the development of effective strategies to mitigate UHI. By implementing these strategies, cities can create more sustainable, livable urban environments that are resilient to the adverse effects of UHI.

By considering the concept of urban sink areas when evaluating UHI, urban planners can gain a more comprehensive understanding of the factors contributing to heat island effects within cities. This knowledge can guide the development of effective strategies and interventions to mitigate UHI and create more sustainable, livable urban environments.

In conclusion, evaluating the concept of UHI in terms of urban sink areas provides a deeper understanding of the factors contributing to heat island effects in cities. By analyzing the spatial distribution, monitoring microclimates, implementing green infrastructure interventions, reviewing urban design and land use planning regulations, and considering social equity, urban planners can develop effective strategies to mitigate UHI and create more sustainable, livable urban environments. By addressing UHI and its relation to urban sink areas, cities can work towards reducing the adverse effects of heat islands and improve the well-being of their residents.

**ÖZET**

Bu araştırma, YÖK Ulusal Tez Merkezinde yayınlanan çok kültürlü eğitim alanında yapılmış yüksek lisans ve doktora tezlerinin farklı değişkenler çerçevesinde sistematik açıdan incelemeyi amaçlamıştır. Araştırma, nitel araştırma yöntemlerinden doküman incelenmesi yöntemiyle desenlenmiştir. Veriler araştırmacı tarafından hazırlanan “İçerik Analiz Formu” aracılığıyla toplanmıştır. Araştırmanın çalışma grubunu, 1998-2023 yılları arasında YÖK Ulusal Tez Merkezinde tam metin olarak yayınlanan 144 tane yüksek lisans ve doktora tezi oluşturmaktadır. Verilerin analizi yapılırken içerik analiz formunda bulunan her bir soru çerçevesinde tezler gruplandırılmış, temalar oluşturulmuş ve veriler betimsel istatistikler ile frekans (*f*) ve yüzde (%) olarak ifade edilmiştir. Veriler analiz edilirken tezlerin yıllarına, üniversitelerine, anabilim dallarına, enstitülerine, türüne, çalışma gruplarına, araştırma yöntemlerine ve tezlerin sonuçlarına göre bütüncül ve kapsamlı bir şekilde ele alınmıştır. Elde edilen bulgulara göre; çok kültürlü eğitim alanında yapılan çalışmalar en çok %19.81 oranıyla 2019 yılında yayınlandığı görülmektedir. Bu çalışmalar en fazla Marmara Üniversite’sinde (%9.72) yapılmıştır. Çok kültürlü eğitim alanında yazılan tezlerin büyük bir oranı Eğitim Bilimleri Anabilim Dalı (%34.02) ve Eğitim Bilimleri Enstitüsü (%52.08) bünyesinde yapıldığı görülmüştür. Çalışmalara en çok danışmanlık yapan akademisyenlerin % 34.89 oranıyla doçent unvanına sahip olduğu sonucuna ulaşılmıştır. Tezlerin çalışma grubunun %48.14’ünü öğretmenler oluştururken çalışmalarda en fazla nicel yöntem kullanılmıştır. Lisansüstü tezlerin sonuçlarına göre en fazla öğretmen adaylarının/eğitim fakültesi lisans öğrencilerinin çok kültürlü eğitim ile ilgili görüşleri, tutumları ve öz yeterlik algıları yüksek düzeyde bulunduğu ve öğretmenlerin çok kültürlülük ve çok kültürlü eğitim konusunda algıları olumlu, çok kültürlü eğitim uygulamalarından pek fazla haberdar olmadıkları ve çok kültürlü eğitim konu olunca sorumluluk bilinçlerinin olduğu sonucuna ulaşılmıştır.

**CONTENT ANALYSIS OF POST-GRADUATE THESES RELATED TO  
MULTICULTURAL EDUCATION**

**ABSTRACT**

This research aims to examine the master's and doctoral theses about multicultural education published in The Council of Higher Education National Thesis Center from a systematic perspective within the framework of different variables. The research is patterned by the document analysis method which is one of the qualitative research methods. The data was collected through the "*Content Analysis Form*" prepared by the researcher. The study group of this research consists of 144 master's and doctoral dissertations published in full text in the Council of Higher Education National Thesis Center between 1998-2023. While studying contents of each question in analysis form, theses were grouped, themes were created and the data was identified as frequency (f) and percentage (%) with descriptive statistics. Through analyzing the data, it was handled the results of the theses holistically and comprehensively regarding to theses' dates, type, participants, and methods and also universities, departments and institutes that studies were applied. According to the results obtained from this research, the studies in the field of multicultural education were published in 2019 with a maximum rate of 19.81%. These studies were mostly conducted at Marmara University (9.72%). It was observed that a large proportion of the theses written in the field of multicultural education were made within the Department of Educational Sciences (34.02%) and the Institute of Educational Sciences (52.08%). It was concluded that the academicians who counseled the most in the studies had the title of associate professor with 34.89%. 48.14% of the study group of theses were teachers, and the quantitative method was mostly used in the studies. According to the results of the post graduate theses, the opinions, attitudes, and self-efficacy perceptions of most prospective teachers and undergraduate students of the faculty of education regarding multicultural education are high and the perceptions of teachers about multiculturalism and multicultural education are positive. It has been concluded that they are not very aware of multicultural education practices and that they have responsibility consciousness when it comes to multicultural education.

## **GİRİŞ**

Çok kültürlülük; ırk, dil, din, sosyal sınıf, eğitim, yaş, etnik grup ve kültürel farklılıkların birlik içerisinde olmasına dayanan bir kavram ve toplumlara ait farklılık ve çeşitlilikleri önyargı olmadan kabul etmeyi ve huzur içinde yaşamayı hedefleyen bir kavramdır (American Psychological Association (APA), 2002). Çok kültürlülük, ilk olarak farklı etnik topluluğa ait bireylerin kendi etnik kimliklerini korumak amacıyla ortaya çıkardıkları bir kavramdır (Vatandaş, 2002). İnsanlar, dünyada yalnızca kendi kültürlerine odaklanır ve sadece kendi bakış açılarıyla bakarlarsa diğer insanların tecrübelerinden yoksun kalırlar. Bu bağlamda kültürel anlamda sınırlanırlar. Birey farklı kültüre ait bireylerle iletişim halinde olduğu sürece farklı bakış açılarına sahip olabilir (Banks, 2013). Çok kültürlülük kavramının toplum tarafından kabulünün en önemli araçlarından biri eğitimidir. Okullar toplumun küçük bir parçası olduğu için çok kültürlü özellik göstermektedir. Bundan dolayı çok kültürlü eğitim kavramı gelişmiştir. Kavram olarak çok kültürlü eğitim ele alındığında özgürlük, hak, eşitlik, adalet gibi terimler üzerine inşa edilmiştir (Grant, 1994; National Association of Multicultural Education (NAME), 2018). Çok kültürlü eğitim, öğrencilere eşit haklar sunulması bir eğitim ortamının sağlanmasını savunur (Banks, 2015). Çok kültürlü eğitim öğrencilere farklı bakış açılarını edindirecek kendi kültürlerini ve diğer kültürleri tanımalarına olanak sağlar. Farklı kültürden bireylerin kültürleriyle karşılaşan çocuklar kendi kültürleriyle karşılaştırma olanağı bulur ve böylece kendi kültürlerini daha iyi tanıma fırsatı bulurlar (Banks, 2015). Çok kültürlü eğitim, öğrenciler arasında bulunan çeşitliliklere sahip çocukların kendilerini buldukları eğitim ortamına ait hissetmeleri ve eşit bir biçimde verilen eğitimden yararlanmasını sağlar (Banks, 2013). Çok kültürlü eğitim kapsamında öğrencilerin nesnel bir biçimde kararlar alabilmek, çeşitliliği bulunan bireylere saygı duymalarını sağlamak (Parekh, 2002), farklı kültürlerin varlığının kabul edilip kültürlerin tanınmasına yardımcı olmak ve farklı kültürel alt yapıya sahip bireylerin biraraya gelerek verimli çalışmayı amaçlayan bir süreç olarak tanımlanmaktadır (UNESCO, 2006). Çok kültürlü eğitim, farklı etnik gruptan, cinsiyetten, dinden, dilden, ırktan vs. gelen bireylerin birarada eğitim almasını sağlamak ve öğrencilerin farklı etnik çeşitliliğe sahip bireyleri saygıyla karşılayabilmeleri için öğrenme ortamlarının çeşitlendirilmesi temeline dayanmaktadır (Cırık, 2008). Çok kültürlü eğitim sınıflarında öğretmenlerin, farklı özelliklere sahip öğrencilere karşı ayrımcılığı, önyargıları ortadan kaldırmalı ve eğitimde eşitliği sağlayabilecek, farklılıkları kabul edebilecek bir sınıf ortamı sağlamalıdır (Polat, 2009). Farklı kültürlere saygı Birleşmiş Milletler tarafından önem arz edilen konular arasında yer alırken (Başbay ve Bektaş, 2009) Wilson (2008)'a göre çok kültürlü eğitimi sınıf iklimine dahil etmek

amaçlanmalıdır. Çok kültürlü eğitim temel hedeflerinden bir anlamak ve anlamlandırmaktır. Bu süreçlerden sonra ise saygı duymak gelmektedir. Bu yolla çok kültürlü eğitimin bir diğer amacı olan iletişim kurmak gerçekleşmektedir. İletişim kuran çocuklar yerel ve evrensel açıdan bilgi, beceri ve olumlu yaklaşımlar edinebilir. Çocukları kültürel açıdan önyargılarını önlemek, akademik gelişimlerini sağlamak, kültürel duyarlılıklarını geliştirmek ise çok kültürlü eğitimin diğer amaçlarından biridir (Bozkurt & Alcı, 2013). Dunn (1997) ve Gay (1994) ise çok kültürlü eğitimin amaçlarını şu şekilde ortaya koymuştur; tutum ve değerleri görünür hale getirme, temel olan yeteneklerin edindirilmesi, çok kültürlü okur-yazarlığın geliştirilmesi, eğitim noktasında eşitliği sağlanmasıdır. Çok kültürlü eğitimin amaçları beraberinde çok kültürlü eğitimin boyutlarını da getirmektedir. Çok kültürlü eğitimi uygulama, çok kültürlü eğitimi iyi hale getirme açısından uygulayıcılar çok kültürlü eğitimin boyutlarını kendilerini yol gösterici olarak kabul etmektedir (Banks, 2019). Parks (1999)'a göre çok kültürlü eğitimin boyutları şu şekildedir; ahlak eğitimi, barış eğitimi, akran arası çatışmaları çözme, karakter eğitimi, hizmet öğretimi, eleştirel düşünme, küresel eğitim ve duygusal zekâ eğitimidir. Ahlak eğitimi; herkese saygılı olmayı savunur. Barış eğitimi; insanlar arasında oluşan ayrıştırmacılığın/ayrımcılığın önlenmesini savunur. Akran arası çatışmaları çözme; açık veya örtük olarak yapılan ırkçılığı önler. Karakter eğitimi; iyi insan olmayı öğütler. Hizmet öğretimi; farklılıklara sahip bireylerin uyumunu sağlar. Eleştirel düşünme; farklı bakış açıların kabul edilmesini savunur. Küresel eğitim; ırkçılığı sorun olarak görür. Duygusal zekâ eğitimi; farklı kültüre ait bireyin korku veya üzüntüsünün kontrolünü sağlar. Eğitim bu boyutlarını edindirme ve farklı bakış açılarını edindirme noktasında okullar devreye girmektedir (Toprak, 2008).

Erdem (2017) ele aldığı çalışmasında eğitim ve öğretim sürecinde en önemli sorun olarak dilin görüldüğünü, öğretmenlerin farklı dilleri konuşan/milletten olan çocuklar için içerik düzenlemesi yapmadığı ve öğrencileri değerlendirirken nesnel bir biçimde değerlendirme sürecini tamamlamadıkları sonucuna ulaşmıştır.

Yıldırım & Muyo Yıldırım'ın Kosova'da 2019 yılında yapmış oldukları çalışmada öğretmenlerin çok kültürlü eğitim uygulamalarının farklı değişkenlere göre durumları incelenmiştir. Araştırmanın sonucuna göre ise seviye, anadil ve branşın öğretmenlerin uygulamaları üzerinde etkili olduklarını ortaya koymuştur. Ng, Chai, Chan & Chung'un 2021 yılında yapmış oldukları çalışmaya göre azınlık okul öncesi kurumlarında görev yapan öğretmenlerin kültürel olarak duyarlı bir öğretim sağlayıp sağlayamadıklarını ortaya koymayı amaçlamıştır. Azınlık okullarında görev yapan öğretmenlerin öğretim yöntemlerini uyarlama noktasında yeterli oldukları ancak çok kültürlü eğitim programları tasarlama ve materyalleri

eđitim sürecine dahil etme noktasında yetersiz kaldıkları sonucuna ulařılmıştır. Çok kùltürlùlùk bağlamında alanyazın incelendiđinde çok kùltürlùlùğün bireyler üzerindeki ve eđitim üzerindeki önemi ele alınmıştır. Bu açıdan bakıldıđından çok kùltürlùlùğün bireylerin topluma uyum sürecinde ne denli önemli olduđu sonucuna varılabilir. Bunu bireylere anlatmanın en etkili yollarından biri olan eđitim devreye girmektedir. Eđitim yoluyla bireyler toplumda farklılıklara ve çeřitliliklere sahip bireylere karřı nasıl davranacaklarını, ön yargısız nasıl kabul edebileceklerini vs. öğrenirler ve farklılıklara sahip bireylerin birarada bulunduđu okullar da bunları öğretmek için en uygun ortam olarak görülebilir. Bu dođrultuda yapılan çalışmalar incelendiđinde; yurtdıřı çalışmalarında genellikle öğretmen ve öğretmen adaylarıyla ilgili yapılan çalışmalar yoğunluk göstermekte (Kaya & Söyleme, 2014; Tařtekin, Bozkurt-Yükçü, İzođlu, Güngör, Iřık-Uslu & Demirciođlu, 2016; Aslan, 2017; Aslan & Kozikođlu, 2017; Sezer & Kahraman, 2017; Kervan, 2017; Güngör, Buyruk & Özdemir, 2018; Kimzan & Arıkan, 2018; Ateř, 2021; Çoban, Güney Karaman & Dođan, 2010; Demirciođlu & Özdemir, 2014; Engin & Genç, 2015; Polat, 2009; Kimzan & Arıkan, 2018; Tortop, 2014; Yıldırım, 2022). Ders kitaplarıyla/doküman incelemesi ile ilgili yapılan çalışmalara (Bektař, 2023a; Bektař, 2023b, Dođan, 2019) ve öğrencilerle ilgili yapılan çalışmalara da az da olsa yer verilmiştir (řimřek, 2022). Öte yandan çok kùltürlùlùk bağlamında yurt dıřında yapılan çalışmalar da oldukça fazlalık göstermektedir. Bu çalışmalar uygulamaya yönelik, öğretmenlere yönelik, öğrencilere yönelik, doküman incelemesine yönelik çalışmalardan oluşmaktadır (Samuels, 1994; Jae-Kyung, 2000; Walters, 2007; Yenlin Miranda, 2008; Park, 2010; Phoon, Abdullah & Abdullah, 2013; Bartelo, 2014; Park, 2014; Huh, Choi & Jun, 2015; Vittrup, 2016; Guo, 2017; Abdullah & Abdullah, 2018; Aragona-Young & Sawyer, 2018; Pourdavood & Yan, 2020; Zain, Basir & Mustafa, 2020; Ng, Chai, Chan & Chung, 2021). Ancak yapılan literatür taraması neticesinde çok kùltürlü eđitim ile ilgili yapılan lisansüstü tezlerin içerik analizini ortaya koyan herhangi bir çalışmaya yer verilmediđi görülmüřtür. Bu açıdan çok kùltürlü eđitimle ilgili çalışmaların sınırlı sayıda olması, alana katkı sağlaması, ailelere, eğitimcilere, öğrencilere vs. katkı sağlaması konusunda 144 lisansüstü tezin toplu bir biçimde tek bir çalışmanın çatısı altında sunulması noktasında önem taşımaktadır. Ayrıca çok kùltürlü eđitim ile ilgili yapılan lisansüstü tezlerin içerik analizi noktasında ilk çalışma olması da çalışmanın önemini ortaya koymaktadır.

#### **AMAÇ**

Bu çalışma, eđitim ve öğretim konusunda çok kùltürlü/çokkùltürlùlùğü ele alan Yüksek Öğretim Kurumu Ulusal Tez Merkezinde indekslenen yüksek lisans ve doktora tezlerinin farklı deđiřkenler açısından sistemli bir řekilde incelenmesi amaçlanmıştır.

## **YÖNTEM**

Bu arařtırmada çok kltrl/okkltrl eēitim ile ilgili yapılan lisansst tezler incelenirken nitel arařtırma yntemleri kullanılmıřtır. Nitel alıřmalar, arařtırmacıya direkt olarak veri kaynaēına eriřebilme imkn sunar. Durum ve olayların ayrıntılı bir Őekilde anlaşılmasını saēlayacak betimlemeler yaparak elde edilen bilgiler ışığında genellemeler yapılmasını saēlar (Bykztrk, 2023). Bu arařtırma, nitel arařtırma yntemlerinden dokman incelemesi yntemiyle desenlenmiřtir. Nitel arařtırma modeli olarak verilerin elde edilerek yorumlanması ařamasında dokman incelemesi yntemi kullanılmıřtır. Dokman incelemesi ynteminde basılı ve web tabanlı bilgilerin sistematik bir biimde ele alınmasıdır (Bowen, 2009). Bu arařtırmada incelemesi yapılan dokmanlar çok kltrl/okkltrl eēitim kapsamında yapılan yksek lisans ve doktora tezleridir.

## **Evren ve rneklem**

alıřmada lisansst tezlerin elde edilmesinde ‘‘YK Ulusal Tez Merkezi’’ kullanılmıřtır. Arařtırma 1998-2023 tarihleri arasında çok kltrl/okkltrl eēitim konusunda eēitim bilimleri alanında yer alan 144 tane doktora ve yksek lisans tezlerinden oluřmaktadır. Aralık 2023 tarihinde ‘‘ok kltrl eēitim’’ ve ‘‘okkltrl eēitim’’ kavramına ynelik yapılan aramada ‘‘ok kltrl eēitim’’ kelimesi taratılınca 113, ‘‘okkltrl eēitim’’ kelime taratılınca 202 tane doktora ve yksek lisans tezine ulařılmıřtır. Konu alanı eēitim bilimleri dıřında olan ve eriřime kapalı olan tezler (Hamurabi Szen, 2005; Kahyaoēlu, 1998; ztrk, 1998; Altař, 2001) arařtırma kapsamı dıřında bırakılmıřtır. Geriye kalan 144 alıřma, eēitim bilimleri alanında ve eriřime aık ‘‘ok kltrl eēitim’’ ve ‘‘okkltrl eēitim’’ konularını kapsayan yksek lisans ve doktora tezlerinden oluřmaktadır.

## **Verilerin Toplanması ve Analizi**

alıřmanın rnekleme dahilinde 144 doktora ve yksek lisans tezi dahil edilmiřtir. Bu alıřmaların veri toplama srecinde arařtırmacılar tarafından geliřtirilen ‘‘İerik Analiz Formu’’ kullanılmıřtır. İerik analiz formu toplamda dokuz sorudan oluřmaktadır. Bu soruların her biri ierik analiz ynergesi iin birer tema olarak ele alınmıřtır. alıřmaların geerlik ve gvenirlikleri iin  hafta sonra tekrar ‘‘YK Ulusal Tez Merkezi’’nden ‘‘ok kltrl eēitim’’ ve ‘‘okkltrl eēitim’’ konuları taratılmıř ve uzmanların grřleri doērultusunda ierik analiz formu iin Miles & Huberman (1994)’nın uyurum yzdeliēi ( $(\text{grř birliēi}/(\text{grř ayrılıēi} + \text{grř birliēi}) \times 100)$ ) forml kullanılmıřtır.  hafta sonra ‘‘YK Ulusal Tez Merkezi’’nden ‘‘ok kltrl eēitim’’ ve ‘‘okkltrl eēitim’’ konuları taratıldıēında aynı sonulara ulařılmıřtır. Ayrıca ierik analiz formu iin uyurum yzdeliēine bakıldıēında %90

olarak hesaplanmıştır. Miles & Huberman (1994) uyuşum yüzdeliğinin %70'i geçmesi durumunda güvenilir olduğunu savunmuştur. İçerik analiz formu dahilinde hazırlanan sorular şunlardır:

1. Çok kültürlü/çokkültürlü eğitimi konu alan tezlerin yıllara göre dağılımı nasıldır?
2. Çok kültürlü/çokkültürlü eğitimi konu alan tezlerin yazarlarının üniversitelere göre dağılımı nasıldır?
3. Çok kültürlü/çokkültürlü eğitimi konu alan tezlerin enstitülerine göre dağılımı nasıldır?
4. Çok kültürlü/çokkültürlü eğitimi konu alan tezlerin anabilim dallarına göre dağılımı nasıldır?
5. Çok kültürlü/çokkültürlü eğitimi konu alan tezlerin tez türüne göre dağılımı nasıldır?
6. Çok kültürlü/çokkültürlü eğitimi konu alan tezlerin danışmanlarının unvanlarına göre dağılımı nasıldır?
7. Çok kültürlü/çokkültürlü eğitimi konu alan tezlerin çalışma grubuna göre dağılımı nasıldır?
8. Çok kültürlü/çokkültürlü eğitimi konu alan tezlerin araştırma yöntemine göre dağılımı nasıldır?
9. Çok kültürlü/çokkültürlü eğitimi konu alan tezlerin sonuçları nasıldır?

#### **Verilerin Kodlanması ve Çözümlemesi**

Veriler, çok kültürlü/çokkültürlü eğitim ile ilgili yapılan 144 yüksek lisans ve doktora çalışmasının analiz formunda yer alan 10 soru çerçevesinde kodlanmıştır. Bu amaç doğrultusunda sorulan sorular “tema” ve “alt temalar” şeklinde belirlenmiş ve frekans ve yüzdelikleri hesaplanmıştır (Örneğin; 4. sorudaki “tema” için toplamda 6 “alt tema” belirlenmiştir). Kodlanan veriler betimsel istatistikler ile frekans (*f*) ve yüzde (%) şeklinde ifade edilmiştir.

#### **ARAŞTIRMA VE BULGULAR**

##### **Yüksek Lisans ve Doktora Tezlerinin Yıllara Göre Dağılımı**

Tablo 1’de doküman analizi yapılan 148 lisansüstü tezin yıllara göre dağılımları verilmiştir.

**Tablo 1. Çok kültürlü/çokkültürlü eğitimi konu alan tezlerin yıllara göre dağılımı**

<b>Yayın Yılı</b>	<b>f</b>	<b>%</b>
2023	10	6.75
2022	20	13.51
2021	16	10.81
2020	10	6.75
2019	28	18.91
2018	10	6.75
2017	8	5.4
2016	8	5.4
2015	5	3.37
2014	11	7.43
2013	9	6.08
2012	2	1.35
2011	1	.67
2010	1	.67
2009	2	1.35
2008	2	1.35
2006	1	.67
2005	1	.67
2001	1	.67
1998	2	1.35
Toplam	148	100

Tablo 1’de 148 çalışmanın yıllara göre dağılımı şu şekildedir; 1998 yılında 2 çalışma (% 1.35), 2001 yılında 1 çalışma (% 0.67), 2005 yılında 1 çalışma (% 0.67), 2006 yılında 1 çalışma (% 0.67), 2008 yılında 2 çalışma (% 1.35), 2009 yılında 2 çalışma (% 1.35), 2010 yılında 1 çalışma (% 0.67), 2011 yılında 1 çalışma (% 0.67), 2012 yılında 2 çalışma (% 1.35), 2013 yılında 9 çalışma (% 6.08), 2014 yılında 11 çalışma (% 7.43), 2015 yılında 5 çalışma (% 3.37), 2016 yılında 8 çalışma (% 5.4), 2017 yılında 8 çalışma (% 5.4), 2018 yılında 10 çalışma (% 6.75), 2019 yılında 28 çalışma (% 18.91), 2020 yılında 10 çalışma (% 6.75), 2021 yılında 16 çalışma (% 10.81), 2022 yılında 20 çalışma (% 13.51), 2023 yılında 10 çalışma (% 6.75) yapılmıştır. Elde edilen bulgular dahilinde çok kültürlü/çokkültürlü eğitim alanından en fazla 2019 (%18.91) ve 2022 (%13.51) yıllarında yüksek lisans ve doktora tezlerinin yazıldığı

görülmektedir. Bu çalışmalarda dördü erişime kapalıdır (Kahyaoğlu, 1998; Öztürk,1998; Altaş, 2001; Hamurabi Sözen, 2005).

### **Yüksek Lisans ve Doktora Tezlerinin Üniversitelere Göre Dağılımı**

Tablo 2’de doküman analizi yapılan 144 lisansüstü tezin yazarların üniversitelerine göre dağılımları verilmiştir.

**Tablo 2. Çok kültürlü/çokkültürlü eğitimi konu alan tezlerin yazarlarının üniversitelere göre dağılımı**

<b>Üniversitenin Adı</b>	<b>f</b>	<b>%</b>	<b>Üniversitenin Adı</b>	<b>f</b>	<b>%</b>
Marmara Üniversitesi	14	9.72	Gaziantep Üniversitesi	3	2.08
Hacettepe Üniversitesi	8	5.55	Çağ Üniversitesi	2	1.38
Yıldız Teknik Üniversitesi	7	4.86	Necmettin Erbakan Üniversitesi	2	1.38
Abant İzzet Baysal Üniversitesi	6	4.16	İnönü Üniversitesi	2	1.38
Çukurova Üniversitesi	5	3.47	Bahçeşehir Üniversitesi	2	1.38
Trakya Üniversitesi	4	2.77	Gazi Osman Paşa Üniversitesi	2	1.38
Dokuz Eylül Üniversitesi	4	2.77	Balıkesir Üniversitesi	2	1.38
Van Yüzüncü Yıl Üniversitesi	4	2.77	İstanbul Üniversitesi- Cerrahpaşa Üniversitesi	2	1.38
Dumlupınar Üniversitesi	4	2.77	On Dokuz Mayıs Üniversitesi	2	1.38
Çanakkale On Sekiz Mart Üniversitesi	4	2.77	Gazi Üniversitesi	2	1.38
Akdeniz Üniversitesi	4	2.77	Boğaziçi Üniversitesi	2	1.38
Ege Üniversitesi	4	2.77	Fırat Üniversitesi	2	1.38
İstanbul Aydın Üniversitesi	3	2.08	Zonguldak Bülent Ecevit Üniversitesi	2	1.38
Ankara Üniversitesi	3	2.08	Kastamonu Üniversitesi	2	1.38
Uludağ Üniversitesi	3	2.08	Hacı Bektaş Veli Üniversitesi	2	1.38
Sakarya Üniversitesi	3	2.08	Erciyes Üniversitesi	2	1.38
Dicle Üniversitesi	3	2.08	Pamukkale Üniversitesi	2	1.38
Anadolu Üniversitesi	3	2.08	Diğer Üniversiteler	23	15.97

Tablo 2’de verilen 144 çalışmanın üniversitelere göre dağılımı şu şekildedir; Marmara Üniversitesi’nde 14 (%9.72), Hacettepe Üniversitesi’nde 8 (%5.5), Yıldız Teknik Üniversitesi’nde 7 (%4.86), Abant İzzet Baysal Üniversitesi’nde 6 (%4.16), Çukurova Üniversitesi’nde 5 (%3.47), Trakya Üniversitesi’nde 4 (%2.77), Dokuz Eylül Üniversitesi’nde 4 (%2.77), Van Yüzüncü Yıl Üniversitesi’nde 4 (%2.77), Dumlupınar Üniversitesi’nde 4 (%2.77), Çanakkale On Sekiz Mart Üniversitesi’nde 4 (%2.77), Akdeniz Üniversitesi’nde 4 (%2.77), Ege Üniversitesi’nde 4 (%2.77), İstanbul Aydın Üniversitesi’nde 3 (%2.08), Ankara

Üniversitesi'nde 3 (%2.08), Uludağ Üniversitesi'nde 3 (%2.08), Sakarya Üniversitesi'nde 3 (%2.08), Anadolu Üniversitesi'nde 3 (%2.08), Gaziantep Üniversitesi'nde 3 (%2.08), Çağ Üniversitesi'nde 2 (%1.38), Necmettin Erbakan Üniversitesi'nde 2 (%1.38), İnönü Üniversitesi'nde 2 (%1.38), Bahçeşehir Üniversitesi'nde 2 (%1.38), Gazi Osman Paşa Üniversitesi'nde 2 (%1.38), Balıkesir Üniversitesi'nde 2 (%1.38), İstanbul Üniversitesi-Cerrahpaşa Üniversitesi'nde 2 (%1.38), On Dokuz Mayıs Üniversitesi'nde 2 (%1.38), Gazi Üniversitesi'nde 2 (%1.38), Boğaziçi Üniversitesi'nde 2 (%1.38), Fırat Üniversitesi'nde 2 (%1.38), Zonguldak Bülent Ecevit Üniversitesi'nde 2 (%1.38), Kastamonu Üniversitesi'nde 2 (%1.38), Hacı Bektaş Veli Üniversitesi'nde 2 (%1.38), Erciyes Üniversitesi'nde 2 (%1.38), Pamukkale Üniversitesi'nde 2 (%1.38) ve diğer Üniversitelerde toplamda 23 (%15.97) lisansüstü tez yazılmıştır. Elde edilen bulgulara göre çok kültürlü/çokkültürlü eğitim konusunda en fazla lisansüstü tez Marmara (%9.72) ve Hacettepe (%5.5) üniversitelerinde yazılmıştır.

#### **Yüksek Lisans ve Doktora Tezlerinin Enstitülerine Göre Dağılımı**

Tablo 3'te doküman analizi yapılan 144 lisansüstü tezin enstitülerine göre dağılımları verilmiştir.

**Tablo 3. Çok kültürlü/çokkültürlü eğitimi konu alan tezlerin enstitülerine göre dağılımı**

<b>Enstitüler</b>	<b>f</b>	<b>%</b>
Eğitim Bilimleri Enstitüsü	75	52.08
Sosyal Bilimler Enstitüsü	52	36.11
Lisansüstü Enstitüsü	15	10.41
Sağlık Bilimleri Enstitüsü	1	.69
Yurtdışı Enstitüsü	1	.69
Toplam	144	100

Tablo 3'teki verilere göre çalışmaların enstitülere göre 75 (%52.08)'i Eğitim Bilimleri Enstitüsü'nde, 52 (%36.11)'si Sosyal Bilimler Enstitüsü'nde, 15(%10.41)'i Lisansüstü Enstitüsü'nde, 1(% 0.69)'i Sağlık Bilimleri Enstitüsü'nde ve 1 (% 0.67)'i de Yurtdışı Enstitüsü'nde yazılmıştır. Elde edilen bulgulara göre lisansüstü tezler en fazla Eğitim Bilimleri Enstitüleri (%52.08) kapsamında yazılmıştır.

#### **Yüksek Lisans ve Doktora Tezlerinin Anabilim Dallarına Göre Dağılımı**

Tablo 4'te doküman analizi yapılan 144 lisansüstü tezin anabilim dallarına göre dağılımları verilmiştir.

**Tablo 4. Çok kültürlü/çokkültürlü eğitimi konu alan tezlerin anabilim dallarına göre dağılımı**

<b>Anabilim Dalı</b>	<b><i>f</i></b>	<b>%</b>
Eğitim Bilimleri Anabilim Dalı	49	34.02
Türkçe ve Sosyal Bilimler Anabilim Dalı	19	13.19
İlköğretim Anabilim Dalı	17	11.8
Eğitim Programları ve Öğretimi Anabilim Dalı	8	5.55
Temel Eğitim Anabilim Dalı	7	4.86
Diğer	44	30.55
Toplam	144	100

Tablo 4’te çalışmaların anabilim dallarına göre dağılımı şu şekildedir; Eğitim Bilimleri Anabilim Dalı 49 (%34.02), Türkçe ve Sosyal Bilimler Anabilim Dalı 19 (%13.19), İlköğretim Anabilim Dalı 17 (%11.8), Eğitim Programları ve Öğretimi Anabilim Dalı 8 (%5.55), Temel Eğitim Anabilim Dalı 7 (%4.86) ve diğer anabilim dallarında 44 (%30.55) lisansüstü tez yayınlanmıştır. Bu bulgulara göre en fazla lisansüstü tez yayınlayan anabilim dalının Eğitim Bilimleri Anabilim Dalı (%34.02) olduğuna ulaşılmıştır.

#### **Yüksek Lisans ve Doktora Tezlerinin Türüne Göre Dağılımı**

Tablo 5’te doküman analizi yapılan 144 lisansüstü tezin türüne göre dağılımları verilmiştir.

**Tablo 5. Çok kültürlü/çokkültürlü eğitimi konu alan tezlerin tez türüne göre dağılımı**

<b>Tez Türü</b>	<b><i>f</i></b>	<b>%</b>
Yüksek Lisans	114	79,16
Doktora	30	20,83
Toplam	144	100

Tablo 5’te çalışmaların tez türlerinin dağılımına göre 114 (%79,16) yüksek lisans tezi ve 30 (%20.83) doktora tezi yayınlanmıştır. Verilere göre yüksek lisans tezlerinin oranı (%79.16) doktora tezlerinin oranından (%20.83) oldukça fazladır.

#### **Yüksek Lisans ve Doktora Tezlerinin Danışman Unvanlarına Göre Dağılımı**

Tablo 6’da doküman analizi yapılan 144 lisansüstü tezin danışman unvanlarına göre dağılımları verilmiştir.

**Tablo 6. Çok kültürlü/çokkültürlü eğitimi konu alan tezlerin danışmanlarının unvanlarına göre dağılımı**

<b>Danışman Ünvanları</b>	<b>f</b>	<b>%</b>
Profesör	47	31.54
Doçent	52	34.89
Doktor Öğretim Üyesi/ Yardımcı Doçent Doktor	49	32.88
Doktor	1	.67
Toplam	149	100

Tablo 6'ya göre tezlerin danışman unvanlarına göre dağılımı şu şekildedir; 47 (%31.54) profesör, 52 (%34.89) doçent, 49 (%32.88) doktor öğretim üyesi/yardımcı doçent ve 1 (% 0.67) doktor unvanına sahip danışmanın yer aldığı toplamda 144 tane lisansüstü tez yayınlanmıştır. Tezlerin frekans toplamının 149 olmasının sebebi ise bazı çalışmaların iki danışmana (Toprak, 2008; Sarıkaya Serdaroğlu, 2023; Arslan, 2014; Şahin Bektaş, 2022; Kılıçoğlu, 2014) sahip olmasından kaynaklanmaktadır.

#### **Yüksek Lisans ve Doktora Tezlerinin Çalışma Grubuna Göre Dağılımı**

Tablo 7'de doküman analizi yapılan 144 lisansüstü tezin çalışma grubuna göre dağılımları verilmiştir.

**Tablo 7. Çok kültürlü/çokkültürlü eğitimi konu alan tezlerin çalışma grubuna göre dağılımı**

<b>Çalışma Grubu</b>	<b>f</b>	<b>%</b>
Öğretmen	78	48.14
Öğretmen Adayı	26	16.04
Öğrenci	20	12.34
Ders Kitabı/Dokümantasyon	18	11.11
Öğretim Görevlisi/Elemanı	8	4.93
Okul Yöneticisi/Personeli	7	4.32
Diğer	5	3.08
Toplam	162	100

Tablo 7'de tezlerin çalışma gruplarına göre dağılımı şu şekildedir; 78 (%48.14) çalışmada öğretmene, 26 (%16.04) çalışmada öğretmen adayına, 20 (%12.34) çalışmada öğrenciye, 18 (%11.11) çalışmada ders kitabı/dokümantasyona, 8 (%4.93) çalışmada öğretim görevlisi/elemanına, 7 (%4.32) çalışmada okul yöneticisi/personeline ve 5 (%3.08) diğer (program, ebeveyn, farklı etnik grup katılımcıları) grubuna yer verilmiştir. Araştırmalarda

çalışma grubu olarak öğretmenlerin oran (%48.14) olarak en fazla tercih edildiği bulgular dahilinde elde edilmiştir.

### **Yüksek Lisans ve Doktora Tezlerinin Araştırma Yöntemine Göre Dağılımı**

Tablo 8’de doküman analizi yapılan 144 lisansüstü tezin araştırma yöntemine göre dağılımları verilmiştir.

**Tablo 8. Çok kültürlü/çokkültürlü eğitimi konu alan tezlerin araştırma yöntemine göre dağılımı**

<b>Araştırma Yöntemi</b>	<b>f</b>	<b>%</b>
Nitel	46	31.94
Nicel	79	54.86
Karma	19	13.19
Toplam	144	100

Tablo 8’de tezlerin araştırma yöntemlerinin dağılımı incelendiğinde 46 (%31.94) nitel, 79 (%54.86) nicel ve 19 (%13.19) karma çalışmaya yer verilmiştir. Bu bulgulara göre lisansüstü tezlerin nicel (%54.86) çalışmalara en fazla yer verdiği görülmektedir.

### **Yüksek Lisans ve Doktora Tezlerinin Sonuçlarına Göre Dağılımı**

Tablo 9’da doküman analizi yapılan 144 lisansüstü tezin sonuçlarına göre dağılımları verilmiştir.

**Tablo 9. Çok kültürlü/çokkültürlü eğitimi konu alan tezlerin sonuçları**

\* Öğretmenlerin çok kültürlülük ve çok kültürlü eğitim konusunda algıları olumlu, çok kültürlü eğitim uygulamalarından pek fazla haberdar olmadıkları ve çok kültürlü eğitim konu olunca sorumluk bilinçlerinin olduğu sonucu elde edilmiştir (Karadeniz, 2019; Teymur, 2020; Sağlam, 2016; Kaya, 2013; Polat, 2013).

\* Öğretmen adaylarının/eğitim fakültesi lisans öğrencilerinin çok kültürlü eğitim ile ilgili görüşleri, tutumları ve öz yeterlik algıları yüksek düzeyde bulunmuştur (Başarır, 2012; Moumin, 2019; Karadağ, 2019; Oğuz, 2016; Alanay, 2015).

\* Okul öncesi öğretmenlerinin yeterlilik algılarına bakıldığında farklı değişkenler doğrultusunda (yaş, eğitim durumu, etnik köken, görev yaptığı okulun bulunduğu yerleşim yeri vs.) farklılıklar gösterdiği sonucuna varılmıştır (Çapçı, 2020; Kimzan, 2016; Acar Çiftçi, 2015; Polat, 2013).

\* Öğretmenlerin farklı toplum anlayışını kabul etmektedir. Öğretmenlerin farklılıklara karşı farklı tutumları bulunmaktadır. Öğretmenler, öğretmenlik mesleğini yerine getiren bireylerin

önyargılı olduklarını ancak kendilerinin önyargılı olmadıklarını ifade etmektedirler (Esen, 2009; Teymur, 2020).

\* sosyal bilgiler öğretmenlerinin çok kültürlülüğe ait olumlu görüşlere sahip olduğu, eğitim sisteminde çok kültürlülüğe ait eksiklerin olduğu sonucuna ulaşılmıştır (Çetinkaya, 2020; Ateş, 2017).

\* Çok kültürlü yeterliliğin en önemli iki unsurunun motivasyon ve üst biliş olduğu ve çok kültürlü eğitim tutumlarının kişilik özellikleriyle ilişkili olduğu sonucuna ulaşılmıştır (ekinci, 2019; kaba, 2019).

\* Öğretmenlerin çok kültürlülüğe ilişkin tutumları görev yaptıkları okulun türüne, sahip oldukları branşlara, cinsiyetlerine, kariyer basamaklarına göre farklılık göstermekte ayrıca çok kültürlü sınıf ortamlarında sınıf yönetim becerileri cinsiyete göre farklılık gösterirken mezuniyet durumu, kıdem yılı, ana dili, yaş gibi durumlara göre farklılık göstermemektedir ayrıca öğretmenlerin çok kültürlü eğitim ve çok kültürlülük kavramına ilişkin bilgi, tutum ve becerilerinin yüksek derecededir (Pınarcıoğlu, 2023; Sevilmiş, 2022; Kafa, 2022).

\* Sosyal bilgiler ders kitapları incelendiğinde beş, altı ve yedinci sınıfların bazı ünitelerinde çok kültürlülük bağlamında kazanımlara yer verildiği ancak yeteri düzeyde çok kültürlülüğe yer verilmediği ve sosyal bilgiler ders kitaplarında çok kültürlülüğün yansımalarına değinildiği sonucuna ulaşılmıştır (Bektaş, 2023a; Bektaş, 2023b, Doğan, 2019).

\* Öğretmenlerin, farklı kültüre ait veliler ve çocuklarla iletişim problemi yaşaması, verdikleri eğitimin yeterince karşılıkları alamamaları, farklı kültüre sahip çocukların çatışmalar yaşadıkları ile ilgili problemler öğretmenlerin çok kültürlü eğitime olan görüşlerini olumsuz etkilemekte ve öğretmenlerin çok kültürlü eğitim algıları ve sınıf yönetim becerileri düşük düzeyde ve negatif yönlü bir ilişki içerisindedir (Yıldırım, 2022; Şahin Bektaş, 2022; Tanış, 2021).

\* Psikolojik danışmanların Suriyeli bireyler ile kurulan ilişkinin/temasın miktar ve düzey olarak okul dışında düşük seviyede olduğu ve psikolojik danışmanların çok kültürlülük algılarının yüksek olmasına rağmen Suriyeli bireyler hakkında pek bilgi sahip olmadığı ya da eksik ve yanlış bilgiye sahip oldukları sonucuna varılmıştır (Yalçın Güler, 2020; Polat, 2013).

\* Göçmen çocuklarla çalışan öğretmenlerin çok kültürlülüğe ait tutumları, iş doyumları ve yaşam doyumları yüksektir (Duygu, 2023; Kervan, 2017).

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

**April 09-16, 2024 / Lisbon, Portugal**

- \* Sınıf öğretmenlerinin kültürel sermaye yeterlik düzeylerinin yüksek olduğu ve kültürel sermaye yeterlik düzeylerinin anne eğitim düzeyi, yaş ve meslekte geçirilen yıla göre anlamlı farklılık gösterdiği ve öz duyarlılıkla çok kültürlülük yeterlik algıları arasında pozitif bir ilişki bulunduğu sonucuna ulaşılmıştır (Güleç, 2019).
- \* Çok kültürlülük kavramının; zenginlik, çeşitlilik, süreklilik, hoşgörü, tahammül gibi kavramları çağrıştırdığı sonucuna ulaşılmıştır (Gholizadeh Avval, 2018).
- \* Çok kültürlü kişilik özelliklerinin çok kültürlü eğitime karşı olan tutumlarda herhangi bir belirleyicilik göstermediği sonucuna ulaşılmıştır (Özdemir, 2018).
- \* Farklılıklara saygı ve çok kültürlülük arasında olumlu ilişkiler bulunmaktadır. Açık görüşlülük, empati, esnekliğin arttığı durumlarda farklılıklara saygının da arttığı görülmüştür (Kacar, 2018).
- \* Öğretmen yetiştirme programlarında en fazla katıda bulunan dersin çok kültürlü eğitim uygulaması ile birleştirilmiş olan sınıf yönetimi dersi olduğu sonucu elde edilmiştir (Akcaoğlu, 2017).
- \* Okul öncesi öğretmenlerinin çok kültürlü kişilik özellikleri ve çok kültürlü eğitime olan tutumları okul öncesi öğretmen adaylarına göre daha yüksek düzeydedir (Bulut, 2015).
- \* Okul yöneticilerin ve öğretmenlerin çok kültürlü eğitime yönelik tutumlarının olumlu olduğu sonucu elde edilmiştir (Marangoz, 2014).
- \* Öğretmen ve öğrenci görüşlerinin incelendiği çalışmada vatandaşlık eğitiminin yetersiz kaldığı sonucuna ulaşılmıştır (Arslan, 2014).
- \* Türk ve yabancı öğrencilerin çok kültürlü eğitim ortamına bakışı olumludur (Demirel, 2014).
- \* Kültürel zekanın çok kültürlü eğitim üzerinde pek bir etkiye sahip olmadığı (Özer Koçak, 2020), bir diğer çalışma da ise kültürel zekâ ve çok kültürlü eğitim tutumu ve kültürler arası tutarlılık arasında pozitif bir ilişki olduğu sonucuna ulaşılmıştır (Uğur, 2019).
- \* Öğretmenlere göre kültürel konuların yüz yüze eğitimle iletilmesinin daha etkili olduğu ancak farklılıklara saygı ve çok kültürlülük uygulamalarının bazı noktalarda ilişkilendiremedikleri sonucuna varılmıştır (Ateş, 2021).
- \* Beden eğitimi öğretmenlerinin daha büyük yaş grubundaki bireylerle çalışanlar çok kültürlü farkındalık düzeyleri diğerlerine göre daha yüksek olduğu ve ayrıca öğretmenlerin öğrenim durumları yükseldikçe çokkültürlülük algı bilgi düzeylerinin arttığı sonucuna ulaşılmıştır (Alçin, 2021).

- \* Sosyal bilgiler öğretmenleri İngilizce öğretmenlerine göre daha yüksek çok kültürlü tutum sergilemektedir (Dağdemir, 2021).
- \* Okulun bulunduğu yer, fiziki şartları, sosyo-ekonomik durum ve verilen eğitimin kalitesinin çok kültürlü eğitimi etkilediği sonucuna ulaşılmıştır (Ekşi, 2020).
- \* Öğretmenler, çok kültürlü eğitime çok yönlü bir bakış açısı geliştirmesi ve evrensel değerleri ön planda tutması noktasında olumlu ancak suiistimale açık olması noktasında ise olumsuz bir bakış açısına sahiptir. Öğretmenlerin çok kültürlü eğitimde kullandıkları teknikler; münazara, altı şapkalı düşünme tekniği, örnek olaydır (Yıldırım, 2021).
- \* Öğretmenlerin kültürler arası duyarlılıklarının yüksek seviyede olduğu ve barışa yönelik tutumları arasında orta düzey pozitif bir ilişki olduğu sonucuna ulaşılmıştır (Gençtürk Erdem, 2022).
- \* Yetişkinler çok kültürlü eğitimi önemli ve avantajlı, eğitimciler ise çok kültürlü eğitim ortamını kültürel açıdan farklı insanların ve materyallerin birarada bulundurulmasıyla ilişkilendirmişlerdir (Elçiçek, 2022).
- \* Çalışmaya katılan bireylerin oyunun çok kültürlü eğitim ve çok kültürlü oyunun sahip olduğu olumlu kısımları dikkate aldıklarına ulaşılmıştır (Kurşun, 2023).
- \* Yabancı basım ders kitaplarını kullanan öğrencilerin yerli basım ders kitaplarını kullanan öğrencilere göre çok kültürlülük algılarının daha yüksek olduğu sonucuna ulaşılmıştır (Çarıkçı Kula, 2023).
- \* Fen bilimleri öğretmenlerinin büyük bir kısmının çok kültürlülük yeterlik algısına sahip olduğu yaş ve deneyim açısından büyük olanların ise diğer öğretmenlere oranla daha çok çok kültürlü eğitim algı ve yeterlik algısına sahiptir (Güner, 2023).
- \* Okul öncesi öğretmenlerinin çok kültürlü eğitim tutumlarına veya çocuk hakları hakkında sahip oldukları bilgi düzeyi; yaş, çalışma yılı, öğrenim düzeyi, çok kültürlü eğitim konusunda eğitim alıp almama gibi durumlara etki etmediği sonucuna ulaşılmıştır (kopuz yavuz, 2019).
- \* Yabancı öğrencilere Türkçe öğreten öğretmenlerinin çok kültürü eğitime yönelik tutumları mesleki kıdem, yaş ve eğitim düzeyine göre farklılık göstermemektedir (yılmaz, 2019).
- \* Tarih derslerinde katılımcılar kendi kültürlerine ait kimliklerin yeteri kadar yer bulmadığını, yer verilen bölümlerde ise ötekileştiren söylemlerin yer aldığı belirtilmiştir (Yazıcı, 2013).

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

**April 09-16, 2024 / Lisbon, Portugal**

- \* Okul öncesi eğitim sınıfındaki çocukların aile ortamında okul ortamına geçiş sürecinde kültürel etkileşimler ve unsurlar önemlidir (şimşek, 2022).
- \* Hizmet içi eğitim programının çok kültürlü eğitime karşı algıların ve mesleki yeterliliklerin artırılması hakkında iyileştirilmeye ihtiyaç duymaktadır (durmuş, 2022).
- \* Sosyal empati becerisi, kültürler arası iletişim kaygısı ile öğretmenlerin çok kültürlü yeterlik algısı yordadığı sonucuna ulaşılmıştır (Akgül, 2022).
- \* Türkiye’de çok kültürlü eğitim ile ilgili çalışmalar dünyada yapılan çalışmalardan 29 yıl sonra yapıldığı, çok kültürlülükle ilgili yapılan çalışmaların konularının ise eğitim-öğretim, kültür, kimlik, öğretmen vb. dir (şangül, 2022).
- \* Öğretmenlerin çok kültürlü eğitim ortamlarını gözlemleyerek yeterliliklerini geliştirdikleri sonucuna ulaşılmıştır (başar, 2022).
- \* Öğretmenlerin sosyal adalete bağlı olarak öğretme yeterlikleri ve çok kültürlü öğretim yeterlilikleri arasında olumlu bir ilişki vardır (can, 2021).
- \* Öğretmenlerin çok kültürlü eğitime karşı tutumlarının ve empati düzeylerinin yüksek ve aralarında pozitif yönde düşük bir ilişki bulunmaktadır (Babur, 2021).
- \* İkili öğretmen modelinin kalabalık ve çok kültürlü sınıflarda uygulanabileceği ancak iki öğretmenin bir sınıfa girmesinin görüş ayrılıklarının olabileceği sonucunu da ortaya çıkarmaktadır (Altay, 2021).
- \* Çok kültürlü eğitimin amacı ülke genelinde birlik ve beraberliğini, düşünce ve ifade özgürlüğünü sağlamak, hoşgörü ve empati bilincini geliştirmek olarak öğretmen adayları tarafından aktarılmıştır (keçesi, 2019).
- \* Medya okuryazarlığı dersinin sosyal bilgiler öğretmen adaylarının çok kültürlü tutum geliştirmeye yönelik etkisine bakıldığında olumsuz yönde bir etki elde edilmiştir (Çelik, 2011). Sosyal bilgiler öğretmenlerinin bir kısmının çok kültürlülüğü tanımlayamamıştır (Yıldırım, 2019).
- \* Türkiye tarih öğretim programlarının içeriklerine bakıldığında çok kültürlülüğe yönelik meyilli olduğu sonucu elde edilmiştir (Çınar, 2010).
- \* Bireylerin kendi kültürel kimliklerine karşı olumlu tutumları arttıkça yabancı dil öğrenme noktasında tutumlarının azaldığı sonucuna ulaşılmıştır (Sökmen Ramos, 2019).
- \* Öğretmen adaylarının sosyal medya kullanımına göre çok kültürlü eğitime ilişkin görüşlerine bakıldığında; sosyal medya sitelerinin kullanım amacına, zaman geçirilen sosyal

medya grubuna, sosyal medya sitelerinde üye olunan kişi sayısına göre farklılık gösterdiği sonucuna ulaşılmıştır (Hark Söylemez, 2017).

\* Türkiye ve Yunanistan'da yayınlanmış olan resimli çocuk kitaplarının çok kültürlülük açısından incelenmesine bakıldığında inanç boyutunun fantastik öğeler alt boyutunda benzer olduğu sonucu elde edilmiştir (Veli Amet, 2021).

\* Okul ortamının sosyal ve duygusal becerilere etkisine bakıldığında yaş grubu ve kültürel farklılıkların yordayıcılığı dikkat çekmektedir (Hayır, 2023).

\* din kültürü ve ahlak bilgisi dersleri çok kültürlülüğü ele bir ortamlarda etkili olabilmesi için öğretmenlerin dersi anlatış tarzı, tutum ve davranışları etkili olmaktadır (Doğru, 2022).

\* Beden eğitimi öğretmen adaylarının çok kültürlü eğitime yönelik tutumlarının yüksek olduğu sonucuna ulaşılmıştır (ırmak, 2022).

\* Sığınmacı öğrencileri tanımak amacıyla gelişi güzel bir yol izlendiği, eğitimde en önemli sorunun dil olduğu, öğretmenlerin bu durumlara karşı hazırlıksız olması, en çok kullanılan yöntemlerin düz anlatım ve akıllı tahtanın kullanılması ve sonuç olarak iki öğretmen yaklaşımına varılmıştır. Bunlardan ilki Türk öğrencilere odaklı anlatım ve tüm öğrencileri temel alarak yapılan anlatım şeklindedir (Yılmaz, 2023).

\* Ders kitapların çok kültürlülük öğelerine yer verilmesine rağmen bu öğeler arasında bir dengenin olmayışı dikkat çekmektedir (Korkmaz, 2009).

\* Kadın sınıf öğretmenlerinin erkek sınıf öğretmenlerine oranla çok kültürlü kişilik özelliklerinin farklılaşma gösterdiği, öğretmenlerin çok kültürlü kişilik özelliklerinin on sekiz yaşına kadar yaşadıkları yer ve baba eğitim düzeylerine bağlı olarak değişiklik göstermediği, anne eğitim düzeyinin çok kültürlü kişilik özellikleri üzerinde anlamlı bir farklılık olmadığı ancak çok kültürlü algıları üzerinde anlamlı bir farklılık olduğu sonucu elde edilmiştir. Öğretmenlerin kıdem yılları arttıkça çok kültürlü yeterlik algılarının azaldığı, sınıf öğretmenlerinin çok kültürlü yeterlilik algıları arttıkça çok kültürlü kişilik özelliklerinin de arttığı sonucuna ulaşılmıştır (Durşen Ünal, 2018).

\* Okulda görev yapmakta olan psikolojik danışmanların kültüre duyarlı psikolojik danışma yeterlikleri, medeni durumları, cinsiyetleri, hayatlarının en fazla geçtiği mekan, görev süresi,, kültüre duyarlılık ile ilgili ders alması gibi değişkenlere göre anlamlı düzeyde bir farklılaşma görülmediği, ancak psikolojik danışma yeterlik algısı, farklı kültürlere ait danışmanların sıklığı, öğrenim düzeyi ve bildikleri dil sayısına göre anlamlı bir düzeyde farklılaşmanın olduğu sonucuna ulaşılmıştır (Demir, 2016).

\* Öğrencilerin çok kültürlü bir ortamda yapılan birebir ve ikili testlerin tercih etmesi konusunda yapılan çalışmaya göre bireysel farklılıkların temel olduğu sonucuna ulaşılmıştır (Öncel, 2016).

\* Vatandaşlık ve demokrasi eğitimi ders kitabı ve ders programına katılan bireylerin kültürel farklılıkları tanıma ve tanıtmaya noktasında ihtiyaca cevapsız kaldıkları ve farklı kültüre ait bireylerin en fazla şikayetçi oldukları konunun önyargı olduğu sonucu elde edilmiştir (Yiğit, 2014).

\* Okul yöneticileri öğretmenlere oranla kendi çok kültürlü yeterlilikleri hakkında daha olumlu görüş bildirmişlerdir. Küçük okulda çalışan okul yöneticilerinin çok kültürlü yeterlilik hakkında daha olumlu görüşler bildirmişleridir (Karadağ, 2015). Okul yöneticileri çok kültürlü kişilik özelliklere sahip olduğu ve çatışmadan kaçındıkları sonucuna ulaşılmıştır (Günçavdı Alabay, 2022).

\* İlkokulda görev yapan öğretmenlerin çok kültürlülükle ilgili farkındalık düzeyleri genel olarak yüksek olduğu sonucuna ulaşılmıştır. Ayrıca bu öğretmenlerin çok kültürlülükle ilgili beceri, bilgi ve farkındalık alt boyutlarına göre değişkenler (cinsiyet, kıdem, öğrenim ve çalışılan okul) arasında anlamlı herhangi bir farklılık bulunmamıştır (Cırık, 2014).

\* Lise öğretmenlerinin çok kültürlü yeterlilik algıları diğer kademelerdeki (ilkokul ve ortaokul) öğretmenlere göre daha yüksek olduğu sonucuna ulaşılmıştır. Ayrıca öğretmenlerin demokratik tutum ve çok kültürlü yeterlilik algıları arasında pozitif bir ilişki bulunmuştur (Bulut, 2014).

\* Öğretmen adaylarının çok kültürlü bir eğitim sınıfında ders verme noktasında hazırbulunuşluk seviyesi olarak orta düzeyde yer aldıkları sonucuna ulaşılmıştır. Bu hazırbulunuşluk seviyelerinin ise çok kültürlülük konusunda dersler almak, göçmen veya göçmen kökenli olmak ve öğretmen yetiştirme programına göre farklılıklar göstermektedir (Subaşı, 2013).

\* İlköğretim öğretmenlerinin çok kültürlü eğitim tutumları orta ve kişilik özellikleri yüksek düzeydedir (Gürel, 2013).

Tablo 9’da tezlerin sonuçlarına yer verilmiştir. Buna göre lisansüstü tezlerin sonuçlarına göre en çok ulaşılan sonuçlar şu şekildedir; öğretmenlerin çok kültürlülük ve çok kültürlü eğitim konusunda algıları olumlu, çok kültürlü eğitim uygulamalarından pek fazla haberdar olmadıkları ve çok kültürlü eğitim konu olunca sorumluluk bilinçlerinin olduğu sonucu elde edilmiştir. Diğer sonuçlara bakıldığında öğretmen adaylarının/eğitim fakültesi lisans öğrencilerinin çok kültürlü eğitim ile ilgili görüşleri, tutumları ve öz yeterlik algıları yüksek

düzeyde bulunmuştur. Okul öncesi öğretmenlerinin yeterlilik algılarına bakıldığında farklı değişkenler doğrultusunda (yaş, eğitim durumu, etnik köken, görev yaptığı okulun bulunduğu yerleşim yeri vs.) farklılıklar gösterdiği sonucuna varılmıştır. Öğretmenlerin farklı toplum anlayışını kabul etmekte ve farklılıklara karşı farklı tutumları bulunmaktadır. Öğretmenler, öğretmenlik mesleğini yerine getiren bireylerin önyargılı olduklarını ancak kendilerinin önyargılı olmadıklarını ifade etmektedirler. Sosyal bilgiler öğretmenlerinin çok kültürlülüğe ait olumlu görüşlere sahip olduğu, eğitim sisteminde çok kültürlülüğe ait eksiklerin olduğu sonucuna ulaşılmıştır. Çok kültürlü yeterliliğin en önemli iki unsurunun motivasyon ve üst biliş olduğu ve çok kültürlü eğitim tutumlarının kişilik özellikleriyle ilişkili olduğu sonucuna ulaşılmıştır. Öğretmenlerin çok kültürlülüğe ilişkin tutumları görev yaptıkları okulun türüne, sahip oldukları branşlara, cinsiyetlerine, kariyer basamaklarına göre farklılık göstermekte ayrıca çok kültürlü sınıf ortamlarında sınıf yönetim becerileri cinsiyete göre farklılık gösterirken mezuniyet durumu, kıdem yılı, ana dili, yaş gibi durumlara göre farklılık göstermemektedir ayrıca öğretmenlerin çok kültürlü eğitim ve çok kültürlülük kavramına ilişkin bilgi, tutum ve becerilerinin yüksek derecededir. Sosyal bilgiler ders kitapları incelendiğinde beş, altı ve yedinci sınıfların bazı ünitelerinde çok kültürlülük bağlamında kazanımlara yer verildiği ancak yeteri düzeyde çok kültürlülüğe yer verilmediği ve sosyal bilgiler ders kitaplarında çok kültürlülüğün yansımalarına değinildiği sonucuna ulaşılmıştır. Öğretmenlerin, farklı kültüre ait veliler ve çocuklarla iletişim problemi yaşaması, verdikleri eğitimin yeterince karşılıklarını alamamaları, farklı kültüre sahip çocukların çatışmalar yaşadıkları ile ilgili problemler öğretmenlerin çok kültürlü eğitime olan görüşlerini olumsuz etkilemekte ve öğretmenlerin çok kültürlü eğitim algıları ve sınıf yönetim becerileri düşük düzeyde ve negatif yönlü bir ilişki içerisinde olduğu görülmektedir. Psikolojik danışmanların Suriyeli bireyler ile kurulan ilişkinin/temasın miktar ve düzey olarak okul dışında düşük seviyede olduğu ve psikolojik danışmanların çok kültürlülük algılarının yüksek olmasına rağmen Suriyeli bireyler hakkında pek bilgiye sahip olmadığı ya da eksik ve yanlış bilgiye sahip oldukları sonucuna varılmıştır. Göçmen çocuklarla çalışan öğretmenlerin çok kültürlülüğe ait tutumları, iş doyumları ve yaşam doyumlarının yüksek olduğu, sınıf öğretmenlerinin kültürel sermaye yeterlik düzeylerinin yüksek olduğu ve kültürel sermaye yeterlik düzeylerinin anne eğitim düzeyi, yaş ve meslekte geçirilen yıla göre anlamlı farklılık gösterdiği ve öz duyarlılıkla çok kültürlülük yeterlik algıları arasında pozitif bir ilişki bulunduğu sonucuna ulaşılmıştır. Çok kültürlülük kavramının; zenginlik, çeşitlilik, süreklilik, hoşgörü, tahammül gibi kavramları çağrıştırdığı sonucuna ulaşılmıştır. Çok kültürlü kişilik özelliklerinin çok kültürlü eğitime karşı

olan tutumlarda herhangi bir belirleyicilik göstermediği sonucuna ulaşılmıştır. Farklılıklara saygı ve çok kültürlülük arasında olumlu ilişkiler bulunmaktadır. Açık görüşlülük, empati, esnekliğin arttığı durumlarda farklılıklara saygının da arttığı görülmüştür. Öğretmen yetiştirme programlarında en fazla katıda bulunan dersin çok kültürlü eğitim uygulaması ile birleştirilmiş olan sınıf yönetimi dersi olduğu sonucu elde edilmiştir. Okul öncesi öğretmenlerinin çok kültürlü kişilik özellikleri ve çok kültürlü eğitime olan tutumları okul öncesi öğretmen adaylarına göre daha yüksek düzeydedir. Okul yöneticilerinin ve öğretmenlerin çok kültürlü eğitime yönelik tutumlarının olumlu olduğu sonucu elde edilmiştir. Öğretmen ve öğrenci görüşlerinin incelendiği çalışmada vatandaşlık eğitiminin yetersiz kaldığı sonucuna ulaşılmıştır. Türk ve yabancı öğrencilerin çok kültürlü eğitim ortamına bakışının olumlu olduğu ve kültürel zekanın çok kültürlü eğitim üzerinde pek bir etkiye sahip olmadığı, bir diğer çalışma da ise kültürel zekâ ve çok kültürlü eğitim tutumu ve kültürler arası tutarlılık arasında pozitif bir ilişki olduğu sonucuna ulaşılmıştır. Öğretmenlere göre kültürel konuların yüz yüze eğitimle iletilmesinin daha etkili olduğu ancak farklılıklara saygı ve çok kültürlülük uygulamalarının bazı noktalarda ilişkilendiremedikleri sonucuna varılmıştır. Beden eğitimi öğretmenlerinin daha büyük yaş grubundaki bireylerle çalışanlar çok kültürlü farkındalık düzeyleri diğerlerine göre daha yüksek olduğu ve ayrıca öğretmenlerin öğrenim durumları yükseldikçe çok kültürlülük algı bilgi düzeylerinin arttığı sonucuna ulaşılmıştır. Sosyal bilgiler öğretmenleri İngilizce öğretmenlerine göre daha yüksek çok kültürlü tutum sergilemektedir. Okulun bulunduğu yer, fiziki şartları, sosyo-ekonomik durum ve verilen eğitimin kalitesinin çok kültürlü eğitimi etkilediği sonucuna ulaşılmıştır.

## **SONUÇ**

Bu çalışmada çok kültürlü eğitim ile ilgili yapılan lisansüstü tezler incelenmiştir. Yapılan araştırma kapsamında ele alınan sonuçlar tartışılmış ve sunulmuştur.

Çok kültürlü eğitim alanında yapılmış olan çalışmalarda yıllara göre dağılım incelendiğinde; 1998 yılında 2 tez, 2001 yılında 1 tez, 2005 yılında 1 tez, 2006 yılında 1 tez, 2008 yılında 2 tez, 2009 yılında 2 tez, 2010 yılında 1 tez, 2011 yılında 1 tez, 2012 yılında 2 tez, 2013 yılında 9 tez, 2014 yılında 11 tez, 2015 yılında 5 tez, 2016 yılında 8 tez, 2017 yılında 8 tez, 2018 yılında 10 tez, 2019 yılında 28 tez, 2020 yılında 10 tez, 2021 yılında 16 tez, 2022 yılında 20 tez ve 2023 yılında 10 tez yayınlanmıştır. Hazırlanmış olan tezlerin yıllara göre dağılımı incelendiğinde yıllar arasında dalgalanmaların olduğu görülmektedir. Ancak son yıllarda yazılmış olan tezlerin sayısında bir artış olduğu ve çok kültürlü eğitim konusunda son yıllarda verilen önemin arttığı yorumu yapılabilir.

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

*April 09-16, 2024 / Lisbon, Portugal*

Çok kültürlü eğitim alanında yapılmış olan çalışmaların yazarlarının üniversitelerine göre dağılımı incelendiğinde; Marmara Üniversitesi'nde 14 tez, Hacettepe Üniversitesi'nde 8 tez, Yıldız Teknik Üniversitesi'nde 7 tez, Abant İzzet Baysal Üniversitesi'nde 6 tez, Çukurova Üniversitesi'nde 5 tez, Trakya Üniversitesi'nde 4 tez, Dokuz Eylül Üniversitesi'nde 4 tez, Van Yüzüncü Yıl Üniversitesi'nde 4 tez, Dumlupınar Üniversitesi'nde 4 tez, Çanakkale On Sekiz Mart Üniversitesi'nde 4 tez, Akdeniz Üniversitesi'nde 4 tez, Ege Üniversitesi'nde 4 tez, İstanbul Aydın Üniversitesi'nde 3 tez, Ankara Üniversitesi'nde 3 tez, Uludağ Üniversitesi'nde 3 tez, Sakarya Üniversitesi'nde 3 tez, Anadolu Üniversitesi'nde 3 tez, Gaziantep Üniversitesi'nde 3 tez, Çağ Üniversitesi'nde 2 tez, Necmettin Erbakan Üniversitesi'nde 2 tez, İnönü Üniversitesi'nde 2 tez, Bahçeşehir Üniversitesi'nde 2 tez, Gazi Osman Paşa Üniversitesi'nde 2 tez, Balıkesir Üniversitesi'nde 2 tez, İstanbul Üniversitesi-Cerrahpaşa Üniversitesi'nde 2 tez, On Dokuz Mayıs Üniversitesi'nde 2 tez, Gazi Üniversitesi'nde 2 tez, Boğaziçi Üniversitesi'nde 2 tez, Fırat Üniversitesi'nde 2 tez, Zonguldak Bülent Ecevit Üniversitesi'nde 2 tez, Kastamonu Üniversitesi'nde 2 tez, Hacı Bektaş Veli Üniversitesi'nde 2 tez, Erciyes Üniversitesi'nde 2 tez, Pamukkale Üniversitesi'nde 2 tez ve diğer üniversitelerde toplamda 23 lisansüstü tez yazılmıştır. Elde edilen bulgulara göre çok kültürlü/çokkültürlü eğitim konusunda en fazla lisansüstü tez Marmara (%9.72) ve Hacettepe (%5.5) üniversitelerinde yazılmıştır. Öte yandan birçok üniversitenin farklı sayılarda çok kültürlü eğitim alanında tez hazırlamış olduğunu ve birçok üniversitenin çok kültürlü eğitim konusuna önem verdiği yorumu yapılabilir.

Çok kültürlü eğitim alanında yazılmış olan tezlerin enstitülerine göre dağılımına bakıldığında; 75 tezin Eğitim Bilimleri Enstitüsü'nde, 52 tezin Sosyal Bilimler Enstitüsü'nde, 15 tezin Lisansüstü Enstitüsü'nde, 1 tezin Sağlık Bilimleri Enstitüsü'nde ve 1 tezin de Yurtdışı Enstitüsü'nde yazıldığı sonucu elde edilmiştir. Elde edilen bulgulara göre lisansüstü tezler en fazla Eğitim Bilimleri Enstitüleri (%52.08) kapsamında yazılmıştır. Bunun sebebi olarak konu alanının eğitim olarak sınırlandırılmış olması yorumu yapılabilir. Çok kültürlü eğitim alanında yazılmış olan tezlerin anabilim dallarına göre dağılımına bakıldığında; Eğitim Bilimleri Anabilim Dalı 49 tez, Türkçe ve Sosyal Bilimler Anabilim Dalı 19 tez, İlköğretim Anabilim Dalı 17 tez, Eğitim Programları ve Öğretimi Anabilim Dalı 8 tez, Temel Eğitim Anabilim Dalı 7 tez ve diğer anabilim dallarında 44 lisansüstü tez yayınlanmıştır. Bu bulgulara göre en fazla lisansüstü tez yayınlayan anabilim dalının Eğitim Bilimleri Anabilim Dalı (%34.02) olduğuna ve farklı anabilim dallarına eğitimlerini tamamlamış lisansüstü öğrencilerinin çok kültürlü eğitim konularına önem verdiği yorumu yapılabilir. Çok kültürlü eğitim alanında yazılmış olan

tezlerin tez türlerine göre dağılımına bakıldığında; 114 yüksek lisans tezi ve 30 doktora tezi yayınlanmıştır. Verilere göre yüksek lisans tezlerinin oranı (%79.16) doktora tezlerinin oranından (%20.83) oldukça fazla olduğu sonucuna ulaşılmıştır. bu sonuca göre yüksek lisans programlarının doktora programlarından sayıca fazla olması, doktora programlarının yeterli olmayışı, yüksek lisans öğrencilerinin doktora öğrencilerine oranla çok kültürlü eğitime ilgisinin daha yüksek olabileceği yorumları yapılabilir. Çok kültürlü eğitim alanında yazılmış olan tezlerin danışmanlarının unvanlarına göre dağılımına bakıldığında; 47 profesör, 52 doçent, 49 doktor öğretim üyesi/yardımcı doçent ve 1 doktor unvanına sahip danışmanın yer aldığı toplamda 144 tane lisansüstü tez yayınlanmıştır. Tezlerin frekans toplamının 149 olmasının sebebi ise bazı çalışmaların iki danışmana (Toprak, 2008; Sarıkaya Serdaroğlu, 2023; Arslan, 2014; Şahin Bektaş, 2022; Kılıçoğlu, 2014) sahip olmasından kaynaklanmaktadır. Ayrıca farklı unvanlara sahip akademisyenlerin veya bu akademisyenlerinin öğrencilerinin çok kültürlü eğitim konusuna önem verdikleri/ilgi duydukları yorumu yapılabilir. Çok kültürlü eğitim alanında yazılmış olan tezlerin çalışma gruplarına göre dağılımına bakıldığında; 78 çalışmada öğretmene, 26 çalışmada öğretmen adayına, 20 çalışmada öğrenciye, 18 çalışmada ders kitabı/dokümantasyona, 8 çalışmada öğretim görevlisi/elemanına, 7 çalışmada okul yöneticisi/personeline ve 5 diğer (program, ebeveyn, farklı etnik grup katılımcıları) grubuna yer verilmiştir. Araştırmalarda çalışma grubu olarak öğretmenlerin oran (%48.14) olarak en fazla tercih edildiği sonucu elde edilmiştir. Çalışmalarda en fazla öğretmenlere yer verilmesinin sebebinin kolay ulaşılabilir olması, çok kültürlülük konusuna olumlu algılara sahip olmaları (Karadeniz, 2019; Teymur, 2020; Sağlam, 2016; Kaya, 2013; Polat, 2013) yorumları yapılabilir. Çok kültürlü eğitim alanında yazılmış olan tezlerin araştırma yöntemlerine göre dağılımına bakıldığında; 46 çalışma nitel, 79 çalışma nicel ve 19 çalışma karma yöntemle hazırlanmıştır. Karma ve nitel çalışmaların sayılarının artması durumda çok kültürlü eğitim ile ilgili farklı verilere ve sonuçlara ulaşılabilir. Çok kültürlü eğitim alanında yazılmış olan tezlerin sonuçları incelendiğinde en çok ulaşılan sonuçlar şu şekildedir; öğretmenlerin çok kültürlülük ve çok kültürlü eğitim konusunda algıları olumlu, çok kültürlü eğitim uygulamalarından pek fazla haberdar olmadıkları ve çok kültürlü eğitim konu olunca sorumluluk bilinçlerinin olduğu, öğretmen adaylarının/egitim fakültesi lisans öğrencilerinin çok kültürlü eğitim ile ilgili görüşleri, tutumları ve öz yeterlik algıları yüksek düzeyde olduğu ve okul öncesi öğretmenlerinin yeterlilik algılarına bakıldığında farklı değişkenler doğrultusunda (yaş, eğitim durumu, etnik köken, görev yaptığı okulun bulunduğu yerleşim yeri vs.) farklılıklar gösterdiği sonucuna varılmıştır.

**Özet**

Buğday Türkiye’de birçok çiftçinin gelir kaynağı olup yoğun olarak üretilmektedir. Ayrıca temel gıda maddesi olması buğdayın önemini daha da artırmaktadır. Bu çalışmada, buğdayın dünya ve Türkiye’de ekim alanı, üretimi ve dış ticaretinin gelişiminin ortaya konulması amaçlanmıştır. Ayrıca Türkiye’de farklı illerde buğday üretiminin ekonomik analizinin yapıldığı çalışmalardan faydalanarak buğday üreten işletmelerin bazı teknik ve ekonomik özellikleri incelenmiştir. Çalışmanın ana materyalini ilgili istatistikler (Türkiye İstatistik Kurumu, Birleşmiş Milletler Gıda ve Tarım Örgütü) ve literatürde konuyla ilgili yapılmış olan ulusal ve uluslararası bilimsel çalışmalar oluşturmuştur. Dünya ve Türkiye’de buğday üretimindeki ve dış ticaretindeki gelişmeler basit ve zincirleme indeks hesabı yapılarak yıllar itibariyle değişimleri incelenmiştir. İncelenen çalışmalarda buğday üretiminde sabit masrafların oranı ortalama %25,80 ve değişen masrafların oranı ortalama %74,11 olarak tespit edilmiştir. Buğday üretiminde nispi kâr ise 1,28 olarak belirlenmiştir. Yani işletmeler 1 birimlik masraf karşılığında 1,28 birimlik gelir elde etmekte olup bunun 0,28 birimi kârdır. İşletmelerin ortalama işletme arazisi genişlikleri 244,7 dekar, buğday ekim alanlarının ortalama genişliği 124,2 dekar, buğday verimi ise 351,76 kg/da olarak tespit edilmiştir. 2022 yılı itibariyle Türkiye buğday üretiminde dünyada 12. sırada yer almaktadır. Buğday ihracatında dünyada 30. sırada, buğday ithalatında ise 3. sırada yer almaktadır. Türkiye hem miktar bakımından hem değer bakımından buğday dış ticaretinde açık vermektedir. Buğday dış ticaret açığı 8 milyon 512 bin ton ve 3 milyar 187 milyon dolardır. Türkiye önemli bir buğday ithalatçısı ülke olmakla birlikte ithal edilen buğdayı tarıma dayalı sanayi kollarında (un sanayi, makarna sanayi vb.) işleyerek katma değer kazandırmakta ve ihraç etmektedir. Her ne kadar ithal edilen buğday tarıma dayalı sanayinde kullanılsa da Türkiye’de yıllar itibariyle buğday ekim alanlarının azalması ve dış ticaret açığının artması üzerinde durulması gereken önemli bir konudur.

**Anahtar Kelimeler:** Buğday, Türkiye, Yapısal Analiz, Nispi kâr, Masraf

**STRUCTURAL ANALYSIS OF WHEAT PRODUCTION: Türkiye EXAMPLE**

**Abstract**

Wheat is the source of income for numerous farmers in Türkiye and is produced in large areas. In addition, the fact that it is a staple food increases the importance of wheat even more. This study aimed to reveal the development of wheat cultivation areas, production, and foreign trade in the world and Türkiye. In addition, some technical and economic characteristics of wheat-producing farms were examined by utilizing the studies in which economic analysis of wheat production in different provinces in Türkiye. The main material of the study consisted of relevant statistics (Turkish Statistical Institute, Food and Agriculture Organization of the United Nations) and national and international scientific studies in the literature. Wheat production and foreign trade developments in the world and Türkiye were analyzed using simple and chain indexes. In the analyzed studies, the ratio of fixed costs in wheat production was 25.80%, and the ratio of variable costs was 74.11 % on average. The relative profit in wheat production was determined as 1.28. In other words, farms earn 1.28 units of income for 1 unit of expenditure, of which 0.28 units is profit. The average size of the farms was 244.7 decares, the average size of the wheat cultivation area was 124.2 decares, and the wheat yield was 351.76 kg/da. As of 2022, Türkiye ranked 12th in the world in wheat production. It ranks 30th globally in wheat exports and 3rd in wheat imports. Türkiye has a wheat foreign trade deficit in terms of quantity and value. The wheat foreign trade deficit was 8 million 512 thousand tons and 3 billion 187 million dollars. Although Türkiye is an important wheat-importing country, it processes the imported wheat in agriculture-based industries (flour industry, pasta industry, etc.) and exports it. Although imported wheat is used in agriculture-based industries, the decrease in wheat cultivation areas and the increase in the foreign trade deficit in Türkiye over the years are important issues that should be emphasized.

**Keywords:** Wheat, Türkiye, Structural analysis, Relative profit, Cost

## **Giriş**

Toplumların yaşamlarının devamı için önemli bir gıda maddesi olan buğday üretimden tüketime kadar tüm aşamalarda ekonominin önemli bir konusudur (Önkal, 1991). Öyle ki buğday üreminin azalması tarım sektörünün büyümesini azaltacak ve ülkelerin gıda güvenliğini etkileyecektir (Chandio vd. 2021). Üretimdeki arz ve tüketimdeki talep değişimleri gıdada kendine yeterlilik kavramını ön plana çıkarmaktadır. Türkiye 2000'li yılların başından beri buğday ithalatının artmasına karşın buğday üretiminde kendine yeterlilik ortalaması 101,26'dır. Türkiye ithal ettiği buğdayı un sanayi, makarna sanayi vb. gibi sanayi kollarında işleyerek ürüne katma değer kazandırmakta ve ihracat geliri elde etmektedir. Bu sayede tarıma dayalı sanayi işletmelerinin atıl durumda bekleyen kapasite kullanım oranları da artmaktadır. Türkiye'de toplam işlenen tarım arazilerinin %28,54'ünde, toplam tahıl ekim alanlarının ise %40,89'unda buğday üretilmektedir (TÜİK, 2024a). Bu bakımdan birçok çiftçinin temel gelir kaynağı buğdaydır. Bu çalışmada, dünya ve Türkiye'de buğday ekim alanları ve üretimindeki gelişmeler, dış ticaretteki durum değerlendirilmeye çalışılmıştır. Dünyada buğday üretiminin ülkelere göre, Türkiye'de ise illere göre dağılımı incelenmiştir. Dünya buğday üretimi ve dış ticaretinde Türkiye'nin yeri ve önemi ortaya konulmuştur. Ayrıca Türkiye'nin farklı illerinde buğday üretiminin ekonomik analizini ele alan çalışmalarından yararlanılarak buğday üreten işletmelerin bazı özellikleri incelenmiştir.

## **Materyal ve Metot**

Çalışmanın ana materyalini ikincil veriler oluşturmaktadır. İkincil veriler; Türkiye İstatistik Kurumu (TÜİK), Birleşmiş Milletler Gıda ve Tarım Örgütü (FAO), ulusal ve uluslararası literatürdeki konuyla ilgili bilimsel yayınlardan elde edilmiştir. Dünya ve Türkiye'de buğday üretimine ilişkin verilere basit ve zincirleme indeks hesabı yapılarak yıllar itibarıyla değişim incelenmiştir. İndeks hesabında temel amaç nispi artış veya azalışları ortaya koymaktır. Basit indekste her yıl temel alınan yıla oranlanarak hesaplanırken, zincirleme indekste her yıl bir önceki yıla oranlanarak hesaplanmaktadır.

## **Araştırma Bulguları ve Tartışma**

Dünya buğday ekim alanı 2000-2022 yılları arasında 213-220 milyon hektar arasında değişmektedir. 2000-2004 yılları ortalamasında 213 milyon 536 bin hektar olan buğday ekim alanı 2022 yılında %2,63 artarak 219 milyon 154 bin hektara çıkmıştır. Aynı tarihler itibarıyla dünya buğday üretimi ise 590-810 milyon ton arasında değişmektedir. 2000-2004 yılları ortalamasına göre 590 milyon 516 bin ton olan buğday üretimi %36,90 artarak 2022 yılında 808 milyon 442 bin tona yükselmiştir. Bir önceki döneme göre üretimdeki değişim

incelendiğinde en fazla artış %8,96 ile 2015-2019 yılları ortalamasında gerçekleşmiştir. Dünya buğday ekim alanlarında çok fazla bir değişim olmamasına rağmen üretim miktarı her geçen yıl artmaktadır. Dünya buğday verimi 2000-2004 yılları ortalamasında hektara 2.764 kg iken 2022 yılında %33,44 artarak hektara 3.689 kg olarak gerçekleşmiştir (Çizelge 1). Dünya buğday verimi incelenen yıllar itibariyle artış eğilimindedir. Dünya buğday ekim alanlarının çok fazla değişmemesine karşın üretim miktarının artmasının sebebi olarak verimdeki artışlar gösterilebilir.

**Çizelge 1.** Dünya buğday üretiminin gelişimi (FAO, 2024a)

Yıllar	Ekim Alanı			Üretim Miktarı			Verim		
	Bin hektar	Basit indeks	Zincirleme indeks	Bin ton	Basit indeks	Zincirleme indeks	Kg/ha	Basit indeks	Zincirleme indeks
2000-2004	213.536	100,00		590.516	100,00		2.764	100,00	
2005-2009	219.404	102,75	102,75	642.386	108,78	108,78	2.927	105,86	105,86
2010-2014	218.327	102,24	99,51	690.072	116,86	107,42	3.160	114,31	107,98
2015-2019	217.984	102,08	99,84	751.917	127,33	108,96	3.450	124,80	109,18

Dünya buğday üretim miktarı bakımından %17,04'lük pay ile Çin ilk sırada yer almaktadır. Çin'i sırasıyla %13,33'lük pay ile Hindistan, %12,89'lük pay ile Rusya takip etmektedir. Bu üç ülke dünya buğday üretiminin %43,26'sını oluşturmaktadır. Türkiye'nin payı ise %2,44 olup dünya buğday üretiminde 12. sırada yer almaktadır. İncelenen yıllar itibariyle Türkiye'nin dünya buğday üretimi içerisindeki payının azaldığı tespit edilmiştir (Çizelge 2).

Dünya buğday ithalat miktarı 2000-2004 yılları ortalamasına göre 115 milyon 560 bin ton iken yaklaşık %60 artış göstererek 2022 yılında 184 milyon 800 bin ton olarak gerçekleşmiştir. 2022 yılında dünya buğday ithalatının %5,34'ünü Çin, %5,12'sini Endonezya, %4,82'sini Türkiye, %4,33'ünü Mısır ve %3,80'ini Cezayir gerçekleştirmiştir. Türkiye'nin dünya buğday ithalatındaki payı %0,92 ile %5,10 arasında değişmekte olup 3. sırada yer almaktadır. İncelenen dönemler itibariyle Türkiye'nin buğday ithalatı yaklaşık 8,4 kat artmıştır (Çizelge 4). Türkiye'de ithal edilen buğday, buğday unu olarak işlenip katma değer kazandırılarak ihraç edilmektedir (Karlı vd. 2022). Bu sebeple Türkiye önemli bir buğday ithalatçısıdır.

Türkiye’de 2000-2004 yılları ortalaması 9 milyon 290 bin hektar olan buğday ekim alanı %26,45 azalarak 2023 yılında 6 milyon 833 bin hektara gerilemiştir. İncelenen yıllar itibariyle 2023 yılı hariç azalan bir seyir izlemiştir. 2023 yılında bir önceki yıla göre %3,08 artış göstermiştir. Buğday üretim miktarı ise incelenen yıllarda 17,5 milyon ton ile 22 milyon ton arasında değişmiştir. 2000-2004 yılları ortalamasında 19 milyon 900 bin ton olan buğday üretimi 2023 yılında %10,55 artarak 22 milyona yükselmiştir. Aynı dönemde buğday verimi ise %50,34 artarak 2.142 kg/ha’dan 3.220 kg/ha’a yükselmiştir (Çizelge 5). Türkiye’de buğday ekim alanlarında azalan, üretim miktarında dalgalı artan, verimde ise mutlak artan bir seyir olduğunu söylemek mümkündür.

Türkiye'nin buğday ihracatı 2000-2004 yılları ortalamasına göre 588 bin ton ve 68 milyon dolar olup 2022 yılında ihracat miktarı %32,78 azalarak 395 bin tona, ihracat değeri ise %148,32 artarak 169 milyon dolara yükselmiştir. Aynı tarihler itibariyle buğday ithalat miktarı 8,38 kat artarak 1 milyon 62 bin tondan, 8 milyon 907 bin tona yükselmiştir. İthalat değeri ise 20,42 kat artarak 164 milyon dolardan, 3 milyar 356 milyon dolara yükselmiştir. Dış ticaret dengesinde ise Türkiye hem miktar bakımından hem değer bakımından açık vermektedir. Buğday dış ticaret açığı miktar bakımından 17,94 kat artarak 474 bin tondan 8 milyon 512 bin tona, değer bakımından ise 33,06 kat artarak 96 milyon dolardan 3 milyar 187 milyon dolara çıkmıştır (Çizelge 8). İncelenen dönemler itibariyle Türkiye'nin net buğday ithalatçısı olduğu söylenebilir.

Çizelge 8. Türkiye’de buğday dış ticaretinin gelişimi (FAO, 2024b)

Türkiye’nin buğday dış ticaret açığı yıllar itibariyle artmaktadır. Türkiye incelenen 2000-2022 yılları arasında; 2000 yılında 70 milyon dolar, 2001 yılında 87 milyon dolar, 2005 yılında 27 milyon dolar ve 2006 yılında 28 milyon dolar dış ticaret fazlası vermiştir. Diğer yıllarda ise buğday dış ticaretinde açık vermiştir (Şekil 1).

Şekil 1. Türkiye’nin buğday dış ticaret açığı (FAO, 2024b)

Türkiye’de buğday üretiminde kendine yeterlilik derecesi 2000-2022 yılları arasında %87,30 ile %120,60 arasında değişmekte olup ortalama %101,26’dır. 2000 yılında buğdayda kendine yeterlilik derecesi %106,50 iken 2022 yılında %9,95 azalarak %95,90 olarak gerçekleşmiştir (Şekil 2).

**Şekil 2.** Türkiye’nin buğday üretiminde kendine yeterlilik derecesi (TÜİK, 2024b)

Türkiye’de farklı illerde yapılmış çalışmaların sonuçlarına göre buğday üreten işletmelerin ortalama işletme büyüklükleri genellikle 100 dekar ve üzeridir. Ortalama işletme büyüklüğü en fazla olan il 482,5 dekar ile Edirne olurken bunu sırasıyla 382,5 dekar ile Erzurum, 289,1 dekar ile Adana takip etmektedir. Buğday ekim alanları ise yaklaşık 45 dekar ile 288 dekar arasında değişmekte olup en fazla buğday ekim alanı 288,5 dekar ile Erzurum ilindedir. Buğday ekim alanlarının toplam işletme arazileri içerisindeki payları ise Erzurum’da %75,42, Adana’da %66,86 ve Haymana’da %58,64’tür. İncelenen 9 farklı bölgenin ortalamasına göre işletme büyüklükleri 244,7 dekar, buğday ekim alanları 124,2 dekar, payı ise %50,78 olarak tespit edilmiştir (Çizelge 9).

**Çizelge 9. Türkiye’de buğday işletmelerinin büyüklükleri**

Yapılan çalışmalar	İşletme büyüklüğü (da) (A)	Buğday ekim alanı (da) (B)	Buğday ekiminin payı (%) (A/B)
Adana <sup>1</sup>	289,1	193,3	66,86
Burdur <sup>2</sup>	79,4	43,4	54,66
Cihanbeyli <sup>3</sup>	231,3	144,9	62,66
Edirne <sup>4</sup>	452,5	53,2	11,75
Erzurum <sup>5</sup>	382,5	288,5	75,42
Haymana <sup>6</sup>	222,9	130,7	58,64
Isparta <sup>2</sup>	108,9	46,3	42,52
Konya <sup>7</sup>	206,1	103,9	50,41
Trakya <sup>8</sup>	229,5	114,0	49,67
Ortalama	244,7	124,2	50,78

1. Alemdar vd., 2014; 2. Gül vd., 2015; 3. Güldal, 2016; 4. Aydın vd., 2022; 5. Birinci ve Küçük, 2004; 6. Taşçı ve Oğuz, 2014; 7. Arısoy, 2004; 8. Erdem, 2012.

Araştırmaların farklı yıllarda yapılması sebebi ile buğday üretiminin maliyet ve kârlılık göstergeleri oransal olarak incelenmiştir. İncelenen çalışmalarda buğday üretiminde sabit masrafların oranı %11,92 ile %43,91 arasında değişmekte olup ortalama %25,80 olarak belirlenmiştir. Değişen masraflar ise %56,09 ile %88,08 arasında değişmekte olup ortalama %74,11 olarak tespit edilmiştir. Buğday üretiminde nispi kâr Ağrı’da 0,88, Erzurum’da 0,81’dir. Bu illerdeki işletmeler buğday üretimi için yaptıkları masrafları dahi karşılayamamakta olup zarar etmektedirler. Kırıkkale’nin Çelebi ilçesinde yapılan çalışmada buğday üretimi için nispi kâr 1,97 olarak hesaplanmış olup en kârlı bölge olmuştur. Genel olarak ise buğday üretiminde nispi kâr 1,28 olarak belirlenmiş ve buğday üretiminden elde edilen gelirin masrafları karşıladığı ve işletmelerin kâr ettikleri tespit edilmiştir. Araştırmalarda buğday verimi ise dekara 102,22 kg ile 506,29 kg arasında değişmekte olup ortalama 351,76 kg olarak belirlenmiştir (Çizelge 10).

**Çizelge 10. Buğday üretiminin masraf ve kârlılık durumu**

Yapılan çalışmalar	Değişen masraf (%)	Sabit masraf (%)	Nispi kâr	Verim (kg/da)
Adana <sup>1</sup>	65,21	34,79	1,19	506,29
Ağrı <sup>2</sup>	88,08	11,92	0,88	102,22

**Sonuç ve Öneriler**

Bu çalışmada dünyada ve Türkiye'deki buğday üretimi ve dış ticaretinin seyri, Türkiye'deki buğday üretiminin yapısal analizi üzerine bir inceleme yapılmıştır. Buğday üretimi Türkiye'nin tarım sektöründe ve ülke ekonomisi için önemli bir yere sahiptir. Bu öneme rağmen buğday üretiminde nispi kârın düşük olması, dış ticaretteki dengesizlikler ve verim düşüklüğü gibi faktörler işletmelerin karşılaştıkları zorluklardır. Türkiye, dünya buğday üretim sıralamasında yüksek bir konumda olmasına rağmen, dış ticaret açığının sürekli artması ve ekim alanlarının daralması, buğday üretiminin geleceği için endişe vericidir. Bu nedenle, buğday ekim alanlarını, üretimini ve verimini artıracak destekleme politikalarına ve buğday üretimindeki yapısal sorunlara çözüm bulmaya odaklanılması gerekmektedir. Ayrıca, tarıma dayalı sanayi kollarında işlenen buğdayın katma değerinin artırılarak ihraç edilmesi, sektörün sürdürülebilirliği açısından önemlidir.

**Abstract**

Heavy metals play an essential role in living organisms because they participate in the structure of enzymes, proteins, biochemical processes, etc. However, many heavy metals are toxic to human health and the environment, with different levels of impact depending on the type of heavy metal. Four heavy metals have the most significant effect on living organisms: As (in the form of organic As), Hg (in the form of Methylmercury), Pb (Pb<sup>2+</sup>), and Cd (Cd<sup>2+</sup>). The effects of heavy metals on human health often manifest through the accumulation of heavy metals in food, mainly from crop products. Plants are intermediaries that absorb, accumulate, and transport heavy metals from soil, water, and air to human and animal bodies. Therefore, to minimize the effects of heavy metals on human and animal health, pay attention to the existence and absorption of heavy metals in the soil and the ability of plants to absorb heavy metals, especially in areas at risk of heavy metal pollution. Using plants to treat pollution in general and heavy metals, in particular, is commonly called “Phytoremediation.” Phytoremediation is one of the methods many countries choose to treat heavy metal contamination in soil because of its high feasibility, financial savings, and environmental landscape improvement. As a developing country, Vietnam has limited financial resources for ecological restoration, so phytoremediation is an entirely suitable choice. Studies in Vietnam show that *Lantana camara L.*, *Vetiveria zizanioides*, *Pteris vittata*, *Pityrogramma calomelanos*, and *Eleusine indica* are lead (Pb) hyperaccumulators. Arsenic (As) can be effectively treated by *Pteris vittata*, *Eleusine indica*, and *Bidens pilosa L.* Plants that have sound potential at absorbing Cadmium (Cd) include *Solanum nigrum L.*, *Helianthus annuus*, *Phragmites Australis* and *Eleusine indica*. *Pteris vittata*, *Jussiaea fissentocarpa Haines*, and *Saccharum Arundinaceum* can accumulate high Zinc (Zn) levels in their biomass. In Vietnam, *Vetiveria zizanioides*, *Phragmites Australis*, and other plants of the *Polypodiaceae* family are commonly researched and applied to treat heavy metals in soil. In addition, some scientists also focus on researching native plant species that grow on lands with high heavy metal content to find more plant species that super absorb heavy metals. However, studies on treating plant biomass after using them to absorb heavy metals have not received much attention. Therefore, scientists in Vietnam need to focus on researching this issue in the future to support phytoremediation technology better.

**Keywords:** heavy metals, hyperaccumulator, phytoremediation, polluted soil.

## **INTRODUCTION**

Soil is a non-renewable natural resource that plays a significant role in all human activities. When soil is polluted, the ecosystem is damaged and causes many severe diseases in humans and animals through the food chain. In industrialization and modernization, there are more and more factories and areas. Concentrated industries were built and put into operation, creating a volume of industrial products accounting for a high proportion of the entire product of the national economy. Besides, industrial production also causes many adverse effects on the environment, especially the soil environment. Not only Vietnam but also countries worldwide are facing enormous challenges with the problem of soil environmental pollution because it threatens the habitat of many types of organisms (Hoang, 2021). One of the leading agents that pollute the soil environment that scientists are concerned about is heavy metals. Heavy metal elements in the soil environment exist in many different forms. Existence forms of heavy metals depend on environmental conditions in the soil and soil properties. Heavy metals play an essential role in living organisms because they participate in the structure of enzymes, proteins, biochemical processes, etc. However, many heavy metals are toxic to human health and the environment, with different levels of impact depending on the type of heavy metal. Many causes of soil heavy metal pollution include industrial waste, battery industry, mining activities, mechanical engineering, traffic, precipitation, domestic waste, and fertilizers ( Khoa et al., 2012). Studies conducted in Vietnam have shown that heavy metal pollution occurs in most types of soil, such as urban soil (Binh et al., 2020), soil in craft villages (Pho et al., 2022), agricultural land (Huong et al., 2012; Na and Bai, 2019; Na et al., 2023; Tuyen, 2024), landfill soil (Ha, 2018; Thang and Viet, 2022), industrial park soil (Binh and Hoang, 2020), mineral mining areas (Hoai and Khanh, 2021). Biological systems require the presence of certain metals, including Cu and Zn, which have a specific concentration range and become hazardous at higher levels (Garbisu and Alkorta, 2003). Four heavy metals have the most significant effect on living organisms: As (in the form of organic As), Hg (in the form of Methylmercury), Pb ( $Pb^{2+}$ ), and Cd ( $Cd^{2+}$ ) (Sharma and Agrawal, 2005). The effect of heavy metals to human health is often manifest through the accumulation of heavy metals in food, mainly from crop products. Treatment is necessary for soil concentrations of heavy metals that have surpassed safe limits (Baker et al., 1994). Various approaches, such as chemical, physical, and biological, accomplish soil remediation. While chemical treatments utilize powerful acids and chelators to cleanse polluted soils, physical treatments entail removal from contaminated places (soil excavation), deep burial (landfilling), and capping. Plants are intermediaries that absorb,

accumulate, and transport heavy metals from soil, water, and air to human and animal bodies (Zwolak et al., 2019). Therefore, to minimize the effects of heavy metals on human and animal health, pay attention to the existence and absorption of heavy metals in the soil and the ability of plants to absorb heavy metals, especially in areas at risk of heavy metal pollution. Using plants to treat pollution in general and heavy metals, in particular, is commonly called “*Phytoremediation*.” Phytoremediation is one of the methods many countries choose to treat heavy metal contamination in soil because of its high feasibility, financial efficiency, and environmental landscape improvement (Ansari et al., 2016). Finding suitable plant species has been the focus of numerous research efforts in Vietnam on applying plants to treat heavy metals on various soil types. This review article summarizes recent research and applications related to phytoremediation of heavy metal-contaminated soils in Vietnam, including the investigation and selection of plant species that hyperaccumulate arsenic (As), cadmium (Cd), lead (Pb), and zinc (Zn); introducing plant species commonly used to treat heavy metals in soil; Survey and evaluate the ability of native plant species to treat with heavy metals-contaminated soil increases efficiency and reduces processing costs; presenting methods for treating plant biomass after adsorbing heavy metals.

## **2. RESEARCH RESULTS ON THE ABILITY OF PLANTS TO HYPERACCUMULATE SOME HEAVY METALS IN SOIL.**

Hyperaccumulation is the uptake, translocation, and accumulation of heavy metals at concentrations higher than the surroundings in different plant parts (Maestri et al., 2010). Three primary characteristics set hyperaccumulators apart from non-hyperaccumulating plants and are necessary for hyperaccumulation: 1) a significantly higher capacity to absorb heavy metals from the soil, 2) improved metal ion translocation from the root to the shoot, and 3) a significantly higher capability to detoxify and sequester incredibly enormous levels of heavy metals in the shoots (Rascio and Navari-Izzo, 2011). Plants that are hyperaccumulators can accumulate heavy metals in their aboveground organs at concentrations that are 100 – 1000 times higher than those of nonhyperaccumulators, all without showing any overt signs of cytotoxicity (Jabeen et al., 2009; Grobelak et al., 2010; Rascio and Navari-Izzo, 2011). This review paper will discuss four typical soil metals-Cd, As, Pb, and Zn-that plants in Vietnam hyperaccumulate.

### **2.1 Lead (Pb)**

Hanh and Zarli (2007) conducted experimental planting of *Lantana camara L.* on soil samples taken at some locations at risk of Pb pollution in Ho Chi Minh City. The results showed that,

when growing *Lantana camara L.* in control soil without Pb, the Pb content in the roots was only  $0.4 \text{ mg.kg}^{-1}$ ; But when the Pb content in the soil increases to  $1 \times 10^3 \text{ mg.kg}^{-1}$ , plants can absorb up to  $0.4 \times 10^3 \text{ mg.kg}^{-1}$  of Pb on a dry weight basis without harm to growth and development. When growing plants in a soil environment that is periodically treated every two weeks, each time with a Pb content of  $1 \times 10^3 \text{ mg.kg}^{-1}$ , after seven times of treatment, the accumulated Pb content in the soil is up to  $7 \times 10^3 \text{ mg.kg}^{-1}$ , plants can accumulate up to  $1.7 \times 10^3 \text{ mg.kg}^{-1}$  of Pb in roots, without significant growth differences compared to plants grown in Pb-free environments. *Lantana camara L.* can increase from an initial dry weight of 7.87 g; after 105 days of planting, the dry biomass rises about 15 times. *Lantana camara L.* can absorb up to 1% of Pb, on a dry weight basis, in its root system. This physiological characteristic makes it possible for the plant to be used as a plant to decontaminate Pb in soil. Research results of Phuong et al. (2023) showed that Vetiver grass (*Vetiveria zizanioides*) can grow in Pb-contaminated farmland. With a Pb content in the soil of about  $2,500 \text{ mg.kg}^{-1}$ , after three months from planting, the ability to accumulate Pb in the leaves and roots of Vetiver plants reaches the highest threshold (corresponding to  $908.83 \text{ mg.kg}^{-1}$ ). At the same time, the ability of Vetiver grass to remove Pb from the soil is also the highest ( $14.23 \text{ mg.kg}^{-1}$ ). According to Son et al. (2018), when growing Vetiver grass on soil around the lead and zinc mine with an initial Pb content of  $1,670 \text{ mg.kg}^{-1}$ , the accumulation in their leaves and roots reached  $641.41 \text{ mg.kg}^{-1}$  after three months of the experiment. However, this accumulation ability gradually decreases after three months of planting. Studies show that the ability to accumulate in the roots of Vetiver grass is many times higher than in its leaves and that the Pb accumulation rate in biomass accounts for 36 – 38% of the Pb content in the soil.

Two species of *Polypodiaceae* family, including *Pityrogramma calomelanos L.* and *Pteris vittata*, are also plants that can grow well on soils with high Pb content ( $<1,000 \text{ mg.kg}^{-1}$ ). After 45 days of planting, *Pityrogramma calomelanos L.* absorbed and accumulated the highest Pb content in the stem of  $1,342 \text{ mg.kg}^{-1}$  and in the roots of  $1,956 \text{ mg.kg}^{-1}$  (Dung et al., 2022), Meanwhile, *Pteris vittata*, accumulates the highest Pb content of  $147.34 \text{ mg.kg}^{-1}$  in shoots and  $3,267.86 \text{ mg.kg}^{-1}$  in roots (Tua et al., 2011). *Eleusine indica* is also highly appreciated by scientists for its ability to accumulate Pb. According to Phuong et al. (2018), the Pb content in soil is about  $1,500 - 3,000 \text{ mg.kg}^{-1}$ , and the ability to accumulate Pb in stems and leaves reaches  $149.25$  to  $189.60 \text{ mg.kg}^{-1}$  and in roots reaches  $1,332.65$  to  $2,754.6 \text{ mg.kg}^{-1}$ , the ability of plants to remove Pb from soil is high, reaching  $14.01 - 14.36 \text{ mg.tree}^{-1}$  after three months of

experimental planting. During the same period of experimental planting, research by Son et al. (2018) showed that the accumulated Pb content in roots was 121.08 mg.kg<sup>-1</sup>, the accumulated Pb content in leaf stems was 17.97 mg.kg<sup>-1</sup> with the initial Pb content in soil being 1,671.01 mg.kg<sup>-1</sup>. Research results show that *Eleusine indica* can achieve a high cumulative effect after three months (90 days) of planting. Pb accumulation in roots is always much higher than in stems and leaves.

## 2.2 Arsenic (As)

Studies on As accumulation in plants in Vietnam generally recognize that two fern species, *Pityrogramma calomelanos*, and *Pteris vittata* L., are hyperaccumulators of As, in which *Pteris vittata* has a higher ability to accumulate As than *Pityrogramma calomelanos*. In the study of Anh (2016), *Pteris vittata* contains more than 0.1% in the aboveground part of the plant. After 16 weeks of growing *Pteris vittata* on soil with an initial As content of 1,420 mg.kg<sup>-1</sup>, the accumulated As content in the biomass of *Pteris vittata* reached 4,789 mg.kg<sup>-1</sup> in shoot and 818.9 mg.kg<sup>-1</sup> in the roots. Anh et al. (2010) studied the effects of nitrogen (N) and phosphorus (P) on the ability to grow and accumulate As of *Pteris vittata*. This study also showed that the concentration accumulated in the aboveground part of *Pteris vittata* is always much higher than in the roots. This is a massive advantage of this fern when applied to environmental treatment. The ability to grow and accumulate As of *Pteris vittata* is positively influenced by the P and N content added to the experiment. The growth and As accumulation of *Pteris vittata* is highest when N is added at 100 ppm – 200 ppm and P is added at a concentration of 800 ppm. When

growing both of these fern species on As-polluted soil with the addition of organic and inorganic fertilizers, their ability to accumulate As will increase from 2 times (*Pityrogramma calomelanos*) to 6 times (*Pteris vittata*) (Anh, 2014). A study by Nghiem et al. (2016) showed that *Bidens pilosa L* grew usually, and yield did not change much when increasing As in soil from 0 ppm to 500 ppm. But when it reached 1,000 ppm, productivity showed signs of decreasing. The As content in the roots of *Bidens pilosa L* also increased as the As concentration in the soil increased and reached a maximum of 240.70 mg.kg<sup>-1</sup> biomass at 3,000 ppm As. However, at 3,000 ppm, some *Bidens pilosa L* died, growth ability is much poorer, and the total amount of As absorbed by the plant will certainly be low. Ha et al. (2019) also concluded that *Bidens pilosa L*. has excellent potential in phytostabilizing As and heavy metal-contaminated mined soils due to its significant contribution to reducing As content in soil by accumulating in their biomass. *Eleusine indica L*. is also a plant that absorbs As well when the accumulated content in the shoot is 499 mg.kg<sup>-1</sup> and in the root is 791.8 mg.kg<sup>-1</sup> after 16 weeks of planting in soil with an initial As content of 1,420 mg.kg<sup>-1</sup> (Anh, 2016).

In addition to the above plants, some plants in nature also have the potential to accumulate As in biomass, such as *Phragmites australis* (Linh and Canh, 2018), *Vetiveria zizanioides* (Danh et al., 2012).

**Table 2. As concentration in soil (before the experiment) and in plant biomass (after the experiment)**

Plant	As Concentration (mg.kg <sup>-1</sup> )				References
	Soil	Shoots	Roots	Biomass	
<i>Bidens pilosa</i>	240.70	-	-	3,000	Nghiem et al., 2016
<i>Pteris vittata</i>	1,420	4,789	818.9	5,607.9	Anh, 2016
<i>Eleusine indica</i>	1,420	499	791.8	1,290.8	Anh, 2014 Anh, 2016

### **Cadmium (Cd)**

Research results of some authors also concluded that *Solanum nigrum L*. is a plant species that hyperaccumulators Cd (Phuong et al., 2016; Hung, 2016; Hung et al., 2018). *S. nigrum* grows, develops, and produces suitable biomass in normal farming conditions. This is an advantage of choosing this object when using plants to treat polluted soil. *S. nigrum* can live and grow in soil contaminated with Cd from 0 – 200 mg.kg<sup>-1</sup>, in soil contaminated with Cd from 10 – 25 mg.kg<sup>-1</sup>, growing *S. nigrum* effectively treats the highest Cd storage. Aboveground biomass

(stems, leaves, flowers, shoots) accumulates more Cd than belowground biomass (roots). The total Cd content can accumulate up to 914.2 mg.kg<sup>-1</sup> (dry biomass) (Hung, 2016). In an experiment by Phuong et al. (2016), with a Cd content in the soil of about 50 mg.kg<sup>-1</sup>, the biomass of the tree reaches 22.30 mg.tree<sup>-1</sup>, the accumulated Cd content in the leaf stem is 152.52 mg.kg<sup>-1</sup>, in the roots, is 745.45 mg.kg<sup>-1</sup> and the highest ability to remove Cd from the soil, reaching 5.21 mg.tree<sup>-1</sup>. *Helianthus annuus* is evaluated for its potential to control the spread of Cd in the ecosystem as a plant that can survive in high metal concentrations. Many scientific reports show that *H. annuus* can absorb and accumulate heavy metals in roots but rarely in shoots and branches (Saxena et al., 1999; Lin et al., 1999; Lin et al., 2003). Research by Thao and Hien (2017) pointed out that the range of Cd concentration in soil reaching the threshold of 50 mg.kg<sup>-1</sup> can be considered a reference value for devising a metal detoxification strategy in polluted areas. *Phragmites australis* is also a species that accumulates high Cd in its biomass. *P. australis* can absorb and accumulate Cd in stems and leaves more than in roots (Minh and Hai, 2016; Linh and Canh, 2018). The accumulated Cd content in *P. australis* after eight months of planting increased 41.17 times compared to the initial content. Research by Van et al. (2013) showed that *P. Australis* can grow well on polluted soils after ore mining, with the highest Cd content in the soil up to 37.14 mg.kg<sup>-1</sup>. The highest accumulated Cd content was 33.38 mg.kg<sup>-1</sup> in roots and 8.89 mg.kg<sup>-1</sup> in shoots. *Eleusine indica* L. can grow and develop in Cd-polluted farmland. With a Cd content in soil of about 50 – 200 mg.kg<sup>-1</sup>, the accumulated Cd content in the leaf stem of *E. indica* reaches 75.61 mg.kg<sup>-1</sup> to 195.21 mg.kg<sup>-1</sup>, and in the roots of *E. indica* reached 365.09 mg.kg<sup>-1</sup> to 482.08 mg.kg<sup>-1</sup>. The ability of plants to remove Cd from the soil is relatively high, reaching 2,883 – 2,973 mg.tree<sup>-1</sup> (Phuong et al., 2018). If appropriate N, P, and K are supplemented, after 16 weeks of planting, *E. indica* can absorb Cd with a content of 41.2 mg.kg<sup>-1</sup> in shoots and 160.7 mg.kg<sup>-1</sup> in roots from soil containing the initial Cd content is 200 mg.kg<sup>-1</sup> (Anh, 2016).

#### **2.4 Zinc (Zn)**

*Pteris vittata*'s ability to accumulate Zn in the stems and roots of the plant increases when the Zn content in the soil increases. However, the increase is not linearly proportional to the Zn concentration in the soil. When the Zn concentration in the soil rises from 300 – 1,500 mg.kg<sup>-1</sup>, the plant's ability to accumulate Zn only increases from 345.46 – 580.09 mg.kg<sup>-1</sup> for the stem and from 3,430.70 – 5,380.17 mg.kg<sup>-1</sup> for the stem and roots. Like with the Pb tolerance experiment, when considering the Zn accumulation rate between the roots and shoots of *Pteris vittata* in the experimental concentrations, this number does not fluctuate much (in the range of 8.5 – 10.5). This proves that the Zn concentration in the soil does not significantly affect the ratio of Zn concentration in parts of *Pteris vittata*. Thus, *Pteris vittata* can withstand Zn concentrations up to 1500 mg.kg<sup>-1</sup> in soil. However, the best tolerance and removal of Zn is at a concentration of 300 mg.kg<sup>-1</sup> (Tua et al., 2011). After growing *Pteris vittata* for 16 weeks on soil (with an initial Zn content of 3,267 mg.kg<sup>-1</sup>) taken from mining sites, analysis results showed that *Pteris vittata* can accumulate Zn about 810.2 mg.kg<sup>-1</sup> in shoots and 1,298.8 mg.kg<sup>-1</sup> in roots (Anh, 2016). *Jussiaea fissendocarpa haines* have been proven by many domestic and foreign authors to have the capacity to accumulate great quantities of heavy metals in the body. However, combining microbial strains can help increase the heavy metal content accumulated in plant parts, shortening the pollution treatment time (Hung et al., 2010). The absorption of heavy metals (Cu, Zn, Pb) of *J.F.haines* plants in the roots increased with the amount of inoculant applied to the soil and was significantly higher than the control. In the formula of fertilizing inoculant/kg dry soil, the highest absorption of heavy metals was 124.51 mg.kg<sup>-1</sup> Zn; 41.44 mg.kg<sup>-1</sup> Pb; 20.57 mg.kg<sup>-1</sup> Cu, respectively (Hung et al., 2010). Research

by Kieu et al. (2011) also showed that growing *J.F.haines* in soil supplemented with microbial strains will increase the efficiency of Zn accumulation in biomass by 2.5 times compared to without supplemented with microbial strains (increased from 44.9 mg.kg<sup>-1</sup> to 113.18 mg.kg<sup>-1</sup>). *Saccharum arundinaceum*: The amount of Zn accumulated in the tree after planting is higher than that of the original tree. After four months of planting, the accumulated Zn content in some plants was 30.3 mg.kg<sup>-1</sup> (in stems and leaves) and 50.39 mg.kg<sup>-1</sup> (in roots). The Zn content in *S.arundinaceum* roots is absorbed 1.66 times more than in the leaves. After eight months of planting *S.arundinaceum*, the Zn content accumulated in plants is very high: Zn content in leaves and stems is 79.87 mg.kg<sup>-1</sup>. Accumulation in roots is 111.44 mg.kg<sup>-1</sup>. The Zn content in *S.arundinaceum* roots is absorbed 1.4 times more than in the leaves (Hoa et al., 2022).

### 3. SURVEY OF NATIVE PLANT SPECIES CAPABLE OF ACCUMULATING SOIL HEAVY METALS

Related to this content, in Vietnam, there have been studies on surveying, screening, and evaluating the ability of native plants to accumulate and process heavy metals in soil. These species live on soil contaminated with very high levels of heavy metals.

Hung and Tra (2021) focused on screening native plant species with the ability to absorb the heavy metal Chromium (Cr) to treat contaminated soil in Long Khanh City, Dong Nai province. Forty-eight plant species with their outer morphology specific to heavy metal hyper-accumulators were collected. After examining scientific names and making a checklist of plant species, the results presented that there were 16 orders, 21 families, and 37 genera capable of accumulating heavy metals. Among them, four plant species survived in Cr-contaminated soil

from 150 – 350 mg.kg<sup>-1</sup> dried soil, concluding: (1) *Cyperus rotundus* L., (2) *Cynodon dactylon* (L) Pers., (3) *Amaranthus spinosus* L., and (4) *Solanum nigrum* L.

The results of the assessment of Lead (Pb) accumulation in native plants growing on coal mine sites in Northeastern Vietnam showed that all three species of plants could grow and well-develop in the environment with the concentrations of Pb. The average Pb accumulated was the highest in *Lantana camara* at 3.38 mg.kg<sup>-1</sup>, followed by *Eleusine indica* and *Aglaonema muntifolium* at 1.67 mg.kg<sup>-1</sup> and 1.37 mg.kg<sup>-1</sup>, respectively. Based on the enrichment coefficients for stem, leaves and root values, the plant was separated into two groups, including hyperaccumulator (*A.muntifolium*) and photo stabilizer (*L.camara* and *E.indica*) (Dung et al., 2022). Fifteen native plant species grow in a Pb recycling zone of Dong Mai village, Hung Yen province, Vietnam. *Hymenachne acutigluma* (Steud.) Gilliland, a potential hyperaccumulator of Pb (1,160 mg.kg<sup>-1</sup>-DW), is considered the best candidate for phytoremediation of Pb-contaminated soil (Ha et al., 2019). Ha et al. (2019) evaluated the phytoextraction and phytostabilization potential, two standard techniques of phytoremediation, of 21 plant species growing logically at the largest tungsten (W) mine in Vietnam—the second largest production of W in the world. The results indicated that hyperaccumulation levels (mg.kg<sup>-1</sup>-DW) were obtained for only As in *Pityrogramma calomelanos* (2400) and *Pteris vittata* L. (1860). Based on the recorded hyperaccumulation levels, translocation and accumulation factors, biomass, and fast growth of these plants, *P. calomelanos* and *P. vittata* were considered promising native plants for the phytoextraction of As contaminated soils. *Bidens pilosa* L. also has excellent potential for phytostabilization of mining soils contaminated with As and heavy metals. The research of Hung et al. (2018) was conducted for two years in northern Tan Uyen, Binh Duong province, Vietnam, to screen native plant species capable of absorbing the heavy metal Cd. The results showed that only 9 per 52 plant species studied were able to live in soil contaminated with Cd with concentrations from 25 to 50 mg.kg<sup>-1</sup>, of which *Solanum nigrum* L. and *Physalis angulata*, BF above 10, were considered to be Cd super accumulation. Anh et al. (2011) determined the heavy metal uptake into shoots and roots of 33 indigenous plant species in Thai Nguyen Province, Vietnam. Two species of the plants investigated, *Pteris vittata* L. and *Pityrogramma calomelanos* L. were hyperaccumulators, containing more than 0.1% heavy metals in their shoots. *Eleusine indica* L., *Cynodon dactylon* L., *Cyperus rotundus* L., and *Equisetum ramosissimum* accumulate very high Pb (0.15–0.65%) and Zn (0.22–1.56%) concentration in their roots.

#### **4. TREATMENT OF PLANT BIOMASS AFTER THEIR HEAVY METAL ABSORPTION**

Recently, many research projects worldwide have been treating or utilizing accumulated plant biomass rich in metals, such as Keller et al. (2005) investigated whether thermal treatment could be a practicable option for evaporatively separating metals from the plant residues. This study uses a laboratory reactor scale designed to simulate the volatilization performance of heavy metals in a grate furnace. Hao et al. (2018) reported a greener and more effective process of hydrothermal change of rice straw (Cd low accumulated crop) and *Elsholtzia splendens* (Cu accumulated plant) to improve the metals and simultaneously produce biofuel for harmless treatment and resource reuse. In the research of Zhi et al. (2020), for the initial time, a mesoporous carbon-supported nano CdS (CdS@C) photocatalyst was gained by in situ upcycling of Cd-enriched *Sedum plumbizincicola* biomass through a mixture of pyrolysis carbonization and hydrothermal reaction. In the study of Haiwei et al. (2022), CaO/Ca(ClO)<sub>2</sub> was used to promotion As retrieval in hydrothermal liquefaction of As-enriched *Pteris vittata* L. Anaerobic digestion (AD) approach a guarantee to covert phytoremediation biomass into renewable energy (biogass) and control soil contamination. Accumulation of heavy metals in digestive substrates affects the enzymatic activities of methanogenic bacteria in AD (Aman et al., 2022). In general, research worldwide focuses mainly on treating hyperaccumulated plant biomass, recovering heavy metals, and recycling biomass to create fuel. The thermal method is commonly used to treat heavy metal hyperaccumulator plant biomass. However, The number of studies on treating plant biomass after heavy metal absorption is still minimal. In 2014, Minh and Hai studied the treatment of fern and vetiver biomass adsorbing heavy metals (Pb, Cd, As) after planting on post-mining land using the ashing method. Fresh biomass of Ferns and Vetiver is collected and dried, and after ashing, it is further treated with lime to reduce the content of mobile heavy metals. Research results show that after ashing the tree, biomass decreased significantly, only 5–6% compared to the original. Using lime mixed with ash for two months has dramatically reduced the amount of mobile heavy metals in the soil. The total heavy metals content in the ash before and after the experiment did not change much. However, the mobile heavy metals content in the ash after treatment with lime has changed clearly. This is very meaningful in limiting the harmful effects of heavy metals in soil.

## **5. CONCLUSION AND RECOMMENDATION**

### **5.1 Conclusion**

Research related to the field of plant application for heavy metal treatment in Vietnam has produced several valuable results, including:

1. Researching about Hyperaccumulators:

- Pb: *Lantana camara L.*, *Vetiveria zizanioides*, *Pityrogramma calomelanos*, *Pteris vittata*, and *Eleusine indica*

- As: *Pteris vittata*, *Eleusine indica*, and *Bidens pilosa L.*

- Cd: *Solanum nigrum L.*, *Helianthus annuus*, *Phragmites Australis* and *Eleusine indica*.

- Zn: *Pteris vittata*, *Jussiaea fissentocarpa Haines*, and *Saccharum Arundinaceum* .

2. In Vietnam, *Vetiveria zizanioides*, *Phragmites Australis*, and other plants of the *Polypodiaceae* family are commonly researched and applied to treat heavy metals in soil

3. Some scientists also research native plant species that grow on lands with high heavy metal content to find more plant species that super absorb heavy metals.

4. The number of studies on treating plant biomass after heavy metal absorption is still very limited in Vietnam.

### **5.1 Recommendation:**

- Scientists in Vietnam need to focus on researching this issue in the future to support phytoremediation technology better.

- The above research is mainly carried out in the laboratory. Therefore, in the future, it is necessary to turn these research results into applied research.

**Özet**

Derin öğrenme, günümüzde birçok alanda kullanılan etkili bir yapay zeka yöntemidir. Büyük veri setleri ve karmaşık problemlerle başa çıkmak için ideal olan derin öğrenme yöntemi görüntü işleme, tıp, tarım gibi çeşitli alanlarda kullanılmaktadır. *Tarımsal alanda derin öğrenme uygulamalarını günümüzde popüler hale gelmiştir. Bu uygulamalardan bazıları bitki algılama, nesne tanıma, rekolte tahmini, hastalık kontrolü, akıllı sulama sistemleridir.* Çalışma için seçilen enginarın hasadında işçilik maliyetleri büyük bir sorundur. Enginarın tüm yetiştirme sürecince ve hasadında insan gücü büyük bir yer tutmaktadır. İşçilik maliyetinin azaltılması enginar üretim sürecine doğrudan katkıda bulunacaktır. Bu çalışmanın amacı, derin öğrenme yöntemi kullanılarak enginarın baş büyüklüğü yardım ile fide üzerinde belirlenmesidir. Enginar hasadı, bitkinin doğru zamanda ve doğru şekilde toplanmasıyla gerçekleştirilir. Baş büyüklüğü enginar hasadını belirleyici en önemli faktördür. Bu nedenle enginar hasadının zamanında ve etkin bir şekilde gerçekleştirilmesi amacıyla, Özellikle YOLOv8l (large) modeli, yüksek F1 skoru ve mAP@0.5:0.95 değerleri ile diğer algortimalardan daha iyi bir performans göstermiştir. Bu bulgular, YOLOv8l'nin, nesne tespiti için gelişmiş bir seçenek olarak, gerçek zamanlı robotik hasat uygulamalarında tercih edilebileceği anlaşılmıştır. YOLOv8l (large) modelinin sağladığı avantajlar çiftçilerin enginar hasadı sürecini optimize etmelerine, verimliliği artırmalarına ve kaynakları daha etkin bir şekilde kullanmalarına yardımcı olacaktır.

**Anahtar Kelimeler:** Derin öğrenme, tanımlama, enginar, YOLO

**IDENTIFICATION OF ARTICHOKE (*Cynara scolymus*) ON SEEDLINGS WITH  
THE HELP OF DEEP LEARNING METHOD**

**Abstract**

Deep learning is an effective artificial intelligence method used in many fields today. Ideal for dealing with large data sets and complex problems, deep learning is used in various fields such as image processing, medicine, agriculture, etc. Deep learning applications in agriculture have become popular today. Some of these applications are plant detection, object recognition, yield prediction, disease control, intelligent irrigation systems, etc. Labor costs are a major problem in harvesting the artichoke selected for the study. Manpower plays a major role in the entire growing process and harvesting of artichokes. Reducing the labor cost will directly contribute to the artichoke production process. The aim of this study is to determine the head size of artichoke on seedlings using deep learning method. Artichoke harvesting is realized by collecting the plant at the right time and in the right way, and head size is the most important factor determining the artichoke harvest. According to the results of the comparative analysis, the YOLOv8 algorithm has better object detection performance compared to YOLOv7. In particular, the YOLOv8l (large) model outperformed the other algorithms with high F1 scores and mAP@0.5:0.95 values. These findings suggest that YOLOv8l (large) can be preferred in real-time robotic harvesting applications as an advanced option for object detection. The advantages of the YOLOv8l (large) model will help farmers to optimize the artichoke harvesting process, increase efficiency and use resources more effectively.

**Keywords:** Deep learning, identification, artichoke, YOLO

## **Giriş**

Derin öğrenme, yapay sinir ağları kullanarak karmaşık ve soyut verileri anlamlandırma ve örüntülerini çıkarma sürecidir. Bu yöntem, makine öğrenmesinin bir alt dalıdır. Geleneksel makine öğrenmesi yöntemlerinde, verilerin elle seçilmiş bir dizi öznelik veya nitelik ile temsil edilmesi gerekmektedir. Ancak derin öğrenme yaklaşımında ise, algoritma, girdi verilerini otomatik olarak analiz ederek önemli özellikleri kendisi belirler. Derin öğrenme algoritmaları genellikle çok katmanlı sinir ağı mimarilerinden oluşur. Bu katmanlar arasında birbirleriyle bağlantılı olan yapay sinir hücreleri yer alır ve bu hücrelerden her biri girdi sinyallerini işleyerek çıktı üretir. Derin öğrenmenin uygulama alanları oldukça geniş kapsamlıdır. Görüntü tanıma, doğal dil işleme, ses tanıma ve oyun stratejisi gibi pek çok alanda kullanılabilir. Derin öğrenme teknolojisi kullanarak yüz tanıma sistemleri geliştirilebilir veya anlamını anlayabilen konuşan robotlar oluşturulabilir. YOLOv8, YOLO (You Only Look Once) nesne algılama algoritmaları serisinde önemli bir gelişmedir. Orijinal YOLO'dan YOLOv8, YOLO-NAS ve dönüştürücülü YOLO'ya doğru bir evrimi temsil etmektedir. YOLOv8 çeşitli alanlarda uygulanarak çok yönlülüğünü ve etkinliğini ortaya koymuştur. *YOLOv8, kendi başına bir derin öğrenme modelidir ve çeşitli yapay sinir ağı katmanlarından oluşur. Girdi olarak RGB görüntülerini alır ve bu görüntüler üzerinde tespit etmek istediğimiz nesnelere bulmaya çalışır. Derin öğrenme alanında YOLOv8 gibi modeller, nesne algılama problemini çözmek için yaygın olarak kullanılır. Bu modeller, otonom araçlar, güvenlik sistemleri, video analizi gibi birçok alanda kullanılabilir ve insanları ya da diğer nesnelere algulamak için büyük bir potansiyele sahiptir. Bu nedenle birçok alanda kullanılmaktadır.* Pediyatrik bilek travması X-ışını görüntülerinde kırık tespiti Ju ve ark.(2023), çelik yüzey kusur tespiti (Xie ve ark., 2024), otomotiv ABS fren ana silindiri kusur tespiti (Liu ve ark., 2024), termal görüntülemeye dayalı cerrahi kesi iyileşme değerlendirilmesi, düşük irtifa hava görüntülerinde nesne tespiti (Zhao ve ark., 2024) ve rüzgar türbini kanadı kusurlarının tespitinde (Yang ve ark., 2024) kullanılmıştır. Ayrıca YOLOv8, çöp sınıflandırma ve algılama, uzaktan algılama görüntülerinden kırsal yerleşim alanı çıkarma (Rui ve ark., 2023), izolatör hedef tespiti (Hu ve ark., 2023) ve manyetik rezonans anjiyografide beyin arteriyovenöz malformasyon tespiti gibi uygulamalarda kullanılmıştır. Algoritmanın yetenekleri, veri toplama ve analiz için araçlar ve paketler geliştirilerek genişletilmiş, böylece çeşitli araştırma ve pratik bağlamlarda daha erişilebilir ve uygulanabilir hale getirilmiştir. Derin öğrenme, tarımsal hasatta çeşitli uygulamalarda kullanılan etkili bir yapay zeka yöntemidir. Özellikle bitki stres fenotipleme, bitki hastalıklarının sınıflandırılması ve tarımsal üretimde verimliliğin artırılması gibi alanlarda

derin öğrenme yöntemleri başarıyla kullanılmaktadır. Singh ve ark.(2018) bitki stres fenotipleme konusunda derin öğrenme araçlarının diğer mevcut tekniklere göre karar doğruluğu, veri boyutu gereksinimi ve çeşitli senaryolardaki uygulanabilirlik açısından karşılaştırmalı bir değerlendirmesini sunmuşlardır. Derin öğrenme ayrıca hyperspectral görüntü sınıflandırması gibi tarımsal uygulamalarda da kullanılmaktadır. Fırat ve ark.(2022) hyperspectral görüntü sınıflandırması için derin öğrenmeye dayalı bir mimari önermişlerdir. Bu tür uygulamalar, tarımsal alanlarda bitki örtüsü analizi ve tarım alanlarının izlenmesi için önemli bir araç haline gelmektedir. Ayrıca, tarımsal üretimde makine öğrenimi ve derin öğrenme tekniklerinin kullanımı, örneğin bitki hastalıklarının tespiti, mahsul verimliliğinin artırılması ve tarımsal üretim süreçlerinin otomasyonu gibi konularda mavi yaban mersini meyvelerinin hasat edilebilirlik ve verimle ilişkilendirilen özelliklerinin belirlenmesi için derin öğrenme görüntü segmentasyonu ve çıkarma yöntemlerini kullanmıştır (Ni ve ark.,2020). Kim ve ark.(2021) otonom bir biçerdöver için zayıf denetimli mahsul alanı segmentasyonu konusunda çalışmış ve modelin küçük veri ölçeği ile kolayca uygulanabilir olduğunu göstermiştir. Li ve ark.(2023) yaptıkları çalışmada yüksek kaliteli çay toplama robotu için derin öğrenme ile tanımlama sistemi gerçekleştirmişlerdir. Gentilhomme ve ark.(2023) derin öğrenme yardımıyla asma için akıllı budama sistemi üzerine çalışmışlardır. Bir başka çalışmada Patil ve ark.(2023) füzyon derin öğrenme ile hasat öncesi ve sonrası üzüm kalite tahmini yapmışlardır. Pandey ve ark.(2023) 'de derin öğrenme yardımıyla pamukta yaprak hastalıklarının sınıflandırmasını gerçekleştirmişlerdir. Sekharamanry ve ark.(2023) derin öğrenme modeli olan YOLOv5 ile ağaç üstünde elma tespitini yapmışlardır. Ceyhan ve ark.(2022) görüntü tabanlı derin öğrenme ile buğday çeşitlerinin sınıflandırılması gerçekleştirmişlerdir. Zhang ve ark.(2022) domates hasat robotu için YOLOv5 derin öğrenme modeli geliştirmişlerdir. Bai ve ark.(2022) otomatik robotik hasat için makine öğrenimi destekli görüntü analizi kullanarak kümeleneş domates tespiti ve toplama noktası konumu seçimi çalışması yapmışlardır. Badeka ve ark.(2023) hassas bağcılık için derin öğrenme yaklaşım için YOLOv7 ile üzüm olgunluğunun değerlendirilmesi gerçekleştirmişlerdir. Bu çalışmalar, tarımsal hasat süreçlerinde verimliliği artırmak ve ürün kalitesini iyileştirmek için derin öğrenme yöntemlerinin potansiyelini ortaya koymaktadır. Bu bağlamda, derin öğrenme yöntemlerinin tarımsal hasatta kullanımı, bitki hastalıklarının tespiti, bitki stres fenotipleme, mahsul sınıflandırması ve tarımsal verimlilik analizi gibi alanlarda önemli bir araştırma ve uygulama alanı oluşturmaktadır. Bu tekniklerin tarımsal üretimdeki rolü, gelecekteki tarımsal

uygulamaların geliştirilmesinde ve tarımsal verimliliğin artırılmasında önemli bir rol oynayacaktır.

## **2. Materyal ve Yöntem**

### **2.1. Materyal**

Enginar (*Cynara scolymus*) potansiyel sağlık faydaları ve besin değeri ile bilinen bir bitkidir. Araştırmalar enginar yaprağı ekstraktlarının anti-mikrobiyal, anti-alerjik, anti-enflamatuar ve antikanser etkiler gösteren dikafeoilkinik asitler, klorojenik asit, luteolin glukozit ve apigenin glukozit gibi antioksidan fenolik bileşikler içerdiğini göstermiştir (Tang ve ark., 2017). Ayrıca enginar brakteleri diyet lifi, fenolik içerik ve antioksidan aktivite açısından zengindir, bu da onları gıda ürünlerinde değerli bir fonksiyonel bileşen haline getirir (Dadalı, 2023). Enginarın karaciğer hasarına karşı potansiyel koruyucu etkileri ve kolesterol biyosentezi üzerindeki inhibitör etkileri vardır. (Gebhardt, 2002). Bu bulgular ışığında enginarın sağlığı geliştirici çeşitli özelliklere sahip fonksiyonel bir gıdadır.

*Enginar hasadı, enginar üretiminin çok önemli bir yönüdür. Çok yıllık bitkilerin en yoğun üretimi Mart-Nisan ayları arasında gerçekleşir ve bu dönem enginar hasadı için en uygun dönemdir (Smith ve ark., 2008). Hasat zamanının seçimi enginarın polifenol profilini önemli ölçüde etkilemektedir ve bu da hasat zamanının istenen polifenol içeriğine sahip enginar elde etmek için gerekli olduğunu göstermektedir (Pandino ve ark., 2013). Organik ve geleneksel olarak yetiştirilen enginarların karşılaştırıldığı bir çalışmada, enginarın organik yetiştiricilik için en uygun bitkilerden biri olduğu tespit edilmiş, bu da organik yöntemlerin enginar hasadı için etkili bir şekilde kullanılabileceğini düşündürmüştür (Yıldırım ve ark., 2020). Enginar çeşitlerinin farklı gübre rejimlerine ve gibberellik asit uygulaması gibi uygulamalara verdiği nutrasötik tepkinin hasadın kalitesini ve verimini etkileyebileceğini göstermiştir (Lombardo ve ark., 2015; Lombardo ve ark., 2022). İstenen kalite ve verim için enginar hasadını optimize etmek amacıyla hasat zamanlamasının, yetiştirme yöntemlerinin ve uygulamaların dikkate alınması gerekmektedir.*

### **2.2. Yöntem**

#### **Veri Setinin Hazırlanması:**

Enginar bitkisinin veri setinin hazırlanmasında Tekirdağ Naip Köyü üretici tarlarında çekilmiş hasat fotoğrafları ve videoları kullanılmıştır. Şekil 1’de örnek fotoğraflar verilmiştir. Eğitim seti ve test seti için 150 adet enginar bitkisi görseli çalışmada kullanılmıştır. Her bir fide üzerinde birden fazla enginar bulunmaktadır. Şekil 1’de veri setinde kullanılan görsellere örnek gösterilmiştir.

**Şekil 1.**Naip Köyü üretici tarlasından alınmış görüntüler

### **Etiketleme ve Eğitim Seti**

Bir nesne tespiti modelinin, bir veri seti üzerinde eğitim gerçekleştirebilmesi için, tespit edilmesi hedeflenen nesnelerin eğitileceği veri setinde etiketlenmiş/ imzalanmış olması gerekmektedir. Bu sebeple eğitim seti için 100 görselin her birinde enginar görüntüsünü içeren kısımların sınırlayıcı kutu alanı ile işaretlenmesi yapılmıştır. 50 görsel ise test setinde kullanılmıştır.Görsel etiketlemesi yapmak için, açık kaynak topluluklarında çok sayıda program, internet sitesi ve yardımcı araç bulunmaktadır. Şekil 2 'de etiketleme ekranı görüntüsü gösterilmiştir.

**Şekil 2.**Etiketleme ekranı

Bu araçlardan bir tanesi ise, nesne tespiti projelerinde sıklıkla kullanılan, popüler bir web sitesi olan Roboflow'dur. Roboflow, ham görüntüleri özel olarak eğitilmiş bir bilgisayar görme modeline dönüştürmek ve onu uygulamalarda kullanmak üzere dağıtmak için gereken tüm araçları sağlayan; görüntüler üzerinde alan seçimleri, işaretlemeleri ve sınıf etiketlemeleri yapılmasını sağlayan bir web sitesidir. Bu işaretleme ve etiketleme işlemi, sitenin sahip olduğu grafiksel kullanıcı arayüzü aracılığıyla kolaylıkla yapılmaktadır.

### **Eğitim Model Seçimi**

Yapmış olduğumuz projede, CNN yöntemiyle geliştirilmiş YOLO model ailesinin açık kaynak olarak geliştirilen en son versiyonu olan YOLOv8 tercih edilmiştir. RCNN benzeri iki aşamalı ağ kullanan modellere göre oldukça avantaja sahip olan YOLO model ailesinin YOLOv8 modeli, kendisinden önce geliştirilmiş sürümlere doğruluk değerleri ve hız oranı açısından avantaj sağladığı için tercih edilmiştir.

Enginarın fide üzerinde tespiti yapacak olan modelin eğitiminin başlatılması için, YOLOv8 modelinin bilgisayardaki konumuna gidilerek Python çalıştırıcı editör açıldı. Ana dizinde bulunan ve YOLOv8 eğitimini sağlayan train.py programı, çalıştırılmak üzere kontrol edildi. Bu Python programının çalıştırılması, çeşitli parametreler ile özelleştirilebilmektedir. Çalışma dahilinde, enginar için aşağıda yazılı olan kod içerisindeki parametreler ve düzenlemeler tercih edildi.

- `!yolo task=detect mode=train model=yolov8n.pt data={dataset.location}/data.yaml epochs=80 imgsz=640 plots=True`
- `!yolo task=detect mode=train model=yolov8s.pt data={dataset.location}/data.yaml epochs=80 imgsz=640 plots=True`
- `!yolo task=detect mode=train model=yolov8m.pt data={dataset.location}/data.yaml epochs=80 imgsz=640 plots=True`
- `!yolo task=detect mode=train model=yolov8l.pt data={dataset.location}/data.yaml epochs=80 imgsz=640 plots=True`

**task:** Eğitimin hangi görevi gerçekleştireceğini belirler. “detect” nesne tespiti görevini ifade eder.

**mode:** Modelin eğitim modunda çalıştırılacağını belirtir. YOLO, farklı modlarda çalıştırılabilir örneğin “train” eğitim için, “test” test etme veya doğrulama için kullanılabilir.

**model:** Eğitim sırasında kullanılacak modelin yolunu ve adını belirtir.

**imgsz:** Eğitimi yapılacak görsellerin YOLOv8 modeli tarafından düşürüleceği piksel boyutudur.

**--plots:** Eğitim sırasında oluşturulan grafik çizimlerini ifade eder. Bu grafikler, modelin performansını izlemek için kullanılır.

### **3.Araştırma Sonuçları**

Yapılan çalışmada, nesne tanıma görevleri için özelleştirilmiş dört farklı YOLOv8 modelinin (Nano, Small, Medium, Large) performansları incelenmiştir. Analizler her bir modelin eğitim süresince kaydettiği ilerleme ile başlangıç ve bitiş epochlarında elde edilen metrik değerler üzerinden gerçekleştirilmiştir. YOLOv8s ‘un başlangıçtaki performansı, düşük bir mAP50-95 oranı ile (%2.505) olduğu görülmüştür. Ancak, model hızla olgunlaşmış ve 5. epoch itibarıyla %75.079'luk bir mAP50-95 değerine ulaşarak kayda değer bir gelişme göstermiştir. Modelin eğitimi sırasında, epoch 6'da gözlenen hafif bir kayıp artışına rağmen, model stabil bir ilerleme kaydetmiş ve mAP50-95 değerlerinde tutarlı bir yükseliş göstermiştir. Özellikle epoch 18'de %71.237'lik bir mAP50 değeri ile modelin doğru pozitif tanımlamalarda başarılı olduğu

görülmüştür. Modelin eğitimi boyunca kayıp değerlerinde (loss values) genel bir düşüş trendi ve metriklerde (precision, recall, mAP50, mAP50-95) sürekli bir iyileşme izlenmiştir. Modelin son epoch'larına baktığımızda, YOLOv8s 'in mAP50-95 değeri %87.825 ile en yüksek seviyeye ulaşmıştır. YOLOv8n ve YOLOv8m son epochlarda yüksek performans göstermiş olmasına karşın YOLOv8s 'in gösterdiği istikrar ve yüksek performans seviyelerine ulaşamamışlardır. YOLOv8l, özellikle başlangıç epochlarında düşük performans sergilemiş ve son epochlarda performansında sınırlı bir iyileşme gözlemlenmiştir. Ayrıca Medium ve Large modellerinin eğitimlerinin 52 ve 53. epochlarda kesilmesi, erken durdurma (early stopping) mekanizması nedeniyle gerçekleşmiştir. Erken durdurma, modelin aşırı uyuma (overfitting) gitmesini önlemek ve eğitim sürecinde kaynak kullanımını optimize etmek için tasarlanmış bir yöntemdir. Bu durum, her iki modelde de belirlenen performans eşiği altında ilerleme kaydedilmemesi sonucunda devreye girmiştir. Özellikle, bu modellerin son epochlarında doğrulama kaybında (validation loss) ve metriklerinde önemli bir iyileşme olmaması, sistem tarafından eğitimin otomatik olarak durdurulmasına yol açmıştır. Tablo 1, Tablo 2 ve Tablo 3' de analizi sonuçları verilmiştir.

**Tablo 1.**Farklı Koşullarda Performans Analizi

Test Koşulu	YOLOv8n	YOLOv8s	YOLOv8m	YOLOv8l
	Performansı	Performansı	Performansı	Performansı
Düşük Işık	Yeterli	İyi	Çok İyi	Mükemmel
Karmaşık Arka Plan	Yeterli	İyi	Çok İyi	Mükemmel

Nano model, düşük güç ve daha basit görevler için yeterliyken, Large model karmaşık koşullarda üstün performans sergilemiştir.

**Tablo 2.**Veri Artırma Teknikleri Etkileri

Veri Artırma Tekniği	YOLOv8n	YOLOv8s	YOLOv8m	YOLOv8l
	Performansı	Performansı	Performansı	Performansı
Döndürme	Pozitif	Pozitif	Pozitif	Pozitif
Renk Uzayı Dönüşümleri	Pozitif	Pozitif	Pozitif	Pozitif

Tüm modeller, veri artırma tekniklerinden olumlu etkilenmiş ve performanslarını artırmıştır.

**Tablo 3.**Gerçek Zamanlı Performans Değerlendirmesi

Özellik	YOLOv8n	YOLOv8s	YOLOv8m	YOLOv8l
	Performansı	Performansı	Performansı	Performansı
İşlem Hızı	Hızlı	Hızlı	Orta	Yavaş
Tespit Doğruluğu	Yeterli	İyi	Çok İyi	Mükemmel

Nano ve Small modeller hız açısından avantaj sağlarken, Medium ve Large modeller doğrulukta daha iyi performans göstermiştir.

### **YOLOv8 algoritmalarının sonuçlarının hata matrisi metriklerine göre incelenmesi:**

#### **F1 Score Analizi**

Yapılan F1 analizi ile modelin precision ve recall değerlerinin harmonik ortalaması hesaplanmakta ve modelin genel performansını ölçmekte kullanılmaktadır. Grafikte F1 Score değerlerinin başta en yüksek değeri gördüğü ve benzer değerlerde kaldığı görülmektedir. Bu durum, modelin daha ilk epochlardan iyi performans gösterdiğini ve nesnelere daha doğru bir şekilde tespit etmeye başladığını göstermektedir. Şekil 3’de F1 score analizi grafiği verilmiştir.

Size: 640x640, Epoch: 80, Algorithm:  
YOLOv8n

Size: 640x640, Epoch: 80, Algorithm:  
YOLOv8s

Size: 640x640, Epoch: 80, Algorithm:  
YOLOv8m

Size: 640x640, Epoch: 80, Algorithm:  
YOLOv8l

#### **Şekil 3.F1 score analizi grafiği**

Şekil 3’de F1 score analizi grafiği verilerine göre, YOLOv8l modelin F1 puanı düşük güven eşiklerinde başlangıçta düşükken, eşik değeri arttıkça F1 puanının arttığı gözlemlenmiştir. F1

puanının artışı, yaklaşık 0.7 güven eşiğinde belirgin bir şekilde yükselmiş ve maksimum F1 puanına ulaşmıştır. YOLOv8l modelin belirli bir güven eşiği üzerinde maksimum F1 puanına ulaşabileceğini gösterir. Burada 0.72 güven eşiğinde 1.0 F1 puanına ulaşıldığı görülmektedir. YOLOv8l modelin bu eşikte tespitleri maksimum hassasiyet ve duyarlılık ile gerçekleştirdiğini işaret etmektedir. Ancak, F1 puanının 0.8'den 1.0'a kadar olan güven eşiği aralığında hafif bir düşüş göstermesi, YOLOv8l modelin en yüksek güvenlik düzeylerinde yanlış negatifleri artırabileceğini ve bu da toplam F1 puanını azaltabileceğini göstermektedir. Bu, modelin güven eşiğinin hassas bir şekilde ayarlanmasının gerekliliğini vurgulamaktadır.

### **Precision Analizi**

Precision, modelin yanlış pozitifleri minimize ederek doğru pozitif tahminlerini ne kadar başarılı bir şekilde gerçekleştirdiğini ölçer. Precision grafiğinde, farklı sınıflar için elde edilen precision değerlerini gözlemlemekteyiz. Precision değeri, doğru pozitif tahminlerin toplam tahmin sayısına oranını ifade eder ve yanlış pozitiflerin minimize edilmesini hedefler. Yüksek bir precision değeri, modelin yanlış pozitifler yapma olasılığının düşük olduğunu gösterir. Şekil 4'de precision(hassasiyet) analizi grafiği verilmiştir.

Size: 640x640, Epoch: 80, Algorithm: YOLOv8n

Size: 640x640, Epoch: 80, Algorithm: YOLOv8s

Size: 640x640, Epoch: 80, Algorithm: YOLOv8m

Size: 640x640, Epoch: 80, Algorithm: YOLOv8l

#### Şekil 4. Precision (hassasiyet) analizi grafiği

Şekil 4'deki Precision (hassasiyet) eğrisi, farklı güven eşiklerinde YOLOv8l modelin hassasiyet değerlerinin nasıl değiştiğini ortaya koymaktadır. Grafikteki eğri, YOLOv8l modelin düşük güven eşiklerindeki hassasiyetinin oldukça düşük olduğunu, ancak güven eşiği yükseldikçe hassasiyetin belirgin bir şekilde arttığını göstermektedir. Özellikle, yaklaşık 0.68

güven eşiği değerinde hassasiyetin 1.0'a ulaştığı görülmektedir. Bu değer YOLOv8l modelin yüksek güvenilirlikle tespit yapabildiği durumları ifade etmektedir.

### Recall Analizi

Recall, gerçek pozitiflerin ne kadar başarılı bir şekilde tahmin edildiğini ölçer ve yanlış negatifleri minimize etmeyi hedefler. Recall grafiğinde, farklı sınıflar için elde edilen Recall değerlerini gözlemlemekteyiz. Recall değeri, gerçek pozitif tahminlerin gerçek pozitiflerin toplam sayısına oranını ifade eder ve yanlış negatifleri minimize etmeyi hedefler. Şekil 5'de Recall(duyarlılık) analizi grafiği verilmiştir.

Size: 640x640, Epoch: 80, Algorithm:  
YOLOv8n

Size: 640x640, Epoch: 80, Algorithm:  
YOLOv8s

Size: 640x640, Epoch: 80, Algorithm:  
YOLOv8m

Size: 640x640, Epoch: 80, Algorithm:  
YOLOv8l

**Şekil 5.**Recall(duyarlılık) analizi grafiği

Şekil 5'teki Recall(duyarlılık) analizi grafiğinde, YOLOv8l modeli güven eşiğinin çok düşük olduğu noktalarda neredeyse tam duyarlılık sergilediği görülmektedir. YOLOv8l modelinin mevcut tüm pozitif örnekleri tespit etme eğiliminde olduğunu göstermektedir. Bu noktada, hatta sıfır güven eşiğinde, YOLOv8l modelinin tüm pozitifleri yakalama eğiliminde olduğu anlaşılmaktadır. Ancak bu yaklaşımın yanlış pozitiflerin sayısını da artırabileceği anlamına gelmektedir.

### **Precision-Recall Analizi**

Precision, modelin yanlış pozitifleri minimize ederek doğru pozitif tahminlerini ne kadar başarılı bir şekilde gerçekleştirdiğini ölçerken, Recall, gerçek pozitifleri ne kadar başarılı bir şekilde tahmin ettiğini ölçer. Precision-Recall grafiğinde, farklı sınıflar için elde edilen Precision ve Recall değerlerini gözlemlemekteyiz. Precision, doğru pozitif tahminlerin toplam tahmin sayısına oranını ifade ederken, Recall gerçek pozitiflerin tahmin edilen pozitiflerin toplam sayısına oranını ifade eder. Şekil 6'de Precision-Recall(hassasiyet-duyarlılık) analizi grafiği verilmiştir.

Size: 640x640, Epoch: 80, Algorithm: YOLOv8n

Size: 640x640, Epoch: 80, Algorithm: YOLOv8s

Size: 640x640, Epoch: 80, Algorithm: YOLOv8m

Size: 640x640, Epoch: 80, Algorithm: YOLOv8l

Şekil 6. Precision-Recall (hassasiyet-duyarlılık) analizi grafiği

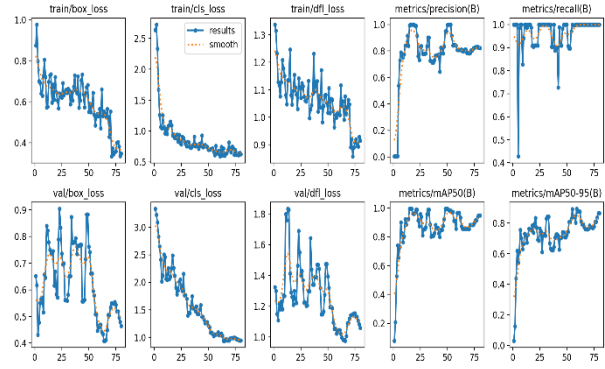

Şekil 6’da Precision-Recall(hassasiyet-duyarlılık) analizi grafiğinde, yüksek duyarlılık seviyelerinde YOLOV8l modelin hassasiyetinin belirli bir düşüş gösterdiği görülmektedir. YOLOv8l modelin neredeyse tüm pozitif örnekleri tespit etme eğiliminde olduğu anlaşılmaktadır.Ancak bunun yanlış pozitif sayısında artışa yol açtığı anlamına gelmektedir. Özellikle, 0.725 mAP@0.5 değeri, modelin bu belirli duyarlılık düzeyinde ulaştığı hassasiyeti göstermektedir.Eğrinin başında gözlemlenen yüksek hassasiyet seviyesi, YOLOv8l modelin güçlü tespit kabiliyetine işaret ederken, duyarlılık değerleri düşükken hassasiyetin neredeyse mükemmel olduğunu belirtir. Duyarlılık arttıkça hassasiyetin düştüğü alanlar, YOLOv8l modelin doğru pozitif tahminler yapma kapasitesinin belirli bir duyarlılık seviyesinde sınırlı olduğunu gösterir. Bu eğri aynı zamanda, modelin doğru pozitif ve yanlış pozitifler arasında dengeli bir performans sergileme potansiyeline sahip olduğunu gösterir.

### **Loss Function Analizi**

Loss Function, modelin tahminlerinin gerçek değerlerden ne kadar uzak olduğunu ölçer ve eğitim sürecinde kullanılarak modelin optimize edilmesini sağlar.Loss Function tablosunda, YOLOv8 modelinin eğitim sürecinde elde edilen Loss Function değerlerini gözlemlemekteyiz. Loss Function değeri, modelin tahminlerinin gerçek değerlerden ne kadar uzak olduğunu ölçer ve bu değer minimize edilmesi hedeflenir. Şekil 7’de Loss Function analiz grafiği verilmiştir.

Size: 640x640, Epoch: 80, Algorithm: YOLOv8n

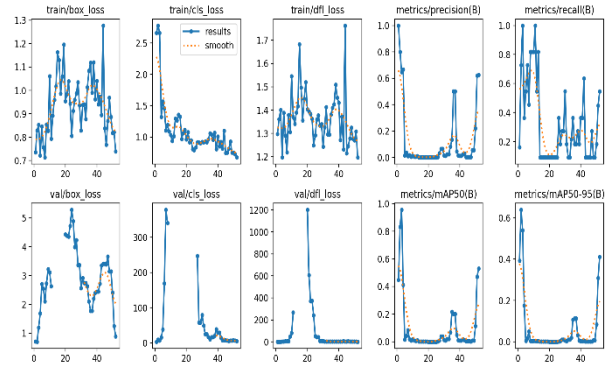

Size: 640x640, Epoch: 80, Algorithm: YOLOv8s

Size: 640x640, Epoch: 80, Algorithm: YOLOv8m

Size: 640x640, Epoch: 80, Algorithm: YOLOv8l

### Şekil 7. Loss Function analiz grafiği

Daha düşük bir Loss Function değeri, modelin daha iyi bir şekilde eğitildiğini ve tahminlerinin gerçek değerlere daha yakın olduğunu gösterir. Şekil 7’de Loss Function analiz grafiğinde değerlere göz attığımızda, eğitim süreci boyunca Loss Function değerlerinin genellikle

azaldığını görüyoruz. Bu, modelin doğru tahminler yapma yeteneğinin arttığını ve tahmin hatalarının azaldığını gösterir. Şekil 8 'de test sonucu ekran görüntüleri verilmiştir.

```

Yukarıda verilen değerler göre analiz sonuçları şu şekildedir;

- **YOLO Nano**, hız açısından diğer modellere üstünlük sağlarken, tespit doğruluğu daha düşük seviyelerde kalmıştır. Bu, düşük güç tüketimi gerektiren uygulamalar için uygun olduğunu göstermektedir.
- **YOLO Small**, dengeli bir performans sergileyerek, ışık ve arka plan değişkenliğinde iyi sonuçlar elde etmiştir.
- **YOLO Medium**, çeşitlilik ve zorluğu daha yüksek olan veri setlerinde bile etkili bir performans göstererek, genelleştirme kabiliyeti açısından öne çıkmıştır.
- **YOLO Large**, en karmaşık sınıflandırma görevlerinde bile mükemmel doğruluk sunarak, model serisinin en güçlüsü olarak belirlenmiştir.

## 4.Sonuç

Yapılan çalışma ile YOLOv8 modeli ve hazırlanan veri seti ile yapılan örnek eğitim ve doğrulama görsellerindeki nesne tespiti doğruluk oranları incelenmiştir. Modellerin nesne tespit başarılarını belirten metrik verileri ve doğruluk tahmin oranları incelenmesi sonucunda modelin eğitim sonucunun başarılı olduğu görülmüş ve doğrulanmıştır. İlk epochlar boyunca, eğitim ve doğrulama kayıpları hızlı bir şekilde azaldığı ve metriklerde de belirgin bir gelişme olduğu görülmüştür. Analiz sonuçlarına göre Precision, recall ve mAP değerlerinin daha yüksek seviyelerde başladığı ve sürekli olarak değişkenlik gösterdiği görülmüştür. YOLOv8l(large) modelinin iyi bir başlangıç performansı sergilediği anlaşılmıştır. Son epochlar boyunca, eğitim kaybı ve doğrulama kaybı sürekli olarak azalmış ve en düşük seviyelere ulaşmıştır. Metriklerdeki gelişme de devam etmiştir. Analiz ve doğruluk sonuçlarına göre YOLOv8l(large) modelinin en iyi eğitim modeli olduğu anlaşılmıştır.

**Özet**

İnsan çağlar boyunca kimlik edinme içgüdüleriyle kendi ötekilerini yaratır. Bu kimliğin ihtiyaç duyduğu aidiyet hissidir. Tarih pek çok dönemde toplumdaki belli bir kesimi dışlama, yargılama ve damgalama gibi olgulara tanık olmuştur. Bu çalışma eşcinsel bireyin öteki olma hikâyesini analiz eder ve bunu bir sinema dili haline getiren *queer* kavramının ortaya çıkış sürecini ele alır. Araştırmanın amacı eşcinsel imgesinin olumlu-olumsuz temsilleri üzerine *queer* sinemadaki filmleri analiz etmek ve bununla birlikte kavramın ortaya çıkışındaki tarihsel süreci, nasıl/neden sahiplenilerek sinema dili haline getirildiğini araştırmaktır. Aynı zamanda karşıtı olan Ana akım sinemanın tutucu tavrının sebeplerini ve örneklerini yapıtlar üzerinden içerik analizi yöntemiyle çözümlenmektedir. Araştırma amacına yönelik ise kuir teori çerçevesinde, muhafazakâr toplumları (din, aile ve sosyal kurumlar gibi) araştırmanın evreni ve örnekleme odağına oturtarak Yönetmenliğini Patrick Kuang Hui-Liu'nun yaptığı 2020 yapımı Tayvan yapımı *Your Name Engraved Herein* (Adın Buraya Kazınmış,2020) filmi ele alınmıştır. Film, sıkıyönetimin bahsedildiği 1986 yılında iki eşcinsel erkeğin öteki olma hikâyesini konu etmesi bakımında araştırmayla doğrudan örtüşür. Analiz edildiği üzere öteki olan, toplumda muhafazakâr yapı içerisinde kendi varlığını kabul ettirmekte zorluk çekmiş, toplumun her sosyal kurumunda hatta sanat olan sinema da bile hor görülmüş, fakat mücadelesini bırakmayarak kendi evrenini oluşturmuştur. Araştırmanın sonucuna göre tam anlamıyla sorun olmaktan çıkamayan eşcinsellerle ilgili olumsuz temsiller düşük bir yüzdeye sahip olsa dahi düşmüştür. Bu da sinemanın giderek daha olumlu temsiller çıkarması için önündeki engelleri aşmaya hevesli olduğu kanısını ortaya çıkarır. Mücadelesini sürdüreceğini gösterir.

**Anahtar Kelimeler:** Queer, Queer Sinema, Öteki, Ötekileştirme, Eşcinsellik

**IN THE CONTEXT OF OTHERALIZATION IN QUEER CINEMA: MOVIE  
ANALYSIS OF *YOUR NAME ENGRAVED HERE***

**Abstract**

Throughout the ages, humans create their own others with the instinct of gaining identity. This is the feeling of belonging that identity needs. History has witnessed phenomena such as exclusion, judgment and stigmatization of certain segments of society in many periods. This study analyzes the homosexual individual's story of being the other and discusses the emergence of the concept of queer, which turns this into a cinema language. The aim of the research is to analyze films in queer cinema on positive and negative representations of the homosexual image, and to investigate the historical process of the emergence of the concept and how/why it was appropriated and turned into a cinema language. At the same time, it is to analyze the reasons and examples of the conservative attitude of mainstream cinema, which is its opposite, through the works by content analysis method. For the purpose of the research, within the framework of queer theory, the 2020 Taiwanese film *Your Name Engraved Herein* (2020), directed by Patrick Kuang Hui-Liu, focuses on conservative societies (such as religion, family and social institutions) as the universe and sample of the research. It is discussed. The film directly coincides with the research in that it tells the story of two gay men becoming the other in 1986, when martial law was mentioned. As analyzed, the other had difficulty in accepting its existence within the conservative structure of society, was despised in every social institution of the society, even in cinema, which is an art, but it did not give up its struggle and created its own universe. According to the results of the research, negative representations about homosexuals, who cannot completely cease to be a problem, have decreased, even if they are at a low percentage. This suggests that cinema is eager to overcome its obstacles to produce increasingly positive representations. It shows that he will continue his struggle.

## **GİRİŞ**

İnsan etrafında ötekiler yaratarak yaşamı şekillendirir ve böylece dogmalar kurar, kurduğu bu dogmalardan da güç alır. Tüm bu dogmalar içinde de yaşamın sınırlı ve düzenli olmasıyla aidiyet hissine kapılır. Aidiyet hissi, ötekinin var olmasıyla yeterince harmanlanınca da yaşam daha anlamlı bir hale gelir. Toplumun özellikle eril bir yapıya sahip olması ve bu eril zihniyetin, zayıf, güçsüz ve farklı cinsel tercihlere olan gruplara karşı değişmez kurallar koyması, toplumun bir noktada ayrışmasına ve ötekilerin nihayetinde var olmasına sebep olur. Bu öteki bir çingene, Yahudi, siyahi, kadın ya da eşcinsel olabilir. Çalışmada öteki olarak karşımıza çıkan “eşcinsel” birey araştırılmıştır. *Queer* kavramı ile birlikte zaman içinde nasıl algılandığına, özellikle sinema gibi güçlü bir sanatın içinde nasıl tasvir edildiğine bakılmıştır. 1990’larda AIDS hastalığının yaygınlaşması ve bu hastalığın yalnızca eşcinsel bireylerden bulaştığı iddiasının ortaya atılması kavramın, LGBTİ+ aktivistleri tarafından bilinçli ve stratejik olarak sahiplenilmesine sebep olmuştur. *Queer* birey tarihin pek çok kesiminde kavramın kendisi gibi öteki, iğreti, tuhaf ve acayip olmuştur. Fakat bugün *queer*’in anlamına baktığımızda “öteki” olandan çok tek tip kimliği dayatanlara, bunu sınırlayanlara ve cinsel yönelimleri görmezden gelenlere karşı; din, aile, ırk, hukuk gibi güçlü sosyal yapılara meydan okuduğunu söylemek yanlış olmaz. Tüm bunlar neticesinde kavramın yaratılan olumsuz anlamdan çıkartılması ve dayatılan tüm normlara başkaldırması *queer* olan için önemli bir adımdır. *Queer* her ne kadar ötekileştirilse de sosyoloji gibi bilimlerin içerisinde sınırlı kalmayıp sinemanın da sorunu haline gelmiştir. Araştırmanın amacına yönelik Tayvan yapımı *Your Name Engraved Herein* filminde “öteki/ötekileştirilen” bireyin tarih boyunca nasıl/neden ve ne şekilde var olduğuna, değişimin nelerle ve ne sebeple başladığına bakılmıştır. Aynı zamanda kavramın evrimleşerek sinemaya kadar uzanışına ve tüm bu süreçlerle birlikte yapılan filmlerin Ana akım sinemanın yarattığı cinsiyetçi ideolojiye karşı farklı bir alternatif oluşturabilmesi üzerinde durulmuştur. Sonucunda ise olumlu temsillerin çok az olduğu fakat eskiye nazaran sinemanın bunun için çabaladığı kanısına varılmıştır.

## **QUEER NEDİR?**

Queer ve ya Kuir, 90’lı yıllardan önce “Tuhaf, acayip, iğreti, dengesiz, kötü ve değersiz” gibi anlamlarla ifade edilirdi. Batı’da uzun bir sürede eşcinselleri aşağılamak için kullanıldı ve sonrasında bilinçli ve stratejik olarak karşıt bir ifade oluşturacak şekilde sahiplenildi. Queer bugün bir kimlik modeli olmaktan çok, kimlikleri birbirine bağlayan, kimliği gözetmeksizin herkesin homofobi ile kavga ettiği ve bir araya geldiği bir kavram olarak karşımıza çıkar.

Queer, feminizm çalışmalarında değinilen, Ana Akım'ın kadınları bir kanon içine sokmaya çalışan ve onları sindirmeyi amaçlayan ideolojik tutumun içinde gelişir ve mücadelesini yine toplumsal cinsiyet normlarını yıkma gayesi üzerine kurar. Toplumsal cinsiyet nedir, nasıl ve yeniden üretilir, imkânları nelerdir sorusuna Butler: "Toplumsal cinsiyet normları içerisinde neyin idrak edilebilir bir biçimde insan olup neyin olmayacağına, neyin "gerçek" kabul edilip neyin edilmeyeceğini belirler, bedenlerin meşru ifade kazanabilecekleri ontolojik alanı oluştururlar." (Butler, 2005) diye cevap verir. Queer'i bu denli ötekileştiren, heteronormatif toplumun öncü olduğu düşüncesi ve bu sistemin devamlılığının sağlanması gayesidir. Ayrıca cinsel yönelim, tercih ve kimlikleriyle hayattan başka türlü haz alanlara, başka türlü âşık olanlara henüz alışılmış bir bakış açısının kazandırılmamış olmasıdır. Açıkça toplumun Queer bireyi neden ötekileştirdiği sorusuna aile kurumunun önemi ve din faktörünün maddi gerçekliği şeklinde de cevap verilebilir. Günümüzde Tek tanrılı dinler olan Musevilik, Hıristiyanlık ve İslam'ın eşcinselliğe yaklaşımları görece bellidir ve toplumu bu sebeple etkilediği görülür. (Nil, 2013) Eşcinsellik ve din arasındaki bu tartışmaları Nurten Şahin şöyle açıklar: "İnsanlar kadın ve erkek olarak beden yapısına uygun olan bir ruh yapısı ile birlikte dünyaya gelmektedir. Bu nedenle insanın doğuştan gelen özelliklerine müdahale, kişinin sadece kendisinin değil gelecek nesillerin de, yaratılan temiz fitratının değişmesi ile sonuçlanır." (Şahin, 2015, s. 514)

İmparatorluklardan ulus-devletlerine kadar aile kurmak, ulusal varoluşun temel taşlarından biri olmuştur. Eşcinsel birey bu noktada aile ve akrabalık bağlarına zarar veren, toplumun temel yapı taşlarını zedeleyen bir konumda addedilir. Dünya küreselleşip, çok kültürlü bir yapıya sahip olsa bile Heteronormative kimlikler, ataerkil toplum normları, homoseksüel ilişkiye olan bakış açısı ne yazık ki çok az değişmiş hatta Queer birey için; hasta, sapkın, günahkâr, terörist ve gayri insanı gibi sıfatlar bile türemiştir. Çünkü din, insani duygulardan çok normal görünme ve davranma yani topluma uyumlu olma ve topluma uygunluğun sosyal yapıdaki karşılığını arar. Michael Warner 90'lı yılların başında "Heteronormativitenin bütün toplumsal kurum ve ideolojilere sirayet ettiğini, dolayısıyla heteronormatif cinsel düzene itiraz etmenin er ya da geç bizzat bu kurum ve ideolojilere itiraz etmek anlamına geleceğini" (Çakırlar & Delice, 2012, s. 17) söyleyerek durumun ehemmiyetinden söz eder. Tarihi kayıtlar göz önüne alındığında eşcinselin yeni bir olgu olmadığı kanısına varmak mümkündür. Örneğin M.Ö. 1400'lerdeki yasaların yazılı olduğu bir tablette Hititlilerde iki erkek arasında evliliğe izin verildiği görülür. (Nil, 2013, s. 7) Benzeri bir şekilde Hristiyanlığın ilk beş yüz yılı içerisinde de hoş karşılandığı fakat sonra ki yüzyıllarda yasaklandığı görülür. Eşcinsel ilişkiye yönelik açık ve şiddetli düşmanlık geleneği 12.yüzyılda başlar ve bugün hala sürmeye devam eder. (Şahin, 2015, s.

511)1970 yılında Amerikan Psikiyatri Birliği, Hooker'in çalışmasına dayanarak cinsiyet yönelimleri için hastalık, psikolojik rahatsızlık, anormal davranış tanımını kaldırmıştır. (Şahin, 2015, s. 511) Neticesinde eşcinselliğin insan cinselliğinin olağan çeşitliliğinin bir görünümü olduğu bilimsel alanda kabul görmüştür. Türkiye'de ise queer teoriye ilişkin köklü bir araştırma henüz geliştirilememiştir. Queer'in tüm bu zorlu süreçler içerisinde istikrarlı ve kendinden emin tavrı nihayetinde medyanın da ilgisini çeker. Sinema, LGBTİ+ bireylerin hikâyesi için en güçlü silahlarından biri haline gelir. Tüm bu söylemler ve çatışmalar sonucunda bugün queer teorinin cinsel yönelimlere, kimliklerin merkezleşmesine, kimliği tek tipleştirip üreten, bunu onaylayan ve heteroseksist düzenin ötelediği eşcinselleri öne çıkarmakla kalmayan; din, dil, ırk, devlet, kültür şeklindeki sınıflandırmaların hepsini aynı çatı altında toplamayı amaçlayan şemsiye bir kavram olarak ele alındığını görürüz.

### **QUEER SİNEMA?**

1990'lı yılların başında ABD'de "Yeni Queer Sinema" akımı sözünü ettiğimiz gibi tamamen stratejik ve politik sebeplerle var olmaya başlar. Bir zamanlar eşcinselleri aşağılarken bu gün sinemada yarattığı imgelerle eşcinselin hikâyesine odaklanır. Eşcinselliğin konu edildiği ilk film *The Gay Brothers* diğer adıyla Dickson Deneysel Ses Filmi, (Gey Kardeşler, William Kennedy Dickson, 1895) filmidir. Filmde 17 saniye boyunca yalnızca keman eşliğinde vals yapan iki genç erkek görünür. Eşcinselliği konu eden bir diğer önemli film *Diğerlerinden Farklı* (*Anders Als Die Anderen*, Richard Oswald, 1919) filmidir. Film, seyirciler tarafından oldukça sarsıcı bulunur. Konusu sebebiyle itirazlara maruz kalmasına karşın Almanya'da gişe rekorları kırarak ve seks filmi olma özelliğiyle dönemin furyasını oldukça etkilemiştir. Oswald, eşcinsel algısına meydan okumuş olsa dahi film de eşcinsel karaktere iyi bir son yazmaz ve karakter finalde intihar eder. Ulusay: Birkaç temsil dışında, filmlerde eşcinsel karakterlerin çoğunun, öldürüldüğü ya da intihar ettiği veyahut başkalarına zarar veren kişiler olarak tasvir edildiğini söyler. (Ulusay, 2011) Queer Sinemanın köklü bir geçmişinin olmayışı Ana Akım sinemanın patriarkal düzene olan bağlılığıdır. Ana Akım Sinema, tercihlerini toplumsal faydalar üzerine kurar. Çünkü neyin nasıl ve kimin yararına gerçekleşeceğine dair izlediği yol sayesinde kitle kazanır. Sinema her ne kadar bir eğlence aracı, haz verici veyahut bir zaman etkinliği olsa da toplumun yansımasıdır ve sorumlu bir amaç edinir. Bu sebeple eşcinsel birey bu muhalif sinemanın kırmızıçizgisidir ve bu sebeple tarih boyunca öteki olarak atfedilir. Fakat Queer Sinema iyi bir izler kitle kazanınca bugün festivallerin gözdesi haline gelmiş aynı zamanda bağımsız sinema içerisinde büyük ses uyandıran bir türe dönüşmüştür.

1940'lı ve 50'li yıllar sansürün etkisiyle eşcinsel bireylerin filmlerde gizli anlamlar altında yaratıldığı dönem olur. 50'lilerin sonunda filmlerde karşımıza sık sık homofobi çıkar. 60'lar da ise yetişkin konularının perdeye aktarılması ve buna bağlı olarak eşcinselinde ele alınmasına izin verilmesi eşcinsel karakterlerin olumsuz tasvir edilmesinin önüne geçemez. Buna en iyi örneği *Psycho* (Sapık, Alfred Hitchcock 1960) filmini göstermek yanlış olmaz. Yüksek ihtimalle sinemada gördüğünüz bu tip eşcinseller patolojik rahatsızlığı olan, sapkın, sapık, gülünç ya da uzak durulması gereken temsillerdir. *Psycho* filminde bir Motel sahibi olan Norman Bates, annesinin kıyafetlerini giyen kişilik bozukluğuna sahip bir katildir. Kuzuların Sessizliğinde ise Buffalo Bill karakteri kendini kadın zanneden ve onların kıyafetlerini giyen bir seri katildir. Bu bağlamda modern toplumlara rağmen eşcinsel temsiller sinema için oldukça yeni ve alışılmıştın dışındadır. Çünkü muhalif sinema toplumda ikincil konumda olan eşcinsel bireyin müdahale edilmesi gereken bir cinsel tercih olduğu kanısındadır. Eşcinsel birey aile, üreme, kültürel kodlara ve kadın ve erkek fitratına ters düştüğü müddetçe ötekidir. Eşcinsel bireyi beyaz perdeye aktarmak yalnızca ötekinin bakış açısıyla mümkündür. "Ancak 1960'lar, aynı zamanda, eşcinselliğin bir insan hakları konusu olduğuna ilişkin farkındalığın da artmaya başladığı yıllardır." (Ulusay, 2011, s. 5) "Durumun bu şekilde anlaşılmasında, şüphesiz, 1960'ların sonuna doğru ABD ve Avrupa ülkelerinde öğrencilerin, kadınların ve siyahların sürdürdükleri özgürlük, eşitlik ve demokrasi mücadelesinin büyük katkısı bulunmaktadır." (Ulusay, 2011, s. 5) 28 Haziran 1969'da Amerikan'ın New York eyaletinde Stonewall Inn adında bir bara polis baskını gerçekleşir. Bu baskının gerçekleşmesinin hemen ardından eşcinsel harekâtları ve bir dizi direniş eylemleri başlar. Stonewall ayaklanması olarak bilinen bu olay eşcinsel mücadelesinin başlangıcı olarak bilinir. Türkiye de 1962 yılında Aydın Arakon'un yönettiği "*Ver Elini İstanbul*" ilk Lezbiyen film örneği olarak karşımıza çıkar. Filmde Leyla Sayar ve Mualla Kavrur'un öpüşmesi Sansür Kurumu tarafından yayınlanması uygun bulunsa da sonrasında kaldırılır. 1960'lı yıllar Türk Sinemasında birçok LGBT temalı filmin yayınlandığı dönem olur. Fakat çoğunluğu seks filmleri olarak adlandırılır. 70'ler döneminin sineması eşcinsellerin hem olumsuz kalıplardan çıkarıldığı hem de hala geçmişte ki tiplerinin devam ettiği bir dönem olur. Bu dönemde *queer* sinemanın önemli isimlerinden biri olan ve ulus, ırk, sınıf, göçmenlik ve eşcinsellik gibi konuları tartışan Alman yönetmen Rainer Werner Fassbinder karşımıza çıkar. "Fassbinder, 40'ın üzerinde film yapmış ve eşcinsellikle ilgili ilk olarak *Fox ve Arkadaşları'nı* (*Faustrecht der Freiheit*, 1975) filminin çekmiştir." (Ulusay, 2011, s. 6) Devamında Britanyalı yönetmen Derek Jarman, İspanyol yönetmen Pedro Almodovar queeri temsil eden birçok filme imza atmışlardır. Türk Sinemasında 70'ler transların gizlice gösterildikleri bir dönem olur. 50-80'li yıllar arasında lezbiyen aşk veya erotik sahneler açık bir şekilde sergilenmese de iyi bir izleyicinin sezebileceği kapalılıkta

gösterilir.1980'ler *queer*'in AIDS sorunuyla karşı karşıya olduğu önemli bir dönemdir. Homofobi toplumda öyle köklü bir hale gelir ki AIDS'in eşcinsel ilişkiden bulaştığına dair bir inanış başlar. İlk kez 1981 yılında ortaya çıkan bu hastalık milyonlarca insanın ölümüyle sonuçlanır. Queer Sinemanın gelişimindeki en sarsıcı faktör budur. Böylece 80'ler dönemin filmlerine de konu olur. Burada ölüme meydan okuyan pek çok queer filme rastlamak mümkündür. Örneğin, *Zero Patience* (Sıfır Sabır, John Greyson, 1993) adlı Kanada yapımı film, bu hastalığa yakalanan bir pilotun hikâyesini konu eder. Tüm bunlara rağmen 80'ler queer için hala tartışmalı bir konumdadır. Eşcinsel için kriz hala devam etmektedir. Türkiye de eşcinsel karakterler uzun bir süre lezbiyenler üzerinden işlenir. Erkek eşcinselliği içeren filmler lezbiyen filmlere oranla daha az ve geç çevrilir.90'lar Queer'in mücadelesinin daha görünür olduğu ve karşılığını aldığı yıllar olur. Her ne kadar önemli yapımlar da olumsuz temsiller yaratılmaya devam etse de öteki olduğu gerçeği sık sık seyirciye dikte edilir. Böylece izler kitle de farkındalık sağlanması amaçlanır. Örneğin *Ve Orkestra Çalmaya Devam Ediyor* (1993) filminde AIDS virüsünün ortaya çıktığı yılları ve bu hastalığın bir gey laneti olduğuna ilişkin bilim ve politika arasındaki tartışma konu edinir. Nihayetinde filmde verilmek istenen mesaj öteki olunma ihtimalinin kaçılmaz olabileceğidir. Böylece izler kitlenin yalnızca yargılayan değil, önyargılarını birer empatiye dönüştürmesi amaçlanır. Eşcinsel harekâtın bir başlangıcı olarak bilinen Stonewall Ayaklanması 1995 yapımı Stonewall adlı komedi-dram filmine uyarlanır. Amaç yine eşcinselin vermiş olduğu mücadeleyi sinema aracıyla dile getirmektir. 1991 ve 1992 yıllarında Sundance Film Festivali'nde gösterilen *Paris Is Burning* (Jennie Livingston), *Poison* (Todd Hayness), *Swoon* (Tom Kalin) gibi filmler ötekinin hikâyesini işlemesi sebebiyle dikkat çeker. AIDS'in etkisi, homofobinin politik bir mesele haline gelmesi artık yalnızca aktivistlerin değil sinemanın da bir sorunudur. Türkiye'de 90'larda *Düş Gezginleri*(1992), *Dönersen Islık Çal* (1992), Atif Yılmaz'ın yönettiği *Gece, Melek ve Bizim Çocuklar* (1993) Kutlu Ataman, *Lola and Bilidikid* (1998) ve Atilla İlhan'ın yazdığı *Sokaktaki Adam* (1995) filmleri çekilir. Tüm bu yapımlar içinde queer birey açıkça gösterilmese de hissettirilir.“Yeni Queer Sinema” 1992 yılında Amerikalı akademisyen B.Ruby Rich'in *Sight&Sound* dergisinde yayınladığı bir makale sayesinde görünür olur ve pek çok akademisyen tarafından kullanılmaya başlar. Artık bu sinema bağımsız gey ve lezbiyen film ve videoları için bir prestijdir. Paul Verhoeven'in *Temel İçgüdü* (1992) ve Derek Jarman'ın *Edward II* (1991) filmleri New York'ta gösterime girmesinin üzerine Prestijli Yeni Yönetmenler/Yeni Filmler Festivali birkaç gün içinde dört yeni "queer" filmin gösterisini yapar. San Francisco Gay ve Lezbiyen Film Festivali on altı yıllık tarihindeki en başarılı yılını geçirir; katılım 1991'den bu yana iki katına çıkar. Fakat tüm bunlara rağmen filmler festivaller dışında dağıtım şansı bulamaz. “Bu dönemde, özellikle sağ kanat politikacıların queer filmlere yönelttiği baskıcı tutum da bir şekilde filmlerin

duyulmasına katkı sağlıyordu. Böylece özellikle film festivalleri üzerinde yoğunlaşan ve hem türü hem de izleyicileri, dağıtımçıları ve mekânları kapsayan bir sektör meydana gelmişti.” (Candemir, 2016, s. 54) *Bugün Queer* kuramın sınırlı bir kavrayışa meydan okuduğunu söylemek yanlış olmaz. Kuram yalnızca cinsel kimlikleri değil bunu kategorize eden sınırlayan tüm kimliklere karşı çıkar. Dönemin önemli filmleri şöyleydi Mulholland Çıkmazı (2001) *Blue is the Warmest Colour* (Mavi En Sıcak Renktir, 2013), *Pride* (2014), *Moonlight* (2015), *The Holding Man* (2015). *Carol* (2015), *Call Me By Your Name* (Beni Adınla Çağır, 2017), *Portrait of a Lady on Fire* (Alev Almış Bir Kızın Portresi 2019) ve *Your Name Engraved Herein* (Adın Buraya Kazınmış, 2020) gibi olumlu temsillerin olduğu filmlerdir. Fakat tüm bu yapımlar aynı zamanda eşcinselin hali hazırda ötekileştirildiği dünyada acı çektiği ve mücadele ettiği melodram ve biyografik filmlerdir. Türkiye ‘de 2000 sonrasında *İki Genç Kız* (Kutluğ Ataman, 2005) *Yaşamın Kıyısında* (Fatih Akın, 2007), *Zenne* (Binay, Alper 2008) *Güneşi Gördüm* (Mahsun Kırmızıgül, 2009), *Nar* (Ümit Ünal, 2011) ve *Şahane Misafir* (Ferzan Özpetek, 2012) filmleri dışında çok fazla örnek yoktur. Bu filmlerde ise eşcinseller yine heteronormative dünyanın kurbanlarıdır. Ayrıca çoğu için Queer film örnekleri olduğunu söylemek güçtür.

### **ÖTEKİLEŞTİRME**

Kavramsal bağlamda öteki, sözü edilenden ayrı, öbürü, bilinenden uzak gibi anlamların karşılığıdır. Bu sebeple insanın varlık gösterdiği tüm tarihsel süreçlerde pek çok farklı sebepten ötekiye rastlanır. Örneğin Siyahiler, Yahudiler, kadınlar, eşcinseller, çingeneler, göçmenler, mülteciler gibi. Kendilerini bir şekilde kategorize eden insanlar belli bir gruba ait hissetmekten güven duyarlar. Çünkü bu parçası olduğu grupla özdeşleşmek tatmin edicidir. Öteki olmak özellikle modern toplumlarda birer sorun olarak nitelendirilir. Öteki demek kendinden olmayana, aşağı olanı tasnif eder ve sosyal dışlanma, dışarı da kalma, çoğunluk olamama hissi kişi de birer öteki algısı oluşturur. Bu bağlamda ötekiye olan ihtiyaç bireyin kendi kimliğini inşa etmesine katkıda bulunur. Kimlik “kim” sözcüğünden türeyen aidiyeti, aynı olmayı veyahut kim olduğuna, nereye ait olduğuna ilişkin olan soruların cevabıdır. Ayriyeten kimlik, bir toplumda insanlar veya gruplar arasında ki farklı olanı yaratan temel değişkenlerden biridir. Çünkü 'öteki'nin farkı olmadan kimliğin çok az anlamı vardır. Bu sebeple ötekiye olan ilgi ve motivasyonun yüzyıllarca vazgeçilebilecek bir yönelim olmadığı aksine bir takım grupların kendi kimlikleri için önemli olduğunu söylemek yanlış olmaz. Bu noktada öteki’den söz ederken temel problemin “ben” ve “biz” kutuplaşması olduğu görülür. Biz olan önceden formüle edilmiş konular, kişinin doğduğu toplumun ilkeleri, insanın inanç ve yargılarının belli bir grupla tutarlı olması gibi öteki olanın belirli olduğu gruptur. “Ben” ise biz’in yarattığı bu evrenin dışında kalan, farklı olan ve bilinmezliğiyle biz için tehdit oluşturan gruptur.

Biz olma duygusu zaman içinde kişinin bilinç dışı taraf olma motivasyonunu geliştirir. Bu sebeple “biz” olanın kendi anlayışlarının dışında kalan birey ve grupları ötekileştirerek, yok sayma, dışlama, yaşamsal haklarına müdahale etme, nefret söylemleri ve suçlarına uzanan istenmeyen tutum ve davranışları geliştirdiklerini ifade etmek mümkündür. Derrida; “Ancak ötekinin bizim kurallarımıza, yaşam tarzımıza, hatta dilimize, kültürümüze, siyasal sistemimize vb uyması koşuluyla konukseverlik gösteririz.” der. (Borradori, 2003, s. 160). Fakat yine Derrida’nın kendisi şöyle der: “Saf ve koşulsuz konukseverlik, konukseverliğin *kendisi*, ne beklenen ne de davet edilen, mutlak anlamda yabancı bir *konuk* olarak, yeni *gelen* olarak ulaşan herkese, tanımlanamaz ve öngörülemeyen olana, kısacası bütünüyle öteki olana kapıların açılmasıdır.” (Borradori, 2003, s. 160) Kimlik olgusu politik, ekonomik, etnik ve kültürel sebeplerle oluşmaya devam eder. Bir diğeri ise biyolojik sebeplerdir. Bununla birlikte ötekileştirme başladığında cinsel kimlik tartışmalarını görmezden gelmek mümkün değildir.

### **3.1 Cinsel Kimlik**

Cinsel kimlik, bireyin biyolojik olarak kendisinin kız ya da erkek cinsiyetinden hangisi olduğunu anlaması ve bununla özdeşleştiğini hissetmesidir. Bireyler doğduğu andan itibaren 2-3 yaşlarına kadar cinselliğin ne olduğuna ilişkin fikir geliştiremezler. 3 yaşından sonra çocuğun kendi cinsel kimliğine dair anlamlar aradığı ve keşfettiği yaşlar olur. Fakat cinsel yönelimin hangi yaşlarda başladığı bilinmez. (Özsungur, 2010) Cinsel yönelim, kişinin duyguları ve arzularıyla hangi cinsiyete ilgi duyduğu ile alakalıdır. Freud’un psiko-seksüel kuramında fallik dönem (3-6 yaş) ile birlikte bireyler cinsiyet farklılıklarının ve vücudundaki haz bölgelerini keşfeder. Latent/Gizil (6-12 yaş) ve Genital(12-18 yaş) dönemde ise libido etkilerinin görüldüğü ve bireyin cinselliğe dair ilgi ve motivasyonunun giderek arttığı görülür. (Celiloğlu, 2022) Tüm bu dönemler içerisinde bireyin doğru cinsel eğitim alması cinsel yönelimi için oldukça önemlidir. Bu eğitim neticesinde birey kendini bedenini tanıır. Kendi cinsel kimliğine veyahut başkalarının cinsel kimliklerine dair davranış tutumlarını geliştirir. Fakat günümüz toplumunda cinselliğin ne olduğuna ilişkin konuşmak zordur. Toplumlar cinsellik üzerine konuşmayı genellikle ayıp olarak görür. Bir ebeveynin çocuğu ile bu konu hakkında konuşmaması ya da konuşulduğu takdir de suçluluk hissi uyandırması da beraberinde gelir. Fakat cinsellik, ilişki kurmanın dinamiklerinden biri olmaya devam ettiği müddetçe görünmez olması mümkün değildir. Toplumlar yalnızca iki cinsel kimlik üzerinden cinsiyetleri sınırlar. Bu sebeple kadın ve erkekte giyim, görünüş, davranış ve beden özelliklerinin dışavurumunu dair uygunluk bekler. Cinsel kimlikleri bu şekilde belirginleştirmek ve nesneleştirmek toplumun dinamiklerinden biridir. Bunun dışında ki çeşitli cinsel kimliklerden olan: gey, lezbiyen, biseksüel, transları ayrıştırmaya yönelir. Bu tarz farklı cinsel kimliklerin toplumdan

ayrışması ve ötekileştirilmesi yeni bir olgu değildir. Cinselliği üreme odaklı konumlandırılan toplumlar görece kadın ve erkek arasındaki ilişki dışındaki birliktelikleri meşru kılmaz. Bireyden buna ilişkin birliktelikler kurmasını bekler. Bunun dışındaki ilişkileri doğal ve yahut normal kabul etmez. Farklı cinsel kimliklere ilişkin toplumun bu tutumu cinsel kimlik temelli nefret söylemini ve homofobiyi beraberinde getirir.

### **3.2 Homofobik “Öteki”**

“Fobi” sözcüğü bugün belirli nesnelere ya da durumlar karşısında duyulan, kaygı, endişe veyahut tehdit oluşturmayan şeylere karşı abartı boyutunda ki korkuya verilen addır. “Homo” eş, benzer, denk anlamlarında kullanılagelen bir önek olduğu için, ne ile ilgili bir korkunun ifadesi olduğunu anlamak kolay değildir.” (Başar, Homofobi, 2013) “Homofobi” 1960’larda ilk kullanıldığında eşcinsellerin (homoseksüellerin) yakınında, çevresinde bulunmayla ilgili korkuyu ifade etmek için, yine bu korkuyu duyan kişiler tarafından ortaya atılmıştır.” (Başar, Homofobi, 2013, s. 60) Fakat bugün kavramın eşcinsel bireyden korkmaktan çok onu aşağıya çeken, ötekileştiren hatta tikslenme, nefret gibi eylemleri doğuran bir kavrama tekabül ettiğini söylemek yanlış olmaz. İnsanlık tarihi boyunca bireyler kendi cinsiyetinden insanlara karşı bir yakınlık duymuş veyahut duygular beslemiştir. Fakat çoğunluğun heteroseksüel olduğu bu toplumda bu yakınlık kabul görülmemiştir. 17 Mayıs 1990 yılında eşcinsellik bilim içerisinde normal kabul edilmesine karşın politika ve din içerisinde tartışmalara sebebiyet vermeye devam etmiştir. Çünkü toplum bugün hala kendi değerler sisteminin dışına çıkan bu bireyleri kabul etmeme konusunda ısrarcıdır. Bu nedenle eşcinsellik heteronormative hayatın günlük pratiklerinden biri olamamış aksine toplumun homofobik söylemlerine maruz kalmıştır. Heteroseksüel düşünce dünyasında eşcinselliğin sağlıksız ve insan doğasına aykırı olduğu savının öne sürülmesi özellikle aile gibi önemli bir kurumun korunmasına yönelik bir önlemdir. Siyasi otorite bugün ahlaki değerleri koruma ideolojisiyle oluşturduğu yasalarla, otoritesini de kullanarak eşcinseli sistem içerisinde bastırır. Nitekim üremeye yönelik olmayan bu cinsel yönelimin toplumun düzenini bozacağına dair bir gerekçe sunulur. Tek tipleştirme, çoğunluk olamama, cinselliği kurallara bağlama, çekirdek aile kurma, tüm bunlar toplumun alışmış olduğu düzendir. Bu sebeple homofobik tutumlar, azınlık olanı dışlama ve ötekileştirme misyonuna bireye doğar doğmaz bahşeder. Bugün tek tanrılı dinlere baktığımızda eşcinsel bireyin günahkâr olduğu vurgulanır. Çünkü yaratana karşı kadın ve erkek fitratının dışına çıkan bu cinsel tercihlerin birer başkaldırı, düzeni bozan bir olgu olduğu görüşü hâkimdir. Bazı Asya ve Avrupa ülkeleri eşcinselliği uluslararası haklara sahip, normal görülen ve evliliklerinin yasallaştığı konumlara kadar yükseltmiştir. Fakat pek çok ülke bu haklar bir yana eşcinselliği idamla

cezalandırmaya, günahkâr ilan etmeye devam etmiştir. Küreselleşmeyle birlikte kültürel değerlerin yavaş yavaş aşınmaya başladığı bu yüzyılda bile eşcinsellik henüz meşru değildir.

### **FİLMİN ÇÖZÜMLEMESİ**

Bu çalışma kapsamında, Patrick Huang Hui-Liu'nin Tayvan yapımı "Your Name Engraved Herein" filmi, ötekileştirme olgusuyla bağlantılı olarak ve nitel içerik analizi yöntemiyle ele alınmaktadır. İçerik analizi yöntemi sosyal gerçekliğin içinde gizli kalanın keşfedilmesi ve yeniden yorumlanmasını içeren bir tekniktir. Araştırma da amaç incelenen materyalde ötekileştirmeye dair sosyal yapıya ait çıkarımlarda bulunmaktadır. İncelenen filmde göstergeler ve metinsel anlatımların ötekileştirme kavramıyla bağlantılı olan eşcinsel imgesini nasıl işlendiğine odaklanılmıştır. Tematik olarak filmdeki ötekiler, ötekileştirme, eşcinsellik, homofobi, toplum gibi kavramlar incelenip metinsel bağlamda açıklanmıştır.

#### **4.1. Filmin Künyesi ve Konusu:**

Yönetmen: Patrick Kuang Hui-Liu

Yapımcı: Yu Ning Chu, Danielle Yen, Liu Zhi-Syuan

Senarist: Yu Ning Chu, Jie Zhan, Alcatel Wu

Müzik: Chris Hou, Jason Huang

Türü: Tarih, Dram, Romantik

Yapım Yılı: 2020

Gösterim Süresi: 114 Dakika

#### **Konusu:**

Film, 14 Temmuz 1987 yılında sıkı rejimin kaldırıldığı fakat etkisinin hala sürdüğü 1988 yılında, Katolik lisesinde okuyan iki genç erkeğin aşkını anlatır. Yönetmenin ilk uzun metrajlı ve Tayvan'ın ilk LGBT temalı filmi olma özelliğine de sahiptir. Ayriyeten Tayvan, Asya'nın ilk LGBT evliliğini resmileştiren ve Asya tarihinin 100 milyon gişesiyle en yüksek hasılatını yapan ülkedir. Tayvan'da arka arkaya diktatörlüğün olduğu insanların özgürlüklerinin kısıtlandığı, hükümet karşıtı protestoların başladığı ve propaganda medyasının ürettiği her şeyin engellendiği ve hükümetin muhalefeti bastırmaya başladığı bir dönem söz konusudur. Bu dönem Beyaz Terör Katliam'ının başlangıcı olan 1947 yılında birçok Tayvanlının ölmesiyle sonuçlanan, halkın ayaklanmasıyla bağımsızlık hareketini bastırabilmek için hükümetin, 1949-1987 yıllarında işleyen sıkıyönetimi ilan ettiği dönemdir. Fakat 1987 yılında sıkıyönetim kaldırılması siyasal ve devrim sonrası karışıklıkların ortaya çıkmasına sebep olur. Yönetmen tam da bu tarihi Tayvan atmosferinde Erkek Katolik Lisesinde olan Jia-Han (Edward Chen) ve Wang-Po Te (Birdy) (Jing-Hua Tseng) aşkını işlemeye başlar. Başkarakterlerden biri olan Chang Jia-Han Katolik bir aile ve despot bir babayla yetiştirilen bir gençtir. Hayali müzisyen

olmaktır. Abisinin başarısının gölgesinde “kaybedenler için olan” sosyal bilgiler bölümünü seçtiği için evde küçük düşürülür. Wang Po-te (Birdy) karakterimiz askeri geçmişi olan bir babanın 4 kızından tek erkek çocuktur. Ayriyeten Birdy’nin diyaloglarından da anlaşılacağı üzere babası tarafından sıklıkla hor görülür. Homofobinin kol gezdiği, ötekinin sosyal yapının her yerinde yaratıldığı bu çağda eşcinsel olmak zor bir seçimdir. Hikâyede Peder Oliver (Fabio Grangeon) üçüncü bir ana karakter olarak karşımıza çıkar. Eşcinsel kimliğini reddeden, kendini Tanrı’ya adayan ve erkek lisesinde öğrencilere birçok derste liderlik eden bir temsildir.

#### **4.2. “Ötekileştirme” Üzerine Filmin İçerik Analizi**

Filmde neredeyse birçok sahne de bize ötekinin kim olduğu söylenir. Açılış sekansında Peder ve Jia-Han’ın arasındaki bir konuşma da Peder, Jia-Han’ın yaralı suratına bakar ve –bir kız yüzünden kavga ettiğini düşünerek- “Kız hangi sınıfta?” diye sorar. Daha ilk sahneyle birlikte eşcinsel bireyin ne kadar görünür –öteki- olduğu tartışması başlar. Filmde bahis edildiği gibi eşcinselliğin cinsiyet rolleri arasında normal sayılması henüz mümkün değildir. Bu sebeple eşcinsel olmak toplumun alışık olmadığı ve müstehcen gördüğü bir anormalliktir. Haneke; "İster cinsellik, ister şiddetle ya da başka bir tabuyla alakalı olsun, normu bozan her şey müstehcendir. “ der (Savaş, 2019, s. 26) Böylece müstehcen demek, toplum tarafından dayatılan, belletilen, öğretilen normların dışında kalan her şey demektir. Toplumun %90’ının heteroseksüel olduğu düşünüldüğünde azınlıkta olan eşcinsellerin öteki olması bu noktada kaçınılmazdır. İlk sekanslarda heteroseksüel olan Horn karakterinin arkadaşlarıyla birlikte gey olan Xie Zhen’in zorbalık yaptığı görülür. Şiddetin alenen gösterildiği bu sahnede homofobik söylemler karakterlerin ağızından dökülür. Horn, elindeki çakmakla Xie Zhen’in cinsel organını yakmak ister ve ondan uzak durulması gerektiğini, hastalıklı olduğunu, onlara bulaştırabileceğini söyler. Bu sahne, AIDS’in 1980’lerde yarattığı etkiye bir atıftır ve eşcinselin ötekileştirilmesinde gerekçelerinden biri olarak karşımıza çıkar. Horn’un ”Onu direğe geçirelim” cümlesi ise Katolik inancındaki çarpmıha germe düşüncesiyle özdeşleşen eşcinselin günahkâr olduğu vurgusudur. Horn’un öğrenilmiş zorbalığı ile birlikte heteronormative dünya da eşcinselin ötekileştirilmesinin adeta bir norma dönüştüğünü söylemek yanlış olmaz. Anlaşıldığı üzere eşcinsellik hem kadın ve erkek fitratına, hem dini olgular için uygunsuz ve öteki olandır. Heteroseksüel kimliklerin homoseksüel kimliklere karşı tutunduğu bu tavır homofobinin sürdürülmesine de katkı sağlamıştır. Jia-Han’ın şahit olduğu bu tavırlar şüphe ve korkuyu beraberinden getirir ve nihayetinde karakterde kimlik kaygısı oluşmaya başlar. İlerleyen sekanslarda öteki olmanın daha da zorlaştığı anlarda Jia-Han’ın kimlik kavgası yerini aşka bırakır. Artık eşcinsel olmak Jia-Han için öteki olmaktan daha kolaydır. Birdy ise güvenli alandan çıkmama konusunda ısrarcıdır. Jia-Han’ı koruduğunu düşünerek bir kızla ilgilenmeye başlar. Toplumun dayattığı yaşamı

tercih ederek 33 yıllık bir pişmanlığın içine sürükleneceğinden habersizdir. Dahası eşcinsel kimliğini reddeden, böyle davranarak düzenin parçası olmayı sevgiden daha cesurca gören bir karaktere dönüşür. Böylece yönetmen, toplumun genç bir çocuğu “öteki terörü” altında gerçeği yaşamaktan nasıl alıkoyduğunu gözler önüne sermiştir. Bir video stüdyosunda ikili, Birdy filmi izlerler. Jia-han Birdy’i öpmek için eğildiğinde oda servisi onları camdan gözlemler. Eşcinselin sık sık gözlemlenmesi ve bunun suç olduğuna ilişkin argümanların sıklıkla söylenmesi adeta toplumun eşcinseller üzerindeki tahakkümünü gözler önüne serer. Bu baskı her yapının içinde belirgindir. Kimi zaman bir arkadaş, aile, okul müdürü ve çoğunlukla dindir. Filmde izleyiciye ötekinin kim olduğu ve neden olduğuna ilişkin pek çok sahne verilir. Amaç eşcinsel ilişkiye dair farklı bir perspektiften alternatifler sunmaktır. Film ile birlikte eşcinselliğin niçin ötekileştirildiği sorusu şöyle cevap bulur. Muhafif toplumlar din, aile, kültür, ulusal değerler gibi toplumsal normları bozan her türlü eyleme karşıdır. Çünkü amaç var olanı korumak ve sürdürmektir. Normu bozduğu iddiasıyla bu noktada eşcinselin öteki olması da kaçınılmazdır. Üreme odaklı olmayan, yalnızca haz merkezli ilişkilerin meşru kılınması hiçbir toplumda kabul görülmemiştir. Özellikle Hristiyanlık, Yahudilik, Müslümanlık gibi tek tanrılı inançlar da eşcinsel olmak günahkâr olmaktadır. Çünkü beden eğer böyle yaratılmış ise bedene yapılan tüm müdahale tanrıya karşı bir başkaldırıdır. Bu sebeple eşcinselin tanrıyla arasının açık olduğu inancı baskın görülmüştür. Fakat yönetmen, her sahnesinden dua eden, tanrıya inandığını ve onu sevdiğini söyleyen queer-tanrı ilişkisini daha da güçlendirip yeni bir bakış açısı yaratmaya çalışır. Zhen Xie ve Jia-Han’ın konuştuğu bir sekansta arka fonda güvercin sembolü bir cam vardır. “Güvercin Katolik inancında saflığı, barışı, yeniden doğuşu ve kutsal ruhu ifade eder.” (Alp, 2015, s. 202) “Ahit’te ki bu hikâyede güvercin Tanrı’nın insanlarla barış yaptığını ve yeni başlayacak hayatı haber veren bir görev üstlendiğini belirtmiştir.” (Alp, 2015, s. 202) Yönetmen bu kadraj da göstergelerle iki eşcinsel karakterin saflığını ve yeni bir başlangıç yapmak istediklerini vurgulamıştır. Toplumun eşcinseli ötekileştirme gayretine karşı yeni alternatifler sunmuştur. Din ile alakalı başka bir sekansta Jia-han ve Pederin sohbet etkileri bir mekânın kutsal tablolar ve tanrıyla örülü olduğu görülür. Yüzleri İsa’ya dönük olan karakterlerimizle Yönetmen queer-tanrı ilişkisini göstergelerle derinleştirerek burada eşcinselin günahkâr olmadığını, inançla yüzünü Tanrı’ya dönebileceğini yeniden hatırlatır. Bunu filmin pek çok sahnesinde yapar. Yapar ki seyirci alenen eşcinsellikle ilgili olan tüm kalıplarına alternatif cevaplar bulabilmiş olsun. Peder ve Jia-Han’ın arasındaki diyaloglarda da bunu vurgulamaya devam eder. Jia-Han; “Tanrı: İstersen elde edersin. Arayan bulur. Kapılar, ona çalana açılır. dedi. Kapıyı son gücümle çalıyorum. Neden duymuyor? “ diye karaktere soru sordurarak seyircinin kafasındaki soruları da cevaplar. Yönetmen, eşcinselin öteki olma sorununa her perspektiften bakarak çözüme ulaştırmayı amaçlar.

Tarih boyunca eşcinsel ilişkinin sorun olduğu diğer bir yer aile kurumudur. Ataerkil sistem de ebeveynlerin erkek çocuklardan bekledikleri, iyi, ahlaklı, gerçek bir mesleği olan ve evlenip çocuk sahibi olmalarıdır. Kadın ve erkek birlikteliğinin aile kavramı için ideal olduğu görüşü bu bağlamda kabul edilir. Buna değinmek isteyecek olmalı ki yönetmen “Aile varsa çocuk olmalıdır.”, “Normal olan heteroseksüel ilişkidir” gibi söylemlerle konuyu gün yüzüne çıkarır. Böylece karşı bir söylem yaratarak da üreme üzerine yapılan bir konuşma da dünya nüfusunun yeterince arttığını, büyüyünce çocuk yapmak istemediklerini iki karakterimize söyler. Başka bir sahne de Jia-Han’ın babasıyla tartışması üzerine annesiyle yaptığı konuşma da eşcinselin aile kavramına olan bakışının altını çizer. Jia-Han annesine babasıyla neden evlendiğini sorduğunda aşk için cevabını alamaz ve böylece neden üremek amaçlı birlikte olduklarını anlayamadığını söyler.

Olumlu eşcinsel temsili mümkün müdür sorusunu sorduğumuzda karşımıza üç ana karakterimiz çıkar. Jia-Han yalnızca aşkının karşılığını almak isteyen, eşcinsel olduğunu kabul etse dahi sık sık tanrıya dua eden bir gençtir. Wang-Po-Te karakteri asi, haylaz ve umursamaz görünse de, eğlenceli, düşünceli ve cesurdur. Peder Oliver saygılı bir din adamı ve yol göstericidir. Finalde onunda eşcinsel olduğu görülür. Yönetmen böyle olumlu ve ahlaklı eşcinsel temsiller yaratarak seyircinin öteki anlayışını sorgular ve soyut bir yüzleşme gerçekleştirir. Olumlu eşcinsel temsiller mümkün müdür sorusuna ise iki genç karakterimizin, dönemin Devlet Başkan’ının ölümü için çıktıkları gezide “Evlilik insan hakkıdır. Eşcinsellik hastalık değildir.” tabelası taşıyan bir erkek aktivisti göstererek cevaplar. Aktivist, 1986’dan beri ulusal televizyon yayımlarında Tayvan’da ilk eşcinsel haklarını savunan Chi Chia-Wei’nin bir tasviridir. Yönetmen böyle önemli ve gerçek bir karakteri es geçmeyerek tarihe yine saygı duruşunda bulunur ve film boyunca yalnızca queer bireyin öteki sorununu değil güçlü yanlarını da gösterir.

Sonuç olarak yönetmen, duyguların kasten soyutlaştırılmasının güç yanlarını göstererek gerçeğin eninde sonunda yaşanacağını somutlaştırır. Peder Oliver’in filmin sonunda aşığına geri dönmesi ise bunu kanıtlar niteliktedir. Karakterlerimiz 33 yıl birbirlerini göremedikleri bir ayrılıkla birlikte gerçeklerle yüzleşirler. Jia-han daha sonra Birdy’nin eski karısı ve çocuklarının annesi olan Ban Wu ile temasa geçer. Boşandıklarını, Birdy’nin gerçekte kim olduğunu asla kabul etmeyerek hayatlarını mahvettiği gerçeğini anlatır. Ban Wu’nun eşcinselliğin kişinin doğasında olduğunu kabul etmesi ve Jia-Han ile Birdy’nin karşılaştıkları barın önünde iki erkeğin arkada öpüşmesi ülkenin 33 yıl sonra “eşcinsel/öteki” olana bakışının ne denli değiştiğini gösterir. Final de Birdy’nin Jia-han’ı gerçekten sevdiğini rahatça söylemesi ve bunu kabul edemediğini itiraf etmesi ise dönem farkını gözler önüne serer. Patrick Kuang Hui-Liu her sahnesinde eşcinseli olumlarken onun güç yanlarını göstermeyi

ihmal de etmez. Ötekileştirmenin yalnızca cinsellik sorunuyla sınırlı olmadığı heteronormative düzende her türlü yapının içerisinde ötekiler yaratıldığına altını çizer.

### **SONUÇ**

Çalışmamızda kişilerin sosyal yaşamlarında neden ötekileştirmeye yöneldiği sorusu sorulmuştur. Ötekinin kim olduğuna, ötekileştirme pratiklerine, heteronormative dünyanın bu argümana neden ihtiyaç duyduğuna ilişkin görüşler analiz edilmiştir. Kimliğin inşasında ötekinin konumuna, queer kavramının ne olduğuna, öteki ve queer ilişkisine, *queer*'in tarih içerisindeki kavramsal değişimine, bir sinema akımı olarak karşımıza çıktığı sürece kadar olan kronolojik değişimine bakılmıştır. Queer kavramının uzun süre olumsuz anlamlarda kullanıldığı fakat sonrasında eşcinseller de dâhil olmak üzere öteki statüsüne düşürülmüş her kesim tarafından sahiplenildiği tespit edilmiştir. Queer Sinema da ilk temsillerden bu yana eşcinselliğin görece daha kabul edilebilir olduğuna fakat bugün henüz bir sorun olmaktan çıkamadığı kanaatine varılmıştır. Sinema içerisindeki yapımların heteroseksüel ilişkiye dair tutumlarının eşcinsel temsiller için çok yeni olduğu görüşü bu bağlamda kabul edilmiştir. İncelenen filmlerle de bu desteklenmiştir. Homofobik tutumların heteronormative dünyanın davranış kalıplarından biri olduğu kanaatine varılmış ayrıyeten toplumun kimlik edinme içgüdüleriyle ötekileştirmeyi birer ihtiyaca dönüştürdüğü de gözlemlenmiştir. Cinsel kimliklerin sınırlılıklarına müsaade edilmediği, görece erkek ve kadının kendisinden bedenen bekleneni yapması istenildiği analiz edilmiştir. Araştırmanın amacına uygun olarak Tayvan yapımı *Your Name Engraved Herein* (Adın Buraya Kazınmış, 2020) filmi seçilmiştir. Filmde eşcinselin maruz kaldığı ötekileştirme pratiklerine karşı alternatifler sunulmuş, öteki olmasına dair yeni bir bakış açısı kazandırılmaya çalışılmıştır. Yönetmen, seyircinin sevebileceği, empati kurabileceği hatta onlar için üzülebileceği olumlu eşcinsel temsiller yaratmış böylece eşcinselle olan ayrıştırıcı tutumlara karşı alternatifler sunmuştur. Sonuç olarak ötekiye dair tüm algıların değiştirilebileceğine, bugün eşcinsel bireyin cinsel yöneliminin hastalık ve ya haz merkezli olmadığına, kimlik edinme sürecindeki tüm sorunların çözümsüz olmayacağına ilişkin farklı bir bakış açısı kazandırılmaya çalışılmıştır. Eşcinselliğin meşrulaştırılması üzerinden argümanlar oluşturmaya çalışılmıştır.

**ÖZET**

Günümüzde insan odaklı pazarlama yaklaşımı beraberinde “sürdürülebilirlik” kavramını getirmiştir. Özellikle iklim değişikliği ile dünyadaki kaynakların tükenir hale gelmesi gelecek için endişeleri kayda değer şekilde artırmıştır. Bugün özellikle kaynakların sürdürülebilirliği konusunda işletmelerin stratejik eylem planlarında sürdürülebilirlik olsa da, bu yaşam kaynaklarının yok olmasında da işletmelerin duruma sebebiyet vermesi düşündürücü bir durum olarak değerlendirilmektedir. Özellikle daha çok tüketimi teşvik eden bir mekanizmanın “tüketmeme”, “az tüketim”, “ikinci el tüketim” ya da “yavaş tüketim” kavramlarını referans alması sürdürülebilirlik konusundaki yaklaşımlarına güvenin ve bu konudaki samimiyetlerinin tartışılmasına sebep olmaktadır. Tüketimin devamlılığının iş yaşantısı için önemli olduğu dikkate alındığında ise “lüks ürünlerin” tüketiminin devamlılığının kolayda ya da hızlı tüketim ürünlerinde olduğu kadar önemli olduğu görülmektedir. Özellikle Pandemi döneminde “ikinci el lüks” uygulamalarının görülmesi ise bu alanda sürdürülebilir çalışmaların yapılmasında öncülük etmiştir denilebilir. Diğer taraftan tüketim edimlerinde “sürdürülebilir uygulamalar” açısından hassas olan ve ayrıca “lüks ürünlere” karşı zaafı olan kuşakların görece olarak Y ve Z kuşağı olması dikkat çekmektedir. Demografik faktörlerden cinsiyet ve gelir durumu ise satın alma niyeti ve davranışı üzerinde etkili olan önemli iki faktördür. Bu kapsamda çalışmada Türkiye’deki Y ve Z kuşaklarını temsil eden tesadüfi olmayan örnekleme yöntemiyle seçilmiş 424 tüketicilere çevrimiçi anket yöntemi uygulanmış olup, çalışma sonucunda gelir durumuna göre tüketicilerin gelir durumu ile Marka Tercihleri Sürdürülebilirlik ve alt boyutları Ekonomik sürdürülebilirlik, Sosyal sürdürülebilirlik ve Çevresel sürdürülebilirlik, Satın alma Niyeti arasında anlamlı bir fark vardır. Ayrıca analiz sonucuna göre tüketicilerin cinsiyet durumu ile Marka Tercihleri Sürdürülebilirlik ve alt boyutları Ekonomik sürdürülebilirlik, Sosyal sürdürülebilirlik ve Çevresel sürdürülebilirlik, Satın alma Niyeti arasında da anlamlı bir fark olduğu görülmüştür.

**Anahtar Kelimeler:** Lüks Marka, Sürdürülebilirlik, Y ve Z Kuşağı, Tüketici Davranışı

<sup>1</sup> Sürdürülebilir Yeni Lüks Markaların Y ve Z Kuşaklarında Tüketici Algıları ve Satın Alma Niyetleri Üzerindeki Etkisi tez çalışmasından üretilmiştir.

**ANALYSIS OF THE IMPACT OF SUSTAINABLE NEW LUXURY BRANDS ON  
GENERATION Y AND Z'S PURCHASE INTENTIONS AND CONSUMER  
BEHAVIOR IN TERMS OF GENDER AND INCOME STATUS<sup>2</sup>**

**ABSTRACT**

The human-centered marketing approach of today has brought along the concept of "sustainability." Especially, concerns about the future have significantly increased with climate change and the depletion of resources worldwide. While sustainability is present in the strategic action plans of businesses, the role of businesses in the depletion of life resources is considered alarming. Particularly, when a mechanism that largely promotes consumption references concepts such as "non-consumption," "minimal consumption," "second-hand consumption," or "slow consumption," trust in sustainability approaches and the sincerity of businesses in this regard are questioned. Considering the importance of continuity of consumption for business life, it is seen that the continuity of consumption of "luxury products" is as crucial as in fast-moving consumer goods. Especially, the emergence of "second-hand luxury" practices during the pandemic period has led the way in sustainable practices in this field. On the other hand, the Y and Z generations, who are relatively sensitive to "sustainable practices" in consumption behaviors and also have a weakness for "luxury products," stand out. Gender and income status, among demographic factors, are two important factors that influence purchase intention and behavior. Within this scope, an online survey method was applied to 424 consumers selected through non-random sampling representing the Y and Z generations in Turkey. As a result of the study, it was found that there is a significant difference between consumers' income status and brand preferences, Sustainability, and its sub-dimensions Economic sustainability, Social sustainability, Environmental sustainability, and Purchase Intention. Furthermore, according to the analysis results, there is a significant difference between consumers' gender and brand preferences, Sustainability, and its sub-dimensions Economic sustainability, Social sustainability, Environmental sustainability, and Purchase Intention.

**Keywords:** Luxury brand, Sustainability, Generation Y and Z, Consumer Behavior

---

<sup>2</sup> The impact of Sustainable New Luxury Brands on Consumer Perceptions and Buying Intentions in the Y and Z Generations is based on a thesis.

## **GİRİŞ**

Bu çalışmada, sürdürülebilir yeni lüks markaların, Y ve Z kuşaklarının tüketici algıları ve satın alma niyetlerinin, cinsiyet ve gelir durumu bakımından etkisi araştırılmıştır. Öncelikle kavramsal çerçevede lüks marka, sürdürülebilirlik, Y ve Z kuşakları ve tüketici davranışı ve lüks markaların sürdürülebilirliği açıklanmış, diğer bölümlerde markaların satışlarını arttıran sürdürülebilirlik felsefesini benimseyip ya da benimsemeyen lüks markaların tüketici davranışlarına etkileri cinsiyet ve gelir durumu çerçevesinde incelenmiştir. Araştırmanın bu konuda sınırlı olması önemini arttırmaktadır.

## **LÜKS MARKA**

Lüks, genel olarak yüksek kaliteli, özel ve genellikle yüksek fiyat etiketine sahip olan ürünleri, deneyimleri veya hizmetleri ifade eder. Lüks mallar ve hizmetler, genellikle işçilik, tasarım, malzeme ve genel deneyim açısından standart karşıtlarına göre üstün olarak kabul edilir. Ayrıca, lüks ürünler genellikle sahiplerine özgünlük, nadirlik ve sahip oldukları statü ile karakterizedir. Lüks marka sınıflandırması ilk kez Alleres (1990) tarafından yapılmıştır. Alleres'e göre lüks marka sınıflandırması sosyo-ekonomik boyut perspektifinden, tüketicinin lüks markaya ulaşılabilirliği üzerinden açıklanmıştır. Şekil 1'de gösterilmektedir.

**Şekil 1: Lüks Marka Sınıflandırması**

**Kaynak:** Alleres, D. (1990). "Luxe - Strategies Marketing", *Economica*, 1(1).

Alleres'in piramidine göre, piramidin en alt tabanını oluşturan ulaşılabilir lüks kısmı (Seviye 3) orta sınıfın ulaşabileceği lüks ürünleri içermektedir. Bu grubun satın aldığı lüks ürünler, statülerini arttırmaktadır. Bir sonraki seviye olan Orta Lüks (Seviye 2), profesyonel sosyo-ekonomik sınıf tarafından elde edilebilen ürünleri içermektedir. En üst seviye olan ulaşılamayan

lüks ise, elit olarak nitelendirilen sosyo-ekonomik kesim tarafından alınabilen ürünleri içermektedir. Bu seviyedeki ürünler, çok yüksek fiyatlı olup, kullanıcılarına çok farklı bir sosyal prestij sağlamaktadır. Bu piramide göre lüks ürüne ulaşılabilirliğin derecesi, sosyal sınıf seviyesini yansıtmaktadır. “Lüks kavramı, şüphesiz yıllar içinde değişmektedir. Ekonomik ve teknolojik sebepler nedeniyle lüks artık çok daha farklı bir kavramı temsil ediyor. Özellikle son 10 yılda lüks kavramı kişiselleştirme ve deneyimle birlikte anılıyor. Kalite, işçilik, tasarım ve dayanıklılık gibi konular zaten lüks markaların sunduğu değerler iken yeni lüks kavramı ile beraber, bambaşka parametreler ortaya çıktı. Artık insanlar satın alma kararı alırken aldıkları ürünün hikayesiyle, onlara yaşattığı deneyimle, kendileri için ne kadar kişiselleştirilmiş olduğu ile ilgileniyor. (<https://www.platinonline.com/2017>)Lüks markalar; prestij sahibi markaların en üstünde yer alan, içinde fiziksel ve psikolojik değerleri bulunduran markalardır. (Wiedmann, vd., 2007: 126). Lüks tüketim, bireyin fizyolojik ihtiyaçlarının ötesinde psikolojik ihtiyaçlarına hizmet eden bir araçtır. Her birey temel ihtiyaçlarını rahatlıkla karşılayabildiğinde, psikolojik ihtiyaçlarına yönelir. Twitchell ‘Gereksizi Gereksinmek: Lüksün Demokratikleşmesi’ adlı kitabında lüksü şu şekilde tanımlamıştır: “Lüks; eğer zor ele geçirilen ve sahip olamadıklarımızın karşılığı ise, lüks ihtiyaçlar bireye, topluma ve zamana göre değişiklik gösterebilmektedir. Örneğin, Akdeniz kıyılarında tatil yapmak ya da dizüstü bilgisayara sahip olmak birileri için lüks iken, birileri için zorunlu olabilecektir. Lüks olarak adlandırılan ihtiyaçlar tatmin edildiğinde, yeni bir lüks ihtiyacının ortaya çıkacağı çok aşikârdır. Renksiz televizyona sahip olduğunda, renklisi lüks olarak kabul edilebilirken, renkliye sahip olduğunda her türlü iletişim olanağı sağlayabilecek dijital ve etkileşimli televizyonlar şimdilik lüks sayılabilmektedir. Günümüzde ne satın aldığımız, ne yaptığımızdan daha önemli hale geldiği için, lüks bir amaç değildir; artık birçok kişi için lüks mutlu azınlık için olmanın ötesinde, bir gereksinimdir diyen Florida Üniversitesi öğretim üyesi Twitchell’e göre; belki de daha az lüks istemek yerine, tam tersini -çelişkili olsa da, herkes için lüksü- toplumsal amaca uygun bulabiliriz.” (Twitchell, J.B. 2004, Aktaran; Odabaşı, 2013:23-24).

### **SÜRDÜRÜLEBİLİRLİK**

Sürdürülebilirlik, üretimin ve çeşitliliğin devamı sağlanırken insanlık yaşamının daimi kılınabilmesidir. En iyi anlamıyla kendi ihtiyaçlarımızı karşılarken gelecek kuşakların ihtiyaçlarından ödün vermeden karşılayabilmektir. Bir kavramın ya da şeyin sürdürülebilir olması o şeyin şuan ki durumunu devam ettirebiliyor olması gerekir. Aynı zamanda kendini yenileyebiliyor olması gerekmektedir. Buradan yola çıkarak bu kavram; gelecek kuşaklara

ekonomik, ekolojik ve aynı zamanda sosyal koşulları devam ettirelebilen bir dünya bırakmak için kullanılır. (<https://www.iienstitu.com/>, 2019)

Sürdürülebilir kalkınmanın ekonomik, çevresel ve sosyal boyut olmak üzere üç boyutundan söz edilmektedir. İdeal ve sürdürülebilir bir ekonomi, en az miktarda kaynak kullanımı ve çevresel zarar ile en yüksek miktarda genel refahı sağlayan ekonomidir. Ekonomik açıdan, gerçekten sürdürülebilir olmak için, doğal kaynaklara yönelik genel talep, doğanın yenilenebilir kaynak arzından daha az olmalıdır (<https://econation.co.nz/>, 2020).

Çevresel sürdürülebilirlik, sürdürülebilir kalkınmanın ayrılmaz bir parçasıdır. Çevreye bağımlılıkları nedeniyle çalışanlar, müşteriler, hissedarlar ve toplum ile birlikte işletmeler için önemli bir paydaştır. Çevresel sürdürülebilirlik, insanların ve doğanın üretken bir uyum içinde var olabileceği ve gelecek kuşakların sosyal, ekonomik ve çevresel ihtiyaçlarının karşılanmasına izin veren koşulları yaratmak ve sürdürmek olarak tanımlanabilir (U.S Department of Energy, 2020).

**Eğitim**, sağlık, mutluluk, güvenli bir yaşam, yaşam kalitesi vb. alanlarda toplumsal koşulların sürdürülebilirliği üzerine odaklanır. İnsanlar arasındaki ilişkilerin zenginleştirilmesinin yanında bireysel ve grupsal hedeflere ulaşılmasını sağlar. Ekonomik ve ekolojik değişimlerin sosyal koşullara yaratacağı etkiler tarafından etkilenebilir. (<https://.iienstitu.com>, 2019)

## **Y KUŞAĞI**

X kuşağından hemen sonra gelen Y kuşağı 1980 ile 1989 yılları arasında doğan nesli kapsamaktadır. Mevcut iş gücüne giren son nüfusun teşkil ettiği gruptur. Bireyciliğin yüksek seyrettiği, esnek ve küreselleşmeyle değişmeye başlayan dünyanın çocukları biçiminde tanımlanan bu kuşak muhtemelen yakın tarihin en eğitilmiş, en çok iletişim gücüne sahip ve kendine güvenen kuşağını oluşturmaktadır. İş ortamında yer aldıkları gruplar içerisinde üretken ve kararlı bir örgüt kültürünün olmasını isterler ve bu konuda oldukça hassastırlar. İyimserlerdir ve çalışma ortamının eğlenceli olmasını isterler. Tıpkı X kuşağında olduğu gibi, yöneticileri tarafından takdir edilmek onlar için çok önemlidir (Aytaş vd., 2017: 36-37).

Cep telefonları, kişisel bilgisayarlar ve internet doğduklarından itibaren hayatlarında olduğundan ve bu dijital aletlerle büyüdükleri için teknoloji ve dijitallik bu kuşak için birçok şeyin simgesi haline gelmiştir. İnternet sayesinde küresel bir köye dönüşen dünyada Y Kuşağı, işletmelerin bilişim teknolojilerini kullanarak yaşam biçimine kadar birçok alanı kontrol edebildiği veya etkileyebildiği bir çevrede yetişti ve halen de bu çevrede yaşamlarını sürdürmektedirler. Bu nedenle de X kuşağı ile karşılaştırıldığında teknolojik açıdan bir adım öndedirler (Mengi, 2016)

Pazarlama ve tüketici davranışları açısından ele alındığında Y Kuşağı, değişen çevre şartlarına kolay uyum sağlayabilen, dinamik bir pazarlama çevresinde hayatını sürdürmekte zorluk yaşamayan bir kuşaktır. Bu nedenle değişime dair sürekli bir beklenti içinde olan bir tüketim anlayışı sürdürmektedirler. Bu kuşağın bireyleri kullandıkları ürünlerin yeni versiyonlarının ya da uygulamalarının piyasaya çıkmasını bekler ve bunların gelişimini yakından takip etmektedirler. Dünyanın önde gelen stratejistlerinden biri olarak tanınan Michael McQueen, Y Kuşağı bireylerinin iddia edildiği gibi savurgan davranışlar sergilemediğini, bu kuşağın “hayattan zevk alma” anlayışı ile hareket ederek bunu tüketime yansıttığını ve bu açıdan bakıldığında da oldukça bilinçli tüketici özelliği gösterdiklerini belirtmektedir. (Yazıcı,2019. s88).....

### **Z KUŞAĞI**

Z kuşağı dünyanın yeni kuşaklarından olan en son kuşaktır. Bu kuşağın mensuplarını 2000 yılı ve sonrasında doğanlar oluşturmaktadır. Z kuşağına farklı isimler verilmektedir. Bunlardan bazıları; Kristal çocuklar, I Kuşağı, Gelecek Kuşağı, iGen, Daima çevrimiçi, çocuklarının yanı sıra, bireysellik yanlısı olduklarından dolayı Strauss ve Howe ismi de verilmektedir (Çetin Aydın ve Başol, 2014, s. 6).Kristal kuşak olarak adlandırılan Z Kuşağı mensupları; teknoloji ile doğup büyüyen, bilgiye çok çabuk ulaşan, hırslı ve maddeci olarak değerlendirilmektedir. Ayrıca bu kitlenin daha dikkatsiz, hız tutkunu, bağımsız, özgüveni yüksek, yalnız, sabırsız, tatminsiz, güven arayan, zevkine düşkün, internette bol vakit geçiren, geleneklere bağlı olmayan ve içe dönük gibi çeşitli özellikler barındırdığı ifade edilmektedir. Bu özelliklerin diğer kuşaklardan önemli oranda ayrıştığı bilinmektedir. Bu kuşağın tüketim eğilimleri de diğer kuşaklarla önemli farklılıklar içermektedir. Bu kitle içerisinde kalite arayan, yenilik ve değişimden zevk alan, farklı kültürleri araştıran, plansız ve anlık satın alan, marka bağlılığı ve sadakati düşük, hobileri olan ve bu hobilerden kazanç elde etmek isteyen, çok hızlı tüketen, şekil ve sembollere bağlı, rol model arayan, interneti yoğun kullanan, araştıran ve karşılaştıran gibi çok sayıda tüketim eğilimi bulunmaktadır. (Beyaz,R. s;25)

### **TÜKETİCİ DAVRANIŞI**

Tüketiciyi ve tüketicinin davranışlarını anlamak, pazarlama stratejilerinin geliştirilmesindeki en önemli safhadır, çünkü üretilen mal ve hizmetlerin, faaliyet gösterilen pazarda, kimler tarafından, ne şekilde, ne miktarda ve nasıl satın alınacağını tahminini yapmadan, stratejileri ve o stratejilere uygun planları tasarlamak mümkün olmayabilir. Amerikan Pazarlama Birliği'nin (AMA, American Marketing Association), tanımlamasına göre, Tüketici Davranışları, ürün ve hizmetlerin yer aldığı pazardaki tüketici ve karar veren kullanıcıların

davranışlarını inceleyen, anlamaya ve tanımlamaya çalışan disiplinler arası bir bilimsel çalışmadır. Tüketici davranışları üzerine çalışan araştırmacılar satın alma davranışları üzerinden ilerleyerek konuyla ilgili tanımlamaları oluşturmaya çalışmışlardır. Kotler (1989), tüketicinin satın alma sürecini etkileyen faktörleri kültürel, sosyal, kişisel ve psikolojik olarak sıralayarak bir model oluşturmuştur;

Tablo 1.1: Tüketici davranışını etkileyen faktörler

<b>Kültürel</b>	<b>Sosyal</b>	<b>Kişisel</b>	<b>Psikolojik</b>
Kültür	Referans Grupları	Yaş ve Yaşam Dönemi	Güdüleme
Alt Kültür	Aile	Meslek	Algılama
Sosyal Sınıf	Rol ve Statüler	Ekonomik Özellikler	Öğrenme
		Yaşam Tarzı	İnanç ve Tutumlar
		Kişilik	

Kaynak: Kotler, P. , Armstrong, G. (1989) Principles of Marketing. 4th Ed. Englewood Cliffs: Prentice Hall International, s.118.Y Kuşağı tüketimle anılan, asıl kimliğini kendi isteğiyle tüketici kimliğine dönüştüren ve aynı zamanda tüketim toplumunu da şekillendiren bir kuşaktır. İnternetin de büyük etkisiyle alışveriş tutkusuna sahip, karar verirken özgür davranan, tüketimi bir eğlence aracı olarak gören Y Kuşağı, hem kendisine hem de topluma yabancılaşan bir tüketim modeli oluşturmuştur.Z Kuşağı'na baktığımızda ise kendi kredi kartı olan çok az bir şanslı kesim dışında bu kuşak henüz tek başına tüketim yapan bir kuşak değildir. Tüketim davranışlarını belirleyen faktörlerden en önemlisi ailelerin kararı olduğu için şirketler ve aileler bu kuşağı çok daha fazla önemsemektedir. Z Kuşağı diğer kuşaklardan farklı olarak internetsiz dönemi bilmeyen ve bu nedenle bu konuda uzman olarak yetişen bir kuşaktır. Bu kuşak kendine has, kişiselleşmiş ve imaja öncelik veren bir tüketim eğilimi göstermekte ve tam bir tüketici olarak tanımlanabilecek bir profil çizmektedir. Diğer kuşaklarla kıyaslandığında doğdukları çağın da etkisiyle eğitim açısından daha donanımlı ve ekonomik açıdan da daha rahat büyüyen bir kuşaktır. Bu kuşak talep ettikleri ürün ve hizmetlere anında ulaşmak, anında tüketmek ve daha sonra yeni tüketim deneyimlerine sahip olmayı tercih etmektedirler. (Yazıcı,2019.s 99)

## **ARAŞTIRMA VE BULGULAR**

### **Araştırmanın Adı**

Sürdürülebilir yeni lüks markaların Y ve Z kuşaklarının satın alma niyetleri ve tüketici davranışları üzerine etkisinin cinsiyet ve gelir durumu açısından analizi

### **Araştırmanın Önemi**

Araştırmanın ana kütlesini tüketiciler oluşturmaktadır. Ana kütlenin tamamına ulaşmak mümkün olmadığından örnekleme yoluna gidilmiş, Türkiye’de yaşayan 424 tüketicilerden veri anket yöntemi ile toplanmıştır.

Araştırmanın zaman ve bütçe kısıtından dolayı, tesadüfi olmayan örnekleme yöntemlerinden kolayda örnekleme yönteminin kullanılması uygun görülmüştür. Kolayda örnekleme yöntemi, kısıtlar nedeniyle araştırmaya katılacak kişilerin ulaşılabilirliğine göre tercih edilir. Ayrıca, araştırmacılar tarafından sıklıkla kullanılan bu yöntem ile, tesadüfi yöntemlere göre daha iyi sonuçlar alınması olasıdır (Yükselen, 2008)

### **Araştırmanın Örnekleme ve Yöntemi**

Bu araştırma ilişkisel tarama modelinde desenlenmiştir. İlişkisel model, bir ya da birden fazla değişken arasında ilişkinin belirlendiği modeldir (Fraenkel ve Wallen, 2005). Bu araştırma özelinde, tüketicilerin sürdürülebilirliklerinin(sürdürülebilirlik algılarının) marka tercihleri ve satın alma niyetlerine olan etkisi incelenmiştir. Veriler anket yöntemi kullanılarak toplanmış ve bu formun giriş bölümünde katılımcılara kişisel verilerinin gizlilik prensibine göre değerlendirileceği ifade edilerek sadece akademik bir araştırmada kullanılacağı belirtilmiştir.

Katılımcılar tarafından cevaplanan anket dört bölümden oluşmaktadır. Birinci bölümde tüketicilerin kişisel özelliklerine ilişkin cinsiyet, yaş ve gelir durumu ile ilgili üç soruya verdikleri cevaplara yer verilmiştir. İkinci bölümde ise Kim ve diğerleri (2015) tarafından geliştirilen ölçeğe yer verilmiştir. Ölçek ekonomik sürdürülebilirlik, sosyal sürdürülebilirlik ve çevresel sürdürülebilirlik olmak üzere toplam 3 boyutu ölçmektedir. Ölçek, 5’li Likert ölçeğinde (5: kesinlikle katılıyorum, 1: kesinlikle katılmıyorum) üzenlenmiş toplam 14 ifade içermektedir. Ölçekte ekonomik sürdürülebilirlik boyutu altında 3 ifade yer almaktadır (Örnek ifade: “Marka mali açıdan hesap verebilir (şeffaf politikaları olan) bir markadır.”). Ölçekte yer alan sosyal sürdürülebilirlik boyutu toplam 6 ifadeden oluşurken (örnek ifadeler: “Marka, toplumsal katkı sağlayan bir markadır.”; “Marka, insan haklarını dikkate almaktadır.”); çevresel sürdürülebilirlik boyutu ise toplam 5 ifade içermektedir (örnek ifadeler: “Marka, çevre dostu ürünler üretmektedir.”; “Marka, çevre için yatırımda bulunmaktadır.”). Ölçekten alınan yüksek puan katılımcının ilgili boyutta olumlu bir değerlendirme yaptığını, düşük puan ise tam tersi bir

durumu göstermektedir. Anket formunun üçüncü bölümünde tüketicilerin marka tercihlerini değerlendirmek amacıyla Sirgy ve diğerleri (1991) tarafından geliştirilen Davies, Veloutsou ve Costa (2006) tarafından uyarlanan Marka Tercihi ölçeği kullanılmıştır. Ölçek, 5'li Likert ölçeğinde (5: kesinlikle katılıyorum, 1: kesinlikle katılmıyorum) düzenlenmiş toplam 3 ifade içermektedir). Dördüncü bölümde ise Satın alma niyetini değerlendirmek amacıyla Satınalma Niyeti ölçeği ise Wongpitch ve diğerlerinin 2016 yılında yapmış oldukları çalışmadan alınan Satınalma Niyeti ölçeği kullanılmıştır. Ölçek, 5'li Likert ölçeğinde (5: kesinlikle katılıyorum, 1: kesinlikle katılmıyorum) düzenlenmiş toplam 3 ifade içermektedir.

### **Araştırma Soruları**

1. X ve Z kuşaklarının sürdürülebilir yeni lüks markaları tercih etme, satın alma ve sürdürülebilirlik boyutları üzerinde cinsiyet faktörünün etkisi nedir?
2. X ve Z kuşaklarının sürdürülebilir yeni lüks markaları tercih etme, satın alma ve sürdürülebilirlik boyutları üzerinde gelir durumunun etkisi nedir?
3. X ve Z kuşaklarının sürdürülebilir yeni lüks markaları tercih etme, satın alma ve sürdürülebilirlik boyutları üzerinde yaş faktörünün etkisi nedir?

### **BULGULAR**

#### **Cinsiyet Bulguları**

Tablo 2 Tüketicilerin Cinsiyete Göre Dağılımları N=424

	<b>Kişisel Özellikler</b>	<b>f</b>	<b>%</b>
<b>Cinsiyet</b>	Kadın	268	63,2
	Erkek	156	36,8

Tablo 2’de görüldüğü üzere tüketicilerin 156’sı (%36,8) erkek ve 268’i (%63,2) kadın katılımcılardan oluşmaktadır.

#### **Tüketicilerin Cinsiyet Dağılımlarına Yönelik Pasta Grafiği**

### 1. Yaş Bulguları

Tablo3 Tüketicilerin Yaş Durumlarına Göre Dağılımları N=424

	Kişisel Özellikler	f	%
Yaş Durumu	23 yaş altı	76	17,9
	24-43 yaş	348	82,1

Tablo 3’de görüldüğü üzere tüketicilerin yaş durumları incelendiğinde; 348’i (%82,1) 23-43 yaş aralığında ve 76’sı (%17,9) 23 yaş altı olduğu belirlenmiştir.

Tüketicilerin Yaş Dağılımlarına Yönelik Pasta Grafiği

### Gelir Düzeyi Bulguları

Tablo 4 Tüketicilerin Gelir Düzeyi Durumuna Göre Dağılımları N=424

	Kişisel Özellikler	f	%
Gelir Düzeyi	11.402 TL ve altı	32	7,5
	11.403-17.500 TL arası	96	22,6
	17.501 – 22.500 TL arası	48	11,3
	22.501 TL ve üzeri	248	58,5

Tablo 4’te görüldüğü üzere tüketicilerin gelir düzeyi durumları incelendiğinde; 32’si (%7,5) 11.402 TL ve altı, 96’sı (%22,6) 11.403-17.500 TL arası, 48’i (%11,3) 17.501 – 22.500 TL arası ve 248’i (%58,5) 22.501 TL ve üzeri gelire sahip olduğu belirlenmiştir.

DEĞERLENDİRME

Cinsiyet Durumu Değişkenine Göre Değerlendirme

Çalışmanın bu kısmında araştırma grubunu teşkil eden tüketicilerin cinsiyet durumu dağılımlarına göre değişkenlerden elde edilen ortalama puanlar arasındaki farklılaşmalar t Testi ile değerlendirilecektir.

Tablo 5 Tüketicilerin Cinsiyet değişkenine göre *Marka Tercihleri Satın alma Niyeti ve Sürdürülebilirlik* Ölçekleri ve Alt Boyutlarından Elde Edilen Puan Ortalamalarının Karşılaştırılması

Değişkenler	Cinsiyet Durumu	N	$\bar{X}$	SS	t	p
Marka Tercihleri	Kadın	268	3,51	1,17	2,867	,004*
	Erkek	156	3,17	1,20		
Sürdürülebilirlik	Kadın	268	3,64	,95	3,456	,001*
	Erkek	156	3,32	,89		
Ekonomik sürdürülebilirlik	Kadın	268	4,09	1,06	2,415	,016*
	Erkek	156	3,83	1,09		
Sosyal sürdürülebilirlik	Kadın	268	3,50	1,20	3,662	,000*
	Erkek	156	3,08	1,02		
Çevresel sürdürülebilirlik	Kadın	268	3,34	1,22	2,546	,011*
	Erkek	156	3,05	1,02		
Satınalma Niyeti	Kadın	268	3,58	1,19	4,886	,000*
	Erkek	156	3,00	1,17		

\*p<.05

Analiz sonucuna göre (Bkz. Tablo 5) tüketicilerin cinsiyet durumu ile Marka Tercihleri (t:2,867, p<.05) Sürdürülebilirlik (t:3,456, p<.05) ve alt boyutları Ekonomik sürdürülebilirlik (t:2,415, p<.05), Sosyal sürdürülebilirlik (t:3,662, p<.05) ve Çevresel sürdürülebilirlik (t:2,546, p<.05), Satınalma Niyeti (t:4,886, p<.05) arasında anlamlı bir fark vardır.

Kadın tüketicilerin Marka Tercihleri puan ortalamalarının ( $\bar{X}=3,51$ ) erkek tüketicilerin Marka Tercihleri puan ortalamalarından ( $\bar{X}=3,17$ ) istatikselsel olarak daha yüksek olduğu belirlenmiştir. Kadın tüketicilerin Sürdürülebilirlik puan ortalamalarının ( $\bar{X}=3,64$ ) erkek tüketicilerin Sürdürülebilirlik puan ortalamalarından ( $\bar{X}=3,32$ ) istatikselsel olarak daha yüksek olduğu belirlenmiştir. Kadın tüketicilerin Ekonomik sürdürülebilirlik toplam puan ortalamalarının ( $\bar{X}=4,09$ ) erkek tüketicilerin Ekonomik sürdürülebilirlik ortalamalarından ( $\bar{X}=3,83$ ) istatikselsel olarak daha yüksek olduğu saptanmıştır. Kadın tüketicilerin Sosyal sürdürülebilirlik ortalamalarının ( $\bar{X}=3,50$ ) erkek tüketicilerin Sosyal sürdürülebilirlik ortalamalarından ( $\bar{X}=3,08$ ) istatikselsel olarak daha yüksek olduğu saptanmıştır. Kadın tüketicilerin alt boyut Çevresel sürdürülebilirlik puan ortalamalarının ( $\bar{X}=3,34$ ) erkek tüketicilerin alt boyut Çevresel sürdürülebilirlik ortalamalarından ( $\bar{X}=3,05$ ) istatikselsel olarak daha yüksek olduğu saptanmıştır. Kadın tüketicilerin Satınalma Niyeti ortalamalarının ( $\bar{X}=3,58$ ) erkek tüketicilerin Satınalma Niyeti ortalamalarından ( $\bar{X}=3,00$ ) istatikselsel olarak daha yüksek olduğu saptanmıştır.

#### Yaş Durumu Değişkenine Göre Değerlendirme

Tablo 6 Tüketicilerin Yaş Durumu değişkenine göre *Marka Tercihleri Satınalma Niyeti ve Sürdürülebilirlik* Ölçekleri ve Alt Boyutlarından Elde Edilen Puan Ortalamalarının Karşılaştırılması

Değişkenler	Yaş	N	$\bar{X}$	SS	t	p
Marka Tercihleri	23 yaş altı	76	3,49	1,13	,842	,400
	24-43 yaş	348	3,36	1,21		
Sürdürülebilirlik	23 yaş altı	76	3,52	,72	,001	,999
	24-43 yaş	348	3,52	,99		
Ekonomik sürdürülebilirlik	23 yaş altı	76	3,86	,89	-1,198	,231
	24-43 yaş	348	4,02	1,11		
Sosyal sürdürülebilirlik	23 yaş altı	76	3,23	1,02	-,984	,326
	24-43 yaş	348	3,37	1,18		
Çevresel sürdürülebilirlik	23 yaş altı	76	3,48	,89	2,110	,035*
	24-43 yaş	348	3,18	1,20		
Satınalma Niyeti	23 yaş altı	76	3,18	1,27	-1,528	,127
	24-43 yaş	348	3,41	1,20		

\*p<.05

Analiz sonucuna göre (Bkz. Tablo 6) tüketicilerin yaş durumu ile Marka Tercihleri ( $p>.05$ ) Sürdürülebilirlik ( $p>.05$ ) ve alt boyutları Ekonomik sürdürülebilirlik ( $p>.05$ ), Sosyal sürdürülebilirlik ( $p>.05$ ) ve Satınalma Niyeti ( $p>.05$ ) arasında anlamlı bir fark yok iken Çevresel sürdürülebilirlik ( $t:2,110, p<.05$ ) arasında anlamlı bir fark olduğu belirlenmiştir.

23 yaş altı tüketicilerin alt boyut Çevresel sürdürülebilirlik puan ortalamalarının ( $\bar{X}=3,48$ ) 24-43 yaş tüketicilerin alt boyut Çevresel sürdürülebilirlik ortalamalarından ( $\bar{X}=3,18$ ) istatistiksel olarak daha yüksek olduğu saptanmıştır.

### Gelir Durumu Değişkenine Göre Değerlendirme

\* $p<.05$ , \*\*Grup Farkı

Analiz sonucuna göre (Bkz. Tablo 7) tüketicilerin gelir durumu ile Marka Tercihleri (F:5,104,  $p<.05$ ) Sürdürülebilirlik (F:11,698,  $p<.05$ ) ve alt boyutları Ekonomik sürdürülebilirlik (F:8,064,  $p<.05$ ), Sosyal sürdürülebilirlik (F:9,964,  $p<.05$ ) ve Çevresel sürdürülebilirlik (F:7,330,  $p<.05$ ), Satınalma Niyeti (F:7,430,  $p<.05$ ) arasında anlamlı bir fark vardır.

Geliri 17.501–22.500 TL arası olan tüketicilerin Marka Tercihleri puan ortalamalarının ( $\bar{X}=3,86$ ) geliri 22.501 TL ve üzeri olan tüketicilerin Marka Tercihleri puan ortalamalarından ( $\bar{X}=3,28$ ) ve geliri 11.403-17.500 TL arası olan tüketicilerin Marka Tercihleri puan ortalamalarından ( $\bar{X}=3,28$ ) istatikselsel olarak daha yüksek olduğu belirlenmiştir.

Geliri 11.403-17.500 TL arası olan tüketicilerin Sürdürülebilirlik puan ortalamalarının ( $\bar{X}=3,78$ ) ve geliri 17.501–22.500 TL arası olan tüketicilerin Sürdürülebilirlik puan ortalamalarının ( $\bar{X}=3,98$ ) geliri 22.501 TL ve üzeri olan tüketicilerin Sürdürülebilirlik puan ortalamalarından ( $\bar{X}=3,31$ ) istatikselsel olarak daha yüksek olduğu belirlenmiştir.

Geliri 11.403-17.500 TL arası olan tüketicilerin Ekonomik sürdürülebilirlik puan ortalamalarının ( $\bar{X}=4,17$ ) ve geliri 17.501–22.500 TL arası olan tüketicilerin Ekonomik sürdürülebilirlik puan ortalamalarının ( $\bar{X}=4,53$ ) geliri 22.501 TL ve üzeri olan tüketicilerin Ekonomik sürdürülebilirlik ortalamalarından ( $\bar{X}=3,80$ ) istatikselsel olarak daha yüksek olduğu saptanmıştır.

Geliri 11.403-17.500 TL arası olan tüketicilerin Sosyal sürdürülebilirlik ortalamalarının ( $\bar{X}=3,64$ ) ve geliri 17.501–22.500 TL arası olan tüketicilerin Sosyal sürdürülebilirlik ortalamalarının ( $\bar{X}=3,90$ ) geliri 22.501 TL ve üzeri olan tüketicilerin Sosyal sürdürülebilirlik ortalamalarından ( $\bar{X}=3,11$ ) istatikselsel olarak daha yüksek olduğu saptanmıştır.

Geliri 11.402 TL ve altı olan tüketicilerin alt boyut Çevresel sürdürülebilirlik ortalamalarının ( $\bar{X}=3,60$ ), geliri 11.403-17.500 TL arası olan tüketicilerin alt boyut Çevresel sürdürülebilirlik puan ortalamalarının ( $\bar{X}=3,53$ ) ve geliri 17.501–22.500 TL arası olan tüketicilerin Çevresel sürdürülebilirlik ortalamalarının ( $\bar{X}=3,50$ ) geliri 22.501 TL ve üzeri olan tüketicilerin Çevresel sürdürülebilirlik ortalamalarından ( $\bar{X}=3,02$ ) istatikselsel olarak daha yüksek olduğu saptanmıştır.

Geliri 17.501–22.500 TL arası olan tüketicilerin Satınalma Niyeti ortalamalarının ( $\bar{X}=4,03$ ) geliri 11.403-17.500 TL arası olan tüketicilerin alt boyut Satınalma Niyeti puan ortalamalarından ( $\bar{X}=3,44$ ) ve geliri 22.501 TL ve üzeri olan tüketicilerin Satınalma Niyeti ortalamalarından ( $\bar{X}=3,18$ ) istatikselsel olarak daha yüksek olduğu saptanmıştır.

## **SONUÇ VE ÖNERİLER**

Bu araştırmada sürdürülebilir yeni lüks markaların Y ve Z kuşaklarının satın alma niyetleri ve tüketici davranışları üzerinde etkisini cinsiyet ve gelir durumu açısından analiz edilmiştir. Demografik faktörlerden cinsiyet ve gelir durumu, satın alma niyeti ve davranışı üzerinde etkili olan önemli iki faktördür. Türkiye'deki Y ve Z kuşaklarını temsil eden tesadüfi olmayan örnekleme yöntemiyle seçilmiş 424 tüketiciden, kadın tüketicilerin erkek tüketicilere kıyasla, marka tercihleri, satın alma niyeti ve sürdürülebilirlik (ekonomik, çevresel, sosyal) anlamda istatistiksel olarak daha yüksek olduğu saptanmıştır. Lüks markalar, toplum içinde prestij ve statü sembolleri olarak kabul edildiğinden, kadınlar lüks markaları tercih ederek sosyal çevrelerinde prestij kazanmayı amaçlamaktadırlar. Bireylerin kişisel tarzlarını ifade etmelerine yardımcı olabildikleri için, lüks ürünleri giyerek kendi benzersiz tarzlarını vurgulamak istemektedirler. Ayrıca lüks markalar genellikle yüksek kalite ve dayanıklılıkla ilişkilendirilir. Bu yüzden de kadınlar uzun süre kullanabilecekleri kaliteli ürünleri tercih etmektedirler. Lüks alışveriş, insanlara tatmin ve mutluluk hissi verdiğinden, kadınlar, lüks ürünleri satın alarak kendilerini ödüllendirmek istemektedirler. Demografik faktörlerden bir diğeri olan gelir düzeyine baktığımızda da, 17.501-22.500TL olan tüketicilerin marka tercihleri ve satın alma niyetleri diğer gelir durumlarına göre yüksektir. 11.403-17.500 gelir durumuna sahip tüketiciler, sürdürülebilirlik, ekonomik ve sosyal sürdürülebilirlik istatistiklerinde daha önemsedikleri ortaya çıkmaktadır. 11.402 ve altı gelir durumuna sahip tüketicilerin ise, çevresel sürdürülebilirlik istatistiklerinde daha hassas olduğu görülmektedir. Alıcıların kararlarında; alıcının yaşı, mesleği, ekonomik durumu, yaşam tarzı, kişiliği ve benlik kavramı gibi kişisel özelliklerin etkisi büyüktür. Bu nedenle satın alma davranışını etkileyen "kültürel faktörler", "sosyal faktörler", "psikolojik faktörler" ve "kişisel faktörler" üzerinde de gerekli çalışmalar yapılmalıdır. Gelecekte bu konu ile ilgili hem belirtilen faktörler değerlendirilmeli, hem de medeni hali ve eğitim durumu da değişkenlerin içinde olmalıdır.

## **FLAT KARAKTER TASARIMI; JETGİLLER ÖRNEĞİ**

**Selin ATİK (ORCID 0009-0000-8312-4292)**

İzmir Katip Çelebi University, Institute of Social Sciences, Department of Art and Design  
Studies, İzmir-Türkiye

**Email:** selinndikmenoglu@gmail.com

### **Özet**

Flat tasarımı “Düz Tasarım” sadeliğin ön planda olduğu minimalist bir tasarım stildir. Modern, yalın ve temiz bir görünüm hedeflemektedir. Genellikle gölge ve kabartma gibi efektler yerine daha çok basit ve modern şekiller, düz renkler, keskin ve iki boyutlu tasarım dili kullanılmaktadır. Üç boyuttan uzak bir yaklaşımı esas aldığı ve aynı zamanda geniş canlı renk skalası kullandığı gözlemlenmektedir. Teknolojinin gelişmesi ile birlikte günümüzde görsel tüketim hızı artmış, basılı ya da basılı olmayan grafik tasarım ürünlerinde, tablet ve telefonlardaki görsel imgelerde, arayüz sayfa tasarımlarında flat tasarım yaklaşımı görülmeye başlanmıştır. Günümüzde kullanım yaygınlığı devam eden bu tasarım yaklaşımının bugüne gelmesinde geçmiş dönem tasarım stillerinin etkisi de bulunmaktadır. İkinci Dünya Savaşı sonrası, 1940–1950’li yıllarda İsviçre’de modernist yaklaşımların görülmesi ve daha sonra popülerleşmesi, flat tasarım yaklaşımının ortaya çıkışı olarak kabul edilmektedir. Bu yaklaşım üzerinden yine aynı dönemlerde Hanna–Barbera yapım şirketi tarafından üretilen ve ABC kanalında (American Broadcasting Company) yayınlanan bir durum komedisi (sitcom) ve bilim kurgu aile çizgi dizisi olan Jetgiller’de de karakter ve mekân resimlemesinde flat tasarımı yaklaşımının uygulandığı gözlemlenmiştir. Bu çalışmada, flat karakter tasarımı yaklaşımı Jetgiller örneği üzerinden incelenecektir. Araştırmada nitel araştırma yöntemlerinden betimsel tarama modeli kullanılacak olup, flat tasarım anlayışının Jetgiller çizgi dizisindeki karakter tasarımlarına nasıl uygulandığı tasarım öğeleri üzerinden incelenecektir.

**Anahtar Kelimeler:** Grafik Tasarım, Flat Tasarımı, İllüstrasyon, Karakter Tasarımı, Minimalizm.

**FLAT CHARACTER DESIGN; THE EXAMPLE OF THE JETSONS**

**Abstract**

Flat design is a minimalist design style where simplicity is at the forefront. It aims for a modern, simple and clean look. It generally uses simple and modern shapes, solid colors, sharp and two-dimensional design language instead of effects, such as shadow and relief. It is observed that it is based on an approach far from three dimensions and at the same time uses a wide range of vibrant colors. With the development of technology, the speed of visual consumption has increased, and flat design approach has started to be seen in printed or non-printed graphic design products, visual images on tablets phones and interface page designs. This design approach, which continues to be widely used today, has also influenced by the design styles of the past. The emergence and subsequent popularization of modernist approaches in Switzerland in the 1940s-1950s, after the Second World War, is accepted as the emergence of the flat design approach. Based on this approach, it was observed that flat design approach was applied in character and space illustrations in The Jetsons, a sitcom and science fiction family cartoon series produced by Hanna-Barbera production company and broadcast on ABC channel (American Broadcasting Company). In this study, flat character design approach will be analyzed through the example of The Jetsons. The descriptive survey model, one of the qualitative research methods, will be used in the study, and how the flat design approach is applied to the character designs in the Jetgiller cartoon series will be examined through design elements.

**Keywords:** Graphic Design, Flat Design, Illustration, Character Design, Minimalism.

## **GİRİŞ**

Grafik tasarım alanlarından biri olan illüstrasyon, görsel ifade dilini kullanarak bir metnin, düşüncenin ya da herhangi bir olayın izleyiciye ulaşmasını hedeflemektedir. Geçmişten günümüze teknolojinin gelişmesi ile birlikte resimleme olarak ta bilinen illüstrasyonun, çizim ve boyama teknikleri tablet ve bilgisayar ortamına taşınmıştır. Bununla birlikte dijital bağlamda illüstrasyon; çizgi diziler, animasyon filmleri, oyunlardaki mekân ve karakter tasarımları, üç boyutlu modellemeler üzerinde varlığını sürdürmektedir. İllüstrasyon temelli çizgi diziler, mekân ve karakter tasarımlarının yanı sıra ışık, gölge, doku, çizgi, açı, renk dinamiğinin sağladığı etkiler ile birlikte çocukların hayal dünyasını genişletmeyi amaçlamaktadır. Çocukların hayal dünyasının genişlemesi, iyi bir gözlemci olmaları üzerinden tanımlanabilir. “Görme konuşmadan önce gelmiştir. Çocuk konuşmaya başlamadan önce bakıp tanımayı öğrenir.” der sanat eleştirmeni ve yazar John Berger. Berger’in bu sözünden yola çıkarak çizgi dizilerde ki illüstratif öğelerin, çocuklara görsel etki yaratarak merak duygusunun gelişmesinde katkı sayılabileceği gibi eğitici ve öğretici olarak bilgi aktarım sürecinin de daha güçlü olabileceği söylenebilir. Günümüz çizgi dizilerinde olduğu gibi geçmiş dönem çizgi dizilerinde de bu unsurlar ön plana çıkmaktadır. Araştırmanın konusu olan Jetgiller çizgi dizisinin illüstratif anlatısal ifadesinde flat tasarım yaklaşımı olduğu gözlenmektedir. Jetgiller, 1962-63 yılları arasında yayınlanmış olsa da fütüristik anlatımı olan bir televizyon dizisidir ve aynı dönemlerde hayat bulmaya başlayan flat tasarımı yaklaşımı etkisi görülmektedir. Çalışmanın amacı, flat karakter tasarımı üzerinden Jetgiller örneği ile incelenip illüstratif dilde karakter resimlemesi hakkında bilgi vermektir. Araştırma, nitel araştırma yöntemlerinden betimsel tarama modeli ile internet ve kitap kaynaklarından elde edilen verilerle sınırlıdır. Çalışmanın konusu, görsel örnekler ile birlikte incelenmiş olup daha geniş bir biçimde bir araya getirilmeye çalışılmıştır. Elde edilen gözlem ve bulgular ışığında detaylıca incelenebilir.

## **FLAT TASARIM**

Grafik sanatı, sanat tarihinde yerini almaya başladığından günümüze kadar çeşitli sanat akımlarından etkilenmiş farklı tarz ve tekniklerde karşımıza çıkmıştır. Tasarımcının yaşadığı dönemin sanat anlayışı ve toplumun kültürel yapısı yaptığı tasarımları da etkilemiştir (Becer, 2011, s.101). İngilizce kökenli olan flat kelimesinin Türkçe anlamı “düz” olarak söylenebilir. Düz kelimesini ise Türk Dil Kurumu (TDK) şöyle tanımlamıştır: “Yatay durumda olan, eğik ve dik olmayan, kıvrımlı olmayan; doğru, stabil. Yalın, sade, süssüz olan, desensiz”(www.sozluk.gov.tr). Flat tasarım yaklaşımının tasarım dilinin bu tanımlamaya uygun olduğu söylenebilir.

Flat tasarım yaklaşımı günümüz tasarımlarında anlatı dili olarak popülerliğini koruyor olsa da aslında kökeni 1940-1950’li yıllara dayanmaktadır. Evrensel tasarım anlayışı olarak ‘‘Uluslararası Tipografik Üslup’’ veya ‘‘İsviçre Tasarımı’’ adı verilen stilin yansıması olduğu söylenebilir. Grafik tasarımın gelişmesinde ve grafik tasarım eğitiminin temelini oluşturan İsviçre stili, aktarılmak istenen mesajı matematiksel olarak çizilmiş kanava (grid) sistemi üzerinden net, sade, abartılardan uzak, serifsiz yazı karakterleri ve basit geometrik şekillerle anlatmayı hedeflemiştir. İsviçre tasarım üslubunun görsel alfabesini oluşturan öğelerini, Becer (2020) ise şu şekilde açıklamıştır; ‘‘Matematiksel bir grid çizimi üzerinde asimetrik olarak düzenlenmiş tasarım unsurları ile oluşturulan görsel bütünlük, serifsiz yazı karakterleri kullanımı, genellikle soldan bloklanan, sağda serbest ve değişken satır uzunluklarına dayalı bir tipografik kompozisyon anlayışı, sözel ve görsel bilgileri açık ve berrak bir tasarım anlayışıyla ileten nesnel metin ve fotoğraflar, ticari reklamcılık ve propagandanın abartılı dilinden uzak, bağımsız bir tasarım anlayışı’’ (Becer, 2020, s. 264). Flat tasarım yaklaşımının kökeninde etkilendiği bir diğer sanat akımı ise minimalizm olduğu söylenebilir. Minimalizmin, grafik tasarım alanında ki etkisini İsviçre’de doğan uluslararası tipografik stil döneminde bulabiliriz. Minimalizm 1950’lerin sonlarında ortaya çıkarak netliği, saflığı ve sadeliği vurgulamıştır. Bu sanat akımının anlatı dili; detaylardan arındırılmış, illüzyon ve efektlerden uzak, anlaşılır olmasıdır. Dönemin modernist mimarlarından ‘‘Fakirlik, yoksunluk, eksiklik değildir. Minimalizm; aksine bilinçli bir tercihtir, zor olanı seçmektir, azla çok yapmaktır.’’ sözleriyle açıkladığı Minimalizm felsefesini ünlü ‘‘Less is more’’ sözüyle ‘‘Az çoktur’’ ifadesini kullanarak özetlemiştir (Islakoğlu, 2006, 4’ten akt. Döl ve Avşar, 2013). Bu ifadeden yola çıkarak flat tasarım yaklaşımı üzerinde minimalizm sanat akımının etkileri olduğu tespit edilebilir. Kökeninde minimalizm sanat akımını barındıran flat tasarım yaklaşımı minimalizme göre kullanım alanları çok daha esnektir; web siteleri, kurumsal kimlik tasarımları, mobil ara yüzler, oyun tasarımları, animasyonlar ve çizgi diziler gibi birçok alanda yetkinliğini sürdürmektedir. Flat tasarım yaklaşımı üç boyut hissiyatını oluşturma kaygısına sahip değildir. Bu nedenle efektlerden, abartılardan, süslemelerden uzak ve basit anlatımı benimsediği görülebilir. Bu tasarım yaklaşımı illüstratif anlatımlar üzerinden güncel uygulamalarda ve geçmiş uygulamalarda çok yaygın olarak kullanılmıştır. Bu uygulama alanlarından biriside karakter tasarımıdır.

### **KARAKTER TASARIMI**

Oxford Advanced Learner's Dictionary (Oxford Gelişmiş Öğrenci Sözlüğü) karakter kelimesini: ‘‘Bir kişiyi diğerlerinden farklı kılan tüm nitelikler ve özellikler’’ olarak

tanımlamıştır(<https://www.oxfordlearnersdictionaries.com/definition/english/character?q=character>). Tasarım kelimesinin birçok anlamı olsa da tasarım yapmak, sonucu görmek ve ona ulaşmak konusunda hayal gücüyle ortaya konulan biçim, zihinde hayal etmek veya canlandırmak üzerinden tanımlanabilir. Geçmişten günümüze kadar teknolojinin de gelişmesi ile birlikte çizgi romanlar, animasyon filmleri, çizgi diziler, oyunlar, çocuk kitapları gibi birçok mecra da karakter tasarımı olduğu gözlemlenebilir. Karakterler sosyolojik, psikolojik ve fizyolojik açıdan topluma ve bireylere dair olgular barındırsa da uygulanan doğru karakter tasarımı izleyici tarafından kabul görünüp benimsenmesine olanak sağlayabilir. Bu süreçte çizerler, toplumda gözlemlenmiş olduğu insan, nesne, mekân, hayvan gibi unsurlar üzerinden pek çok karaktere ait davranış biçimi yükleyebilir. Karakter tasarımının öncelikli olarak canlandırma sanatçıları ile ortaya çıktığı söylenebilir. Winsor McCay, Frank Moser, Early Hurd, Émile Cohl gibi sanatçılar ilk canlandırma sanatçıları olarak görülebilir. Bu sanatçılar tasarlamış olduğu karakterlerle birlikte yeni oluşturulacak olan karakter tasarımları için de hem ilham kaynağı hem de bir yol gösterici niteliğini taşımaktadır. Bir örnek olarak Winsor Zenic McCay (1869-1934) gazete karikatüristi olarak bilinmektedir. McCay'in çalışması olan Dinozor Gertie (Gertie the Dinosaur (1914)) ile izleyicilere çizgi film karakterlerinin çizim aşamalarını göstermektedir (bkz Görsel 1). Bu çalışma, zoomorfizm olgusunun çizgi karakterler üzerinde ki ilk örneği olarak görülmektedir. Gertie karakterinin verilen komutlara yanıt vermesi ve mamut karakterine alınganlık yaparak ağlaması, dans etmesi üzerinden dinazora karakter tasarımında insana özgü kavramlar yüklendiği görülmektedir.

**Görsel 1:** Winsor McCay, Dinozor Gertie, 1914.

**Kaynak:** <https://www.youtube.com/watch?v=32pzHWUTcPc>

Tasarlanan karakterler izleyicinin karaktere karşı yakın hissedebilmesi, her izleyicinin bir animasyon filminin içerisinde gündelik yaşamdan onu uzaklaştırabilecek karakterlerin olması,

karacterin ve öykünün anlamlı bağlantısı üzerine olan ilgi filmin izlenme olanağını arttırabilmektedir. Karakter tasarımı, günümüzde gelişen teknoloji ile birlikte birçok oyun, çizgi dizi, animasyon gibi alanları ilgilendiren sektörleri kapsamaktadır. Bu alanlar ile ilgilenen sektörler izleyicilerin veya oyuncuların bir ya da birden fazla kurgusal karakterlerin bulunduğu mecralarda hikâye anlatımı üzerinden karakterlerin farklılaşması için karakter tasarımına ihtiyaç duymaktadır.

### **KARAKTER TASARIM ÖĞELERİ**

Karakterlerin birbirlerinden farklılaşabilmesi için ise tasarlanan karakterin form ve renk üzerinden oluşturulabilmesi olduğu söylenebilir. Karakterin kişiliğini sağlayan form ise tasarım kurallarına uygun olarak anatomik oranlar içerisinde verilmesi gerekmektedir. Form, karakterin kolaylıkla ayırt edilebilecek bir siluete sahip olmaları açısından önemli sayılabilecek bir unsur olarakta görülebilir. Tasarlanan karaktere uyum sağlayacak olan kostüm ve aksesuarlar ise karakter tasarımında temel konuların içerisinde yer almaktadır. Karakter tasarımında form, genel hatlarıyla birlikte kabaca geometrik şekillerden oluşmaktadır. Bu geometrik şekiller tasarlanan karakterin kişiliği hakkında ön bilgi niteliği taşıyabilir. Bu yüzden yaratılmak istenen karakter için tasarlanacak olan formun özellikleri de önemlidir. Üçgen formlar sivri tavrıyla hareket, hız, gerilim ve tehlike, yuvarlak formlar sevimlilik, cana yakınlık, mutluluk ve rahatlık, kare formlar ise öfke, güven, inatçılık, dayanıklılık gibi çağrışımlar yaratmaktadır. Karakterin tasarlanan formu onu özgün kılan ilk unsur olarak görülebilir fakat formun yanı sıra karakterin kolaylıkla tanınmasında yardımcı olan bir diğer nokta ise silüettir. Siluet, forma bağlı kalınarak oluşturulmuş olan gölge eş zamanlı olarakta karakterin sahip olduğu özgün bir detay olarak belirtilebilir. Form ve siluet birleştiğinde izleyicinin ya da okuyucunun görsel algısına hitap ederek karakteri ayırt edebilmesini sağlamaktadır. Bir çizer tasarladığı karakterin silueti ile karakterin formu, saçının şekli, kostüm ve aksesuarları vb. görsel unsurları algılamasını kolaylaştırabilir. Bu sayede çizerin iyi bir şekilde tasarladığı siluet, karakterin görsel kimliğinin bir parçası haline gelebilir. Çizerin tasarlamış olduğu form ve siluetin tasarım kurallarına uygun anatomik oran ve denge içerisinde olması da önemli bir unsurdur. Karakterin yapısı tasarlanacak olan form üzerinden belirli ölçü ve oran dahilinde olmalıdır. Karakterdeki anatomik yapısı ve bu yapıyı oluşturan parçalar; ağırlık, yaş ve boy onun fiziksel kapasitesi üzerinden bir sınırlılık yaratabilir. Karakterlerin birbirleri arasında oluşan farklılık ise oran-orantıyla ilgilidir. Tasarlanmak istenen karaktere ait farklılıkları vurgulamak ve daha anlaşılır olması için oran orantı ilişkisiyle birlikte denge unsurundan yararlanır. Zafer Özden ve Çağdaş Ülgen (2015), karakterin kendi içerisinde ki oranlarını şu şekilde açıklamışlardır:

“Beden oranları saptanırken, ölçüt olarak baş kullanılmaktadır. Beden tasarlanırken beden başa oranla oluşturulmaktadır. Canlandırma filmlerinde karakter tasarımları, genellikle karakterlerin özelliklerine bağlı olarak iki baş ile dokuz baş arasında bir ölçü değeri içinde yapılmaktadır” Normal bir desen üzerinden değerlendirilecek olunursa bir insanın vücuduna oranı yedi-sekiz baş uzunluğu arasında değişmektedir. Bir çizer karakteri tasarlarırken karakterin kişilik yapısıyla anatomik yapısının birbirleriyle uyumlu ve denge içerisinde olacak şekilde tasarlanmaktadır. Sevimli bir karakterin formu yuvarlak olarak tasarlanırsa da bazen anatomik yapısı dengede olacak şekilde baş büyük, beden küçük olarak karşımıza çıkabilmektedir ya da baş küçük beden büyük olarak tasarlanan karakterler güçlü biri yenilmez bir karakter olarak tanımlanabilmektedir. Karakterin kişilik özelliklerini belirleyen bir diğer unsur ise karakterde ki renk kullanımınıdır. Renk, iletişimin doğal bir ögesi olarak sayılsa da insanlar için psikolojik etkileri olduğu gözlenmektedir. Bir bilgi yazılı olmasa dahi renkler aracılığı ile iletilmek istenen mesaj psikolojik bağlamda ve bilinçaltının etkisiyle insanların zihninde canlanabilmektedir. Renkler sıcak (sarı, kırmızı, turuncu) ve soğuk (mavi, yeşil, mor) olarak ikiye ayrılmaktadır. Genellikle sıcak renklerin insanları harekete geçirdiği ve canlılık uyandırdığı gözlenmektedir. Soğuk renklerin ise insanlarda sakinlik, güven ve rahatlık uyandırdığı söylenebilir. Algılama ve yorumlama üzerine renklerin döneme ve kültüre ait anlamlarının değişmesinden dolayı her bir rengin psikolojik etkisinin evrenselliğinden ve sürekliliğinden bahsetmek olumlu olmayabilir. Karakter tasarımında doğru renk dağılımının yapılması önemli bir unsurdur. Karakterlerin hareketlerinin rahatlıkla okunabilmesi, öykü ile birlikte karakterin kişilik özelliklerine ait renklerin seçilmesi ve karakterlerin bir araya geldiğinde anlamlı bir bütün oluşturabilmesi adına renkler karakter tasarımında önemli bir rol oynamaktadır. Karakter tasarımında renk kullanımının yanı sıra kostüm ve aksesuarlarda karaktere ayrıcalık kazandırabilmektedir. Karakter tasarımında kostüm ve aksesuar karakterin kişilik özelliklerini, bedensel özelliklerini, yaşadığı dönemi, içerisinde bulunduğu kültürü ve mesleği üzerine bilgi verme niteliği taşımaktadır. Karakter tasarımı yapılırken kostüm ve aksesuar (pelerin, şapka, baston, kılıç, çanta, vb.) karakterin formunu ve silüetini etkilediği gözlemlenmektedir. Bu nedenle karakterin kostüm ve aksesuar detayları tasarlanırken karakterin kişiliğine uyum sağlayacak ve bedensel görünümünü dikkate alınacak şekilde tasarlanması gerekmektedir. Karakter, hareket ve aksiyon yüklü ise tasarlanan kostüm ve aksesuarda izleyicide hareket uyandıracak nitelikte kıvrımlı çizgilere sahip olabilmektedir. Tam tersi karakter durağan bir kişiliğe sahip ise karakterin kostüm ve aksesuar tasarımında kullanılan çizgilerde sade, kıvrımdan uzak bir şekilde tasarlanabilmektedir. Karakter tasarımında form, silüet, anatomik

yapı, renk, kostüm ve aksesuar gibi karakter tasarım öğelerinin dışında karakterin dış görünüşünü, tarzını ve kişiliğini etkileyebilecek olan üslup öğelerinin olduğu söylenebilir.

Türk Dil Kurumu (TDK) üslup sözcüğünü şu şekilde tanımlamıştır: “Sanatçının görüş, duyuş ve anlayışındaki kendine özgü anlatış biçimi; biçem, hava, stil”(www.sozluk.gov.tr). Üslup, karakter tasarımında karakterin tarzını ve kişiliğini yansıtmada önemli bir rol oynamaktadır. Karakter tasarımında üslup, diğer tasarım öğelerinde olduğu gibi bütünlüğü etkileyebilmektedir. Karakter tasarım öğeleri, kullanılacak olan üsluba bağlı kalınacak ve uyumlu olunacak şekilde oluşturulmalıdır. Üslup aynı zamanda hedef kitleyi de oluşturabilmektedir. Karakter tasarımında kullanılan üslup basit ve sevimli ise çocuklar için tasarlanmış veya karmaşık detaylara yer veren gerçekçi bir üslup kullanılıyorsa yetişkinlere yönelik tasarlanmış olabilmektedir. Bu yaklaşımdan yola çıkılacak olursa bir çizimin tercih ettiği üsluba göre karakterlerin tasarımları da değişiklik gösterdiği söylenebilir. Bu araştırma kapsamında illüstrasyon alanı üzerinden karakter tasarım öğeleri ele alınarak Jetgiller çizgi dizisinin George, Jane, Judy, Elroy ve Astro karakterlerine günümüz tasarım üslubu olan flat yaklaşımının yansımaları incelenecektir.

### **FLAT TASARIM YAKLAŞIMINDA JETGİLLER KARAKTER TASARIM ÖRNEĞİ**

Jetgillerin yaratıcısı olan yapımcı ve yönetmen ekibi William Hanna ve Joseph Barbera olduğu bilinmektedir. 1950’lerin sonu ile 1960’ların ortası, Hanna ve Barbera’nın en yaratıcı dönemi olduğu söylenebilir. Hanna-Barbera Taş Devri, Ayı Yogi ve Jetgiller animasyon karakterleri ile ön plana çıkmaktadır. Jetgiller ilk olarak 1962-1963’e kadar eğlence kuşağı olarak bilinen prime time’da yayınlanmış olup daha sonra 1985-87 arasında yeni bölümleri tekrar üretilip gösterime sunulmuştur (Matt Novak, 2012). Jetgiller çizgi dizisinin ilk gösterime sunulduğu tarihten önce ki dönemlerde flat üslubunun başlangıcı olarak kabul görüldüğü söylenebilir. Jetgiller çizgi dizisinin tasarım üslubunda flat yaklaşımının izleri olduğu görülmektedir. İncelenecek olan karakterlerden ilki George Jetson’ dır. George, jetgiller çizgi dizisinin kurgusal bir karakteri olup aynı zamanda Jetgiller ailesinde baba rolünü üstlenmektedir. Düzenli olarak işine gidip gelen bir çalışan olarak bilinmektedir. George karakterinin tasarımında kullanılan form yapısı, geometrik bir yapı olup sade şekliyle ön plana çıkmaktadır. Karakterin formunda ki hatlar kontur çizgileri ile desteklenmektedir. Karakterde gölge kullanılmamış olup aynı zamanda anatomik yapısının üç boyutluluktan uzak yalın bir şekilde ve iki boyutlu olarak tasarlandığı görülmektedir. Karakterde tasarlanan kostüm, mavi pantolon, yeşil kemer, beyaz gömlek ve ayakkabıdan oluşmaktadır. Karakterin beyaz ayakkabısının üzerinde birbirine paralel konumlanan çember şeklinde bir çeşit sade aksesuar bulunmaktadır (bkz. Görsel 2).

**Görsel 2:** George Jetson

**Kaynak:** [https://adventures-of-chris-and-tifa.fandom.com/wiki/George\\_Jetson](https://adventures-of-chris-and-tifa.fandom.com/wiki/George_Jetson)

Jetgiller çizgi dizisinde inceleyecek olduğumuz bir başka karakter Jane Jetson' dır. Jane, Goerge karakterinin eşidir ve Jetgiller ailesinde anne rolünü üstlenmektedir. Jane bir ev hanımı aynı zamanda bakımlı olmayı ve alışverişi seven bir karakter olarak bilinmektedir. Karakterin form yapısı sade ve yalındır. Jane karakterinin formunu, kullanılan kontur çizgileri ön plana çıkarmaktadır. Karakterin iki boyutlu anatomik yapısı vardır. Jane üzerine tasarlanan kostüm sade bir elbise olup etek ucu detayı mor rengine yakın lila rengi tonuyla detaylandırıldığı gözlemlenmektedir. Karakterde sade yalın bir anlatımla inci küpeyi andıran bir aksesuar kullanıldığı görülmektedir (bkz. Görsel 3).

**Görsel 3:** Jane Jetson

**Kaynak:** <https://www.pxfuel.com/en/desktop-wallpaper-aenlg>

Jetgiler ailesinde incelenecek olan bir dięer karakter Judy Jetson'dır. Judy, George ve Jane'nin kızlarıdır. Jane daha çok fütüristik zevklere sahip olan bir kız olarak bilinmektedir. Karakterde kullanılan form yapısı sade bir geometrik şekle sahiptir. Judy karakterinin form yapısı kontur çizgileri kullanılarak desteklenmektedir. Karakterde gölge kullanılmamış olup iki boyutlu bir yapıya sahip olduęu gözlemlenmektedir. Judy karakterinin kostümü sade bir t-shirt, etek, çorap ve ayakkabıdan oluşmaktadır. Karakterin kostüm ayrıntıları fuşya renginin farklı tonları ile belirtilmektedir. Karakterde kullanılan toka aksesuarı sade, yalın, düz ve siyah renkli olduęu gözlemlenmektedir (bkz. Görsel 4).

**Görsel 4:** Judy Jetson

**Kaynak:** <https://tv.apple.com/us/movie/rockin-with-judy-jetson/umc.cmc.6vb9xrmitrldndso0km1280xa>

Jetson çizgi dizisinde incelenecek olan bir dięer karakter ise Elroy Jetson'dır. Elroy, Jetgiller ailesinin en küçük çocuęu olup George ve Jane'nin oęlu aynı zamanda Judy'nin erkek kardeři olarak bilinmektedir. Elroy, oldukça zeki bir çocuk aynı zamanda uzay bilimlerine meraklı olmasıyla ön plana çıkmaktadır. Karakter için kullanılan form yalın geometrik şekillerden oluşmaktadır. Gölge kullanılmamış olup detaylar kontur çizgileri ile ele alınmış, yapısı iki boyutlu olarak ön plana çıkmaktadır. Karakterin kostüm tasarımında yeşil sade bahçıvan kıyafeti, basit beyaz t-shirt ve birbirine paralel olarak sade bir anlatımla tasarlanmış olan çember detaylı şapka kullanıldığı gözlemlenmektedir (bkz. Görsel 5).

**Görsel 5:** Elroy Jetson

**Kaynak:** [https://warnerbros.fandom.com/wiki/Elroy\\_Jetson](https://warnerbros.fandom.com/wiki/Elroy_Jetson)

Jetgiller çizgi dizinde son olarak incelenecek karakter Astro'dur. Astro, Elroy Jetson'ın evcil hayvanı, George Jetson'ın en iyi arkadaşı olarak ve George ile uzay yürüyüşü yapmaktan hoşlandığı bilinmektedir. Astro hayvan karakterinin geometrik formları yalın bir anlatımla köpeği betimlemektedir. Anatomik yapı olarak bir insan boyutu andırmakta olup iki boyutlu olarak tasarlandığı görülmektedir. Karakter, kullanılan kontur çizgileri ile ön plana çıkmaktadır. Aksesuar olarak yeşil sade ve basit bir tasma kullanıldığı gözlemlenmektedir (bkz. Görsel 6).

**Görsel 6:** Astro

**Kaynak:** <https://animated-dogs.fandom.com/wiki/Astro>

## **SONUÇ**

İllüstrasyon alanında gerçekleştirilen uygulamaların çocuk ve yetişkin yönünden her yaşa hitap ettiği söylenebilir. Bununla birlikte resimlemenin eğlence sektöründe oyun, animasyon ve çizgi dizi gibi benzer birçok alanda farklı tasarım yaklaşımları ile ele alındığı gözlemlenebilmektedir. Günümüz teknolojisinin gelişmesiyle birlikte artan tüketim hızının tasarım yaklaşımlarına yansması sade, net, abartılardan ve görsel efektlerden uzak okunabilirliği kolay ve akıcı olması yönünden flat tasarımı günümüz tasarımlarında güçlü bir anlatım tekniği olarak kullanılmaktadır. Bu yaklaşım türü hala popülerliğini koruyor olsa da geçmiş dönemlerin tasarım anlayışlarında da izleri görülmektedir. Araştırma kapsamında incelenen Jetgiller çizgi dizisinin, flat tasarım yaklaşımı ile ele alındığı saptanmıştır. Bu yaklaşımın yapısı ve var olan anlatım dili geçmiş dönem tasarım anlayışlarında var olduğu görülmüştür. Araştırma üzerinden sunulan örnekler, karakter tasarımları ve tasarım öğeleri açısından incelendiğinde günümüz flat tasarımının bir yansıması olarak karşımıza çıkmaktadır.

**EVALUATION OF GERTRUDE STEIN'S STUDIO IN THE CONTEXT OF  
POSTMODERN MUSEUM PRACTICES**

**Kemal Barış İLBI**  
Ankara University

**Ceren Güner ÖZ**  
Ankara University

**ABSTRACT**

Today, museums are trying to adapt their exhibition and presentation techniques, approaches and practices to the environments in which new art is produced. In the definition of contemporary museum prepared by the International Council of Museums, it is emphasized that the museum is a non-profit, permanent institution that researches, collects, preserves, interprets, exhibits and is at the service of the society. Along with updating its functions with its new definition, the museum has become responsible for promoting diversity and sustainability as public, accessible and inclusive institutions. To provide a variety of experiences for education, entertainment and knowledge sharing; working ethically, professionally and with the participation of communities, as well as communicating with visitors and audiences, has been added to the definition as the functions that museums assume responsibility for. In this context, with the changing definition, important changes have started to occur in the content of museum visits and in the expectations of visitors. Museum visits, which have started to become individual journeys, become experiences that support lifelong learning with exhibitions that are created in accordance with this expectation that came to the fore with the new definition, and where principles such as "inclusivity", "learning by sharing", which are postmodern museum criteria, are focused and presented. In this study, the art studio of the American writer Gertrude Stein, which is described as "the first museum of modern art", is discussed through the concept of contemporary micro-museum. In this context, examples of museums that are open to diversity, encouraging intercultural communication, organized around Gertrude Stein's "salon-studio model" have been assessed in Turkey. The Adam Michiewicz Museum, Doğançay Museum, Orhan Kemal Museum and Ara Güler Museum in Istanbul, which are thought to be suitable for the salon-studio model in terms of content, were examined. It has also been discussed how the dissemination of the salon-studio model will contribute to the concept of postmodern museum and contemporary micro-museum practices.

**Keywords:** museum, museum studies, micromuseum, studio museum, Gertrude Stein

## **POSTMODERNISM, DIVERSITY, AND EVOLVING MUSEUMS**

### **Micro Museums**

In contrast to larger museums whose missions and ideals are acknowledged by the public, smaller museums that aim to give visitors a sense of the local and indigenous cultures have started to open in many nations throughout the world in the last century. These museums, which Candlin (2016) calls "Micro museums", generally concentrate on famous people who lived in different parts of the world and added value to the national or international community with their productions, courage or heroism, create exhibitions by displaying the objects these well-known individuals used when they were alive to celebrate their lives and commemorate their memories. The museums mentioned above, the majority of which are small-scale, focus on a single subject or theme outside of academic fields, are independent, and often employ more than ten paid staff members (Candlin, 2016, Hibbins, 2022). The micro museums have sparked a significant shift in the way that museums and museology are conceptualized and have made reformative advancements possible in the area. These spaces hosted exhibitions that were typically centered around the life of a particular artist or a specific theme. The context of any chosen subject served as the foundation for the development of the interaction between the shown objects and the audience. Since opening their doors to the public, particularly in rural areas, micro museums have concentrated on telling local and regional stories and have begun to host exhibitions with original artifacts and genuine local details to draw tourists to these areas (Hibbins, 2022, Vella, Cutajar, 2014). Micro museums, some of which have more flexible administrative structures, are not under the direct control of any national, regional, or local government agency or body. In other words, managerial interventions in the processes of exhibition formation and creation are less usual, according to Candlin (2016), therefore, micro museums are now the ones creating artistic production environments where multifaceted communication takes place by refocusing attention and concentration from culturally dominant formations to extraordinary ones. This is claimed to be the best way to demonstrate diversity and inclusivity, which is one of the key tenets of postmodern museums.

### **«Lost Generation» and Gertrude Stein's Salon**

Many thinkers and artists of the early 20th century attempted to combat the negative consequences of the depressing, conservative, and oppressive social codes, facts, and conventions of the preceding century, particularly just before World Wars I and II. The startling results of the economic downturns and crises that industrialized nations had through during that period forced society to reevaluate the social norms they had up until that point. Gertrude Stein,

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

*April 09-16, 2024 / Lisbon, Portugal*

a writer and art collector who was a key architect of the social change and transformation movement, was born into a Jewish American family in Allegheny, Pennsylvania, on February 3, 1874. Before moving back to the United States in 1880, Stein—who would later travel to Europe with her family—lived in two separate European cities: Vienna and Paris. The family moved back to America and lived in San Francisco. (Greelane, 2021). After his brother Leo Stein moved to Paris in the early 1900s, Gertrude Stein traveled to France in 1903. In the meantime, some American artists settled in Paris who would later lead new art movements, be a pioneer in social shifts, and have significant roles in the growth of that era's art world. The phrase "lost generation" was coined to characterize this group of people who had lived through the devastation caused by World War I, had witnessed its effects firsthand, had their lives completely upended, and had the guts to speak out against the judgmental, stereotyped values and oppressive lifestyles of the previous generation (Jaracz, 2021). F. Scott Fitzgerald, Gertrude Stein, Ernest Hemingway, and T.S. Eliot were among the writers and poets of this century and generation who relocated to Paris to breathe and immerse themselves in the inventive setting and reap the rewards of this vibrant and progressive milieu (Longley, 2020). In the same years, Gertrude Stein, who started to gain recognition as an authority and specialist on literature and art, welcomed Ernest Hemingway, F. Scott Fitzgerald, Sinclair, Cezanné, Henri Matisse, Pablo Picasso at her art hall, number 27, on Fleurus Street, according to Özsezgin (2015).

In short, Gertrude Stein created this space; the studio hall at 27 Fleurus Street where she hosted writers and painters who were considered "extraordinary" at the time but are now recognized as the most prominent artists and intellectuals of the 20th century. The space evolved into a micro art museum and collective production area where dynamic discussions took place to spark the development of modern art concepts and criteria. As an interdisciplinary interaction space and a shared cluster, Stein's Hall can be regarded as a place where one of the indispensable merits is valued in postmodern museum criteria, given its direct impact on the art creative processes across many fields. Gertrude Stein's 'Salon' also fostered the artistic understanding of the era and established a liberating and queer atmosphere; It evolved into a location that not only meets but also exceeds the requirements of many postmodern and modern museums, helping to shape some of them. In addition, given the content of the collection in the hall and the diversity of the audience and participants, Gertrude Stein's "Studio" was a platform that united various groups and visits which would trigger the creation, sharing, intercultural and interdisciplinary learning processes that individuals were happy with.

### **Method and Scope**

This study was designed as descriptive research in the document scanning model. The screening model is a research model that aims to detect a past and present situation as it exists. In the study, a literature review was conducted, accompanied by written and visual texts, about Gertrude Stein's artist identity, her works, her studies and the salon-studio museum model she created; documents and examples related to micro museums were examined, and the findings were edited and shared as they existed. The document of this study is four Studio - Art and Artist Museums: Adam Michiewicz Museum, Doğançay Museum, Orhan Kemal Museum and Ara Güler Museum, which serve in Turkey and have the status of private museums within the framework of Gertrude Stein's "Salon - Studio museum" example. These museums were first identified and examined as micro museum examples, examples of art museums or studio museums. Secondly, web pages and publications related to the identified museums were searched; they were visited by the researcher between 2021 and 2023, and the collected data was compiled into a report and presented as suggestions.

The data of the research were collected with structured interview forms and researcher observation notes. The researcher asked the following questions to the experts working in relevant museums:

1. Does the museum have an information brochure/booklet prepared in different languages using universal intercultural elements?
2. Does the museum have object labels, touch screens that introduce objects, etc.? Have the items been prepared in different languages in a way that can attract the attention of different age groups?
3. Have exhibitions been prepared and presentations focused on audience participation in the museum?
4. Are the physical conditions and facilities of the museum (education room, recreation areas, cafe, etc.) arranged in a way where "vulnerable and disadvantaged" groups can come together and share their impressions about the museum?
5. Are there activities in the museum that will support the co-creation and sharing process for the participation of different groups?
6. Are interactive methods centered on advanced technology that will support active and lifelong learning used in the museum?
7. Are social media accounts used to introduce museum exhibitions?

### **Findings and Interpretation**

Numerous small-scale museums featuring individuals and artists can be found across Turkey's cities. To assess if these museums are near an inclusive museum model open to cultural diversity that can be created based on Gertrude Stein's "Salon - Studio," it is necessary to determine whether their management styles adhere to contemporary postmodern museum understanding and criteria, whether the exhibitions organized are constructed by applying postmodern presentation methods, and so on. While carrying out this research, four of the "artist-important person" museums that met the micro museum criteria that were open to visitors in Istanbul were selected and visited by the researcher between 2021 and 2023. Before these research trips, an evaluation form containing postmodern micro museum criteria was prepared and the museums visited were examined in line with these criteria.

### **MICRO ART MUSEUMS IN THE RESEARCH**

#### **Adam Mickiewicz Museum**

Adam Mickiewicz Museum, located in the center of Istanbul as an artist museum, was converted from a residence to a museum in 1955. The museum building is important because it is the house where Adam Mickiewicz lived until 1855 (Bektaş and Yalçınkaya, 2020). Mickiewicz is a poet, patriot and the most important representative of Romanticism in Polish literature, the author of the Polish national epic, who is equated with names such as George Byron and Johann Wolfgang Goethe. The Adam Mickiewicz Museum has a comprehensive booklet on Mickiewicz published by the Polish Consulate General. This booklet consists of articles full of biographical elements such as the poet's personal history, why and when he came to Istanbul, examples of his poems, and articles about the history of the museum. The museum booklet is prepared only in Turkish. Since this booklet is an example prepared using encyclopaedic information about the poet, the museum, the street and the district (Pera) where it is located, rather than a museum brochure that will appeal to different communities or age groups, the intended audience is limited to a certain intellectual group. Since Mickiewicz is a national poet of Poland, these articles, which center on the historical, social, and cultural ties between the two nations, were penned by highly qualified experts and academics; however, audiences from different age groups and social classes will find them uninteresting. The audience can be drawn in by the "history strip" prepared and hung on the museum walls in three languages (Turkish, English, and Polish). It was made with historical details from both cultures, the poet's personal effects, and the hallways brimming with details and artifacts unique to the local Polish culture. Although the identity cards of the objects on display are meticulously

created, there is not enough information or explanation to spark interest across various age and cultural groups. The museum's digital presentations give visitors detailed information on the subject matter. The "poem tree" artwork on the third level, which is constructed out of tiny book pages, is one of the exhibitions important tools that emphasizes audience engagement and is thought to be an application to boost visitor contact. These little sheets of the poet's many poems are available for readers to read. If they'd like, they can even tear off a branch from one of the pages and carry it with them as a tangible reminder of their trip to the museum. In the three-storey museum building, an infrastructure system has not been created to allow disabled visitors to access the museum floors. While the well-designed seating areas placed on each floor of the museum enable the audience to rest and evaluate the objects they see, yet the terrace on the top floor of the building is not actively used. There are no activities in the museum that will enable the participation of different groups, and there is no museum educator who can communicate with the audience. Therefore, as emphasized by Taylor and Neill (2008), it is not possible for educational activities, which are considered the strongest aspect of contemporary museums in the context of social studies, to be carried out with a planned educator. Furthermore, the museum lacks a social media presence on any platform that could promote more interpersonal communication. The Adam Michiewicz Museum is described on the Ministry's website /museumkart website in both Turkish and English, along with a few images and a brief description, like other museums under the Ministry of Culture and Tourism.

### **Doğançay Museum**

Turkey's first museum dedicated to modern art; Doğançay Museum opened its doors to the public in 2004 (Doğançay Museum, 2023). With collections curated from artist Burhan Doğançay's works from the past to the present, the museum provides an opportunity to explore the artist's evolving understanding of art throughout time as well as look at his paintings. Burhan Doğançay's works exhibited in the museum include his figurative works; In the cities where he lived during his maturity period, he produced works inspired by the walls, which he saw as the most important sharing environments of the post-modern city and depicted as platforms where all the myths and stories about the city could be solved, etc. (Doğançay Museum, 2023). The museum also gives visitors the chance to compare the works produced by the Doğançays, and therefore to follow the differences in both style and content in the art perceptions and approaches of the Doğançays, father and son, and the traces left by the social movements and art movements of the historical periods in which they lived. The museum visitor guide booklet is meant to serve as a reference book for art enthusiasts of all ages and backgrounds, as it

provides extensive information about the painter's life, artwork, and museum exhibits. This contrasts with the brochures and promotional booklets, which lack the comprehensiveness necessary to appeal to various audiences, communities, or age groups. The five-storey Doğançay Museum's well-designed display galleries and lighting system allow it to present the works of Burhan and Adil Doğançay in a spectacular fashion by placing them within their respective historical artistic periods. Audiences from a variety of age groups and cultural backgrounds can enjoy visiting the museum because the bilingual tags of the works are placed in convenient locations, are readable without complicating the presentation of the works, and allow users to download the necessary information to their smartphones via the QR codes prepared for each work. Furthermore, information regarding the time periods in which the works were produced can be accessed by scanning the QR codes that have been placed next to the artwork. One can also create a personal connection with the artist by traveling to the historical process and setting in which the artists created their works through listening to the significant music of the era. Although more interactive and audience-oriented technological methods such as touch screens are not used, the use of important musical works of the period as another art that could trigger the production of painting enable the audience to establish a personal relationship with the exhibited works and make the museum experience more permanent. The museum offers services such as teahouses and elevators designed to facilitate the travels of both general visitors and disadvantaged groups and provide them with a respite. Therefore, a visitor who wants to visit the museum in a wheelchair can go to the upper floors by elevator. Important steps taken to ensure the continuity of the museum include not ignoring this issue, which is crucial for audience inclusion, and fostering an atmosphere where guests from various groups can congregate and discuss their thoughts about the works, thanks to the free tea hours held at specific times in the ground floor teahouse. The museum hosts a few lectures and activities that are open to participation from various organizations. For instance: Since September 2021, the museum's culture and art center has hosted the "Beyond Borders" event, which has facilitated discussions between professionals and academics and young people. The series of seminars called "Beyond Borders" is the first of the Doğançay Museum online seminars.

### **Orhan Kemal Museum**

Orhan Kemal Museum was established in 2000 with the contributions of the Orhan Kemal Culture and Arts Coordination Office on the ground floor of a five-storey building in Beyoğlu, with the aim of keeping the memory of the writer Orhan Kemal alive. In the museum, objects

used by Orhan Kemal in certain periods of his life (his glasses, his typewriter, which was one of the most important objects in the construction and shaping of a writer's production area during his lifetime, etc.), his private belongings, private correspondence, family photographs and photographs taken by the famous photographer Ara Güler are exhibited (Hürriyet, 2023). All works in the museum are exhibited with "object-oriented" classical presentation techniques and lighting system. The works were not presented with more technologically advanced applications like touch displays or Barco vision, which may draw in audiences of all ages. The preparation of item tags, which are primarily date tags, is limited to Turkish, making it difficult for audiences and visitors from other countries or cultures to comprehend and relate to the significance of the objects, their histories, and general background. Audience interaction is not feasible because all the museum's works are exhibited using "object-oriented" display systems and lighting processes. Stated differently, the museum does not employ strategies that would boost attendance by endorsing the technology-driven education-entertainment model. Other than leaving notes in the "memory book" located at the museum's entry, there isn't any activity in which the audience can actively participate. The rooms housing the exhibits on display are the only areas of the museum, which is housed in a tiny flat. The Orhan Kemal Museum draws interest from both domestic and foreign tourists due to its status as an artist-museum named after a significant and well-known writer, as well as the writer's and his works' significant influence in both Turkey and the global literary community. To put it succinctly, the museum's display of its artifacts lacks interactivity, and its planned programs play little part in drawing in people from diverse cultural backgrounds.

### **Ara Güler Museum**

A micromuseum with a similar concept, Ara Güler Museum, converted the old Bomonti Beer Factory into a cultural socializing platform in the city's centre, making it one of the public collective production spaces. In honour of renowned photographer Ara Güler, one of Istanbul's most significant memory collectors, the museum opened its doors in 2018. The museum strives to fulfil these objectives and missions. It was founded to preserve the images that Ara Güler took over the years and present them to the younger generations. It also aims to create both temporary and permanent exhibitions using selected frames from its archive and to make them accessible to audiences interested in photography from a variety of social backgrounds. The 2018 opening of the Ara Güler Museum in Bomontiada and its exhibitions have become a significant link in the formation of ties between various social classes because of the imprints they leave on the city's cultural memory and the interactive and transitional dialogue they foster

within people. The "A Handful of Beautiful People" exhibition welcomes guests into the museum's rooms, which are exceptionally well-designed for a photography museum, maintaining the exhibitions' genuine appearance and meticulous preparation, from the presentations to the well-chosen photos. Books about Ara Güler and his work, which are compiled from his archive, are available for purchase on the museum store's shelves, but no brochure regarding the museum's founding or the current show is available for viewing. Examining the works is made easier by the efficient lighting system that illuminates the panel dividers made of the walls. The fact that date strips and object tags are generated in both Turkish and English gives viewers from other cultures or countries an advantage in terms of information accessibility. The effect created by exhibition presentations made inside the texture of a historical place allows visitors to feel as though they are a part of the works and the historical processes in which they were produced. Because of this genuine environment, the museum has grown to be a significant hub for public acculturation as well as a gathering place and sociability hub for visitors. Specifically, the museum's interior architecture is showcased through its design, which includes exhibition spaces and seating arrangements tailored to suit various audience demographics. While speaking with museum authorities, it was learned that a few workshops and events had been planned for the participation of various organizations; however, no formal program or informational brochure had been prepared for these events. Because it is an artist-museum named after a significant and well-known artist, like Doğançay and Orhan Kemal Museum, and because Ara Güler's works are well-known in Turkey and throughout the world of art, the museum draws both domestic and foreign visitors. The Ara Güler Museum has also active social media profiles in addition to a webpage with basic information about the institution.

### **Conclusion**

Museums are communal centers of acculturation and socialization that seek to build bridges between the past, present and future, offer meaningful experiences to communities and individuals while striving to achieve this purpose and mission, and aim to strengthen communication between societies and cultures by eliminating prejudices. (Anonymous cited by Yılmaz, Er, 2020: 171).

Today, technology is used to create spaces where unlimited communication takes place seamlessly in such an addictive manner, and where our emotions and feelings become a commodity for consumption. Although these socializing environments are spaces created to encourage the strengthening of people's bonds with each other and to support the dialogue

between cultures and different communities, these channels are created to provide instant information exchange and flow rather than to reinforce the communication between individuals. As a result of the excessive and unnecessary use of these spaces, the life arteries of many individuals are blocked, the functional abilities they need to use in daily life are restricted, and it is observed that they become identities with serious problems of focusing. The atmosphere created by these "sharing spaces" aims to make individuals visible instead of creating common grounds upon which they might share and exchange ideas with one another.

Owing to the controversial phenomenon and practice of radical democracy imposed by global capitalism, in which all our personal data is systematically stored and stocked, and which has been simply developed by being placed in the centre of the concept of "deconstruction", one of the postmodern philosophical approaches defined by Derrida (2012), different communities living in the world are forced to live in their own bubbles. In short, modern human, far beyond meeting in common spaces, communities, together with the groups they are characterized by, live their lives in ghettos where they affirm their existence by constantly "otherizing" the others through the social networks they have established with only those who are like them in the safe cocoons created. Despite opinions to the contrary, it is a first-hand reality of our times that there are significant differences between making an identity or a group visible or being aware of the existence of such an identity or group, and encouraging and promoting the creation of spaces where different communities can build social and cultural bridges with each other.

"Homes", which in the past were spaces characterized by the connotations of a "warm" word like "nest" and where individuals with certain common values and habits led their lives together, are now defined in completely different terms. It is no coincidence that the concept of "living space" is defined as an area with the facilities of shopping malls, where you can establish ties and be valued only as long as you consume and spend, or that it evolves into a quality to create such a perception. As one of the compasses of sociocultural change, it is impossible for contemporary museums to remain indifferent to the waves of sociocultural transformation. For this reason, like the evolution of the concept of "home", the concept of museum has been defined with many different qualities and characteristics attributed by governments and societies throughout the course of history.

Today, principles such as "inclusiveness and diversity" or "creating common spaces that foster communication between communities and cultures" which are often underlined and emphasized as being parts of the criteria and trends of contemporary museums, have found their way among the constituents of the up-to-date standards of museums especially because of the reformist

social and cultural movements of the previous century. These concepts have been included in the contemporary museum definition because of difficult processes, painful social resistances and fractions, and have changed the traditional understanding and concept of the museum from scratch, thus becoming phenomena that has diverted and shaped postmodern museum practices. As a result of the imposition of today's lifestyle, museums, which are now identified with the concept of "shopping mall museum", are managed with an institutional structure like the administrative organization of international "fast food" restaurant chains. For this reason, most of the above-mentioned contemporary museum criteria which are of great importance for the creation of an environment of social harmony and tolerance remain on paper without being put into practice, or processes during which the speed and duration of an activity during these applications prevent the continuity of learning can be experienced. Moreover, in some large-scale museums, the use of technology has become more of the goal itself than a means to an end, resulting in the satisfaction of individual's own curiosity being elevated to the top of the list of museum experiences. Thus, the audience becomes more interested in the technological device that is supposed to make the presentation interactive than in creating bonds with the objects on display. For this reason, this study, which makes it possible to thoroughly examine the periods and spaces at which social movements and civil rights struggles changing the history of the world and becoming a touchstone by transforming the traditional understanding of art and the concept of the museum, focuses on evaluating the approaches of postmodern museums in the perspective of a micro-scale art museum. In addition to this, this research aims to answer the questions about how today's museums can benefit from the structure of these formations by being fascinated by the common spaces created organically in different art circles, without prescribed programs or calendars. Therefore, while examining one of the best examples of these spaces, the famous studio of Gertrude Stein who was recognized as an art expert in Parisian art circles in the beginning of the last century, this study had the chance to evaluate both the concept of contemporary museum through the definitions of micro-scale museums and the single artist museums in Turkey in the context of the mentioned criteria. Moreover, in this study, micro-scale museums are in focus since there are many examples and experiences showing that postmodern museum trends and practices, as explained in detail with examples above, sometimes lose their functionality in large-scale and international museums and are presented as part of their institutional identity for the sake of "political correctness". In line with this focus, it has been determined that Doğançay Museum, which is only one of the four single artist museums visited in Istanbul, organizes exhibitions and presentations with an awareness of

contemporary museum trends, and tries to apply postmodern museum criteria within the limits of possibilities. On the other hand, the Adam Michiewicz Museum and the Ara Güler Museum generally emphasize postmodern presentation practices, while the Orhan Kemal Museum, by using traditional presentation techniques, displays an approach which is far from inclusiveness. During this study, another small-scale museum, the "Museum of Innocence" of the famous novelist Orhan Pamuk, which received the European Museum of the Year Award in 2014, was also visited. Although the Museum of Innocence did not become one of the subjects of this study due to its being based on fictional characters and plot, the important role of this museum in the development of new generation small-scale museums, especially in Turkey, is undeniable, both in terms of the originality of its collection and the presentation of objects. However, although the interior design of the museum building was impressively created in a way that emphasizes the presentation of objects with details that deepen the museum experience, the Museum of Innocence, like the other small-scale museums in the scope of the research, except the Doğançay Museum, is weak in terms of audience inclusiveness. Due to the architecture of the building, an elevator cannot be installed, so a viewer in a wheelchair can only visit the first floor, while the limited space of the museum is an obstacle to the creation of an interactive environment where intercultural exchange is encouraged, and any museum education can take place. While today's technology (film projectors, audio guides, etc.) is used only to add dimension to the presentation techniques and exhibition methods, the museum does not organize any activities that visitors can participate in and turn their museum visit into a personal experience, except for the copies of Orhan Pamuk's Museum of Innocence in various languages, the novel from which the museum's fictional display was adapted, placed in the resting areas for the visitors to be able to read the sections where the objects on display are mentioned. To sum up, even the "Museum of Innocence", a small-scale museum with international recognition and relatively more opportunities, connections and importance, has difficulty in creating a contemporary perception of a "queer" museum that is interculturally and internationally dynamic and transitional, which the Steins created in the early 1900s by centring the energy of inclusive artistic production. Except for the "poetry tree" activity at the Adam Michiewicz Museum, none of the museums visited had any interactive activities that would involve the audience in one-on-one participation and thus support hands-on learning. In short, only one of these museums has tried to make the audience a part of the visit by designing only one activity. The fact that the Ara Güler Museum does not have an information brochure or booklet that can be understood by different national and international communities in different

languages, using universal intercultural elements, certainly shows that it is one step behind the other museums in terms of inclusiveness. The fact that only Doğançay Museum has a well-developed website that is open to social interaction, and that it organizes educational activities and workshops makes it clear that the other three museums are not in active interaction with the audience. During these visits, it was found that micro-scale organizations, such as single artist museums in Istanbul, primarily lack sufficient financial resources and supporters. This is the primary reason preventing micro-scale museums from organizing more inclusive exhibitions and reaching different audiences. Nevertheless, setting up social media accounts that can be used effectively is an effortless, fast and cost-effective process nowadays. The need for large financial powers or powerful sponsoring companies to feed the social interaction created by these platforms with marketing strategies targeting different age groups and cultural communities, and thus to reach museum audiences, has considerably decreased. Therefore, these financial difficulties, which are also cited as the reason for the lack of audience interest in single artist museums, can actually be overcome in a quicker way with a properly utilized workforce and energy, thanks to the online establishment of connections and social networks similar to those that the Steins established in the first quarter of the 1900s by visiting art salons and various exhibitions in Paris. In short, the first step for today's micro-scale single artist museums to become places where the inclusive, diverse, cross-cultural, interdisciplinary and open atmosphere of Gertrude Stein's salon can be experienced will be the effective use of the right social media tools. Increasing interaction between individuals and communities using targeted marketing techniques and advertising methods will be the second important step, as it will lead to the recognition of the names, images and logos of these museums in different online groups. Gertrude Stein's studio became a common space of freedom across borders, where the art of the period was passed through communities, and where artistic and intellectual production was constantly nourished both individually and collectively. The fact that Gertrude Stein, the owner of the salon, the creator and supporter of this "queer" environment, who was seen as an authority on art and literature at the time, shared social and artistic developments, movements and changes with those who visited her studio and created discussions aligns with the definition of the contemporary museum educator. Therefore, one of the steps that today's micro-scale single artist museums can take to create the aforementioned dynamic and transitional environment is to work with a well-equipped museum educator to ensure that the audience transforms their museum visit into a meaningful experience. Gertrude Stein also opened the modest and homely walls of her studio, which she covered from one side to the other with

original and the most widely discussed paintings of the period, to every viewer interested in art, even though it is now considered a traditional, object-oriented display technique. The fact that these valuable works of art were taken from the familiar exhibition halls and started to be exhibited in an authentic house-workshop with a composition focusing mainly on the "modern art theme" coincides with the logic of contemporary exhibition display that today's curators strive to create. It is a fact that the "walls" of the studio are the most advanced technological tool that could be used at the time for the display of the works; however, the fact that an authentic atmosphere where one-on-one discussions could be held with the artists who created the works in front of these walls was presented to the audience with a thematic exhibition display makes Stein's studio one of the pioneering spaces where the educational activities of contemporary museums are taking place. At this point, if today's micro-scale single artist museums adopt a similar vision and organize face-to-face or online "edu-tainment" oriented events using today's technology, they will provide an information flow that will strengthen the audience's bond with the objects exhibited, and thus, these museums will have taken a step to support the phenomenon of lifelong learning. To summarize, considering the suggestions above, the modeling and dissemination of the inclusive, diverse, intercultural, interdisciplinary atmosphere of Gertrude Stein's salon as a micro-museum is considered as a valuable effort for the postmodern museum concept. Moreover, the implementation of such a modeling is thought to contribute both to the cultural and artistic exchange that will take place in a more organic way and to the sustainability of micro-scale and large-scale museum practices in the long term, especially in the post-Covid period. Following the formation and development processes of micro-museums and supporting them with research will create spaces for sharing stories that are trapped in between due to dominant policies by supporting to open out the door to the diversity and polyphony of cultural exchange within national and international areas.

**Özet**

Antik çağlardan beri geleneksel olarak bitkilerin, gövde, yaprak, kök, meyve, çiçek gibi kısımlarının ve saflaştırılmış fitokimyasal bileşiklerin çeşitli tıbbi durumların tedavisinde mevcut olduğu görülmektedir. Fitokimyasallar bitkilere rengini, lezzetini ve kokusunu veren bileşiklerdir. Bu bileşiklerin şifalı bitkilerin tıbbi özelliklerinden ve sağlık yararlarından büyük ölçüde sorumlu olduğu düşünülmektedir. Bununla birlikte fitokimyasallar aynı zamanda zehirli ve toksik kimyasalları da içermektedir. Bitki kaynaklı metabolitler ve şifalı bitkiler dünya çapında tüm kültürler tarafından uygulanmış ve birçok tıbbi ve farmakolojik amaç ile terapötik değerleri tarihsel olarak kanıtlanmıştır. Iğdır ilinde yaşayanların çoğu kırsal alanda yaşadığı için doğal bitkiler ile yakın ilişkide olup şifalı bitkileri gıda veya tıbbi amaçla kullanmaktadır. Geleneksel olarak kullanılan bitkilerin yan etkilerinin az olması veya hiç olmaması ve doğada çok fazla bulunması nedeniyle alternatif tedavi olarak kullanılmaktadır. Bitkisel ekstraktlar, köklerinden, yapraklarından veya çiçeklerinden elde edilenlerin yara iyileşmesini hızlandırıcı etkilere sahip olduğu bilimsel çalışmalarca gösterilmiştir. Bu ekstraktlar, antibakteriyel etkileriyle birlikte kollajen sentezini artırma, yara iyileşmesinin proliferasyon fazını uyarıcı, fibroblastları stimüle edici, antimikrobiyal ve antioksidan özellikler sergilemektedir. Tıbbi bitkiler genellikle iyileşme sürecinin en az bir fazını etkilemekte ve yara iyileşmesi için uygun bir ortam olan nemli bir alan sağlamaktadırlar. Iğdır ilinde halk arasında yara tedavisi için Belhavis, Buğa tikanı, Camışgulağı, Gılıçotu, Horoz pipiği, Kötangoparan, Kuş eppeği ve Öküzguyruğu, gibi bitkisel ürünlerin etkili olduğu ve kullanılabileceği belirtilmiştir. Bu çalışmada Iğdır ilinde yara bakımında yaygın olarak kullanılan fitoterapötik bitkilerin özellikleri hakkında bilgi vermek amacıyla yazılmıştır.

**PHYTOTHERAPEUTIC PLANTS COMMONLY USED IN WOUND CARE IN İĞDIR  
PROVINCE**

**Abstract**

Traditionally since ancient times, parts of plants such as stems, leaves, roots, fruits, flowers and purified phytochemical compounds have been available for the treatment of various medical conditions. Phytochemicals are compounds that give plants their colour, flavour and smell. These compounds are thought to be largely responsible for the medicinal properties and health benefits of medicinal plants. However, phytochemicals also contain poisonous and toxic chemicals. Plant-derived metabolites and medicinal plants have been applied by all cultures worldwide and have historically proven their therapeutic value for many medicinal and pharmacological purposes. Since most of the people living in İğdir province live in rural areas, they are in close contact with natural plants and use medicinal plants for food or medicinal purposes. Traditionally used plants are used as alternative treatment because they have few or no side effects and are abundant in nature. Herbal extracts, obtained from roots, leaves or flowers, have been shown by scientific studies to have accelerating effects on wound healing. These extracts exhibit antimicrobial and antioxidant properties, increasing collagen synthesis, stimulating the proliferation phase of wound healing, stimulating fibroblasts, along with antibacterial effects. Medicinal plants usually influence at least one phase of the healing process and provide a moist area, which is a favourable environment for wound healing. It was stated that herbal products such as Belhevis, Buğa tikanı, Camışgulağı, Gılıçotu, Horoz pipiği, Kötangoparan, Kuş epeği and Öküzguyruğu can be effective and used for wound treatment among the people in İğdir province. This study was written to give information about the properties of phytotherapeutic plants commonly used in wound care in İğdir province.

**Keywords:** Phytotherapeutic, Wound Care, İğdir

## **Introduction**

Medicinal plants have been practised by all cultures worldwide and have historically proven their therapeutic value for many medicinal and pharmacological purposes (Kadri, 2023). Phytochemical compounds derived from medicinal plants are reported to achieve maximum efficacy with proven therapeutic potential in the treatment of recently emerging and chronic diseases (Kadri, 2023). Phytochemicals are compounds that give plants their colour, flavour and smell. Phytochemicals are compounds that give plants their colour, flavour and smell (Kong et al., 2021). Traditionally since ancient times, parts of plants such as stems, leaves, roots, fruits, flowers and purified phytochemical compounds have been available for the treatment of various medical conditions (Parthasarathy & Evan Prince, 2021). Phytochemicals are essential components of plants that reduce necrotic cell death, restore the antioxidant defence mechanism, limit oxidative stress and prevent tissue inflammation and mitochondrial dysfunction (Parthasarathy & Evan Prince, 2021). In contemporary society, there is an increasing trend towards the use of natural products and medicinal plants for the prevention and treatment of diseases. However, it is important to remember that not all natural products are harmless and their effectiveness must be evaluated through scientific research (Vardar, Mollahaliloğlu, & Öztaş, 2018). Since most of the people living in Iğdır province live in rural areas, they are in close contact with natural plants and use medicinal plants for food or medicinal purposes. Traditionally used plants are used as alternative therapies because they have few or no side effects and are widely available in nature (Altundağ, 2009). Phytochemical compounds obtained from the roots, leaves or flowers of plants have been shown by scientific studies to have wound healing accelerating effects (Bedir & Turgut, 2021). Due to their positive effects on wound healing, plants are often used in holistic medicine (Sürme & Çürük, 2020).

## **Wound Healing**

Wound healing is a complex physiological process involving highly organized cellular, humoral and molecular mechanisms (Tsourdi, Barthel, Rietzsch, Reichel, & Bornstein, 2013). Delayed wound healing represents a major challenge not only for the patient but also for the healthcare system in general. One of the many ways to overcome this challenge is to use herbal remedies and developments that have been widely used in folk medicine for centuries (Rajput, 2022). During the wound healing process, cells, growth factors and cytokines interact with each other to close the lesion (Parlar Köprülü, Mutlu, İpekçi, & Okur, 2022). This interaction process consists of haemostasis, inflammation, proliferative and remodelling stages as shown in Figure 1. (Miraj et al., 2023). The first stage is haemostasis, in which the coagulation cascade is

activated and blood loss is prevented by the formation of a fibrin clot (Kaviyalakshmi & Mekala, 2021; Parlar Köprülü et al., 2022). The second phase is the inflammation phase, which begins after the injury has occurred and can last up to 6 days (Tsourdi et al., 2013). The onset of the inflammatory phase occurs with the secretion of proteolytic enzymes and proinflammatory cytokines from immune cells at the wound site (Varghese & Shinde, 2021). Inflammatory cells produce reactive oxygen species (ROS), which are found at higher levels in chronic wounds and burns. ROS prevent the entry of microorganisms and bacteria. In addition, foreign particles and tissue debris are removed by macrophages and neutrophils during the inflammatory phase (Mirhaj, Labbaf, Tavakoli, & Seifalian, 2022). The next phase is proliferation, which starts 4 days after injury and can last up to 14 days. In this phase, re-epithelialisation and granulation tissue formation occurs (Varghese & Shinde, 2021). The final stage of wound healing is the remodelling (maturation) stage in which type III collagen is replaced by type I collagen (Park, Hwang, & Yoon, 2017; Ribatti & Crivellato, 2012).

**Figure 1.** Shows the wound healing process schematically. (Mirhaj et al., 2022)

**Faz 1:** Haemostasis, **Faz 2:** Inflammation, **Faz 3:** Proliferative, **Faz 4:** Remodelling

For the treatment and management of wounds, some medicinal plants have been shown to be effective wound healers (Jarić et al., 2018). For example, *Terminalia arjuna*, a member of the Combretaceae family, commonly known as Arjuna in India, is a common plant that can be found all over India. It is used for healing wounds (Rajput, 2022). It is also a member of the *Salvia officinalis* (Lamiaceae) family, which grows widely in Iran and is popularly known as sage. It is stated to be effective in wound healing (Farahpour, Pirkhezr, Ashrafian, & Sonboli, 2020). In addition, the Aloe vera plant, which belongs to the Liliaceae family, has been used in many countries such as Greece, China and Mexico since B.C. It has been used traditionally since 1500. Showed that it can improve the wound healing process and reduce inflammation (Hekmatpou, Mehrabi, Rahzani, & Aminiyan, 2019). Many herbs are used as wound healing agents in Turkey (Fatma & Afife, 2019). In Iğdır province of Turkey, it is stated that herbal

products such as Belhavis, Buğa tikanı, Camışgulağı, Gılıçotu, Horoz pipiği, Kötangoparan, Kuş eppeği and Öküzguyruğu are effective and can be used for wound treatment (Table 1.). This study was written to give information about the properties of phytotherapeutic plants commonly used in wound care in Iğdır province.

**Table 1.** Phytotherapeutic plants commonly used in wound care in Iğdır province

No	Family	Plant Name (Scientific)	Plant Name (local)	Part Used	Method of use
1	Plantaginaceae	Plantago major	Bağa yaprağı, Belhevis	Leaves	Leaves are used externally to treat boils and as a wound healer..
2	Apiaceae	Eryngium billardieri Delar	Buğa tikanı, Boğa dikenini, Demir tikanı	Root and Body	While the root parts are used in the treatment of haemorrhoids, the stem parts are also used in wound treatment.
3	Crassulaceae	Sedum telephium subsp. maximum	Camışgulağı	Leaves	Leaves are crushed and placed on the wounds on the skin.
4	Plantaginaceae	Plantago lanceolata	Gılıçotu, Kılıçotu	Leaves	The leaves are applied externally as a blood stopper in cuts and as an anti-inflammatory in festering wounds. It is used as a wound healer and in the treatment of boils.
5	Caryophyllaceae	Silene compacta	Horoz pipiği	Leaves	Leaves are crushed and applied externally as a wound healer
6	Asteraceae	Centaurea glastifolia	Kötangoparan, Kotankıran	Leaves	The leaves are crushed and applied externally as a blood stopper and wound healer.
7	Brassicaceae	Capsella bursa- pastoris	Kuş eppeği	Body	The above-ground parts are crushed and applied externally to bleeding wounds as a blood stopper.
8	Lamiaceae	Leonurus glaucescens	Öküzguyruğu	Root	The root is boiled, dough is made from the juice obtained and applied externally to inflamed wounds.

### 1. Bağa yaprağı, Belhevis

Plantago major, commonly known as Bağa yaprağı or Belhavis, is a widely used medicinal plant from the Plantaginaceae family (Altundağ, 2009; Najafian, Hamed, Farshchi, & Feyzabadi, 2018; Bayrakdar & Keleş, 2024). Plantago major is a herbaceous perennial plant with leaves that grow in rosettes, are elliptic-oval in shape and have between 5 and 9 veins. The plant usually grows up to 15 cm in height, but can vary in size depending on the growing environment (Akbaş, 2019). Plantago major is a plant native to a large area of Europe and Asia, as well as North Africa and North America. Although Plantago species are widely recognised

as weeds, they have been used as medicinal plants for centuries (Gonçalves & Romano, 2016). *Plantago major* contains many active compounds such as flavonoids, polysaccharides, terpenoids, lipids, iridoid glycosides and caffeic acid derivatives and is used in the treatment of various diseases such as constipation, cough, wounds, infection, fever, bleeding and inflammation (Gonçalves & Romano, 2016). *Plantago major* has long been used as an immune modulating, anti-infective, analgesic, anti-inflammatory, antiulcerogenic, antimicrobial, anticancer and antioxidant agent and has also been applied for wound healing purposes (Gonçalves & Romano, 2016; Nikaeen, Yousefinejad, Rahmdel, Samari, & Mahdavinia, 2020). It is stated by many studies that *Plantago major* leaves have long promoted wound healing and are still used in traditional medicine (Ghanadian et al., 2022; Gonçalves & Romano, 2016; Najafian et al., 2018; Nikaeen et al., 2020; Sırrı & Sırrı, 2020). In Iğdır province, the leaves are used externally in the treatment of boils, and also on acute and chronic wounds, green and fresh leaves are applied topically on the wound after slightly crushed and used as a wound healer.

## **2. Boğa dikenî, Buğa tikanî, Demir tikanî**

*Eryngium billardieri* Delar, popularly known as Boğa dikenî, Buğa tikanî and Demir tikanî, is a medicinal plant in the Apiaceae family. *Eryngium billardieri* Delar is a perennial plant and its stem can be more than one. It usually grows on rocky slopes, steppes and fallow fields. The parts of the plant used include the stem and above-ground parts. In Iğdır, the root is used for conditions such as haemorrhoids, sinusitis, colds, boils, snake bites and wound treatment, while the stem can be peeled and eaten as food and used as a wound healer in powder form (Altundağ, 2009). It is an important plant that grows worldwide, especially in Asia, Europe, Australia, North Africa and North and South America (Allafchian, Balali, Vahabi, & Jalali, 2022). Flavonoids, phytosterols, triterpenoid saponins, ecdysteroids, coumarin derivatives, polyacetylenes, phenolic acids and essential oils are the main phytonutrient components of *Eryngium* (Hajian-Maleki & Shams-Bakhsh, 2023; Heidari et al., 2023). Furthermore, the extract of this plant has demonstrated in the laboratory several biological activities against different cell lines of human tumours, including anti-inflammatory, antihyperglycaemic, antimicrobial, antifungal, and antioxidant effects (Allafchian et al., 2022). Extracts from the roots and above-ground parts of various *Eryngium* (Apiaceae) species are used worldwide as folk remedies for the treatment of various inflammatory diseases, scorpion bites, rheumatism, urinary tract infections, wound healing and sinusitis (Allafchian et al., 2022; Khani et al., 2021; K peli, Kartal, Aslan, & Yesilada, 2006; SIRRI & SIRRI, 2020).

### **3. Camışgulağı**

*Sedum telephium* L., locally known as Camışgulağı, is a medicinal plant in the Crassulaceae family. It usually grows in stony, dry places and larch forests. In Turkey, it is also known as Camuskulağı, Manda kulağı, Yaraotu and çıban çiçeği. In Turkey, the leaves of the plant are generally used as a wound healer, in burns, in the treatment of boils and haemorrhoids. It is also used as food in the treatment of constipation (Altundağ, 2009). The Camışgulağı plant was widely used in ancient times in the treatment of many inflammatory skin diseases. The leaves (without the outer cuticle) were often applied topically to painful wounds, burns and eczema to speed healing and reduce inflammation and pain (Bonina et al., 2000; Caverro, Akerreta, & Calvo, 2013). Also in traditional medicine the leaves of this plant are known for their widespread use in the treatment of skin diseases (anti-inflammatory, keratolytic and analgesic activity). Moreover, it has been stated to heal burns, acne and wounds (Jovanović et al., 2017; Karunakaran, Jagathambal, Kumar, & Kolesnikov, 2020). In Iğdır province, the leaves are crushed and left on the wound and used as a wound healing agent.

### **4. Gılıçotu, Kılıçotu**

*Plantago lanceolata*, commonly known as Gılıçotu or Kılıçotu in Iğdır, is a plant belonging to the Plantaginaceae family. It is commonly found in roadside grasslands, meadows, pastures and green areas (Drava, Cornara, Giordani, & Minganti, 2019; Pol, Schmidtke, & Lewandowska, 2021). In Turkey, it is known by many different names such as nerve herb, sinirli herb, vein herb, veined herb, cut herb, wound herb, snakandili, snakanotu and vineyard leaf (Altundağ, 2009). The leaves of the plant are used in many countries for medicinal purposes in the treatment of diseases such as wound healing, inflammation, cancer, respiratory system disorder, blood circulation, reproductive system and digestive organs (Abate, Bachheti, Tadesse, & Bachheti, 2022; Drava et al., 2019; Pol et al., 2021). It is also used against insect and snake bites, toothache or as an immune enhancer (Bahadori et al., 2020; Pol et al., 2021). In Iğdır, the leaves are used as a wound healer and in the treatment of boils. It is also applied externally as a blood stopper in cuts and as an anti-inflammatory in festering wounds.

### **5. Horoz pipiği**

*Silene compacta* Fischer, popularly known as Horoz pipiği in Iğdır, is a member of the Caryophyllaceae family (Arslan, 2024). It is found naturally in Western, Northern, Eastern, Southern and Central Anatolia regions of Turkey in the altitude range of 0-2100 m. (Kosa & Karaguzel, 2020). In Turkey it is also called *Silene compacta*, Kanlıbasıra grass, densely flowered weed, sticky plant (Çimen & Ekici, 2023; Külekçi & Bulut, 2016). The roots and

above-ground parts of the plant have been used as infusion in diseases of the urinary bladder and biliary tract (Akdeniz, 2022; Boğa, 2017). In Iğdır, the leaves are crushed and applied externally as a wound healer.

### **6. Kötangoparan**

*Centaurea glastifolia*, popularly known as Kötangoparan, is a member of the Asteraceae family. Since the root of the plant is very hard and deep, it often breaks the tip of the sickle (sickle) when the herbs are mown, so the plant was named as Kötangoparan or kotankıran in the region. In addition, although it is generally known as prophet's herb in Turkey; it is also known by different local names such as Zerdali thorn, Shepherd's thorn, Gökbaş, etc. The plant grows in meadows, rocky slopes, at altitudes between 1500-2500 m. It is distributed in Central and Eastern Anatolia (Altundağ, 2009; Altundağ, Altundağ, & Gürdal, 2009). Fresh flowers are known to be used against peptic ulcer in Turkey (Aksoy & Gönüz, 2007). In Iğdır, the leaves are crushed and applied externally to cuts as a blood stopper and to wounds as a wound healer.

### **7. Kuş eppeği**

*Capsella bursa-pastoris*, which is widespread worldwide, is a plant belonging to the Brassicaceae family. In our country, it is generally known as 'shepherd's purse' (Cha et al., 2017). It is also known among the people with names such as jingle grass, shepherd's bag, birdbird grass (Altundağ, 2009). The plant is mainly used as haemostatic for injuries, haemorrhoids, intermittent bleeding outside the menstrual cycle, menstrual irregularities, meno-metrorrhagia, kidney and urinary tract infections, blood pressure, oedema and some muscle diseases. For this purpose, the fresh plant can be used topically as a poultice or tincture and the dried plant can be used orally by brewing (Cha et al., 2017; Tuncel & Coşkun, 2022). In Iğdır, the above-ground parts are crushed and applied externally to bleeding wounds as a blood stopper.

### **8. Öküzguyruğu**

*Leonurus glaucescens*, known as Öküzguyruğu herb, is a plant belonging to the Lamiaceae family. The plant has a long history of use in Asian, European and American folk medicine (Zhang et al., 2018). Grows on mountain slopes, from coastal slopes to riverbanks, on cliffs, along houses and roads (Kirillov et al., 2018). Traditionally, since ancient times, folk medicine has used a decoction of the above-ground part of the plant in the treatment of diseases of the heart, stomach and nervous system. In addition, tea and infusion of the plant are also used in the treatment of nervous system disorders, hypertension, epilepsy, tachycardia, gastrointestinal diseases, as a sleep aid, diaphoretic, laxative and anti-inflammatory agent (Sermukhamedova,

Sakipova, Ternynko, & Gemedzhieva, 2017). It is used in folk medicine in the Eastern Anatolia region of Turkey for cardiogenic and burn wounds (Kirillov et al., 2018). It is also used in East Asia for anti-gynaecological disorders and in Europe as a sedative (Zhang et al., 2018). In Iğdır, the root is boiled medicinally, and dough is made from the juice obtained and applied externally to inflamed wounds.

### **Conclusion**

In the literature, it is seen that there are many studies with phytotherapeutic plants related to wound care. In our research, it was observed that the phytotherapeutic plants that are traditionally widely used in wound care in Iğdır province are Belhavis, Buğa tikanı, Camışgulağı, Gülüçotu, Horoz pipiği, Kötangoparan, Kuş eppeği and Öküzguyruğu. These plants are used in Iğdır as well as in other parts of Turkey and in many countries of the world. Although the part of the plants used and the way of use varies, it has been shown in the literature that these plants are used in wound healing. Studies on phytotherapeutic plants traditionally used in wound care in Iğdır are not sufficient. In this context, we believe that in vivo and invitro studies on these plants should be carried out and used in preclinical studies.

**Abstract**

Today, quantum computing represents a paradigm shift in our computational capabilities. It offers unprecedented processing power to tackle problems intractable for classical computers. At the core of this revolution is the quantum bit, or qubit. Unlike a regular computer bit that can be either 0 or 1, a qubit can be both at the same time, leveraging the principles of quantum mechanics. This ability opens up a whole new world of computing possibilities. This capability not only redefines what is computationally possible but also necessitates a reimagining of software development practices tailored to the quantum domain. This capability not only redefines computational possibilities but also necessitates a new set of software development practices uniquely tailored to the quantum domain. This paper aims to explore the Quantum Software Development Lifecycle (QSDLC), a framework that adapts and extends traditional software development methodologies to address the unique challenges and opportunities of quantum computing. Through an examination of each phase of the QSDLC, from requirements analysis through to maintenance, this study highlights the differences, challenges, and innovative solutions inherent to quantum software development. By comparing classical and quantum software development practices, the paper sheds light on the need for new programming paradigms, tools, and techniques to fully leverage quantum computing's potential. Through an investigation of emerging trends, this work also provides insights into the current state and future directions of quantum computing applications across various industries.

**Keywords:** quantum computing, quantum software development, quantum algorithms, quantum programming languages, software development lifecycle, quantum software engineering

## **INTRODUCTION**

Quantum computing is a groundbreaking field of technology that harnesses the laws of quantum mechanics to solve problems too complex for traditional computers. Unlike classical computers, which use bits as the smallest unit of data represented as either 0 or 1, quantum computers use quantum bits, or qubits, which can exist simultaneously in multiple states due to the principle of superposition (Cho et al., 2021; Gill et al., 2022). This capability, along with quantum entanglement and quantum interference, enables quantum computers to perform vast numbers of calculations at once, offering potential breakthroughs in fields such as cryptography, drug discovery, and complex system optimization. As this technology develops, it promises not only to speed up certain types of calculations dramatically but also to tackle challenges that are currently beyond our reach (Gill et al., 2022; Ozdenizci Kose et al., 2024). Developing applications that utilize quantum computing is not straightforward due to its complex nature. Quantum computing combines elements of quantum physics, mathematics, computer science, and engineering, and makes it a field that requires a broad range of expertise. The hardware used in quantum computing is particularly complex and sensitive to even small environmental changes, which means it requires careful control and specific strategies to manage errors and perform calculations accurately (Hevia et al., 2022; García de la Barrera et al., 2023; Dwivedi et al., 2024). Furthermore, developing software for quantum computers is not like creating traditional software. It involves learning new programming languages and approaches specifically designed for quantum computing. Programmers also need to create special algorithms that can work with the quantum properties of the hardware. Currently, the available quantum computers, known as Noisy Intermediate-Scale Quantum (NISQ) devices, are still in the early stages of development (Weder et al., 2020; Sodhi et al., 2021; Weder et al., 2022; Serrano et al., 2022). They have limited capabilities and can make more errors than older, non-quantum computers. These challenges highlight the need for a well-organized and systematic approach to developing quantum software. Such an approach needs to be flexible enough to adapt as new advancements in quantum computing technology are made, ensuring that developers can continue to create effective and reliable quantum software as the field evolves. This structured development process is essential for overcoming the current limitations and fully tapping into the potential of quantum computing in the future (Weder et al., 2020; Weder et al., 2022; Dwivedi et al., 2024). The emerging field of Quantum Software Engineering seeks to address these challenges by establishing a lifecycle for the development of quantum applications. This lifecycle aims to provide a structured framework that guides the development

process from conception to deployment, incorporating best practices, tools, and methodologies suited to the quantum domain. It encompasses everything from initial requirement analysis and design through to implementation, testing, deployment, and maintenance, considering the unique aspects of quantum computing. By formalizing these processes, the goal is to facilitate the creation of high-quality, efficient, and robust quantum software, enabling researchers, developers, and organizations to more effectively harness the power of quantum computing and contribute to its advancement. This paper aims to explore the Quantum Software Development Lifecycle (QSDLC), a framework that adapts and extends traditional software development methodologies to address the unique challenges and opportunities of quantum computing. Through an examination of each phase of the QSDLC, from analysis through to maintenance, this study highlights the differences, challenges, and innovative solutions inherent to quantum software development. By comparing classical and quantum software development practices, the paper sheds light on the need for new programming paradigms, tools, and techniques to fully leverage quantum computing's potential. Through an investigation of emerging tools and platforms, this work also provides insights into the current state and future directions of quantum computing applications.

### **UNDERSTANDING QUANTUM SOFTWARE DEVELOPMENT LIFECYCLE**

The QSDLC is structured into several distinct phases, each critical for the successful development of hybrid quantum applications (Weder et al., 2020; Weder et al., 2022; Dwivedi et al., 2024). These phases facilitate a systematic approach that spans from conceptualization to deployment and beyond. This section provides a conceptual description of each phase within the QSDLC, outlining their respective roles and importance in the lifecycle.

*(1) Conceptualization:* This first stage focuses on problem identification and feasibility study. The development team identifies specific challenges that quantum computing could address, given its superior capability for certain computations over classical systems. A feasibility study then follows to evaluate the practicality of using quantum solutions, including the evaluation of current quantum technology and determining if quantum advantages can be realized. *(2) Quantum Software Analysis:* This phase involves gathering and analyzing the requirements for the quantum application. It includes collecting detailed specifications of what the quantum software needs to achieve, including both functional (i.e., what the software should do) and non-functional requirements (i.e., how the software should perform). *Quantum Algorithm Mapping* is also crucial at this stage in order to align identified requirements with suitable

quantum algorithms or frameworks, or to identify the need for developing new quantum algorithms.

(3) *Quantum Software Design*: In this phase, developers decide which parts of the application are best suited for quantum computing and which should rely on classical computing methods. *Quantum-Classical Splitting* is critical for optimizing performance and leveraging the unique advantages of quantum computing. The decision-making process is informed by the application's requirements and the current state of quantum hardware capabilities. Once the quantum-classical split is performed, the next step is to design the overall architecture of the application. This includes specifying the high-level structure, defining the components and their interactions, and outlining the data flow between quantum and classical parts. This includes outlining the quantum circuit designs, qubit allocations, and gate operations. Afterwards, the design stage advances into a more granular focus with low-level design that focus on the detailed implementation of quantum circuits, including specific gates, error correction techniques, and optimization for quantum hardware constraints. The design phase aims to create a blueprint that ensures the application is scalable, maintainable, and meets the defined requirements.

(4) *Quantum Coding*: During implementation stage, the generated design blueprints are translated into executable code. This involves coding both the quantum algorithms and the classical software components. *Quantum Coding* is carried out using specialized *Quantum Programming Languages*. Alongside, classical integration is executed, wherein the classical components -designed to interact with or support the quantum operations- are developed and refined. This step is crucial to ensure a seamless integration between classical and quantum processing, and enables them to function together as a cohesive unit.

(5) *Quantum Software Testing*: Testing in the QSDLC involves verifying both the individual quantum and classical components and their integration. This includes unit testing, integration testing, and end-to-end system testing. The goal is to ensure the application behaves as expected, performs efficiently, and is free from defects. Unit Testing is concerned with the smallest parts of the quantum application. It ensures that each individual quantum component, such as a specific gate or subroutine, operates correctly in isolation. This is vital in quantum computing, where the functionality of basic elements can have significant impacts on the overall system due to the entangled nature of quantum states. Integration Testing focus on how quantum and classical components interact with each other. Integration testing verifies that these diverse elements work together harmoniously under a variety of conditions. It is a critical step for hybrid systems where quantum and classical computing coexist and must interact without errors. System

Testing evaluates the system's performance, functionality, and behavior, not just in isolated parts or during interactions but as an entire operational unit. This testing can take place on actual quantum hardware, which provides the most realistic environment, or on high-fidelity simulators.(6) *Deployment*: This stage in quantum software development involves several crucial steps to ensure the application is ready for real-world operations. Initially, deployment planning focuses on where considerations such as the availability of quantum hardware and the specific operational environment are addressed. This preparation is essential for ensuring that all necessary resources are aligned and the software is optimized for the conditions it will face. Following this, the deployment execution phase begins, where the software is rolled out to its intended platform. Depending on the application's requirements, this could mean deploying to a cloud-based quantum computing service for scalability and accessibility, or directly to dedicated quantum hardware for enhanced security and performance. This comprehensive approach ensures that the transition from development to active use is seamless, allowing the software to start delivering practical value effectively.(7) *Maintenance*: This phase is a crucial part of the QSDLC which focuses on ensuring the application performs reliably over time. It involves constant monitoring of the application's performance and the health of the quantum environment. The software is regularly checked for issues, with logs and alerts set up to flag any problems. Maintenance also means updating and scaling the software to incorporate new advances in quantum algorithms and hardware, ensuring that the application remains up-to-date and can handle increased demands as quantum technology progresses. These phases are not strictly linear and may overlap or require iteration, reflecting the adaptive and exploratory nature of quantum application development. The QSDLC provides a structured framework that guides teams through the complexities of creating applications that leverage both quantum and classical computing.

### **RECENT TOOLS AND PLATFORMS IN QUANTUM SOFTWARE ENGINEERING**

The quantum computing field includes a variety of tools and platforms that are popular among researchers, practitioners and developers. These tools focus on the different aspects of quantum computing, including algorithm development, simulation, and hardware interaction. Some of the most popular quantum computing tools are described hereunder: (\*) *Quantum Development Kits and Libraries*: IBM's Qiskit [<https://qiskit.org>], Google's Cirq [<https://quantumai.google/cirq>], and Rigetti's PyQuil [<https://www.rigetti.com>] are some essential tools of development kits and libraries for creating quantum programs. Qiskit is notable for its comprehensive suite that allows users to write, simulate, and run quantum

algorithms on IBM quantum computers. Cirq offers a Python library tailored for constructing and operating quantum circuits on Google's quantum processors. Meanwhile, Ocean Software from D-Wave [<https://www.dwavesys.com>] specializes in tackling complex optimization problems with quantum annealers, and ProjectQ [<https://github.com/ProjectQ-Framework/ProjectQ>] facilitates the implementation of quantum programs that can run on simulators or actual quantum hardware. PennyLane [<https://www.xanadu.ai/products/pennylane>] uniquely positions itself at the intersection of quantum computing and machine learning, enabling the optimization of hybrid systems. (\*)

*Quantum Simulators:* Simulators like the IBM Quantum Experience [<https://quantum.ibm.com>] and Microsoft's Quantum Development Kit offer developers simulated environments to test and debug quantum algorithms without the need for physical quantum hardware. These platforms support the early stages of development, and provides a vital testing ground for algorithms with their integrated tools and simulators. Strawberry Fields from Xanadu [<https://strawberryfields.ai>] also plays a key role in the simulation and optimization of quantum photonic circuits, expanding the realm of quantum computing into the photonic domain. (\*)

*Quantum Hardware Access Platforms:* Services like Amazon Braket [<https://aws.amazon.com/braket>] and Azure Quantum [<https://azure.microsoft.com/en-us/services/quantum>] improves access to quantum hardware, and allows developers to run quantum algorithms on a variety of quantum machines from different providers. These platforms provide not only the essential bridge between quantum software and hardware but also the capability for developers to experiment with and fine-tune their programs across different types of quantum systems. (\*)

*Integrated Development Environments and Tools:* Comprehensive development and execution environments such as Quantum Lab [<https://quantum.ibm.com/lab>] and Visual Studio Code, with their quantum-centric extensions, support developers with intuitive interfaces and powerful tools. These IDEs streamline the process of writing, running, and debugging quantum code, making quantum software development more accessible and efficient. These tools and platforms are integral to the development and exploration of quantum computing, and provides resources for education, research, and practical application development in the quantum world. The landscape is rapidly evolving, with new tools and features being regularly introduced to advance quantum computing technology.

## **CONCLUSION**

This study examined the fundamentals of QSDLC, as a comprehensive roadmap for crafting software for the emergent paradigm of quantum computing. Quantum computers have the potential to solve certain problems much quicker than today's classical computers. The QSDLC offers a step-by-step framework that guides practitioners from the initial conception of a quantum software application through to its deployment and maintenance. It combines the new ways of quantum computing with the familiar methods of classical computing, and ensures that software is made in a careful and planned way. Future research in the QSDLC is expected to advance quantum computing significantly. Developing sophisticated quantum error correction methods, enhancing fault tolerance, and refining the interfaces between quantum and classical systems stand as pivotal challenges. Moreover, scaling quantum systems, advancing the design of quantum programming languages, and creating more intuitive software development kits (SDKs) will be essential for realizing the full spectrum of quantum computing's capabilities. These developments are anticipated to enhance the robustness of quantum computers and also facilitate their broader application across disciplines that could benefit from quantum computational power, such as cryptography, optimization, and complex system modeling.

**Abstract**

Quantum computing stands on the threshold of a new era and promises to revolutionize our approach to computation and problem solving. At this point, the development of quantum software is so critical that it presents unique challenges and opportunities, particularly in the realms of testing and validation. Traditional software testing methodologies fall short when applied to quantum software due to its inherently probabilistic nature, the complexity of quantum states, and the entanglement phenomenon. These characteristics necessitate innovative approaches to ensure the reliability, correctness, and efficiency of quantum software. This paper aims to explore the multifaceted challenges associated with testing and validating quantum software. It focuses on the distinctive aspects of quantum computing that complicate standard testing practices, such as the no-cloning theorem and quantum decoherence. Furthermore, the paper sheds light on the current methodologies and tools developed specifically for quantum software testing, from quantum circuit simulators and error correction techniques to the testing frameworks that accommodate the probabilistic outcomes of quantum computations. Through an examination of these innovations, this paper contributes to a deeper understanding of the evolving field of quantum software development. It underscores the need for ongoing innovation in robust testing and validation practices to realize the potential of quantum computing technology.

**Keywords:** quantum computing, quantum software testing, validation techniques, quantum algorithms, quantum error correction, software development challenges

## **INTRODUCTION**

Today, quantum computing represents a significant advancement that harnesses the principles of quantum mechanics to solve problems that are currently beyond the reach of classical computers. This advanced computing technology utilizes quantum bits or qubits, which unlike classical bits, can exist in multiple states simultaneously through superposition, and are interconnected through entanglement (Cho et al., 2021; Gill et al., 2022). This allows quantum computers to perform complex calculations at incredibly high speeds and with greater efficiency. The development of software for such complex systems is structured through the Quantum Software Development Lifecycle (QSDLC), which adapts traditional software development methodologies to meet the unique demands of quantum technology. The QSDLC guides developers from conceptualization through to deployment and maintenance, and addresses the specific challenges posed by quantum computing along the way (Weder et al., 2020; Weder et al., 2022; Dwivedi et al., 2024). Testing and validation play crucial roles for the development of any software, ensuring that the final product functions as intended and is free from defects. In the realm of quantum software development, these processes take on even greater significance due to the inherently complex and revolutionary nature of quantum computing (Ali & Yue, 2023; García de la Barrera et al., 2023). As quantum computing seeks to leverage the principles of quantum mechanics -such as superposition, entanglement, and quantum interference- the tasks of testing and validation become markedly more challenging. These principles enable quantum computers to perform calculations at unprecedented speeds and manage tasks that are infeasible for classical computers. However, they also introduce a unique set of challenges that traditional software testing methodologies are not designed to handle. The challenges in testing and validation for quantum software stem from several quantum-specific characteristics. This paper aims to examine the unique challenges that arise in the testing and validation of quantum software, driven by the inherent properties of quantum computing such as the no-cloning theorem and the phenomenon of quantum decoherence. These quantum-specific characteristics disrupt traditional testing methodologies, and requires a shift in how software validation is approached. The investigation extends to the current state of the art in quantum software testing methodologies and tools. By providing a comprehensive overview of these developments, the paper deepens the understanding of the current landscape of quantum software development and emphasize the critical role of continuous innovation in testing and validation strategies. This focus is essential for advancing the reliability and

efficiency of quantum software and also for unlocking the transformative potential of quantum computing technologies.

### **CHALLENGES IN TESTING AND VALIDATION OF QUANTUM SOFTWARE**

Testing and validation of quantum software introduce a set of unique challenges that stem from the foundational principles of quantum mechanics, significantly diverging from the established practices in classical software testing (Weder et al., 2020; Weder et al., 2022; Ali & Yue, 2023; García de la Barrera et al., 2023). These challenges include: (\*) *No-Cloning Theorem*: This fundamental principle of quantum mechanics stipulates that it is impossible to create an identical copy of an unknown quantum state. In practical terms, this prohibits replicating exact testing conditions for quantum states, a method often used in classical software testing for identifying and fixing errors. (\*) *Quantum Decoherence*: Decoherence occurs when quantum systems, highly sensitive to their surroundings, lose their quantum properties after interacting with their environment. This instability creates a challenge for testing, as it becomes difficult to maintain stable conditions for repeatable tests, which can impact the consistency and reliability of the results. (\*) *Measurement Disturbance*: Measuring a quantum state inevitably alters that state. This phenomenon presents a significant challenge for quantum software testing, as the act of observing or measuring can change the software's behavior, complicating the processes of validation and debugging that rely on stable test conditions. (\*) *Probabilistic Nature of Quantum Computing*: Quantum computing operates on probabilities, not certainties, which contrasts with the deterministic nature of classical computing. Since the outcomes of quantum algorithms are probabilistic, testing these algorithms involves statistical analysis rather than straightforward pass/fail checks. This means a large number of tests must be conducted to ensure the behavior of the software is correct with statistical confidence. (\*) *Error Rates and Fault Tolerance*: The current generation of quantum hardware is prone to errors at a rate higher than that of classical hardware. Creating tests that can accurately identify and separate errors from correct quantum behavior is difficult. Furthermore, integrating quantum error correction into these tests introduces additional complexity and requires more resources. (\*) *Limited Availability of Quantum Hardware*: There is a scarcity of accessible quantum computers, leading many developers to rely on simulators that can not always mimic the exact behavior of actual quantum hardware. This limitation poses a significant challenge in testing and validating quantum software to perform reliably under real-world operational conditions. (\*) *Complexity of Quantum Algorithms*: Quantum algorithms are often highly complex, and incorporates advanced mathematics and logic that can be challenging to grasp and implement

accurately. Testing these algorithms demands an extensive understanding of both quantum mechanics and computational principles, which can be an obstacle for testers who do not have a strong background in these specialized areas. (\*) *Lack of Standardized Testing Frameworks:* Quantum computing is a rapidly evolving field, and there is a lack of established testing frameworks and methodologies specifically designed for quantum computing. Without these standards, developers might face inconsistencies in testing methods, and makes it hard to ensure the correctness and reliability of quantum programs. Developing these tools is crucial for advancing the field but requires overcoming the unique challenges mentioned above. These challenges highlight the need for innovative approaches to testing and validation in quantum software development. Addressing these issues is crucial for ensuring the reliability, correctness, and efficiency of quantum software, paving the way for the realization of quantum computing's full potential.

#### **METHODOLOGIES AND TOOLS FOR QUANTUM SOFTWARE TESTING**

To guarantee the reliability and accuracy of quantum software, a range of advanced testing methodologies is being developed (Nilsen, 2007; Merkel et al., 2013; Keith et al., 2018; Bantysh et al., 2021; García de la Barrera et al., 2023). These methodologies are designed to address the unique challenges presented by quantum computing: (\*) *Quantum State Tomography:* This technique is utilized to deduce the exact state of a quantum system. By conducting a series of measurements on a collection of identically prepared quantum systems, researchers can infer the quantum state, even though it cannot be measured directly. This method provides a comprehensive understanding of the quantum state but can be resource-intensive and challenging to implement as the number of qubits increases. (\*) *Randomized Benchmarking:* This technique offers a practical alternative by evaluating the overall fidelity of quantum gates without needing to identify every potential error. Through the application of random sequences of gates, this method estimates the average error rate across the entire system. It is particularly useful because it reflects how errors accumulate in a realistic computational setting with noise. (\*) *Quantum Process Tomography:* Extending beyond state tomography, Quantum Process Tomography aims to characterize the full quantum process. Rather than just the final state, this technique aims to map out the transformation that the quantum state undergoes through the computational process. It is an extensive method that can provide deep insights into the behavior of quantum algorithms and the effects of quantum operations.

(\*) *Monte Carlo Simulations*: Traditionally used in fields like statistical physics and finance, Monte Carlo Simulations are a powerful tool for modeling the probabilistic nature of quantum systems. They use random sampling to predict how a quantum system might respond under various scenarios, helping to understand the influence of errors and environmental noise on a quantum system's behavior. Recent developments in testing tools have introduced innovative solutions that assist in the practical application of these methodologies, described as follows:

- **Integrated Quantum Development Environments (IDEs)**: These comprehensive software platforms merge the processes of writing, executing, and testing quantum code. They often feature visualization tools for quantum states and operations, which help in interpreting test outcomes.
- **Quantum Circuit Simulators**: Simulators enable the testing of quantum circuit behavior on classical computers and offer developers a way to predict how their quantum algorithms will perform, even without direct access to quantum hardware.
- **Automated Testing Frameworks**: These frameworks streamline the quantum software testing process. They utilize advanced algorithms to explore the extensive potential outcomes of quantum states, pinpoint possible errors and suggest optimizations.
- **Quantum Hardware Emulators**: Emulators replicate the functionality of quantum processors, and provide a crucial testing tool for developers to see how their software would run on different quantum hardware setups.
- **Quantum Error Analysis Tools**: With error rates being a critical factor in quantum computing, these tools are essential for examining the nature and frequency of errors in quantum operations. The insights gained are invaluable for refining algorithm design and enhancing software performance.

In the advancing field of quantum computing, a range of specialized tools have been developed to facilitate the design, testing, and deployment of quantum software. For instance, IBM's Qiskit [<https://qiskit.org>] provides an extensive toolkit for analyzing and visualizing quantum circuits, as well as simulating them on classical hardware to anticipate their performance on actual quantum processors. Google's Cirq [<https://quantumai.google/cirq>] offers features for noise modeling and simulation, key for evaluating how quantum algorithms will fare in the noisy environments typical of today's quantum hardware. Microsoft has contributed with its Quantum Development Kit [<https://docs.microsoft.com/quantum>], which boasts full-state simulators capable of handling up to 30 qubits on standard servers, all while integrating seamlessly with

the Visual Studio environment for testing and debugging. Rigetti's Forest [<https://www.rigetti.com/forest>] platform delivers a comprehensive set of tools, including noise and error modeling simulators, creating a testbed that mirrors the conditions quantum programs will encounter on real quantum hardware. Open-source software framework ProjectQ facilitates the running of quantum circuits on both simulators and actual quantum processors, emphasizing circuit optimization and error emulation. Lastly, Quantum++ [<https://github.com/vsoftco/qpp>] offers a C++ library dedicated to quantum computing and simulations, perfect for crafting and trialing novel quantum algorithms and exploring the realms of quantum computation. Each of these tools plays a vital role in the quantum software development ecosystem, and provides developers with the resources needed to navigate the complexities of quantum programming.

## **CONCLUSION**

This study explored the complexities and unique challenges of testing and validating quantum software. By focusing on methodologies like Quantum State Tomography, Randomized Benchmarking, and Monte Carlo Simulations, alongside innovative tools such as Quantum Circuit Simulators and Quantum Development Environments, this study has illuminated the current landscape of quantum software testing. These approaches are crucial for addressing the unique properties of quantum mechanics, such as the no-cloning theorem, quantum decoherence, and the inherently probabilistic nature of quantum computing. The study underscored how traditional testing methods are inadequate without significant adaptations to accommodate the revolutionary characteristics of quantum computing. Future research should focus on enhancing the precision and efficiency of existing quantum testing methodologies and developing new tools to better accommodate the rapid advancements in quantum hardware. There is an increasing need for more robust quantum error correction techniques, improved frameworks for simulating quantum noise, and more accessible testing environments. Additionally, a deeper integration between theoretical quantum mechanics and practical software engineering practices will be essential for the next generation of quantum software developers.

**ÖZET**

Buğday, insan beslenmesinde temel gıda olması ve farklı çevre koşullarına yüksek adaptasyon kabiliyeti sebebiyle stratejik önemini korumaktadır. Çalışmada amaç, tane verimi ve/veya kalite özellikleri yönüyle standart çeşitlerden üstün olan hatları belirlemek ve buğday ıslah programlarına katkı sağlamaktır. Araştırma, 2014-2015 üretim sezonunda Diyarbakır ilinin yağışa dayalı şartlarında 25 genotip ile tesadüf blokları deneme desenine göre üç tekrarlamalı olarak yürütüldü. İncelenen tüm özelliklerde istatistik olarak genotipler arasında  $p \leq 0.01$  veya  $p \leq 0.05$  seviyesinde önemli anlamlılık olduğu gözlenmiştir. Başaklanma süresi 170-184 gün, bitki boyu 85-120 cm, tane verimi  $499.3-748.1 \text{ kg.da}^{-1}$ , hektolitre ağırlığı  $71.4-80.8 \text{ kg.hl}^{-1}$  ve bin tane ağırlığı 29.9-40.4 g arasında farklılık gösterdi. Araştırmada; G9, G13, G14 ve G24 ileri kademe hatlarının Diyarbakır koşullarında en erken başaklanan genotipler olduğu gözlenmiştir. Tane veriminde G19 en yüksek birim alan tane verimini vermekle beraber G1, G6, G9 ve G13 hatları yüksek tane verimleriyle dikkat çekmiştir. Teknolojik kalite özelliklerinde; G1, G6, G8, G9, Pehlivan, G14, G19, G23, G24 ve Adana-99 genotiplerinin öne çıktığı belirlenmiştir. Diyarbakır ilinde ekmeçlik buğdayın generatif döneminde sıcaklık stresine maruz kalacağı dikkate alınarak erkenci ve aynı zamanda yüksek verimli olduğu tespit edilen G9 ve G13 ileri kademe hatlarının koruma altına alınarak ıslah süreçlerinin devam ettirilmesi gerekmektedir. İlaveeten, teknolojik kalite özelliklerinde ön sırada yer alan G9, G14 ve Pehlivan genotiplerinin ekmeçlik buğday ıslah programlarında genitor olarak kullanılabilceği sonucuna varılmıştır.

**EXAMINATION OF ADVANCED BREAD WHEAT GENOTYPES (*Triticum aestivum*  
*L.*) IN TERMS OF YIELD AND SOME TECHNOLOGICAL QUALITY  
CHARACTERISTICS**

**ABSTRACT**

Wheat maintains its strategic importance because it is the basic food in human nutrition and its high adaptability in in different environments. The aim of the study was to identify lines that were superior to standard varieties in terms of grain yield and/or quality characteristics and to contribute to wheat breeding programs. The research was conducted in three replications according to the randomized block experiment design with 25 genotypes under the rainfed conditions of Diyarbakır province in the 2014-2015 production season. It was observed that there was statistically significant significance between genotypes at the  $p \leq 0.01$  or  $p \leq 0.05$  level in all examined characteristics. Heading time 170-184 days, plant height 85-120 cm, grain yield 499.3-748.1 kg.da<sup>-1</sup>, test weight 71.4-80.8 kg.hl<sup>-1</sup> and thousand grain weight 29.9-40.4 g were varied. In the research; it was observed that G9, G13, G14 and G24 advanced stage lines were the earliest spiked genotypes under Diyarbakır province conditions. While G19 gave the highest grain yield per unit area, G1, G6, G9 and G13 lines attracted attention with their high grain yield. In technological quality features; it was determined that G1, G6, G8, G9, Pehlivan, G14, G19, G23, G24 and Adana-99 genotypes were prominent. Considering that bread wheat will be exposed to heat stress during the generative period in Diyarbakır province, the G9 and G13 advanced stage lines, which are found to be early and also highly productive, should be protected and the breeding processes should be continued. Additionally, it was concluded that G9, G14 and Pehlivan genotypes, which are at the forefront in terms of technological quality characteristics, can be used as genitors in bread wheat breeding programs.

**Keywords:** Bread wheat, heading time, quality

## **GİRİŞ**

Buğdayın kalitesi birçok faktörün etkisi altında şekillenmektedir. Kalite tarıma dayalı sanayinin ve tüketicinin arzu ettiği özelliklerin bütünü olarak değerlendirilmekte (Dziki and Laskowski, 2005) ve kullanım amacına bağlı olarak buğdaya geniş bir anlam yüklemektedir. Teknolojik kalite parametreleri olarak değerlendirilen hektolitre ve bin tane ağırlığı genel kalite kriterleri içerisinde önem arz etmektedir (Kün, 1996; Elgün ve ark., 2002; Ulucan & Atak, 2020).

Dünyada ve ülkemizde tarla bitkileri içerisinde buğday stratejik bir öneme sahiptir. Ülke nüfusumuzun artışına paralel olarak üretimin artması için ıslah çalışmaları hızla devam etmektedir. Geçmişten günümüze başta ekmek olmak üzere buğday ürünleri Türk halkının ana besin kaynaklarından biri olmakla birlikte yıllık kişi başı >200 kg buğday tüketimi ile ülkemiz dünyada ön sıralarda yer almaktadır (Morgounov ve ark., 2016; Atak ve ark., 2021).

**Tablo 1.** Buğday ile ilgili güncel istatistik veriler

<b>Piyasa yılı</b>	<b>Üretim (ton)</b>	<b>Ekilen alan (hektar)</b>	<b>İthalat (ton)</b>	<b>İhracat (ton)</b>	<b>Yeterlilik (%)</b>
2013-14	22.050000	7.772600	4.185189	4.677855	101.8
2014-15	19.000000	7.919209	5.780716	4.358527	89.2
2015-16	22.600000	7.866887	4.109527	5.918407	113.6

2021-22	17.650000	6.744666	9.525066	7.898297	87.3
2022-23	19.750000	6.628738			

Kaynak: Anonim, (2023)

Türkiye’de buğday ile ilgili son on yıla ait istatistik veriler incelendiğinde; ekim alanının 6.628738-7.919209 hektar, üretim alanının 17.650000-22.600000 ton ve yeterlilik oranının %87.3-113.6 arasında farklılık gösterdiği görülmektedir (Tablo 1).

Bu çalışmada amaç, ileri kademe ekmeklik buğday hatlarını teknolojik kalite özellikleri yönüyle standart çeşitler ile kıyaslamak, üstün vasıflara sahip olanları belirlemek ve ıslah süreçlerini devam ettirmektir.

## MATERYAL VE METOT

Araştırma, Diyarbakır merkez lokasyonunda yağışa dayalı şartlarda yürütülmüştür. Deneme materyalini 20 ileri kademe ekmeçlik buğday hattı ve 5 standart çeşit oluşturmuştur. Tesadüf blokları deneme desenine göre tasarlanan deneme 3 tekerrürlü olarak kurulmuştur. Deneme parselleri; 6 sıra, sıra arası 20 cm, 6 m uzunluğunda ve ekim normu 450 tohum.m<sup>-2</sup> yoğunluğunda tasarlanmıştır. Ekim sırasında 7.2 m<sup>2</sup> olarak dizayn edilen parseller kardeşlenme dönemi sonunda başından ve sonundan 0.5 m kesilerek net 6 m<sup>2</sup> bırakılmıştır.

Tablo 2. Deneme alanı topraklarının içeriğine ilişkin bilgiler

Toprak Bünyesi	Toplam tuz (%)	Ph	Kireç	Fosfor	Organik
			CaCO <sub>3</sub> (%)	P <sub>2</sub> O <sub>5</sub> (kg.da <sup>-1</sup> )	madde (%)
Killi-Tın	0.03	7.6	10.1	2.0	0.67

Deneme alanı topraklarının tuzsuz, fosfor içeriği yetersiz ve organik madde içeriği bakımından fakir olduğu belirlenmiştir (Tablo 2). Bitki besin elementi takviyesi için saf madde dikkate alınarak 6 kg fosfor (P<sub>2</sub>O<sub>5</sub>) ve 12 kg azot (N) tatbik edilmiştir. Fosforun tamamı ve azotun ½'si ekimle beraber, azotun kalan ½'si ise kardeşlenme döneminin ortalarında uygulanmıştır.

Tablo 3. Çalışmanın yapıldığı sezon ile uzun yıllara ilişkin iklim verileri

Aylar	Ortalama sıcaklık		Toplam yağış miktarı (mm)	
	2014-2015	Uzun yıllar	2014-2015	Uzun yıllar
Eylül	25.2	24.8	27.4	4.1
Ekim	17.4	17.2	34.2	34.7
Kasım	8.1	9.2	97.6	51.8
Aralık	5.9	4.0	73.6	71.4
Ocak	1.5	1.8	64.6	68.0
Şubat	6.1	3.5	55.2	68.8
Mart	7.8	8.5	127.0	67.3
Nisan	14.4	13.8	48.6	68.7
Mayıs	19.5	19.3	48.2	41.3
Haziran	24.3	26.3	7.4	7.9
Toplam			583.8	484.0

Araştırmanın yapıldığı sezonda uzun yılların ortalaması ile kıyaslandığında yaklaşık 100 mm daha fazla yağış düşmüştür. Fakat, yağışın aylar bazında dağılımı incelendiğinde düzensiz bir yağış dağılımı olduğu görülmektedir. Özellikle Eylül, Kasım ve Mart aylarında uzun yıllar ortalamasının çok üzerinde yağış gerçekleşmiştir (Tablo 3). Sıcaklık verileri incelendiğinde Kasım, Ocak, Mart ve Haziran hariç diğer aylarda sıcaklık değerlerinin uzun yıllar ortalamasının üzerinde olduğu belirlenmiştir. Özellikle haziran ayının serin geçmesi tane dolum döneminin uzamasına katkı sağladığı düşünülmektedir (Tablo 3).

Çalışmada, başaklanma süresi için ekim tarihinden her parselin 2/3'ü başaklanıncaya kadar geçen süre gün olarak belirlenmiştir. Bitki boyu için her parselden 10 bitki seçilmiş ve toprak seviyesinden en üst başakçığa kadar olan mesafe ölçülerek cm cinsinden tespit edilmiştir. Tane verimi için her parselde hasat ve harman işlemi tamamlandıktan sonra elde edilen ürün 0.001 g düzeyde hassas terazide tartıldıktan sonra elde edilen değer  $\text{kg.da}^{-1}$ 'a dönüştürülmüştür. Hektolitre ağırlığı için NID IM 550 cihazında tanede okuma yapılarak  $\text{kg.hl}^{-1}$  cinsinden belirlenmiştir. Bin tane ağırlığının tespitinde 1000 buğday tanesi sayıldıktan sonra tartılarak belirlenmiştir.

### 3.ARAŞTIRMA VE BULGULAR

Çalışmada incelenen özelliklerde genotipler arasında %1 veya %5 seviyesinde önemli farklılık olduğu gözlenmiştir (Tablo 4).

**Tablo 4.** İncelenen özellikler ve oluşan farklı gruplar

Genotip	Başaklanma süresi (gün)	Bitki boyu (cm)	Tane verimi ( $\text{kg.da}^{-1}$ )	Hektolitre Ağırlığı ( $\text{kg.hl}^{-1}$ )	Bin tane ağırlığı (g)

G. Ortalama: genel ortalama

Araştırmada, başaklanma süresi yönünden genotipler arasında geniş varyasyon olduğu tespit edilmiştir. Başaklanma süresinin 170-184 gün arasında farklılık gösterdiği ve deneme

ortalamasının ise 175 gün olduğu belirlenmiştir. Mevcut materyalde G9, G13, G14 ve G24 genotipleri 170 gün süre ile en erkenci, Cemre (184 gün) çeşidi ise en geççi genotip olarak kayıt altına alınmıştır (Tablo 4). Başaklanma süresini Kendal ve ark. (2012) 108.5-114.5 gün, Abbas (2017) 110.90-146.65 gün, Koç & Aydoğan Çifci (2022) 142.25-149.75 gün olduğunu bildirmiştir. Çalışmamızda, daha uzun başaklanma sürelerinin gözlenmesi çevre koşullarının etkisine bağlanabilir. Ekmeklik buğday genotiplerine ilişkin bitki boylarının 85-120 cm arasında değiştiği ve deneme ortalamasının 105.1 cm olduğu belirlenmiştir. Çalışmada, Sagitario (85.0 cm) ekmeklik buğday çeşidinin en kısa ve Nurkent (120 cm) çeşidinin ise en uzun boylu olduğu gözlenmiştir (Tablo 4). Bitki boyu ile ilgili farklı çevrelerde yapılan çalışmalarda Aktaş (2010) 72.63-114.43 cm, Çifci & Doğan (2013) 83.15 ile 85.01 cm, Bozkurt ve ark., (2022) 56.60-76.25 cm, Koç & Aydoğan Çifci (2022) 68.50-86.50 cm olduğu belirlenmiştir. Çalışmamızda elde edilen sonuçlar Aktaş ve ark., (2010)'nın sonuçlarına benzerdir. Çalışmada, tane veriminin 499.3-748.1 kg.da<sup>-1</sup> arasında değiştiği, deneme ortalamasının 627.6 kg.da<sup>-1</sup> olduğu tespit edilmiştir. G19 (748.1 kg.da<sup>-1</sup>) en yüksek verimli ve G21 (499.3 kg.da<sup>-1</sup>) en düşük verimli genotip olarak kayda alınmıştır (Tablo 4). Buğdayda birim alan tane verimini artırmanın yolunun farklı ıslah teknikleriyle genetik kapasiteyi genişletmenin yanı sıra verimi kısıtlayan unsurları minimum düzeye indirmeyle ilişkili olduğu vurgulanmıştır (Roth ve ark., 1984; Erdem & Sakin, 2023). Maksimum verime ulaşmanın yüksek verimli çeşitlerin tercih edilmesine ve doğru agronomik uygulamalara bağlı olduğu bildirilmiştir (Kaya ve ark., 2015; Erdem & Sakin, 2023). Hektolitre ağırlığı, un randımanını önemli seviyede etkileyen teknolojik kalite parametrelerinden biridir. İlâveten, tanenin şekline, boyutuna ve saydamlığına bağlı olarak farklılık göstermektedir. Mevcut materyalde hektolitre ağırlığının 71.4-80.8 kg.hl<sup>-1</sup> arasında değişim gösterdiği ve deneme ortalamasının 76.3 kg.hl<sup>-1</sup> olduğu belirlenmiştir (Tablo 4). Çalışmada, G9 (80.8 kg.hl<sup>-1</sup>) en yüksek ve G2 (71.4 kg.hl<sup>-1</sup>) en düşük hektolitre ağırlığını vermiştir. Bu bağlamda, G9 ekmeklik buğday genotipinde un randımanının daha yüksek olması beklenebilir. Hektolitre ağırlığına ilişkin olarak Aktaş ve ark., (2017) 78.0-85.1 kg.hl<sup>-1</sup>, Karaman (2020a) 75.0-80.2 kg.hl<sup>-1</sup> arasında değişim gösterdiğini bildirmiştir. Bin tane ağırlığı, genetik yapının yanı sıra önemli düzeyde çevre faktörlerinin etkisi altındadır. İlâveten, bin tane ağırlığı da un randımanını etkilemektedir. Bin tane ağırlığının 29.9-40.4 g arasında farklılık gösterdiği ve deneme ortalamasının 34.4 g olduğu tespit edilmiştir. Pehlivan (40.4 g) ekmeklik buğday çeşidi en yüksek bin tane ağırlığına sahip olurken, G8 (29.9 g) en düşük bin tane ağırlığını vermiştir (Tablo 4). Bin tane ağırlığı kalıtım ve ekolojinin etkisi altında farklılık göstermekle beraber bin tane ağırlığının Aydın ve ark. (2007) 32.4- 43.2 g, Metin (2019)

37.28-37.29 g, Bozkurt ve ark., (2022) 30.60-41.55 g, Koç & Aydoğan Çıfci (2022) 26.96-36.25 g farklılık gösterdiğini tespit etmiştir.

### 3.1.GGE Biplot Tekniğinde Genotip-Özellik İlişkisinin Vektörler İle Yorumlanması

Araştırmada; PC1 %35.98, PC2 %29.76 ve PC1+PC2 %65.74 oranında incelenen özellikler yönünden genotipler arasındaki varyasyonu açıklamıştır (Şekil 1). Biplot analizinin vektörler ile yorumlanmasında özellikleri temsil eden vektörlerin yönü, aralarındaki açı ve uzunluğu dikkate alınarak özellikler arasındaki ilişki ve genotipler arasındaki varyasyon açıklanabilir (Yan & Tinker, 2006; Karaman, 2020b). Bu bağlamda, tane verimi ile bin tane ve hektolitreye ağırlığı arasında güçlü pozitif korelasyon olduğu belirlenmiştir. Başaklanma süresi ile bitki boyu arasında pozitif korelasyon olduğu gözlenmiş olmakla beraber tane verimi ve hektolitreye ağırlığı ile negatif korelasyon olduğu tespit edilmiştir.

Şekil 1. Genotip-özellik ilişkisinin vektörler ile sunumu

Ayrıca, başaklanma süresi ve bitki boyu yönünden genotipler arasındaki varyasyon yüksek, bin tane ve hektolitreye ağırlığında varyasyonun düşük olduğu söylenebilir (Şekil 1). Başaklanma süresi uzadıkça tane veriminin ve hektolitreye ağırlığının düşmesi Diyarbakır ili koşullarında sıcaklık stresine maruz kalma ile açıklanabilir. G1, G6, G13, G14, G19 tane veriminde, G1, G6, G9, G14 ve G23 bin tane ağırlığında, G9, Pehlivan, G14 ve G23 hektolitreye ağırlığında öne çıkan genotipler olmuştur (Şekil 1). Korelasyon analizi sonuçlarına göre tane verimi ile hektolitreye ağırlığı ( $r=0.2945^*$ ) ve bin tane ağırlığı ( $0.2383^*$ ) arasında pozitif korelasyon olduğu belirlenmiştir.

İlaveten, bin tane ağırlığı ile hektolitre ağırlığı (0.2304\*) arasında pozitif korelasyon olduğu tespit edilmiştir (Tablo 5).

**Tablo 5.**İncelenen özellikler arası korelasyon ve önemlilik durumu

Özellikler	Başaklanma süresi (gün)	Bitki boyu (cm)	Tane verimi (kg.da <sup>-1</sup> )	Hektolitre ağırlığı (kg.hl <sup>-1</sup> )
Bitki boyu	0.4617**			
Tane verim	-0.1596	0.1891		
Hektolitre ağırlığı	-0.1014	0.0543	0.2945*	
Bin tane ağırlığı	-0.0289	0.1535	0.2383*	0.2304*

Tane verimi ile başaklanma süresi arasında önemsiz olmakla beraber negatif korelasyon görülmesi bölge koşulları için seleksiyon sürecinde dikkate alınması gereken bir sonuçtur (Tablo 5).

#### **4. SONUÇLAR**

Çalışmada, erkenci ve aynı zamanda tane verimi ve/veya kalite bakımından kontrol çeşitlerinden daha üstün olan birçok ileri kademe hattın olduğu tespit edilmiştir. Üstün nitelikli olduğu belirlenen ileri kademe bu hatların aynı zamanda ortalama bir bitki boyuna (95-110 cm) sahip olması saman verimi açısından da kıymetlidir. Bu bağlamda; G1, G6, G9, G13, G14, G23 ve G24 ileri kademe hatlarının geleceğe dönük ümit var hatlar olabileceği, aynı zamanda bu hatların ıslah programlarında ebeveyn olarak kullanılabileceği sonucuna varılmıştır.

**ÖZET**

Nohut (*Cicer arietinum* L.), dünyada ve Türkiye’de ekim alanı ve üretim miktarı bakımından yemeklik tane baklagiller içerisinde ön sıralarda yer almaktadır. Nohut tanesinin besin içeriği bakımından zengin olması insan beslenmesinde büyük önem arz etmektedir. Çalışmada amaç, bazı nohut genotiplerini tane verimi, morfolojik ve fizyolojik özellikler bakımından incelemektir. Deneme, Muş ilinin yağışa dayalı koşullarında tesadüf blokları deneme desenine göre beş tekrarlamalı olarak yürütüldü. İncelenen özelliklerden ana dal sayısı hariç kalan tüm özelliklerde genotipler arasında  $p \leq 0.01$  veya  $p \leq 0.05$  düzeyinde önemli farklılıklar olduğu belirlendi. Çalışmada, tane verimi 100.2-149.2 kg.da<sup>-1</sup>, bitki boyu 25.0-30.9 cm, ilk bakla yüksekliği 8.9-11.8 cm, bakla sayısı 17.3-27.6 adet.bitki<sup>-1</sup>, çiçeklenme süresi 50.0-53.2 gün, bitki örtüsü sıcaklığı 33.1-34.1 °C, normalize edilmiş vejetasyon farklılık indeksi 0.446-0.632 arasında farklılık gösterdi. Zuhul nohut çeşidi en yüksek tane verimine sahip olmakla beraber en düşük bitki örtüsü sıcaklığı ve en yüksek normalize edilmiş vejetasyon indeksi değerini verdi. Bitki örtüsünü serin tutan ve aynı zamanda iyi biyomasa sahip genotiplerin yüksek tane verimi verdiği gözlemlenmiştir. Korelasyon analizi sonuçlarına göre tane verimi ile bitki boyu ( $r=0.5675^{**}$ ), bakla sayısı ( $r=0.8213^{**}$ ) ve normalize edilmiş vejetasyon farklılık indeksi ( $0.9344^{**}$ ) arasında pozitif ve önemli ilişki olduğu belirlendi. Zuhul nohut çeşidinin ebeveyn, bitki örtüsü sıcaklığı ve normalize edilmiş vejetasyon indeksinin seleksiyon kriteri olarak ıslah programlarında kullanılması faydalı olacaktır. İlave olarak, çalışmanın birkaç yıl ve/veya lokasyonda tekrar edilmesinin ise sonuçların kesinliği yönünden ihtiyaç olduğu düşünülmektedir.

**Anahtar Kelimeler:** Nohut, verim, morfoloji, fizyoloji

**EVALUATION OF SOME CHICKPEA VARIETIES IN TERMS OF  
MORPHOLOGICAL AND PHYSIOLOGICAL CHARACTERISTICS**

**ABSTRACT**

Chickpea (*Cicer arietinum* L.) ranks among the edible legumes in the world and in Türkiye in terms of cultivation area and production amount in front of row. The rich nutritional content of chickpeas is of great importance in human nutrition. The aim of the study was to examine some chickpea genotypes in terms of grain yield, morphological and physiological characteristics. The experiment was carried out with five replications according to the randomized experiment blok design based of rainfed conditions in Muş province. It was determined that there were significant differences between genotypes at the level of  $p \leq 0.01$  or  $p \leq 0.05$  in all characteristics examined, except for the number of major branches. In the study, grain yield 100.2-149.2 kg.da<sup>-1</sup>, plant height 25.0-30.9 cm, first pod height 8.9-11.8 cm, number of pods 17.3-27.6 pcs.plant<sup>-1</sup>, flowering time 50.0-53.2 days, canopy temperature 33.1-1. 34.1 °C, normalized difference vegetation index 0.446-0.632 between were changed. Zuhale chickpea variety was the highest grain yield, but also the lowest canopy temperature and the highest normalized difference vegetation index value. It has been observed that genotypes that keep the vegetation cool and also have good biomass give high grain yield. According to the correlation analysis results, it was determined that there were a positive and significant relationship between grain yield and plant height ( $r=0.5675^{**}$ ), number of pods ( $r=0.8213^{**}$ ) and normalized difference vegetation index ( $0.9344^{**}$ ). It would be useful to use the parent, canopy temperature and normalized difference vegetation index of the Zuhale chickpea variety as selection criteria in breeding programs. Additionally, it is thought that it is necessary to repeat the study in several years and/or locations in order to ensure the accuracy of the results.

**Keywords:** Chickpea, yield, morphology, physiology

## **GİRİŞ**

Nohut (*Cicer arietinum* L.), dünya genelinde insan ve hayvan beslenmesinde kullanılan önemli yemekli tane baklagillerden biridir. Türkiye’de nohut ekim alanı 518 bin hektar, üretimi 630 bin ton ve tane verimi ise 122 kg/da’dır. Bu veriler doğrultusunda nohut Türkiye’de en önemli yemeklik tane baklagillerden biri olma potansiyelini korumaktadır (FAO, 2021). Nohutta tane besin değeri yönünden %16.4-31.2 protein, %1.5-6.8 yağ, %38.1-73.3 karbonhidrat ve %1.6-9.0 selüloz içermektedir. Protein kapsamına bakıldığında insan beslenmesinde kıymetli olan amino asitlerce (lysine, isoleucine ve leucine) zengin olduğu söylenebilir. Fakat, methionine, cystine ve tryptophan bakımından fakirdir (Şehirli, 1988; Doğan ve ark., 2015). Nohutta bitki boyu, bitkide dal sayısı ve bitkide bakla sayısı gibi özellikler birim alan tane verimi üzerinde etkili olan faktörlerdir (Tosun ve Eser, 1975; Açıkgöz ve Kıtık, 1994; Düzdemir ve ark., 2007). Tarla bitkilerinin yetiştiriciliğinde toprakta su miktarı azaldıkça stomaların kapanmasına bağlı olarak yaprak sıcaklığının arttığı ve hava sıcaklığından daha yüksek sıcaklıkların görülebileceği, bu bağlamda bitki örtüsü sıcaklığının bitkilerin tarlada yetiştirilme performansıyla doğrudan ilişkili olduğu vurgulanmıştır (Reynolds ve ark., 1994; Başdemir ve Yıldırım). Bitki örtüsü ile ilgili sıcaklık ölçümlerinin verimle en güçlü korelasyonu yüksek sıcaklık problemi olmakla birlikte su kısıtlılığının olmadığı şartlarda verdiği bildirilmiştir (Reynolds ve ark., 1994; Başdemir ve Yıldırım). Çalışmanın amacı; tane verimi ile bazı verim komponentleri, morfolojik ve fizyolojik özellikler arasındaki ilişkiyi belirlemektir.

## **2.MATERYAL VE METOT**

Araştırma, Muş ilinin yağışa dayalı koşullarında 2022 yılı nohut yetiştirme sezonunda yazlık ekim koşullarında yürütülmüştür. Araştırma materyalini Aksu (Orijini: Doğu Akdeniz Geçit Kuşağı Tarımsal Araştırma Enstitüsü Müdürlüğü), Aslanbey (Orijini: Doğu Akdeniz Geçit Kuşağı Tarımsal Araştırma Enstitüsü Müdürlüğü) ve Zuhul (Orijini: Karadeniz Tarımsal Araştırma Enstitüsü Müdürlüğü) çeşitleri ile 1 yerel (Orijini: Muş ili) nohut çeşidi oluşturmuştur. Denemede; her parsel 4 sıra, sıra arası 30 cm, parsel uzunluğu 4 metre uzunluğunda ve ekim normu 50 tohum.m<sup>-2</sup> yoğunluğunda ve deneme deseni tesadüf blokları deneme desenine göre 5 tekerrürlü olarak tasarlanmıştır. Yabancı otlar ile mücadele ihtiyaç dahilinde el ile sökülerek temizlik yapılmıştır. Ekimde toplam 4.8 m<sup>2</sup> olan parselin sağından, solundan birer sıra ve başından, sonundan 0.5 m kesildikten sonra geriye kalan 1.8 m<sup>2</sup> üzerinden hasat yapılmıştır. Hasat işlemi 8 Ağustos 2022 yılında, harmanlama ise 09-30 Ağustos 2024’te tamamlanmıştır.

Tablo 1. Deneme alanı topraklarının içeriğine ilişkin bilgiler

Toprak Bünyesi	Toplam tuz (%)	Ph	Kireç CaCO <sub>3</sub> (%)	Fosfor P <sub>2</sub> O <sub>5</sub> (kg/da)	Organik madde (%)
Killi-Tın	0.38	7.8	2.5	2.0	1.57

Deneme alanı topraklarının tuzsuz, hafif bazik, fosfor ve organik madde içeriğinin az olduğu belirlenmiştir (Tablo 1). Eksik olan bitki besin elementi ihtiyacını tamamlamak için ekim ile beraber saf madde üzerinden 6 kg fosfor (P<sub>2</sub>O<sub>5</sub>) ve 2.5 azot (N) verilmiştir. Çalışmada, üst gübre uygulaması yapılmamıştır.

Şekil 1. Muş İlinin 2022 nohut yetiştirme sezonu ve uzun yıllar yağış miktarı (mm)

Muş ilinde gerçekleşen yağış miktarı incelendiğinde, 2022 nohut yetiştirme sezonunda Mayıs ayı hariç diğer aylarda uzun yıllar ortalamasının altında yağış olduğu gözlenmektedir. Mayıs ayında daha yüksek yağış olması nohut çıkışlarının homojen olmasına katkı sağladığı düşünülmektedir (Şekil 1). Sıcaklık değerlerine bakıldığında Mayıs ayı hariç geriye kalan tüm aylarda daha yüksek sıcaklıkların yaşandığı anlaşılmaktadır. Bu durum, vejetasyon süresinin kısalmasına bağlı olarak tane dolum süresinin beklenenden daha kısa sürmesine sebep olmuş ve nohutta birim alan tane verimini olumsuz etkilediği düşünülmektedir (Şekil 2).

Şekil 2. Muş İlinin 2022 nohut yetiştirme sezonu ve uzun yıllar sıcaklık değerleri (°C)

2022 yılı nohut yetiştirme sezonu yağış ve sıcaklık ekseninde değerlendirildiğinde olağan olmayan bir sezonun yaşandığı söylenebilir. Araştırmada, tane verimini belirlemek için parsel bazında kenar tesirleri devre dışı bırakıldıktan sonra kalan kısım hasat edilmiş ve 0.001 seviyede hassas terazide tartılarak elde edilen değer  $\text{kg}\cdot\text{da}^{-1}$ 'a dönüştürülmüştür. Bitki boyu, ilk bakla yüksekliği, ana dal sayısı ve bakla sayısı hasat öncesinde her parselde 10 bitki üzerinde alınan gözlemlerin ortalaması alınarak belirlenmiştir. Çiçeklenme süresi için ekimden her parselin %50'si çiçekleninceye kadar geçen süre gün olarak hesaplanmıştır. Bitki örtüsü sıcaklığı ve normalize edilmiş vejetasyon farklılık indeksi için gözlemler parsel bazında %50 bakla bağlama döneminde alınmıştır.

### 3.ARAŞTIRMA VE BULGULAR

Araştırmada, bitkideki ana dal sayısı (ADS) hariç tüm özelliklerde genotipler arasında önemli düzeyde varyasyon olduğu belirlenmiştir (Tablo 2). Çalışmada tane verimi  $100.2-149.2 \text{ kg}\cdot\text{da}^{-1}$  arasında değişim göstermiş ve deneme ortalamasının  $129.5 \text{ kg}\cdot\text{da}^{-1}$  olduğu tespit edilmiştir. Zuhul ( $149.2 \text{ kg}\cdot\text{da}^{-1}$ ) nohut çeşidi en yüksek birim alan tane verimi ile ilk sırada yer almıştır (Tablo 2). Birim alan tane verimi ile ilgili farklı çevrelerde yapılan çalışmalarda Biçer ve Anlarsal (2004)  $121.5-166.6 \text{ kg}\cdot\text{da}^{-1}$ , Düzdemir ve ark. (2007)  $94.9-153.1 \text{ kg}\cdot\text{da}^{-1}$ , Mart ve ark. (2021)  $45.52-309.33 \text{ kg}\cdot\text{da}^{-1}$  olduğunu bildirmiştir.

Tablo 2. İncelenen özellikler, elde edilen değerler ve oluşan gruplar

Çeşit	TV (kg.da <sup>-1</sup> )	BB (cm)	İBY (cm)	ADS (ad.bit <sup>-1</sup> )	BS (ad.bit <sup>-1</sup> )	ÇS (gün)	BÖS (°C)	NDVI
Aksu	129.0 c	30.9 a	11.78 a	2.38	25.0 a	53.2 a	33.1 b	0.593 b
Aslanbey	139.6 b	30.8 a	11.74 a	2.50	27.6 a	51.6 ab	34.1 a	0.620 a
Yerel	100.2 d	25.0 b	8.94 b	2.60	17.3 b	50.0 b	33.9 a	0.446 c
Zuhal	149.2 a	29.6 a	11.80 a	2.56	27.2 a	51.8 a	33.0 b	0.632 a
G. Ortalama	129.5	29.1	11.07	2.51	24.3	51.7	33.5	0.573
Mak. değer	149.2	30.9	11.80	2.60	27.6	53.2	34.1	0.632
Min. Değer	100.2	25.0	8.94	2.38	17.3	50.0	33.1	0.446
LSD (0.05)	5.87**	1.95**	1.81*	Ö.D.	3.56**	1.66*	0.50**	0.02**
CV (%)	3.29	4.87	11.89	11.07	10.65	2.34	1.09	2.51

TV: tane verimi, BB: bitki boyu, İBY: ilk bakla yüksekliği, ADS: bitkide ana dal sayısı, BS: bakla sayısı, ÇS: çiçeklenme gün sayısı, BÖS: bitki örtüsü sıcaklığı, NDVI: normalize edilmiş vejetasyon farklılık indeksi, Mak.; maksimum, Min.: minimum, G. Ortalama: genel ortalama, ad.bit<sup>-1</sup>: adet.bitki<sup>-1</sup> Bitki boyunun 25.0-30.9 cm arasında farklılık gösterdiği ve bitki boyuna ilişkin deneme ortalamasının 29.1 cm olduğu gözlenmiştir. Zuhal (29.6 cm) nohut çeşidinin en uzun, yerel (25.0 cm) çeşidin ise en kısa boylu olduğu görülmüştür (Tablo 2). Bitki boyunu; Düzdemir ve ark. (2007) 35.7-44.3 cm, Yalçın ve ark. (2018) 38.2-41.9 cm, Ercan ve ark. (2019) 30.5-47.4 cm, Demirci ve Bildirici (2020) 39.0-48.3 cm olduğunu belirlemiştir. Çalışmada, çeşitlere ait bitki boylarının genel olarak kısa kalmasının yazlık ekim sebebiyle vejetasyon süresinin kısa olmasından kaynaklandığı düşünülmektedir. İlk bakla yüksekliğinin 8.9-11.8 cm arasında değiştiği, yerel çeşit hariç tüm çeşitlerin aynı grupta yer alarak benzer değerler verdiği belirlenmiştir. İlk bakla yüksekliği dikkate alındığında yerel çeşit hariç tüm çeşitlerin makinalı tarıma uygun olduğu söylenebilir (Tablo 2). İlk bakla yüksekliğinin Karakan Kaya (2014) 24.4-35.1 cm, Dinç (2014) 19.1-25.3 cm, Demirci ve Bildirici (2020) 28.8-38.8 cm arasında değişim gösterdiğini belirlemiştir. Bitkide ana dal sayısının 2.4-2.6 adet arasında değiştiği, çeşitler bazında elde edilen değerlerin benzer olduğu ve istatistiki açıdan fark olmadığı tespit edilmiştir (Tablo 2). Ana dal sayısı ile ilgili Kaçar ve ark. (2005) 2.5-3.2 adet.bitki<sup>-1</sup>, Yiğitoğlu (2006) 2.6-3.3 adet.bitki<sup>-1</sup>, Ercan ve ark. (2019) 1.7-2.7 adet.bitki<sup>-1</sup> olduğunu bildirmiştir. Bitkide bakla sayısının 17.3-27.6 adet.bitki<sup>-1</sup>, deneme ortalamasının 24.3 adet.bitki<sup>-1</sup> ve Aslanbey (27.6 adet.bitki<sup>-1</sup>) çeşidinin ilk sırada yer aldığı belirlenmiştir. Bakla sayısına ilişkin yapılan çalışmalarda Düzdemir ve ark., (2007) 13.6-22.2 adet.bitki<sup>-1</sup>, Çiftçi ve ark. (2004) 6.5-18.4 adet.bitki<sup>-1</sup>, Dinç (2014) 5.5-8.3 adet.bitki<sup>-1</sup>, Demirci ve Bildirici (2020) 6.9-13.0 adet.bitki<sup>-1</sup> olduğunu tespit etmiştir (Tablo 2). Çiçeklenme süresinin 50.0-53.2 gün ve

deneme ortalamasının 51.7 gün olduğu gözlenmiştir. Çalışma, yazlık ekim koşullarında yürütüldüğünden dolayı çiçeklenme süreleri kısa olmakla beraber yerel çeşit en erken ve Zuhul çeşidi ise en geç çiçeklenen nohut çeşidi olmuştur. Çiçeklenme süresinin Uzun ve ark. (2012), 57.5- 65.5 gün, Demirci ve Bildirici (2020) 47.3-53.6 gün olduğunu vurgulamıştır (Tablo 2). Bitki örtüsü sıcaklığı yönünden nohut çeşitleri arasında istatistiki açıdan önemli farklılıklar olduğu belirlenmiştir. Denemede, bitki örtüsü sıcaklığının 33.1-34.1 °C aralığında ve deneme ortalamasının ise 33.5 °C olduğu tespit edilmiştir. Çalışmada, Aksu çeşidi (33.1 °C) bitki örtüsünü en serin tutan çeşit olmuştur (Tablo 2). Bitki örtüsünü serin tutan genotiplerin kuraklık stresinin yaşandığı koşullara daha toleranslı olduğu, su stresine ve kuraklığa karşı tolerant genotip geliştirmede bitki örtüsü sıcaklığının seleksiyon unsuru olabileceği bildirilmiştir (Blum ve ark., 1989).Birim alandaki yeşil aksamın yoğunluğu hakkında fikir veren normalize edilmiş vejetasyon indeksi (NDVI) değerinin 0.446-0.632 aralığında ve deneme ortalamasının 0.573 olduğu gözlenmiştir (Tablo 2). Çalışmada tane verimi sıralaması ile NDVI sıralamasının aynı olduğu belirlenmiştir. Bu durum NDVI ile tane verimi arasında önemli bir ilişki olduğunu göstermektedir. Geçit Kuşağı Tarımsal Araştırma Enstitüsü Müdürlüğü deneme alanında nohutun tane doldurma döneminde yapılan NDVI ölçümlerinde 0.60-0.71 arasında değerler elde edilmiştir (Alkan, 2024). Çalışmamızda daha düşük değerlerin elde edilmesinin çeşit ve ekolojik faktörlerden kaynaklandığı düşünülmektedir.

Tablo 3. Araştırılan özelliklere ilişkin korelasyon kat sayısı ve önemlilik durumu ( $p < 0.01$  veya  $0.05$ )

Özellikler	TV (kg.da <sup>-1</sup> )	BB (cm)	İBY (cm)	DS (adet.bitki <sup>-1</sup> )	BS (adet.bitki <sup>-1</sup> )	ÇS (gün)	CS (°C)
BB	0.5675**						
İBY	0.5087*	0.7233**					
DS	-0.0603	0.0059	0.2978				
BS	0.8213**	0.5512**	0.5646**	-0.1111			
ÇS	0.3662	0.6782**	0.4461*	-0.1445	0.277		
CS	-0.3048	-0.2291	-0.3136	0.259	-0.1173	-0.2533	
NDVI	0.9344**	0.7514**	0.7045**	-0.1007	0.8456**	0.496*	-0.3328

Korelasyon analizi sonuçlarına göre TV ile İBY (0.5087\*), BS (0.8213\*\*) ve NDVI (0.9344\*\*) arasında pozitif korelasyon olduğu belirlenmiştir. Ayrıca, NDVI'nın BS (0.8456\*\*) ve ÇS (0.496\*) ile pozitif ilişkili olduğu tespit edilmiştir (Tablo 3). NDVI'nın BS ile pozitif ilişkili olması nohut ıslahında tane verimi odaklı yapılacak olan seleksiyonlarda önem arz etmektedir.

#### **4. SONUÇLAR**

Araştırmada, tane verimi ile morfolojik ve fizyolojik özellikler arasında pozitif ilişki olduğu belirlenmiştir. Bitki örtüsünü serin tutan genotiplerin yüksek normalize edilmiş vejetasyon farklılık indeksi değeri verdiği ve aynı genotiplerin tane verimi bakımından öne çıktığı tespit edilmiştir. Korelasyon analizi sonuçlarına göre tane verimi ile verim komponentlerinden bakla sayısı, morfolojik özelliklerden bitki boyu ve fizyolojik özelliklerden normalize edilmiş vejetasyon farklılık indeksi arasında olumlu ilişki olduğu belirlenmiştir. Zuhul nohut çeşidinin incelenen özellikler yönünden ideal çeşit olması sebebiyle ıslah programlarında genitor olarak, normalize edilmiş vejetasyon farklılık indeksi ve bitki örtüsü sıcaklığı özelliklerinin seleksiyon kriteri olarak kullanılabileceği sonucuna varılmıştır.

**Özet**

Biyokütle bazlı karbon malzemelerinin araştırılması ve geliştirilmesi, çevresel sürdürülebilirlik ve yenilenebilir enerji kaynaklarının keşfi açısından son derece önemlidir. Özellikle atık biyokütle kaynaklarının, ceviz kabuğu ve yer fıstığı kabuğu gibi doğal kaynaklardan karbon bazlı malzemelerin üretimi için potansiyeli oldukça büyüktür. Ceviz kabuğu ve yer fıstığı kabuğu gibi bitkisel atıklar, genellikle değerlendirilmeden önce çevresel sorunlara yol açabilirler. Ancak bu atık kaynakları, uygun işlemlerle karbon bazlı malzemelere dönüştürülerek çeşitli endüstriyel uygulamalarda ve çevresel iyileştirme projelerinde kullanılabilir. Karbon bazlı malzemeler, yüksek yüzey alanına sahip olmaları, mükemmel adsorpsiyon özellikleri ve termal iletkenlik gibi özelliklerinden dolayı birçok alanda potansiyel sunarlar. Bu çalışmada, ceviz kabuğu ve yer fıstığı kabuğu gibi sıkça atık olarak ortaya çıkan biyokütle kaynaklarından karbon bazlı malzemelerin üretim potansiyeli araştırılmıştır. Öncelikle kuru ceviz ve yer fıstığı kabuğu biyokütleri toplanıp, parçalanarak öğütme işlemi ardından 75 µm altı boyutlarında elendi. Boyutu küçültülüp elenen biyokütler kül fırınında belirlenen sıcaklık ve sürede demir içerikli katalizör varlığında karbonizasyon işlemine tabi tutuldu. Karbonize edilen örnekler soğutularak toplandı. Karbonizasyon işlemi sonunda elde edilen karbon bazlı malzemelerin karakterizasyonu X-ray difraksiyonu (XRD), Fourier dönüşümlü kızılötesi spektrofotometresi (FTIR) ve Raman analizleri ile gerçekleştirildi. XRD, FTIR ve Raman analizlerinin sonuçları, lignoselülozik biyokütlenin karbonlaşma sürecinin başarıyla gerçekleştiğini ortaya koymaktadır. Bu analizler, hammaddenin yapısal değişimlerini

ve karbonizasyonun ilerleyişini ayrıntılı bir şekilde göstermektedir. Bu araştırma, ceviz kabuğu ve yer fıstığı kabuğu gibi atık biyokütle kaynaklarının yeniden değerlendirilerek karbon bazlı malzemelerin üretimindeki potansiyelini ortaya koymaktadır. Bu malzemelerin üretim süreci, çevresel olarak sürdürülebilir ve ekonomik açıdan etkin bir yaklaşımı temsil ederken, aynı zamanda çeşitli endüstriyel ihtiyaçlara da yanıt verebilmektedir. Dolayısıyla, biyokütle bazlı karbon malzemelerinin araştırılması ve geliştirilmesi, gelecekteki yeşil ve sürdürülebilir teknolojilerin geliştirilmesine önemli bir katkı sağlayacağı düşünülmektedir.

**PRODUCTION OF CARBON-BASED MATERIALS FROM WALNUT AND  
PEANUT BIOMASS**

**Abstract**

The research and development of biomass-based carbon materials is extremely important for environmental sustainability and the exploration of renewable energy sources. In particular, waste biomass sources have great potential for the production of carbon-based materials from natural resources such as walnut hulls and peanut shells. Crop wastes such as walnut hulls and peanut shells can often cause environmental problems before they are utilized. However, these waste sources can be converted into carbon-based materials through appropriate processes and used in various industrial applications and environmental remediation projects. Carbon-based materials offer potential in many fields due to their high surface area, excellent adsorption properties and thermal conductivity. In this study, the potential for the production of carbon-based materials from biomass sources such as walnut shells and peanut shells was investigated. First of all, dry walnut and peanut shell biomasses were collected, crushed and sieved to a size of less than 75  $\mu\text{m}$  after grinding. The reduced and sieved biomasses were subjected to carbonization process in the presence of iron-containing catalyst in a muffle furnace at the specified temperature and time. Carbonized samples were cooled and collected. The carbon-based materials obtained at the end of the carbonization process were characterized by X-ray diffraction (XRD), Fourier transform infrared spectrophotometry (FTIR) and Raman analysis. The results of XRD, FTIR and Raman analyses reveal that the carbonization process of the lignocellulosic biomass was successful. These analyses show in detail the structural changes of the feedstock and the progress of carbonization. This research demonstrates the potential of recycling waste biomass resources such as walnut shells and peanut shells for the production of carbon-based materials. The production process of these materials represents an environmentally sustainable and economically efficient approach, while at the same time responding to various industrial needs. Therefore, the research and development of biomass-based carbon materials is expected to make a significant contribution to the development of future green and sustainable technologies.

**Keywords:** Peanuts, walnut shells, biomass, carbon-based material

## **Introduction**

Biomass is a renewable, abundant and cheap resource and its conversion into fuel, chemical and material precursors is of great importance to alleviate the energy crisis by reducing over-reliance on fossil resources, reduce environmental pollution and promote sustainable development (Baweja & Jeet, 2019). Recently, there is a high proportion of agricultural waste generated globally that is inefficiently used and cannot be recycled. These wastes can be considered as a viable resource that can impact environmental management. Furthermore, the utilization of biomass resources is thought to enable the use of less toxic reagents during the production phase, as well as adding value to agricultural by-products and reducing global dependence on petroleum-based feedstocks (Çavuş at al., 2022). In this study, it was aimed to investigate the potential of producing carbon-based materials from walnut shell and peanut shell, which are waste biomass sources. The obtained carbon-based materials were characterized by XRD, FTIR and Raman analysis.

## **Materials and Methods**

Dried walnut shells were obtained from Çorum region and dried peanut shells were obtained from Osmaniye region. Dried walnut and peanut shell biomasses were collected, crushed, ground and sieved to a size of less than 75 µm. The sieved biomasses were subjected to carbonization in the presence of iron-containing catalyst in a muffle furnace at 350°C. Carbonized samples were cooled and collected. The carbonized products obtained from dry walnut and peanut shell biomasses were named CC1 and CF1, respectively.

## **Findings and Discussion**

The synthesized samples were characterized by XRD, FTIR and RAMAN analysis. The phases of the biomasses and carbonized samples were observed by XRD patterns (Figure 1). Compared to the biomasses, the characteristic peaks of the prepared CC1 and CF1 carbonized products become more pronounced, indicating that the carbonization process only consumes impurities, but does not destroy the “core” structure of the biomasses. XRD spectra obtained from the crystal phase models of biochar (Figure 1) showed the presence of a peak indicating the formation of the intact structure of carbonaceous materials (Assirey & Altamimi, 2021). As shown in Figure 1, the XRD pattern of the prepared CC1 and CF1 exhibited a diffraction peak ( $2\theta=14^\circ$ ), indicating that the prepared carbon-based material has an amorphous carbon composed of aromatic carbon layers. This result clearly shows that under the process condition of carbonization and activation, it gives a carbonaceous structure composed of aromatic carbon layers (Wang, at al., 2020). After the carbonization process, it is seen that the peak at  $2\theta= 16.3^\circ$

shifted to  $2\theta = 14^\circ$  and sharpened and also the peak between  $2\theta = 21.9$ - $22^\circ$  broadened and a new peak was formed around  $2\theta = 25^\circ$ .

**Figure 1.** XRD diffractograms of biomass wastes and carbon-based materials obtained from these wastes FT-IR analysis of walnut and peanut wastes and carbon-based materials obtained from these biomasses is shown in Figure 2. It is seen that the broadband absorption peak is at  $3700$ - $3000\text{ cm}^{-1}$ , indicating the presence of hydroxyl group (OH). This peak was found to be broadened in CC1 and CF1 samples while it was strong and narrow in biomasses. The absorption peak observed at  $2923\text{ cm}^{-1}$  in biomasses indicates the presence of aliphatic C-H vibration peaks originating from  $\text{sp}^3$ -hybridized carbon atoms. It is observed that the intensity of this peak completely disappears in CC1 and CF1 samples (Melese at al., 2020). The bands at  $1040\text{ cm}^{-1}$  attributed to aromatic C-O almost disappeared, while the C=C peak at  $1610\text{ cm}^{-1}$  and the C=O peak at  $1708\text{ cm}^{-1}$  appeared. All of these observations point to carbonization of lignocellulosic biomass (Wang at al., 2020).

**Figure 2.** FT-IR spectra of biomass wastes and carbon-based materials obtained from these wastes Figure 3 shows the Raman spectra of the respective G and D bands of carbon-based materials derived from various biomass wastes. One of the leading indicators of carbon-based material formation is the characteristic peaks seen in Raman spectroscopy. Raman spectra of carbon-based materials are regularly characterized by two characteristic bands, the D-band and the G-band. The D peak is usually located around  $\sim 1350\text{ cm}^{-1}$  and arises due to point defects in the planar structure. This band corresponds to  $\text{sp}^3$  carbon atoms of disordered or defective carbons. The G band corresponds to the in-plane stretching vibration of  $\text{sp}^2$  hybridized C atoms in a two-dimensional hexagonal lattice and appears around  $\sim 1580\text{ cm}^{-1}$  (Li et al., 2016). On the other hand, XRD diffractograms support the Raman analysis by showing the formation of partially turbostratic structures with assigned peaks. In our study, when all samples are evaluated within themselves, it is seen that only D and G bands belonging to carbon-based material-like structures appear.

**Figure 3.** Raman spectra of biomass wastes and carbon-based materials obtained from these wastes

### Conclusion and Recommendations

Carbon-based materials were successfully obtained from walnut shell and peanut shell biomasses. XRD diffractograms, Raman and FTIR spectra of the prepared biomasses and carbon-based materials were taken. It was determined that the carbon-based materials produced have a carbonaceous structure consisting of aromatic carbon layers.

This research has demonstrated the potential of recycling waste biomass resources such as walnut shells and peanut shells for the production of carbon-based materials. The production process of these materials represents an environmentally sustainable and economically efficient approach, while at the same time responding to various industrial needs.

As a result, the research and development of biomass-based carbon materials is expected to make a significant contribution to the development of future green and sustainable technologies.

### Thanks and Information Note

This study was partially supported by Hitit University Scientific Research Projects Coordination Unit (Project No: MUH19004.22.001) within the scope of the Regional Development Oriented Mission Differentiation and Specialization Program funded by the Presidential Strategy and Budget Directorate and coordinated by the Council of Higher Education. Also, we would like to thank the Scientific and Technological Research Council of Türkiye (TUBITAK) for their support within the scope of TUBITAK 1002-B Emergency Support Module project number 123M017.

**Özet**

Kaplama, madencilik ve deri üretimi başta olmak üzere endüstrilerin faaliyetleri sonucunda sıklıkla atık sularla birlikte yüzey ve yeraltı sularına ciddi kirlilik oluşturan altı değerlikli ağır metal iyonu olan Cr(VI) karışmaktadır. İnsan ve diğer canlıların sağlığı üzerinde tehlikeye neden olan krom, solunum yolu rahatsızlıklarından kansere kadar birçok hastalığa yol açabilmektedir. Buna karşın üç değerlikli Cr(III) iyonlarının sudaki çözünürlüğü ve toksik etkisi çok daha azdır. Son zamanlarda, Cr(VI) içeren atık suların arıtılması için adsorbsiyon tekniği dikkat çekmektedir. Atıkların katma değerli ürünlere dönüştürülmesi amacıyla yola çıkılarak termik santral atığı ile Cr(VI) iyonlarının giderimi incelenmiştir. Yüksek toksik Cr(VI) türlerinin Cr(III) türlerine dönüştürülmesi ve iyonların adsorblanarak giderilmesi amaçlanmıştır. Bu kapsamda çalışma parametreleri Taguchi deneysel tasarım yöntemi kullanılması ile optimize edilmiştir. pH, konsantrasyon, doz, süre ve sıcaklık kontrol edilebilir değişkenler olarak seçilmiştir. Taguchi optimizasyon çalışmasında 5 farklı faktör ve her parametre için 4 farklı seviye seçilerek L16 Taguchi faktöriyel deney tasarımı yapılmıştır. Deneylerin tamamlanmasının ardından Cr (VI) giderim yüzdeleri (%) hesaplanarak, Taguchi yöntemi ile optimum deneysel çalışma koşullarında başlangıç pH'ı 2, konsantrasyon 80 ppm, doz 20 g/L, süre 3 saat ve sıcaklık 25 °C olduğu belirlenmiştir ve belirtilen şartlarda % 99,43 oranında Cr (VI) giderme işlemi başarıyla gerçekleştirilmiştir. Termik santral atığının yüzey morfolojisi ve kimyasını belirlemek amacıyla FT-IR, SEM-EDX, pHZPC, TGA ve XRD analizleri yapılmıştır. Atığın adsorpsiyon kapasitesini belirlemek adına Langmuir, Freundlich, Tempkin ve Dubinin-Radushkevich modelleri kullanılacaktır. Performans değerlendirmesi amacıyla CaSO<sub>4</sub> içerikli termik santral atığının ve ko-piroliz tekniği ile sentezlenen manyetik aktif karbonun Cr(VI) giderimi üzerine karşılaştırmalı değerlendirme çalışması yapılmıştır. Bu

**CR(VI) REMOVAL OF ÇANAKKALE ÇAN THERMAL POWER PLANT FLUE  
GAS TREATMENT WASTE FROM WASTEWATER: COMPARISON WITH  
MAGNETIC ACTIVATED CARBON**

**Abstract**

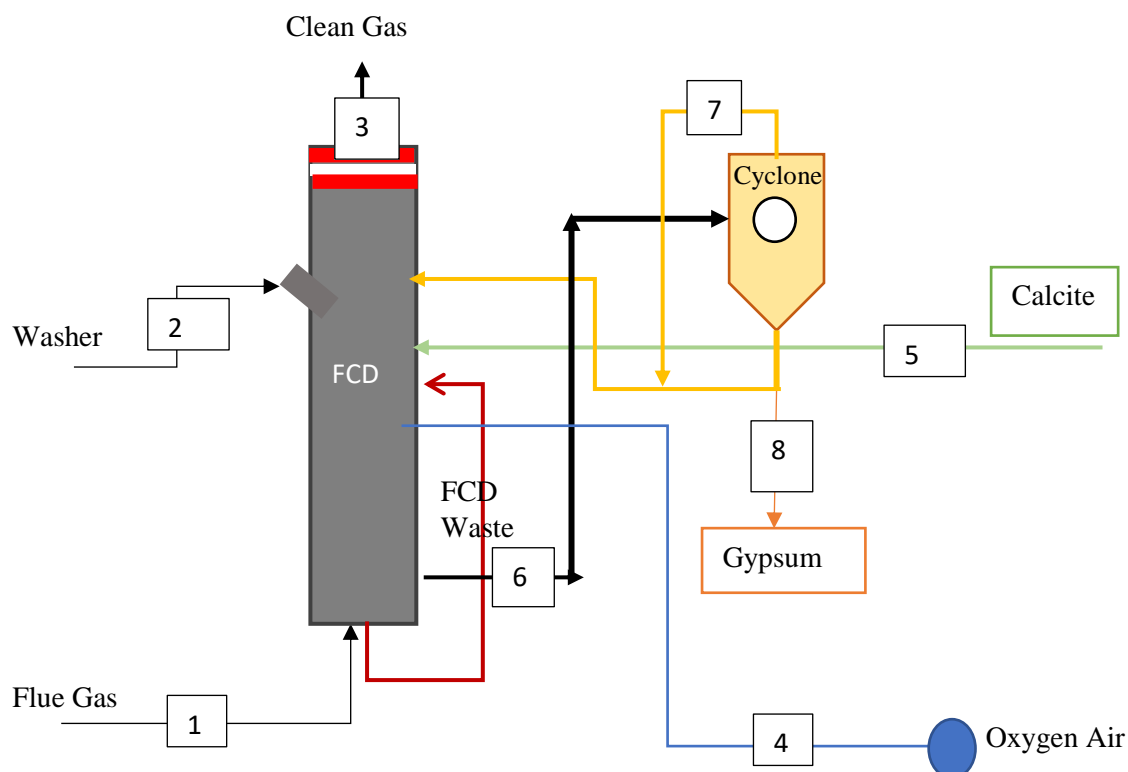

As a result of the activities of industries such as plating, mining and leather production, Cr(VI), a hexavalent heavy metal ion that causes serious pollution to surface and groundwater, is often mixed with wastewater. Chromium, which poses a danger to the health of humans and other living organisms, can cause many diseases ranging from respiratory diseases to cancer. In contrast, the solubility and toxic effect of trivalent Cr(III) ions in water is very low. Recently, adsorption technique has attracted attention for the treatment of wastewater containing Cr(VI). Based on the aim of transforming wastes into value-added products, the removal of Cr(VI) ions with thermal power plant waste was investigated. It was aimed to convert highly toxic Cr(VI) species into Cr(III) species and remove the ions by adsorbing. In this context, the study parameters were optimized using Taguchi experimental design method. pH, concentration, dose, time and temperature were selected as controllable variables. In Taguchi optimization study, L16 Taguchi factorial experimental design was performed by selecting 5 different factors and 4 different levels for each parameter. After the completion of the experiments, Cr (VI) removal percentages (%) were calculated and it was determined by Taguchi method that the optimum experimental working conditions were initial pH 2, concentration 80 ppm, dose 20 g/L, time 3 hours and temperature 25 °C and 99.43% Cr (VI) removal was successfully achieved under the specified conditions. FT-IR, SEM-EDX, pHZPC, TGA and XRD analyses were performed to determine the surface morphology and chemistry of the thermal power plant waste. Langmuir, Freundlich, Tempkin and Dubinin-Radushkevich models will be used to determine the adsorption capacity of the waste. For the purpose of performance evaluation, a comparative evaluation study was carried out on Cr(VI) removal of CaSO<sub>4</sub>-containing thermal power plant waste and magnetic activated carbon synthesized by co-pyrolysis technique. This study was supported by Çanakkale Onsekiz Mart University Scientific Research Coordination Unit with the project number FBA-2023-4480.

**Keywords:** Thermal power plant waste, magnetic activated carbon; Cr(VI) removal; wastewater treatment

## **Introduction**

In recent years, the decrease in water resources due to the rapid increase in population, urbanization and industrialization has become an important problem. As a result of the increasing production activities with the effect of the increase in industrial demands, the levels of pollutants entering the water also increase. This situation causes water resources to be polluted and limited. Water pollutants such as antibiotics, dyestuffs and heavy metals are serious pollutants due to their toxicity levels. Heavy metals, one of the pollutants, are an important area that needs to be studied to remove them from water because they have a high toxic effect on living organisms, especially humans (Wang et al., 2024). Heavy metals are among the most harmful contaminants in water. Heavy metals (e.g. Pb, As, Hg, Cd, Zn, Ag, Cu, Fe, Cr, Ni, Pd and Pt) are mainly transition metals, elements from the lower left of the periodic table and some metalloids. They are highly concentrated elements and are toxic even at ppb levels (Abu Shmeis, 2022). Among heavy metals, chromium (Cr) is highly mobile and therefore highly toxic. As a result of the activities of industries such as plating, metallurgy, tannery and leather production, it is mixed into wastewater and discharged into the environment (Gu et al., 2023). It occurs in nature as oxyanions and is frequently found in hexavalent (Cr(VI)) and trivalent (Cr(III)) forms. Chromium, which enters surface and groundwater through wastewater discharged as a result of industrial activities, can also penetrate the soil and enter the food chain through agricultural products (Ren et al., 2020). The Cr(VI) form has extremely high toxicity, while the Cr(III) form is known to be 500-1000 times less biotoxic (Ren et al., 2020). At the same time, chromium in this form is a necessary ion at limited levels for some metabolic activities such as blood sugar regulation. In contrast, the Cr(VI) form can cause many diseases such as skin irritation, organ failure and even cancer. Since the trivalent form of chromium is less toxic, it is possible to reduce the toxic effect by converting Cr(VI) to Cr(III) (Lathe & Palve, 2023). Recently, adsorption technique for the treatment of Cr(VI) containing wastewater has attracted attention. A study was conducted to investigate the removal of Cr(VI) ions using thermal power plant flue gas desulfurization (FCD) effluents as a way to convert wastes into value-added products. FCD wastes are produced in FCD systems of thermal power plant flue gases. The FGD flue gas desulfurization process used in Çanakkale Çan Thermal Power Plant is schematically shown in Figure 1. The flue gas is fed to the column from zone 1. Lime slurry is fed downwards from the top of the column. The CaSO<sub>4</sub> containing waste material generated in the system is collected from the bottom of the column and stored in the fields (Shanthakumar et al., 2008).

Figure 6. FCD flue gas treatment system flow chart

The clean gas formed after the purification process is released from the upper part of the column. There is no previous study in which thermal power plant flue gas treatment waste was used. In this study, it was aimed to utilize flue gas treatment waste for the first time and to use it as an adsorbent for the removal of heavy metals in wastewater. By using this waste containing  $\text{CaSO}_4$ ,  $\text{Cr(VI)}$  species in wastewater will be converted into  $\text{Cr(III)}$  species and ions will be removed by adsorbing.

### Materials and Methods

Thermal power plant flue gas treatment waste was obtained from Çanakkale Çan Thermal Power Plant. SEM-EDX (Scanning electron microscopy/Energy dispersive spectroscopy), FTIR (Fourier transform infrared spectroscopy), XRD (X-Ray diffraction), XRF (X-Ray fluorescence), TGA techniques were applied for the characterization of surface morphology, particle size, determination of functional groups and elemental composition of the waste. The waste obtained from Çanakkale Çan Thermal Power Plant was dried at  $80^\circ\text{C}$  for 24 hours and then the dried material was sieved through a 100-mesh sieve. Stock chromium solution was prepared to determine the  $\text{Cr(VI)}$  ion adsorption capacity of the waste. For this purpose, 2.808 g of 99% pure  $\text{Na}_2\text{Cr}_2\text{O}_7$  (Merck) was weighed. It was placed in a 1 L balloon jug, some distilled

water was added to dissolve it, and a stock solution of 1000 mg/l was prepared by adding distilled water up to the line of the balloon jug. 6N H<sub>2</sub>SO<sub>4</sub> was prepared from 95-98% (d = 1.84 g/cm<sup>3</sup>) H<sub>2</sub>SO<sub>4</sub> (Merck) solution to be used in the experiments. Experimental parameters were optimized using MINITAB software. Factors affecting the adsorption process such as pH, concentration, dose, time and temperature were determined as study parameters. These 5 factors were determined as controllable variables and 4 levels were determined for each of them and 5 factor 4 level L16 Taguchi factorial experimental design was applied. The pH values were chosen as 1.5, 2, 3, 4, concentration values as 20, 40, 60, 80 ppm, dosages as 5, 10, 20, 40 g/L, time as 1, 3, 6, 12 hours and temperature as 25, 35, 45, 55 °C. 16 experimental sets were determined by Taguchi method and the experimental sets are given in Table 1.

**Table 3.** Taguchi experimental sets and % chromium removal

Experimental No	pH	Concentration	Dosage	Time	Temperature	% Removal
1	1.5	20	5	1	25	100
2	1.5	40	10	3	35	100
3	1.5	60	20	6	45	98,27
4	1.5	80	40	12	55	100
5	2	20	10	6	55	100
6	2	40	5	12	45	98,70
7	2	60	40	1	35	98,79
8	2	80	20	3	25	99,43
9	3	20	20	12	35	100
10	3	40	40	6	25	0,01
11	3	60	5	3	55	0,01
12	3	80	10	1	45	0,01
13	4	20	40	3	45	0,01
14	4	40	20	1	55	0,01
15	4	60	10	12	25	0,01
16	4	80	5	6	35	0,01

After completion of the experiments, the amount of Cr(VI) in the solutions was determined by diphenyl carbazide method (APHA-AWWA-WPCF, 1989).

Chromium solutions with concentrations ranging from 0.1-1.0 mg/L were prepared. Diphenyl carbazide solution was prepared by dissolving 0.5 g 1,5-diphenyl carbazide in 100 ml acetone solution. Additions were made to the solutions according to the procedure and the colors were allowed to stabilize. Absorbance values were measured at 540 nm wavelength with L7 Double Beam UV Spectrophotometer visible region spectrophotometer to generate standard calibration

curve. The solutions formed as a result of Cr(VI) removal processes were diluted considering the color differences and diphenyl carbazide method was applied. Absorbance values were measured by adding 2 ml 6N H<sub>2</sub>SO<sub>4</sub>, 1 ml 1,5-diphenyl carbazide solution to the solutions. The concentrations of Cr(VI) ions in the solutions were determined using the standard calibration curve equation. The percentage of chromium removal is expressed in Table 1.

The optimum experimental operating parameters were determined by Taguchi method. The optimum experimental operating parameters were determined as initial pH 2, concentration 80 ppm, dose 20 g/L, time 3 hours and temperature 25 °C.

Upon testing the reusability of the adsorbent, 3 sets of experiments were repeated with the same adsorbent under optimum conditions.

### **Findings and Discussion**

Elemental analysis, BET, TGA, XRD, FT-IR, SEM-EDX, XRD, FT-IR, SEM-EDX, FT-IR analyses were carried out to determine the physicochemical properties of thermal power plant flue gas treatment waste. Adsorption isotherms and kinetics were also studied to investigate the Cr(VI) removal and mechanism of the material.

Figure 1 shows the FTIR results of the FCD waste. The characteristic vibration bands of sulfates around 1085 cm<sup>-1</sup> confirmed the presence of calcium sulfate in the structure.

Figure 2a shows the EDX result after drying of FCD waste. Figure 2b shows the EDX result of the adsorbent after chromium removal. CaSO<sub>4</sub> content in the structure was observed in both graphs. Cr(VI) ions adsorbed on the structure are seen in the EDX result.

Figure 3a shows the SEM images of the FCD waste. The pore structure on the surface was visualized by SEM analysis. Furthermore, BET analysis of the effluent shows that it has a surface area of 11.936 m<sup>2</sup>/g. Despite exhibiting a low surface area, a high level of removal was achieved. The mapping image in Figure 3b shows the Cr adsorbed on the structure.

### Conclusion and Recommendations

By Taguchi method, initial pH 2, concentration 80 ppm, dose 20 g/L, time 3 hours and temperature 25 oC were determined as optimum adsorption experimental conditions and 99.43% Cr(VI) removal was successfully achieved under these conditions. The experiment was repeated 3 times with the same adsorbent under optimum conditions and the reusability of the waste was investigated. It was found to be reusable. Considering the color changes during the adsorption process, it was observed that Cr(VI) ions were reduced to Cr(III) form and adsorbed by 99.43% under optimum conditions. When the experiment sets were analyzed, chromium removal could not be achieved in the 9th experiment and after. This shows the effect of pH. At low pH values (1.5-2), chromium removal could be realized effectively. In order to evaluate the adsorption performance of thermal power plant flue gas treatment waste, a comparative evaluation study was carried out with magnetic activated carbon (MAC) synthesized by copyrolysis technique. Chromium removal experiments of MAC synthesized from red sludge and sugar beet pulp by slow pyrolysis technique at 800oC were carried out. In this way, the adsorption capacity of FCD waste was compared with a different type of adsorbent.

### Thanks and Information Note

This study was supported by Çanakkale Onsekiz Mart University Scientific Research Coordination Unit with the project number FBA-2023-4480.

**Özet**

Siklofosfamid (CP), metronomik kemoterapötik bir ajan olarak müsinöz ve epitelyal yumurtalık kanserleri, sarkom, akciğer ve prostat kanserleri de dâhil olmak üzere çeşitli tümör tiplerinde etkinlik gösteren antikanser ilaçlardandır. CP'nin iki aktif metabolitinden fosforamid mustard antineoplastik etkilerinden sorumlu olurken diğer aktif metaboliti olan akrolein ise CP'nin toksik etkileri ile ilişkilidir. Bu aktif metabolit doku antioksidan savunma sisteminde yüksek oranda oksijensiz radikal oluşumuna neden olur ve memeli hücreleri için mutajeniktir. CP'nin bu metaboliti ve CP'nin aktivasyonu sırasında oluşan reaktif oksijen türlerinin (ROS) hücre redoks dengesinde değişikliklere neden olarak oksidatif strese yol açar. Bu durum CP kaynaklı kanserleşme ve sağlıklı hücre hasarının nedeni olabilir. Selenyum (Se), memelilerde antioksidan işlevi ve immünomodülasyon fonksiyonlarına sahip temel bir eser elementtir. Se'un antioksidan ve antikanser etkinliği insanlarda çeşitli biyolojik fonksiyonlara sahip selenoproteinlerin yapısına dâhil olması ile gerçekleşir. CP metabolizmasına bağlı artan ROS apoptozda önemli bir kontrol noktası olan mitokondriyal lipid peroksidasyonunu indükleyebilir ve bu durum membran potansiyelini etkileyebilir. Bcl-2 protein ailesi apoptozda mitokondriyal porasyonu kontrol eder. Bu çalışmanın amacı CP'nin neden olduğu karaciğer hasarında mitokondriyal fonksiyon bozukluğunu kontrol eden Bcl-2 ve Bax proteinlerinin Se ile etkileşimlerinin *in silico* olarak araştırılmasıdır. Se'nin CP kaynaklı hasara karşı koruyucu etkisinin mekanizmasının açıklanmasıdır. Bu amaçla AutoDockTools (1.5.6) yazılım programı kullanılarak ilgilenilen proteinlerin üç boyutlu kristal yapıları ile Se, CP ve Se+CP kombinasyonları dikkate alınarak moleküler yerleştirme çalışmaları gerçekleştirilmiştir. Se ve CP uygulama kombinasyonlarına bağlı olarak elde edilen Se@Bcl-2, CP@Bcl-2, Se/C@Bcl-2, Se@Bax, CP@Bax ve Se/CP@Bax komplekslerinde Se'un ve CP'nin makromoleküllerin aktif bölge amino asit kalıntıları ile ve diğer amino asitlerle olan etkileşimleri başta konvensiyonel hidrojen bağ ve Pi-Alkyl türleri olmak üzere değerlendirilmiştir. Bu etkileşimler sonucunda hesaplanan Gibbs Serbest Enerji değişimi ( $\Delta G$ ) değerleri protein-ligand etkileşimi dikkate alınarak proteinin liganda olan bağlanma afinitesi kapsamında değerlendirilmiştir. Elde edilen sonuçlar *in vivo* uygulama sonuçları için ayrıca değerlendirilmiştir.

**Anahtar Kelimeler:** Siklofosfamid, selenyum, hücre ölümü, mitokondriyal lipid peroksidasyonunu, reaktif oksijen türleri

**INTERACTION OF SELENIUM WITH APOPTOTIC MARKERS IN  
CHEMOTHERAPEUTIC AGENT-INDUCED LIVER INJURY: *IN SILICO*  
EVALUATION**

**Abstract**

Cyclophosphamide (CP), a metronomic chemotherapeutic agent, is a cancer drug that is effective in various tumor types, including mucinous and epithelial ovarian cancer, sarcoma, and lung and prostate cancer. Of the two active metabolites of CP, phosphoramidate mustard is responsible for the antineoplastic effects of CP. In contrast, the other active metabolite, acrolein, is associated with the toxic effects of CP. This active metabolite causes a high rate of oxygen-free radical formation in the tissue antioxidant defense system and is mutagenic to mammalian cells. This metabolite of CP and the reactive oxygen species (ROS) generated during CP activation cause changes in the cell redox balance of cells leading to oxidative stress. This could be the cause of CP-induced carcinogenesis and damage to healthy cells. Selenium (Se) is an essential trace element with antioxidant and immunomodulatory functions in mammals. The antioxidant and anticancer effects of Se is realized by its incorporation into the structure of selenoproteins with various biological functions in humans. Increased ROS due to CP metabolism can induce mitochondrial lipid peroxidation, an important checkpoint in apoptosis, which can impair membrane potential. The Bcl-2 protein family controls mitochondrial porosity during apoptosis. The aim of this study was to investigate *in silico* the interactions of Bcl-2 and Bax proteins, which control mitochondrial dysfunction in CP-induced liver injury, with Se. To clarify the mechanism of the protective effect of Se against CP-induced damage. To this end, molecular docking studies were performed using the software program AutoDockTools (1.5.6), taking into account the three-dimensional crystal structures of the proteins of interest and the combinations of Se, CP, and Se+CP. In Se@Bcl-2, CP@Bcl-2, Se/C@Bcl-2, Se/C@Bcl-2, Se@Bax, CP@Bax and Se/CP@Bax complexes obtained as a function of the Se and CP application combinations, the interactions of Se and CP with the active site amino acid residues of the macromolecules and with other amino acids were evaluated, mainly conventional hydrogen bonds and Pi-alkyl species. The Gibbs free energy change values ( $\Delta G$ ) calculated as a result of these interactions were evaluated in the context of the binding affinity of the protein to the ligand, considering the protein-ligand interaction. The results obtained were also evaluated for *in vivo* application results.

**Keywords:** Cyclophosphamide, selenium, cell death, mitochondrial lipid peroxidation, reactive oxygen species

## **Giriş**

Metronomik kemoterapi, geleneksel kemoterapide olduğu gibi yüksek dozlarda ve aralarla verilen döngüler yerine, düşük dozlarda anti-kanser ilaçlarının sürekli olarak veya düzenli aralıklarla uygulanmasını içeren yeni bir kemoterapi yaklaşımıdır (Cazzaniga et al., 2022). Bu kemoterapik yaklaşımın azaltılmış yan etkiler, daha iyi tolere edilebilirlik ve doğrudan kanserli hücrenin apoptoza uğratılmasının ötesinde anti-tümör etki potansiyeli gibi avantajları vardır. Metronomik tedavide ilaç dozu konvensiyonel tedaviye kıyasla daha düşük olduğu için, metronomik tedavi tipik olarak geleneksel kemoterapiye göre daha az ve daha az şiddetli yan etkiler beklenmektedir. Bu özellik azaltılmış yan etkiler olarak tanımlanmaktadır (Gür & Cengiz, 2023; Kieran et al., 2005). Bu, özellikle yüksek doz kemoterapinin olumsuz yan etkilerini tolere edemeyen hastalar için faydalı olabilir. Metronomik tedavinin daha düşük dozları ve sürekli programı, hastaların tedaviyi tolere etmesini kolaylaştırabilir ve yaşam kalitelerini artırabilir. Bu yönü metronomik tedavinin daha iyi tolere edilebilirlik açısından avantajlarını ortaya koymaktadır (Mir et al., 2024). Metronomik tedavi, anjiyogenez (tümörlerin büyümek için ihtiyaç duyduğu yeni kan damarlarının oluşumu), metastaz (kanser hücrelerinin vücudun diğer bölgelerine yayılması) ve bağışıklık sistemi dâhil olmak üzere birden fazla tümör büyüme ve ilerleme mekanizmasını hedef almaktadır. Bu yönüyle de metronomik tedavi doğrudan kanserli hücrenin apoptoza uğratılmasının ötesinde anti-tümör etki potansiyeli gibi avantajlar sağlamaktadır (Kareva, 2017; Kim & Kim, 2019). Düşük dozda kemoterapötik ajanların sürekli uygulanması olarak tanımlanan metronomik kanser tedavisi (MKT), etkilerini immünomodülasyon, anti-anjiyogenez ve doğrudan sitotoksik etkiler yoluyla ortaya koyan bir tedavi olarak kabul edilmektedir. Bu ilaçlar tipik olarak ağızdan verilir, bu da tedaviyi hastalar için daha uygun hale getirebilir. MKT'nin ağızdan uygulanması güvenlidir, kullanımı kolaydır ve esnek ilaç dozajına izin verir. Tolere edilemeyen yan etkilerle ilişkili doz birikimleri nadir olduğundan ilaç daha uzun süre uygulanabilir (Krajnak et al., 2022; Muraro et al., 2023). Tedavi sonrası yeniden tümör oluşumunu önlemeye yardımcı olabilir (Kong et al., 2010). Diğer kanser tedavileri ile birlikte iyi sonuç verebilir (Hadjicharalambous et al., 2022). Tolere edilemeyen yan etkilerle ilişkili doz birikimleri nadir olduğundan ilaç daha uzun süre uygulanabilir. MKT halen araştırılmaktadır, ancak tek başına veya diğer tedavilerle kombinasyon halinde çeşitli kanserler için bir tedavi olarak umut vaat etmektedir. En yaygın kullanılan metronomik kemoteropetik ajanlardan bazıları siklofosfamid (CP), metotreksat, kapesitabin, ve vinorelbine'dir (De Lorenzo et al., 2018; Estevinho et al., 2022; Hamm et al., 2009; Soriano et al., 2011).

CP, Dünya Sağlık Örgütü'nün (WHO) temel ilaçlar model listesinde yer alan metronomik kemoterapötik bir ajan olarak müsinöz ve epitelyal yumurtalık kanserleri, sarkom, akciğer ve prostat kanserleri de dâhil olmak üzere çeşitli tümör tiplerinde etkinlik gösteren antikanser ilaçlardandır. Yaygın kullanım alanına sahip ilaçlardan olan CP hem geleneksel hem de metronomik kanser tedavisinde yaygın olarak kullanılan bir kemoterapi ilacıdır. Metronomik tedavide CP, geleneksel yüksek doz kemoterapi rejimlerine kıyasla genellikle daha düşük dozlarda ve daha sık aralıklarla uygulanır. CP, alkilleyici ajanlar olarak bilinen ve kanser hücrelerinin DNA'sına müdahale ederek sonuçta ölümlerine yol açan bir kemoterapi ilacıdır (Penel et al., 2012). Genel olarak, CP, anti-anjiyogenez ve immünomodülasyon dahil olmak üzere çoklu mekanizmalar yoluyla kanser hücrelerini hedefleyebilen çok yönlü bir kemoterapi ilacı olarak metronomik kanser tedavisinde önemli bir rol oynamaktadır. Metronomik tedavide, CP anti-anjiyogenik özellikleri için kullanılabilir, yani tümörler içinde yeni kan damarlarının büyümesini engellemeye yardımcı olabilir, böylece kan akışını kısıtlayabilir ve büyümelerini yavaşlatabilir. Anti-anjiyogenik etkilerine ek olarak CP, vücudun kanser hücrelerine karşı bağışıklık tepkisini artırabilen immünomodülatör özelliklere de sahiptir. Bu özellik, ilacın doğrudan sitotoksik etkilerini tamamlayabildiği için metronomik tedavide özellikle önemlidir (Kerbel & Kamen, 2004; Lopes-Coelho et al., 2021).MKT'de CP kullanımının önemli avantajları ve dikkate alınması gereken dezavantajları bulunmaktadır. Yüksek doz kemoterapiyi kaldıramayan hastalar için çok önemli olabilecek azaltılmış doz uygulaması sonucu gelişmiş tolere edilebilirlik özelliğine sahiptir. MKT tedavisinde CP, kanser hücrelerini doğrudan öldürmenin ötesinde tümör büyümesini ve yayılmasını engelleyerek anti-tümör etki potansiyeli gösterir. CP ayrıca metronomik yaklaşıma uygunluğu nedeni ile dirençli kanserlere karşı daha iyi etkinlik gösterebilir (Carragher Jr et al., 2014; Elaziz et al., 2024; Lopes-Coelho et al., 2021; Yuan et al., 2021).Öte yandan CP'nin bilinen bu olumlu etkilerine ilaveten bazı dezavantajlı yönleri de literatürde bildirilmiştir. MKT'de düşük doz uygulamaları nedeni ile agresif kanserler için geleneksel kanser tedavisine kıyasla daha zayıf bir doğrudan hücre öldürme etkisi gösterebilirler. Sürekli düşük doz uygulamaları nedeni ile uzun süre kullanımına bağlı olarak kemik iliği baskılanması ve ikincil kanser riskinde artış gibi potansiyel komplikasyonlar önemli araştırma konularıdır. CP'nin dezavantajlarına ilişkin ana endişe konusu mesane ve gonadal toksisite olmuştur. Ayrıca CP'nin sperm morfolojisi, testis histolojisi ve kan oksidan-antioksidan dengesi üzerindeki toksik etkisi de bildirilmiştir (Çeribaşı et al., 2010). CP'nin önemli diğer toksik etkileri hepatotoksisite ve kardiyotoksisitedir.

CP'nin metabolik aktivasyonu, nükleik asitler ve proteinler gibi duyarlı moleküllerin elektron bakımından zengin bölgeleriyle reaksiyona giren yüksek oranda reaktif karbonyum iyonları üreten sitotoksik bir alkilleyici ajandır ve karaciğerde aktif formuna dönüştürülür (Elrashdy et al., 2022). CP'nin bu metabolik dönüşümü iki sitotoksik metabolitin, fosforamid mustard ve akroleinin oluşumuna yol açar. Fosforamid mustard antineoplastik aktiviteye sahiptir ve DNA üzerinden hücre bölünmesine engel olur. Aynı zamanda CP'nin immünosupresif ve antitümör etkilerine aracılık ettiği de bildirilmiştir. Bununla birlikte CP'nin toksik etkileri ise diğer aktif metaboliti olan akroleine atfedilmektedir. Akrolein, biyolojik yarı ömrü kısa olan oldukça reaktif bir metabolittir ve bu durum CP'nin neden olduğu karaciğer hasarından sorumlu olabileceği anlamına gelir. Akrolein yüksek oranda oksijensiz radikal oluşumuna neden olur ve memeli hücreleri için mutajeniktir (Gür & Cengiz, 2023; Hales, 1982; Panigrahy et al., 2011; Senthilkumar et al., 2006).Reaktif oksijen türleri (ROS) hücrelerdeki en yaygın oksidanlardan bazılarıdır. ROS, moleküler oksijenin süperoksit ( $O_2^{\cdot-}$ ), hidrojen peroksit ( $H_2O_2$ ), lipid peroksitler (ROOH) veya bunlara karşılık gelen hidroksil ( $HO\cdot$ ) ve peroksil radikallerine ( $ROO\cdot$ ) kısmi indirgenmesiyle oluşur (Collin, 2019; Liu et al., 2012).CP'nin neden olduğu oksidatif stres ROS malondialdehit (MDA), süperoksit dismutaz (SOD), katalaz (CAT), glutatyon (GSH), glutatyon peroksidaz (GPx) ve glutatyon redüktaz (GR) belirteçleri ile değerlendirilir. Ayrıca CP metabolizmasına bağlı artan ROS apoptozda önemli bir kontrol noktası olan mitokondriyal lipid peroksidasyonunu da indükleyebilir ve bu durum membran potansiyelini etkileyebilir.Bcl-2 protein ailesi apoptozda mitokondriyal poroziteyi kontrol eder. Bu protein ailesinden Bcl-2 proapoptotik bir belirteçtir ve sağlıklı hücrede var olması istenmektedir, aksine azalması durumu apoptozu göstermektedir. Aynı protein ailesinden Bax ise antiapoptotik bir belirteçtir ve sağlıklı hücrede Bax miktarının artışı hücre apoptoza uğruyor anlamına gelir (Cengiz, Ayhanci, et al., 2022; Edlich, 2018).Selenoprotein, selenosistein amino asit kalıntısı içeren bir proteindir. Selenosistein amino asidi, glutatyon peroksidaz, thioeredoksin redüktaz gibi enzimlerin yapısında yer alır. Selenoproteinler adı verilen çeşitli enzim ve proteinlerin bir bileşeni olan selenyum, DNA yapımında rol alır, üreme ve tiroid sağlığını destekler, metabolizmanın sağlıklı çalışmasına yardımcı olur ve oksidatif hücre hasarının yanı sıra enfeksiyonlara karşı vücudu korur. Selenyum (Se), memelilerde antioksidan işlevi ve immünomodülasyon fonksiyonlarına sahip temel bir eser elementtir (Fernández-Lázaro et al., 2020; Ye et al., 2021).Bu çalışmanın amacı CP'nin neden olduğu karaciğer hasarında mitokondriyal fonksiyon bozukluğunun bir belirteci olan Bcl-2 ve Bax proteinlerinin Se ile etkileşimlerinin *in silico* çalışmalarla araştırılmasıdır.

### **Materyal ve Metot**

Se'nin CP kaynaklı hasara karşı koruyucu etkisinin mekanizmasının açıklanması amacıyla AutoDockTools (1.5.6) yazılım programı kullanılmıştır. Bağlanma dinamiklerini analiz etmek ve görselleştirmek amacıyla da Discovery Studio 3.0 programı kullanılmıştır. Çalışılan proteinlerin (Bcl-2 ve Bax) üç boyutlu kristal yapıları ile Se, CP ve Se+CP kombinasyonları dikkate alınarak moleküler yerleştirme çalışmaları gerçekleştirilmiştir. Bu amaçla Bcl-2 (PDB ID: 2O2F) ve Bax (PDB ID: 1F16) hedef proteinlerinin 3D kristal yapıları RCSB protein veri tabanından indirildi (Bruncko et al., 2007; Suzuki et al., 2000). CP'nin ve Se'nin moleküler modelleri SDF formatında sırasıyla Structure2D\_CID\_2907 ve Structure2D\_COMPOUND\_CID\_15103 kodlarıyla PubChem veri tabanından indirildi. AutoDockTools yazılımı (1.5.6) kullanılarak yapılan moleküler yerleştirme işleminden önce protein yapısından su molekülleri uzaklaştırıldı, hidrojen atomları eklendi, polar olmayan hidrojen atomları birleştirildi ve son olarak Kollman yükleri eklenerek protein yapıları hazırlanmıştır. CP ve Se'nin Bcl-2 ve Bax proteinlerine moleküler docking çalışması PyRx programı kullanılarak gerçekleştirilmiştir (Gür, 2020; Gür, Cengiz, et al., 2021; Trott & Olson, 2010). Enerji minimizasyonu ve diğer parametreler önceki çalışmalarımızda yapıldığı gibi ayarlandı (Gür, Cengiz, & Gür, 2021; Gür et al., 2020). PyRx programı ile CP ve Selenomethionine moleküllerinin Bcl-2 ve Bax'ın hangi kalıntılara bağlanma eğiliminde olduğunu bulmak için dokuz farklı bağlanma modu seçildi ve bunun üzerine hem CP hem de Selenomethionine molekülleri ligand olarak kullanılmak üzere Discovery Studio 3.0 programına uyumlu olacak şekilde ayarlandı. Daha sonra Bcl-2 ve Bax makromoleküllerinin CP ve Selenomethionine molekülleri ile etkileşimleri 2D ve 3D etkileşim modları kullanılarak ortaya çıkarılmıştır. Negatif bağlanma enerjisi parametreleri ise en düşük Gibbs serbest enerji değişimi ( $\Delta G$ ) değerleri dikkate alınarak belirlenmiştir. Se ve CP uygulama kombinasyonlarına bağlı olarak elde edilen komplekslerde Se'un ve CP'nin, makromoleküllerin aktif bölge amino asit kalıntıları ile ve diğer amino asitlerle olan etkileşimleri başta konvensiyonel hidrojen bağ (CHB) ve Pi-Alkyl türleri olmak üzere değerlendirilmiştir. Moleküler yerleştirme çalışmalarında öncelikle Bcl-2 ve Bax proteinlerine CP'nin ligand olarak bağlanma dinamikleri araştırılmış ve bu amaçla CP@Bcl-2 ve CP@Bax kompleksleri elde edilmiştir. Daha sonra Se ve CP'nin birlikte kenetlenme işlemleri yapılarak ayrı ayrı Se/CP@Bcl-2 ve Se/CP@Bax kompleksleri elde edilmiştir. Çalışmada kullanılan CP ve Selenomethionine moleküllerinin kimyasal yapıları Şekil 1'de gösterilmiştir.

Şekil 1. Ligand moleküllerinin kimyasal yapıları; a) Siklofosfamid, b) Selenomethionine

### Bulgular ve Tartışma

CP kaynaklı apoptoza karşı selenyumun koruyucu etkisinin olup olmadığının *in silico* olarak araştırıldığı bu çalışmada, kemoterapötik bir ajan olan CP ile indüklenen karaciğer hasarında selenyumun apoptotik belirteçlerden Bcl-2 ve Bax ile etkileşimi *in silico* olarak değerlendirilmiştir (Gür, Cengiz, & Gür, 2021; Trott & Olson, 2010).

### CP@Bcl-2 ve Se/CP@Bcl-2 kompleks oluşum sonuçları

CP ile Bcl-2 proteini arasında meydana gelen etkileşimlere bağlı olarak ortaya çıkan bağlanmalar Şekil 2'de gösterilmiştir.

Şekil 2. CP ile Bcl-2 etkileşimine bağlı moleküler docking sonuçları; a) CP'nin Bcl-2'nin amino asit kalıntılarıyla etkileşimini gösteren 2D görünüm, b) CP'nin Bcl-2 ile etkileşimlerini gösteren 3D görünüm (Çubuk yapı)

Bir CP molekülünün Bcl-2'nin bağlanma bölgesine yerleştirilmesinin ardından, Şekil 2'de gösterildiği gibi bir CP@Bcl-2 kompleksi elde edilmiştir. Bağlanmanın gerçekleştiği bölgenin Bcl-2'nin aktif bölgesi olduğu anlaşılmıştır.

CP'nin Bcl-2'nin aktif bölge amino asitleri ile etkileşimi ve dolayısı ile CP'nin Bcl-2 aktivasyonuna etkisi üzerine selenyum katkısının değerlendirilmesi amacıyla CP ve Se'un Bcl-2 ile birlikte moleküler docking çalışmaları yapılmış ve sonuçlar Şekil 3'te verilmiştir.

**Şekil 3.** CP + Se'nin Bcl-2 ile birlikte etkileşimine bağlı moleküler docking sonuçları; a) CP + Se'nin Bcl-2'nin amino asit kalıntılarıyla etkileşimini gösteren 2D görünüm, b) CP + Se'nin Bcl-2 ile etkileşimlerini gösteren 3D görünüm (Çubuk yapı)

CP ve Se'nin Bcl-2 aktivitesi üzerindeki etkileri birlikte uygulama sonucu moleküler docking çalışmaları ile Se/CP@Bcl-2 kompleksi elde edilmiştir. CP@Bcl-2 ve CP/Se@Bcl-2 kompleks oluşumlarına bağlı olarak elde edilen moleküler docking çalışmalarına ait özet sonuçlar Tablo 1'de sunulmuştur.

**Tablo 1.** Bcl-2'ye CP ve Se + CP kenetlenmelerinin özet sonuçları

	Con. H Bond / Carbon H.Bond	Alkyl / Pi-Alkyl / Pi-Sulfur	
CP	ALA146 (3.02)*, VAL130 (3.14)*	LEU134 (3.53)* / PHE101 (5.39), PHE109 (5.42)	<b>-4.94</b>
Se + CP	Se: Val130 (2.01)*, Phe147(1.89)	Se: MET112 (4.27)* / PHE109 (4.31) PHE150 (5,41) / PHE101 (5,21), PHE109 (4,51), PHE150 (5,78)	-3.89
	Cp: Herhangi bir etkileşim yok	Cp: ASP108* (Electrostatic)	

\* **Active-site residues:** ALA97, ASP100, TYR105, ASP108, MET112, VAL130, LEU134, TRP141, GLY142, VAL145, ALA146, TYR199

CP ve Se'nin birlikte uygulanması, CP için sistemin  $\Delta G$  değerinde 1.05 kcal/mol gibi önemli bir artışa neden olmuştur (Tablo 1). Tablo 1 dikkate alındığında CP'nin Bcl-2 ile iki önemli hidrojen bağ etkileşimi ve üç tane de alkil ve Pi-alkil etkileşimi yaptığı anlaşılmıştır. CP@Bcl-2 kompleks oluşumuna ait  $\Delta G$  değeri -4.94 kcal/mol olarak hesaplanmıştır. Ancak Se ilavesiyle

tüm bu etkileşimlerin gerçekleşmediği sadece CP ile aktif bölge amino asit kalıntılarında ASP108 arasında bir elektrostatik etkileşim olduğu tespit edilmiştir. CP'nin aksine Se ilavesi sonucunda Se ve Bcl-2 arasında önemli CHB etkileşimlerine ek olarak alkil, Pi-alkil ve Pi-sülfür etkileşimleri meydana gelmiştir. Bu etkileşimler sonucunda Se/CP@Bcl-2 kompleks oluşumuna ait  $\Delta G$  değeri -3.89 kcal/mol'e yükselmiştir. *In silico* çalışmalarımız, CP ve Se kombinasyonunda CP'nin Bcl-2'nin katalitik amino asit kalıntıları ile etkileşiminin Se ilavesine bağlı olarak bloklendiğini ve dolayısıyla CP nedenli Bcl-2 inhibisyonunun önlendiğini göstermiştir (Cengiz, Ayhancı, et al., 2022; Cengiz, Kutlu, et al., 2022). Se ilavesine bağlı olarak ortaya çıkan önemli bir etkileşim de Pi-sülfür etkileşimleri olmuştur. Şekil 3 ve Tablo 1 dikkate alındığında Se'un Bcl-2'nin aktif bölge çevresinde bulunan PHE101, PHE109 ve PHE150 amino asitleri ile Pi-sülfür etkileşimleri yaptığı anlaşılmıştır. Bu etkileşimler Bcl-2 proteininde kararlılık ve aktivite gibi iki temel özelliği etkileyerek enzim aktivitesinde önemli katkılar sağlamış olabilir (Ringer et al., 2007). Se ile etkileşim sonucu oluşan Pi-sülfür bağlarına bağlı ortaya çıkan stabilite Bcl-2'nin aktif bölge içinde katalize dâhil olan amino asit kalıntılarının doğru konumlandırılmasının sağlanmasında katkıda bulunmuş olabilir (Dubey et al., 2019). Ayrıca metiyonin gibi kükürt içeren yan zincirler yakındaki amino asitlerdeki aromatik halkalarla zayıf bağlar oluşturarak enzimin substrat bağlanması ve kataliz için en uygun şeklini korumasına yardımcı olmuş olabilir (Brosnan & Brosnan, 2006). Ayrıca meydana gelen bu Pi-sülfür etkileşimleri Bcl-2'nin katalitik mekanizmasına doğrudan dâhil olabilir. Bu etkileşim, katalize katılan amino asitlerin elektronik özelliklerini etkileyerek potansiyel olarak onları daha reaktif hale getirmiş veya kataliz için daha iyi konumlanmış hale getirebilir (Dubey et al., 2019).

#### **CP@Bax ve Se/CP@Bax kompleks oluşum sonuçları**

CP ile Bax proteini arasında meydana gelen etkileşimlere bağlı olarak ortaya çıkan bağlanmalar Şekil 4'te gösterilmiştir.

**Şekil 4.** CP ile Bax etkileşimine bağlı moleküler docking sonuçları; a) CP'nin Bax'ın amino asit kalıntılarıyla etkileşimini gösteren 2D görünüm, b) CP'nin Bax ile etkileşimlerini gösteren 3D görünüm (Çubuk yapı)

CP molekülünün Bax'ın bağlanma bölgesine yerleştirilmesinin ardından, Şekil 4'te gösterildiği gibi bir CP@Bax kompleksi elde edilmiştir.

CP'nin Bax'ın amino asitleri ile etkileşimi ve dolayısı ile CP'nin Bax aktivasyonuna etkisinin selenyum katkısı ile nasıl değiştiğinin değerlendirilmesi amacıyla CP ve Se'un Bax ile birlikte moleküler docking çalışmaları yapılmış ve sonuçlar Şekil 5'de verilmiştir.

**Şekil 5.** CP + Se'nin Bax ile birlikte etkileşimine bağlı moleküler docking sonuçları; a) CP + Se'nin Bax'ın amino asit kalıntılarıyla etkileşimini gösteren 2D görünüm, b) CP + Se'nin Bax ile etkileşimlerini gösteren 3D görünüm (Çubuk yapı)

CP ve Se'nin Bax aktivitesi üzerindeki etkileri birlikte uygulama sonucu moleküler docking çalışmaları ile Se/CP@Bax kompleksi elde edilmiştir. CP@Bax ve CP/Se@Bax kompleks

oluşumlarına bağlı olarak elde edilen moleküler docking çalışmalarına ait özet sonuçlar Tablo 2'de sunulmuştur.

**Tablo 2.** Bax'a CP ve Se + CP kenetlenmelerinin özet sonuçları

Ligand	Bax Interactions (Distance: Å)		ΔG (kcal/mol)
	Con. H Bond / Carbon H.Bond	Alkyl / Pi-Alkyl / Pi-Sulfur	
CP	<b>ARG134 (2.03 ve 2.96)</b> / GLN28 (3.18), LEU45 (3.57)	LEU47 (5.40), ARG134 (4.02), MET137 (4.66 ve 4.48)	<b>-3.82</b>
Se + CP	Se: <b>GLY23 (1.98 ve 2.00)</b>	Se: : LEU27 (4.06), LEU113 (4.48), ALA117 (3.37) / PHE114 (5.14) / <b>PHE114 (5,29)</b>	-3.89
	CP: <b>ARG134 (1.96 ve 2.85)</b> / LEU45 (3.77)	CP: LEU45 (4.91), ARG134 (4.04), MET137 (4.89)	

CP ve Se'nin birlikte uygulanması, CP için sistemin ΔG değerinde 0,07 kcal/mol gibi bir azalmaya neden olmuştur (Tablo 2). Tablo 2 dikkate alındığında CP'nin Bax ile dört önemli hidrojen bağ etkileşimi ve dört tane de alkil etkileşimi yaptığı ve kompleks oluşumuna ait ΔG değerinin -3.82 kcal/mol olduğu anlaşılmıştır. Se ilavesiyle Se/CP@Bax kompleksinde ARG134'e ait hidrojen bağ uzunluklarının kısaldığı belirlenmiş ve bu durum oluşan kompleksin kararlılığının arttığını düşündürmüştür. Bcl-2 ile CP ve Se kompleks özelliklerinin aksine Se varlığında Se/CP@Bax kompleksinde aktif bölge ile olan etkileşimler hem CP için hem de Se için daha fazla olmuştur. Bunun sonucunda ΔG değerinde daha da azalma olmuştur. Se ve Bax'ın amino asit kalıntıları arasında önemli hidrojen ve alkil, pi-alkil bağlanmalarına ilave olarak bir tane pi-sülfür etkileşimi de meydana gelmiştir. Bu etkileşimler Bax proteinini daha da kararlı hale getirmiş ve özellikle Pi-sülfür etkileşimine bağlı olarak inhibe etmiş olabilir (Gao et al., 2020; Gür et al., 2023; Sami et al., 2022).CP kaynaklı apoptoza karşı selenyumun koruyucu etkisinin olup olmadığının *in silico* olarak araştırıldığı bu çalışmada karaciğerde lipit peroksidasyonu ve buna bağlı olarak ortaya çıkan mitokondriyal fonksiyon bozukluğu sonucunda önemli proapoptotoik ve antiapoptotoik belirteçler üzerinde Se katkısının etkisi değerlendirilmiştir. Bu değerlendirme Şema 1'de özetlenmiştir.

**Şema 1.** Se ve CP'nin Bcl-2 ve Bax proteinleri üzerine etkisi (Petros et al., 2001; Regina, 2020; Suzuki et al., 2000)

### Sonuç ve Öneriler

*In silico* sonuçlara dayanarak, Se'nin CP ile indüklenen apoptoza karşı koruyucu etkilerinin Bcl-2 inhibisyonunun önlenmesi ile artması ve kararlı Bax komplekleri oluşturarak azalması yoluyla ortaya çıkabileceğini ve bu amaçla kullanılabilir bir aday olduğu düşünülebilir. Sonuç olarak Se'un CP ve benzeri alkileyci ajanların kullanımını gerektiren kanser hastalarında klinik uygulamadan önce daha iyi değerlendirilmesini sağlayabileceğine inanıyoruz.

**Özet**

Endüstriyel tarımın gelişmesi, uzak bölgelerden gelen gıdaların daha yaygın bir şekilde tüketilmesine ve bu gıdaların taşınmasıyla ilgili çevresel etkilerin fark edilmesine yol açmıştır. İlk olarak, gıdaların hangi mesafeler boyunca taşındığı ve bu taşımının ne kadar enerji gerektirdiği gibi konulara odaklanan araştırmalar, gıda mili kavramının gelişmesine katkı sağlamıştır. Gıda mili kavramı, gıda sistemlerinin ve küresel ticaretin evrimiyle birlikte ortaya çıkmıştır. Bu kavram, tüketicilerin gıda alımlarını daha sürdürülebilir bir şekilde yönlendirmelerine yardımcı olmak için önemli bir araç haline gelmiştir. Gıda mili kavramı, bir gıdanın üretildiği yerden tüketicilere ulaşana kadar kat ettiği mesafeyi ölçmektedir. Gıda mili tarımsal ürünlerin taşınma sürecindeki çevresel etkileri, tüketiciye ulaşmadan önceki süreyi ve ürünlerin tazeliğini etkilemektedir. Daha uzun gıda mili, daha fazla enerji tüketimi ve çevresel etkiye yol açtığı gibi, ürünlerin tazeliğini ve besleyiciliğini de olumsuz etkilemektedir. Bu çalışmanın temel amacı tarımsal ürünlerdeki gıda millerine yönelik bir değerlendirme yapmaktır. Bu çalışma dört bölümden oluşmaktadır. Birinci bölümde gıda milinin tarımda neden önemli olduğu açıklanmıştır. İkinci bölümde gıda milinin nasıl ölçüldüğüne yönelik bilgiler verilmiştir. Üçüncü bölümde tarımsal ürünlerdeki gıda millerine yönelik bir değerlendirme yapılmıştır. Bu kapsamda çeşitli tarımsal ürünlerden örnekler sunulmuştur. Dördüncü bölümde ise, tarım ürünleri ticaretinde gıda mili ile ilgili karşılaşın temel sorunlar belirtilerek öneriler getirilmiştir.

**Anahtar Kelimeler:** Gıda Mili, Tarım, Tarımsal Ürünler, Sürdürülebilirlik

**FOOD MILES: AN ASSESSMENT OF AGRICULTURAL PRODUCTS**

**Abstract**

The development of industrial agriculture has led to more widespread consumption of foods from remote areas and a recognition of the environmental impacts associated with transporting these foods. Firstly, research focusing on the distances food is transported and how much energy this transportation requires contributed to developing the food mile concept. The concept of the food mile emerged with the evolution of food systems and global trade. This concept has become an important tool to help consumers direct their food purchases more sustainably. The food mile measures the distance a food travels from where it is produced to reach consumers. Food mileage affects the environmental impacts of agricultural products during the transportation process, the time before they reach the consumer and the freshness of the products. Longer food miles not only lead to greater energy consumption and environmental impact but also negatively affect the freshness and nutrition of products. The primary purpose of this study is to make an evaluation of food miles in agricultural products. This study consists of four parts. The first part explains why the food mile is essential in agriculture. The second section gives information on how food miles are measured. In the third section, an evaluation was made regarding food miles for agricultural products. In this context, examples from various agricultural products are presented. In the fourth chapter, the main problems encountered regarding food miles in the trade of agricultural products are stated and suggestions are made.

**Keywords:** Food Miles, Agriculture, Agricultural Products, Sustainability

## **Giriş**

Yirminci yüzyılın sonunda gıda ürünlerine yönelik değerlendirmeler küresel sürdürülebilirlik veya sürdürülebilir üretim kavramları ile düşünülmektedir. Öncelikle Rachel Carson'un 1962'de yayınladığı *Sessiz Bahar* eserinde gıda ürünleri üretiminin çevresel etkileri olduğu açıklanmıştır. Bu kavramlar üzerinde yapılan araştırmalar, genellikle gıda ürünlerinin çiftlik ve çatal arası mesafelerini incelemektedir. Bu değerlendirmeler neticesinde yerel ürün tüketmek ve yerel gıda depoları oluşturmak sürdürülebilir tarımın ihtiyaç duyduğu bir anlayış olmuştur. Gıda üretiminin çevre ve insanlar üzerinde etkileri alanındaki araştırmaların devamı ile gıdanın ulaşım mesafesine tüketicilerin ilgi düzeyleri artmıştır. Gıda mili olarak literatüre kazandırılmış olan bu kavram, gıdanın üretildiği yerden tüketicilere ulaştığı yere kadarki mesafedir (McWilliams, 2013). 1990 yıllardan günümüze kadar bu ana akım konu hakkında çeşitli çalışmalar yapılmıştır (Grant, 2007; Goleman, 2009). Bu çalışmalarda Avrupa ve Kuzey Amerika ön plana çıkmıştır. Gıda üretiminin ve seçimlerinin çevre üzerindeki etkileri fark edilmiştir. Tüketilen gıdanın güvenliği ve menşei diğer girdi maliyetlerin yükselmesine neden olduğu için yönetimler tarafından da takip edilmeye başlanmıştır. İklim değişikliği veya iklim krizi konusundaki son zamanlarda yapılmakta olan araştırmalar sera gazı ve emisyon kelimelerini çok sık kullanmaktadır. Sürdürülebilir üretim ve tüketim alanının genişlemesi ile gıda ürünlerinin üretim ve tüketiminin çevresel ve iklim üzerindeki etkileri gösterilmeye başlanmıştır (Hertwich, 2005; Weber and Matthews, 2008; Tukker and Jansen, 2006). Tüketicilerin gıda ürünleri tercihlerinde çevresel sürdürülebilirlikle bağlantılı günümüzde birçok trend oluşmuştur. ABD ve Avrupa'da yerel ve organik üretilen ürünlerin miktarındaki artışlar, tüketicilerin tükettikleri gıdaların nereden ve nasıl üretildiği kriterlerine dikkat ettiğini göstermektedir. Bu alanda 1995 yılında Birleşik Krallık'ta ortaya çıkmış olan gıda mili kavramı ise gıda sürdürülebilirliği konusundaki araştırmalara yön vermiştir (Paxton, 1994; Canals et al, 2007). Uluslararası ticaretin günümüzde gelişmesi ile gıda mili kavramına odaklanılmış ve çeşitli araştırmalar yapılmıştır. Bu araştırmaların etkisi nedeni ile çoğu çevre aktivistleri tarafından küresel tedarik zincirinin yerelleşmesi gerektiği savunulmaktadır (Jones, 2002). Bu görüşün aksine farklı bölgelerdeki üretim uygulamaları yapanlar ve depolama-taşımacılık işletmeleri ise bu isteğin haklı ve doğru olup olmadığını sorgulamışlar ve açıklamışlardır. Hayvansal ürün üretiminin ve tüketiminin çevresel etkilerini gösteren çoğu araştırmacılar gıda tercihlerinde genel olarak bitkisel ürünlerin olması gerektiğini açıklamışlardır (Eshel and Martin, 2006). Gıda ürünleri, birçok çevresel sorunlara neden kabul edildiği için yaşam döngüsü değerlendirmesi (LCA) araştırmalarında önemli bir yere sahiptir (Jungbluth et al, 2000).

Tüketilen gıda ürünlerinin sayısı nedeni ile analizlerin çoğu az sayıda gıda ürünü ile ilgili çalışmalarla sınırlı kalmıştır. Sınırlı gıda ürünleri üzerinde ise çok ayrıntılı analizler yapılmıştır (Carlsson et al, 2003). Literatürdeki gıda mili ve gıda taşımacılığına olan yüksek ilgiye rağmen, sera gazı emisyonları için önemli olabilecek çiftlik ekipmanları ve malzemelerin çiftliklere taşınması gibi konulardaki araştırmalar sınırlı kalmıştır. Bu çalışmanın temel amacı tarımsal ürünlerdeki gıda millerine yönelik bir değerlendirme yapmaktır. Bu çalışma dört bölümden oluşmaktadır. Birinci bölümde gıda milinin tarımda neden önemli olduğu açıklanmıştır. İkinci bölümde gıda milinin nasıl ölçüldüğüne yönelik bilgiler verilmiştir. Üçüncü bölümde tarımsal ürünlerdeki gıda millerine yönelik bir değerlendirme yapılmıştır. Bu kapsamda çeşitli tarımsal ürünlerden örnekler sunulmuştur. Dördüncü bölümde ise, tarım ürünleri ticaretinde gıda mili ile ilgili karşılama temel sorunlar belirtilerek öneriler getirilmiştir.

### **Materyal ve Yöntem**

Bu araştırmanın verileri ikincil veri kaynaklarına dayanmaktadır. Konu ile ilişkili ulusal ve uluslararası makaleler, kitaplar, tezler, kurumların yayınladığı raporlar ve web siteleri başlıca ikincil veri kaynaklarını oluşturmaktadır.

### **Gıda Mili Kavramı ve Önemi**

Gıda mili kavramı, Birleşik Krallık'ta 1990 yılında ortaya çıkmıştır. Prof. Dr. Lang tarafından 'Gıda Milleri Raporu: Uzun Mesafe Gıda Taşımacılığının Tehlikeleri' yayınında açıklanmıştır. Lang bir sözünde, 'ölümün kimse tarafından hatırlanmaz ancak, kitabemde gıda milini icat eden bilim insanı olarak yazması önemlidir' demiştir. Bu durum Angela Paxton tarafından da yazıya geçirilmiştir (Lang 2006; Paxton 1994; Iles, 2005). 1994 yılında gıda mili kavramı ayrıntılı olarak açıklanmış ve kamuoyunda konu hakkında tartışmalar başlamıştır. 1995 yılında Birleşik Krallık Çevre Bakanlığı tarafından finanse edilmiş Tüketici Bilgilendirme Projesinin yapıldığı, aynı yılda 'Çok Uzak Bir Ziyafetin Hesabı: Tüketicilerin Endişeleri' isimli bir başka araştırma gerçekleştirildiği görülmektedir. 1996 yılında ise Gıda Milleri Eylemi paketi (yerel gıda ekonomisi stratejileri) hazırlanmıştır. 1997 yılında gıda mili konusunda ekmek, patates ve çilek ürünlerinde ilk Food Facts (Gıda Gerçekleri) araştırması yapılmıştır. 1998 yılında portakal, bitkisel yağ, tavuk eti, marul, bira, soya, havuç, armut, elma, süt ve sığır eti ürünlerinde Food Facts araştırmaları yapılmış ve broşür-materyaller piyasaya dağıtılmıştır. 1999 yılında 5 yılı kapsayan gıda mili güncelleme çalışması yapılmıştır (Sustain, 1999). 2007 yılında yapılan gıda mili üzerindeki araştırmalar ile 'Locavore' kelimesi literatüre kazandırılmıştır. Locavore; ürün üretilme aşamasında çevreye olan etkilerin göz önünde bulundurulmasıdır (Anonim, 2024b). Gıda mili, üretim yerinden tüketildiği yere kadarki mesafede gıda taşınmasının üretmiş

olduđu emisyon miktarını ve çevresel etkilerini incelemektedir. Gıdanın uzaklığı, karbon ayak izi ve çevresel etkileri bu kapsamda ayrıntılı ele alınmaktadır (Engelhaupt, 2008; Kissinger, 2012). Gıda mili arařtırmalarında et, meyve ve sebze ürünleri incelenmektedir (Andersson et al, 1998; Marletto and Sillig, 2014; Wiedemann et al, 2015; Meisterling et al, 2009). Bu kavramın Birleşik Krallıkta çıkmasının ve ilgi görmesinin iki nedeni vardır. Bu da Birleşik Krallıkta tüketilen sebzelerin %50'sinin ve meyvelerin %95'inin ithal olarak karşılanmasıdır (Stacey, 2008).Gıda mili, gıda ürünlerinin tüketicilere ulaşmadan önceki kat etmiş olduđu coğrafi mesafeyi ifade etmektedir. Üretimden tüketime olan mesafenin kısa olması hem insanlar hem de çevre için faydalı olduđu açıklanmaktadır. Ürünlerin işlenmesi ve taşınmasında fosil yakıtlar kullanılmakta ve miktarları değişmektedir. Kullanılan yakıt miktarlarının en önemli sonuçları ise iklim değişikliği ve ürün fiyatlarındaki artışlardır. Ne kadar çok gıda taşınması ve kilometresi olursa o kadar emisyon üretilir ve iklim değişikliği de o ölçüde etkilenmektedir (Anonim, 2024a). ABD'de et endüstrisinin %80'nini dört işletmenin kontrol ettiđi (üretim ve satış aşamaları) bulunmuştur (USDA, 1998). Küresel firmaların üretimi ve taşımacılığı sonucu ürünlerin büyük üreticiler, işleyiciler, nakliyeciler, distribütörler ve perakendeler aracılığıyla ulaştırıldıđı ortaya çıkmıştır (Brian, 2006). Bu tedarik zinciri nedeni ile ABD'nin ürünlerinin ortalama gıda mili 1500 mil olarak bulunmuştur (Foodwise, 2024).Gıda mili kavramı sürdürülebilir ve küresel gıda sanayisinin ayak izinin hesaplanmasında ve yerel kaynakların verimli kullanılmasına önemli katkı sağlanmıştır. Fazla mile sahip gıdalar taşıma ve depolama aşamalarında besin değerini ve tazeliđini kaybetmektedir. Yerel ürünlerin tazelik, yüksek besin değerli ürünler, istihdama olan katkısı ve yerel üreticilerin desteklenmesi gibi olumlu katkıları bulunmaktadır (Commons, 2024). Geleneksel gıda ürünlerinin yerel ürünlere göre tüketiciye ulaşmasında 4-17 (arası) kat daha fazla yakıt tükettiđi bulunmuştur. Bu yakıt tüketimi aynı oranda emisyon üretimi olarak da anlaşılmaktadır (Deweert, 2009). ABD'de Time dergisinde yayınlanan 'Yerel Gıda Hareketi: 100 Mil Diyeti' makalesiyle yerel gıdanı teşvik edilmiş ve gıda milinin azaltılması için önemli bir adım olmuştur (Roosevelt, 2006). ABD'de çalışmalar neticesinde üretici pazarı sayısında artışlar tespit edilmiştir. ABD'de aktif üretici pazarı sayısı 2000 yılında 2863'den 2012 yılına kadar 7864'e yükselmiştir. Üretici pazarı sayısında ortalama 3 katı artış olduđu bulunmuştur. Diğer bir arařtırmaya göre, üretici pazarı müşterilerinin %64'ünün yerel ürün için geldikleri tespit edilmiştir (Wolf et al, 2005).Ürünlerin su yolu, demiryolu, karayolu ve havayolu sıralamasında emisyon miktarının artış gösterdiđi bulunmuştur. Uçakla taşınan gıda ürünleri, karayolu ile taşınan ürünlere göre 10 kat fazla emisyona neden olduđu bulunmuştur. Gıdanın

uçakla taşınması, su yolu ile taşınmasına göre %50 daha çok emisyon üretmektedir (Harris, 2022). İngiltere’de mevsim dışı olan ve uçakla taşınan yüksek değerli ürünler Birleşik Krallığın gıda taşımacılığı emisyonunun %11’ni oluşturmaktadır. DEFRA araştırmasında, Birleşik Krallık’ta yapılan taşımacılığın %25’ini gıda ürünleri taşımacılığı oluşturduğu bulunmuştur. Birleşik Krallık ve çevresinde gıda ürünü taşımacılığında yılda 19 milyon ton CO2 üretilmektedir ve bu da yaklaşık 5,5 milyon normal araca karşılık gelmektedir (DEFRA, 2020).Gıda mili ve emisyon konusuna en yakın tarım sektörü bulunmaktadır. Tarım sektörü; üretim, işleme, taşıma, depolama ve perakende aşamalarında emisyon üretmektedir. Gıda mili araştırmalarında önemli yere sahip olan tarım sektörünün öneminin anlaşılması için dünyanın tarım ihracat ve ithalat miktarlarının incelenmesi gerekmektedir. Küresel tarım ürünleri ihracatı 2022 yılında yaklaşık 2 trilyon dolar olarak bulunmuştur. Küresel tarım ürünleri ihracatı içindeki ürünler (en çok ihraç edilen ürünler) incelendiğinde, hayvansal ve bitkisel yağlar %8.5 (171.1 milyar dolar), hububat %8.3 (166.7 milyar dolar), et ve et ürünleri %8.0 (162.6 milyar dolar), yağlı tohumlar %7.5 (151.4 milyar dolar) ve meşrubat, alkollü içecekler ve sirke %7.2 (146.4 milyar dolar) oranlarında pay almaktadır (Trademap, 2022).Tarım ürünlerinde üretim miktarı, dağıtım kanalı seçenekleri ve tüketicilerin bulunma noktası gıda mili hesaplamalarında farklılıklara neden olmaktadır. Tarımsal faaliyetler ve gıda üretimi gıda milinde artışa ve çevre sorunlarına yol açabilmektedir.

### **Gıda Milinin Ölçülmesi**

Gıda millerini hesaplamak için bir dizi formül geliştirilmiş ve genel olarak kabul görmüştür. Bir gıda ürününün kat ettiği mesafeyi hesaplamanın karmaşıklığı, ürünün tek bir bileşenden mi yoksa birden çok malzemeden mi oluştuğuna ve ürünü taşımak için kullanılan nakliye yöntemine bağlı olarak değişmektedir. Ağırlıklı Ortalama Kaynak Mesafesi (WASD) formülü, 1997 yılında Annika Carlsson-Kanyama tarafından geliştirildi ve taşınan gıda miktarını ve üretim yerinden satış yerine kadar kat ettiği mesafeyi hesaba katmaktadır. Sadece bir bileşenden oluşan meyve ve sebzeler ve diğer ürünlerde gıda millerini hesaplamak için WASD formülü kullanılmaktadır. Ağırlıklı Toplam Kaynak Mesafesi (WTSD) formülü, Leopold Sürdürülebilir Tarım Merkezi tarafından geliştirilmiştir ve her bir bileşen için kat edilen mesafeyi ve ağırlığı hesaplayarak çok bileşenli gıdaları açıklamaktadır. Aromalı yoğurt, ekme ve diğer işlenmiş gıdalar gibi gıdalarda, gıda millerini hesaplamak için WTSD formülü kullanılmaktadır. Hem WASD hem de WTSD, üretici ile tüketici arasında gıdanın kat ettiği mesafeye ilişkin hesaplama yaparken, hiçbir formül kat edilen bu mesafeyle ilişkili sera gazı emisyonlarını ele almamaktadır. Ağırlıklı Ortalama Emisyon Oranı (WAER) formülünde, farklı ulaşım

yöntemleri için hem mesafe hem de ilişkili sera gazı emisyonları hesaba dahil edilmektedir Bu formül, 2004 yılında kar amacı gütmeyen kuruluş LifeCycles tarafından geliştirilmiştir.Çevresel etkinin ölçülmesinde sadece seyahat miktarının ele alınması doğru değildir. Gıda milinin önemli belirleyicisi olan yakıtın verimliliği üzerinde eğitim, araç cinsi ve lojistik de önemlidir. Gıda ürünlerinin nakliyesinde sera gazı üretimini etkileyen unsurlar incelendiğinde;

- Taşıma yöntemi,
- Yakıt cinsi,
- Taşıma esnasındaki hava koşulları,
- Yük faktörü,
- Gıda ürünlerinin ortam sıcaklığı ve soğutulması durumu,
- Taşıma için gerekli olan diğer faktörler ve depolama ihtiyacı bulunmaktadır.

Ağırlıklı ortalama kaynak mesafesi (km) aşağıdaki şekilde hesaplanmaktadır (Aras ve Uğurluoğlu, 2018):

$$AOKM = m \cdot k \cdot d(k) / m(k)$$

k = Üretim noktası

m = Her üretim noktasından tüketiciye ulaştırılan ürünün miktarı (ton)

d = Üretim noktasından tüketim noktasına olan mesafe (km)

Ağırlıklı ortalama emisyon oranı (CO<sub>2</sub> eşd./ton) aşağıdaki şekilde hesaplanmaktadır.

$$AOEMO = m \cdot k \cdot d \cdot k \cdot e(k) / m(k)$$

k = Farklı üretim noktaları

m = Her üretim noktasından tüketiciye ulaştırılan ürünün miktarı (ton)

d = Üretim noktasından tüketim noktasına olan mesafe (km)

e= Sera gazı emisyonu miktarı (CO<sub>2</sub> eşd./ton.km)

Gıdanın üretim yerinden tüketiciye taşınması esnasında açığa çıkan ton cinsinden CO<sub>2</sub> eşdeğeri olarak sera gazı miktarı ise aşağıdaki formül ile hesaplanmaktadır.

$$SGM = AOEMO \cdot c \cdot i$$

c= Belirlenen bölgede gıdanın toplam tüketimi (ton)

i= Tüketicinin ithalattan gerçekleşme yüzdesi (%) olarak ifade edilmektedir.

Ağırlıklı ortalama enerji oranı (MJ/ton), gıda maddesinin üretim yerinden tüketiciye ulaştırılması esnasında birim ağırlık başına harcanan enerji olarak tanımlanmakta olup, aşağıdaki formül yardımıyla hesaplanmaktadır.

$$AOENO = m \cdot k \cdot q \cdot k \cdot d(k) / m \cdot k$$

k = Farklı üretim noktaları

m = Her üretim noktasından tüketiciye ulaştırılan ürünün miktarı (Ton)

d = Üretim noktasından tüketim noktasına olan mesafe (km)

q= Birim nakliyat başına enerji tüketimi (MJ/Ton.km)

Gıda mili hesaplanmasında yapılmış farklı araştırmalar bulunmaktadır. Iowa'da komisyoncu ve toptancıların Chicago Terminal pazarına satın aldıkları ürünlerin ve Ferry Plaza çiftliği ürünlerinin tüketiciye ulaştığı miller hesaplanmıştır ve karşılaştırılmıştır. Terminal Pazarı ve Ferry Plaza Çiftçi Pazarı ürünleri için sırasıyla; elmaların 1.555 mil ve 77 mil, domateslerin 1.369 mil ve 117 mil, üzümün 3.543 mil ve 134 mil, fasulyelerin 766 mil ve 101 mil, şeftalilerin 1.674 mil ve 173 mil, kış kabağının 781 mil ve 98 mil, yeşillerin 889 mil ve 99 mil, marulların 2.055 mil ve 102 mil yol kat ettiği bulunmuştur (Foodwise, 2024). Gıda ürünleri tedarik zinciri içerisinde (ABD'de) yapılmış bir araştırmaya göre, ortalama 1640-6760 km içerisinde sera gazı oluştuğu tespit edilmiştir. Oluşan emisyon miktarı ABD'nin 8.1 ton CO2 emisyonunun %83'ü olduğu bulunmuştur. Gıda ürünleri içerisinde özellikle kırmızı et, tavuk eti ve balık ürünleri emisyon üretiminde başlıca ürünler olarak bulunmuştur. Bu sonuçlar göz önüne alındığında gıda milinin önemli ölçüde azaltılması için yerel ürün satın almak yerine öncelikle et ürünlerinin tüketiminin azaltılması gerektiği bulunmuştur (Weber and Matthews, 2008). ABD'de Leopold Sürdürülebilir Tarım Merkezi, yerel ürünlerin gıda millerini hesaplamıştır. Gıda milleri üzümde 2143 mil, brokolide 2095 mil, kuşkonmazda 1671 mil, elmada 1555 mil mısırdaki 813 mil ve bal kabağında 233 mil olarak bulunmuştur (LCSA, 1998). Diğer ürünlerle birlikte ortalama mesafe ise 1518 olarak bulunmuştur. Diğer bir çalışmada ise, yoğun bir şekilde tüketilen 58 ithal ürünün gıda mili hesaplanmıştır. Gıda ürünlerinin ortalaması 4497 kilometre ve 2811 mil mesafe kat ettiği belirlenmiştir. Yıllık bu ürünlerin 51 709 ton sera gazı ürettikleri bulunmuştur (Xuereb, 2005). ABD'de yapılmış bir araştırmada, dünyanın çeşitli bölgelerinden gelen ürünlerin gıda milleri hesaplanmıştır. Karpuzun 1886 mil Meksika'dan, kivi'nin 5015 mil Şili'den, domatesin 456 mil Kanada'dan, Muzun 2048 mil Panama'dan, armutun 5216 mil Arjantin'den ve ananasın 2048 mil Kosta Rika'dan geldiği bulunmuştur. Bu millerin uzun olmasını başlıca nedeni olarak yakıtlara ulaşılabilir olması ve gelişmiş taşımacılık sistemleri gösterilmiştir (Yee, 2012). Gıda mili hesaplanmasında üretim faktörüne dikkat edilmesi gerekmektedir. Yeni Zelanda'dan Londra'ya gönderilen kuzuların, İngiltere'nin kendi kırsallarında üretilmiş kuzulardan dört kat daha fazla enerjide verimli olduğu tespit edilmiştir (Barber et al, 2006). Burada önemli olan kuzu üretiminde kuzunun hangi mesafe veya nereden geldiği değil, nasıl üretildiğidir. Brezilyadan ithal edilerek alınan Alman elma suyunda yerel

üretim ve işleme göre daha az enerji kullanıldığı bulunmuştur. Almanya’da elmaların enerji yoğun seralarda yetiştirilmesinin gıda mili mesafesini artırdığı saptanmıştır. İthal edilebilecek elma ürünlerinin daha az mile sahip olduğu ortaya çıkmıştır (Blanke and Burdick, 2005).Yüksek gıda miline sahip gıda ürünlerine şüphe ile yaklaşan araştırmacılara göre gıdanın yerelleşmesi veya sadece yerel gıda tüketiminin sonuçları araştırılmıştır. ABD’de yerel ürünlerin talebi karşılayamayacağı, tropik ürünlerin tüketicilere ulaştırılamayacağı ve toplumların sağlık durumunda ciddi etkilerinin olabileceği bulunmuştur (Wilkins, 2009). Gıdanın yerelleşmesi ile küçük üretici birimlerinin oluşmasının, kirlilik, koku, atıkların imhası ve çevresel diğer sorunlara neden olabileceği tahmin edilmiştir (Jones et al, 2004). Bu çalışmalara göre, ihtiyaçlar doğrultusunda farklı bölgelerde yetiştirilen bazı yüksek gıda miline sahip ürünlerin ithalatı ve tüketiminin yapılmasının doğru olduğu bulunmuştur. Tarımsal Ürünlerde Gıda Milleri: Çeşitli Tarımsal Ürünlerden Örnekler ABD’nin gıda endüstrisi tüm fosil yakıt tüketiminin %10’unu oluşturmaktadır. Gıda sisteminin tükettiği enerjinin %21’inin üretim, %14’ünün taşımacılık, %16’sının ürün işleme, %7’sinin paketlenme, %4’ünün gıda perakende, %7’sinin restoran-kafe ve %31’inin konut ısıtma için kullanıldığı bulunmuştur. ABD küresel olarak %23’lük emisyon miktarı ile dünyada en büyük emisyon üreticisidir. ABD gıda sisteminin yıllık kullandığı enerji miktarı Fransa’nın yıllık enerji miktarına karşılık gelmektedir (Tablo 1) (Murray, 2005).

Tablo 1 ABD Gıda Sisteminin Enerji Kullanımı

Alanlar	Kullanım Miktarı
Üretim	%21
Taşımacılık	%14
Ürün işleme	%16
Paketleme	%7
Gıda perakende	%4
Restoran ve Kafe	%7
Konut ısıtma	%31
<b>Toplam</b>	<b>%100</b>

Birleşik Krallıkta ürünlerin gıda mili hesaplanması dört ulaşım yöntemine göre incelenmiştir. Gıda milleri 423 ton-km su yolu, 677 ton-km demiryolu, 2890 ton-km karayolu ve 15839 ton-km havayolu olarak bulunmuştur. Hava taşımacılığı, gıda ve diğer malların taşınmasında çok fazla enerji yoğun bir ulaşım yöntemi olarak belirlenmiştir. Hava taşımacılığı, Birleşik Krallıkta

%1'lik yer kaplamasına rağmen, ülkede %11'lik bir emisyon ürettiği tespit edilmiştir. Bunun yanı sıra; gürültü, kazalar ve trafik sorunları gibi diğer problemlerle gıda taşımacılığının ekonomik ve sosyal maliyetinin yıllık 9 milyar sterlin veya 18 milyar doları geçtiği saptanmıştır (Tablo 2) (Smith et al, 2005).

Tablo 2 Farklı Yük Taşımacılığı Modları İçin Enerji Kullanımı Ve Emisyon Miktarları

	Suyolu	Demiryolu	Karayolu	Havayolu
Birincil enerji tüketimi KJ Ton-km	423	677	2890	15839
Spesifik toplam emisyonlar g/Ton-km				
Karbondiyoksit	30.0	41.0	207	1260
Hidrokarbonlar	0.04	0.06	0.3	2.0
VOC	0.1	0.08	1.1	3.0
Nitrojen oksit	0.4	0.2	3.6	5.5
Karbon monoksit	0.12	0.05	2.4	1.4

Yerel gıda ürünlerinin millerinin geleneksel gıda ürünlerine göre kısa olduğu ve az emisyon ürettikleri bulunmuştur. ABD-Iowa bölgesinde yapılan araştırmada, yerel ve geleneksel gıda ürünlerinin gıda milleri karşılaştırılmıştır. Yerel gıda ürünlerinin gıda mili toplamı 716 mil ve geleneksel gıda ürünlerinin gıda mili toplamı 25 301 mil olarak bulunmuştur (Tablo 3). Geleneksel gıdaların yerel gıdalara göre 4-17 kat daha fazla yakıt kullandığı ve 5-17 kat daha fazla emisyon ürettiği saptanmıştır (Tablo 4). Bu araştırma ile bölgede fazla enerji için yakıt kullanıldığı da tespit edilmiştir. Taşıma yöntemi göz önüne alındığında bölgesel ürün taşıması için küçük araçlar ve kamyonlar kullanılmaktadır. Küçük kapasiteli araç kullanılmasının fazla sefer, fazla yol ve fazla emisyonu neden olduğu da tespit edilmiştir. Gıda taşımacılığında araç türlerine göre verimliliğin değişebileceği belirtilmektedir.

Küresel gıda sistemi birbirine çok sıkı şekilde bağlıdır. Çin'de tüketilen bir etin üretimi için dünyanın çeşitli bölgelerindeki üretim materyallerine ihtiyaç duymaktadır. Şekil 1'de baloncuklar gıda üretimi emisyonlarını ve oklar ise gıda kilometresini göstermektedir. Çin'deki et talebini karşılamak için girdiler çeşitli ülkelerden ithal edilmektedir. ABD'de meyve-sebze ve Brezilya'da soya fasulyesi üretimi için karayolu kullanılarak Kanada'dan kimyasallar ithal edilmektedir. Almanya'dan makine ve Avustralya-Endonezya'dan kömür ithal edilmektedir.

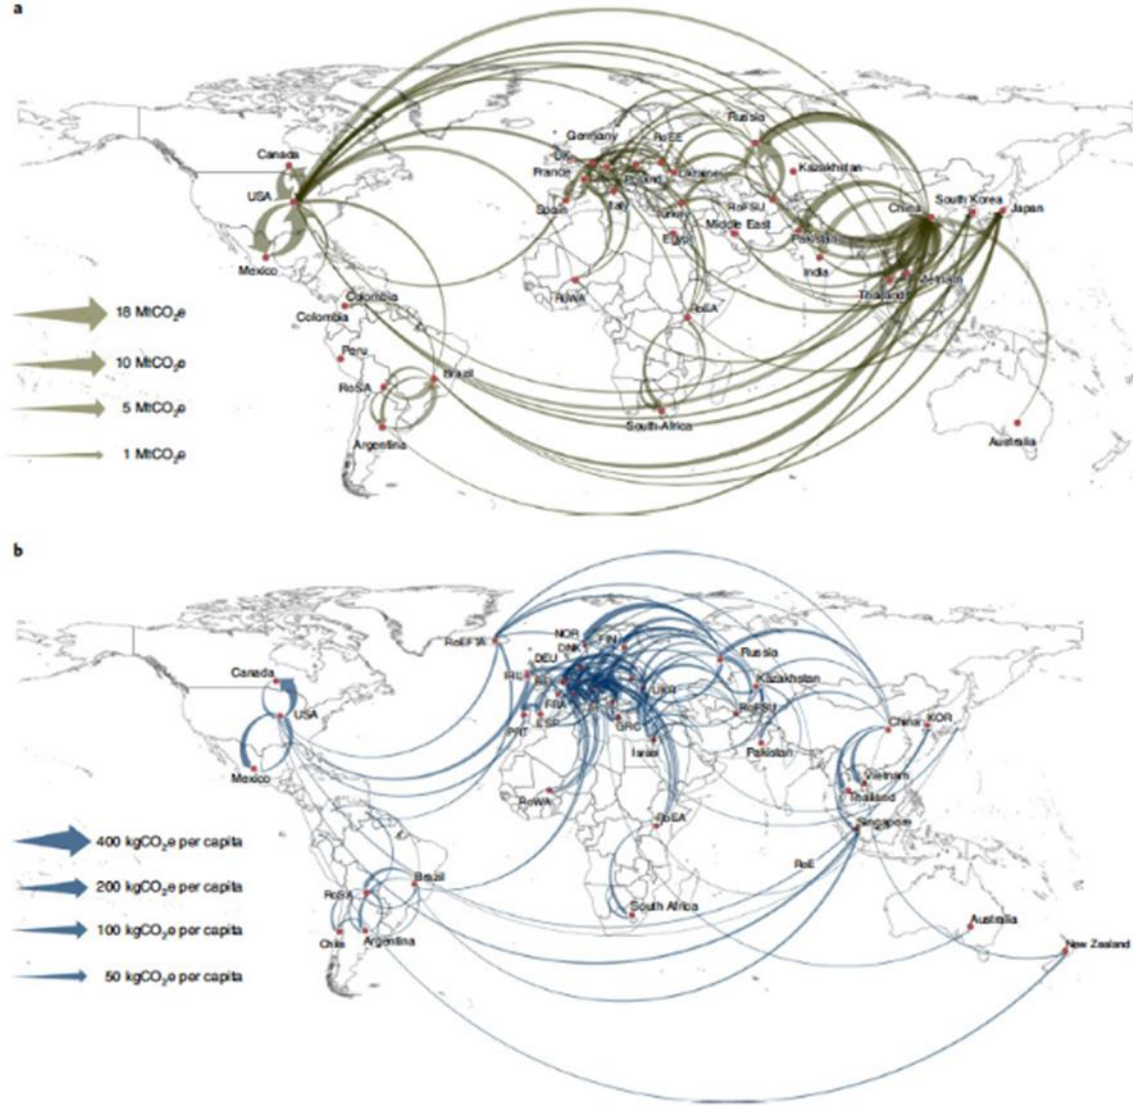

Ülkeler arası bu gıda tedarik zinciri et üretimini sağlamak ve Çin'deki et talebini karşılamak içindir. Üretimin gıda milini artırdığı hipotezinin doğruluğu anlaşılmaktadır.

Şekil 1 Çin'de Kırmızı Et Tüketimine İlişkin Tedarik Zinciri Emisyonu (Li et al, 2022)

Küresel tedarik zincirinde gıda sisteminin emisyon miktarları hesaplanmıştır. Avrupa ve Çin merkezli ticaret noktaları vurgulanmıştır. Afrika kıtasında önemli bir ticaret miktarının olmadığı da bulunmuştur. Gıda emisyonlarını önemli ölçüde zengin ülkelerin arttırdığı tespit edilmiştir. Düşük gelirli ülkelerin (kişi başı 3000 ABD doları altında) uluslararası gıda kilometrelerinin %12'sini ve emisyonların ise %20'sinden sorumlu oldukları ortaya çıkmıştır. Okyanusya, Kuzey Amerika ve Avrupa dahil zengin ülkelerin gıda kilometreleri ve emisyon miktarları diğer bölgelerden 2.7-2.8 kat daha fazla olduğu tespit edilmiştir. Mt CO<sub>2</sub>e cinsinden uluslararası gıda mili emisyonlarının ilk 100 ikili akışı (üstte) ve kişi başına kgCO<sub>2</sub>e cinsinden uluslararası gıda mili emisyonlarının ilk 100 ikili akışı (altta) gösterilmektedir. Okların kalınlığı emisyonların miktarını göstermektedir (Şekil 2).

**Şekil 2** Küresel Tedarik Zinciri Ağı Boyunca Gıda Kilometresi Akış Haritası (Li et al, 2022)  
Birleşik krallıkta yapılan bir çalışmada gıda ürünlerinin taşıma yöntemlerine göre emisyon miktarları incelenmiştir. ~25 emisyon (gCO<sub>2</sub>/tkm) derin deniz – okyanus, ~50 emisyon (gCO<sub>2</sub>/tkm) kısa deniz- iç su yolları, ~600 emisyon (gCO<sub>2</sub>/tkm) havayolları (uzun mesafe) ve ~1600 emisyon (gCO<sub>2</sub>/tkm) havayolları (kısa mesafe) olarak bulunmuştur. Gıda millerinin artması ve emisyon miktarının artmasındaki ana neden havayollarının kullanılması ve kısa mesafede defalarca sefer yapılması olarak bulunmuştur. Gıda ürünlerini ideal gıda mili ve emisyon miktarları ile taşımak için uzun mesafeli denizyolu kullanımının uygun olacağı belirlenmiştir (Tablo 5).

Tablo 5 Birleşik Krallıkta Ürünlerin Ulaşım Yöntemlerine Göre Emisyon Üretim Miktarları

Ulaştırma Yöntemi	Emisyon (gCO <sub>2</sub> /tkm)
Derin Deniz-Okyanus	~25
Kısa Deniz ve İç Su Yolları	~50
Havayolları (Uzun mesafe)	~600
Havayolları (Kısa mesafe)	~1600

Üretilen ürünlerin fosil kaynaklar kullanılarak tüketiciye ulaştırılmasındaki akış incelenmiştir. Geleneksel ürün ve yerel ürün(doğrudan pazarlama, üretici pazarı veya çiftlikten satış) aşamaları verilmiştir. Geleneksel üründe üretilen bir ürün için sekiz aşama ve yerel ürünlerde ise üç aşama ile tamamlanmaktadır. Geleneksel yöntemlerle üretilen ve pazarlaması yapılan ürünlerde fosil yakıt, elektrik, fazla insan-araç, uzun mesafeler ve farklı yollar kullanılmaktadır. Ulaştırmada fazla faktörün bulunmasının gıda milini ve emisyon miktarını artırdığı bulunmuştur. Yerel üretilen ve pazarlanan ürünler için ise üç aşamada (üretim ve pazarlama) tamamlanmaktadır. Yerel ürünlerde fazla fosil yakıt, araç, yol ve insan kullanımı olmadığı için gıda mili ve emisyon üretim miktarı düşük kalmaktadır (Tablo 6).

Tablo 6 Geleneksel ve Yerel Ürünlerin Akış Şeması

Aşamalar	Geleneksel Ürün Akışı		Yerel Ürün Akışı
1	Tarımsal üretim: Traktörler ve diğer makineler (dizel)	1	Tarımsal üretim: Traktörler ve diğer makineler (dizel)
2	Çiftlikte soğuk hava deposu (elektrik)	2	Müşteri tarafından çiftlik mağazasına seyahat ve ürün alma (benzin)
3	Paketleme ve yönetim (elektrik ve ısıtma)	3	Tüketicinin depolama aşaması (elektrik)
4	Ağır vasıtalarla bölgesel merkezlere dağıtım (dizel)		
5	Merkezde soğuk hava deposu (elektrik)		
6	Yükleme ve merkez yönetimi (elektrik ve ısıtma)		
7	Hafif ticari araçla eve teslim (dizel)		
8	Tüketicinin depolama aşaması (elektrik)

ABD’de gıda ürünleri arasında emisyon üretim miktarları incelenmiştir. Emisyon miktarı ile gıda milleri hakkında çıkarımlar yapılmıştır. ABD’de gıda ürünleri emisyon miktarları incelendiğinde; %30’unun kırmızı et, %18’inin süt ürünleri, %11’inin tahıllar-karbonhidratlar, %11’inin meyve-sebzeler, %10’unun tavuk-balık-yumurta, %9’unun diğer ürünler, %6’sının içecekler ve %5’inin yağlar-tatlılar-çeşniler kaynaklı olduğu belirlenmiştir. En fazla emisyon üreten ve gıda miline sahip olan ürünler kırmızı et ve süt ürünleri olarak saptanmıştır (Tablo 7).

Tablo 7 ABD’de Gıda Ürünlerinin Emisyon Üretim Miktarları

Ürünler	% Pay
Kırmızı Et	30
Süt Ürünleri	18
Tahıllar/Karbonhidratlar	11
Meyve ve Sebzeler	11
Tavuk/Balık/Yumurta	10
Diğer Ürünler	9
İçecekler	6
Yağlar/Tatlılar/Çeşniler	5
Toplam	100

Kaynak: ACS, 2008

Gıda mili üzerinde yapılan araştırmalar neticesinde kavram ve içerik yönünden belli değişiklikler olmuştur. Gıda mili, gıda ürünlerinin tarladan tabağa kadarki mesafeyi ele almaktadır. Geliştirilmiş gıda mili, gıda millerinin çevresel, sosyal ve ekonomik maliyetlerinin de olması nedeni ile bir bütün olarak incelenmektedir. Gıda zincirinin sürdürülebilirliği, taşımacılıktan kaynaklanan dışsallıklar (çevresel, sosyal ve ekonomik maliyetler) yanında üretim, işleme, dağıtım, satış ve tüketimden kaynaklanan dışsallıklarında dahil edilerek incelenmesidir (Tablo 8). Gıda zincirinin sürdürülebilirliği, yaşam döngüsü analizi (LCA) olarak da tanımlanmaktadır. Yaşam döngüsü analizi (LCA), üretim ve tüketim aşamalarına kadar tüm çevresel etkilerin bütünsel olarak incelendiği yöntemdir.

Tablo 8 Gıda Mili, Geliştirilmiş Gıda Mili ve Gıda Zincirinin Sürdürülebilirliği Şeması

Kavramlar	Gıda Mili	Geliştirilmiş Gıda Mili	Gıda Zincirinin Sürdürülebilirliği
1	Gıda Taşımacılığı (Kilometre-Mil)	Çevresel Maliyetler	Üretim
2		Sosyal Maliyetler	İşleme
3		Ekonomik Maliyetler	Dağıtım
4		Taşıma Yöntemi Taşıma verimliliği	Satış
5			Tüketim

Kanada'nın ithal etmiş olduğu meyvelerin gıda milleri ve CO2 emisyon miktarları da incelenmiştir. Şekil 3'de ithal edilen meyvelerin Kanada'nın Ontario eyaletine ve Britanya Columbia'sına ulaştırılmak için kat ettiği mesafeler gösterilmiştir. Gıda millerinin ürünler bazında farklı olduğu bulunmuştur. Britanya Columbia meyvelerinin %17'si 500 km'nin altındaki bölgelerden getirilirken, Ontario meyvelerinin sadece %0.1'i bu mesafelerden (500 km) getirilmektedir. Ortalama meyvelerinin %40'ı 5 000 km'den fazla yok kat ettiği bulunmuştur. Ontario meyvelerinin %15'i ve Britanya Columbia meyvelerinin %10'u 10 000 km'den fazla mesafeden ithal edilmektedir. Bu araştırmada; bütün ülkenin ve bir bölgenin gıda mili hesabının ötesinde belli ürünlerin taşınmasında üretilen CO2 emisyon miktarları da bulunmuştur. Kanada'ya ithal edilen meyve ürünlerinin gıda mil, emisyon miktarı ve ürün menşei ayrıntısı ile sunulmuştur (Tablo 9).

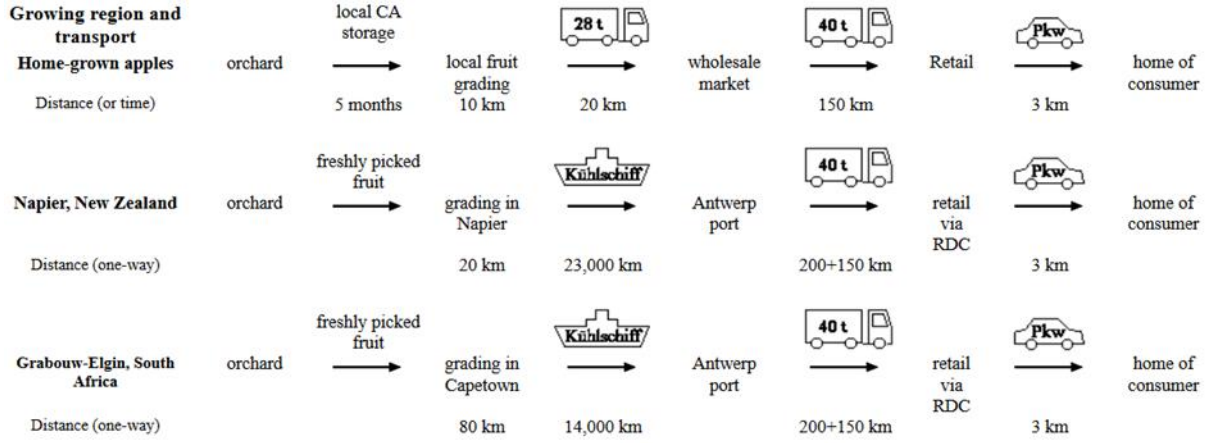

Şekil 3 Kanada'nın Ontario ve Britanya Columbia'sına İthal Edilen Meyvelerin Haritada Gıda Mili Gösterimi, (Kissinger, 2012)

Tablo 9 Kanada'nın Ontario ve Britanya Columbia'sına İthal Edilen Meyvelerin Gıda Milleri ve Tedarik Kaynakları

Ürünler	Ortalama Mesafe (km/kg)	Ortalama CO2 gCO2/Kg	Tedarik Kaynakları	
			ABD Eyaletleri	Diğer Ülkeler
Elma	4990	360	Washington, Kaliforniya, Michigan	Yeni Zelanda, Şili, Güney Afrika
Muz	6566	75	-	Columbia, Kosta Rika, Ekvador, Guatemala, Honduras
Armut	7970	350	Kaliforniya, Michigan, Oregon, Washington	Arjantin, Çin
Şeftali	4110	480	Kaliforniya, New York, Washington	Şili
Erik	5400	530	Kaliforniya, Michigan, Washington	Şili
Çilek	3250	580	Kaliforniya, Florida, Michigan	Meksika

Almanya'da üretilen ve ithal edilen elma ürününün gıda mili de hesaplanmıştır. Yerel olarak üretilen elmalar; 5 hafta soğuk depolama, 170 km zincir marketlere ve 3 km sonrasında tüketici evine ulaşmaktadır. Yeni Zelanda'dan ithal edilen elmalar; gemi ile 23 000 km, zincir marketlere 350 km ve 3 km sonrasında tüketici evine ulaşmaktadır. Güney Afrika'dan ithal edilen elmalar; gemi ile 14 000 km, zincir marketlere 350 km ve 3 km sonrasında tüketici evine ulaşmaktadır. Bu araştırmada Almanya'da tüketim için yerel üretilen ve ithal edilen elmaların gıda mili hesaplanmıştır. Gıda mili fazla olan ithal elmalarda; soğuk depolama için elektrik, deniz taşımacılığı için gemi, ülke içi taşımacılık için çeşitli kara araçları ve fazla personel kullanılmaktadır. Gıda mili fazla olan ithal elmaların emisyon üretim miktarının da yüksek olduğu bulunmuştur (Şekil 4).

Şekil 4 Almanya'ya İthal Edilen Elmaların Akışı(Taşımacılık ve Gıda Zinciri) (Blanke, 2006)

### Sonuç ve Öneriler

Literatüre belli süre önce (1990-1995) girmiş olan gıda mili kavramı üzerinde çeşitli ve ayrıntılı araştırmalar yapılmıştır. Araştırmalar öncelikle ABD ve Avrupa ülkelerinde ithal edilen ürünler incelenerek devam etmiştir. Gıda mili kavramı sadece mesafe ile ilgilenmektedir. Son gelişmeler ile üretim, işleme, dağıtım, perakende ve tüketim aşamaları da dahil edilerek çevresel, sosyal ve ekonomik maliyetlerde bir bütün olarak ele alınmaktadır. Gıda mili ne kadar yüksek olursa o kadar çevreye olumsuz etkisinin var olduğu bulunmuştur. Ancak bazı ürünlerde yerel ürünlerin gıda mili (üretim emisyon değeri nedeni ile yüksek olması) ithal ürünlerden yüksek olmaktadır. İspanya'nın domates, Almanya'nın elma ve Birleşik Krallığın kuzu örnekleri bu konuda örnek gösterilebilmektedir. Gıda mili konusunda karşılaşılan sorunlar; küresel gıda üreten firmaların sayısının artması, fosil yakıtın ulaşılabilir olması ve aşırı kullanımı, ulaşım sistemlerinin gelişmiş olması ve fazla araç ile seferlerin yapılması, yerel firmaların ürün pazarlamada yetersiz kalması ve pazarda küresel firmaların etkin rol oynaması, üretici ve tüketici açısından öncelikli ilkenin ürün miktarı ve kazanç payı olması, her bölgede her ürünün yetişememesi veya ithalatın zorunlu olması, bazı ürünlerin ithalatının yetiştirilmesine göre düşük mil içermesi (Almanya, İspanya, İngiltere) şeklinde belirtilebilir. Ürünlerde gıda mili miktarını azaltmak için çeşitli öneriler bulunmaktadır. Bunların belli ölçüde uygulanması bile gıda mili ve çevresel etkileri azaltmak konusunda fayda sağlayabilecektir. Bu kapsamda yerel ürün ve üretici pazarlarının tercih edilmesi, mevsimsel yiyeceklerin tüketilmesi, hayvansal ürünlerden et ve süt ürünleri tüketim miktarının azaltılması, genellikle az işlenmiş ve paketlenmiş ürünlerin tercih edilmesi, yerel ve organik ürünlerin tüketimi ve pazarlamasının artırılması söz konusu önerilerden bazılarıdır.

**Özet**

Kemometrik yöntemler, özellikle son birkaç on yılda ilaç endüstrisinde son derece değerli araçlar haline gelmiştir. Bu yöntemler, farmasötik üretim ve kalite kontrolünün farklı yönlerinde yaygın olarak kullanılmaktadır. Önemli uygulamalardan biri, farmasötik ürünlerin etkinliğini ve güvenliğini sağlamak için çok önemli olan tabletlerdeki aktif bileşen içeriğinin tahmin edilmesidir. Kemometrik yöntemler ayrıca üretim hatalarının tespit edilmesinde ve farmasötik ürünlerin genel kalitesinin korunmasında da rol oynar. Çeşitli uygulama alanları arasında, temel bileşen regresyonu (PCR) ve kısmi en küçük kareler regresyonu (PLS) gibi kemometrik yaklaşımlar, farmasötik formülasyonların kantitatif analizinde büyük başarı göstermiştir. Bu derlemede, endüstriyel antibiyotik üretimi ve analizi bağlamında kemometrik yöntemlerin potansiyeline odaklanacağız. Antibiyotikler sağlık hizmetlerinde büyük önem taşımaktadır ve kalite ve etkinliklerinin sağlanması çok önemlidir. Kemometrik yöntemler kullanılarak, üretim sürecini gerçek zamanlı olarak izlemek ve kontrol etmek mümkündür, bu da verimliliğin ve güvenilirliğin artmasına yol açar. Özellikle eritromisin, vankomisin, penisilin, sefalosporin ve amoksisilin gibi antibiyotikler kemometrik analizden büyük ölçüde faydalanabilir. Bir mikro bilgisayar kontrol sistemi, fermantasyon süreçlerinin gerçek zamanlı olarak izlenmesini kolaylaştırarak anormalliklerin ve beklenen modellerden sapmaların erken tespit edilmesini sağlayabilir. Örneğin, eritromisin üretiminde kemometrik yöntemler verimliliği artırabilir ve biyoteknolojik metabolizmada yer alan karmaşık fermantasyon sürecini optimize edebilir. Ayrıca kemometrik teknikler, fermantasyon sırasında istenen ölçüm prosedürlerinin oluşturulmasına olanak tanır. Bu, farmasötik dozaj formlarının belirlenmesine ve tutarlı kalite kontrolünün sürdürülmesine yardımcı olur. Kemometrik yöntemler, fermantasyon sırasındaki hataları anında tespit edip düzelterek antibiyotik üretiminin genel güvenilirliğine ve güvenliğine büyük ölçüde katkıda bulunur. Sonuç olarak, bu derleme, kemometrik yöntemlerin endüstriyel antibiyotik üretimi ve analizindeki pratik uygulamalarına ışık tutmayı amaçlamaktadır. Bu gelişmiş analitik tekniklerin kullanılması, ilaç üreticilerinin süreçlerini kolaylaştırmalarına, ürün kalitesini artırmalarına ve nihayetinde sağlık hizmetlerinin iyileştirilmesine önemli katkılarda bulunmalarına olanak tanır.

**Anahtar kelimeler:** Kemometri, Antibiyotikler, Biyoteknoloji, Üretim, Eritromisin, Vankomisin, Penisilin, Sefalosporin.

**STUDIES ON THE USE OF CHEMOMETRIC METHODS IN THE  
BIOTECHNOLOGICAL PRODUCTION AND ANALYSIS OF ANTIBIOTICS**

**Abstract**

Chemometric methods have become extremely valuable tools in the pharmaceutical industry, particularly in the past couple of decades. These methods are widely used in different aspects of pharmaceutical manufacturing and quality control. One important application is estimating the active ingredient content in tablets, which is crucial for ensuring the efficacy and safety of pharmaceutical products. Chemometric methods also play a role in detecting production errors and maintaining the overall quality of pharmaceutical products. Chemometric methods such as baseline regression (PCR) and partial least squares regression (PLS) have become established in pharmaceutical content analysis. In this review, we will focus on the potential of chemometric methods in the context of industrial antibiotic production and analysis. Antibiotics are of utmost importance in healthcare, and it is crucial to ensure their quality and effectiveness. By utilizing chemometric methods, it is possible to monitor and control the production process in real time, leading to increased efficiency and reliability. Specifically, antibiotics like erythromycin, vancomycin, penicillin, cephalosporin, and amoxicillin can greatly benefit from chemometric analysis. A microcomputer control system can facilitate the real-time monitoring of fermentation processes, enabling the early detection of anomalies and deviations from expected patterns. For instance, in erythromycin production, chemometric methods can improve efficiency and optimize the complex fermentation process involved in biotechnological metabolism. Additionally, chemometric techniques allow the establishment of desired measurement procedures during fermentation. This aids in determining pharmaceutical dosage forms and maintaining consistent quality control. By promptly identifying and rectifying errors during fermentation, chemometric methods greatly contribute to the overall reliability and safety of antibiotic production. In conclusion, this overview will shed light on the practical applications of chemometric methods in industrial antibiotic production and analysis. The utilization of these advanced analytical techniques allows pharmaceutical manufacturers to streamline their processes, enhance product quality, and ultimately make significant contributions to improved healthcare.

**Keywords:** Chemometry, Antibiotics, Biotechnology, Production, Erythromycin, Vancomycin, Penicillin, Cephalosporin.

## **Introduction**

Chemometrics encompasses a variety of concepts and applications related to data processing. These include descriptive and descriptive statistics, signal processing, experimental design, modeling, calibration, optimization, structure recognition, classification, artificial intelligence methods, image processing, and information and systems theory (Heyden, and Massart 2001). High-throughput experimental studies are based on experimental design and quantitative evaluation methods. These studies are usually conducted using mathematical models or designs. Especially for complex nonlinear systems, artificial intelligence methods, such as artificial neural networks, are widely preferred (Chen 2022). In the field of chemistry, solving industrial and scientific practical problems is very important. In chemistry, values that cannot be measured directly can be determined indirectly. Chemists have developed special techniques and instruments for such measurements. Any data obtained in this way can be converted into information, such as how much of a substance is in a mixture. With modern analytical methods, this data can be collected in large quantities and with high precision (Wang and Xu 2023). Chemometrics has a wide range of applications. In quantitative research, experimental design has a useful structure that encompasses many concepts and applications that can be discussed under the name of optimization and calibration. High-throughput experimental studies are based on experimental design and quantitative evaluation methods (Assubaie, Alnajjar and Naheid 2013). Such studies can be realized by mathematical models or designs. Especially for complex non-linear systems, artificial neural networks are often used as methods of artificial intelligence. In the field of chemistry, the solution of practical problems that arise in industrial and scientific fields is of crucial importance. With modern analytical methods, this data can be collected in large quantities and with high precision (Engel, Buydens, Blanchet 2017). Biotechnological processes are usually characterized by a variety of inputs, outputs and complex correlations between them, including operational and performance parameters. A biotechnological application consists of 15 to 30 steps. These parameters can influence the performance of the application and the product quality (Roggo, Chalus, Maurer, Lema-Martinez, Edmond, Jent 2007). Chemometrics offers an effective approach to understanding processes based on complex data sets. The increased use of this approach supports the progressive acceptance of quality through advanced design and process analytical technology in the regulatory and biotechnology industries.

Figure 1.

Applications of chemometrics in industry

### Application of Chemometric Methods to Antibiotic Production “Erythromycin, Vancomycin, Penicillin, Cephalosporin.” and Their Analysis

The analysis of scientific processes and components requires the analysis and understanding of components and processes. In particular, it is essential to identify and monitor the components of complex mixtures. Techniques such as chromatography and spectroscopy are often used for this purpose. Chemometrics is particularly used to analyze complex mixtures and generates large amounts of data using spectroscopic techniques to identify components of biological origin. Chemometrics helps to analyze this data and convert it into meaningful information. Chemometrics also reduces the complexity of the data through data processing and modeling and develops appropriate models for analysis that highlight important information (Yuk 1992).

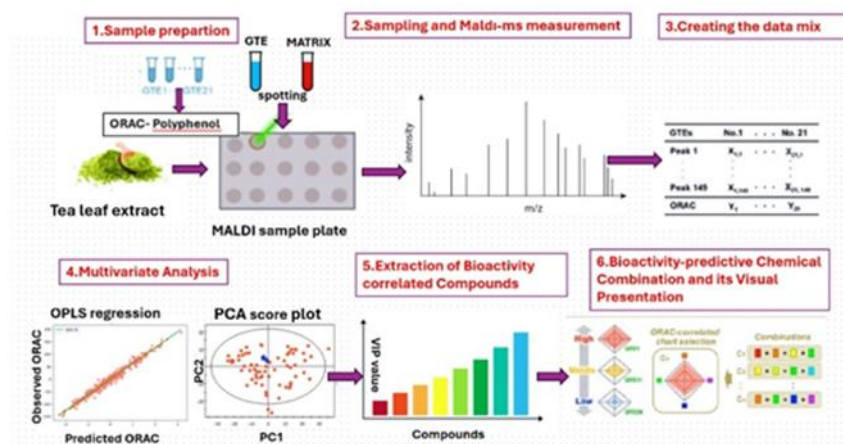

Figure 2: Chemometric Modelling of Biotechnological Processes

### **Erythromycin**

Erythromycin is a macrolide antibiotic discovered in 1952 (Zhang and Qin 2010). Macrolides are a group of antibiotics that prevent bacteria from synthesizing proteins. Erythromycin is useful in the treatment of respiratory diseases, including bronchitis, pneumonia, Legionnaires' disease (a type of lung disease) and diseases caused by conditions such as whooping cough (pertussis; a serious illness that can cause severe coughing), recurrent rheumatic fever (Guay 1996). Its mechanism of action is to stop the growth of bacteria. Erythromycin, which is effective against gramme-positive bacteria, has also been shown to be effective against some gramme-negative bacteria and some other organisms.

**Figure 3:** Molecular Structure of Erythromycin

### **Penicillin**

Penicillin is the most important antimicrobial agent and dates back to the 1920s. In terms of their mechanism of action, penicillin belongs to the group of inhibitors of cell wall synthesis (Usleber and Märtlbauer 1998). Some types of penicillin are: Amoxicillin, Ampicillin, Cloxacillin, Dicloxacillin, Methicillin, Nafcillin, Oxacillin, Penicillin G, Penicillin V, Ticarcillin, Piperacillin (Rocco, Moloney, O'Beirne, Earley, Berendsen, Furey, and Danaher 2017). Penicillins are used to treat diseases such as ear, throat and sinus infections and to prevent dental infections. These antibiotics can be effective against bacterial infections and play an important role in the treatment of many diseases.

**Figure 4:** Molecular Structure of Penicillin

**Cephalosporins:** Cephalosporins are antibiotics from the group of  $\beta$ -lactams and have a bactericidal effect, i.e. they kill bacteria (Bush and Macielag 2010). These properties play an important role in fighting infections. Cephalosporins have a broad spectrum against gram-negative and gram-positive bacteria. The first and second generation cephalosporins are generally effective against gram-positive bacteria, while the third generation cephalosporins are more effective against gram-negative bacteria (García-Rodríguez, Bellido and Sánchez, 1995). Due to their chemical structure, they are similar to penicillins. Their effect is to destroy the bacteria by stopping the synthesis of the bacterial cell wall. Cephalosporins are used for treatment purposes in a variety of areas, from the respiratory tract to the world, from subcutaneous sugar to bone and muscle diseases. They are also effective in treating infections affecting the brain and nervous system, bacterial infections spread through the bloodstream and sexually transmitted diseases such as gonorrhea. Cephalosporins protect against many different bacteria and have become a very popular treatment option in the health sector.

**Figure 5:** Molecular Structure of Cephalosporin

**Vancomycin:** Vancomycin, one of the first bactericidal antibiotics, is synthesized by *Amycolatopsis orientalis* (Yarlagadda, Sarkar, Manjunath, and Haldar 2015). This microorganism first produces vancomycin A and then synthesizes vancomycin B, which contains glycoctisin. Vancomycin is a high molecular weight glycopeptide antibiotic. It shows its antibacterial properties by inhibiting the formation of the bacterial cell wall (Lian, Liu, Wang, Xu, Cui, and Bai 2013). It is particularly active against gram-positive bacteria and is effective against organisms such as staphylococci, streptococci, aerobic and anaerobic bacilli and *Corynebacterium*. Vancomycin achieves its bactericidal effect by interrupting the formation of the N-acetylmuramic acid pentaglycan chain, one of the cell wall components (Guthei 2021). Vancomycin is an important antibiotic that can cure serious and life-threatening infections. It is effective for infections of the pericardium, lungs, meninges and enterobacteria, as well as conditions such as sepsis caused by resistant bacteria (Martin, Alaya, Mallet, Viviani, Ennabli, Said, and De Micco 1994).

**Figure 6:** Molecular Structure of Vancomycin

### **Application of chemometric methods to the production and analysis of erythromycin, penicillin, cephalosporin, vancomycin antibiotic species**

#### **Biotechnological production of erythromycin**

Erythromycin is produced by the bacterium *Streptomyces erythraeus*. It is important for biotechnological production. The steps of biotechnological production include the selection of suitable microorganisms, fermentation, optimization of conditions, extraction of the product, purification and production of the final product. This process can be more efficient than that obtained from natural sources and better results can be achieved by genetically modifying the microorganisms. In a study on erythromycin biotechnology (Zeng and LI 2010), *Saccharopolyspora erythraea* strains were found to control the amount of enzymes that enable the biotransformation of erythromycin D to Er-A (Liu 2008). The main objective of this study was to use metabolic engineering approaches to increase the production of Er-A and improve its purity in the experiments, it was determined that adding corn sump liquor to the 50-litre fermenter increased Er-A production, and furthermore, the maximum Er-A production was 8.196 U/mL by 191-fold. This value is 81.8% higher than the control group (control class 184 times 4.507 U/mL) (Zeng and LI 2010). It was also observed that Er-B impurities were completely eliminated and Er-C impurities were reduced.

#### **Chemometric Studies on Erythromycin**

Erythromycin estolate was characterized by thermogravimetric analysis and differential scanning calorimetry. Compatibility tests were carried out with four different incompatibilities such as magnesium stearate, sodium starch glycolate, povidone and mannitol and possible

incompatibilities were analyzed (Daniel and Trevisan 2021). Potential thermal mismatches were identified using Pearson correlation coefficients and simulated and experimental thermogravimetric curves were compared. An  $r(2)$  Table 1 value of about 0.91 for mixtures of magnesium stearate and mannitol shows that there is communication. Dynamic thermal FT-IR spectroscopy and MCR-ALS analysis of atomic particles to allow separation of chemical classes without the mass loss observed in thermogravimetric analysis. These techniques have successfully detected incompatibilities between erythromycin and magnesium stearate and mannitol, as well as between povidone and sodium starch glycolate.

<b>Eksipiyans</b>	<b>Pearson correlation coefficient (<math>r^2</math>)</b>
Magnesium stearat and Mannitol	~ 0,91

**Table 1:** Value of Eksipiyans for Mixtures.

An analytical method developed for the analysis of mixtures of antibacterial drugs was investigated. The UV absorption spectra of mixtures containing norfloxacin, tinidazole, erythromycin and trimethoprim show a clear spectral overlap. Chemometric techniques such as first derivative of zero crossing (D-1), classical least squares (CLS) regression analysis and principal component regression (PCR) can be used for quantitative analysis of drugs, including norfloxacin-tinidazole mixtures and trimethoprim-tinidazole mixtures (Mohamed, Abdelmageed, and Refaat 2007). The methods developed are in agreement with the results of the chemometric and colorimetric methods and show that the investigated drugs can be accurately determined in binary mixtures and commercial dosage forms. These methods are recognized as an effective tool for the analysis of antibacterial drug mixtures. Ren's 2008 study used near-infrared (NIR) spectroscopy to quantify the amounts of active ingredients in drug samples. In this block, four different GA-RBF network models are developed using genetic diseases for the diversity of RBF networks. GA-RBF networks achieve the best results according to SNV. The same structures were used in the quantitative analysis of erythromycin ethyl succinate powder samples. Thanks to the global search capabilities of GA, the risk of jamming at local minima was reduced. It was experimentally demonstrated that GA-RBF networks performed better compared to conventional RBF networks. It has been shown that SNV spectra have the lowest AIC value of GA-RBF network and SNV correction can achieve satisfactory results for the application of GA-RBF network. Marcello and Trevisan (2020) investigated the compatibility between ERY and excipients by thermal analysis. TG curves were important to identify potential interactions. Chemical incompatibilities were investigated by FT-IR on the hotplate, but PCA did not confirm the incompatibilities. MCR-ALS confirmed

the presence of five major components. No new degradation products were detected in the mixture of erythromycin and mannitol, but the deconvolution method confirmed the change in erythromycin concentration. The low correlation between ERY and magnesium stearate indicated incompatibility ERY + magnesium stearate  $\Delta H_{\text{fusion}}/\text{J g}^{-1}$   $39.1 \pm 0.9$ c (Silva, Trevisan, and Garcia 2020). An easy-to-use and reliable reversed-phase liquid chromatography (LC) spectrophotometric method was developed for the detection of erythromycin stearate (Elkady 2011). The method involved analyses using spectrophotometry, spectrofluorometry, near-infrared spectroscopy and high-performance liquid chromatography (HPLC). Two spectrophotometric methods were used to examine the colored product formed when erythromycin stearate (12 M) reacts with perchloric acid. The spectrophotometric method was used for simultaneous and inverse quantification. Other spectrophotometric methods used consist of three separate chemometric techniques: classical least squares (CLS), inverse least squares (ILS), principal component regression (PCR) and partial least squares (PLS). It is also used to separate and analyze strongly overlapping spectra. In addition, the absorbance values of zero degree and derivative spectra were measured at many points in the lymphatic path, spectral interferences between erythromycin and its colored product, spectral interferences between erythromycin and its colored product, in the first spectrophotometric method or spectrometric techniques, namely classical least squares, principal component regression and partial least squares regression. The most common methods for solving spectral interference between other components ERS are classical least squares, inverse least squares, principal component regression and partial least squares.

### **Optimal Control of Erythromycin Fermentation Processes**

The fermentation process used in the production of erythromycin was developed by a special pattern optimization method. This method was effectively utilized in erythromycin production units in a pharmaceutical manufacturing plant (Zhu, Lu, and Xu 1998). The effects of important factors such as temperature, pressure, pH value and air flow during the production process were analyzed in detail. The dissolved oxygen content and the condition of the fermenters were also measured using appropriate sensors. The temperature and pH values were intermittently adjusted according to the fermentation status using a CS-91 programmable digital controller. The microcomputerised feeding system has shown that computerized feeding can improve the fermentation process compared to manual feeding. This control system lays a solid foundation for optimizing the erythromycin fermentation process through pattern recognition. Various pattern recognition methods were used to create a pattern space that can well represent the

process. The resulting process data was processed with an artificial neural network (ANN) and used as input for this system (Mei, Yang, Shu, Jiang, Liu, and Liao 2016). The PLS method shows how the samples are represented in a two-dimensional pattern space as a result of analyzing the pre-processed data. As can be seen in the figure, the samples are almost completely separated thanks to the developed method. The PLS method shows that the erythromycin fermentation process is a suitable modeling method for pattern recognition. The arrow in the figure indicates the direction of optimization. This means that the top right region corresponds to high chemical activity. The two points on the plane (i.e. points A and B) are chosen intentionally.

### **Penicillin**

#### **Biotechnological production of penicillin.**

Penicillin is an antibiotic that is used to treat bacterial infections. The biotechnological production process usually involves the fermentation of fungi such as *Penicillium chrysogenum*. In this process, the microorganisms are grown in suitable culture media and fermentation takes place under strict control (Srirangan, Orr, Akawi, Westbrook, Moo-Young, and Chou 2013). Once produced, penicillin is collected, purified and processed into various medicines. After penicillin production, this valuable antibiotic is collected, purified and integrated into various drug formulations. Biotechnological methods of production can offer higher efficiency than conventional methods, and genetic engineering techniques can further increase the production capacity of penicillin. The study “Integrated Condition Monitoring and Control of Feed Batch Fermentation Processes” shows how important the use of DCS models is in such fermentation processes (Zhang and Lennox 2004). This modeling allows for more effective control of production plants by accurately assessing the factors affecting the quality of the fermentation process. Moreover, the inclusion of predictive control mechanisms contributes to a more effective diagnosis of control systems, improving error analysis.

#### **Chemometric Studies on Penicillin**

The study focused on the combination of chemometrics and laser-induced breakdown spectroscopy (LIBS) to determine the conditions of penicillin production (Wang 2022). The aim was to monitor quality differences in the production of the same type of drugs by different manufacturers. By proposing a LIBS-based method, it was highlighted as an important step to identify problems that may affect drug quality and identify production. The study examined three different penicillin strains produced by 10 different manufacturers. The LIBS spectra were

used to identify the characteristic lines of the penicillin species. Three different classification methods were used to identify the different producers of the penicillin species. The best classification result was obtained with the RF-ANN model with an accuracy of 100%. The results show that the LIBS technique can be used for product quality control in the manufacture of penicillin. An FIA system with factorial design was investigated for penicillin determination. In this method, penicillinase [E.C.] was deposited on silica gel in the reactor where production took place. 3.5.2.6], the enzyme was immobilized and analyzed (Lima and Lins 1997). A potentiometric FIA system with a statistical experimental design was developed and evaluated based on the effects of certain parameters on the signal response and the number of measurements per hour. In the study, using the three-factor factorization technique, parameters such as reactor length, carrier flow rate and sample volume were investigated in two stages to determine the best operating conditions. The pure measurement error was estimated using unequal replicates. The balance between the best response signal and the number of detections per hour and the ideal operating conditions were determined when the reactor length was 1.5 cm, the carrier flow rate was 2.2 mL/min and the sample volume was 150  $\mu$ L. It was determined that a shorter reactor length and a lower flow rate led to an increase in the reaction signal (reference). It was found that the sample volume had no effect on the reaction. An interaction between the reactor length and the flow rate of the carrier was observed, and it was determined that the interaction was greater for relatively short reactor lengths. Due to the stability of the immobile silica surface of the enzyme, approximately 45 samples per hour could be analyzed. The system was tested for 73 days with a total of 800 measurements. It was found that the environmental conditions applied caused a decrease in activity of 8.9 and a recovery of 98% (Kubota 1997). The detection of penicillin G salts in pharmaceutical mixtures was carried out using FT-IR spectroscopy with a chemometric approach. Due to the complexity of the content, partial least squares (PLS) and radial basis function-partial least squares (RBF-PLS) methods were used and orthogenic signal correction (OSC) was pre-processed. The results showed that OSC is an effective preprocessing method for both linear (PLS) and nonlinear (RBF-PLS) models.

#### **Optimal Control of Penicillin Fermentation Processes**

The combination of PyMS and ANN was used to measure the penicillin content in *Penicillium chrysogenum* strains and the ampicillin content in *Escherichia coli* samples (Goodacre 1995). Four *P. chrysogenum* strains were analyzed with PyMS. Data obtained using the standard back-propagation algorithm were subjected to sigmoidal squashing. Linear regression methods did

not provide accurate predictions. ANNs are highly capable of predicting ampicillin quantities and were accurate for values beyond the concentration data for which they were trained. Principal component analysis was effective in distinguishing between *P. chrysogenum* strains and identifying phenotypic differences in their growth stages. Sampling with homogenized agar plugs was found to speed up the analysis process.

### **Cephalosporin**

#### **Biotechnological production of cephalosporin**

The production process of cephalosporin antibiotics is carried out with the fungus *Cephalosporium*. This process involves a number of steps, starting with the selection of the appropriate microorganism, creating the necessary environment for fermentation, carrying out the fermentation process, extracting and purifying the resulting product, and finally bringing it into drug form (Wilhelm 1991). The improvement of microorganisms through genetic engineering methods allows the production of cephalosporins with higher yields and new properties, thus improving the production processes in the pharmaceutical industry. Sometimes chromatography is used to determine the composition and purity of a substance. Nonlinear regression analysis can generate process parameter effects to determine optimum values. Multivariate calibration techniques can represent and optimize relationships between multiple process variables. Chemometric methods used in the production of cephalosporins from *Cephalosporium* fungi are important for monitoring, controlling and optimizing the production process. These methods can be used to determine product quality, improve process efficiency and reduce production costs (Cruz, Pan, Giordano, Araujo, and Hokka 2004). Spectroscopic analysis, for example, evaluates product quality by quickly determining the chemical structures and components of samples. These approaches foster efficiency, stability and better quality of cephalosporin production processes. Also, if there are continuous monitoring systems set up with controls on them as well, then any potential problems may get caught earlier on in the production process so that it doesn't stop all together.

#### **Chemometric Studies on Cephalosporins**

pH-sensitive Bio-FETs have been developed for the analysis of glucose, urea and cephalosporin C and have been used in various biological systems. For example, GOD-FETs for glucose analysis have been integrated into the EVA system and used to monitor glucose concentration in microbial cultivation processes. Urease-FET-FIA has been used to monitor urea concentration and in combination with GOD-FET-FIA to monitor urea and glucose concentration in the cultivation of *S. cerevisiae*. These sensors are suitable for online

monitoring and control of media component concentrations. However, experiments are required to determine the optimal conditions in different biological systems, as pH and buffer capacity vary and high substrate concentrations may require dilution (Brand 1991).

### **Optimal Control of Cephalosporin Fermentation Processes**

Cephalosporin C biosynthesis was investigated by *Cephalosporium acremonium*. Higher productivity was achieved in continuous stirred tank bioreactors compared to batch reactors. The pH control increased cephalosporin C production. Experiments were performed with free cells and the typical time course of the bioprocess was determined. During the high growth rate, glucose is preferred, while sucrose is metabolized more slowly (Hokka 2001). In this phase, growth is somewhat inhibited, while a higher production rate is achieved. The kinetic model was elaborated using linear and non-linear regression analysis. The effective diffusivity of oxygen was determined and compared with values from the literature. The remaining kinetic constants were determined by solving non-linear differential equations. This method allowed the determination of the process behavior together with the concentration profiles of the components in the bioparticles. Industrial cephalosporin batch fermentation has some advantages for a "normal operating conditions" (NOC) model with fewer prediction parameters, requiring little memory and representing multidimensional data at the same time. A total of 20 groups of normal cephalosporin fermentations were used to develop the NOC models (Yuan 2009).

### **Chemometric Studies on Cephalosporin**

Three common cephalosporin solutions, such as ceftriaxone, cefotaxime sodium and cefazolin sodium, were analyzed for quantification using Raman spectroscopy and chemometric methods (Lin 2013). Partial least-squares regression models were created on the basis of pre-processed spectral data. High correlation coefficients and low prediction errors indicate that Raman spectroscopy is a suitable method for the quantification of cephalosporin solutions. Pre-processed partial least squares (OSC) PLS models gave positive results in determining the concentrations of mixed triplet cephalosporin solutions. This study demonstrates that by combining Raman spectroscopy with the PLS regression technique, the concentrations of the components of cephalosporin mixtures can be accurately and rapidly determined. A boron-doped diamond electrode was used for the first time for the sensitive and selective analysis of cefixime, a third-generation cephalosporin, using the square-wave voltammetry technique (Keskin 2019). The effect of electrode pretreatment on the current response was investigated. The best signals were obtained by anodic and cathodic electrochemical pretreatment of the

electrode and subsequent polishing with a polishing pad. In a  $0.1 \text{ mol dm}^{-3} \text{ H}_2\text{SO}_4$  supporting electrolyte, Cefixime showed an irreversible and diffusion-controlled oxidation peak at  $+1.25 \text{ V}$  (Ag/AgCl vs.  $3 \text{ mol dm}^{-3} \text{ NaCl}$ ). With the best instrumental conditions and pretreatment procedure, the linear calibration curve ranged between  $2.2 \times 10^{-6} \text{ mol dm}^{-3}$  to  $1.3 \times 10^{-4} \text{ mol dm}^{-3}$  having a detection limit of  $5.9 \times 10^{-7} \text{ mol dm}^{-3}$ . This method can also be used for analyzing cefixime from pharmaceutical formulations when other methods fail because it gives consistent results and is ecofriendly in nature. Cephalosporins are the most commonly prescribed  $\beta$ -lactam antibiotics (Elbashir 2015). Spectrophotometry is probably the most suitable analytical technique for routine analysis as it is simple, inexpensive and widely used in quality control laboratories. In recent years, several papers have been presented on the development and validation of spectrophotometric methods for the analysis of cephalosporins in pharmaceutical formulations. Most of the methods reported are visible spectrophotometric methods. These methods are based on the formation of a colored product due to charge transfer and reaction of cephalosporins with oxidant reagents or ion pair formation. The methods have been used for the quantitative determination of the drug in pure form and in commercial preparations. Common excipients do not interfere with the determination.

## **VANCOMYCIN**

### **Biotechnological production of Vancomycin**

To produce vancomycin an effective antibiotic used to treat bacterial infections through biotechnology, various procedures should be followed. Initially, it is necessary to choose a proper strain of *Streptomyces orientalis* and create the right environment for fermentation. It is essential to check closely and control strictly the growth of bacteria as well as the amount of produced vancomycin in each stage during fermentation so that they will remain at their best condition always until fermentation completes. Once done with fermenting, purify collected vancomycins until forms pure enough are achieved. Therefore, different pharmaceutical preparations like tablets or injectable solutions can be made from them (Koller, Hesse, Salerno, Reiterer and Braunegg 2011). Biotechnology can make more of vancomycin than any natural method. Furthermore, genetic engineering may alter microorganisms so that they produce vancomycin more effectively or make the drug acquire novel characteristics. This is a key step in making pharmaceutical-grade vancomycin.

### **Chemometric Studies on Vancomycin**

*Streptomyces* species are ubiquitous organisms of nature and can produce many different bioactive compounds. Among them, of great interest, are the glycopeptides, which form the

basis of drugs like vancomycin, effective to treat antibiotic-resistant staphylococcal infections. Vancomycin is vital in the fight against common and difficult-to-treat infections in hospitals. Vancomycin is usually produced by bacteria such as *Amycolatopsis orientalis*. To determine the optimal production conditions, various factors are evaluated and the interaction of these factors is studied by statistical analysis. For example, factors such as pH, temperature, size of the inoculum, agitation speed and aeration influence the efficiency of vancomycin production (Aly and Tolba 2021). By determining optimal production conditions, a valuable antibiotic such as vancomycin can be produced more efficiently. This is important to meet demand and reduce costs. However, given the complexity of the process and the naturally occurring diversity, continuous research and development is required to improve production efficiency (de Castro and Sanches 2017). Genetic engineering and improved culture media could yield antibiotics such as vancomycin more cheaply. Such developments pave the way to develop new ways of fighting against resistant bacteria, thus enabling more production and distribution of the life-saving drugs. Improved access to treatment will therefore be more easily acquired by patients treated for resistant infections. The study focused on the optimization of culture conditions for vancomycin production of strain *Amycolatopsis orientalis* KCCM-10836P. It was noted that pH and dissolved oxygen tension (DOT), which were established as most critical factors, was identified. It was determined that the production of vancomycin reached its maximum under the conditions of pH control at 7.0 and under DOT in the range of 20-30%. Using various carbon and nitrogen sources, different sources of carbon and nitrogen were tested. The highest production of vancomycin was achieved with the use of dextrin as the source of carbon. The nitrogen sources, in turn, shown a strong influence on the specific vancomycin content. The production of red metabolite was detected under low oxygen tension conditions. It was found that red metabolite production slowed down vancomycin production when DOT was below 20%. Ultimately, vancomycin production has been successfully transferred from a laboratory to pilot and plant scale. Thus, the strain *A. orientalis* KCCM-10836P has huge potential for commercial production of vancomycin. Further optimization of culture conditions and the choice of highly productive strains may bring increased productivity and efficiency in industrial vancomycin production (Oh and Lee 2007).

#### **Chemometric Studies on Vancomycin**

HPLC/UHPLC studies in this field are very limited. HPLC methods coupled with mass spectrometry or tandem mass spectrometry detectors are generally used for the detection of vancomycin in biological fluids or tissues. There is a method for the quantification of

vancomycin and ceftazidime in cerebrospinal fluid using an internal standard called thienol. This method gave detection times of 7 minutes and 11 minutes for vancomycin and ceftazidime, respectively. Quantification methods for vancomycin, imipenem and cefepime in human plasma were also developed. The primary standard used was cefuroxime and the analysis time was spread over 30 minutes. Theoretical plate numbers and symmetry factor values were measured for three solutes (benzoic acid, N,N-dimethylaniline and vancomycin) in chromatographic systems (using different stationary phases and mobile phase compositions). These measurements were performed to classify the systems and to investigate the possible variations of the columns and eluent compositions. The mobile phases consisted of acetonitrile or methanol as exchanger and  $K_2HPO_4$ - $H_3PO_4$  or triethylamine- $H_3PO_4$  as aqueous buffer. The organic content of the mobile phases was adjusted so that the  $\log R_f$  (logarithm of the retention factor) of the tested compounds was between 0.1 and 1.3 for all chromatographic systems and test compounds (Heberger 2005). The plate numbers and symmetry factors were analyzed by principal component analysis (PCA). The input data were organized into 13 x 28 data matrices for the plate numbers and symmetry factors separately for all compositions. Two principal components accounting for at least 98% of the total variance were retained in the model. This analysis showed which chromatographic systems (stationary and mobile phases) gave the same or similar chromatographic parameters (De Zan 2017). PCA provides a way to switch chromatographic systems and columns. Monofunctional test compounds provide only approximate information on the usefulness, classification and replacement of HPLC systems when multifunctional solutes are to be separated. Using PCA, it is possible to determine the potential trade-offs between chromatographic systems and columns. PCA shows which chromatographic systems (column and mobile phases) give the same or similar chromatographic parameters using three different types of test compounds. Characterization of Nonribosomal Peptide Antibiotic Solid Dispersion Formulation with Process Analytical Technology Sensors", the focus of the research was to characterize and evaluate the variability of an amorphous vancomycin (VCM) solid dispersion (SD) using a crystalline polyethylene glycol (PEG-6000) carrier (Khan 2013). For this purpose, it was aimed to determine the percentage values of the compositions using the non-destructive method of process analytical sensors (PAT). SD was prepared using heat fusion method and characterized in terms of physicochemical and spectral properties. Improved dissolution was observed in these formulations, while the crystallinity of PEG-6000 decreased, indicating that the drug is present in dissolved and dispersed form in the polymer. The homogeneity of the SD formulations was

also confirmed by chemical NIR imaging data. Principal component analysis (PCA) and partial least squares (PLS) methods were applied to the NIR and PXRD data to quantify the drug and carrier. The PLS models developed for both data sets had high correlation coefficients ( $>0.9934$ ) and low mean square error and standard deviation values, indicating good predictive ability. The model based on NIR and PXRD was able to predict the amount of PEG-6000 two times more accurately than the VCM. In summary, the resolution of drug from SD increased with decreasing crystallinity of PEG-6000 and the chemometric models showed that the PAT sensor was suitable for simultaneous estimation of VCM and PEG-600 content."A method for the determination of two antibiotics prescribed for the treatment of nosocomial infections, linezolid and meropenem, in plasma and urine", using micellar liquid chromatography. This innovative method for determining the concentrations of linezolid and meropenem in plasma and urine uses crystalline polyethylene glycol (PEG-6000) as a carrier. The biological fluids, plasma and urine, were diluted in the mobile phase, filtered and injected directly without an extraction step (Heberger 2005). Both antibiotics were eluted in  $<15$  minutes using a C18 column and a phosphate-buffered mobile phase in isocratic mode. Absorption was detected at 255 nm for linezolid and 310 nm for meropenem. Using chemometric techniques, an analysis was performed to study the effect of the concentrations of sodium dodecyl sulfate and methanol on the retention times of these two chemicals in the chromatography. The method was highlighted as it requires only small amounts of toxic and volatile solvents and can be performed quickly. Consequently, this method can be used for the rapid and efficient determination of antimicrobial drugs in plasma and urine. The results of accuracy and precision were at an acceptable level and the method is suitable for routine analysis in a clinical laboratory

## **CONCLUSION**

The quantitative and statistical aspects of all the investigated methods in the production and preparation of antibiotic species have the advantages of simplicity, precision, accuracy and ease of use and therefore the proposed methods can be used for quality control in the laboratories of production and dosage forms of all the mentioned antibiotic species. It has been shown that the chemometric procedures performed for all fermentation processes can be easily implemented in a comparative simulation and that the procedure can provide an accurate inference of quality variables such as biomass concentration, which is difficult to measure with online sensors. The relevant results of pattern recognition and refinement process optimization tests have shown that the optimal target, chemical efficiency, can be significantly increased by adapted

techniques. All the proposed methods have the advantages of simplicity, precision, accuracy and convenience for separation and quantification and can be used to study their dosage forms. Therefore, the proposed methods can be used for quality control of the indicated drugs in normal laboratories.

**Özet**

Bu araştırmanın amacı beslenme ve diyetetik bölümü öğrencilerinde beslenme durumu ve fiziksel aktivite düzeyleri arasındaki ilişkinin değerlendirilmesidir. Çalışma, Mayıs 2022-Temmuz 2022 tarihlerinde çalışmaya katılmayı gönüllü kabul etmiş, 18-25 yaşlarında 134 üniversite öğrencisi üzerinde yürütülmüştür. Çalışmaya dahil edilen tüm öğrencilere bir anket formu, 24 saatlik besin tüketim kaydı ve fiziksel aktivite formu uygulanmıştır. Verilerin değerlendirilmesinde SPSS 27.0 programı kullanılmıştır. Araştırmaya yaş ortalaması  $21,7 \pm 2,5$  olan 22 erkek ve 112 kız öğrenci olmak üzere toplamda 134 kişi katılmıştır. Katılımcıların %44'ü dördüncü sınıf öğrencilerinden oluşmaktadır. Beslenme için aylık ortalama bütçe değerlendirildiğinde %55,2'sinin 300-1000 TL cevabını verdiği görülmüştür. Öğrencilerin %71,6'sının üç ana öğün tükettiği, %40,3'ünün öğle öğünü atladığı, %42,5'inin hafta 1-3 kez dışarda yemek yediği, %47'sinin doğru beslenme bilgilerinin davranış durumlarını sıklıkla etkilediği, %42,5'inin etiket okuma alışkanlığının bazen olduğu belirlenmiştir. Öğrencilerin günlük ortalama su tüketimlerinin  $1,8 \pm 0,7$  litre olduğu tespit edilmiştir. Öğrencilerin %7,5'i fiziksel olarak aktif olmayanlardan, %63,4'ü fiziksel aktivite düzeyi düşük olanlardan ve %29,1'i fiziksel aktivite düzeyi yeterli olanlardan oluşmaktadır. Toplam fiziksel aktivite düzeyi ise  $2546,2 \pm 2159,8$  MET-dk/haftadır. Öğrencilerin enerji ve besin ögesi alım miktarları ile fiziksel aktivite düzeyleri arasında istatistiksel olarak anlamlı ilişki saptanmamasına rağmen ( $p > 0,05$ ) posa, A vitamini, E vitamini, B<sub>1</sub>, B<sub>2</sub>, B<sub>6</sub>, folat, C vitamini, potasyum, kalsiyum, magnezyum ve demir alımının fiziksel olarak aktif olmayan öğrencilerde daha düşük düzeylerde olduğu tespit edilmiştir. Sonuç olarak bu kesitsel çalışmada yer alan beslenme ve diyetetik öğrencilerinin çoğunluğunun düşük fiziksel aktivite düzeyine olduğu sahip olduğu belirlenmiştir. Ayrıca beslenme durumları dikkate alındığında, öğün atlama, yeterli miktarda su içmeme, ev/yurt dışında besin tercih etme gibi bazı yanlış alışkanlıklara sahip oldukları saptanmıştır. Bu sonuçlar yeterli ve dengeli beslenme ile düzenli fiziksel aktiviteyi kapsayan sağlıklı yaşam tarzı konusunda bireylerin daha çok bilinçlendirilmesi gerektiğini göstermektedir. Ülkemizde özellikle beslenme ve sağlık alanında eğitim gören öğrencilerin yaşam tarzlarını değerlendirecek ve bu anlamda hatalı davranışların değişimi için müdahaleler planlayacak kapsamlı çalışmalara ihtiyaç duyulmaktadır.

**Anahtar Kelimeler:** Beslenme durumu, fiziksel aktivite düzeyi, sağlıklı yaşam, üniversite öğrencileri

**EVALUATION OF NUTRITIONAL STATUS AND PHYSICAL ACTIVITY LEVELS  
IN NUTRITION AND DIETETICS DEPARTMENT STUDENTS**

**Abstract**

This study aimed to evaluate relationship between nutritional status and physical activity levels in nutrition and dietetics department students. Study was conducted on 134 university students aged 18-25, who voluntarily agreed to participate between May and July 2022. A survey form, 24-hour food consumption record and physical activity form were applied. SPSS 27.0 program was used to evaluate data. A total of 134 people, 22 male and 112 female students, with an average age of  $21.7 \pm 2.5$ , participated in research. 44% of participants are fourth grade students. 55.2% answered 300-1000 TL for average monthly budget for nutrition, 71.6% of the students consume three main meals, 40.3% skip lunch, 42.5% eat out 1-3 times a week, 47% say that correct nutrition information often affects their behavior and 42.5% of them sometimes had the habit of reading labels. Students' average daily water consumption was  $1.8 \pm 0.7$  liters. 7.5% of students are physically inactive, 63.4% are those with low physical activity levels, and 29.1% are those with sufficient physical activity levels. Total physical activity level is  $2546.2 \pm 2159.8$  MET-min/week. Intake of fiber, vitamin A, vitamin E, B<sub>1</sub>, B<sub>2</sub>, B<sub>6</sub>, folate, vitamin C, potassium, calcium, magnesium and iron was significantly higher ( $p > 0.05$ ). It was found to be at lower levels in students who were not physically active. As a result, majority of nutrition and dietetics students in this cross-sectional study had low physical activity levels. In addition, they have some wrong habits such as skipping meals, not drinking enough water, and choosing to eat outside of home/dormitory. Individuals should be made more aware of a healthy lifestyle that includes adequate and balanced nutrition and regular physical activity. Comprehensive studies are needed to evaluate lifestyles of students, especially those studying in field of nutrition and health, and to plan interventions to change erroneous behaviors in this sense.

**Keywords:** Healthy life, nutritional status, physical activity level, university students

## **Giriş**

Üniversite dönemi ergenliğin son dönemleri ile yetişkinliğin ilk döneminin başladığı bir geçiş dönemidir. Gençler aile ortamından ayrıldıklarında stres düzeyleri artmakta ve buna bağlı olarak beslenme durumları da değişmektedir. Dış etkenlerden daha fazla etkilenecek, kendi özgür seçimlerini ön plana çıkarmaya başlamaktadır (Akdevelioğlu & Yörüsün, 2019). Bu dönemde öğrencilerin yeni bir disipline uyum sağlamalarının yanı sıra, daha hızlı yaşam temposu da sağlıksız ve düzensiz beslenme davranışlarını artırmaktadır (Kartal ve ark., 2017). Bu bakımdan üniversite yaşamı, beslenme ve yaşam tarzı alışkanlıklarının oluştuğu önemli bir dönem olup, obezite ve buna bağlı kronik hastalıkların gelişiminde uzun vadeli sonuçlar doğurabilmektedir (Mahfouz ve ark., 2016; Kapinos ve ark., 2014). Üniversite döneminde öğrencilerin beslenme alışkanlıkları ve fiziksel aktiviteleri olumsuz etkilenebilmektedir (Caestine ve ark., 2017; Beaudry ve ark., 2019). Öğrenciler genellikle besinlerini kantinlerden, yemekhaneden ya da dışarıda bir restorandan temin etmektedirler. Kantinde bulunan yiyecekler genellikle hijyenik olmayan koşullarda pişirilmekte, pişirme işlemi sırasında da temel besin maddelerinin çoğu yok olmakta ve dolayısıyla öğrencilerin besin ögesi gereksinimlerini karşılayamamaktadır (Priya ve Sinha, 2020). Bu nedenle öğrencilerin üniversite döneminde sağlıksız ve enerji açısından yoğun besin tüketimini arttırıp, sağlıklı ve besin değeri açısından zengin besin alımını azaltması beslenme kalitelerinde genel bir düşüşe neden olmaktadır (Beaudry ve ark., 2019). Birçok çalışma, üniversite öğrencilerinin büyük bir kısmının kötü beslenme ve fiziksel aktivite eksikliği gibi sağlıksız yaşam tarzı davranışları ile beslenme durumlarının kötü olduğunu vurgulamaktadır (Blake ve ark., 2017; Calamidas ve Crowell, 2018; Bernardo ve ark., 2016; Deliens ve ark., 2013; Pengpid ve ark., 2015). Üniversite öğrencilerinin yetersiz beslenme ve yetersiz fiziksel aktivite durumlarına katkıda bulunan ortak faktörler arasında stres, yoğun programlar, alışılmış davranışlar ve sosyal medya yer almaktadır (Calamidas & Crowell, 2018; Sogari ve ark., 2018). Zemzemoğlu ve ark. (2019), sağlık bilimleri fakültesi öğrencileri arasında yüksek düzeyde ana öğün atlama ve fazla atıştırma tüketimi bulmuşlardır. Ayrıca Arslan'ın (2016) çalışmasında bu öğrencilerin fiziksel olarak aktif olmadığı saptanmıştır. Ayrıca yeterli su içmeme ve hazır besin tercih etme gibi alışkanlıkların da bu dönemde arttığı belirlenmiştir (Arslan ve ark., 2016). Beslenme ve Diyetetik Bölümü gibi sağlık ve besin ile ilgili programlara kayıtlı üniversite öğrencilerinin, çalışma alanları ve aldıkları derslerin niteliği göz önüne alındığında, akranlarına göre daha iyi beslenme alışkanlıklarına sahip olmaları düşünülmektedir. (Rivera Medina ve ark., 2020). Dolayısıyla bu öğrencilerin öğrenimleri sırasında edindikleri bilgileri, beslenme alışkanlıklarını

ve yaşam tarzlarını iyileştirecek şekilde uygulayabilmeleri beklenmektedir. Ancak Rizo-Baeza ve ark. (2014) tarafından İspanya Alicante Üniversitesi Beslenme ve Diyetetik Bölümü üniversite öğrencileri arasında yürütülen bir çalışma, makro ve mikro besin öğelerinin tüketiminin beslenme kurallarına uymadığını, beslenmeyle ilgili bilginin varlığının sağlıklı beslenme ve yaşam tarzına ilişkin karar almayı etkilemediğini göstermiştir (Rizo-Baeza ve ark., 2014). Geleceğin sağlık profesyonelleri olmak üzere sağlık ile ilgili bölümlerde eğitim gören üniversite öğrencileri aynı zamanda toplumda sağlıklı davranışları eğitmek ve teşvik etmekle de görevlendirileceklerdir. Beslenme ile ilgili programlara kayıtlı öğrencilerin de bu bağlamda, beslenme kavramlarının edinilmesi ve öğrenilmesi açısından diğer çalışma alanlarına göre avantajlı olmaları ve akademik programlarının bu konuda yeterlikler sağlaması nedeniyle sağlıklı beslenme alışkanlıklarını uygulama konusunda daha iyi bir konumda olmaları beklenmektedir. Ancak geleceğin sağlık profesyoneli olma yolunda eğitim alan üniversite öğrencilerinin beslenme ve fiziksel aktivite davranışları hakkında çok az şey bilinmektedir. Bu nedenle bu çalışmanın amacı, Beslenme ve Diyetetik Bölümü öğrencilerinde beslenme durumu ve fiziksel aktivite düzeyleri arasındaki ilişkinin değerlendirilmesidir.

### **Yöntem**

#### **Araştırmanın Yeri, Zamanı ve Örneklem Seçimi**

Bu çalışma, Mayıs 2022-Temmuz 2022 tarihleri arasında Ankara Üniversitesi Sağlık Bilimleri Fakültesi, Beslenme ve Diyetetik Bölümü'nde eğitim almakta olan çalışmaya katılmayı gönüllü olarak kabul etmiş, 18-25 yaş arasındaki 134 öğrenci üzerinde yürütülmüştür. Çalışmaya gönüllü olmayan, 18 yaşının altında ve 25 yaşının üstünde, gebe ve emzicilik döneminde olan ve herhangi bir psikolojik hastalığı olup psikolojik ilaç kullanan bireyler dahil edilmemiştir.

#### **Verilerin Toplanması**

Çalışmaya dahil edilen tüm öğrencilere sosyo-demografik özelliklerini sorgulayan anket formu, günlük enerji ve besin ögesi alımını değerlendirmek için 24 saatlik geriye dönük besin tüketim kaydı, fiziksel aktivite düzeyini saptamak için Uluslararası Fiziksel Aktivite Anketi Kısa Formu uygulanmıştır.

#### **Besin Tüketim Durumunun Saptanması**

Katılımcıların günlük enerji ve besin ögesi alımları 24 saatlik hatırlatma yöntemi kullanılmasıyla oluşturulan besin tüketim kayıtlarından değerlendirilmiştir. Besin tüketim kayıtlarına dair verilerin değerlendirilmesinde Türkiye'de uygulanan beslenme programı beslenme bilgi sistemleri paket programı (BEBİS) programı ile katılımcıların günlük ortalama makro ve mikro besin öğeleri değerleri hesaplanmıştır

### **Uluslararası Fiziksel Aktivite Anketi**

Uluslararası Fiziksel Aktivite Anketi (UFAA) 15-65 yaş aralığındaki katılımcıların fiziksel aktivite düzeylerini belirlemek amacıyla Craig ve ark. (2003) tarafından geliştirilmiştir (Craig, 2003). UFAA'nın Türkiye'de geçerlik ve güvenilirlik çalışması Öztürk (2005) tarafından yapılmıştır. Bütün aktivitelerin değerlendirilmesinde her bir aktivitenin tek seferde en az 10 dk yapılıyor olması ölçüt alınmaktadır. Dakika, gün ve MET değeri çarpılarak "METdakika/hafta" olarak bir skor elde edilmektedir. Fiziksel aktivite düzeyleri, fiziksel olarak aktif olmayan (<600 MET- dk/hafta), fiziksel aktivite düzeyi düşük (600 – 3000 METdk/hafta) ve fiziksel aktivite düzeyi yeterli olan (sağlık açısından yararlı olan) (>3000 METdk/hafta) şeklinde sınıflandırılmıştır (Öztürk, 2005).

### **Verilerin İstatistiksel Değerlendirilmesi**

Veriler SPSS 27.0 (Statistical Pack age for the Social Sciences 27.0) programı ile analiz edilmiştir. Değişkenlerin normallik dağılımı kontrolünden sonra fiziksel aktivite düzeyi ile besin öğeleri alımı arasında farklılık olup olmadığını belirlemek için Tek Yönlü ANOVA testi kullanılmıştır. Tüm testler için anlamlılık düzeyi ( $p < 0,05$ ) olarak belirlenmiştir. Bu çalışma Ankara Üniversitesi Girişimsel Olmayan Klinik Araştırmalar Etik Kurulu'nun 25.04.2022 tarih ve 08/80 sayılı Etik Kurul Onayı ile gerçekleştirilmiştir.

### **Bulgular ve Tartışma**

Oğur ve ark.'nın (2015) Beslenme ve Diyetetik Bölümü öğrencileri ile yaptıkları çalışmada kadın öğrenci popülasyonu erkeklerden fazla görülmüştür (Oğur & ark., 2015). Benzer şekilde Beslenme ve Diyetetik öğrencilerinin de dahil olduğu bir diğer çalışmada da kadın öğrencilerin sayısı daha fazladır (Andızoğlu, 2022). Katılımcıların genel özellikleri Tablo 1'de özetlenmiştir. Bu çalışmada yer alan öğrencilerin %16,4'ü erkek, %83,6'sı kız olarak saptanmıştır. Sonuçlar benzerlik göstermektedir. Kadın öğrenci sayısının fazla olmasının nedeni Beslenme Diyetetik Bölümü'nü tercih edenlerin daha çok kadın öğrenciler olmasından kaynaklı olabilmektedir. Beslenme ve Diyetetik öğrencilerinin beslenme durumlarının incelendiği bir diğer çalışmada katılımcıların çoğu dördüncü sınıftaki öğrencilerden oluşmaktadır. Yine aynı çalışmada yaş ortalaması erkeklerde  $21.2 \pm 1.5$  yıl ve kadınlarda  $21.1 \pm 0.7$  yıl olarak belirlenmiştir (İspir, 2022). Bu çalışmada da paralel bir şekilde katılımcıların %44'ü dördüncü sınıf öğrencilerinden oluşmaktadır. Öğrencilerin yaş ortalaması da  $21,7 \pm 2,5$  olarak belirlenmiş ve benzer sonuç çıkmıştır. Sonuçların benzer olması üniversite dönemi öğrencilerinin yaş ortalamalarının yakın olduğunu göstermektedir. Sağlık Bilimleri Fakültesi öğrencilerinde yapılan bir çalışmada öğrencilerin beslenme için aylık bütçelerinin

yarısını ayırdıkları bildirilmiştir (Aydemir ve ark., 2023). Bu çalışmada Beslenme için aylık ortalama bütçe değerlendirildiğinde %55,2'sinin 300-1000 TL cevabını verdiği görülmüştür. Sonuçlardaki bu farklılık öğrencilerin okudukları şehirlerinin ekonomik durum farklılığı ile bütçe olanaklarının kısıtlı olmasına bağlı olduğu düşünülebilir.

**Tablo 1.** Öğrencilere ilişkin özellikler

	Toplam (n:134)	
	n	%
<b>Cinsiyet</b>		
Erkek	22	16,4
Kız	112	83,6

4	59	44
<b>Beslenme için ayrılan aylık ortalama bütçe</b>		
<300 TL	31	23,2
300-1000 TL	74	55,2
1000-2500 TL	26	19,4
2500-5000 TL	3	2,2
>5000 TL	-	-
<b>Yaş</b>	21,7±2,5	

Sağlıklı diyetler hazır beslenme olan batı diyetine doğru değişmekte ve bu beslenme geçişinden en çok etkilenen popülasyonlardan biri üniversite öğrencileridir (Costa Silva Zemdegs ve ark., 2011; Baldini ve ark., 2009). Bireylerin 18-24 yaş aralığı, sıklıkla öğün atladıkları, yanlış ve sağlıksız beslenme alışkanlıkları ile davranışa sahip olduğu yetişkinliğe geçiş dönemi olarak bilinmektedir (Horacek ve diğerleri, 2002; Rinaldi ve diğerleri, 2012). Tekirdağ'da Beslenme ve Diyetetik öğrencileriyle yapılan bir çalışmada 3 ana öğün tüketenlerin sayısının 2 ya da 1 ana öğün tüketenlere oranla daha fazla olduğu bildirilmiştir. Aynı çalışmada öğle ana öğünü atlayanların sayısı da kahvaltı ve akşam yemeği ana öğününü atlayanlardan fazla bulunmuştur (Torpil, 2021). Benzer şekilde Beslenme ve Diyetetik öğrencileriyle yapılan diğer çalışmalarda da en çok atlanılan ana öğün öğle öğünü olarak saptanmıştır (Smail, 2022; Özüpek & Arslan, 2021). Üniversite öğrencileri ile yürütülen başka bir çalışmada öğrencilerin 3 ana öğün tükettikleri görülmüştür (Sönmez 2021). Üniversite öğrencilerinde yapılan benzer bir çalışmada öğrencilerin çoğunluğu öğle öğününü atladığını bildirmişlerdir (Tözün ve ark., 2017). Katılımcıların sağlıklı yaşam biçimi alışkanlıkları Tablo 2'de gösterilmiştir. Bu çalışmada

öğrencilerin %71,6'sının üç ana öğün tükettiği, %40,3'ünün öğle öğününü atladığı görülmüştür. Öğrencilerin öğle zaman aralığında daha çok dışarıda oldukları ve bu zamanın ders saatine denk gelmesiyle öğle öğünlerine yeterince özen gösteremedikleri bu sonuçlar ile ilişkilendirilebilir. Çiçekli'nin (2022) yaptığı çalışmada öğrenciler arasında haftada 1-3 kez dışarıda yemek yiyenlerin sayısı daha fazla saptanmıştır (Çiçekli, 2022). Bu çalışmada da benzer şekilde %42,5'inin hafta 1-3 kez dışarıda yemek yediği bulunmuştur. Çalışmanın sonuçları birbirine paralellik göstermektedir. Yapılan bir çalışmada Sağlık Bilimleri Fakültesi öğrencilerinde doğru beslenme bilgilerine erişildiğinde davranış değişikliği durumuna evet diyenlerin hayır diyenlere kıyasla daha fazla olarak bildirilmiştir (Smail, 2022). Bu çalışmada katılımcıların %47'sinin doğru beslenme bilgilerinin davranış durumlarını sıklıkla etkilediği belirlenmiştir. Kişilerin dahil oldukları toplumda beslenme bilgi düzeyleri ile alışkanlıklarının, etkileşimde oldukları kişilerin değerleri ve eğitim düzeyleri ile ilişkili olup bu parametrelerin kişilerin davranışlarını da etkilediği düşünülebilir. Üniversite öğrencileriyle yapılan bir çalışmada beslenme eğitimi dersi alanların besin etiketine her zaman okudukları bildirilmiştir (Ayaz ve ark., 2021). Beslenme ve Diyetetik Bölümü'nde okuyan kız öğrencilerle yapılan bir çalışmada da benzer şekilde besin etiketi okuyanların sayısının okumayanlara göre daha fazla olduğu saptanmıştır (Garipoğlu ve ark., 2019). Bu çalışmada da benzer çıkarımlar elde edilerek, katılımcıların %51,5'inin etiket okuma alışkanlığına evet cevabının verildiği görülmüştür. Beslenmeye dair ders veya eğitimi alma durumunun öğrencilerin motivasyonunu ve bilgi düzeylerini artırarak besin etiketi kullanımını geliştirerek bu konuda farkındalıklarını artırmış olabileceği düşünülebilir. Günlük su tüketim miktarı kişilerin yaşına, sahip oldukları fiziksel aktiviteye, bireysel sağlık durumlarına ve hava koşullarına göre değişmekle birlikte genelde 1,5-2 litre su tüketmek önerilmektedir (Akbulut, 2017; Bach-Faig 2011). Sağlık Bilimleri Fakültesi öğrencilerinde yapılan bir çalışmada öğrencilerin günlük su tüketimlerinin  $1632.22 \pm 767.86$  mililitre olduğu saptanmıştır. Beslenme ve diyetetik öğrencileriyle yapılan bir diğer çalışmada da günlük su tüketimi  $1473,78 \pm 675,8$  mililitre bulunmuştur (Çiçekli, 2022). Bu çalışmada günlük ortalama su tüketimlerinin  $1,8 \pm 0,7$  litre olduğu belirlenmiştir. Günlük su tüketimi belirtilen referans aralığında olup, sonuçlardaki farklılıklar öğrencilerin yaşadığı yere bağlı iklim koşulları ile öğrencilerin bireysel olarak su yerine tüketmeyi tercih ettikleri kahve, çay gibi diğer sıvı tüketimlerinden kaynaklı olabilir.

**Tablo 2.** Öğrencilerin Sağlıklı Yaşam Biçimi Alışkanlıkları

		n	%
<b>Günlük ana öğün sayısı</b>	2 öğün	38	28,4
	3 öğün	96	71,6
<b>Gün içerisinde atlanılan ana öğün</b>	Sabah	36	26,9
	Öğle	54	40,3
	Akşam	3	2,2

Haftada en az 150 dakika orta şiddette yapılan fiziksel aktivite Dünya Sağlık Örgütü tarafından önerilmektedir (World Health Organization, 2020). Ancak dünya çapında bu öneri uygulanamamakta ve fiziksel hareketsizlik tüm dünyada farklı yaş gruplarında artan sorun haline gelmektedir. Fiziksel aktivite ve buna bağlı olarak beslenme sorunlarının da olmasıyla birlikte obezite ve diğer hastalıkların oluşma riski artmaktadır. (Fagaras ve diğerleri, 2015). Beslenme ve Diyetetik öğrencileri ile yapılan bir çalışmada öğrencilerin %4,4'ü her gün, %52,5'i haftada 1 gün veya daha az sıklıkla fiziksel aktivite düzeyine sahip olduğu görülmüştür (Çiçekli, 2022). Yapılan prospektif bir kohort çalışmasında da fiziksel aktivitedeki en fazla azalmanın, üniversite yıllarında olduğu bildirilmiştir (Kwan ve ark., 2012). Beslenme ve Diyetetik öğrencileriyle yapılan bir diğer çalışmada öğrencilerinin %19,8'inin minimal oranda aktif olduğu saptanmıştır (İspir, 2022). Öğrencilerin Uluslararası Fiziksel Aktivite Anketi'nden (UFAA) elde edilen fiziksel aktivite düzeyleri ve puanları Tablo 3'te belirtilmiştir. Öğrencilerin %7,5'i fiziksel olarak aktif olmayanlardan, %63,4'ü fiziksel aktivite düzeyi düşük olanlardan

ve %29,1'i fiziksel aktivite düzeyi yeterli olanlardan oluşmaktadır. Bu çalışma sonuçlarıyla paralel olarak Downes'in (2015), yaptığı çalışmada üniversite öğrencilerinin fiziksel aktivite düzeylerinin yetersiz olduğunu saptamıştır (Downes, 2015). Çalışmaların sonucu benzer çıkmış olup, üniversite öğrencilerinin yeteri düzeyde fiziksel aktivite yapmadığı ve sağlığı geliştirme bakımından fiziksel aktivite düzeylerinin yetersiz olduğu görülmüştür. Bunun nedeni olarak çalışmada sayıca fazla olan son sınıf öğrencilerinin iş yükü ve sorumluluklarının daha fazla olması ile çalışma saatlerinin artmış olması, fiziksel aktiviteye zaman ayıramama olarak gösterilebilir. Sağlık bilimleri öğrencilerinin fiziksel aktivite durumlarına bakılan bir çalışmada öğrencilerin %80.3'ünde önerilen 3000 MET-dk/hafta altında aktivite skoruna sahip olduğu görülmüştür. Bu çalışmada toplam fiziksel aktivite düzeyi ise 2546,2±2159,8 MET-dk/hafta olarak saptanmıştır. Benzer şekilde çıkan sonuçlar için öğrencilerin fiziksel aktivite ile ilgili farkındalıklarının az ve fiziksel aktivitenin sağlık üzerine etkisini gözardı ettikleri söylenebilir.

**Tablo 3.** Öğrencilerin Uluslararası Fiziksel Aktivite Anketi'nden (UFAA) elde edilen fiziksel aktivite düzeyleri ve puanları

	n	%
Fiziksel olarak aktif olmayan	10	7,5
Fiziksel aktivite düzeyi düşük olan	85	63,4
Fiziksel aktivite düzeyi yeterli olan	39	29,1
<b>Toplam fiziksel aktivite (MET-dk/hafta)</b>	2546,2±2159,8	
<b>Şiddetli fiziksel aktivite (MET-dk/hafta)</b>	375,2±1225,8	
<b>Orta düzeyde şiddetli fiziksel aktivite (MET-dk/hafta)</b>	314,8±1019,9	
<b>Yürüme (MET-dk/hafta)</b>	1288,7±1301,7	
<b>Oturma süresi (dk)</b>	567,5±262,8	

Sağlıklı bir yaşam tarzının temelini oluşturan etmenler arasında beslenme ve düzenli fiziksel aktivite önemli rol oynamaktadır. Fiziksel aktivitenin enerji tüketimini artırma yönünde olumlu etkisi bulunmaktadır ancak beslenme alışkanlıklarında ve buna bağlı olarak besin ögesi alımlarında neden olduğu değişiklikler ile ilgili kesin kanıtlar bulunamamıştır (Amatori ve ark., 2020; Küçükçankurtaran, 2024). Üniversite öğrencilerinde beslenme durumu ve fiziksel aktivite düzeyinin incelendiği bir çalışmada fiziksel aktivite düzeyi ile sağlıklı beslenme arasında bir ilişki bulunamamıştır (Özen, 2019). Yapılan bir başka çalışmada günlük tüketilen sebze ve meyve ile orta düzeyde yapılan fiziksel aktivitenin birbiriyle doğru orantılı bir ilişki olduğu görülmüştür (Duan ve ark., 2017). Diğer çalışmalarda da tüketilen toplam yağ, protein, karbonhidrat ile fiziksel aktivite düzeyi arasında negatif bir ilişki saptanmıştır Matvienko ve ark., 2001; Laska ve ark., 2016; Heeren ve ark., 2018). Öğrencilerin besin ögeleri alımları ile

fiziksel aktivite düzeyleri arasındaki ilişki Tablo 4’te belirtilmiştir. Öğrencilerin enerji ve besin ögesi alım miktarları ile fiziksel aktivite düzeyleri arasında istatistiksel olarak anlamlı ilişki saptanmamasına rağmen ( $p>0.05$ ) posa, A vitamini, E vitamini, B<sub>1</sub>, B<sub>2</sub>, B<sub>6</sub>, folat, C vitamini, potasyum, kalsiyum, magnezyum ve demir alımının fiziksel olarak aktif olmayan öğrencilerde daha düşük düzeylerde olduğu tespit edilmiştir. Üniversite öğrencilerinde bu konuda yapılan çalışmalarda bulunan farklılıkların nedeni öğrencilerin yeterli ve dengeli tüketim yapma imkânı bulamama ve fiziksel olarak aktif olabilecekleri sürenin kısıtlılığında kaynaklanabilir. Ayrıca çalışmaya katılan öğrencilerin özellikleri, besin tüketim kaydı ve fiziksel aktivite düzeyini saptamak için kullanılan yöntemlerin çeşitliliği de bu farklılığı oluşturabilir.

**Tablo 4.** Öğrencilerin besin ögeleri alımları ile fiziksel aktivite düzeyleri arasındaki ilişki

	<b>Aktif olmayan</b>	<b>Düşük aktivite</b>	<b>Yeterli aktivite</b>	<b>p</b>

<b>Çinko (mg)</b>	10,2 ± 3,9	11,9 ± 8,1	9,9 ± 4,5	0,301

### **Sonuç ve Öneriler**

Sonuç olarak, bu çalışmaya katılan Beslenme ve Diyetetik öğrencilerinin çoğunluğunun fiziksel aktivite düzeylerinin düşük veya yetersiz olduğu belirlenmiştir. Öğün atlama, ev/yurt dışında beslenme ve su tüketimleri de göz önüne alındığında, öğrencilerin beslenme durumlarının

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

***April 09-16, 2024 / Lisbon, Portugal***

yeterli olmadığı ve sağlıksız beslenme alışkanlıklarına sahip oldukları gözlemlenmiştir. Bu sonuçlar, dengeli ve sağlıklı beslenmeye daha fazla odaklanıldığı günümüzde, üniversite öğrencilerinin edindikleri bilgi ve alışkanlıklarının kendilerine doğru bir şekilde uygulayamadıklarını göstermektedir. Üniversite öğrencileri gibi genç ve iyi eğitilmiş grupların nispeten daha iyi sağlık davranışları sergilemesi beklenmektedir. Ülkemizde özellikle beslenme ve sağlık alanında eğitim gören öğrencilerin yaşam tarzlarını değerlendirecek ve bu anlamda hatalı davranışların değişimi için müdahaleler planlayacak kapsamlı çalışmalara ihtiyaç duyulmaktadır.

**Özet**

Bitkisel sütler son yıllarda vegan ve vejetaryen beslenmenin popüler olmasıyla birlikte merak duyulan besinler arasında yer almaktadır. Bu çalışmada, badem, soya ve yulaf sütü esaslı fermente içeceklerin farklı depolama süreleri sonucunda duyuşal özelliklerinin değerlendirilmesi amaçlanmıştır. Fermantasyonda Streptococcus thermophilus, Lactobacillus delbrueckii, Lactobacillus acidophilus (NCFM®), Bifidobacterium lactis(HN019™) bakteri türleri kullanılmıştır. İnkübasyonu tamamlanan örnekler 21 gün süre boyunca 4±1°C'de depolanmıştır. Duyusal analiz aşaması için çalışmaya 10 kadın, 10 erkek olmak üzere 20 sağlıklı panelist katılmıştır. Ayrıca analiz öncesinde yoğurt, süt ürünleri ve bitki bazlı süt tüketim alışkanlıkları üzerine bir sıklık anketi ile besin neofobi ölçeği uygulanmıştır. Elde edilen veriler SPSS27 programı kullanılarak analiz edilmiştir. Tat puanları değerlendirildiğinde, kadın bireylerin 1. günde fermente soya sütüne kıyasla fermente yulaf sütüne daha yüksek puan verdiği, 7.günde erkeklerin fermente badem ve yulaf sütüne kıyasla fermente soya sütüne daha düşük puan verdiği belirlenmiştir(p<0,05). Ayrıca 7. günde fermente inek ve soya sütünde kadınların erkeklere kıyasla önemli düzeyde daha yüksek puan verdiği saptanmıştır (p<0,05). Renk puanları değerlendirildiğinde, 7. günde kadınların fermente yulaf sütüne kıyasla fermente soya sütüne daha fazla puan verdiği, 14. günde kadınların fermente yulaf sütüne kıyasla fermente inek sütüne daha fazla puan verdiği belirlenmiştir(p<0,05). Koku puanları değerlendirildiğinde, erkeklerin 1. günde fermente inek ve yulaf sütüne kıyasla soya sütüne daha fazla puan verdiği, 7.günde fermente badem sütüne kıyasla fermente inek ve soya sütüne daha fazla puan verdiği, 21.günde fermente yulaf sütüne kıyasla fermente soya sütüne daha fazla puan verdiği saptanmıştır(p<0,05). 14. günde ise fermente yulaf sütünde kadınların erkeklere kıyasla daha fazla puan verdiği belirlenmiştir(p<0,05). Asidik tat puanlarında 1. günde fermente yulaf sütünde kadınların erkeklere kıyasla daha fazla puan verdiği saptanırken, 7. günde fermente soya sütünde kadınların erkeklere kıyasla daha fazla puan verdiği belirlenmiştir(p<0,05). Fermente bitkisel bazlı içeceklerde aroma özelliklerinin kullanılmasının duyuşal açıdan tercih edilebilirliği arttıracakı düşünülmektedir.

**Anahtar Sözcükler:** Besin tüketim sıklığı, bitkisel sütler, duyuşal analiz, neofobi ölçeği.

**EVALUATION OF THE SENSORY PROPERTIES OF PLANT-BASED  
FERMENTED BEVERAGES**

**Abstract**

Plant milks are interest as vegan and vegetarian diets have become popular in recent years. This study aimed to evaluate sensory properties almond, soy and oat milk-based fermented beverages as a result of different storage periods. *Streptococcus thermophilus*, *Lactobacillus delbrueckii*, *Lactobacillus acidophilus*(NCFM®), *Bifidobacterium lactis*(HN019™) were used in fermentation. Incubated samples were stored at 4±1°C for 21 days. For sensory analysis 20 healthy panelists, 10 women and 10 men, participated in study. In addition, a frequency survey and a food neophobia scale were applied. Data obtained was analyzed using SPSS27 program. In taste scores, it was determined that females gave higher scores to fermented oat milk compared to fermented soy milk on 1st day, and men gave lower scores to fermented soy milk compared to fermented almond and oat milk on 7th day (p<0.05). Women gave significantly higher scores than men on fermented cow and soy milk on 7th day(p<0.05). In color scores, on 7th day, women gave more points to fermented soy milk than to fermented oat milk, and on 14th day, women gave more points to fermented cow's milk compared to fermented oat milk(p<0.05). In odor scores, men gave more points to soy milk compared to fermented cow and oat milk on the 1st day, more points to fermented cow and soy milk than fermented almond milk on the 7th day, and more points to fermented soy milk compared to fermented oat milk on the 21st day. (p<0.05). On 14th day, women gave higher scores to fermented oat milk than men(p<0.05). In acidic taste scores, women gave more points than men to fermented oat milk on 1st day, while women gave more points than men to fermented soy milk on 7th day(p<0.05). Aroma properties in fermented plant-based beverages can increase sensory preferability.

**Keywords:** Food consumption frequency, neophobia scale, plant milks, sensory analysis.

## **Giriş**

Son yıllarda, küreselleşmenin artışıyla birlikte hayvansal besinlere talepte de hızlı bir artış meydana gelmiştir. Önümüzdeki on yılda küresel et proteini tüketimindeki büyümenin, büyük ölçüde gelir ve nüfus artışına bağlı olarak 2018-2020 ortalamasına kıyasla 2030 yılına kadar %14 oranında artması öngörülmektedir. Sığır eti, domuz eti, kümes hayvanları ve koyun etinden sağlanacak protein miktarının 2030 yılına kadar sırasıyla %5,9, %13,1, %17,8 ve %15,7 artacağı tahmin edilmektedir (OECD/FAO, 2021). Küresel ortalama kişi başına et talebinin ise 2020-2022 temel döneminden 2032'ye kadar %2 oranında artması beklenmektedir. Ayrıca 2032 yılına kadar kişi başı balık, et ve süt ürünleri tüketiminin sırasıyla %14, %12 ve %12 oranında artması beklenmektedir. Bu oranlar, tahıl tüketimindeki %0,5'in altındaki büyümeyle zıt şekilde ilerlemekte ve beslenme değişikliğinin ciddi boyutlarını vurgulamaktadır (OECD/FAO, 2023). Dünyamız bir yandan hayvansal besin tüketiminde artış ve bunun beraberinde getirdiği çevre, sağlık, ekonomik vb. birçok sorunla karşı karşıyayken bir yandan da besine ulaşılabilirlik, besin yoksunluğu, besin güvencesizliği gibi kavramlarla mücadele etmektedir. Diğer yandan gelişmiş ülkeler başta olmak üzere dünya genelinde hem sağlığın korunması hem de meydana gelebilecek olumsuz çevresel etkileri önlemek için hayvansal kaynaklı besinlerin üretimine yönelik taleplerde azalma gözlenmiştir. Tüm bunlar sonucunda hem üreticiler hem de tüketiciler sağlıklı ve sürdürülebilir alternatif besin üretimlerine yönelmiştir. Sağlıklı ve sürdürülebilir diyetler arasında vejetaryen ve vegan diyetleri de saymak mümkündür. Vejetaryen ve vegan beslenme günümüz post modern dünyasında ivme kazanmaya devam etmektedir. Bununla birlikte vejetaryen ve vegan besinlere talepler artış göstermekte ve besin sanayisinde de sağlıklı ve sürdürülebilir beslenmenin sağlanması için adımlar atılmaktadır (Henchion et al., 2017). Bu noktada özellikle sağlıklı beslenmenin sağlanması, hastalıkların önlenmesi ve vücudun iyilik halinin devam ettirilmesinde fonksiyonel besin kavramı ön plana çıkmaktadır. Fonksiyonel bileşiklerden probiyotiklerin fermente besin üretiminde kullanımı yeni değildir, ancak son zamanlarda besin sanayisindeki üretim amaçları hayvanların korunması, organoleptik iyileştirmeler ve sağlığın korunmasına doğru ilerlemiştir (Saad et al., 2013). Fonksiyonel besin örneklerinden bazıları ise yararlı etkiler sağlayan mikroorganizmaları içermesi nedeni ile insan mide-bağırsak sistemi ve insan sağlığı üzerinde olumlu etkiler yaratmaktadır. Şimdiye kadar, probiyotik ürünlerin en büyük kısmı hayvan sütünden yapılan fermente besinlerle tüketicilere sunulmaktadır (Mäkinen et al., 2016). Bitkisel bazlı fermente içecekler, süt ürünleri içermeyen alternatifler arasında önemli bir segmenti temsil etmekte ve hayvansal kaynaklı süt alerjileri ve etik kaygıları olan birçok tüketicinin ihtiyaçlarını

karşılacaktır (Phillips & Williams, 2011). Bu kapsamda son zamanlarda bitkisel süt endüstrileri önem kazanmıştır. Bitkisel sütler, beslenme ve sağlık yararlarının yanı sıra prebiyotik bileşikler içerdiğinden, bu sütler sinbiyotik ürünler üretmek için önemli kaynaklardır (De Souza Oliveira et al., 2009). Bitkisel sütlerden elde edilen fermente içecekler genellikle farklı hammaddelerden (örn. kurubaklagiller, yağlı tohumlar, tahıllar veya pseudo tahıllar) elde edilen sulu özütlerin, bu malzemelerin parçalanması ve homojenleştirilmesinden kaynaklanan inek sütüne benzer görünüm ve kıvama sahip olacak şekilde fermente edilmesiyle elde edilmektedir (Sethi et al., 2016). Fermente içeceklerin üretiminde kullanılan bitkisel bazlı kaynaklar arasında soya fasulyesi, protein miktarı, kalitesi ve fonksiyonel özellikleri nedeniyle özellikle son yıllarda popüler hale gelmiştir. Ayrıca, soya sütünün fermente içecek yapımında yaygın olarak kullanılan laktik asit bakterilerinin (LAB) gelişimi için iyi bir substrat olduğu gösterilmiştir (Chou & Hou, 2000). Soya, bitki bazlı içecek üretiminde en yaygın kullanılan substrat olmasına rağmen, günümüzde hindistan cevizi, badem, kenevir ve çeşitli tahıllar (örneğin yulaf, karabuğday ve pirinç) bitki bazlı içeceklerin üretiminde kullanılmaktadır. Badem, tekli ve çoklu doymamış yağ asitleri, fitosteroller, polifenoller, proteinler, vitaminler ve mineraller ile diyet posası açısından zengin olup bu bileşiklerin çoğu antioksidan özelliklere sahiptir. Bu antioksidan özellikleri ile plazmada düşük dansiteli lipoprotein (LDL) oksidasyonunu önleyerek lipid profili ve inflamatuvar süreçler üzerinde olumlu etkiler sağlamaktadır (Jones et al., 2011; Liu, 2012). Badem sütünün ve badem sütünden elde edilen fermente içeceklerin kardiyovasküler hastalıklar, tip 2 diyabet, obezite ve bazı kanser türleri gibi kronik hastalıkların gelişme riskini azalttığı öne sürülmektedir (Kamil & Chen, 2012). Yulaf ve diğer bitkisel sütlerin de sağlık üzerine olumlu etkileri bulunmaktadır (Paul et al., 2020). Tüm bu bilgiler ışığında yapılan çalışmada, badem, soya ve yulaf sütlerinin fermantasyonu ile elde edilen fermente içeceklerin farklı depolama süreleri sonucunda duyu analizlerinin gerçekleştirilmesi amaçlanmıştır.

### **Materyal ve Metod**

Çalışmada kullanılacak bitkisel sütler çalışma öncesinde yapılan bir ön çalışma niteliğindeki araştırma ile belirlenmiştir. Bu kapsamda vegan ve vejetaryen bireylerin en sık tükettiği badem, soya ve yulaf sütü olmak üzere 3 bitkisel süt çeşidinin bu çalışmada kullanılmasına karar verilmiştir. Bu aşamadan sonra ise bu çalışmada aynı ticari markaya ait badem sütü, soya sütü ve yulaf sütü olmak üzere 3 çeşit bitkisel süt, kontrol grubu olarak aynı markanın olmadığı için farklı marka yarım yağlı inek sütü kullanılmıştır. Tüm sütlerin seçiminde son kullanma tarihinin birbirine benzer olmasına dikkat edilmiştir. Sütlerden fermente içecek üretimi ve

kimyasal analizler Ankara Üniversitesi Ziraat Fakültesi Süt Teknolojisi laboratuvarında yapılmıştır. Çalışmanın duysal analiz aşaması için Ankara Üniversitesi Rektörlüğü Etik Kurulu 25.04.2022 tarihli, 08 sayılı toplantı ve 87 sayılı karar sayısı sonucunda gerçekleştirilmesinin uygun olduğuna karar verilmiştir. Sütlere ilişkin etiket bilgileri Tablo 1’de belirtilmiştir.

### **Starter Kültür**

Çalışmada kullanılan bütün mikroorganizma çeşitleri Danisco markasının VEGE 053 LYO 200 DCU kültüründen temin edilmiştir. Kültür içeriği *Streptococcus thermophilus*, *Lactobacillus delbrueckii* (*Lactobacillus delbrueckii* subsp. *bulgaricus*, *Lactobacillus delbrueckii* subsp. *lactis*) *Lactobacillus acidophilus* (NCFM®), *Bifidobacterium lactis* (HN019™) bakteri türlerinden oluşmaktadır.

### **Örneklerin Hazırlanması ve Fermantasyon**

Marketten alınan sütler analize başlanacağı aşamada temin edilmiştir. Tüm sütlere ilk olarak 90 °C’de 10 dakika ısı işlem uygulanmış ve pastörizasyon işlemi gerçekleştirilmiştir. Daha sonra fermantasyon için 43 °C’de aseptik koşullarda 100 ml süte 0,5 g oranında bakteri suşları eklenmiştir. Bu aşamadan sonra elde edilen karışımlar 100 ml’lik polietilen tabanlı sert plastik kaplara doldurulmuş ve örnekler pH değerleri 4,6 düzeyine gelene kadar inkübasyona bırakılmıştır (Mühlhansová et al., 2015).

### **Fermente İçeceklerin Depolanması**

İnkübasyonu tamamlanmış örnekler 20±1°C oda sıcaklığında 30 dakika süre ile bekletilerek ön soğutma işlemine tabi tutulmuş ardından da 21 gün süresince 4±1°C’de buzdolabı koşullarında

depolanmıştır. Buzdolabında  $4\pm 1^{\circ}\text{C}$  sıcaklıktaki depolanmış örneklerin analiz işlemleri depolama aşamasının 1., 7., 14. ve 21. günlerinde yapılmıştır. Her bir depolama süresi sonrasında örnekler bekletilmeden direkt olarak analizleri gerçekleştirilmiştir.

### **Duyusal Analiz**

Çalışmanın duyuusal analiz aşaması Ankara Üniversitesi Sağlık Bilimleri Fakültesi Besin Kimyası laboratuvarında yürütülmüştür. Çalışmada duyuusal analiz testleri için 18–50 yaş aralığında 10 kadın, 10 erkek olmak üzere toplam 20 sağlıklı, sigara içmeyen, gönüllü panelist seçilmiştir. Duyusal analizden önce panelistlere testin nasıl ve ne amaçla yapılacağı konusunda bilgi verilmiştir. Testlerin sessiz ve havalandırılabilir bir ortamda ve 10:30–11:30 saatleri arasında yapılmasına dikkat edilmiştir. Ayrıca bireylerin seçimi için acı, tatlı, tuzlu ve ekşi olmak üzere dört temel tada duyarlılıkları duyuusal analiz testinden önce değerlendirilmiştir. Tat alımlarının değerlendirilmesinde duyuusal analiz testi olarak görsel analog skala (VAS) kullanılmıştır. Testler sırasında panelistlere ağızlarını çalkalamaları için su ve ağız dokusunu değiştirmesi için çok şekerli ve tuzlu olmayan bir bisküvi verilmiştir. Daha sonra çalışmanın esas bölümüne geçilmiş olup bitkisel ve hayvansal sütlerden elde edilen fermente içecek örneklerinde duyuusal analizi için örneklerin her biri üç basamaklı farklı sayılarla kodlanmış olarak panelistlere sunulmuştur. Örneklerin her biri 10 g'lık şeffaf kaplarda her bir oturumda 4 örnek (1.,7.,14.,21. gün süresince depolama işlemlerinden sonra elde edilen bitkisel ve hayvansal fermente içecek örnekleri) 4 oturum şeklinde panelistler tarafından değerlendirilmiştir. Panel üyeleri fermente içecekleri hedonik skala testine göre değerlendirmiş ve panelistlerden formda belirtilen toplam kabul edilebilirlik, renk, yapı, görünüş, tat, koku, asidik tat parametrelerinin her birini 1 “hiç beğenmedim” ile 9 “çok fazla beğendim” arasında olacak şekilde puanlandırmaları istenmiştir. Buna ek olarak duyuusal analiz değerlendirmesine katılan panelistlere analiz öncesinde yoğurt, süt ürünleri ve/veya bitki bazlı süt tüketim alışkanlıkları üzerine bir sıklık anketi ve bir besin neofobi ölçeği uygulanmıştır. Besin neofobi ölçeğinin Türkçe geçerlilik ve güvenilirliği çalışması 2020 yılında Duman vd. tarafından yapılmıştır (Duman et al., 2020). Ölçeğin orijinali ise 1992 yılında Pliner ve Hobden tarafından besin neofobisini tanımlamak için psikometrik bir araç olarak geliştirilmiştir. Besin neofobi ölçeği, on maddeden oluşan 7 puanlı likert tipi ölçek, kesinlikle katılmıyorumdan (1 puan) kesinlikle katılıyorum (7 puan) doğru her bir seçenekte 1'er puan artacak şekilde düzenlenmiş olup 10-70 puan aralığında değer almaktadır (1, 4, 6, 9 ve 10. sorular ters skorlanmaktadır). Yüksek puanlar yeni besin korkusunu, düşük puanlar yeni besinlerden hoşlanmayı göstermektedir (Pliner & Hobden, 1992). Yeni besin korkusu, bireylerin besin çeşitliliğinin

azalmasına neden olmanın yanında yeni besinlere karşı tutum ve tat memnuniyeti üzerinde de önemli bir etmen olmaktadır. Bu nedenle bu çalışmada, besin neofobi ölçeği ve tüketim sıklığı anketi, duyuşsal analiz aşamasında bireylerin herhangi bir besini denemeye karşı fobisinin olup olmadığını belirlemek ve bunun yanında bireylerin hayvansal ve bitkisel süt ve ürünleri tüketim alışkanlıklarını değerlendirmek amacıyla uygulanmıştır. Duyusal analiz aşaması gerçekleştirilirken kullanılacak malzemelerin steril olmasına ve her katılımcıya özel olmasına özen gösterilmiştir. Ayrıca, katılımcıların kahvaltı yapmaları ne aç ne de tok olmalarını gerektiği vurgulanmış ve panelden önce bu ilkeler açısından sorgulanmıştır. Verilerin gizliliğinin onam formunda belirtildiği gibi tamamen gizli tutulacağı ve başka bir kişi ile paylaşılmayacağı beyan edilmiştir.

### **İstatistiksel Analiz**

Çalışmada yürütölen tüm analizler iki tekrarlı olarak gerçekleştirilmiştir. Çalışmanın istatistiksel değerlendirmesinde ise kullanılacak örneklerin normallik dağılımları, örnek sayısına uygunluğu açısından Shapiro–Wilk Testi ile değerlendirilmiştir. Tüm grupların karşılaştırılmasında one-way ANOVA testi, ikili karşılaştırmalar arasındaki farklar için ise post hoc Tukey testi kullanılmıştır. Yapılan analizler sonucunda nicel değişkenler ortalama ve standart sapma (SS) değerleri ile gösterilmiştir. Elde edilen veriler SPSS (Statistical Package for the Social Sciences) 26 paket programı kullanılarak analiz edilmiştir. İstatistiksel olarak  $p<0,05$  değeri önemlilik düzeyini ifade etmektedir.

### **Bulgular ve Tartışma**

Fermente süt örneklerinin 21 gün depolama süresince görünüş puanları Tablo 2’de gösterilmiştir. Görünüş puanlarında cinsiyete ve depolama süresine göre önemli sonuçlar elde edilmemiştir ( $p>0,05$ ).

**Tablo 2.** Fermente süt örneklerinin 21 gün depolama süresince görünüş puanları

Fermente süt örneklerinin 21 gün depolama süresince tat puanları Tablo 3'te gösterilmiştir. Tat puanları değerlendirildiğinde, kadın bireylerin 1. günde fermente soya sütüne kıyasla fermente yulaf sütüne daha yüksek puan verdiği, 7.günde erkeklerin fermente badem ve yulaf sütüne kıyasla fermente soya sütüne daha düşük puan verdiği belirlenmiştir( $p<0,05$ ). Ayrıca 7. günde fermente inek ve soya sütünde kadınların erkeklere kıyasla önemli düzeyde daha yüksek puan verdiği saptanmıştır ( $p<0,05$ ).

Fermente süt örneklerinin 21 gün depolama süresince renk puanları Tablo 4 'te gösterilmiştir. Renk puanları değerlendirildiğinde, 7. günde kadınların fermente yulaf sütüne kıyasla fermente soya sütüne daha fazla puan verdiği, 14. günde kadınların fermente yulaf sütüne kıyasla fermente inek sütüne daha fazla puan verdiği belirlenmiştir (p<0,05).

Duyusal analize katılan bireylerin hayvansal ve bitkisel bazlı ürünleri tüketim durumu Şekil 1'de gösterilmiştir. Hayvansal ve bitkisel bazlı ürünleri tüketim durumu için her gün, haftada 5-6, haftada 3-4, haftada 1-2, 15 günde 1 ve ayda 1 yanıtlarını veren bireyler arasında çoğunluk yüzdeleri göz önünde bulundurulduğunda, bireylerin %34,6'sının haftada 3-4 kez yoğurt,

%38,5'inin haftada 1-2 inek sütü ve %34,6'sının ayda bir dondurma tükettikleri belirlenmiş ve genel olarak bireylerin çoğunluğunun hayvansal süt ve ürünlerini tükettikleri görülmüştür. Bireylerin bitkisel süt tüketimleri incelendiğinde ise bireylerin %3,8'inin ayda bir hindistan cevizi sütü tükettiği görülmüş ancak diğer bitkisel süt tüketimlerinin olmadığı saptanmıştır.

**Şekil 1.** Duyusal analize katılan bireylerin hayvansal ve bitkisel bazlı ürünleri tüketim durumu. Duyusal analize katılan bireylerin besin neofobi ölçek puanları Şekil 2'de gösterilmiştir. Erkeklerin besin neofobi ölçek puan ortalaması  $36,23 \pm 6,04$  iken, kadınların besin neofobi ölçek puan ortalaması  $33,61 \pm 8,95$  puan olarak belirlenmiştir. Erkekler ve kadınların besin neofobi ölçek puanları arasında önemli farklılık belirlenmemiştir ( $p=0,392$ ). Toplam besin neofobi ölçek puan ortalaması ise  $34,92 \pm 7,60$  olarak saptanmıştır. Elde edilen puanlar incelendiğinde duyusal analize katılan bireylerin besin neofobisinin düşük olduğu saptanmıştır.

**Şekil 2.** Duyusal analize katılan bireylerin besin neofobi ölçek puanlarının değerlendirilmesi. Besin neofobi ölçeği sorularının dağılım yüzdeleri Şekil 3'te belirtilmiştir. Çoğunluk cevaplar değerlendirildiğinde "sürekli yeni ve farklı besinler seçerim/denerim" sorusuna % 53,8'inin az

katıldığı, “yeni besinlere güvenmem” sorusuna %23,1’inin katılmadığı ve %23,1’inin ise yansız olduğu, “yemeğin içinde ne olduğunu bilmezsem onu tüketmem” sorusuna %29,9’unun katıldığı, “farklı ülkelere özgü yemekleri severim” sorusuna %38,5’inin az katıldığı, “etnik besinler, yemek için fazla garip görünüyorlar” sorusuna %30,8’inin yansız olduğu, “yemek davetlerinde yeni besinler denerim” sorusuna %46,2’sinin katıldığı, “daha önce yemediğim şeyleri yemeye korkuyorum” sorusuna %34,6’sının katılmıyorum, “tüketeceğim besinler konusunda çok titizim” sorusuna %30,8’inin az katılıyorum, “neredeysse her şeyi yerim” sorusuna %30,8’inin az katılıyorum ve “yeni etnik restoranları denemekten hoşlanırım” sorusuna %46,2’sinin katılıyorum cevabını verdiği belirlenmiştir.

**Şekil 3.** Besin neofobi ölçeği sorularının dağılım yüzdelerinin değerlendirilmesi

Duyusal analize katılan bireylerin besin neofobi ölçek puanları Şekil 2’de gösterilmiştir. Erkeklerin besin neofobi ölçek puan ortalaması  $36,23 \pm 6,04$  iken, kadınların besin neofobi ölçek puan ortalaması  $33,61 \pm 8,95$  puan olarak belirlenmiştir. Erkekler ve kadınların besin neofobi ölçek puanları arasında önemli farklılık belirlenmemiştir ( $p=0,392$ ). Toplam besin neofobi ölçek puan ortalaması ise  $34,92 \pm 7,60$  olarak saptanmıştır. Elde edilen puanlar incelendiğinde duyusal analize katılan bireylerin besin neofobisinin düşük olduğu saptanmıştır. Duyusal ya da hedonik olarak da adlandırılan tüketici kabul edilebilirlik testleri, duyusal çekiciliğe dayalı olarak bir ürünün beğenilme derecesini değerlendirmek için kullanılan analizlerdir (Fiorentini et al., 2020). Soya sütünün fermantasyonu ile duyusal analiz sonuçlarını değerlendiren çalışmalar incelendiğinde; yapılan bir çalışmada, soya sütünün fermantasyonu ve 15 günlük depolanması sonucunda duyusal analiz sonuçlarına göre en yüksek puanın yapı ve doku alanına verildiği

belirlenirken, renk, koku, tat ve genel kabul edilebilirlik puanlarının düşük olduğu saptanmıştır. Ayrıca yapı ve doku puanları dışındaki puanlamalarda depolama süresiyle puanlarda azalmaların olduğu belirlenmiştir ( $p<0,05$ ) (Almghawesh et al., 2022). Yapılan bir diğer çalışmada, ise soya sütüne ayrı ayrı olmak üzere %2'lik FOS ve %2'lik inülin ilavesi yapılmış ve yoğurt kültürü ile fermente edilerek 4 °C'de 1, 7, 21 ve 28 gün depo edilmiştir. Duyusal analiz sonuçlarına göre FOS takviyesi yapılan örnekler inülin takviyeli örneklerle karşılaştırıldığında önemli ölçüde daha gelişmiş duyusal özelliklerin sağlandığı belirtilmiştir. İnülin ilaveli örneklerde ise ST-LA ve ST-LR kombinasyonları kullanılarak yapılan örnekler maksimum duyusal puanı almıştır. İncelenen tüm örnekler arasında görünüm ve doku puanlarında önemli bir fark bulunmazken ( $p>0,05$ ) FOS katkılı örneklerin, inülin katkılı örneklerle kıyasla daha iyi görünüm ve tekstür skoruna sahip olduğu saptanmıştır ( $p<0,05$ ) (Mishra & Mishra, 2018). Bir başka çalışmada, soya sütü ve hindistan cevizi sütü ilavesi ile yapılan kombinasyonlar sonucunda duyusal analiz sonuçları incelenmiş ve aroma, kıvam ve kabul edilebilirlik için en yüksek puanlar soya sütüne %30 hindistan cevizi sütü ilave edilen kombinasyonda saptanırken, renk ve tat için sade soya sütü daha yüksek puan almıştır ( $p<0,05$ ) (Kolapo & Olubamiwa, 2012). Badem sütünün fermasyonu ile duyusal analiz sonuçlarını değerlendiren çalışmalar incelendiğinde; Türkiye'de yapılan bir çalışmada, badem sütünün *S. thermophilus*, *Lb. delbrueckii subsp. bulgaricus*, *L. acidophilus* ve *Bifidobacterium animalis subsp. lactis* bakterileri ile fermantasyonu gerçekleştirilmiş ve  $4\pm 1$  °C'de 21 gün süresince depolanmıştır. Depolama günleri karşılaştırıldığında ise panelist değerlendirmelerinde genel olarak istatistiksel olarak önemli farklar saptanmamıştır ( $p>0,05$ ) (Yılmaz-Ersan & Topcuoglu, 2022). İspanya'da yapılan bir çalışmada, badem sütü *L. reuteri* ve *S. thermophilus* ile fermente edilmiş ve 4 °C'de 28 gün boyunca depolanmıştır. Çalışmada numuneler ne kadar uzun süre depolanırsa o kadar asidik olacağı belirtilmesine rağmen duyusal analiz sonuçlarına göre panelistler, 1 gün boyunca saklanan numunelerin, 28 gün boyunca saklanana göre önemli ölçüde daha asidik ve daha az tatlı olduğunu ifade etmişlerdir. Bu tartışmalı sonuç ise fermente ürünlere keskin ve asidik kokuları aktardığı görülen *L. reuteri* suşunun neden olduğu uçucu asetik asidin sentezi dikkate alınarak açıklanmıştır. Bu asit esas olarak fermantasyonun başlangıcında oluşmakta ve 28 gün depolamadan sonra, uçucu hale gelmesi nedeniyle asetik asidin olumsuz etkisi ortadan kalkmış olabilir şeklinde yorumlanmıştır. Depolama süreleri ve genel kabul edilebilirlik arasında önemli farklılık belirlenmemiştir ( $p>0,05$ ) (Bernat et al., 2015). Türkiye'de yapılan bir çalışmada, fermente badem sütü portakal suyu ilaveleri ile kombine edilmiş ve duyusal analiz sonucuna göre %30 portakal suyu ilave edilen

kombinasyona göre ilave yapılmayan fermente badem sütünün kıvam, renk, asitlik, aroma, genel kabul edilebilirlik puanları önemli düzeyde düşük olarak saptanmıştır ( $p<0,05$ ) (Duran & Cevik, 2022). Yulaf sütünün fermasyonu ile duyusal analiz sonuçlarını değerlendiren çalışmalar incelendiğinde; yapılan bir çalışmada, *Streptococcus salivarius sub sp. thermophilus*, *L. acidophilus* ve *Bifidobacterium bifidum* suşlarıyla fermente edilen yulaf sütü 4 °C’de 21 gün boyunca depolanmıştır. Duyusal analiz sonuçlarına göre fermente yulaf ve inek sütünde renk ve görünüş açısından önemli farklılık belirlenmezken ( $p>0,05$ ) fermente yulaf sütünde kıvam puanları inek sütüne kıyasla daha yüksek saptanmıştır ( $p<0,05$ ). Ayrıca inek sütünün yulaf sütüne göre daha fazla tat, koku ve genel kabul edilebilirlik puanlarına sahip olduğu saptanmıştır ( $p<0,05$ ). Depolama süresine göre ise inek ve yulaf sütünün genel duyusal kalitesinin ilk 7 gün artış gösterdiği daha sonrasında ise azaldığı belirtilmiştir ( $p<0,05$ ) (El-Batawy et al., 2019). Yapılan bir başka çalışmada, deve sütüne yulaf sütü eklenmesiyle yapılan kombinasyonlarda *S. thermophilus*, *L. acidophilus* ve *Bifidobacterium bifidum* bakterileri ile fermentasyon gerçekleştirilmiş ve  $4\pm 1$  °C’de 10 gün süresince depolanmıştır. Deve sütüne kıyasla %40 yulaf sütünün ilave edilmesi duyusal analiz sonuçlarını olumlu yönde etkileyerek daha yüksek puanların elde edilmesi ile sonuçlanmıştır ( $p<0,05$ ) (Atwaa et al., 2020). Türkiye’de yapılan bir çalışmada, yulaf sütü ve inek sütü farklı kombinasyonlarda karıştırılarak *Lactococcus spp* ve *Lactobacillus spp.* bakterileri ile fermente edilmiş ve  $4\pm 1$  °C’de 21 gün boyunca depolanmıştır. Depolama sonrası genel olarak değerlendirildiğinde %60 ile en fazla yulaf sütü oranı ile yapılan kombinasyonun diğer kombinasyonlara kıyasla tüm duyusal analiz değerlendirmelerinde daha düşük puana sahip olduğu saptanmıştır ( $p<0,05$ ) (Dinkçi et al., 2015). İnek sütünün fermasyonu ile duyusal analiz sonuçlarını değerlendiren çalışmalar incelendiğinde; Yunanistan’da yapılan benzer bir çalışmada, *S. thermophilus*, *Lb. delbrueckii* ve *Lactobacillus casei* bakterileri ile fermente edilmiş ve 4 °C’de 28 gün depolama işlemi gerçekleştirilmiştir. Duyusal analiz sonuçlarına göre fermente inek sütünde en yüksek puan sırasıyla viskozite, genel kabul edilebilirlik ve renk alanlarına verilmiştir. Keçi sütüne göre yapılan kıyaslamada inek sütünün genel olarak daha düşük puanlar aldığı belirlenmiştir ( $p<0,05$ ) (Dimitrellou et al., 2019). Kanada’da yapılan bir çalışmada, soya sütü ilaveli inek sütleri *Lactobacillus rhamnosus GR-1* bakterisi ile fermente edilmiş ve 4 °C’de 30 gün depolama işlemi gerçekleştirilmiştir. Duyusal analiz sonuçlarına göre görünüş ve doku açısından soya ilavesiz fermente inek sütü en yüksek puanı alırken ( $p<0,05$ ), lezzet ve kabul edilebilirlik açısından soya ilavesiz fermente inek sütü ve soya sütü ilaveli fermente inek sütleri benzer puanlar almışlardır ( $p>0,05$ ) (Fatima & Hekmat, 2020). Yapılan bir başka çalışmada,

100:0, 75:25, 50:50, 25:75 ve 0:100 oranlarında soya sütü ilaveli inek sütü *L. acidophilus* NCFM, *B. lactis* HN019 ve yoğurt bakterileri ile fermente edilmiş ve 4 °C’de 21 gün boyunca depolanmıştır. Örnek kombinasyonlarından 0:100 ve 100:0 (inek sütü:soya sütü) oranlarının, depolama süresine göre en düşük ve en yüksek toplam duyusal puana sahip olduğu belirlenmiştir. genel olarak ise her bir kültür kompozisyonu için 50:50 oranının kullanılması duyusal analiz açısından en uygun seçenek olarak kabul edilmiştir (Mohammadi et al., 2017). Bu çalışmada duyusal analiz değerlendirmesinden önce bireylerin hayvansal ve bitkisel bazlı ürünleri tüketimi ile bu ürünlere karşı neofobi durumlarının olup olmadığını belirlemedeki amaç ise Türk toplumunun damak tadına uzak olarak nitelendirilebilecek fermente bitkisel bazlı içeceklerin duyusal analiz sonuçlarında yanlış değerlendirilmelerin dışlanmasını sağlamaktır. Yapılan bu çalışmada, elde edilen puanlar incelendiğinde ise duyusal analize katılan bireylerin besin neofobisinin düşük olması çalışma tasarımı ile paralellik göstermiştir.

### **Sonuç ve Öneriler**

Özellikle son yıllarda bitkisel süt tercihlerine yönelim ile bu bireyler evlerinde bitkisel sütlerden fermente içecek ve yoğurt üretimi gibi besinler elde etmektedirler. Bu bireyler bu yolla kendilerine alternatif fonksiyonel bir içecek ürettiklerini ifade etmektedirler. Bu çalışma sonuçlarına göre, duyusal analiz sonuçları ve panelist yorumlarına göre fermente bitkisel içecek üretiminde tüketici açısından aroma içeriğine sahip bakteri suşlarının kullanılmasının tüketici seçimi için daha iyi olacağı düşünülmektedir. Fermantasyon aşaması her ne kadar ürünün duyusal özelliğinde iyileşmeler sağlasa da bitkisel sütler Türk damak kültürüne temel olarak yabancı besinlerdir. Bu nedenle fermente bitkisel içecek elde edilirken aroma içeriğine sahip bakteri suşlarıyla fermantasyon işlemi gerçekleştirilebilir. Ayrıca bitkisel sütler birbirleri ile belirli oranlarda karıştırılarak duyusal açıdan daha iyi fermente içeceklerin üretimi sağlanabilir. Ayrıca depolama süresi ile fermente içeceklerde ekşimsi bir tat ve koku oluşumunun gerçekleşmesinden dolayı depolama süresinin çok uzun tutulmaması gerekmektedir. Ayrıca bu çalışma yürütülürken ülkemizde toplumun kolayca ulaşabildiği market alanlarında fermente bitkisel içeceklerin bulunmadığı ve bunun yanında bitkisel süt çeşitlerinin de oldukça sınırlı olduğu görülmüştür. Toplumumuzda vegan ve vejetaryen bireylerin sayısı gün geçtikçe artmaktadır. Bu bireylerin besin ve besin ögesi açısından çoğunlukla yetersizlik durumları ile karşılaşmaları da göz önüne alınarak ticari olarak fermente bitkisel ürünlerin üretiminin yapılmasının hem bu bireyler hem de sanayide yeni bir sektör açısından faydalı olabileceği düşünülmektedir. Bu çalışmanın bu anlamda literatüre önemli bir katkı sağlayacağı düşünülmektedir.

**Bilgilendirme Notu**

Bu çalışma, Ankara Üniversitesi Sağlık Bilimleri Enstitüsü Beslenme ve Diyetetik Doktora programında öğrenciliğini tamamlamış olan Gül Eda KILINÇ'ın doktora tez çalışmasından üretilmiştir.

**Özet**

Beton üretiminde, geleneksel Portland çimentosu (PC) yerine puolanik malzemelerin (SCM'ler) kullanılması, hem karbon dioksit (CO<sub>2</sub>) emisyonlarının önemli ölçüde azalmasını sağlar hem de sürdürülebilirliğe önemli katkı sağlar. Beton, küresel konut ihtiyaçlarına yanıt veren temel bir yapı malzemesidir ve yıllık üretimi 10 milyar m<sup>3</sup>'ü aşmaktadır, suyun ardından en çok üretilen ve tüketilen ikinci madde konumundadır. Çimento, su, agrega ve çeşitli kimyasal katkı maddelerini içeren beton, hidratasyon reaksiyonları sonucunda zamanla katılaştır ve dayanıklılık kazanır. Taze betonun zorunluluğu, belirlenen yükleri karşılamak için optimum işlenebilirlik özelliklerine ve yeterli basınç dayanımına sahip olmasıdır. Bununla birlikte, geleneksel betonda birincil bağlayıcı malzeme olarak Portland Çimentosu'na (PC) yaygın olarak kullanılması, CO<sub>2</sub> emisyonlarının artışına önemli ölçüde katkıda bulunarak çevre ve sağlık risklerinin meydana gelmesine sebep olur. Bu olumsuz etkinin azaltılması için çimento esaslı ürünlerde PC'lerin SCM'lerle değiştirilmesi ve sürdürülebilir uygulamalara doğru bir değişim gerekmektedir. Çeşitli endüstriyel işlemlerden elde edilen yüksek fırın cürufu (GBFS), silis dumanı (SF) ve uçucu kül (FA) gibi atık puzolanik malzemeler, PC üretiminin çevresel etkisinin azaltılmasında önemli bir rol oynar. Bu atık malzemelerin beton karışımlarına entegre edilmesi, inşaat sektöründe sürdürülebilirliğin ve çevresel sorumluluğun geliştirilmesi yönünde önemli bir adımdır.

**Anahtar Kelimeler:** Beton, karbon azaltımı, tamamlayıcı çimentolu malzemeler

**SUSTAINABILITY IN CONCRETE: EXPLORING THE BENEFITS OF  
POZZOLANIC CEMENTITIOUS MATERIALS**

**Abstract**

In concrete production, the use of pozzolanic materials (SCMs) instead of traditional Portland cement (PC) not only significantly reduces carbon dioxide (CO<sub>2</sub>) emissions but also contributes significantly to sustainability. Concrete, a fundamental building material addressing global housing needs, boasts an annual production exceeding 10 billion m<sup>3</sup>, positioning itself as the second most produced and consumed substance after water. Concrete, consisting of cement, water, aggregate, and various chemical additives, solidifies and gains strength over time through hydration reactions. The imperative for fresh concrete lies in possessing optimal workability properties and sufficient compressive strength to meet designated loads. However, the prevalent reliance on Portland Cement (PC) as the primary binding material in conventional concrete significantly contributes to heightened CO<sub>2</sub> emissions, posing environmental and health risks. Mitigating such impact necessitates a shift towards sustainable practices, emphasizing the substitution of PCs with SCMs in concrete formulations. Critical pozzolanic materials like blast furnace slag (GBFS), silica fume (SF), and fly ash (FA), derived from various industrial processes, play a pivotal role in curbing the environmental impact of PC production. Integrating these waste materials into concrete mixtures is a critical stride towards fostering sustainability and environmental responsibility in the construction industry."

**Keywords:** Concrete, carbon reduction, supplementary cementitious materials

## **Introduction**

In accelerated industrialization and heightened energy demands, reliance on fossil fuels raises critical environmental concerns. Utilizing waste materials in various applications presents an avenue for achieving sustainable development, concurrently improving the quality of life by mitigating environmental pollution. Concrete, a ubiquitous construction material in structures ranging from residences and shopping malls to bridges and dams, underscores the need for a paradigm shift toward sustainability in the construction industry. Heightened societal emphasis on sustainable practices, escalating demands, decreasing resource availability, and the imperative to reduce carbon dioxide (CO<sub>2</sub>) emissions, necessitates innovative approaches within the construction sector (Hasanbeigi et al. 2012; Yang et al. 2015; Gartner & Hirao 2015). The cement sector, contributing approximately 5% of global anthropogenic CO<sub>2</sub> emissions, underscores the urgency to address sustainability issues arising from CO<sub>2</sub> emissions in Portland cement (PC) production (Andrew 2018). The conventional use of fossil fuels in PC production results in the release of 1 ton of CO<sub>2</sub> per ton of clinker produced, necessitating transformative measures (Justnes 2012). A compelling strategy involves replacing a portion of cement in concrete with mineral additives, such as ground granulated blast furnace slag (GBFS) or silica fume (SF), both possessing latent hydraulic properties. This approach significantly mitigates CO<sub>2</sub> emissions from cement production, contributing to environmental preservation and sustainability (Saranya et al. 2018; Shin et al. 2016; Song et al. 2022). Globally, PC production reached approximately 4 billion tons in 2015, with Turkey contributing 75 million tons, resulting in an annual release of 60 million tons of CO<sub>2</sub> (Özcan & Güngör 2019). Supplementary Cementitious Materials (SCMs) are pivotal in concrete production, serving as secondary binders alongside PC. Implementing fly ash (FA) as a percentage replacement for PC influences various fresh and hardened concrete properties, including workability, hydration characteristics, and mechanical strength (Han et al. 2022; Wang 2019; Zhang et al. 2014). A schematic representation of the benefits of FA in concrete mixes is shown (Figure 1).

Figure 1. A schematic representation of the benefits of FA in concrete mixes

Fly ash (FA) reacts with lime from cement hydration, forming an additional binding gel that enhances concrete compactness, reduces permeability, and augments durability (Nath & Sarker 2011; O'Brien et al. 2009). Moreover, Supplementary Cementitious Materials (SCMs), including FA, significantly impact compressive strength, modulus of elasticity, and time-dependent deformations in concrete, influencing properties such as creep and shrinkage (Johari et al. 2011). Durability aspects, including resistance to acids, sulfates, alkali-aggregate reaction, repeated freeze-thaw cycles, and reinforcement corrosion, are also profoundly influenced by SCMs, varying based on their type and pozzolanic activity (Limbachiya et al. 2012; Wang et al. 2021; Jiang et al. 2022). As an artificial pozzolan, FA consists of glassy, spherical granular particles that enhance concrete strength and durability through a hydration reaction with slaked lime (Ebrahimi et al. 2017; Diamond 1986). The integration of SCMs emerges as a transformative strategy, redefining the landscape of concrete production to align with sustainable principles and mitigate the environmental impact associated with traditional practices. The construction industry is undergoing a transformative shift towards sustainable practices, and a key player in this evolution is the strategic integration of supplemental cementitious materials (SCMs). These materials, including fly ash, slag, and silica fume, are gaining prominence for their significant contributions to environmental conservation and improved concrete performance. SCMs are valuable alternatives to traditional Portland cement (PC), the primary binder in concrete production. By incorporating these materials into concrete

mixtures, the industry can address environmental concerns, particularly the high carbon dioxide (CO<sub>2</sub>) emissions associated with PC production. Reducing CO<sub>2</sub> emissions aligns with global sustainability goals, marking a crucial step towards creating environmentally responsible structures. The importance of SCMs lies in their environmental benefits and their positive impact on concrete properties. Concrete blended with SCMs exhibits enhanced durability, reduced permeability, and improved resistance to harsh environmental conditions. These improvements contribute to the longevity and resilience of structures, reducing the need for frequent maintenance and repairs. Fly ash, a byproduct of coal combustion is a commonly used SCM. Its incorporation in concrete not only diverts waste from landfills but also enhances workability, mitigates the risk of alkali-silica reaction, and improves sulfate resistance. Similarly, ground granulated blast furnace slag (GGBFS), a byproduct of iron production, contributes to concrete strength development, reduces heat of hydration, and enhances resistance to aggressive chemicals. Silica fume, an ultrafine byproduct of silicon and ferrosilicon alloy production, is another noteworthy SCM. Its addition to concrete enhances compressive strength, reduces permeability, and provides resistance to chloride ion penetration. Using silica fume is particularly advantageous in marine structures and environments with high chloride concentrations. In conclusion, adopting SCMs in the construction industry represents a significant stride towards sustainability and improved concrete performance. By reducing reliance on traditional binders like PCs and incorporating these innovative materials, the industry can meet the growing demand for environmentally responsible practices while ensuring the longevity and resilience of structures. As the construction sector prioritizes sustainability, SCMs emerge as indispensable elements in shaping an industry's greener and more robust future.

### **Conclusion**

Concrete, a widely-used building material known for its strength and affordability, is facing serious challenges due to its reliance on Portland cement (PC). The production of PC is a major contributor to carbon dioxide (CO<sub>2</sub>) emissions, harming the environment and increasing production costs. To address these issues, there's a recent push to reduce the use of PC in concrete and explore alternatives that are both environmentally friendly and cost-effective. Materials like ground granulated blast furnace slag (GBFS), fly ash (FA), and silica fume (SF) from industrial waste are gaining attention as potential substitutes for PC in concrete. This shift not only helps in reducing CO<sub>2</sub> emissions but also opens up avenues for creating concrete that's more sustainable. Researchers, the construction industry, and end-users are actively involved

in adopting these eco-friendly practices. It's essential to delve into the detailed properties, advantages, and potential challenges of using GBFS, FA, and SF in concrete to ensure environmentally conscious production. Beyond just mitigating environmental impact, the move towards sustainable concrete production could fundamentally change construction practices, aligning with global sustainability goals. Concrete mixes enriched with GBFS, FA, and SF not only meet rigorous standards but also offer superior qualities such as increased durability, strength, and resistance to environmental factors. These benefits extend beyond the construction site, making substantial contributions to reducing carbon footprints, lessening environmental harm, and enhancing overall well-being. As awareness grows and industry practices evolve, the momentum towards sustainable concrete production is poised to significantly impact the future of construction. Collaborative efforts involving researchers, industry players, and end-users are vital in driving this shift towards widely adopting environmentally friendly and economically viable concrete formulations. Embracing this change isn't just an option; it's a collective responsibility towards building a sustainable future for the construction industry and the planet.

**Özet**

Renkli beton, estetik uygulamalardan ortaya çıkan bir malzemedir ve beton matrisi içinde pigmentler kullanılarak elde edilmektedir. Sağlam ve aşınmaya dayanıklı bir tabaka sağlamanın ötesinde, görsel olarak çekici bir yüzey elde edilmektedir. Genellikle beton renklendirme için iki yöntem kullanılır. İlk yöntem, betonun üzerine renklendiricilerin, genellikle toz halindeki pigmentlerin, taze betona eklenmesini içerir ve ardından baskı kalıplar kullanılarak desenler oluşturulur. Alternatif yöntem ise renklendiricilerin geleneksel beton karışımına, agregalar, kum, çimento, su ve katkı maddeleri içeren karışıma doğrudan entegre edilmesini içermektedir. Baskı betondan farklı olarak, bu teknik toz halindeki pigmentleri gerektirir ve genellikle demir ve krom oksit gibi inorganik minerallerden oluşmaktadır. Diğer taraftan, ikinci yaklaşım renklendiricilerin ve renkli çimento çeşitlerinin kullanılmasına izin verir ve yapı uygulamalarında geleneksel gri çimento kullanımından farklı alternatifler tanımaktadır.

**Anahtar Kelimeler:** Renkli beton, baskı beton, renklendiriciler, toz pigmentler

**ASSESSING THE ROLE AND SIGNIFICANCE OF COLORED CONCRETE IN  
MODERN CONSTRUCTION PRACTICES**

**Abstract**

Colored concrete emerges from aesthetic applications employing pigments within the concrete matrix. Beyond providing a robust wear-resistant layer, it achieves a visually appealing surface. Generally, two methods are employed for concrete coloring. The first involves pressing concrete, where layers of colorants, typically powdered, are introduced to fresh concrete before employing texturing molds. The alternative method is directly integrating colorants into the conventional concrete mixture comprising stone aggregates, sand, cement, water, and additives. In contrast to stamped concrete, this technique necessitates powdered pigments, typically inorganic minerals such as iron and chromium oxides. Alternatively, the second approach allows for the use of pigments and colored cement varieties, deviating from the conventional gray cement in construction applications.

**Keywords:** Colored concrete, pressing concrete, colorants, powdered pigments.

## **Introduction**

Global surges in demand for construction projects have positioned concrete as the most extensively utilized building material (Shah et al., 2021; Li et al., 2022; Naik, 2020; Kishore & Gupta, 2020; Chyliński et al., 2022). Beyond its utilitarian applications, concrete serves as a prominent architectural material within the construction industry, demonstrating not only versatility but also aesthetic potential. Traditional concrete production incorporates gray cement, while the inclusion of white cement and pigments expands avenues for color customization. Colored concrete finds widespread applications in sculpture, surface reliefs, exterior facades, the manufacturing of interior architectural products, and the design of park and garden furniture (Karagüler, 2002; Karagüler, 2003; Özkul, 2005). The term 'architectural concrete' refers to the transparency of the produced concrete or reinforced concrete element on the outer surface without requiring an additional coating layer. This type of concrete, often referred to as 'exposed concrete,' is prominently visible on the outer shell of buildings. In specific construction applications, 'exposed concrete' is also utilized within the interior of buildings. The introduction of pigments to architectural concrete enables the creation of desired colors and textures (Sharifi & Sheibani, 2022; Utesena & Pernicova, 2022; Arruda Junior et al., 2022). In the production of colored concrete, aesthetic considerations become pivotal alongside conventional concrete's expected workability, strength, and durability properties. Various aspects, including the impact of pigments on cement setting, color stability, resistance to environmental conditions, effects on mechanical properties, and resilience against factors like heat and freezing-thawing, gain significance in colored concrete (Sharifi & Sheibani, 2022; Utesena & Pernicova, 2022). Beyond these properties, attention to the formwork system and mold release agents is crucial for achieving visually appealing colored concrete applications (Arruda Junior et al., 2022). Research in this domain has delved into the effects of mineral pigments on the compressive strength of colored concrete, with a focus on the role of an improved color palette in current urban environments (Sharifi & Sheibani, 2022). Another study explored the color stability of colored concrete over time, depending on the type of pigment used (Utesena & Pernicova, 2022). Additionally, a study investigated the use of red mud and kaolin waste in the production of a new building material, specifically a pozzolanic pigment for colored concrete and mortar (Arruda Junior et al., 2022). These academic endeavors collectively contribute valuable insights into the aesthetic and performance dimensions of colored concrete, reflecting its increasing popularity in the construction industry (Shah et al., 2021; Li et al., 2022; Naik, 2020; Kishore & Gupta, 2020; Chyliński et al., 2022; Karagüler,

2002; Karagüler, 2003; Özkul, 2005; Sharifi & Sheibani, 2022; Utesena & Pernicova, 2022; Arruda Junior et al., 2022).

### **Exploring Colored Concrete Applications: A Concise Overview**

Colored concrete has become a favored building material in contemporary architectural practices, attracting attention for its pronounced aesthetic potential. Integration of color pigments into the concrete mix expands the palette beyond conventional gray tones, offering a spectrum of colors that substantially enhance the visual appeal of architectural endeavors (Tau et al., 2023; de Sousa et al., 2020; Assaad et al., 2022). The resultant color intensity of cured concrete is intricately influenced by various factors inherent in the concrete mix production process, notably the type and color of the cement employed. Parameters such as the quantity of aggregate, water-to-cement ratio, mold absorption, release agent type, and, in the case of colored concrete, the pigment dosage and color tone play pivotal roles in determining the outcome (Golshan et al., 2023; Jinnai, 2020; Saade & Assaad, 2022). The dosage of added pigment is typically expressed in terms of the weight of the binder, emphasizing precision in weight rather than volume. Misinterpretations or deviations in the bulk density of the pigment used during the addition process can lead to undesirable fluctuations in the resulting color intensity, underscoring the importance of meticulous dosage control (Jinnai, 2020; Saade & Assaad, 2022). Furthermore, due to its chemical composition, an often-overlooked component profoundly influences the concrete hardening process, thereby impacting the ultimate state of the concrete (Mahmud & Abdulrehman, 2021). This intricate interplay of variables underscores the need for a comprehensive understanding and precise management of factors contributing to concrete coloration, ensuring optimal aesthetic outcomes in architectural applications.

### **Conclusion**

In contemporary construction practices, there has been a substantial upsurge in using pigments to design concrete structural elements, enhancing conventional concrete's aesthetic appeal. Colored concretes derived from these pigments find extensive application, particularly in self-compacting concretes, repair mortars, and paving and curb stones adorning parks and gardens. The prevalence of colored concrete, particularly in Arab and Gulf countries, is noteworthy in today's construction landscape, attributed to elevated living standards, cutting-edge construction techniques, and a growing preference for intricate works and decorative elements among end-users. Despite the evident advantages of colored concrete, scientific research in this domain remains relatively scarce compared to other engineering disciplines. Structural-colored concrete emerges as a material offering unique aesthetic qualities, disrupting the monotony of

traditional buildings and proving more cost-effective as a finishing surface. The exploration of such specialized concretes is inherently innovative, given the need for more research, particularly concerning durability. The capacity to imbue concrete with hues spanning yellow, orange, red, blue, and green enhances structural attractiveness and presents captivating design opportunities. This study delves into various examples elucidating the evolving use and development of colored concrete in construction applications. By emphasizing the aesthetic and economic dimensions, it underscores the transformative impact of colored concrete in breaking traditional design paradigms and contributing to a more visually dynamic built environment.

**ABSTRACT**

Introduction and Purpose: The place of great historical figures in the world civilization, their activities on the page of history have become the basis for analysis and interpretations in different periods. In the course of historical development, leaders of mankind have emerged in different eras. This proves that they have a strong spirit of humanity, worldliness, and the spirit of convincing the people to follow their thoughts and views. Therefore, it is necessary to note that the great historical figures who left a significant mark in the history of the world have their place in the civilization of a certain era. Materials and Methods: It should also be noted that the life of historical figures in this process is complex, full of socio-political conflicts, and emerged in the background of contradictions. The place, knowledge, and potential of the historical figures of this period are leading in the structure of civilization, which prepares the ground for the analysis and interpretation of their skills in this process, which will be studied by the peoples of the world centuries later. Studying long-term historical processes, drawing analytical conclusions, analyzing the processes of creating the artistic image of the great historical figures of a certain nation, their recognition by the peoples of the world, and the ability to deeply understand their place in a certain historical situation are comparable. based on the example of analysis. Marcel Brion was considered a talented person who perfectly knew and understood not only French history and literature, but also world history, as well as the history of Turkic peoples. In the process of creating the image of historical figures who contributed to the creation of great history in their time, first of all, they study their history, activities, their place in social and political life, get acquainted with historical sources, and conduct long research. Along with the high assessment of the creator's research in the process of studying history and the activities of historical figures, it is shown in the example of analysis that Marcel Brion is one of the talented people who was able to reasonably and correctly assess the activities of people in world history. Starting from 1924, Marcel Brion published his first exercises in magazines such as *Le Feu*, *L'Art vivant*, *Fortunio*. In his early creations, the tradition of understanding man, reasonable interpretation of his psychology, analysis of unique qualities in the process of historical period and environment was leading. Together with his colleagues, he also founded the magazine *Les Cahiers du Sud*. There are reasons why this magazine is a leader not only in France, but also in world civilization. During the time of Marcel Brion, the magazine became famous not only in the West, but also in the world. The main reason for this is that it is also famous for expressing reasonable views, analyses, concepts, dialectic unity between life and man. The image of Amir Temur and his artistic expression are leading in the work of Marcel Brion. In the historical novels of the writer, the complex and conflicting characteristics of the era, the artistic expression of the concepts of governance and humanity are based on leadership. We tried to justify that the historical events, the life and complexities of the people of Shaqr were revived on the basis of very real events. At the core of the works of Marcel Brion's work, the artist's skill in creating an artistic expression of historical reality is based on the example of

analysis. The talented master of Uzbek literature Muhammad Ali skill in creating the image of Amir Temur and the Timurids is comparatively analyzed on the example of the works of Marcel Brion. This allowed to analyze the poetic features of Uzbek literature, which is a component of world literature, based on the example of historical works.

**Key words:** history, life, image, analiz, creativity.

**Introduction:** In the history of Danya, the activities of great historical figures, their actions on the pages of history are represented not only by historical sources, but also by their interpretation in artistic and journalistic spheres. It is not for nothing that the artistic image of people who have taken an important place in the development of society is interpreted in epic works. The artistic image of figures from the history, together with the artistic reproduction of their various characteristics, became the basis for interpreting their spiritual world. In the interpretation of the figure of a historical figure and his artistic character, space and time, i.e., the historical function of the chronotope, also lead, because the historical figure also acts in a certain space and time. The artistic expression of this movement deepens in the chronotope. The artistic expression of the historical truth is embodied on the basis of the characteristics of the historical scene, and it requires a perfect study of the life of a person, his activity on the stage of history. In the novel "Menkim, Sahibqiron - Jahangir Temur" by the mature representative of French literature, it is based on the peculiarities of the artistic interpretations of the image of the historical figure, to show that Amir Temur's activity, his struggles, and his life full of hardships are interpreted. In the work, the understanding of a person in the series of historical events is to reveal the creative skill in the artistic expression of reality aimed at illuminating his character traits. The main feature arising from the article is to study, analyze, and draw reasonable conclusions about the expression of the image of great historical figures in world literature based on the artistic inkosi of historical reality in the artistic interpretations of the image of Amir Temur in the interpretation of Marcel Brion. The author's well-studied history of Movarounnahr and Khorasan, which is the basis for the artistic interpretation of the character of Amir Temur by the creator and historian, and the analysis of the basis for the incorporation of reasonable images into the artistic text.

**Review of literature:** world novels, direct historical novels have their own views on the chronotope, its artistic function in the text, and world literary scholars have their own views. In particular, the theoretical views of world scientists such as H. Meyerhof [1], A. James, W. Heffernan [2], J. Guller [3], M. Atkins [4] should be noted. Also, theoretical views analyzing various artistic features of the chronotope have been noted. M. Vukanovicand, L. Grmusa [5] analyzed the dialectical unity of the chronotope, epic space and time in the novel, while N. Bemong, P. Scholars such as Borghart [6] noted the concepts of the role of space and time in the formation of the character of the historical Shavs. Russian scientists such as M.M. Bakhtin [7], E. Meletinsky [8], V.E. Khalizev [9] analyzed the characteristics of the poetics of the chronotope in the work of art, while Uzbek scientists U. Jurakulov's researches talk about the

characteristics of the chronotope in the poetic interpretation of the creator. Yuritsa [10], and B. Toraeva analyzes the artistic functions of chronotope in modern novels [11]. A.N. Nasirov in his monograph "Artistic and vital reality" revealed the features of the chronotope in the artistic expression of historical reality [12; 13; 14]. Also, in historical novels, the individual characteristics of the artistic era [15], in the comparative-typological content [16; 17] analyzed poetic features consisting of forms, categories and methods of epic time [18; 19]. Based on the creative concept of the author of the historical novel and the general poetic concept of his work, he analyzed and made theoretical conclusions based on the role of the artistic era in the formation of the character of the hero of the work [20]. It is possible to observe the unique interpretations of the character of the master Amir Temur, because in the interpretations of the novel "Jahongir Temur" by the French historian, scientist and writer Marcel Brion, the artistic expression of the truth of history is skillfully illuminated. It can be justified that the artistic expression of the interpretations in the writer's novel is skillfully interpreted [21].

**The main part.** It is a work covering the life and activities of our great grandfather Amir Temur from the history pages of the French historian, scientist, writer Marcel Brion. In the work, Amir interprets the period from Temur's childhood to the last moments of his life. In the novel, his mental and spiritual image is reasonably revealed. At the heart of this, it can be observed that the environment of the period in which the hero of the work lived is also interpreted very reasonably. In the novel, Marcel Brion, speaking of the birth of Amir Temur, his father's views on his child, it is not without reason that he pays serious attention to the specific customs and traditions of the peoples of the East: "My father's name is Turagai, the city of Kesh He was one of the owners. He was a person who gained special respect and attention among the residents of the city. He had a dream some time before I was born, in which an angel came to him and put a sword in his hand. My father took the sword and swung it over his head, and they woke up immediately" [21, p. 3]. As the work begins with these interpretations, one can observe the originality of its interpretations. From the first pages of the work, it is not for nothing that it begins with the centuries-old customs and principles of the people of Shaqr. Mahmud Tragai's dream also brought a unique artistry to the work. It is inextricably linked with the father's dream, the interpretation of its reasons, and the birth of Amir Temur more than a year later. Character centers the system of events and the components of the plot. The personality of the hero is formed according to the direction of the will. The meaning and content of the image achieves social status at the intersection of interests and needs. Therefore, human nature is such that he always feels helpless in the face of objective reality. The social essence determines the lifestyle

and living space of each character. Rather, society's demands and requirements, or fate's judgment, play an important role in the formation of human character. The complete and full-blooded nature of the artistic character depends on the pathos of a number of aesthetic criteria. In our opinion, the poet's poetic skill is manifested in the impartial description of images on the border of possibility and impossibility, dream and dream, ideal and the most complicated situations of life. A serious development in the psyche of the hero goes back to defining characteristic points. A person who realizes his identity becomes a member of a progressive society. A writer infuses a simple observation with a profound and extraordinary generalization through the medium of description. It seems that the image of Shogosim, who is firm in his beliefs and life views, has become a criterion of spiritual maturity. His character acquires its own depth. It also becomes a defining feature of spiritual maturity. In fact, only a person who loves life with all his being will appreciate it and feel its value. Living life consciously prevents mistakes and defects. In the novel, Maresel Brion embodies his life ideas with the help of a clear human image. The author illuminates the very personal, unique inner world of his characters. It elevates the true expression of the spiritual world to the level of the main goal. While interpreting the youth period of Amir Temur, the artist reveals very reasonable factual images, which proves that Marcel Brion studied this period perfectly. Let's pay attention to the author's interpretations: "The idea to further strengthen the power, to further strengthen the power of the ruler of the land of Movarounnahr arose because of my passion for hunting. Autumn month of 757 AH. I am twenty one years old. We went hunting in the desert. I sent some of my soldiers and ordered them to make a circle across the desert and drive the wild birds towards the center. I, along with several military commanders, occupied the places where the birds fled. This place was north-west of Samarkand. I did not know that this place belongs to the "Kurultoy" tribe" [pages 21, 39]. If we look at the images, we can see that based on Marcel Brion's forms of expression, the interpretations that serve to reveal the unique characteristics of Amir Temur are leading. Because the development of the next events in the novel is human I made it my goal to make plans for such military operations that would cover at least two or three years. So that I don't have to wait for spring to return to Movarounnahr in the winter season and go on a trip again... On the sixth day of my arrival in Samarkand, I went out into the desert. After building a camp, I began to prepare warriors for the military expedition to be carried out in the land of the Kipchaks" [21, page 165]. In the interpretations of the novel, we can see that Amir Temur is a thoughtful person, in his views, he respects and protects the people around him, strictly controls every situation of the army, looks at their situation and gives them wider opportunities.

We observe that he responds to a person with his human qualities. In the interpretations of Marcel Brion, along with humanity, the need to make very responsible decisions for military actions was very well and reasonably absorbed into the development of events. Amir Temur wanted to leave Iran in the late fall in order to fight against the Mongols, but at the same time, he understood very well how difficult it was to walk through the mountains and desert deserts with soldiers in cold weather. He orders to return to Samarkand. A week after arriving in Samarkand, he leaves for the desert to prepare for battle. The fact that he makes a firm decision in such situations, taking into account the opinions of the officials, shows his human qualities. Marcel Brion's poetic skill is shown in clearly and truthfully defining the roots of the vices that are forming in the nature of the hero. In the novel, the human existence and the spirit of the time are expressed consistently and deeply, holistically and completely. The novel reveals the mental world of the hero in detail, and also expresses a conscious creative attitude to reality. The integrity of the work is ensured by the combination of details with memories, the author's point of view is mixed with the speech of the hero, and the depth of the philosophical and journalistic scope. Reality brings the reader into the inner world of the hero and gradually guides him to the social essence. At first glance, the novel seems like a psychological work, because the interpretations, expressions, and experiences of Amir Temur are very reasonable.

**Conclusion:** Marcel Brion illuminates the artistic character of the writer's character, the conflicts in his inner world through an internal monologue. This testifies to the poetic skill of the writer. Although we observe unique interpretations of the inner monologue in the prose, we can witness that the writer effectively used the inner monologue to describe the psyche of the hero in his time. Marcel Brion poetically interprets the social environment of the 14th century, the spirit of the era, based on artistic criteria, through the conflict and struggle of the characters in the plot of the work of art, the conflicts between the hero and the environment, and in his psyche. Through the spiritual world of the hero, he creates the image of the king and scientist Ulugbek, who is a part of history. By developing the spiritual and spiritual world of man, he summarizes the philosophical concepts of life, society and historical period.

Teacher of the Samarkand branch

**Abstract**

In the process of globalization, humanity's attitude to life and existence is formed and various features emerge. In this process, the activities of students, their role in the development of society, and the formation of knowledge skills are being expressed in different ways. Today, the formation and development of various pedagogical technologies in the modern education also supports these views. As education is based on the process of formation of knowledge and skills, it is noted that it is necessary not to forget the existence of strict responsibility of the student in this process. In addition to modern principles of teaching, international strategies, new approaches, the introduction of the global and international education system into the scientific methodology, the essence of taking national traditions into account has been revealed. Also, priority aspects of the use of the international concepts of the pedagogue, the researches and experiences being conducted on a global scale, and the formation of the principles of a reasonable approach were analyzed. Because the formation of changes in the educational process on the basis of international standards, together with the expansion of students' opportunities for learning, the process of self-control, the need for the formation of skills, is based on the experiences of world pedagogy. The use of modern educational technologies, based on their characteristics, the pedagogical and psychological aspects of the specific principles in the tradition of application to the educational process were also analyzed. Along with increasing the responsibility of the pedagogue in the educational process, along with the manifestation of potential, knowledge and talent, the possibilities of independent work and research skills in the student are approached from the pedagogical point of view. Analytical approach is also given to the need to pay serious attention to the formation of the ability of the teacher to acquire knowledge in the students with the help of educational tools, and to develop the ability to independently study, conduct research and experiments on specific topics. In addition to a deep understanding of life and changes in society, the student's activity is especially noted for the importance of correctly and reasonably understanding the innovations in the field of education, enriching his views on this with the theoretical views of world pedagogy. One of the main features of today's integration process is the formation of a self-management system in the educational process, the development of skills in this regard, and the level of the acquired concepts at the level of international requirements. A student with self-control skills develops higher knowledge and skills than those who are focused only on the results of teacher control. This gives a wide opportunity for the student to learn the essence of learning, to become a mature specialist in his field, and to become a staff at the level of international requirements. In this article, it is emphasized that the formation of the ability of students to learn, which gives them a reasonable opportunity to understand the possibility of independent education.

**Key words:** pedagogue, motivation, skills, independent education.

**Enter.** Pupils and students will have the opportunity to form independent opinions, draw conclusions, and execute judgments. He will have a wider opportunity to perform independent work, to express his views in creative and analytical approaches, and to record his concepts in a reasonable manner. Each student should have a deep sense of responsibility, enrich their independent understanding of their views, and open a wide way to allow them to draw reasonable conclusions. The main activity of students in the process of completing independent educational tasks is to enable them to make independent conclusions, to express their concepts in a simple but reasonable way. It was based on the fact that it directly serves to ensure the student's activity and curiosity. To ensure that the student tries to record the concepts he will explain based on the speaking lesson. Literature review. In the main part of the literature on the topic, an attempt was made to pay serious attention to the processes of independent education, but the essence of this concept was not adequately explained. The characteristics of the art of oratory have been recorded since ancient times. In this work, attention is paid to the views about the specific principles of public speaking [1]. On the basis of the art of public speaking, the concept of recording is proved to be the embodiment of the concept of clear, expressive recording [2]. Approaching the views in the mentioned literature theoretically, we would like to note that it is necessary to be directly aware of the student's way of thinking, his oratory art [3]. In order to produce a highly qualified specialist, it is noted that it is necessary not only to train the student, but also to form the practice of independent work [4], familiarization with literature [5], drawing conclusions [6]. Content. At the heart of today's changes in the field of education in the process of globalization, it is necessary to organize the independent work of the student into a certain system, to make him feel his activity at a high level. At the heart of any discovery is the fact that, together with the activity of a person, he has consciously decided that his independent research will lead him, which will give him a wide opportunity for fortune-telling. Serious reforms in Uzbekistan are becoming more visible in the field of education, which requires the persons who determine the development of the society directly to form the conscious and thinking of students, and also to form their sufficient knowledge and skills in such a process. Therefore, it is necessary to note the need to study the education system of France, England, the USA, Germany, Japan, which are the leading countries of the world, to introduce their most characteristic aspects in this field, to form cooperation with their leading experts, and it is necessary to note that today's development requires such aspects. Reasonable thinking is necessary for the maturity of each person, for him to add his share to the development of society within the limits of his ability.

Education of young people is very important in the development of society. At the heart of this is the development of the future, the consistency and activity of the next generations, which is the basis for explaining the various features of the process. In addition to forming a logical consistency in all aspects of continuous education, which is the basis for ensuring the literacy of students, it is necessary to allow him to think independently. The main feature of this concept is the presence of advanced ideas in the student's views, regardless of the language he communicates. The main feature of the family education system in the Republic of Uzbekistan is to ensure the activity of each student, to comprehensively reveal the methods of independent analytical approaches in the study process. Because during the student's education, it is not limited to lectures, practicals, and seminars, but the most important of them is to take a serious look at their independent research, rulings and conclusions, while ensuring the logical consistency of each of the specified topics. The student's independent work, together with expanding the possibility of understanding the scope of the topics, allows him to enrich his thinking. Don't forget that independent education allows students to gain a deeper understanding of the activity of students and the effectiveness of their research on a given topic. It should not be forgotten that the goal is to give students a wider opportunity to think and make judgments. It is necessary to analyze the performance of daily activities on the basis of free concepts, and to pay serious attention to the main principles of their views when covering the specified topic. One of the criteria that determines the level of a student's adequate education requires a serious attitude to their independent research activities. It is one of the correct and sufficient methods of acquiring knowledge, together with determining the student's social activity, providing a basis for his independent views, research, familiarization with the text, analysis of the necessary topic, deep understanding of their characteristics and drawing conclusions based on the use of literature. It is also necessary for him to feel his responsibility. In addition to creating a wide opportunity for the student to get independent education, it is also important to create a wide opportunity for him, to constantly encourage his research in the way of creating knowledge and innovation. This, together with the expansion of the student's ability to think, creates conditions for an increase in self-confidence. Helping the student to be successful in his studies and research, making him confident in the knowledge he has received, will have a positive effect on his further work. A science teacher should not forget that every student is a person who provides the future, and should treat him from this point of view. This allows the student's respect for the teacher to increase, as well as his confidence in himself and his work in a dialectical unity. There is also a great content phenomenon in the communication between the

student and the teacher. Because paying attention to the logicity of each student's reasoning, reasonable thinking, the consistency and sequence of concepts, encouraging them in this process, gives a wide opportunity to increase their confidence. It is necessary to consistently listen to the student's thoughts and ensure that he does not deviate from the topic. It is also possible to give a reasoned statement of the scope of the specified topic, sometimes orally, sometimes in writing. The combination of these two situations, together with his independent views, allows his literacy to grow.

**Summary.** It is necessary to emphasize that every understanding of the student should be based on the textuality instilled in his views, and should also form the culture of communication. During the dialogue, it is necessary to pay serious attention to the student's eloquence, methods of conveying the scope of concepts, and not to forget to encourage them from time to time.

Paying serious attention to how a student learns independent tasks in the field of science, expands his thinking as well as the ability to understand science and draw logical conclusions. It should not be forgotten that the eloquence formed in the student in this process gives a wide opportunity to form all the processes of oral and written presentation of the topic. Because educational processes focused on a person prepare the ground for the enrichment of his concepts and are the basis for the rise of self-confidence.

**INFORMATION IN THE PROCESS OF ELECTRONIC EDUCATION METHODS  
OF ENSURING SECURITY**

**Rakhimov Akmal AKBAROVICH**

Tashkent International University of Kimyo,  
Teacher of the Samarkand branch

**ABSTRACT**

In the following years, it became possible to generalize the reforms in the field of education in Uzbekistan with pedagogical achievements in the gradual development of world civilization, to understand the leading principles in a coherent manner, and to create an environment for the exchange of experiences. In this process, there is a need to establish concepts, news, their place in the information service in every field of education. It was specially noted that there is a need to further improve the continuous education system, to rapidly implement forms of education at the level of quality and meeting international standards. The essence of the reforms aimed at bringing out the educational process in harmony with the modern needs of the labor market is explained. Considering the essence of the changes in the world education system as the need to understand a person, the process of staffing preparation together with modern pedagogical technologies, with the understanding of its essence, is related to the process of formation. One of the unique principles of the effectiveness of the lesson was the generalization of the concepts arising from the conscious approach of the student. The changes in the basis of educational development show that non-traditional interactive teaching methods have also entered in organic unity with the traditional methodology. This, together with expanding the possibility of effective work of pedagogues, creates an opportunity for the introduction of the electronic education process. It is noted that the formation of attitudes towards the principles and principles of the national methodology, and the fact that it is changing based on the standards of education, made it possible to advance opinions based on analytical views on the basis of concepts in the field of global education. The benefits of the electronic education process require a deep understanding of its essence and justification of its methodological features. Analytical approach to situations such as the essence of views in the educational system of developed countries, a reasonable analysis of its methodological and educational features, drawing conclusions. In person-oriented education, emphasis is placed on increasing the attention of the teacher to the independent research of students, and the processes of providing remote evaluation based on the electronic system are also based on theoretical foundations and concepts. In this process, the principles of protection of information and its protection against attacks were expressed. It cannot be denied that the basis of information security in the e-learning process is the evaluation of the student, the result of his aspirations for research. In the process of continuous education along with the change in the essence of the views, it was felt that there is also a demand to move towards world education standards and to have a reasonable approach to its leading principles. One of the most characteristic aspects of the period. Discussions about educating talented and potential cadres and ensuring the perfection of the information system in the main educational process were also discussed.

**Key words:** training, characteristic, electronicization, trust, aspiration.

**Enter.** Long-term research shows that it cannot be denied that electronicization is the demand of the times, that it has its own principles. Because it is natural for a student who steps into a family educational institution to have great confidence and love for education. However, it is necessary to create an opportunity to further develop their activities, views, love for the image. Every student is looking for a scientific leader, a mentor who will try to open the knowledge and potential in him, and he is looking for him. It is necessary to take into account the unique talent of the student, his interest and love for his profession. This process also requires the meaningful grazing of every moment of the student. Because the views in the process of globalization, the integration system also bring about reforms in the current education system. In this regard, it should not be forgotten that a number of tasks such as the development and implementation of the electronic education system, its mechanism, strict control of information security have already formed as one of the global problems. Therefore, the merits of the electronic information system, the tradition of its formation on the basis of the established laws, and the exchange of experience with the developed educational system of the world are also required.

**Literature review.** The development of the electronic information system makes it possible to form its features on the basis of a wide range of possibilities. In the textbook "Psychology", E.G. Ghaziyev noted how difficult a task it is to describe a person and explain his character, and he emphasized that the process of globalization manifests its various characteristics, and in the process of information [1] and dissemination, it affects the psychology of a person. focused on [2]. In the textbook "Preschool Pedagogy" by F.R. Kadirova and others, it was noted that the role of the information system is incomparable in the early formation of the child [3], and the concepts that allow him to think correctly and logically [4] are recognized. The materials of the conference "Global Education and Development of Methodology" also touched on such issues to a certain extent. attention was paid to primary information [5].

**The main part.** In the following years, at the heart of the reforms in the field of education in Uzbekistan, the desire to prepare personnel responding to the era of globalization has increased. Therefore, measures are being developed to further improve the educational system, increase its quality and efficiency. In the educational system, opening up the inner potential of students, giving them a wide opportunity to think and express independent concepts, adapting their activities to the modern spirit, and enabling them to become individuals and experts who respond to the processes of integration. required. They were required to work on new projects,

to reveal the main features of the information system, to be able to justify its place in the process of globalization, and to be sure of its activity in this process.

Student's activity and its characteristics are at the heart of the development of reforms in the educational system. In 2017-2021, in the "Strategy of Actions" according to the five priority areas of the development of the Republic of Uzbekistan, further improvement of the continuous education system, increasing the possibilities of quality education services, continuing the policy of training highly qualified personnel in line with the modern needs of the labor market it was not without reason that the notions of continuation were firmly established. On the basis of these concepts, together with reforms in the education system, a number of issues such as further improvement of research and innovation activities, implementation of scientific and innovation achievements into practice were put forward. Indeed, today's globalization process requires modernization of all sectors. Therefore, in recent years, the introduction of traditional interactive methods into the field of education, in order to ensure its gradual development, makes it possible to improve the conditions of giving and receiving information. Based on this, it should be noted that the principles and principles of the national methodology are closely related to the new innovative teaching methods. The basis of modern education is the electronic information system, its functions play a leading role, which is manifested in an integral unity with the development of this field. As the reforms in the field of education are implemented, the need for effective and reasonable use of international concepts of education and the results of research conducted at the world level has emerged, which has also created an opportunity to study and implement the leading principles in the field of education of developed countries. Together with the production of the research results, it also creates the possibility to continue in a logical consistency. Today, it is necessary to note that the development of world science is closely related to the achievements in education, therefore, the strengthening of the information system has also formed its own principles. Information security also allows keeping electronic documents and their necessary aspects secret. On the basis of the reforms in the field of education, distance learning of the student has formed the need to ensure the proper operation of various information systems. Because the results of research in the field of education and the content of the content are the basis for improving these theoretical views and paying serious attention to them.

**Summary.** The excellence of any field of education is inextricably linked to its electronicization and demonstration of its security. It should not be forgotten that the concept of globalization is based on this concept. The development of human thinking, together with

the embodiment of the features of any era, is in a dialectic unity with the criteria determining the development of society in their views, reforms. This, in turn, is reflected in the distribution and reception of information together with the improvement of the electronic system.

In general, from the end of the 20th century to the first quarter of the 21st century, the rise of social reforms, the renewal of scientific networks allowed the updating of the characteristics of the information system. Each social reality sets specific goals and tasks for a certain science, which allows it to expand its features and express the uniqueness of its principles.

**ABSTRACT**

In this study, a novel thymol-linked imino compound was synthesized and characterized using FTIR, NMR, and elemental analysis. The antiproliferative activity of this compound was tested against two human cancer cell lines. According to the *in vitro* cytotoxic activity results, although the synthesized compound had antiproliferative activity against both cell lines, its effect was found to be lower than cisplatin. IC<sub>50</sub> values of this Schiff base molecule were obtained as 61.62 and 45.22 µM in A549 and MDA-MB-231 cell lines, respectively.

**Keywords:** Antiproliferative activity, Cancer, Thymol.

## **INTRODUCTION**

The incidence and mortality rates of cancer vary by region, country, and type. The most common types of cancers worldwide include lung, breast, colorectal, prostate, and stomach cancers. However, the incidence and mortality rates of specific types of cancer vary by region and population. The number of new cancer cases diagnosed annually continues to increase globally. This increase is partly due to factors such as population growth, aging, changes in lifestyle habits (such as smoking, diet, and physical activity), and improvements in cancer detection and diagnosis. One class of extensively used organic chemicals is Schiff bases, or imines, which have a wide range of applications in pharmaceutical, organic, analytical, and bioorganic chemistry, among other domains [1,2]. Numerous biological actions, including antifungal, antibacterial, antimicrobial, genotoxic, antiviral, antioxidant, and anticancer properties, have been widely recognized [3-8]. Schiff bases have potential applications in optical switching devices, nonlinear optical devices, security, and trace inspection devices, in addition to various biological functions [9]. Thymol, scientifically referred to as 2-isopropyl-5-methylphenol is the predominant constituent found in thyme plants [10]. Thymol, a highly potent molecule, is as a fundamental synthetic precursor for the fabrication of a diverse array of pharmacologically active compounds [11]. Moreover, the substitution of a compound with an imine functional group greatly enhances the biologically active characteristics of Schiff bases, which are heavily reliant on their molecular configuration [9-11]. In this study, a novel thymol-linked imino compound was synthesized by the reaction of 4-aminothymol and an appropriate aldehyde to determine its cytotoxic activity. Its structure was elucidated by FTIR, NMR, and elemental analysis. The antiproliferative activity of this compound was tested against two human cancer cell lines.

## **EXPERIMENTAL**

### **Materials and Methods**

All chemical substances and solvents used in the production of the desired compounds and laboratory experiments were obtained from commercial vendors such as Merck, Sigma-Aldrich, Across Organics, and Thermo Fisher Scientific, and were employed without the need for supplementary purification. The melting points of the synthesized compound was determined utilizing a DMP-100 digital melting point apparatus. Fourier-transform infrared spectroscopy (FT-IR) was conducted using a Perkin Elmer Spectrum 400 spectrometer. Attenuated total reflection (ATR), in combination with infrared spectrometry using a Fourier transform, was employed in the analyses.  $^1\text{H}$  NMR and  $^{13}\text{C}$  NMR spectra, were acquired in

DMSO- $d_6$  solutions using a Bruker AVANCE III 400 MHz spectrometer. Tetramethylsilane served as an internal reference at frequencies of 400 MHz and 100 MHz for the  $^1\text{H}$  NMR and  $^{13}\text{C}$  NMR spectra, respectively. Elemental analysis was conducted using a Thermo Scientific Flash 2000 elemental analyzer.

#### Synthesis of 4-aminothymol

2-isopropyl-5-methylphenol (5.00 g) was dissolved in 25 mL EtOH, and 25 mL concentrated HCl was slowly added to the solution. After the mixture was cooled to 0 °C,  $\text{NaNO}_2$  (3.60 g) was added and the mixture was stirred for 2 h. To obtain 2-isopropyl-5-methyl-4-nitrosophenol, the product was filtered, cleaned with cold water, and dried in a vacuum oven after exposed to open air. 2-isopropyl-5-methyl-4-nitrosophenol (1.00) g) was dissolved in 8 mL  $\text{NH}_4\text{OH}$  and 14 mL distilled water.  $\text{C}_2\text{H}_5\text{NS}$  (0.84 g) was then slowly added to the solution and stirred for 2 h at 25 °C. The product was filtered, washed with cold water, dried first in open air and then in a vacuum oven. Brown solid; yield: 72%; m.p. 180-181 °C (lit. [12] 177 °C).

#### Synthesis of 4-((3-hydroxy-4-methoxybenzylidene)amino)-2-isopropyl-5-methylphenol

Isovanillin (0.1 mmol) dissolved in EtOH (5 mL) was added dropwise to a solution of 4-aminothymol (0.1 mmol) dissolved in EtOH (5 mL). After refluxing the mixture for 6 h, the reaction was completed using TLC. The resulting solid was filtered, dried, and crystallized in ethanol. The targeted thymol-linked imino compound was obtained with yellowish color and 78% yield. M.p. 172-174 °C. FT-IR/ATR ( $\nu_{\text{max}}$ ,  $\text{cm}^{-1}$ ): 3556 (O-H), 3068, 3004 ( $\text{C-H}$ )<sub>aromatic</sub>, 2960, 2864 ( $\text{C-H}$ )<sub>aliphatic</sub>, 1609 (C=N).  $^1\text{H}$  NMR (400 MHz, DMSO- $d_6$ , ppm): 9.27 (s, 1H, thymol-OH), 9.12 (s, 1H, Ar-OH), 8.32 (s, 1H, -CH=N), 7.43 (s, 1H, Ar-H), 7.27 (d,  $J = 8.1$  Hz, 1H, Ar-H), 7.01 (d,  $J = 8.2$  Hz, 1H, Ar-H), 6.85 (s, 1H, Ar-H), 6.64 (s, 1H, Ar-H), 3.82 (s, 3H, Ar-OCH<sub>3</sub>), 3.16 (septet, 1H, thymol-CH(CH<sub>3</sub>)<sub>2</sub>), 2.21 (s, 3H, thymol-CH<sub>3</sub>), 1.17 (d,  $J = 6.8$  Hz, 6H, thymol-CH(CH<sub>3</sub>)<sub>2</sub>).  $^{13}\text{C}$  NMR (100 MHz, DMSO- $d_6$ , ppm): 150.74 (C=N), 156.36, 152.86, 147.17, 142.25, 132.77, 130.51, 130.44, 122.17, 116.96, 115.37, 113.74, and

112.07 (ArC), 56.07 (OCH<sub>3</sub>); 26.84 (CH(CH<sub>3</sub>)<sub>2</sub>), 23.05 (CH(CH<sub>3</sub>)<sub>2</sub>), 17.70 (CH<sub>3</sub>); Elemental analysis for C<sub>18</sub>H<sub>21</sub>NO<sub>3</sub> (299.37 g/mol); Calculated, %: C, 72.22; H, 7.077; N, 4.68; Found, %: C, 72.39; H, 7.18; N, 4.81; S.

### Antiproliferative activity studies

The antiproliferative activity studies were performed according to following the procedure of our previous studies [13, 14]. The human breast cancer cell line (MDA-MB-231; ATCC<sup>®</sup> HTB-26<sup>™</sup>) and the human lung cancer cell line (A549; ATCC<sup>®</sup> CCL-185<sup>™</sup>) were purchased from the American Type Culture Collection (ATCC, USA). Cancer cells were cultured in Dulbecco's modified Eagle's medium-high glucose (DMEM) supplemented with 10% fetal bovine serum (FBS) and %1 glutamax. The cells were seeded at a density of  $5 \times 10^3$  cells/well in sterile 96-well plates. The MDA-MB-231 and A549 cells were exposed to different concentrations of compound (200, 100, 50, and 25  $\mu$ M) for 72 h. The MTT solution was added to each well of the plates and incubated for another 2 h. Absorbance values were measured in the Elisa plate reader at 590 nm. IC<sub>50</sub> values were calculated using GraphPad Prism Software 5.

## RESULT AND DISCUSSION

### Chemistry

In this study, we synthesized a new thymol-linked imino compound by reacting the 4-aminothymol compound synthesized in our previous study [10] with isovanillin in ethanol to investigate its antiproliferative activity. The synthesis of this compound is illustrated in Scheme 1. Thymol-linked imino compound underwent characterization through elemental analysis as well as spectroscopic techniques including FT-IR, <sup>1</sup>H, and <sup>13</sup>C NMR. The characterization data obtained exhibited a high level of compatibility with the corresponding molecular structure.

**Scheme 1.** Synthesis pathway of target compound

### FT-IR spectroscopy

The primary vibrational bands that were most prominent in the FT-IR spectra of the thymol-linked imino compound detected stretching of the O-H bond ( $3556\text{ cm}^{-1}$ ) and the stretching of the C=N bond in the imine group ( $1609\text{ cm}^{-1}$ ) (Figure 1). In addition, asymmetric and symmetric stretching of the C-H band of the aromatic ring of this compound was observed at  $3068\text{ cm}^{-1}$  and  $3004\text{ cm}^{-1}$ , respectively, while asymmetric and symmetric stretching of the C-H band of the aliphatic group was observed at  $2960\text{ cm}^{-1}$  and  $2864\text{ cm}^{-1}$ , respectively (Figure 2).

Figure 1. Display of important data for FT-IR on the structure of the target compound

Figure 2. FT-IR spectra of Schiff base derivative

### NMR spectroscopy

In the  $^1\text{H}$  NMR spectra of the Schiff base derivative, it was determined that the proton of the azomethine  $\text{CH}=\text{N}$ , which serves as the most distinctive characteristic denoting the creation of a Schiff base, exhibited resonance as a singlet at  $\delta$  8.32 ppm. Furthermore, the proton of the –

OH group within the thymol framework in the structure was observed to resonate at  $\delta$  9.27 ppm, while the methyl protons ( $-CH_3$ ) exhibited resonance at  $\delta$  2.21 ppm. Additionally, the protons of the isopropyl group ( $-CH(CH_3)_2$  and  $-CH(CH_3)_2$ ) resonated at  $\delta$  3.16 and 1.17 ppm, respectively (Figure 3). The protons (Ar-H) of the aromatic rings resonated within the range of  $\delta$  6.64 to 7.43 ppm. The protons of OH and OCH<sub>3</sub> groups of isovanillin were found to be resonant at  $\delta$  9.12 ppm and  $\delta$  3.82 ppm, respectively (Figure 4).

Figure 3. <sup>1</sup>H NMR demonstration on the structure of the target compound

Figure 4. <sup>1</sup>H NMR spectra of Schiff base derivative

In the  $^{13}\text{C}$  NMR spectra of the compound, the carbon atom with the  $\text{CH}=\text{N}$  functional group exhibited a resonance at  $\delta$  150.74 ppm (Figure 5). Additionally, the aromatic carbons (Ar-C) displayed resonances between  $\delta$  112.07 and  $\delta$  156.36 ppm. Furthermore, the methyl carbon ( $-\text{CH}_3$ ) of thymol demonstrated resonance at  $\delta$  17.70 ppm, in contrast to the methoxy carbon ( $-\text{OCH}_3$ ) of isovanillin, which showed resonance at  $\delta$  56.07. In addition, isopropyl carbons ( $-\text{CH}(\text{CH}_3)_2$  and  $-\text{CH}(\text{CH}_3)_2$  of thymol) exhibited resonances at approximately  $\delta$  27 and  $\delta$  23 ppm, respectively (Figure 6).

Figure 5.  $^{13}\text{C}$  NMR demonstration on the structure of the target compound

Figure 6.  $^{13}\text{C}$  NMR spectra of Schiff base derivative

### **Antiproliferative Activity Studies**

Schiff base derivative was evaluated for its cytotoxicity at 200, 100, 50, and 25  $\mu\text{M}$  concentrations in cancer cell lines for 72 h using the MTT assay method. The results are presented in Table 1.

**Table 1.**  $\text{IC}_{50}$  results for compounds against human cancer cell lines

<b>Compounds</b>	<b><math>\text{IC}_{50}</math> (<math>\mu\text{M}</math>)</b>	
	<b>A549</b>	<b>MDA-MB-231</b>
Schiff base derivative	61.62	45.22
Cisplatin	13.22	8.36

According to the  $\text{IC}_{50}$  values obtained, this compound had antiproliferative activity and an effect comparable to that of the positive control in the A549 and MDA-MB-231 cell lines, with  $\text{IC}_{50}$  values of 61.62 and 45.22  $\mu\text{M}$ , respectively. As can be seen in Table 1, the synthesized compound showed lower effectiveness than cisplatin against both cell lines.

### **CONCLUSION**

A synthesized new compound was synthesized, characterized using different spectroscopic methods. This new molecule was tested in two cancer cell lines, and the results demonstrated that the compound had antiproliferative activity against A549 and MDA-MB-231 cells. Studies on this compound will continue to be conducted and tested against different cancer cell lines.

### **ACKNOWLEDGMENTS**

This study was financially supported by the Süleyman Demirel University Scientific Research fund (TBY-2020-8053).

**ABSTRACT**

In this study, a novel fluorine-containing hydrazone compound was synthesized via the reaction of 4-fluorobenzoic hydrazide with an appropriate aldehyde. The structure of the compound was elucidated using elemental analysis and spectroscopic methods such as FT-IR, <sup>1</sup>H, and <sup>13</sup>C NMR. The cytotoxic activity of this molecule was tested in a human lung cancer cell line after 72 h of incubation. The results showed that the fluorine-containing hydrazone compound had a cytotoxic effect on the A549 cell line with an IC<sub>50</sub> value of 137.80 µM.

**Keywords:** Hydrazone, Cancer, Cytotoxic activity.

## **INTRODUCTION**

Lung cancer is a type of cancer that begins in the lungs. It is one of the most common types of cancer and a leading cause of cancer-related death worldwide. There are two main types of lung cancer: non-small cell lung cancer (NSCLC) and small cell lung cancer (SCLC). Non-small-cell lung cancer (NSCLC) accounts for approximately 85% of all lung cancer cases. It includes several subtypes such as adenocarcinoma, squamous cell carcinoma, and large cell carcinoma. Small cell lung cancer (SCLC) is less common, but tends to grow and spread more aggressively than NSCLC. Hydrazone derivatives, a versatile class of organic compounds, are renowned as an essential compound class in organic chemistry and widely utilized in diverse domains within the field [1]. Hydrazones with the general chemical formula  $R_1CO-NH-N=CR_1(H)R_2$  have gained significant attention in recent times because of their effectiveness as reactive agents in the creation and production of novel compounds [2]. The compounds in question, which are produced through the reaction of hydrazine with aldehydes or ketones in appropriate organic solvents, sometimes in the presence of an acid catalyst, can be readily identified using elemental analysis and established spectral techniques. These compounds can function as both nucleophiles and electrophiles and can undergo various reductive and oxidative changes. [3] Recently, the attention of medicinal chemists has focused on hydrazones owing to their biological activities [4,5]. Their significance has increased in recent years because they are frequently utilized in the synthesis and discovery of biologically active molecules in medicinal chemistry [6]. Numerous studies have reported that these compounds possess a wide range of biological activities, including antioxidant, anti-bacterial, anticonvulsant, analgesic, antimicrobial, anti-HIV, anti-tubercular, anticancer, antidepressant, and so on [7-15]. In this study, a novel fluorine-containing hydrazone compound was synthesized via the reaction of 4-fluorobenzoic hydrazide with an appropriate aldehyde. The structure of the compound was elucidated using elemental analysis and spectroscopic methods such as FT-IR,  $^1H$ , and  $^{13}C$  NMR. The cytotoxic activity of this molecule was investigated in a human lung cancer cell line *in vitro* for 72 h.

## **EXPERIMENTAL**

### **Materials and Methods**

All starting materials (4-fluorobenzoic hydrazide (CAS No.: 456-06-4), 3-bromo-5-chlorobenzaldehyde (CAS No.: 188813-05-0), and solvents employed in this investigation were obtained from Sigma-Aldrich and Merck. These were used without additional refinement for all the experiments. The progression of the reactions was observed using TLC plates, which

were subjected to UV light (254 nm) for identification of the spots. The melting point of synthesized hydrazone compound was assessed using a DMP-100 digital melting point apparatus and were not corrected. FT-IR spectra were recorded on a Perkin Elmer Spectrum 400 spectrometer with ATR (Attenuated Total Reflectance).  $^1\text{H}$  and  $^{13}\text{C}$  NMR spectra were recorded on a Bruker Avance III 400 MHz spectrometer using  $\text{DMSO-}d_6$  as the solvent and tetramethylsilane as an internal standard at 400 MHz and 100 MHz, respectively. Elemental analyses (C, H, N) were performed using a Thermo Scientific Flash 2000 elemental analyzer.

***Synthesis of N'-(3-bromo-5-chlorobenzylidene)-4-fluorobenzohydrazide***

3-Bromo-5-chlorobenzaldehyde (1 mmol) and 4-fluorobenzohydrazide (1 mmol) were dissolved in ethanol (10 mL). Following reflux of the reaction mixture for approximately 4 h under constant stirring, it was allowed to cool to ambient temperature. Subsequently, the resulting crude product was removed via filtration, meticulously rinsed multiple times with diethyl ether, and finally crystallized using ethanol to obtain the hydrazone derivative (Scheme 1). White solid, 81% yield, mp. 219-220 °C. Anal. Calcd. for  $\text{C}_{14}\text{H}_9\text{BrClFN}_2\text{O}$ : C, 47.29; H, 2.55; N, 7.88%. Found: C, 47.41; H, 2.38; N, 7.97%.

Figure 3. <sup>13</sup>C NMR spectra of hydrazone compound

### Cytotoxic Activity Studies

The cytotoxic activity studies were performed according to the procedure described in our previous studies [16, 17]. The human lung cancer cell line (A549; ATCC<sup>®</sup> CCL-185<sup>TM</sup>) was purchased from American Type Culture Collection (ATCC, USA). Cancer cells were cultured in Dulbecco's modified Eagle's medium-high glucose (DMEM) supplemented with 10% fetal bovine serum (FBS) and %1 glutamax. The cells were seeded at a density of  $5 \times 10^3$  cells/well in sterile 96-well plates. A549 cells were exposed to different concentrations of compound (200, 100, 50, and 25  $\mu$ M) for 72 h. The MTT solution was added to each well of the plates and incubated for another 2 h. Absorbance values were measured in the Elisa plate reader at 590 nm. IC<sub>50</sub> values were calculated using GraphPad Prism Software 5.

## RESULT AND DISCUSSION

### Chemistry

In this study, a new hydrazone compound was obtained by the condensation of 3-bromo-5-chlorobenzaldehyde with the corresponding 4-fluorobenzohydrazide (Scheme 2). The structure of the synthesized compound was elucidated using FT-IR,  $^1\text{H}$ - and  $^{13}\text{C}$ - NMR spectroscopic techniques, and elemental analyses (C, H, and N). Elemental analyses (C, H, and N) were suitable for the proposed structures of the synthesized target compounds.

Scheme 2. Synthesis of new hydrazone compound

### Spectroscopic Analysis

The FT-IR spectrum of the hydrazone compound exhibited a peak at  $3169\text{ cm}^{-1}$ , which can be attributed to the N-H stretching band. The presence of C=N absorption bands in the  $1601\text{ cm}^{-1}$  region provides strong evidence for the formation of an azomethine group ( $-\text{NH}-\text{N}=\text{CH}-$ ). Furthermore, the occurrence of a distinct and strong band in the  $1660\text{ cm}^{-1}$  range, corresponding to C=O, confirms the hydrazone nature of the target compound (Figure 4).

Figure 4. Display of important data for FT-IR on the structure of hydrazone compound

In the  $^1\text{H}$  NMR spectrum of the hydrazone derivative, the proton belonging to the NH proton resonated as a singlet at 12.16 ppm. Another proof of the successful synthesis of hydrazone compound was the disappearance of the proton peaks of the free amino group of the hydrazide

compound. The proton peaks belonging to  $-\text{NH}-\text{N}=\text{CH}-$  resonated at 8.32 ppm and singlet, as expected in the target compound. The aromatic protons of the benzene ring resonated between 7.38 and 8.00 ppm. The  $^{13}\text{C}$  NMR spectrum of the target compound showed that the  $\text{C}=\text{O}$  carbon in the carbonyl group resonated at 165.97 ppm, and the aromatic carbons resonated in the range of 162.76-116.06 ppm. Resonance of the carbon atom of the  $-\text{C}=\text{N}$  group in the range of 144.97 ppm (Figure 5).

**Figure 5.**  $^1\text{H}$  and  $^{13}\text{C}$  NMR demonstration on the structure of hydrazone compound

### Cytotoxic Activity Studies

The cytotoxicity of hydrazone and cisplatin was evaluated at concentrations of 200, 100, 50, and 25  $\mu\text{M}$  in a lung cancer cell line for 72 h using the MTT assay. The results are presented in **Table 1**.

**Table 1.**  $\text{IC}_{50}$  results for compounds against human lung cancer cell line

Compounds	$\text{IC}_{50}$ ( $\mu\text{M}$ )
	A549
Hydrazone compound	137.80
Cisplatin	13.22

$\text{IC}_{50}$  (half maximal inhibitory concentration) refers to the concentration of a compound that inhibits biological processes or responses by 50%. This compound has a high  $\text{IC}_{50}$  value of 137.80  $\mu\text{M}$ , indicating that relatively high concentrations are required to achieve 50% inhibition of the biological response. According to the results in the table above, cisplatin was almost ten times more effective against the A549 cell line than the hydrazone compound.

### CONCLUSION

In this study, a novel fluorine-containing hydrazone compound was prepared from 4-fluorobenzoic hydrazide and 3-bromo-5-chlorobenzaldehyde. This compound was

characterized using elemental analysis, FT-IR,  $^1\text{H}$  NMR, and  $^{13}\text{C}$  NMR. This molecule was tested against a human lung cancer cell line for 72 h incubation time. The results showed that the fluorine-containing hydrazone compound had a cytotoxic effect on the A549 cell line with an  $\text{IC}_{50}$  value of 137.80  $\mu\text{M}$ .

**Özet**

Bu araştırmanın temel amacı Afyonkarahisar Sağlık Bilimleri Üniversitesi Tıp Fakültesi öğrencilerinin Proje Uygulama dersine ilişkin öz yeterlilik düzeylerini belirlemek ve bu ders ile öğrencinin başka bir ders olan Bilimsel Araştırmalar dersine yönelik tutumları arasındaki ilişkiyi ortaya koymaktır. Araştırmada, Bilimsel Araştırma Öz Yeterlilik Ölçeği ve Bilimsel Araştırma Yöntemleri Tutum Ölçeği kullanıldı. Verilerin değerlendirilmesinde Student-t testi, Mann-Whitney U testi ve Yapısal Eşitlik Modellemesinden yararlanıldı. Araştırmaya toplam 155 öğrenci katıldı. Öğrencilerin %64,5'i Bilimsel Araştırma Yöntemleri dersinin Proje Uygulama dersine faydalı olduğunu bildirdi. Proje Uygulama dersinin Bilimsel Araştırma Yöntemleri dersi tarafından pozitif yönde ve anlamlı düzeyde açıkladığı ve bu sonuçların istatistiksel olarak anlamlı olduğu görüldü.

**Anahtar Kelimeler:** Öz-yeterlilik, Bilimsel Araştırma Yöntemleri, Yapısal Eşitlik Modellemesi

**PROJECT IMPLEMENTATION COURSE THE ROLE OF THE SCIENTIFIC  
RESEARCH METHODOLOGY IN DETERMINING THE SELF-EFFICACY LEVEL**

**Abstract**

The main purpose of this research is to determine the self-efficacy levels of Afyonkarahisar Health Sciences University Medical Faculty students concerning the Project Implementation course, and to reveal the relationship between this course and the student's attitudes toward another course, namely, Scientific Research Methods. In the study, Scientific Research Self-Efficacy Scale and Scientific Research Methods Attitude Scale were used. Student-t test, Mann-Whitney U test, and Structural Equation Modelling were used in the evaluation of the data. A total of 155 students participated in the research. 64.5% of the students stated that the Scientific Research Methods course is beneficial to the Project Implementation course. It was seen that the Project Application course was explained positively and significantly by the Scientific Research Methods course and these results were statistically significant.

**Keywords:** Self-efficacy, Scientific Research Methods, Structural Equation Modeling

## **INTRODUCTION**

Research, learning, and teaching are the needs of every society and they play a big role in spreading scientific services and improving society (Salehi & Ahanchian, 2012). The desire to solve social problems in a healthier way is one of the most important reasons for conducting scientific research (Aslan & Karagül, 2016). At universities, the Scientific Research Methods course is taught at undergraduate, postgraduate, and doctorate degrees. Students who take this course at the undergraduate level are worried about whether the gains they have gained from the course in business life will work for them (Murtonen et al., 2008). Undergraduate and graduate students think that they will encounter problems in many subjects such as being inadequate in the literature review, data collection, and data analysis. Scientific Research Methods course; The basic concepts of research include research types, research features, research methods, research processes, data collection and analysis methods, report writing, and interpretation of research results. Students who attend the Scientific Research Methods course generally acquire skills such as accessing information, determining the characteristics of the research, knowing the ways of accessing the data, and determining the research stages (Kurt et al, 2011). The main purpose of this research is to determine the self-efficacy levels of Afyonkarahisar Health Sciences University, Medical Faculty students concerning the Project Implementation course and to reveal the relationship between this course and the students' attitudes towards another course, namely, Scientific Research Methods.

## **MATERIALS AND METHODS**

While Afyonkarahisar Health Sciences University, Faculty of Medicine students who are enrolled in their 4th, 5th, and 6th year comprise the population, the sample of this project consists of the students who take the Project Implementation course and want to participate in the study. The Scientific Research self-efficacy scale developed by Tuncer et al. Was used to determine the students' self-efficacy levels in the Project Application Study course (Tuncer & Ozeren, 2012). This scale consists of 12 items in total. These 12 items include four sub-dimensions: 2 of them "Literature", 2 of them "Method", 3 of them "Discussion" and 5 of them "Suggestion and Reference". The scale of attitude towards the Scientific Research Methods course developed by Yaşar consists of 20 items in total. These 20 items include four sub-dimensions: 6 of them are the importance of scientific research, 5 of them are cognitive "Self-confidence", 5 of them are positive attitude "Interest", and 4 of them are daily life-professional relationship "Occupational" (Yaşar, 2004). Student t-test, Mann-Whitney U test and Structural Equation Modeling were used to evaluate the data. Structural Equation Modeling is a frequently

used statistical method in modeling causal relationships between variables. Especially in health sciences (medicine, nursing, psychiatry, etc.), economics, social sciences, behavioral sciences (sociology, psychology, education, management, marketing, etc.) and sports sciences, it is used in the analysis of causality in evaluating the relationships between variables and in testing theoretical models (Doğan, 2015). A value of  $p < 0.05$  was accepted for statistical significance. SPSS (version 20) package program and AMOS (21.0) were used to evaluate the data.

### **FINDINGS AND DISCUSSION**

A total of 155 students (75 males, 80 females) with a mean age of  $22.63 \pm 1.5$  years participated in the study. 33.5% of the students stated that their most important aim in this lesson was to conduct scientific research and 64.5% of them stated that the Scientific Research Methods course was beneficial for the Project Application Study course. Self-efficacy scores of students who think that the Scientific Research Methods course is beneficial are significantly higher than other students ( $p < 0.05$ ). As can be seen from Table 1, the students who think that the Scientific Research Methods course is beneficial for the Project Application Study course; The scores of the importance of scientific research, cognitive self-confidence (ability to succeed), positive attitude (research-oriented) and daily life-professional relationship sub-dimensions are significantly higher than the other students ( $p < 0.05$ ).

**Table 1.** Scores of the Sub-dimensions of the Attitude Scale Towards the Scientific Research Methods Course

<b>Do you think that the Scientific Research Methods course is beneficial for the project implementation work?</b>			
<b>Sub-Dimensions</b>	<b>Yes (100)</b>	<b>No (55)</b>	<b>P</b>
	<b><math>\bar{x} \pm SD</math></b>	<b><math>\bar{x} \pm SD</math></b>	
Importance	3.34 $\pm$ 0.85	2.74 $\pm$ 0.69	<0.05
Cognitive Self-confidence	3.61 $\pm$ 0.79	2.98 $\pm$ 0.80	<0.05
Positive Attitude	3.16 $\pm$ 0.88	2.47 $\pm$ 0.66	<0.05
Daily Life-Professional relationship	3.34 $\pm$ 0.85	2.74 $\pm$ 0.69	<0.05

SD: Standard Deviation

Confirmatory Factor Analysis was conducted to determine whether the factor structures in the original form of the scales were verified within the framework of this study. The Goodness of Fit values obtained as a result of the Confirmatory Factor Analysis performed on the attitude scale of the Scientific Research Methods course (CMIN / DF = 2.66, GFI =0.77, CFI =0.89, NFI =0.84, AGFI =0.71 and RMSEA =0.10) has been calculated. In addition, the goodness of

fit values obtained as a result of the confirmatory factor analysis for the Scientific Research self-efficacy scale (CMIN / DF = 4.97, GFI =0.79, CFI =0.89, NFI =0.87, AGFI =0.66 and RMSEA =0.16 ) was calculated. According to the confirmatory factor analysis results regarding the validity of the scales; It can be said that the values of the goodness of fit indices of the model created are at an acceptable level (Meydan & Şeşen, 2011). As a result of these analyses, it can be said that the factor structures in the original form of the scales were also confirmed for this study, in other words, this scale has sufficient validity. The goodness of fit values obtained as a result of the structural equation modeling created to determine the effect of the attitude of the Scientific Research Methods course on the Project Application Study course was calculated as CMIN / DF = 2.28; GFI =0.71; CFI =0.87; NFI =0.79; AGFI =0.66; It was found that RMSEA =0.09. According to these results, it can be said that the values obtained are at an acceptable level. According to the results regarding the structural equation model, it was seen that the Project Application Study course was explained positively and significantly ( $\beta = 0.81$ ,  $p < 0.05$ ) by the Scientific Research Methods course and these results were statistically significant. According to these results, it can be said that as the positive attitude towards the Scientific Research Methods course increases, the self-efficacy levels of the Project Application Study course increase. Many studies have been conducted in education, psychology, sociology and generally social sciences (Baloğlu, 2003; Çoğaltay, 2016; Lei, 2008; Baki, 2017; Boswell, 2013; Zeidner, 1991). However, no such study was found in Medical Faculties. In these studies, it was stated that students developed a negative attitude toward the scientific research course. In the study, 56.1% of the students participating in the study stated that they would not choose this course if the course was elective. This high rate of students shows their negative attitude towards this course. Lei stated that high-level research anxiety reduced the sense of self-efficacy and caused people to develop negative attitudes toward research (Lei, 2008). In the study conducted by Ravazi et al., They stated that there is a significant negative relationship between research anxiety and self-efficacy. They stated that research anxiety among graduate students may have a negative effect on their performance in different ways (Razavi et al., 2017). Research anxiety can reduce the quantity and quality of students' scientific productivity and cause students' burnout and dissatisfaction, and anxiety towards research can affect personal life and even cause physical and mental health deterioration. According to the results, it was observed that as the positive attitude towards the Scientific Research Methods course increased, the self-efficacy levels of the Project Application Study course increased. In most studies, it is stated that taking research methods courses encourages individuals to do research and increases

their research self-efficacy levels, and individuals with high research self-efficacy are very willing to participate in research in the future (Saraçoğlu et al., 2005). It has been observed that the students who are interested in the Scientific Research Methods course, who are aware of the importance of the research and have a positive view, have the power to succeed in this course and associate it with their daily life, have higher self-efficacy in the Project Application Study course. Therefore, it is thought that emphasizing the importance of the Scientific Research Methods course to students, will increase their interest in this course and contribute to the training of students who show a positive attitude towards scientific culture. Academic education should prepare students with an understanding of the skills they need in society and their future work life (Murtonen et al., 2008).

### **CONCLUSION AND RECOMMENDATIONS**

Considering the result regarding the structural equation model, it was observed that as the positive attitude towards the Scientific Research Methods course increased, the self-efficacy levels of the Project Implementation Study course increased. Based on the fact that the students develop positive attitudes towards the areas they are interested in and love, we think that this course will shed light on the relevant parties in order to determine the deficiencies, if any, and to make the necessary arrangements against these deficiencies in order to make this course more useful. For this reason, it is thought that the faculty members' attitudes towards the Scientific Research Methods course and turn towards activities that increase positive attitudes towards the effect of their approach to this course on students will have positive contributions to students.

**Thanks and Information Note:** I would like to thank our Faculty of Medicine students Burcu Kösen, Hatice Kübra Gökmen, Yasemin Kuzu, Hidayet Ege Şan, Furkan İncebacak and Esin Erdiñç, who contributed to the process of determining the subject and collecting data.

**Özet**

Bu çalışmada, Türkiye’de 2009-2022 yılları arasında çocuk, ergen ve gençlerde intihara bağlı mortalitenin cinsiyet ve yaş gruplarına göre trend analizini incelemeyi amaçladık. Araştırmada kullanılan veriler Türkiye İstatistik Kurumu resmi internet sitesinde yer alan ölüm veri tabanından elde edildi. Yaşa özel mortalite oranlarının değerlendirilmesinde üç farklı yaş grubu (<15, 15-19, 20-24) dikkate alındı. Joinpoint Regresyon Analizi kullanılarak intihar mortalite trendleri tahmin edildi. Yıllık yüzde değişim ortalama yıllık yüzde değişim ve bunlara ait güven aralıkları verildi. 2009-2022 döneminde yaklaşık 47.000 kişi intihar nedeniyle hayatını kaybetti. Bunun dörtte biri <24 yaş grubundadır. Joinpoint Regresyon Analizi’ne göre, erkeklerde <15 yaş grubunda periyod boyunca istatistiksel olarak anlamlı azalma görülürken ( $p=0.013$ ), 20-24 yaş grubunda ise periyod boyunca istatistiksel olarak anlamlı artış görüldü ( $p<0.001$ ). Kadınlarda <15 yaş grubunda periyod boyunca istatistiksel olarak anlamlı azalma, 15-19 yaş grubunda ise 2020 yılına kadar anlamlı azalma ( $p=0.001$ ) sonrasında ise anlamlı olmayan artış görüldü. Bu yaş grubunda intihar düşünceleri hızla gelişebilir ve bu nedenle kriz hizmetlerinin yaygın olarak mevcut olması gerekir.

**Anahtar kelimeler:** Joinpoint Regresyon Analizi; intihar; mortalite

**SUICIDE MORTALITY TRENDS IN CHILDREN, ADOLESCENTS AND YOUNG  
ADULTS IN TURKEY**

**Abstract**

This study aims to analyze the trend analysis of suicide-related mortality among children, adolescents, and young people in Turkey between 2009 and 2022 by gender and age groups. The data used in the study were obtained from the mortality database on the official website of the Turkish Statistical Institute. Three different age groups (<15, 15-19, 20-24) were considered in the evaluation of age-specific mortality rates. Suicide mortality trends were estimated using Joinpoint Regression Analysis. Annual percentage change, average annual percentage change, and their confidence intervals were given. Approximately 47,000 people died by suicide in the period 2009-2022. A quarter of these were in the <24 age group. According to the Joinpoint Regression Analysis, there was a statistically significant decrease in the <15 age group in males over the period ( $p=0.013$ ), while there was a statistically significant increase in the 20-24 age group over the period ( $p<0.001$ ). In females, there was a statistically significant decrease in the <15 age group throughout the period a significant decrease in the 15-19 age group until 2020 ( $p=0.001$ ), and a non-significant increase thereafter. Suicidal thoughts can develop rapidly in this age group and therefore crisis services should be widely available.

**Keywords:** Joinpoint Regression Analysis; suicide; mortality

## **GİRİŞ**

İntihar dünya çapında önemli bir halk sağlığı sorunu olarak kabul edildiğinden intihara ilişkin epidemiyolojik çalışmalar çok sayıdadır. Dünya genelinde her yıl 703.000 kişi intihar nedeniyle hayatını kaybetmektedir. Sadece yüksek gelirli ülkelerde değil, dünyanın tüm bölgelerinde görülen küresel bir olgudur. 2019 yılında küresel intiharların %77'den fazlası düşük ve orta gelirli ülkelerde meydana gelmiştir. İntihar, 15-29 yaş grubunda dördüncü önde gelen ölüm nedenidir (WHO, 2021). Çocuklar ve ergenler arasında intihar oranları artmaya devam etmektedir; Amerika Birleşik Devletleri'nde 15 ila 19 yaş arası ergenlerde ikinci önde gelen ölüm nedenidir (Benton ve ark., 2021). Garnett ve arkadaşları intihar oranlarının 15-24 yaş arası erkeklerde 2020 ile 2021 arasında önemli ölçüde arttığını ifade etmiştir (Garnett ve Curtin, 2023). Gerstener ve arkadaşları Ekvator'da 1990 ile 2017 yıllarını kapsayan çalışmalarında, 10-14 yaş arası genç erkeklerde, kızlarda, ergen erkeklerde ve genç yetişkinlerde artış olduğunu bildirmişlerdir (Gerstener, 2019). Bosna'da 2010 ile 2020 yılları arasında en büyük artışların 15 ila 29 yaş arası gençler arasında meydana geldiği vurgulanmıştır (Cilovic-Lagarija ve ark., 2021). Milena ve Irena'nın 2022 yılında dünya genelinde yaptıkları çalışmada, dünyanın birçok ülkesinde intihar ölümlerinde azalma eğilimi gözlemlendiğini ama bazı ülkelerde de arttığını, erkeklerde 10-19 yaş grubundaki yaşa özel intihar ölüm oranlarının, tüm yaş gruplarında kadınlara göre iki ila üç kat daha yüksek olduğunu belirtmişlerdir (Ilic ve Ilic, 2022). Becker ve arkadaşları, ruhsal hastalığı olan çocuk ve ergenlerde intihar riski 3 ila 12 kat daha yüksek olduğunu, mobingin de intihar riskini artırdığını bildirmiştir. Ayrıca, çocuklara ve ergenlere antidepressan ilaçların uygulanmasının intihar eğilimini artırdığına dair kanıtlar olduğunu ifade etmiştir (Becker ve Correll, 2020). Depresyon, duygu durum bozukluğu gibi tıbbi bozuklukların geçmişi ve bilişsel bozulmanın intihar için önemli risk faktörleri olduğu belirlenmiştir, ancak sosyokültürel faktörlerin de intihar epidemiyolojisinde önemli bir rol oynadığı göz önünde bulundurulmalıdır (Pompili ve ark., 2015). Yüksek gelirli ülkelerde her kadın ölümü başına üç erkek ölümü, düşük gelirli ve orta gelirli ülkelerde ise her iki kadın ölümü başına üç erkek ölümü oranıyla, riskte önemli cinsiyet dengesizlikleri bulunmaktadır. Bu çalışmada, Türkiye'de 2009-2022 yılları arasındaki intihara bağlı mortalitenin cinsiyet ve yaş gruplarına göre trend analizlerinin yapılması amaçlandı.

## **MATERYAL VE METOT**

Veriler Türkiye İstatistik Kurumu ölüm veri tabanından elde edildi (TÜİK, 2022). Uluslararası Dünya Sağlık Örgütü Uluslararası Hastalık Sınıflandırması (ICD-10)'na (World Health Organization, 2004) göre X60-X84 (intihar ve kasıtlı kendine zarar verme) kodları dikkate

alındı. Cinsiyete göre, farklı yaş grupları (<15, 15-19, 20-24) için yaşa özel oranlar hesaplandı. Yaş özel oranlar 100,000 kişi başına ölüm olarak ifade edildi. Verilerin değerlendirilmesinde Joinpoint Regresyon Analizi (JRA) kullanıldı. JRA, iki değişken arasındaki ilişkiyi, parçalı doğrusal bir regresyon aracılığıyla açıklayan istatistiksel bir modelleme tekniğidir. Bu teknik, epidemiyolojik çalışmalarda mortalite veya insidans serilerindeki trendleri modellemekte yaygın olarak kullanılmaktadır. JRA'da değişim noktası "joinpoint" olarak tanımlanmış ve 2000 yılında Kim ve arkadaşları bu değişim noktalarının bulunmasında Lerman tarafından önerilen Grid Serch metodu kullanılmıştır (Kim ve ark., 2000). İstatistiksel olarak anlamlı olan her bir değişim noktası için yıllık yüzde değişim (YYD), ortalama yıllık yüzde değişim (OYYD, tüm kırılma noktalarındaki YYD değerlerinin ortalamasıdır ) ve bunlara ait %95 güven aralıkları hesaplandı. Analizler, ABD Ulusal Kanser Enstitüsü tarafından hazırlanan Joinpoint Regresyon Programı (versiyon 4.9.1.0–2021) kullanılarak gerçekleştirildi (National Cancer Institute, 2021).  $P < 0.05$  değerini istatistiksel olarak anlamlı kabul edildi.

### **BULGULAR**

Türkiye'de, 2009-2022 döneminde yaklaşık 47,000 kişi intihar nedeni ile hayatını kaybetmiştir. Bunların yaklaşık %75'i erkektir. Bu dönemde <25 yaş grubunda ise intihar mortalite sayısı 11,700 kişidir. Bu toplam intihar ölümlerinin dörtte birini oluşturmaktadır. Ülkemizde bu yaş grubunda intihar mortalite oranı erkeklerde kadınlardan yaklaşık olarak 2 kat daha fazladır (Tablo 1). Yaş gruplarına göre değerlendirildiğinde erkeklerde <15 yaş grubunda periyod boyunca istatistiksel olarak anlamlı düşüş gözlenirken ( $p=0.013$ ), 20-24 yaş grubunda ise periyod boyunca istatistiksel olarak anlamlı artış gözlemlendi ( $p < 0.001$ ) (Şekil 1, Tablo 2).

**Tablo 1.** Çocuk, ergen ve genç yetişkinlerde intihar ölüm sayıları, Türkiye (TÜİK, 2022)

Yıl	<15		15-19		20-24		Toplam		Erkek/Kadın
	Erkek	Kadın	Erkek	Kadın	Erkek	Kadın	Erkek	Kadın	
2009	49	46	175	156	177	95	401	297	1,4
2010	48	59	202	179	205	106	455	344	1,3
2011	45	58	175	179	176	90	396	327	1,2

## TARTIŞMA

Elde edilen sonuçlar, erkeklerde periyod boyunca intihar mortalite oranında anlamlı artışlar olduğunu, kadınlarda ise 2019 yılına kadar anlamlı düşüş sonrasında ise artış olduğu gösterdi. Erkeklerde intihar mortalite oranının kadınlardan yaklaşık iki kat daha fazla olduğu görüldü.

Ekvador'da 25 yaş altı nüfusta intihar önemli bir halk sağlığı sorunudur ve 1990 ile 2017 yılları arasında özellikle çocuklar ve 15-24 yaş arası erkekler arasında artış göstermiştir (Gerstner, 2019). Doğan ve arkadaşlarının 2015 yılında yapmış olduğu çalışmada, 15-24 yaş grubunda dönem boyunca kadınlarda ortalama yıllık %4.9'luk anlamlı düşüş, erkeklerde ise 1987-2005 yılları arasında yıllık %4.9'luk artış sonrasında ise yıllık %2.5'lik düşüş gözlenmiştir (Doğan ve Toprak, 2015). İntihar, çoğunlukla erkeklerde görülen önemli bir halk sağlığı sorunudur. Dünya çapında yaşa özel intihar oranı erkeklerde kadınlara göre 2,3 kat daha yüksektir. Erkek:Kadın intihar oranlarının 1'den büyük olması, intihar oranlarının erkeklerde kadınlara göre daha yüksek olduğunu göstermektedir (WHO, 2021). Ülkemizde ise bu yaş grubunda intihar mortalite oranı erkeklerde kadınlardan yaklaşık olarak iki kat fazladır ve benzer sonuçlar elde edilmiştir. Kadınlar toplamda erkeklere göre yaklaşık iki kat fazla intihar girişiminde bulunmakla birlikte ölümlerle sonuçlanan intiharlarda erkeklerin gerisinde kalmaktadır (Kırcı, 2017). Özellikle toplumsal baskılar nedeniyle kadının kendini ifade etmesinde sesini yükseltmesinde rahat olmadığı ülke ve topluluklarda intihar girişimi bir imdat çığılığı olarak öne çıkmaktadır. Erkekler, gerçekten ölmeye kararlı olarak girişimde bulunmakta, aynı zamanda ateşli silah, motorlu araç kullanma gibi intihar yollarına daha kolay ulaşmalarından erkeklerde kadınlardan iki kat fazla başarılı intihar görülmektedir. Geleneksel erkekliğin, erkek kırılma için önemli bir risk faktörü olduğu ve duygusal dışavurum, yardım arama isteksizliği veya alkol kullanımı gibi uyumsuz başa çıkma stratejilerini teşvik ettiği gösterilmiştir. Bu temel erkek eğiliminin, farklı toplumsal koşullar nedeniyle psikososyal stresi artırdığı görülmüştür (Möller, 2002). Ekonomik durgunluğun uzun süreli etkisi işsizlik ve iş güvensizliği sorununu ortaya çıkarmaktadır. Durgunluk veya ekonomik kriz yaşayan ülkelerde, erkeklerde intihar oranları artma eğilimi göstermektedir. Bu faktörlerin doğrudan veya dolaylı olarak depresyon, anksiyete, aşırı içki gibi ruh sağlığı sorunlarına ve daha sonra intihar davranışına yol açabileceği ileri sürülmektedir (Haw ve ark., 2014). Kavaklı, yaptığı çalışmada bölgesel farklılıkların intiharda önemli rol oynadığını, 15-19 yaş grubunda Güneydoğu Anadolu, 20-24 yaş grubunda ise İstanbul'da intihar olaylarının daha yüksek olduğunu ifade etmiştir (Kavaklı, 2023). Türkiye'de son yıllardan üniversitelerin artması, mezun sayılarında da bir artış meydana getirmiştir. Bu artışa rağmen yeterli istihdamın karşılanamaması, özellikle genç işsiz sayısında önemli bir yükseliş göstermiştir. Genç nüfusa sahip olan Türkiye'de bu durum genç işsizliğin artmasına ve bu yaştaki bireylerin hayat beklentilerinin düşmesiyle birlikte intihara yönelimi arttırmaktadır (Kavaklı, 2023). Batman'da 25 yaş ve altı bireylerle yürütülen bir çalışmada en önemli intihar nedenlerinden ilk iş hayatına

erken yaşıta katılmak (çocuk işçiliği), diğeri ise erken yaşıta evlilikler neticesinde çocuk gelin problemi olarak karşımıza çıkmaktadır (Komisyon, 2022). Duygusal ve davranışsal düzensizlik, teşhis grupları arasında tutarlı bir şekilde intihar davranışlarıyla ilişkilendirilmiştir ve akut ve kronik olarak bağımsız risk faktörleridir (Benton ve ark., 2022). İntihar eğilimi, altta yatan psikiyatrik bozuklukların varlığında daha sık ortaya çıksa da, akut stres tepkileri veya ergenlik krizlerinden de kaynaklanabilir (Becker ve Correll, 2020)

### **SONUÇ**

Dünyanın birçok ülkesinde her iki cinsiyette de kaydedilen düşüş eğilimine rağmen, intihar nedeniyle ölüm oranları bazı popülasyonlarda artış eğilimi göstermektedir (Ilic ve Ilic, 2022). İntihardaki bu artışın önlenmesine yönelik daha etkili önlemler sağlamak amacıyla, daha fazla araştırma yapılarak bu olumsuz eğilimlerin nedenlerini açıklığa kavuşturmalıdır. İntihar, özellikle incelenen yaş grubunda ülkelerin gelecekteki üretken nüfusuna yönelik kayıplara yol açması nedeniyle önemi daha da artmaktadır. Bu yaş grubuna ilişkin alınması gereken tedbirlerin belirlenmesinde intiharın sosyal, kültürel, coğrafi ve yaşla ilgili değişkenleri olduğu unutulmamalıdır. Aile, eğitim, din, ekonomi, siyaset gibi toplumsal kurumların işlevselliklerini sağlamak, toplumsal değişim ve dönüşümlerde mevcudiyetlerini ve etkinliklerini muhafaza etmek, intiharları önlemek açısından değerlidir.

**Özet**

Alüminyum alaşımları yüksek özgül mukavemet avantajına sahip olsalar da düşük sertlik, aşınma ve korozyon dayanımları nedeniyle bazı uygulamalarda kullanımları sınırlıdır. Yüzey modifikasyonu ise alaşımların sertlik ve aşınma dayanımlarını geliştirmenin etkili bir yoludur. Bu doğrultuda, metal ve seramik içerikli kompozit ve fonksiyonel bir kaplama tabakasının çeşitli termal püskürtme yöntemleri ile yüzeye kaplanması uygulamanın tipine ve gerekliliklerine göre çeşitli avantajlar sağlayabilir. Yapılan çalışmada yüksek özgül mukavemeti ve endüstride sık kullanılması sebebi ile geliştirilmek üzere 7075 Al alaşımı numuneler tercih edilmiştir. Kaplama sırasında numunelerin ısıdan minimum etkilenmesini sağlamak için soğuk spreyci yöntemi kullanılmış ve kaplama öncesi uygulanan yüzey işlemlerinin aşınma dayanımına sertlik ve morfolojiye etkisi değerlendirilmiştir. Yüzey işlemleri olarak cam bilye ve çelik bilye ile kumlama, zımparalama ve parlatma işlemleri kullanılmıştır. Kaplamalarda DYMET K714 kodlu Ni, Zn ve Al<sub>2</sub>O<sub>3</sub> içerikli ticari tozlar kullanılmıştır. Kaplama sonrası numune morfolojileri Nikon marka Clemex Vision PE yazılımlı mikroskop kullanılarak incelenmiştir. Kaplama kalınlık ölçümleri yine aynı yazılım ve mikroskop kiti kullanılarak kesitlerden alınan görüntülerden yapılmıştır. Mikrosertlik testleri numunelerin enine kesitlerinden, altlık, ara yüzeyler ve kaplama tabakası olacak şekilde farklı bölgelerden alınarak gerçekleştirilmiştir. Sertlik testlerinde HCK-404SXV Dijital Mikro Vickers sertlik cihazı kullanılmış ve 500 gram yük altında ölçümler gerçekleştirilmiştir. Numunelerin aşınma testleri CSM tribometre ball-on disk aşınma cihazı kullanılarak gerçekleştirilmiştir. Aşınma testleri için Al<sub>2</sub>O<sub>3</sub> aşındırıcı bilyeler numune yüzeyinde yük 10N olacak şekilde, 10cm/s kayma hızı ile kaydırılmıştır. Çalışma sonucunda zımparalama işlemi sonrasında kaplanan numunenin en yüksek sertliğe ve maksimum aşınma dayanımına sahip olduğu gözlemlenmiştir.

**Anahtar Kelimeler:** Alüminyum, Soğuk spreyci, Yüzey işlemleri, Aşınma.

**THE EFFECT OF SURFACE TREATMENTS ON WEAR RESISTANCE IN COLD  
SPRAY COATING OF 7075 ALUMINUM ALLOYS**

**Abstract**

Although aluminum alloys have the advantage of high specific strength, their use in some applications is limited due to low hardness, wear, and corrosion resistance. Surface modification is an effective way to enhance the hardness and wear resistance of alloys. In this context, coating the surface with a composite and functional coating layer containing metal and ceramic components using various thermal spray methods can provide various advantages depending on the application type and requirements. In the conducted study, 7075 Al alloy samples were chosen for improvement due to their high specific strength and frequent use in the industry. The cold spray method was employed during coating to minimize the heat impact on the samples, and the effect of pre-coating surface treatments on wear resistance, hardness, and morphology was evaluated. Surface treatments such as sandblasting with glass beads and steel beads, sanding, and polishing were used. Commercial powders with the code DYMET K714 containing Ni, Zn, and Al<sub>2</sub>O<sub>3</sub> were used in the coatings. Post-coating sample morphologies were examined using a Nikon Clemex Vision PE microscope with dedicated software. Coating thickness measurements were also performed using the same software and microscope kit from images taken from cross-sections. Microhardness tests were conducted on transverse sections of the samples, including the substrate, interfaces, and coating layers. HCK-404SXV Digital Micro Vickers hardness tester was used for hardness tests, and measurements were taken under a 500-gram load. Wear tests on the samples were carried out using a CSM tribometer ball-on-disk wear apparatus. For wear tests, Al<sub>2</sub>O<sub>3</sub> abrasive balls were slid on the sample surface with a load of 10N and a sliding speed of 10cm/s. As a result of the study, it was observed that the sample coated after sanding had the highest hardness and maximum wear resistance

**Keywords:** Aluminum, Cold spray, Surface treatments, Wear.

## **Giriş - Introduction**

Alüminyum alaşımı 7075-T651, yüksek mukavemet, hafiflik ve nispeten düşük maliyet gibi çeşitli avantajlar sunar ve otomobil ve uçak imalat endüstrilerinde kritik bir yapısal malzeme olarak yaygın şekilde kullanılmaktadır (Chen et al., 2019; Dursun and Sourtis, 2014). Bununla birlikte, yüzey oksidasyonu ve zayıf aşınma direnci genellikle yüksek sürtünme katsayısına ve şiddetli aşınmaya yol açar (Peng et al., 2018). Alüminyum alaşımlarının aşınma dayanımlarının geliştirilmesinde bir çok yüzey modifikasyon yöntemi ve kaplama malzemesi kullanılmaktadır. Metalik, oksitli veya yüzeyin sonradan oksitlendirilmesine yönelik, seramik ve hatta kompozit kaplamalar yapılarak alüminyum alaşımları ortamın aşındırıcı etkilerinden korunmak istenmiştir (Li et al., 2022; Duan et al., 2021). Farklı yöntemler arasında altlık malzemenin ısınmasını minimuma indirebilecek ve dolayısıyla istenmeyen oksit oluşumunu engelleyebilecek son yıllarda popüler olan bir yöntem ise soğuk sprej kaplama yöntemidir (Kim et al., 2023). Soğuk sprej kaplama sistemleri özellikle düşük basınçlı sistemlerde temelde genellikle kompresöre bağlı bir gaz ısıtıcı, süpersonik bir nozül ve bu nozüle direk olarak bağlı bir toz besleme sisteminden oluşur. Isıtılan gazlar kullanılarak tozlar bu nozülden aktarılır ve altlık yüzeylerine püskürtülür (Vaz et al., 2023). Soğuk sprej kaplama sistemine ait şematik bir gösterim Şekil 1’de verilmiştir.

**Şekil 1.** Soğuk sprej yöntemi şematik gösterimi (Vaz et al., 2023)

Bu çalışmada, 7075 alüminyum alaşım yüzeylerine iki farklı tür bilye ile kumlama işlemi, zımparalama ve parlatma yüzey işlemleri uygulandıktan sonra aynı koşullar altında K714 tozları ile soğuk sprej kaplama yapılmıştır. Farklı yüzey işlemi olarak parlatma, çelik ve cam bilye ile kumlama ve zımparalama işlemleri seçilmiş ve kaplama sonrası numuneler morfolojik ve mekanik özellik bakımından birbirleriyle karşılaştırılmıştır.

### **Malzeme ve Metot - Materials and Methods**

7075 alüminyum alaşımları altlık malzeme olarak kullanılmak üzere  $10 \times 3 \text{ cm}^2$  boyutlarında 5 mm kalınlıkta plakalar şeklinde kesilerek hazırlanmıştır. Alaşım yüzeylerine cam bilye püskürtme, çelik bilye ile kumlama, zımparalama ve parlatma işlemleri uygulanmış ve hazırlanan yüzeyler aynı şartlar altında kaplanmıştır. Kaplama yöntemi olarak soğuk sprej yöntemi tercih edilmiş ve kaplama işlemleri  $500 \text{ }^\circ\text{C}$  sıcaklıkta gerçekleştirilmiştir. Kaplama cihazı olarak DYMET 423 düşük basınçlı soğuk sprej ekipmanı kullanılmıştır. Kaplama işlemlerinde DYMET K714 kodlu Ni, Zn ve  $\text{Al}_2\text{O}_3$  içerikli ticari tozlar kullanılmıştır. Tüm kaplama işlemlerinde toz besleme hızı 9 g/dk olarak belirlenmiştir. Kaplama sonrası numune morfolojileri Nikon marka Clemex Vision PE yazılımlı mikroskop kullanılarak 200X büyütmede incelenmiştir. Kaplama kalınlık ölçümleri yine aynı yazılım ve mikroskop kiti kullanılarak 50X büyütmede enine alınan kesitlerden gerçekleştirilmiştir. Yüzey pürüzlülük ölçümlerinde Mitutoyo SurfTest SJ-310 kullanılmıştır. Mikrosertlik testleri numunelerin enine kesitlerinden, altlık, ara yüzeyler ve kaplama tabakası olacak şekilde farklı bölgelerden alınarak gerçekleştirilmiştir. Sertlik testlerinde HCK-404SXV Dijital Mikro Vickers sertlik cihazı kullanılmış ve 500 gram yük altında ölçümler gerçekleştirilmiştir. Numunelerin aşınma testleri CSM tribometre ball-on disk aşınma cihazı kullanılarak gerçekleştirilmiştir. Aşınma testleri için 6mm çapında  $\text{Al}_2\text{O}_3$  bilye aşındırıcı eleman olarak tercih edilmiştir. Aşınma mesafesi olarak 200m belirlenmiş ve yük 10N olacak şekilde ayarlanmıştır. Aşınma yarıçapı 3,3 mm olacak şekilde hazneye yerleştirilen numuneler üzerinde bilye 10cm/s hız ile kaydırılmıştır.

### **Bulgular ve Tartışma - Findings and Discussion**

Kaplama sonrası yapılan pürüzlülük ölçüm sonuçlarına göre, cam bilyelerle kumlanmış, zımparalanmış ve parlatıldıktan sonra kaplanmış numunelerin yüzey pürüzlülük değerleri benzerlik göstermektedir. Bu değerler sırasıyla cam bilye ile kumlanan numune için  $5,97 \text{ } \mu\text{m}$ , zımparalandıktan sonra kaplanan numune için  $5,8 \text{ } \mu\text{m}$  ve patlatıldıktan sonra kaplanan numune için ise  $6,27 \text{ } \mu\text{m}$  olarak ölçülmüştür. Numuneler arasında yüzey pürüzlülüğündeki belirgin farkla öne çıkan numune  $6,94 \text{ } \mu\text{m}$  pürüzlülük değeri ile kumlandıktan sonra kaplanan numune olmuştur. Kaplama tozları soğuk sprej yöntemi ile püskürtüldüğünde, diğer termal sprej yöntemlerindeki gibi tam ergime sağlanmadan kaplama işlemi gerçekleştirilir. Tozlar süpersonik olarak adlandırılan bir kritik hıza ulaştıktan sonra yüzeye çarptırılır ve bu hızın etkisiyle plastik deformasyona uğrar (Assadi et al., 2016; Vinay et al., 2022). Başlangıçtaki yüzeyin pürüzlü olması kaplama sonrası yüzeyin pürüzlülük oranını etkileyebilir. Fakat soğuk sprej yönteminde atomsal boyutta düzenli bir birleşme söz konusu olmadığı için pürüzsüz ve

parlatılmış yüzeylerde dahi pürüzsüz bir kaplama yüzeyi elde etmek mümkün değildir. Daha yüksek hızla çarpan ve daha küresel şekle sahip olan, plastik deformasyonun daha kolay gerçekleşebileceği parçacıklar, kaplama sonrası daha yassı tanecikler olarak yapıda bulunacağından, pürüzlülüğü bir miktar azaltabilir (Gül et al., 2022). Vaz vd. (2023), çalışmalarında ise kumlanmış ve pürüzlendirilmiş yüzeylerde daha heterojen bir büyümeden söz edileceği için pürüzlülüğünde kaplama sonrası artmış olacağını vurgulamışlardır. Artan pürüzlülük ise daha efektif bir kaplama eldesini sağlayabilir Vaz vd., (2023). Kaplama sonrası yüzeylerden alınan mikroskop görüntüleri Şekil 2’de verilmiştir. Görüntüler alınan pürüzlülük ölçümlerini destekler niteliktedir.

**Şekil 2.** Kaplanmış yüzeylerden alınan mikroskop görüntüleri a) cam, b) zımparalanmış, c) parlatılmış d) kumlanmış numune yüzeyleri (200X büyütme)

Kaplanmış numunelerin kesitlerinden alınan kaplama kalınlık ölçümleri Şekil 3’te verilmiştir. Alınan ölçümlere göre ortalama kaplama kalınlıkları ortalamaları cam bilye ile kumlanan numune için 67,6 µm, parlatıldıktan sonra kaplanan numune için 72,52 µm ve kumlama sonrası kaplanan numune için 77,5 µm olarak ölçülmüştür. Numuneler arasında yüzey pürüzlülüğündeki belirgin farkla öne çıkan numune ise zımparalandıktan sonra kaplanan numune olmuştur ve kaplama kalınlığı ortalaması 175,9 µm olarak ölçülmüştür. Zımparalanmış numunede kaplama tabakasının altında oksit tabakası olduğu düşünülen ikinci bir tabakaya rastlanmıştır. Bu tabakanın kaplama kalınlığını destekler nitelikte olduğu düşünülmektedir.

Şekil 3. Kaplanmış numune kesitlerinden gerçekleştirilen kaplama kalınlık ölçümleri a) cam, b) zımp, c) parl d) kum numune yüzeyleri (50X büyütme)

Kaplanmış numunelerin sertlik ölçümleri Şekil 4’te verilmiştir. Altlık WE43 Mg alaşımının sertliği 150 HV0,5 olarak ölçülmüştür ve tüm numunelerde ortalama bu değerdedir. Arayüzeylerden yapılan ölçümler ile de paralel olacak şekilde en yüksek sertlik zımparalanmış numunede gözlemlenmiş olup kaplama tabakası altında gözlemlenen oksit tabakası olduğu düşünülen tabakanın, ana kaplama yapısının sertliğini artırıcı nitelikte olmasıdır. Tüm kaplanmış numunelerin sertliği altlık malzemenin sertliğinden yüksek olmakla birlikte mikrosertlik ortalamaları cam bilye ile kumlanan numune için 320 HV0,5, parlatıldıktan sonra kaplanan numune için 270 HV0,5, kumlama sonrası kaplanan numune için 284 HV0,5 ve zımparalama sonrası kaplanan numune için 339 HV0,5 olarak ölçülmüştür.

Şekil 4. Numunelerin mikrosertlik grafiği

Aşınma testleri sonrası aşınma iz genişlik ölçümleri Şekil 5’te verilmiştir. Aşınma iz genişlikleri ortalamaları cam bilye ile kumlanan numune için 1191 µm, zımparalandıktan sonra

kaplanan numune için 1328  $\mu\text{m}$  , parlatıldıktan sonra kaplanan numune için 1656  $\mu\text{m}$  ve kumlama sonrası kaplanan numune için 1780  $\mu\text{m}$  olarak ölçülmüştür. Minimum aşınma iz genişliği cam bilye ile kumlandıktan sonra kaplanmış numunede ve zımparalama sonrası kaplanan numunede gözlemlenirken, maksimum iz genişliği kumlandıktan sonra kaplanan numunede gözlemlenmiştir.

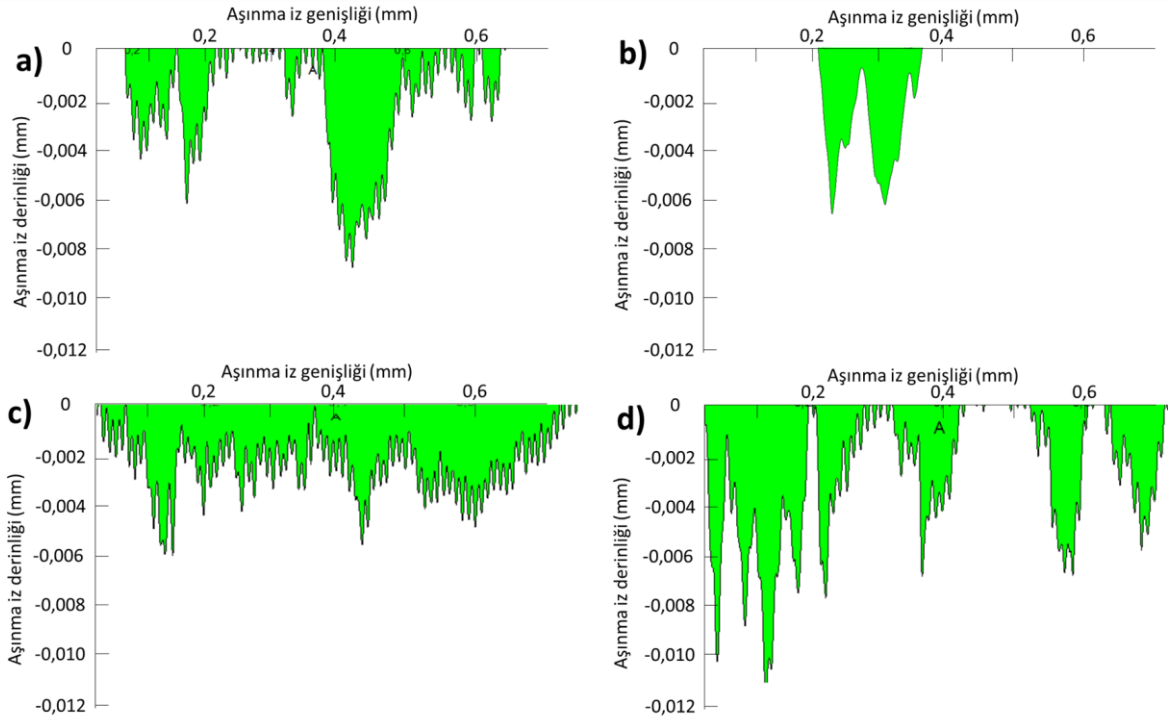

**Şekil 5.** Aşınma iz ölçümleri a) cam, b)zımp, c)parl d)kum numune

Aşınma sırasında kaydedilen sürtünme katsayısı değerlerinin zamanla değişimini gösteren grafik Şekil 6'da verilmiştir. Sürtünme katsayısı maksimum değere çıkan ve zaman içinde de diğer numunelerden açık ara fark ile yüksekte seyreden numune zımparalandıktan sonra kaplama işlemi uygulanan numune olmuştur. Aşınma iz genişliğinin daha az olması bu durumu desteklemekte olup bu numunede kaplama kalınlığının maksimum değerinde elde edilmesinin olumlu bir etkisinden söz edilebilir. Minimum sürtünme katsayısı parlatıldıktan sonra kaplanan numunede elde edilmiştir. Aynı zamanda parlatıldıktan sonra kaplanan numune için, aşınma izi genişliğinin de fazla ölçülmesi ile birlikte değerlendirildiğinde, en düşük aşınma dayanımını sergilediği söylenebilir.

Şekil 6. Sürtünme katsayısı grafiği

Şekil 7. Aşınan alan grafikleri a) cam, b)zımp, c)parl d)kum numune yüzeyleri

Şekil 7, numunelerin aşınma testleri sonrası aşınma izlerinden alınan profil ölçümlerini göstermektedir. Parlatma ve kumlama işlemleri sonrası numunelerde maksimum aşınma ile hacim kaybı gözlemlenmiştir. Aşınma profillerine göre minimum aşınmanın zımparalanmış numunede olduğu söylenebilir. Hesaplanan hacim kayıpları sırasıyla cam bilye ile kumlanan numune için  $0.0264 \text{ mm}^3$ , zımparalandıktan sonra kaplanan numune için  $0.0241 \text{ mm}^3$ , parlatıldıktan sonra kaplanan numune için  $0.0371 \text{ mm}^3$  ve kumlama sonrası kaplanan numune için  $0.0446 \text{ mm}^3$  olarak hesaplanmıştır. Yüzey pürüzlülüğünün maksimum olduğu çelik bilye

ile kumlanmış numune grubunda fazla pürüzlülüğün abraziv aşınmayı tetiklemesi nedeni ile (Liang et al., 2018) daha büyük parçaların koparak kaplama tabakasından ayrıldığı düşünülmektedir. Bu durum aşınma sonrası hacim kayıplarının daha büyük boyutta olmasına neden olmuş ve kumlanmış ve parlatılmış numunede minimum aşınma dayanımı gözlemlenmesine neden olmuştur.

#### **Sonuçlar ve Öneriler - Conclusion and Recommendations**

7075 alüminyum alaşım plaka numuneler, DYMET K714 kodlu Ni, Zn ve Al<sub>2</sub>O<sub>3</sub> içerikli ticari tozlar kullanılarak soğuk sprey yöntemi ile başarılı bir şekilde kaplanmıştır. Cam bilye ile kumlama, zımparalama, çelik bilye ile kumlama ve parlatma yüzey işlemleri sonrası aynı parametreler kullanılarak aynı ortam koşullarında kaplamalar gerçekleştirilmiş ve bu kaplamaların morfolojik özellikleri ve aşınma dayanımları arasındaki farklılıklar incelenmiştir. Gerçekleştirilen çalışma sonucunda en yüksek yüzey pürüzlülüğü çelik bilye ile kumlama sonrası kaplanan numunede gözlemlenmiştir. Tüm yüzeylerde homojen bir kaplama tabakası elde edilebilmiş olup zımparalama sonrası kaplanan numunede diğer numune gruplarına göre yaklaşık 2,5 kat kadar daha kalın bir kaplama tabakası elde edilebilmiştir. Yapılan tüm analizler sonrasında sertlik ve aşınma dayanımı en yüksek olan numune zımparaladıktan sonra kaplanan numune olmuştur.

**Özet**

Alüminyum alaşımları, hafifliklerinden dolayı pek çok sektörde geniş bir uygulama alanında kullanılmaktadır. Bununla birlikte, bazı uygulamalar alüminyum alaşımlarının aşınma direncinin iyileştirilmesini gerektirmektedir. Bu çalışmanın amacı, başlangıç yüzey koşullarının 2024 alüminyum alaşımı üzerindeki soğuk püskürtmeli kaplamaların aşınma direnci üzerindeki etkisini araştırmaktır. Farklı yüzey işlemleri uygulanmış (zımparalanmış, parlatılmış ve kumlanmış) parçaların üzerine ticari K-20-11 tozları 500 °C de püskürtülerek kaplanmıştır. Kaplamaların uygulanmasında N<sub>2</sub> gazı kullanılmış ve kaplama öncesi yüzey işlemleri farklılık gösteren tüm bu numuneler aynı şartlar altında kaplanmıştır. Yüzey pürüzlülükleri kaplama öncesi ve sonrası olacak şekilde yüzey profilmetresi kullanılarak incelenmiştir. Kaplama kalınlıkları kesitlerden alınan mikroskop görüntüleri üzerinden ölçülmüş ve yüzey pürüzlülüğünün kaplama kalınlığına etkisi tartışılmıştır. Numunelere kuru kayma koşullarında ball-on disk aşınma testi uygulanmış ve aşınma sonrası tüm numunelerin aşınma profilleri oluşturulmuştur. Aşınma profilleri kullanılarak hacim kayıpları hesaplanmış ve sürtünme katsayısı değişiklikleri ve aşınma profilleri birlikte tartışılmıştır. Numunelerin kaplama kalınlıkları parlatılmış, zımparalanmış ve kumlanmış numunelerde sırasıyla ortalama 87 µm, 228 µm ve 147 µm olarak ölçülmüştür. Aşınma direnci en yüksek olan numune kumlama işlemi sonrası kaplanan numune olmuştur. Sonuç olarak soğuk spreylere kaplama uygulaması ile Al, Zn ve Al<sub>2</sub>O<sub>3</sub> içerikli K-2011 ticari kodlu kaplama uygulaması ile 2024 alüminyum alaşımlarının kuru kayma koşullarındaki aşınma direnci geliştirilmiştir. Kumlama sonrası kaplanmış numunelerde parlatılmış ve sonrasında kaplanmış numuneler ile karşılaştırma yapıldığında gözlemlenen yaklaşık %33'lük bir aşınma dayanımı artışı mevcuttur.

**Anahtar Kelimeler:** 2024 Al Alaşımı, aşınma, kaplama, soğuk spreylere.

**EFFECTS OF SURFACE TREATMENTS PRIOR TO COLD SPRAY ON THE WEAR  
RESISTANCE OF 2024 ALLOYS**

**Abstract**

Aluminum alloys are widely used in various industries due to their lightweight properties. However, certain applications require the improvement of the wear resistance of aluminum alloys. The aim of this study is to investigate the effects of initial surface conditions on the wear resistance of cold-sprayed coatings on 2024 aluminum alloy. Parts with different surface treatments (sanded, polished, and shot-blasted) were coated with commercial K-20-11 powders at 500 °C using cold spraying. Nitrogen gas was used in the coating process, and all these samples with varying pre-coating surface treatments were coated under the same conditions. Surface roughness was examined using a surface profilometer before and after coating. Coating thicknesses were measured from microscope images of cross-sections, and the impact of surface roughness on coating thickness was discussed. Dry sliding ball-on-disk wear tests were conducted on the samples, and wear profiles of all samples were generated after the wear tests. Volume losses were calculated using the wear profiles, and changes in friction coefficients and wear profiles were discussed together. Coating thicknesses of the samples were measured as 87 μm, 228 μm, and 147 μm for polished, sanded, and shot-blasted samples, respectively. The sample with the highest wear resistance was the one coated after shot blasting. In conclusion, cold spray coating application with K-2011 commercial code, containing Al, Zn, and Al<sub>2</sub>O<sub>3</sub>, improved the wear resistance of 2024 aluminum alloys under dry sliding conditions. When compared to polished and subsequently coated samples, a significant increase of approximately 33% in wear resistance was observed in the samples coated after shot blasting.

**Keywords:** 2024 Al alloy, wear, coating, cold spray.

## **Giriş - Introduction**

Alüminyum alaşımlarının sahip olduğu düşük yoğunluk, yüksek şekillendirilebilme kolaylığı, yüksek korozyon dayanımı, fiziksel ve mekanik özelliklerinin iyileştirilebilmesi özellikleri sayesinde endüstride yaygın olarak kullanılmaktadır (İpekoğlu, 2011). Tüm alüminyum alaşımları arasında Al/Cu (2XXX-serisi) alaşımları, uçak endüstrisinde sıklıkla gövde ve kapı kaplamaları, sırt yüzgeçleri ve pervaneler olarak kullanılan yüksek dayanımlı alaşımlardır. Ayrıca, alüminyum alaşımları, kuru sürtünme koşulları altında büyük sürtünme katsayılarına ve zayıf aşınma direncine yol açan adheziv aşınmaya eğilimlidir (Mehta et al., 2004). Hafiflik avantajı ve yüksek spesifik mukavemet özelliklerine karşın, gerçek koşullar altında, 2XXX serisi alüminyum alaşımlarının korozyon ve aşınma direnci düşük olarak nitelendirilmektedir (Long et al., 2017). Çeşitli yüzey işlemleri, alüminyum alaşımlarının yüzey özelliklerini iyileştirmenin etkili bir yoludur. Anotlama (Abdel-Gawad et al., 2019), fiziksel buhar biriktirme (PVD) (Bashir et al., 2017; Lu et al., 2018), elektrolitik biriktirme (Yin et al., 2016), sol-jel biriktirme (Yu et al., 2019), lazer kaplama (Ravnikar et al., 2013) ve plazma nitrüleme (da Silva Savonov et al., 2019) gibi teknikler kullanılarak Al alaşımları üzerinde koruyucu kaplamalar hazırlanmıştır. Ancak bu yöntemlerin yüksek maliyet, karmaşık süreç, zayıf kontrol edilebilirlik ve uygulama zorluğu gibi çeşitli eksiklikleri vardır. Ayrıca çoğunda yüksek sıcaklıklar gerekir ve bu sıcaklıkların çoğu yapıda termal gerilmelere neden olmakta ve dikey ve yatay çatlak oluşumları nedeniyle kaplama-altlık ara-yüzeyini ve hatta kaplamanın kendisini negatif etkilemektedir. Soğuk sprey prosesi özellikle metalik toz parçacıkların çok yüksek hızla (süpersonik) ivmelendirilerek yüzeye çarpmaları sonucunda parçacıkların deformasyon kabiliyetine bağlı olarak yüzeyde birikmesine olanak sağlayan yeni bir kaplama prosesisidir. Bu yüksek ivmelenme proses gazlarının (hava, azot, helyum ve karışım kombinasyonu) önce ısıtılması ve basınç altında sıkıştırılmasını takiben nozülden genişleterek çıkışı ile sağlanmaktadır (da Silva et al., 2017). Eklemeli imalat proseslerinden biri olarak da kabul edilen bu yöntem, diğer termal sprey kaplama yöntemlerine göre daha düşük sıcaklıklarda gerçekleştiği için zararlı termal etkilerin azaltılmasını sağlar. Kaplama tabakasını oluşturacak parçacıklar ve altlık malzeme arası arayüzlerdeki şiddetli plastik deformasyona atfedilen metalurjik bağlanma ve mekanik kilitleme, altlık üzerinde çökme mekanizmaları ile gerçekleşir (Kim et al., 2023). Bu yöntemde diğer püskürtme yöntemlerinden farklı olarak yüksek kinetik enerji ve düşük termal enerji kullanılır. Böylece, kaplamalar daha kalın, termal gerilmeler daha az olduğu için çatlaksız ve minimum oksidasyonla elde edilebilir. Püskürtme işlemi sırasında kullanılan sıcaklıklar, termal bozulmanın yanı sıra hammadde malzemesinin

oksidasyonunu da önler; Böylece kaplamalar pratik olarak oksitsizdir ve yeni fazların oluşumuna yol açabilecek kimyasal reaksiyonlar oluşmaz (da Silva et al., 2017; Kim et al., 2023). Şekil 1’de soğuk sprej prosesi şematik olarak gösterilmiştir.

**Şekil 1.** Soğuk Sprej Prosesi (da Silva et al., 2017)

Soğuk sprej prosesinde kullanılan kaplama malzemeleri metal ve alaşımları, sermetler, kompozitler ve polimer esaslı malzemelerdir. Sistem üreticileri tarafından endüstriyel açıdan yaygın olarak kullanılan malzemeler: WC-Co, CrC-NiCr, Al, Cu, Al<sub>2</sub>O<sub>3</sub>, SiO<sub>2</sub>, SiC, Ni, Cr, Fe, B, C, Ti, Cr<sub>2</sub>O<sub>3</sub>, Zn, B<sub>2</sub>O, TiO<sub>2</sub>, WC, ZnB<sub>2</sub>, (Ti+Ni), (C, Co, Fe, W), (C, Cr, Ni), (Al, Ni), (Al, Hf, Fe, Mg, Si, Ti, Y, Zr), epoksi reçineler, poliüretan ve bir çok termoplastik malzemeler olup altlık malzeme olarak metal ve alaşımlar, seramikler, cam, kağıt ve polimerler kullanılabilir (Üstel and Altuncu, 2017) Yapılan çalışmada 2024 alüminyum alaşımları yüzeylerine farklı yüzey işlemleri uygulandıktan sonra aynı şartlar altında Al, Zn ve Al<sub>2</sub>O<sub>3</sub> karışım tozları ile soğuk sprej kaplama işlemi uygulanmıştır. Yüzey işlemlerinin yüzey pürüzlülüğüne, kaplama kalınlıklarına ve numunelerin aşınma dayanımlarına etkileri incelenmiştir.

### **Malzeme ve Metot - Materials and Methods**

Altlık numune olarak kimyasal bileşimi Tablo 1’de verilen 2024 alüminyum alaşımları kullanılmıştır. Alaşımlar 10x30 mm<sup>2</sup> yüzey alanı ve 4 mm kalınlıkta numunelere kesildikten sonra üç farklı gruba ayrılmıştır. Yüzeyleri parlatma, zımparalama ve kumlama işlemleri her bir gruba sırasıyla uygulanmıştır. Parlatma işlemi uygulanan grup numuneleri 1200 gride kadar zımparalanmış ve 3 µm’ye kadar parlatılmıştır. Zımparalama işlemi uygulanan grup 120 gride kadar zımparalanmıştır. Tüm zımpara izlerinin paralel ve tek yönde olması sağlanmıştır. Kumlama işlemi uygulanan numuneler 0,5 MPa basınç ile S330 ticari kodlu çelik kumlama bilyeleri kullanılarak kumlanmıştır. En son tüm numuneler ultrasonik temizleyici kullanılarak etanol ile 20 dakika temizlenmiştir.

**Tablo 1.** 2024 Al alařımının kimyasal ieriđi

Element	Fe	Si	Cu	Cr	Mn	Mg	Zn	Diđer	Al
ađ.%	0,5	3,8- 4,9	0,1	0,3- 0,9	1,2- 1,8	0,5	0,25	0,30	Kalan

Yüzey hazırlıkları tamamlanan numuneler aynı kořullar altında kaplanmıřtır. Tüm numunelerin kaplanmasında ieriđi ađ.%33- 37 Al, ađ.%38-42 Zn, ađ.%23-27Al<sub>2</sub>O<sub>3</sub> olan K-20-11 ticari kodlu karıřım tozlar kullanılmıřtır. Sıcaklık 500 °C olarak ayarlanmıř ve karıřım toz besleme hızı dakikada 6g seçilmiřtir. Kaplanmıř numune yüzey ve kesitleri stereo mikroskopta incelenmiřtir. Dikey kesitleri incelenen numunelerin kaplama kalınlıkları ölçölmüřtür. Stereo mikroskop incelemelerinde Clemex yazılımlı Nikon optik mikroskop kullanılmıřtır. Numunelerin kaplama öncesi ve sonrası yüzey pürüzlölükleri Mitutoyo SurfTest SJ-310 kullanarak incelenmiřtir. Numunelerin aşınma testleri CSM tribometre ball-on disk aşınma cihazı kullanılarak gerekleřtirilmiřtir. Ařındırıcı eleman olarak 6mm apında Al<sub>2</sub>O<sub>3</sub> bilyeler kullanılmıřtır. Yük 2N ve mesafe 50 m olacak řekilde belirlenmiř ve bilye kayma hızı 10cm/s olarak ayarlanmıřtır. İz apı 5mm'dir. Ařınma testleri sonrası oluřan aşınma iz profilleri stereo mikroskop ve pürüzlölük ölçüm cihazı ile incelenmiřtir. Hacim kayıpları hesaplamaları için aşınma yolu dik kesilecek řekilde ölçüm yapılmıř ve hesaplanmıřtır.

### **Bulgular ve Tartıřma - Findings and Discussion**

Kaplama iřlemi sonrası numunelerin yüzey morfolojileri řekil 2'deki gibidir. Tüm numune yüzeyleri homojen bir řekilde kaplanmıř olup kumlama iřlemi sonrasında kaplanan c numunesinde yükselti farkları nedeni ile oluřan bir kontrast farkı mevcuttur. Bu durum kaplama tabakasının daha pürüzlölü elde edildiđinin bir göstergesi olarak düşünölebilir.

**řekil 2.** a)Parlatma b)Zımparalama c)Kumlama iřlemleri sonrası kaplanan numunelerin yüzeyi  
Kaplama öncesi ve sonrası yüzey pürüzlölük ölçüm grafikleri řekil 3'te verilmiř olup stereo mikroskop ile elde edilen bulguları destekler niteliktedir. Beklenen řekilde en düşük yüzey pürüzlölüđü parlatılmıř numunede elde edilmiřtir. En yüksek yüzey pürüzlölüđü ise kumlanmıř

numunededir. Kaplama işlemi sonrası yüzey pürüzlülükleri kaplama öncesine paralellik göstermektedir.

Şekil 3. Yüzey pürüzlülüğü grafiği

Numunelerin dikey kesitleri ve kaplama kalınlık ölçümleri Şekil 4'te verilmiştir. Kaplama kalınlıkları ortalaması grafiği ise Şekil 5'tedir. Parlatılmış numune arayüzeyi zımparalanmış ve kumlanmış numune ara yüzeylerine göre daha keskindir. Net bir geçiş bölgesi görülmemiştir. Yüzeyin parlatılmış olması sebebi ile yüzeyin kaplama parçacıklarına tutulumu diğer numunelere kıyasla daha az olmuş ve bu durum en düşük kaplama kalınlığının parlatılmış numunede gözlemlenmesine neden olmuştur. Yüzey pürüzlülüğünün en çok gözlemlendiği kumlama sonrası kaplanan numunelerde kalınlığı ortalama 33,5 µm olarak ölçülen bir geçiş bölgesi gözlemlenmiştir. Zımparalanmış ve kumlanmış numunelerin her ikisinde de altlık ve kaplama tabakası arasında keskin bir geçiş olmadığı ve bir geçiş bölgesi mevcut olduğu görülebilir. Bu durum metalurjik bağın daha kuvvetli olduğunun bir göstergesidir (Winnicki et al., 2015). Ayrıca uygulanan yüzey işlemleri kaplamaların yüzeye tutunabilirliğini kolaylaştırmış ve birikme verimliliğini de artırarak kaplama kalınlığının parlatılmış numuneye göre daha fazla olmasını sağlamıştır. Parlatılmış numunedeki ortalama kaplama kalınlığı 83,9 µm olarak ölçülürken, zımparalanmış numune için bu değer 227,3 µm ve kumlanmış numune için 174,8 µm olarak ölçülmüştür.

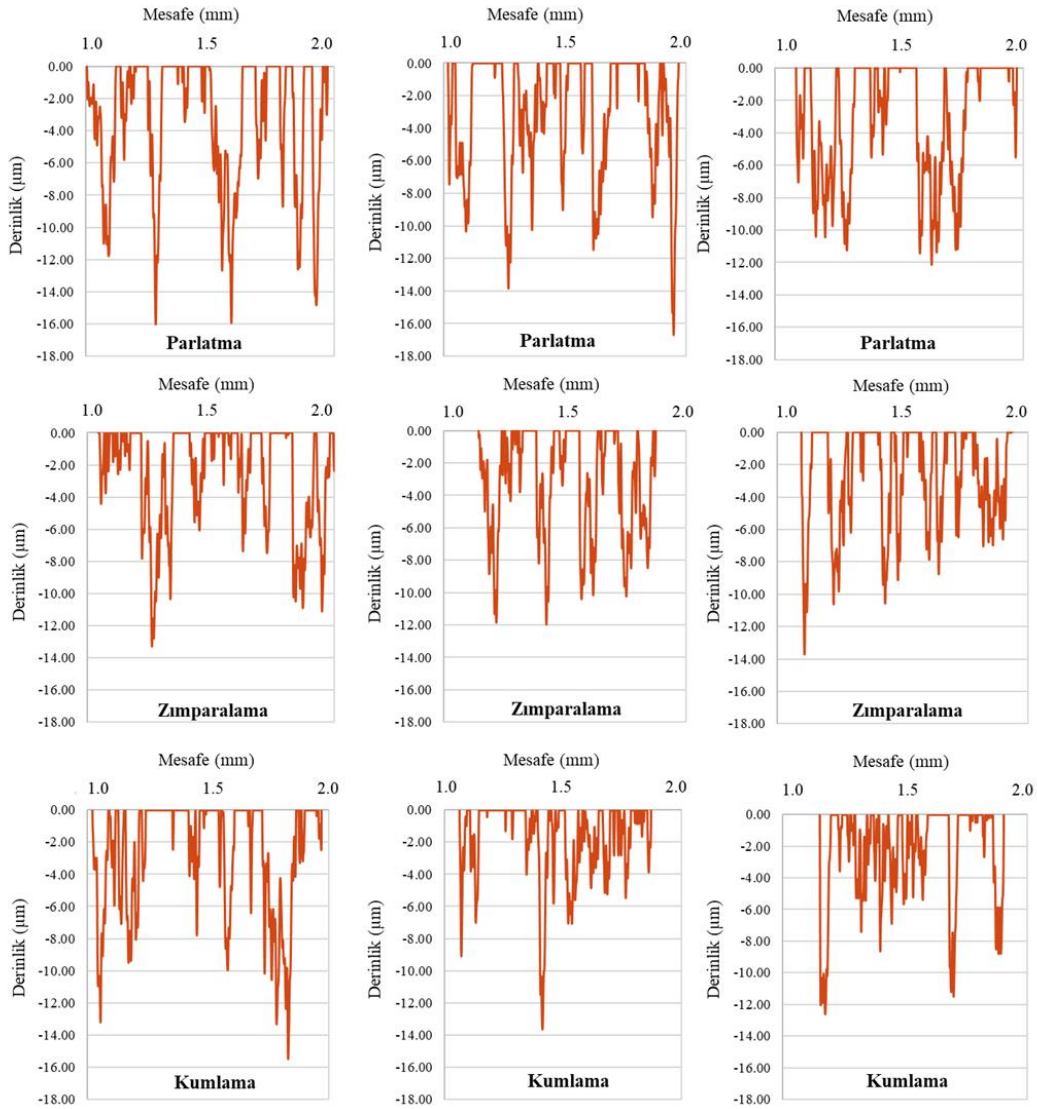

Şekil 4. a)Parlatma b)Zımparalama c)Kumlama işlemleri sonrası kaplanan numunelerin kaplama kalınlıkları

Şekil 5. Kaplama kalınlıkları grafiği

Aşınma sonrası numunelerin aşınma izleri profilometre ile ölçülmüş ve her bir yüzey işlemine ait numuneden üç farklı ölçüm alınarak aşınma izi profilleri çizilmiştir. Aşınma izi profil grafikleri Şekil 6'da verilmiştir. Aşınma iz derinliğinin en fazla gözlemlendiği profil parlatılmış ve kaplanmış numune yüzeyleri olmuştur. Aşınma iz genişlikleri de parlatılmış ve kaplanmış numunelerde daha fazla gözlemlenmiştir. Zımparalama ve kumlama yüzey işlemleri sonrası kaplanan numunelerde iz derinlik ve genişlikleri daha az gözlemlenmiştir.

Şekil 6. Aşınma profilleri

Hacim kaybı hesaplamaları yapılmış ve Şekil 7'deki grafikte tüm numuneler için bir karşılaştırma yapılmıştır. Kaplama kalınlıklarının düşük olduğu gözlemlenen ve metalurjik bağın daha zayıf kurulduğu düşünülen parlatma sonrası kaplanmış numunelerde maksimum hacim kaybı gözlemlenmiştir. Her ne kadar kumlanmış numunelerin hacim kaybı hesaplamaları daha geniş bir aralıkta seyretse de, en az hacim kaybı ortalaması kumlanmış numunede ve sonrasında zımparalanmış numunede gözlemlenmiştir. Uygulanan yüzey işlemleri kaplamaların daha etkili olmasını sağlamış ve aşınma dayanımını arttırmıştır. Tek yönde yönelmiş zımpara izlerinin aşınma dayanımına etkisine göre kumlama etkisi daha yüksek olmuş ve kumlama işlemi aşınmaya karşı daha dayanıklı kaplamaların elde edilmesini sağlamıştır.

**Şekil 7.** Hacim kaybı grafiği

Aşınma sırasında ölçülen sürtünme katsayıları grafiği Şekil 8’de verilmiştir. Grafik incelendiğinde tüm aşınma sonuçları ile de uyumlu olacak şekilde parlatılmış ve kaplanmış numune aşınmaya karşı yeterli direnci gösterememiş ve diğer yüzey işlemlerine göre daha düşük sürtünme katsayısı elde etmiştir. Maksimum sürtünme katsayısı kumlama sonrasında kaplanmış numunede gözlemlenmiştir ve bu durumda maksimum dayanımı kumlanmış numunenin sergilediği söylenebilir.

**Şekil 8.** Sürtünme katsayıları değişimi

### **Sonuçlar ve Öneriler - Conclusion and Recommendations**

Gerçekleştirilen çalışma kapsamında zımparalama, parlatma ve kumlama yüzey işlemleri uygulanan 2024 Al alaşım numuneler üzerine Al, Zn ve Al<sub>2</sub>O<sub>3</sub> içeren ticari K-20-11 karışım tozu 500 °C de soğuk sprej yöntemi kullanılarak kaplanmıştır. Kaplamaların yüzey pürüzlülüğü, kalınlığı ve aşınma direnci incelenmiştir. Çalışma sonucunda kumlama ve zımparalama sonrası kaplanan numunelerde sırasıyla 3 ve 4 kata kadar daha fazla kaplama kalınlığı elde edilmiş ve bu durum uygulanan yüzey işlemlerinin kaplamaların yüzeye tutunabilirliğini arttırması ile açıklanmıştır. Tüm numuneler içinde hem kaplama öncesi hem de kaplama sonrası maksimum yüzey pürüzlülüğü kumlanmış numunelerde elde edilmiştir.

Maksimum aşınma derinliđi ve geniřliđi ve dolayısıyla maksimum hacim kaybı parlatma iřlemi sonrasında kaplanan numunede gözlemlenmiřtir. Sürtünme katsayısı deđiřimi de bunu desteklemektedir ve minimum sürtünme katsayısı parlatma sonrası kaplanan numunede gözlemlenirken maksimum sürtünme katsayısı kumlama iřlemi sonrası kaplanan numunede gözlemlenmiřtir. Tüm sonuçlar deđerlendirildiđinde aşınma dayanımı en yüksek olan numune kumlandıktan sonra kaplanan numune olmuřtur.

**Abstract**

The main female sex hormone, estrogen, is in charge of secondary sexual traits that emerge during puberty and sexual maturity as well as the regulation of female reproductive system processes. In order to influence gene expression, estrogens attach to specialized receptors called estrogen receptors (ERs), which then trigger transcriptional processes and signaling events. These effects could be mediated by processes other than direct binding to DNA, such as the direct binding of estrogen receptor complexes to certain regions in gene promoters. In humans, estrogen receptors control a wide range of intricate physiological functions. Numerous conditions, such as those pertaining to reproduction, abnormalities of the bones, lung cancer, cardiovascular disease, gastrointestinal problems, urogenital tract diseases, neurological disorders, and cutaneous melanoma, can be brought on by aberrant ER signaling. The three most well-known ERs are ER alpha, ER beta, and novel G-protein coupled estrogen receptor 1. Differential expression of estrogen receptors in different cell lines, species differences, varied experimental methods, and indirect effects of estrogens can all account for the findings of experimental investigations. Estrogens have been linked to an increased risk of disease overall, elevated concerns around environmental estrogen exposure, and the pathophysiology of a number of malignancies. An overview of estrogen and its receptors is given in this text.

**Keywords:** Cancer, Antiandrogen, Malignancy, estrogen receptor alpha, estrogen receptor beta, signaling pathway, mediation, G-protein-coupled estrogen receptor 1

## **Introduction**

One of the most significant female sex hormones is estrogen, a fat-soluble steroid hormone (Pepermans et al, 2021). It also affects a wide range of other physiological systems, such as the immunological, cardiovascular, and metabolic systems. It performs numerous vital physiological roles and is primarily produced by the adrenal cortex, testes, and ovaries. Since it has been established that estrogens and estrogen receptors contribute to the development and spread of several tumor types, including breast, ovarian, kidney, adrenal, prostate, testicular, lung, and colon cancers, interest in estrogens and estrogen receptors has grown (Aitken et al. 2004). In both sexes, the effects of estrogens and associated estrogenic compounds are intricate and varied. It is widely known to have a key part in the development of estrogen receptor-expressing breast cancers, but it also plays a significant role in a variety of other malignancies. It directly impacts tumor cells as well as the activity of other cells, including fibroblasts, in the tumor microenvironment. Numerous synthetic, natural, and medicinal compounds target the pathways that generate and react to estrogen (Arterburn and Prossnitz, 2024). In around 80% of cases of breast cancer, estrogen is also a major factor since it stimulates the growth of tumors, which is mostly estrogen-dependent (McDonnell et al, 2021; Haines et al, 2021). According to Soares et al. (2023), estrogens are also crucial in the occurrence and progression of several cancers, including ovarian, endometrial, and breast cancer.

## **Estrogens and ERs**

Estrogen receptor  $\alpha$  (ER- $\alpha$ ) and estrogen receptor  $\beta$  (ER- $\beta$ ) are the two types of receptors that estrogens work on to carry out their physiological functions. Two distinct genes on separate chromosomes encode the proteins ER- $\alpha$  and ER- $\beta$  (Ghodbane et al, 2013). The most prevalent estrogen receptor in the skin, ER- $\beta$  is also present in the brain, colon, prostate, and other well-known estrogen-sensitive tissues such the uterus and mammary glands (Aitken et al, 2004). The antiproliferative effects of ER- $\beta$  activation seem to be counterbalanced by ER- $\alpha$ 's opposite action. According to Caruntu et al. (2016), recent research has determined that the balance between ER- $\alpha$  and ER- $\beta$  expression is the primary determinant of estrogen signaling. It is well recognized that certain malignancies, like breast cancer, are estrogen-dependent. Hormones including progesterone and estrogen are known to be crucial in the development of this cancer (Hilton et al, 2018). Melatonin has been shown to suppress breast cancer cell growth in vivo as well as in vitro (Laborda et al., 2023). Eventually, it was discovered that melatonin caused cancer cells to undergo programmed cell death, or apoptosis, and decreased the growth of breast cancer cells (Bushra et al, 2011). Melatonin is believed to have this impact because it can lower

inflammation and oxidative stress, two things that are known to have a role in the development of cancer. A hormone with many oncostatin actions, melatonin is particularly useful in treating breast cancer (Gutic et al., 2023). By scavenging free radicals, it demonstrates antioxidant qualities and shields cells from oxidative damage caused by carcinogen-mediated deoxyribonucleic acid alterations. This delays the beginning of malignant transformation (Hilton et al, 2017). Melanoma incidence rates in females are comparable to those of breast cancer, indicating a potential involvement for female sex hormones in the development of melanoma in females (Ramadan et al, 2002). Simultaneously, a second study revealed that patients with melanoma were also at risk for breast cancer, and that women who had previously been diagnosed with breast cancer were more likely to develop melanoma (Hong et al, 2005). The association between ERs and melanoma is confirmed by the expression of ER- $\beta$ s in several melanoma cell lines investigated (BLM, WM115, A375, WM1552) (Hamada et al., 2011).

### **Estrogen Receptor Signaling Mechanisms**

Estrogen functions as a steroid hormone and has the ability to cross the plasma membrane to directly affect DNA sequences through interaction with intracellular ER $\alpha$  and ER $\beta$ . On the other hand, estrogen can work with GPER1, ER $\alpha$ , and ER $\beta$  to initiate intracellular signaling cascades. Because of differences in the cellular and molecular mechanisms that control gene expression, estrogen-mediated signaling events can be categorized as either genomic or non-genomic. Direct or indirect DNA binding can occur between estrogen-receptor complexes (Fuentes & Silveylla, 2019). Examples of genomic implications include the translocation of estrogen-receptor complexes into the cell nucleus and direct interaction with chromatin at specific DNA sequences known as estrogen response elements (EREs). More than one-third of human genes controlled by estrogen receptors have been reported to lack ERE sequence elements, despite the fact that EREs have been found in a variety of gene promoters and regulatory regions (O'Lone, Frith, Karlsson, & Hansen, 2004). Conversely, non-genomic impacts entail the indirect control of gene expression via a variety of intracellular signaling pathways.

### **Estrogens and Their Effects on Carcinogenesis**

Over the world, 18.1 million new instances of cancer have been found; according to reports, breast cancer is the most common form to be identified, with more cases than colon cancer (2.3 million cases, 11.7%) (Hall and Filardo, 2023). The International Agency for Research on Cancer (IARC) of the World Health Organization recorded 685,000 deaths from breast cancer in 2020 and projects that by 2040, there would be 1 million fatalities and 3 million new cases (Arnold et al., 2022). It is noteworthy that the number of instances of breast cancer is rising

quickly in transitioning nations, despite the fact that the disease's death rate is still quite high (Abancens et al, 2020). The sharp rise in colon cancer, which has been linked to a significant hereditary component and a bias towards men, is equally worrisome (White et al, 2018). Although the exact causes of colon cancer in young adults are unknown, environmental factors such as inflammation, nutrition, and microbiome have been proposed (Sinicrope, 2022). The fact that this trend is in line with rising human exposure to environmental estrogens and rising rates of obesity in young people is equally worrisome (Newbold et al, 2009). Metabolic syndrome is linked to increased exposure to environmental estrogens (Agnoli et al, 2010; Zheng et al, 2023). A group of illnesses known as metabolic syndrome are known to have a role in the development of cancer, particularly malignancies of the breast and colon (Esposito et al., 2012; Chan et al., 2014). Estrogens have been linked to the pathogenesis of several cancers (Sun et al, 2018; Schouten et al, 2022), including colon and kidney cancer (Mori et al, 2021). They are effective against female reproductive cancer (Miyamoto and Shiozawa, 2019; Johansson et al., 2022), as well as lung (Chakraborty et al., 2010; Hsu et al., 2017), liver (Shi et al., 2014; Sukocheva, 2018; Carruba, 2021). Understanding the receptor-based processes by which endogenous and environmental estrogens promote their biochemical and biological effects is fundamentally required, regardless of the specific nature of the model underlying estrogen-induced carcinogenesis (Hall and Filardo, 2023).

### **Effects of Estrogen-Induced Carcinogenesis through Exposure to Environmental Estrogens**

Endocrine disrupting chemicals (EDCs) are substances found in our environment that mimic estrogen. These compounds are referred to as xenoestrogens. Foods, plastics, food containers, cosmetics, and skin care items are common sources of xenoestrogens (Lóránd et al, 2010). Dietary phytoestrogens like genistein and daidzein, artificial environmental contaminants like bisphenol A, and 4-hydroxytamoxifen are a few specific instances of xenoestrogens (Hall and Filardo, 2023). Although EDCs have long been linked to carcinogenesis, there is disagreement regarding how much of a role they play in cancer (Morgan et al, 2017; Gonzalez et al, 2019). Bisphenols are widely utilized in the manufacturing of dental sealants, thermal invoice sheets, polycarbonate plastics, and plasticized linings in packaged foods (Porrás et al, 2014; Russo et al, 2017). Research has demonstrated that BPA seeps into the environment and is found in over 95% of the population, with newborns and children having the greatest quantities found (Calafat et al, 2005; Lehmler et al, 2018). According to experimental data from a number of lab investigations, BPA has a "provocative effect" on the development of breast cancer (Seachrist

et al, 2016; Wang et al, 2017). Toxicologists' mechanistic hypotheses for monotonicity include the impact of high hormone concentrations on desensitized, weakened, or inactivated receptors.

### **Conclusion**

Estrogens are important for both health and illness. There are sex hormones everywhere. Both sexes exhibit a balance of male and female hormones. It seems that estrogens have a significant impact on the growth and metastasis of many neoplasms. Many tumors contain estrogens, which are produced locally. The role of estrogen receptors in oncogenesis is not negligible. Hormones, receptors, and enzymes interact intricately in the complex process of estrogen activity; it is neither simple nor unidirectional. Numerous signaling channels are activated. Not just malignant tumors known to be hormone-dependent, such lung cancer, but also many other malignant tumors that are oncogenesis- and progression-related are influenced by sex hormones. The most often prescribed and successful cancer treatment is endocrine therapy. Additional reasons for the development of GPER-targeted cancer therapies include the rise in cancer cases worldwide, the known carcinogenic effect of environmental estrogens, their abundance in economically developed countries, and the significant role that GPER plays in metabolic syndrome, a health condition that promotes cancer. With great and exciting potential to offer a more comprehensive approach to endocrine therapy for breast cancer and other solid malignancies, GPER is still a "drug-free" therapeutic target in this field. Positive outcomes from these clinical trials should supplement current antiestrogen therapy techniques and maybe broaden our understanding of the patients who may benefit from it.

**Özet**

Bu çalışmada, okul binası maliyetlerinin ön tahmini için bir yöntem önerisinde bulunulmuştur. Bu amaçla, Kamu Kurumları tarafından ihaleye çıkmış ve sonuç ilanı yayınlanmış 96 adet okul binasına ait projeler Elektronik Kamu Alımları Platformu (EKAP)'tan sağlanmıştır. Bu projeler 81 adet eğitim, 15 adet test verisi olacak şekilde ayrılmıştır. Projeler üzerinden eğitim yapılarının inşaat maliyeti çıktı vektörlerini etkileyebilecek; “Derslik Sayısı, Yapım Süresi, Toplam Kat Sayısı, Kat Yüksekliği, Bina Yüksekliği, Bina Yükseklik Sınıfı (BYS), Bodrum Yüksekliği, Deprem Tasarım Sınıfı (DTS), Zemin Sınıfı, Zemin Emniyet Gerilmesi, Yatak Katsayısı, Beton Sınıfı, Asansör Sayısı, Islak Alan, Radye Temel Yüksekliği, Kat Alanı, Bodrum Alanı, Toplam Alan” parametreleri belirlenerek modelleme ve analizlerde kullanılmıştır. Analizler “SPSS Statistics 26” yazılımı ile gerçekleştirilmiştir. Bu parametreler kullanılarak Regresyon Analizleri (RA) yapılmış ve eğitim yapılarının maliyetlerini tahmin etmek için denklemler geliştirilmiştir. Geliştirilen modellerle Yaklaşık Maliyetleri ve Sözleşme Bedelleri tahmin edilmeye çalışılmıştır. Oluşturulan denklemlerle tüm parametrelerin kullanıldığı model Yaklaşık Maliyet Bedeli için determinasyon katsayısı  $R^2=0.900$ , Sözleşme Bedeli için ise  $R^2=0.927$  ile en iyi ilişki düzeyine sahip model olmuştur. Modelin kullanılması ile elde edilen yaklaşık maliyet tahminleri ve gerçek maliyetler arasında %17,5 düzeyinde hata oranı saptanmıştır. Tahmin edilen sözleşme bedelleri ile gerçek sözleşme bedelleri arasında ise %18,2 hata olduğu belirlenmiştir. Tahmin edilen sonuçlar ile gerçek sonuçlar arasındaki tutarlılığı kontrol etmek amacıyla Durbin-Watson kriteri kullanılmıştır. Sonuç olarak, farklı tip ve katsayılarına sahip okul yapılarının yaklaşık maliyetlerini ve sözleşme bedellerini %20'den düşük hata oranları ile tahmin edebilen bir yaklaşım oluşturulmuştur. Gerek kamu kuruluşları gerekse taahhütçü yapım firmaları bu modellemelerden istifade ederek zamansal tasarrufler sağlayarak gerçekçi maliyet tahminlerinde bulunabileceklerdir. Benzer çalışmaların veri adetleri artırılarak yapılması, daha sonraki modellemelerde hata oranı minimizasyonu için bir çözüm olabilir.

**A MODEL PROPOSAL FOR ESTIMATE THE APPROXIMATE COSTS AND  
CONTRACT FEES OF PUBLIC EDUCATION BUILDINGS (SCHOOL BUILDINGS)**

**Abstract**

In this study, a method is proposed for the preliminary estimation of school building costs. For this purpose, the projects of 96 school buildings, which were put out to tender by public institutions and the result announcement was published, were provided from the Electronic Public Procurement Platform (EKAP). These projects are divided into 81 training data and 15 test data. The construction cost of educational buildings through projects may affect the output vectors; "Number of Classrooms, Construction Duration, Total Number of Floors, Floor Height, Building Height, Building Height Class (BYS), Basement Height, Earthquake Design Class (DTS), Floor Class, Ground Safety Stress, Bed Coefficient, Concrete Class, Number of Elevators, "Wet Area, Raft Foundation Height, Floor Area, Basement Area, Total Area" parameters were determined and used in modeling and analysis. Analyzes were carried out with "SPSS Statistics 26" software. Using these parameters, Regression Analyzes (RA) were performed and equations were developed to estimate the costs of educational structures. Approximate Costs and Contract Prices were tried to be estimated with the developed models. The model in which all parameters were used with the created equations was the model with the best correlation level, with the determination coefficient  $R^2=0.900$  for the Approximate Cost Price and  $R^2=0.927$  for the Contract Price. An error rate of 17.5% was found between the approximate cost estimates obtained using the model and the actual costs. It was determined that there was an 18.2% error between the estimated contract prices and the actual contract prices. The Durbin-Watson criterion was used to check the consistency between predicted results and actual results. As a result, an approach that can estimate the approximate costs and contract prices of school buildings of different types and coefficients with error rates lower than 20% has been created. Both public institutions and contracting construction companies will be able to make realistic cost estimates by benefiting from these modeling, providing time savings. Conducting similar studies by increasing the number of data may be a solution to minimize the error rate in subsequent modeling.

**Keywords:** Building Cost Model, Multiple Linear Regression Model, School Buildings, Building Cost Estimation

## **GİRİŞ**

Maliyet, bir ürünün ortaya çıkması için yapılan harcamaların tümü olarak ifade edilmektedir. Yapı maliyeti ise, yapı ihtiyacının oluşmasından itibaren başlayan, yapımın inşa sürecindeki harcamaların toplamı olarak değerlendirilmektedir (Akınbingöl ve Gültekin, 2005). Maliyet tahminindeki en önemli amaç, kıt kaynakları en etkin şekilde kullanarak, değerlendirerek istenilen kalitede hizmet ya da ürünün sağlanması için gereken maliyeti belirleyebilmektir. Maksimum üretimin elde edilmesi ve projenin öngörülen kalitede tamamlanabilmesi için oluşacak harcamaların önceden doğru tahmin edilmesi ve aynı zamanda belirlenen maliyet limitleri içerisinde etkin bir maliyet kontrol sistemi ile denetlenmesi gereklidir (Kuruoğlu, Yönez, Topkaya ve Çelik, 2012). Yatırım kaynaklarının kısıtlı olduğu düşünüldüğünde, maliyet hesabının çok titiz çalışmalarla belirlenmesi, planlanması ve kontrol edilmesi gerekmektedir. Maliyet hesabının eksik ya da fazla tahmin edilmesi, bir inşaat projesinin uygulamasının maliyet açısından başarısız olmasına yol açabilir (Uğur, 2007). İhale, birden çok istekli arasından bir hizmetin veya bir malın en uygun istekliye bırakma işlemidir. İşi oluşturan kalemlerin piyasa fiyatının tam olarak bilinmediği veya belirsiz olduğu durumlar için ihale, fiyat oluşturma sürecinde önemli bir rol oynamaktadır (Emek, 2002). Kamu ihalesi, devletin idari kurumlarının taleplerini karşılamak ve halkın ihtiyacını gidermek için mal, hizmet ve yapım işlerinin satın alınmasıdır. Bu ihaleler, ülkelerin ekonomilerini yakından ilgilendirdiği için ülkelerin geleceğinde önemli bir yer kaplamaktadır (Kömürcü, 2006). Türkiye’de, kamu hukukuna tâbi olan veya kamunun denetimi altında bulunan veya kamu kaynağı kullanan kamu kurum ve kuruluşlarının yapacakları ihaleler de uygulanacak esas ve usulleri belirlemek amacıyla 2002 yılında 4734 sayılı Kamu İhale Kanunu yürürlüğe girmiştir (www.ihale.gov.tr).

## **2.YAPI MALİYETİ HESAPLAMA YÖNTEMLERİ**

Yapımın inşa sürecindeki her aşamada maliyet tahmini için kullanılan maliyet modelleri, kullanım amaçları doğrultusunda farklı sınıflara ayrılabilirler. İlk olarak 1950’li yıllarda, Avrupa’da konut ve kamu yapıları üzerinde basit bir planlama şeklinde ortaya çıkan model kavramı, 1970 ve 1980’li yıllardan sonra yapılan çalışmalar neticesinde sınıflandırılmaya başlanmıştır. Bunlar; geleneksel modeller, tanımlayıcı modeller, gerçekçi modeller, enformasyon sistemi yaklaşım modelleridir (Akınbingöl ve Gültekin, 2005).

### **2.1. Geleneksel modeller**

Geleneksel modeller; Analitik modeller, fonksiyonel elemanlara dayalı modeller, kaynaklara dayalı modeller, yapım birimlerine dayalı modeller olarak sıralanabilir (Akınbingöl ve Gültekin, 2005).

### **2.1.1. Analitik modeller**

Yapı üretim sürecinde eldeki bilgilerin kapsamının çok düşük olduğu ilk çalışmalardan ön tasarıma kadar ki aşamalarda kullanılan modellerdir. Amaç, en hızlı şekilde en doğru maliyet hesaplaması yapılması ve kullanıcılara sunulmasıdır (Akinbingöl ve Gültekin, 2005).

### **2.1.2. Fonksiyonel elemanlara dayalı modeller**

Elemanlara dayalı maliyet hesabı, yapı üretim sürecinin tasarım evresinde, maliyet planlaması ve kontrolünün yapılabilmesi için kullanılan bir maliyet hesabı türüdür (Uğur,2007).

### **2.1.3. Kaynaklara dayalı maliyet modelleri**

Yapı üretim sürecinin yapım aşamasında kullanılan bu modeller yardımıyla şantiye organizasyonu sağlanarak, yapılan organizasyonlarla etkin bir şantiye yönetimi gerçekleştirilebilir. Modeller, yapılacak olan her bir işe ait işgücü, malzeme ve araç gereç listesinin oluşumunu belirleyerek bunların maliyetlerinin bulunmasını sağlamaktadır (Uğur,2007).

### **2.1.4. Yapım birimlerine dayalı modeller**

Yapı üretim sürecinin yapım evresinde yapıyı oluşturmak için gerekli olan üretim birimleri ve işlemler yapım birimlerini oluşturmaktadır. Yapım birimlerine dayalı maliyet modeli de yapım birimlerinin uygulama projesi üzerinden ölçülen miktarlarıyla her birim için daha önceden belirlenmiş olan birim fiyatlarının çarpılıp elde edilen sonuçların alt alta toplanması ile yapının toplam maliyetinin hesaplanması ilkesine dayanır (Uğur,2007).

### **2.2. Gerçekçi modeller**

Gerçekçi modellerin tahmin doğruluğunun miktarlara dayalı modellere göre daha azdır. Buna rağmen, miktarlara dayalı modeller gelişmelerini neredeyse tamamladıkları halde, gerçekçi modellerin gelişme potansiyellerinin çok yüksek olduğu ileri sürülmektedir (Akinbingöl ve Gültekin, 2005).

### **2. 3. Uzman sistemler**

Bu modeller ile maliyet tahmini yapabilmek için veri tabanı ve bilgisayardan yararlanır. Maliyet tahmininde başarılı olabilmek için de bu sistemlerin mutlaka uzman kişiler tarafından yönlendirilmesi gerekir(Akinbingöl ve Gültekin, 2005).

### **2.4. Tanımlayıcı modeller**

Bu yaklaşım, maliyetleri miktarlar yerine tasarımın tanımlayıcı özelliklerine bağlamak fikrini temel alır. Tanımlayıcı modeller regresyon analizleri kullanılarak geliştirilmiştir. Regresyon analizini kullanma fikri, yapının maliyetini hem tasarım aşamasında belirlemek için hem de yüklenicinin yaklaşık maliyeti kestirebilmesi için geliştirilmiştir (Uğur,2007).

### **2.4.1. Regresyon Analizi**

Regresyon; aralarında neden-sonuç ilişkisi olan iki veya daha çok sayıdaki değişkenin bir denklem yardımıyla ifade edilmesidir. Herhangi iki veya daha çok sayıda değişken arasındaki ilişkinin yönü veya büyüklüğü ise regresyon analizi ile belirlenir. Regresyon analizinde, kurulan regresyon denkleminin tahmini yapılarak modelde yer alan değişkenlere dair parametreler tahmin edilir ve bu şekilde bağımlı ve bağımsız değişkenler arasındaki ilişkiler matematiksel olarak ortaya konur. Burada bağımlı değişken bir tane olmasına karşın bağımsız değişkenlerin sayısı değişebilir. Tek bağımlı ve tek bağımsız değişkenden oluşan modellere basit regresyon modeli, tek bağımlı ve birden çok bağımsız değişkenin oluşturduğu modellere ise çoklu regresyon modeli adı verilir. Regresyon analizinde modeli oluşturan değişkenlere dair katsayılar tahmin edilir. Bu katsayılar ise bağımlı değişken ile bağımsız değişken arasındaki ilişkilerin yönünü ve büyüklüğünü gösterir. Regresyon analizi kısaca, aralarında neden-sonuç ilişkisi bulunan iki veya daha çok sayıda değişken arasındaki matematiksel ilişkileri ortaya koyan yöntemdir (Temurlenk ve Yıldız, 2020).

#### **2.4.1.1. Doğrusal Regresyon Modeli**

Regresyon analizi, temel olarak bir değişkenin başka değişkenler tarafından açıklandığı varsayımına dayanır. Burada bir değişken, aralarında neden-sonuç ilişkisi bulunan diğer değişkenler ile birlikte matematiksel olarak modellenir ve bu modele *regresyon modeli* adı verilir. Regresyon modeli fonksiyonel formda şu şekilde ifade edilebilir:

$$Y = \beta_0 + \beta_1 X \quad (1. 1)$$

Eşitlik (1. 1)'de iki değişken arasındaki ilişkinin fonksiyonel formu gösterilmektedir. Bu değişkenler  $Y$  ve  $X$  değişkenleridir. Burada  $Y$  açıklanan veya bağımlı değişken olarak adlandırılırken  $X$  değişkeni açıklayıcı veya bağımsız değişken olarak isimlendirilmektedir.  $\beta_0$  sabit katsayısını,  $\beta_1$  ise  $Y$  ve  $X$  değişkeni arasındaki ilişkinin yönünü ve büyüklüğünü gösteren katsayısı temsil etmektedir (Temurlenk ve Yıldız, 2020).

##### **2.4.1.1.1. Bağımlı ve Bağımsız Değişken**

Bağımlı değişken kısaca bağımsız değişkenlere bağlı olarak değişen yani bağımsız değişkenler tarafından açıklanan değişkendir. Bağımsız değişken ise bağımlı değişkeni açıklayan değişkendir ve değişimi herhangi bir değişkene bağlı değildir. Eşitlik (1. 1)'de yer alan  $Y$  ve  $X$  sırasıyla bağımlı ve bağımsız değişkenleri temsil etmektedir. Yani bağımlı değişken olan  $Y$  bağımsız değişken olan  $X$  tarafından açıklanmaktadır (Temurlenk ve Yıldız, 2020).

#### **2.4.1.1.2. $\beta_0$ ve $\beta_1$ Katsayıları**

Modelde yer alan  $\beta_0$  katsayısı sabit katsayıyı temsil etmektedir. Sabit katsayı temel olarak bağımsız değişkenin sıfır olduğu durumda bağımlı değişkenin alacağı değerdir.  $\beta_0$  katsayısı güçlü teorik gerekçeler bulunmadığı takdirde doğrusal regresyon modellerinde yaygın biçimde yer almaktadır. Öte yandan modelde yer alan  $\beta_1$  katsayısı bağımsız değişken katsayısıdır ve bağımsız değişkendeki değişimin bağımlı değişkeni ne yönde ve ne düzeyde etkilediğini gösterir (Temurlenk ve Yıldız, 2020).

#### **2.4.1.2. Çoklu Doğrusal Regresyon Modeli**

Doğrusal regresyon analizi bağımlı ve bağımsız değişken/değişkenlerden oluşur. Eğer tek bağımsız değişken var ise basit doğrusal regresyon, iki ya da daha fazla bağımsız değişken var ise çoklu doğrusal regresyon adı verilmektedir. Regresyon analizinde değişkenler arasındaki ilişkinin fonksiyonel olarak anlamlandırılması ve modellenmesi hedeflenmektedir (Narin, Doğan, Bande, ve Genç,2023). Değişkenlerden birini veya değişkenin kategorisini önceden belirlenmiş düzeylerde tutma ve diğer değişkenin o düzeye göre nasıl değiştiğini inceleme kuralına dayanır. Regresyon, modern istatistiklerde bilinen değerleri kullanarak bilinmeyen değerleri bulmak olarak da yorumlanmaktadır (Akış, 2013). Çoklu regresyon eşitliğinde  $y$  bağımlı değişkeni,  $a$  sabit katsayıyı,  $x_1...n$  bağımsız değişkenleri ve  $\beta_1...n$  her bağımsız değişkenin katsayısını ifade eder.

$$y = a + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_n x_n \quad (1.2)$$

### **3. ARAŞTIRMA VE BULGULAR**

#### **3.1. Amaç ve Yöntem**

Bu çalışmanın amacı, Türkiye'deki kamu eğitim yapıları yapım ihalelerinde, mimari ve statik projelerden seçilen, belirli sayıdaki parametre ile yaklaşık maliyet ve sözleşme bedelini hızlı ve kolay tahmin eden bir regresyon denkleminin bulunması ve parametre seçiminin önemini araştırmaktır.

Bu çalışma, yaklaşık maliyet ve sözleşme bedelinin gerçeğe yakın olarak tahmin edilmesi, uzun süren metraj yükünün hafifletilmesi konularında literatüre de katkı sağlayacaktır. Bu bağlamda bu çalışmanın yöntemi, iki adımdan oluşmaktadır ve aşağıda sıralanmıştır:

1. Birbirine benzer ve çok sayıda projelerin *Elektronik Kamu Alımları Platformu (EKAP)* üzerinden temin edilmesi.
2. Metraj çalışmalarının yapılması ve yaklaşık maliyet ve sözleşme bedellerinin güncellenmesi.
  - a. 96 adet kamu eğitim projeleri üzerinden metraj çalışmalarının yapılması

- b. Projelerin yaklaşık maliyet bedellerinin ve sözleşme bedellerinin TÜİK verilerine göre güncellenmesi.
3. Çoklu doğrusal regresyon yöntemi ile yaklaşık maliyet bedeli ve sözleşme bedelinin tahmin denkleminin bulunması:
  - a. Bağımsız değişkenlerin bir birleri ile olan ilişkilerinin korelasyon analizleri ile incelenmesi ve regresyon veri setlerinin belirlenmesi,
  - b. Korelasyon analizi sonucunda elde edilen veri setleri ile yaklaşık maliyet bedelleri ve sözleşme bedellerinin regresyon analizi ile tahmin edilmesi.
  - c. Korelasyon analizleri sonucunda farklı değişkenler seçimi ile maliyet tahmininde yaklaşık maliyet bedeli ve sözleşme bedeli tahminlerinin hata oranının incelenmesi.

### **3.2. Bulgular**

Türkiye'nin farklı illerinde *Elektronik Kamu Alımları Platformu (EKAP)* üzerinden temin edilen 2020 ile 2022 yılları arasında kamu kurumlarınca ihale edilmiş ve sözleşmesi imzalanmış 96 adet eğitim binası incelenmiştir. Yapılacak regresyon analizinde eğitim serisi olarak 81 adet proje, test amaçlı kullanılmak üzere 15 adet proje ayrılmıştır.

Her yıl gerçekleşen birim fiyat değişikliklerinden dolayı ihalesi yapılmış projeler arasında zamana bağlı maliyet farkı oluşmaktadır. Bu çalışmada zamana bağlı farkın ortadan kaldırılması adına her yıl TÜİK tarafından yayınlanan ve Tablo 1. 'de gösterilen bina inşaatı maliyet endeksi ve değişim oranları değişim oranları tablosu kullanılmıştır. Tablo 1. 'e göre 2023 yılı Ocak ayı ortalama maliyet oranı referans alınarak 2020-2022 yılları arasındaki her ay için ayrı ayrı katsayılar belirlenmiştir. Veri setindeki bütün projeler yaklaşık maliyet ve sözleşme bedelleri ihale edildikleri yıl ve aya göre bu katsayılar kullanılarak güncellenmiştir. Bu projelerin ihale yapıldığı yıllardaki ve güncellenmiş yaklaşık maliyet ve sözleşme bedeli rakamları Tablo 2. ve Tablo 3.' de gösterilmiştir.

**3.3. Veri Setinin Oluşturulması**

Bu bölümde 4734 sayılı Kamu İhale Kanununa göre ihale edilmiş Eğitim yapıları yapım projeleri hakkında bilgiler verilmiştir.

### **3.3.1. Analizlerde Kullanılan Projelerin Özellikleri**

Bu çalışmada, 4734 sayılı Kamu İhale Kanununa tabi kurumlar tarafından 2020 ile 2022 yılları arasında ihale edilmiş ve sözleşmesi imzalanmış 96 adet eğitim yapısı yapım projesi kullanılmıştır.

### **3.3.2. Metraj Hesabı**

Metraj hesabı, uygulama projelerinden her bir iş kalemi için ölçülen ölçümlerin yapılarak miktarların belirlenmesi işlemidir. Hem işi ihale eden kamu kurumu, hem de işi almak isteyen istekli tarafından yapının maliyetinin belirlenmesi için yapılan metraj çalışması, uzun zaman alan ve detaylı hesapların yapıldığı aşamadır.

Bu bölümde çalışmada kullanılacak veri setinin oluşturulması için yapılan metraj çalışmaları anlatılmıştır. Veri setinin oluşturulmasında, eğitim binaları maliyet modellemesi için uygun olduğu düşünülen metraj kalemleri seçilmiştir. Bu çalışma için yapı maliyetini etkilediği bilinen 18 adet ana metraj kalemi seçilmiş olup seçilen bu kalemler, veri setinin bağımsız değişkenlerini oluşturmaktadır. Bu bağımsız değişkenlerin özellikleri aşağıda anlatılmıştır.

#### **3.3.2.1. Derslik Sayısı**

Eğitim projelerindeki oluşacak yapılarda bulunan derslik sayılarıdır. Veri setinde en düşük 2 derslikli, en yüksek 32 derslikli yapı bulunmaktadır.

#### **3.3.2.2. Yapım Süresi**

Projelerin ihale dosyalarında bulunan ve ihaleyi yapan kurum tarafından inşaatın tamamlanması için öngörülen süresidir. Veri setindeki proje sürelerinin en azı 100 gün, en fazlası ise 750 gündür.

#### **3.3.2.3. Toplam Kat sayısı**

Projelerde tek bloktan oluşan binalar tercih edilmiştir. Veri setindeki projeler arasında bodrum kat dâhil minimum kat sayısı 1, maksimum kat sayısı ise 5'dir.

#### **3.3.2.4. Kat yüksekliği**

Bu bağımsız değişken projedeki bir binanın normal katları için belirtilen kat yüksekliğidir. Burada yüksekliğin ölçümü katların döşeme üstlerinden döşeme üstüne yapılmıştır. Veri setindeki projelerde minimum kat yüksekliği 3,20 m, maksimum kat yüksekliği 4,00 m'dir.

#### **3.3.2.5. Bina yüksekliği**

Bu bağımsız değişken binaların +0,00 kotu ile en üst katın döşeme üst kotu (çatı yüksekliği hariç) arasındaki farkı ifade etmektedir. Veri setindeki projelerde minimum bina yüksekliği 3,20 m, maksimum bina yüksekliği 20,50 m'dir.

### 3.3.2.6. Bina yükseklik sınıfı (BYS)

Bu bağımsız değişken, 2018 Deprem yönetmeliğine göre; Deprem etkisi altında tasarımda binalar yükseklikleri bakımından sekiz Bina Yükseklik Sınıfı'na (BYS) ayrılmıştır. Bu sınıflara giren binalar için tanımlanan yükseklik aralıkları, Deprem Tasarım Sınıflarına bağlı olarak belirlenmektedir. Veri setinde Bina Yükseklik Sınıfının sayısına göre isimlendirilmiştir. Veri setindeki en düşük değer 5, en yüksek değer 8'dir.

**Tablo 4.** Bina Yükseklik Sınıfları ve Deprem Tasarım Sınıflarına Göre Tanımlanan Bina Yükseklik Aralıkları(<https://www.resmigazete.gov.tr>)

Bina Yükseklik Sınıfı	Bina Yükseklik Sınıfları ve Deprem Tasarım Sınıflarına Göre Tanımlanan Bina Yükseklik Aralıkları [m]		
	DTS = 1, 1a, 2, 2a	DTS = 3, 3a	DTS = 4, 4a
BYS=1	HN >70	HN > 91	HN >70
BYS=2	56 > HN >70	70 > HN > 91	HN >70
BYS=3	42 > HN >56	56 > HN > 70	HN >70
BYS=4	28 > HN >42	42 > HN > 56	
BYS=5	17.5 > HN >28	28 > HN > 42	
BYS=6	10.5 > HN >17.5	17.5 > HN > 28	
BYS=7	7 > HN >10.5	10.5 > HN > 17.5	
BYS=8	HN <7	HN < 10.5	

### 3.3.2.7. Bodrum kat yüksekliği

Bu bağımsız değişken, projelerde doğal zemin kodu olan sıfır kotunun altında yer alan katların sayısını ifade etmektedir. Toplamda 16 adet yapının bodrum katı bulunmamaktadır. 80 adet yapının ise bodrum katı vardır. Veri setindeki projelerde minimum bodrum kat yüksekliği 0.00 m, maksimum bodrum yüksekliği ise 5,15 m' dir.

### 3.3.2.8. Deprem tasarım sınıfı

Bu bağımsız değişken, 2018 deprem yönetmeliğine göre tanımlanan Bina Kullanım Sınıflarına ve DD-2 deprem yer hareketi düzeyi için Kısa Periyot Tasarım Spektral İvme Katsayısına bağlı olarak, bu Yönetmelik'te deprem etkisi altında tasarımda esas alınacak Deprem Tasarım Sınıfları (DTS) belirlenecektir.

**Tablo 5.** DD-2 Deprem Yer Hareketi Düzeyinde Kısa Periyot Tasarım Spektral İvme Katsayısı (<https://www.resmigazete.gov.tr>)

DD-2 Deprem Yer Hareketi Düzeyinde Kısa Periyot Tasarım Spektral İvme Katsayısı ( SDS )	Bina Kullanım Sınıfı	
	BKS = 1	BKS = 2, 3
SDS < 0.33	DTS = 4a	DTS = 4
0.33 < SDS < 0.50	DTS = 3a	DTS = 3
0.50 < SDS < 0.75	DTS = 2a	DTS = 2
0.75 < SDS	DTS = 1a	DTS = 1

**Tablo 6.** Veri Setinde Deprem Tasarım Sınıfına göre tanımlanan değerler

Deprem Tasarım Sınıfı (DTS)	Tanımlanan Değer
1a	1
2a	2
3a	3
4a	4
1	5
2	6
3	7
4	8

Veri setindeki en düşük değer 1, en yüksek değer 5'dir

### 3.3.2.9. Zemin sınıfı

Bu bağımsız değişken, zeminin dane çapı ve kıvamı esas alınarak belirlenen ve ZA ile ZF arasında değişen değerdir. Bu çalışmadaki projelerin zemin sınıfları, statik projelerde veya geoteknik raporlarda yer alan bilgilere göre belirlenmiştir. Veri setinde ZB ile ZE arasında değişen bütün zemin sınıflarını temsil eden projeler bulunmaktadır.

**Tablo 7. Zemin Sınıfı Değerleri**(<https://www.resmigazete.gov.tr>)

Yerel Zemin Sınıfı	Zemin Cinsi	Üst 30 metrede ortalama		
		(VS)30 [m/s]	(N60)30 [darbe/30 cm]	(Cu)30 [kPa]
<b>ZA</b>	Sağlam, sert kayalar	> 1500	-	-
<b>ZB</b>	Az ayrılmış, orta sağlam kayalar	760 - 1500	-	-
<b>ZC</b>	Çok sıkı kum, çakıl ve sert kil tabakaları veya ayrılmış, çok çatlaklı zayıf kayalar	360 - 760	> 50	> 250
<b>ZD</b>	Orta sıkı-sıkı kum, çakıl veya çok katı kil tabakaları	180 - 360	15 - 50	70 - 250
<b>ZE</b>	Gevşek kum, çakıl veya yumuşak-katı kil tabakaları PI > 20 ve w>% 40 koşullarını sağlayan toplamda 3 metreden daha kalın yumuşak kil tabakası (cu < 25 kPa) içeren profiller.	< 180	< 15	< 70
<b>ZF</b>	ZF Sahaya özel araştırma ve değerlendirme gerektiren zeminler: 1) Deprem etkisi altında çökme ve potansiyel göçme riskine sahip zeminler (sıvılaştırılabilir zeminler, yüksek derecede hassas killer, göçebilir zayıf çimentolu zeminler vb.), 2) Toplam kalınlığı 3 metreden fazla turba ve/veya organik içeriği yüksek killer, 3) Toplam kalınlığı 8 metreden fazla olan yüksek plastisiteli (PI > 50) killer, 4) Çok kalın (> 35 m) yumuşak veya orta katı killer.			

**Tablo 8. Veri Setinde Zemin Sınıfına göre tanımlanan değerler**

Zemin Sınıfı	Tanımlanan Değer
<b>ZA</b>	<b>1</b>
<b>ZB</b>	<b>2</b>
<b>ZC</b>	<b>3</b>
<b>ZD</b>	<b>4</b>
<b>ZE</b>	<b>5</b>
<b>ZF</b>	<b>6</b>

Veri setindeki en düşük değer 2, en yüksek değer 5'dür

### 3.3.2.10.Zemin emniyet gerilmesi

Bu bağımsız değişken, zemin sınıfı değişkeninde olduğu gibi projelerin yapılacağı zeminin yapısına göre farklılık gösteren, zeminin emniyetle taşıyabileceği en yüksek gerilme değeridir. Bu çalışmada zemin emniyet gerilmesi değerleri, statik projelerde veya geoteknik raporlarda bulunan bilgilere göre belirlenmiştir. Veri setinde maksimum 116 t/m<sup>2</sup>, minimum 8,50 t/m<sup>2</sup> zemin emniyet gerilmesine sahip projeler yer almaktadır.

### **3.3.2.11.Yatak katsayısı**

Projelerin yapılacağı zeminin yapısının belirlenmesi amacıyla hesap edilen bir diğer bağımsız değişken de yatak katsayısıdır. Bu değişken, binanın yapılması sonucunda zemine etki edecek ağırlığa karşı zeminde oluşan hacimsel değişim miktarını ifade eden değerdir. Bu çalışmada yatak katsayısı statik projelerde veya geoteknik raporlarda bulunan bilgilere göre belirlenmiştir. Veri setinde, yatak katsayısı maksimum  $15000 \text{ t/m}^3$ , minimum  $1100 \text{ t/m}^3$  olarak değişmektedir.

### **3.3.2.12.Beton sınıfı**

Bu bağımsız değişken, statik hesap ve projelerde yer alan beton sınıfı değeridir. Beton sınıfı statik hesaplarda kullanılan, küp ve silindir numuneler üzerinde yapılan deney sonuçları ile belirlenen ve betonun basınç dayanımını ifade eden bir değerdir. Veri setinde beton sınıfı C25, C30, C35 ve C40 olarak değişen projeler yer almaktadır. Analizlerde 25 değeri C25'i, 30 değeri C30'u, 35 değeri C35'i ve 40 değeri C40'ı ifade etmektedir.

### **3.3.2.13.Asansör sayısı**

Bu bağımsız değişken, projedeki asansör sayısını göstermektedir. Analizlerde asansörü bulunmayan 7 adet yapı bulunmaktadır. 70 adet yapıda 1 asansör, 19 adet yapıda 2 asansör bulunmaktadır.

### **3.3.2.14.Islak alan**

Mimari projelerde yer alan banyo ve WC alanları, "**Islak Alan**" olarak isimlendirilmektedir. Bu bağımsız değişken, projede her bir katta yer alan ıslak alanların toplamı ile belirlenmiştir. Veri setindeki projelerde minimum ıslak alan  $22,62 \text{ m}^2$ , maksimum ıslak alan ise  $387,91 \text{ m}^2$ 'dir.

### **3.3.2.15. Radye Temel tipi yüksekliği**

Bu bağımsız değişken, statik projelerde yer alan temel çizim ve detayları esas alınarak belirlenmiştir. Veri setindeki en düşük değer  $0,30 \text{ m}$ , en yüksek değer ise  $1,20 \text{ m}$ 'dir.

### **3.3.2.16.Kat alanı**

Bu bağımsız değişken, veri setini oluşturan projelerin normal bir kata ait alanı ifade etmektedir. Bir binada farklı normal kat alanlarının olması durumunda en çok ortak olan normal katlardan birinin değeri alınmıştır. Veri setindeki projelerde minimum kat alanı  $413,29 \text{ m}^2$ , maksimum kat alanı ise  $1270,32 \text{ m}^2$ 'dir.

### **3.3.2.17.Bodrum alanı**

Bu bağımsız değişken, projelerin mimari ve statik hesapları sonucu belirlenen projelerde doğal zemin kodu olan sıfır kotunun altında yer alan katların alanını ifade etmektedir. Veri setinde bulunan projelerde bina oturma alanı minimum  $0 \text{ m}^2$ , maksimum  $1427,60 \text{ m}^2$ 'dir.

### **3.3.2.18. Toplam inşaat alanı**

Bu bağımsız değişken projede yer alan katların toplam inşaat alanını ifade etmektedir. Veri setinde kat alanı minimum 325,00 m<sup>2</sup>, maksimum 9113,12 m<sup>2</sup>'dir.

Yukarıdaki hesaplanmış 18 adet değişken kullanılarak Sözleşme Bedeli ve Yaklaşık Maliyet tahmini analizi yapılmıştır.

### **3.4. Çoklu Doğrusal Regresyon ile Model Oluşturulması**

Yapılan modelleme çalışmasında; Derslik Sayısı, Yapım Süresi(Gün), Toplam Kat Sayısı, Kat Yüksekliği(metre), Bina Yüksekliği(+0,00 Kotundan itibaren (metre)), Bina Yükseklik Sınıfı(BYS), Bodrum Yüksekliği(metre), Deprem Tasarım Sınıfı(DTS), Zemin Sınıfı, Zemin Emniyet Gerilmesi(t/m<sup>2</sup>), Yatak Katsayısı(t/m<sup>3</sup>), Beton Sınıfı, Asansör Sayısı, Islak Alan(m<sup>2</sup>), Radye Temel Yüksekliği(metre), Kat Alanı(m<sup>2</sup>), Bodrum Alanı(m<sup>2</sup>), Toplam Alan(m<sup>2</sup>) değerleri bağımsız değişken olarak alınmış ve bu değişkenler ile projenin sözleşme Bedeli ve yaklaşık maliyet değerleri açıklanmaya çalışılmıştır. Yapılan çalışmada SPSS paket programı ile çoklu regresyon modeli kullanılmıştır. 81 adet Okul projesine ait regresyon analizi sonucunda aşağıdaki veriler elde edilmiştir.

#### **Sözleşme Bedeli Regresyon Modeli**

**Sözleşme Bedeli** = - 2349012.559 + 46452.464 \* (**Derslik Sayısı**) - 277.169 \* (**Yapım Süresi**) + 496947.262 \* (**Toplam Kat Sayısı**) + 2021313.907 \* (**Kat Yüksekliği**) - 445038.095(Bina Yüksekliği) - 2020336.669 \* (**BYS**) - 2413730.060 \* (**Bodrum Yüksekliği**) + 21079.829 \* (**DTS**) + 196257.334 \* (**Zemin Sınıfı**) - 34217.334 \* (**Zemin Emniyet Gerilmesi**) + 207.823 \* (**Yatak Katsayısı**) + 427461.327 \* (**Beton Sınıfı**) + 5537494.092 \* (**Asansör Sayısı**) + 16687.841 \* (**Islak Alan**) + 9752894.338 \* (**Radye Temel Yüksekliği**) - 2534.565 \* (**Kat Alanı**) + 12246.067 \* (**Bodrum Alanı**) + 3711.671 \* (**Toplam Alan**)

Tabloya göre bazı değişkenler arasında yüksek güçte ilişkiler bulunmaktadır. Bu değişkenlerin aynı anda modele alınması çoklu bağıntı sorunu yaşanmasına neden olabilir. Bu nedenle oluşturulan modelde çoklu bağıntı kontrolleri yapılması gerekecektir.

**Tablo 12. Eğitim yapılarına ait istatistiksel veriler (Otokorelasyon ve Çoklu Bağıntı  
Varsayımlarının Kontrolleri)**

Durbin-Watson	<b>1,523</b>
Collinearity (VIF)	
Derslik Sayısı	7.524
Yapım Süresi (Gün)	1.889
Toplam Kat Sayısı	32.216
Kat Yüksekliği (mt)	2.179
Bina Yüksekliği (m)	10.897
Bina Yükseklik Sınıfı(BYS)	3.301
Bodrum Yüksekliği (m)	10.720
Deprem Tasarım Sınıfı (DTS)	1.632
Zemin Sınıfı	1.981
Zemin Emniyet Gerilmesi (t/m <sup>2</sup> )	1.698
Yatak Katsayısı (t/m <sup>3</sup> )	2.340
Beton Sınıfı	1.913
Asansör Sayısı	3.905
Islak Alan (m <sup>2</sup> )	6.505
Radye Temel Yüksekliği (mt)	2.551
Kat Alanı (m <sup>2</sup> )	24.326
Bodrum Alanı (m <sup>2</sup> )	14.567
Toplam Alan (m <sup>2</sup> )	73.277

Otokorelasyon, oluşturulan modeldeki hatalar arasında ilişki olması durumudur. Regresyon modelinde otokorelasyon olmamalı, oluşturulan modeldeki hatalar rastgele olmalıdır. Bu durum Durbin-Watson testi ile kontrol edilir. Durbin-Watson testi sonucunun 2 civarında çıkması modelde otokorelasyon problemi olmadığını göstermektedir. Yapılan inceleme sonucunda 1,523 olarak tespit edilen Durbin- Watson sonucuna göre oluşturduğumuz modelde otokorelasyon probleminin olmadığı görülmektedir. Modelde çoklu bağıntı problemi olup olmadığını ise değişkenlere ait VIF değerine bakılarak incelenmektedir. VIF değerinin 10'un üzerinde olmaması gerekmektedir. Modele alınan 18 bağımsız değişken içinde VIF değerinin 12 değişkenin 10'un altında kaldığı görülmektedir. Bu sonuca göre modele alınan değişkenler arasında 12 değişken için çoklu bağıntı problemi olmadığı söylenebilir. Toplam Kat Sayısı, Bina Yüksekliği, Bodrum Yüksekliği, Kat Alanı, Bodrum Alanı ve Toplam Alan değişkenlerinde çoklu bağıntı problemi olduğu görülmektedir.

**Tablo 13. Eğitim yapılarına ait istatistiki veriler(Model anlamlılığı)**

Düzeltilmiş R <sup>2</sup>	F	p
<b>0.927</b>	43,620	,000 <sup>b</sup>

,000<sup>b</sup> :p<0,05 olduğunu ifade eder.

Sözleşme Bedeli değişkenini açıklamak için oluşturulan modelin anlamlı bir model olduğu görülmektedir (F:43,620, p<0,05). Anlamlı olan bu modelde bağımsız değişkenler, bağımlı değişkendeki değişimin %92,7 'sini açıklayabilmektedir.

Tabloya göre bazı değişkenler arasında yüksek güçte ilişkiler bulunmaktadır. Bu değişkenlerin aynı anda modele alınması çoklu bağıntı sorunu yaşanmasına neden olabilir. Bu nedenle oluşturulan modelde çoklu bağıntı kontrolleri yapılması gerekecektir.

**Tablo 17. Eğitim yapılarına ait istatistik veriler (Otokorelasyon ve Çoklu Bağıntı  
Varsayımlarının Kontrolleri)**

Durbin-Watson	1,950
Collinearity (VIF)	
Derslik Sayısı	7.524
Yapım Süresi (Gün)	1.889
Toplam Kat Sayısı	32.216
Kat Yüksekliği (mt)	2.179
Bina Yüksekliği (m)	10.897
Bina Yükseklik Sınıfı(BYS)	3.301
Bodrum Yüksekliği (m)	10.720
Deprem Tasarım Sınıfı (DTS)	1.632
Zemin Sınıfı	1.981
Zemin Emniyet Gerilmesi (t/m <sup>2</sup> )	1.698
Yatak Katsayısı (t/m <sup>3</sup> )	2.340
Beton Sınıfı	1.913
Asansör Sayısı	3.905
Islak Alan (m <sup>2</sup> )	6.505
Radye Temel Yüksekliği (mt)	2.551
Kat Alanı (m <sup>2</sup> )	24.326
Bodrum Alanı (m <sup>2</sup> )	14.567
Toplam Alan (m <sup>2</sup> )	73.277

Otokorelasyon, oluşturulan modeldeki hatalar arasında ilişki olması durumudur. Regresyon modelinde otokorelasyon olmamalı, oluşturulan modeldeki hatalar rastgele olmalıdır. Bu durum Durbin-Watson testi ile kontrol edilir. Durbin-Watson testi sonucunun 2 civarında çıkması modelde otokorelasyon problemi olmadığını göstermektedir. Yapılan inceleme sonucunda 1,950 olarak tespit edilen Durbin- Watson sonucuna göre oluşturduğumuz modelde otokorelasyon probleminin olmadığı görülmektedir. Modelde çoklu bağıntı problemi olup olmadığını ise değişkenlere ait VIF değerine bakılarak incelenmektedir. VIF değerinin 10'un üzerinde olmaması gerekmektedir. Modele alınan 18 bağımsız değişken içinde VIF değerinin 12 değişkenin 10'un altında kaldığı görülmektedir. Bu sonuca göre modele alınan değişkenler arasında 12 değişken için çoklu bağıntı problemi olmadığı söylenebilir. Toplam Kat Sayısı, Bina Yüksekliği, Bodrum Yüksekliği, Kat Alanı, Bodrum Alanı ve Toplam Alan değişkenlerinde çoklu bağıntı problemi olduğu görülmektedir.

**Tablo 18.** Eğitim yapılarına ait istatistiksel veriler (Model anlamlılığı)

Düzeltilmiş R <sup>2</sup>	F	p
0.900	39,470	,000 <sup>b</sup>

,000<sup>b</sup> :p<0,05 olduğunu ifade eder.

Sözleşme Bedeli değişkenini açıklamak için oluşturulan modelin anlamlı bir model olduğu görülmektedir (F:43,620, p<0,05). Anlamlı olan bu modelde bağımsız değişkenler, bağımlı değişkendeki değişimin %90 'ını açıklayabilmektedir.

**Tablo 19.** Eğitim yapılarına ait istatistiksel sonuç verileri

	Yaklaşık Maliyet	Sözleşme Bedeli
Hata Oranı	% 17,50	% 18,20
Düzeltilmiş R <sup>2</sup>	0,900	0,927
Durbin-Watson değeri	1,950	1,523

## SONUÇ

Bu çalışmada, Kamu Kurumları tarafından ihaleye çıkılmış ve sonuç ilanı yayınlanmış 96 adet okul binasına ait projeler Elektronik Kamu Alımları Platformu(EKAP)' tan indirilmiştir. Projeler 81 adet eğitim, 15 adet test verisi olacak şekilde ayrılmıştır. Yapım yılı maliyetleri TÜİK' ten elde edilen *Bina inşaatı maliyet endeksi ve değişim oranları* tablosuna göre 2023 yılı Ocak ayına çevrilmiş Yaklaşık Maliyet Bedeli ve Sözleşme Bedeli güncellenmiştir. Projeler üzerinden eğitim yapısının inşaat maliyeti çıktı değişkenini etkilediği bilinen; Derslik Sayısı, Yapım Süresi, Toplam Kat Sayısı, Kat Yüksekliği, Bina Yüksekliği, Bina Yükseklik Sınıfı(BYS), Bodrum Yüksekliği, Deprem Tasarım Sınıfı(DTS), Zemin Sınıfı, Zemin Emniyet Gerilmesi, Yatak Katsayısı, Beton Sınıfı, Asansör Sayısı, Islak Alan, Radye Temel Yüksekliği, Kat Alanı, Bodrum Alanı, Toplam Alan parametreleri belirlenmiş ve regresyon analizinde kullanılmıştır. Regresyon analizi "SPSS Statistics 26" yazılımı ile gerçekleştirilmiştir. Bu parametreler kullanılarak Regresyon Analizleri (RA) yapılmış ve eğitim yapılarının maliyetlerini tahmin etmek için formüller geliştirilmiştir. Geliştirilen formüllerle Sözleşme Bedeli ve Yaklaşık Maliyet Bedeli tahmin edilmeye çalışılmıştır. Elde edilen formüller ile test verisi olarak seçilen 15 eğitim projesinde hata oranları tespit edilmiştir. Geliştirilen

formüllerden tüm parametrelerin kullanıldığı model Sözleşme Bedeli için  $R^2=0.927$ , Yaklaşık Maliyet Bedeli için ise  $R^2=0.900$  katsayısı ile en iyi ilişki düzeyine sahip modeller oluşmuştur. Tahmin edilen sonuçlar ile gerçek sonuçlar arasındaki tutarlılığı kontrol etmek amacıyla Durbin-Watson kriteri kullanılmıştır. Çoklu regresyon analizi için verilerin normal dağılımı koşulu sağlanmış, çoklu bağlantı ve otokorelasyon sorunları olmadığı tespit edilmiştir ( $p<0,05$ ). Yaklaşık Maliyet Bedeli tahmini için yapılan regresyon modelinin sonucunda hesaplanan hata değeri ortalama % 17,50 hata oranı olarak bulunmuştur. Sözleşme Bedeli tahmini için yapılan regresyon modelinin sonucunda hesaplanan hata değeri ortalama % 18,20 hata oranı olarak bulunmuştur. Ancak farklılıkları da temsil edecek yeter sayıda örnekle çalışılması durumunda daha sağlıklı sonuç almak mümkündür. Sonuç olarak, farklı tip ve katsayılarına sahip okul yapılarının yaklaşık maliyetlerini ve sözleşme bedellerini %20'den düşük hata oranları ile tahmin edebilen bir yaklaşım oluşturulmuştur. Gerek kamu kuruluşları gerekse taahhüt eden yapım firmaları bu modellemelerden istifade ederek zamansal tasarruflar sağlayarak gerçekçi maliyet tahminlerinde bulunabileceklerdir. Benzer çalışmaların veri adetleri arttırılarak yapılması, daha sonraki modellemelerde hata oranı minimizasyonu için bir çözüm olabilir.

**Özet**

Dijital teknoloji, günümüzde topluma katılımın önemli bir bileşeni haline gelmiştir. Yaşlı bireylerin bağımsızlıklarını korumalarına, bilgiye kolayca erişmelerine ve sosyal çevreleri ile bağlantıda kalmalarına yardımcı olması, dijital teknolojiyi yaşlı bireylerin toplumsal hayata katılımı için güçlü bir kolaylaştırıcı kılmaktadır. Yaşlı bireylerin sosyal katılımını teşvik eden teknoloji, zihinsel uyarımı artırarak yaşlı bireylerin bilişsel becerilerini sürdürmesine destek olmaktadır. Bir başka ifadeyle teknolojiye adapte olmanın yaşlı bireylerde sağlığın farklı boyutları üzerinde iyileştirici etkisi bulunmaktadır. Her ne kadar dijital teknoloji, yaşlı bireylerin yaşam kalitesini artırarak toplumda daha aktif bir rol oynamalarına yardımcı olsa da yaşlılar yeni teknolojileri öğrenmede zorluklarla karşılaşmakta ve daha fazla eğitime ihtiyaç duyabilmektedir. Yaşlıların teknolojiye adaptasyonunun önündeki zorluklar yaşlanmayla ilişkilendirilen bir dizi fiziksel, bilişsel, algısal ve psikolojik sorunu içermektedir. Bu zorluklar, yaşlı bireylerin teknolojiye adaptasyonunu güçleştirmekte, bu durum ise dijital uçurumun büyümesine neden olmaktadır. Yeni teknolojiler aynı zamanda, kişiler arası iletişimde ileri yaştaki bireyler ile gençler arasındaki en büyük iletişim engelini oluşturmaktadır. Dijital teknolojilerin yaşlı bireyler için barındırdığı potansiyel ve teknolojiye adapte olamamanın beraberinde getirdiği olumsuzluklar göz önünde bulundurulduğunda dijital okuryazarlığın yaşlılar için önemli bir ihtiyaç olduğu aşikardır. Bu bağlamda çeşitli dijital okuryazarlık aktiviteleri ile yaşlı bireylerin teknolojiye adaptasyonun desteklenmesi ve teknoloji kullanımının teşvik edilmesi gerekmektedir. Bu derleme bildirinin amacı, literatürdeki çalışmalar ışığında yaşlı bireyler arasında teknoloji kullanım yaygınlığının, yaşlı bireylerde teknoloji kullanmanın fırsatlar ile zorluklarının incelenmesi ve yaşlılara yönelik dijital okuryazarlık aktivitelerinin tartışılmasıdır.

**Anahtar Kelimeler:** Dijital okuryazarlık, yaşlılar, sosyal katılım, teknoloji kullanımı

**DIGITAL OLD AGE: DIGITAL LITERACY AND ADAPTATION TO  
TECHNOLOGY IN THE ELDERLY**

**Abstract**

Digital technology has become an important component of participation in society today. Helping older adults maintain their independence, easily access information, and stay connected to their social environment makes digital technology a powerful facilitator for older adults' participation in social life. Technology that encourages the social participation of older adults helps them maintain their cognitive skills by increasing mental stimulation. In other words, adapting to technology has a healing effect on different dimensions of health in older adults. Although digital technology helps older adults play a more active role in society by improving their quality of life, older adults face difficulties in learning new technologies and may need more training. Challenges to older adults' adaptation to technology include a number of physical, cognitive, perceptual and psychological problems associated with aging. These difficulties make it difficult for older adults to adapt to technology, which causes the digital divide to widen. New technologies also create the biggest communication barrier between older adults and young people in interpersonal communication. Considering the potential of digital technologies for older adults and the negativities brought about by not being able to adapt to technology, it is obvious that digital literacy is an important need for the elderly. In this context, it is necessary to support older adults' adaptation to technology and encourage their use of technology through various digital literacy activities. The purpose of this review paper is to examine the prevalence of technology use among older adults, the opportunities and difficulties of using technology in older adults, and to discuss digital literacy activities for the elderly in the light of studies in the literature.

**Keywords:** Digital literacy, elderly, social participation, technology use

## **Giriş**

Teknolojinin hızla gelişmesi toplumsal, ekonomik, kültürel ve sosyal dinamikleri etkilemiştir. Günümüzde birçok eylem dijital teknoloji kullanımına bağımlı hale gelmiştir. Bu durum, teknolojiyi bir ihtiyaçtan ziyade zorunluluk haline getirmiştir. Dünyanın demografik olarak yaşlandığı günümüzde, dijital teknoloji yaşlılık deneyimini dönüştürmekte ve yaşlı bireyler için birçok fırsat sunmaktadır. Sağlığın fiziksel, ruhsal ve sosyal boyutlarına sağladığı faydanın yanında dijital teknolojiler yaşlı bireylerin yaşam kalitesini artırmakta ve bağımsızlıklarını desteklemektedir. Diğer yandan teknoloji kullanımı yaşlılık döneminde bir zorluk olarak ortaya çıkmaktadır. Bu fırsatlar ve zorluklar ikileminde yaşlı bireylerin dijital teknolojiye adaptasyonu önemli bir araştırma ve tartışma konusu haline gelmektedir.

## **Dijital Dönüşümün Yaşlılar Üzerindeki Etkisi**

Dijital teknoloji gelişimindeki baş döndürücü hız toplumun her kesimini etkilemektedir. Yaşlı nüfusun giderek artması, yaşlı bireylerin teknoloji ile etkileşimini ve dijital dönüşümün yaşlılar üzerindeki etkisini daha önemli hale getirmektedir. Yaşlanma ile azalan fiziksel ve bilişsel işlevlerin iyileştirilmesine yardımcı olmak, yaşlı bireylerin sosyal ilişkilerini sürdürmelerini sağlamak, bağımsız yaşamı desteklemek, bireylerin iyilik halini ve refahlarını korumak dijital teknolojinin yaşlanan dünya için barındırdığı fırsatlardandır. Yaşlı bireyleri dijital teknoloji kullanması, bireyin refahını iyileştirmekte, çevrimiçi etkinliklere katılma yaşlı bireylerin sosyal katılımını teşvik etmekte, böylelikle sosyal izolasyon ve yalnızlık duygusunu minimize etmektedir. Zira sosyal medya platformları ve video konferans ile görüşme uygulamaları yaşlı bireylerin aileleri, torunları, sosyal çevreleri ile etkileşim halinde olmalarını sağlamaktadır. Bilhassa bakım kurumunda kalan yaşlı bireyler aileleri ile daha az iletişimde kalma eğiliminde olabilmektedir. Bu noktada teknoloji, yaşlı bireylerin aileleri ile bağlantıda kalmaları için bir araç olabilmektedir. Yaşlı bireylerin sosyal izolasyonunu azaltarak aile bağlarını güçlendiren teknolojik ürün ve uygulamaları kullanmak, aynı zamanda yaşlı bireylerin teknolojiyi kullanma konusundaki özgüvenlerini artırabilmekte ve teknolojinin günlük yaşamın bir parçası olarak benimsenmesine katkı sunmaktadır. Dijital ortamda oyun oynanması yaşlıların motor becerilerini, algısal/bilişsel yeteneklerini ve duygusal/motivasyonel durumlarını geliştirmektedir (Nimrod, 2019; Szabo, Allen, Stephens, & Alpass, 2019; Wang, Hou, & Tsai, 2020). Bu fırsatlar göz önünde bulundurulduğunda dijital teknolojiyi kullanan yaşlı nüfusun katlanarak artması şaşırtıcı değildir (Anderson & Perrin, 2017). Türkiye İstatistik Kurumu tarafından gerçekleştirilen Hanehalkı Bilişim Teknolojileri Kullanım Araştırması verilerine göre 2017 yılında internet kullanan 65-74 yaş aralığındaki birey oranı %11,3 iken bu oran 2022

yılında %36,6'ya yükselmiştir (Türkiye İstatistik Kurumu, 2023). Her ne kadar yaşlılar arasında teknoloji kullanımı yaygınlaşsa da bu oran genç nüfusa kıyasla düşük kalmakta ve dijital bir uçuruma neden olmaktadır.

### **Yaşlıların Teknolojiye Adaptasyonunda Engeller**

Yaşlı bireylerin teknoloji kullanımının önünde bir dizi güçlükler bulunmaktadır. Bunlardan ilki yaşa bağlı engellerdir. Yaşa bağlı engeller olarak nitelendirilebilecek olan görme problemleri, el becerisi ve hareketliliği ile ilişkili sorunlar, anlama güçlüğü, algılama sınırlılığı yaşlı bireyleri teknolojiyi kullanırken karşı karşıya kalabileceği engellerdendir. Bununla birlikte teknolojinin karmaşık olduğu algısı, teknik terimler, küçük yazılar bu engelleri artırabilmektedir. Bu engeller yaşlı bireyler ile teknoloji arasında bir bariyere neden olmaktadırken diğer yandan teknoloji, yaşla ilişkili olan bu olumsuzlukların giderilmesinde önemli bir destek sunmaktadır. Yaşlı bireylerin güvenliğini ve bağımsız yaşamını kolaylaştıran teknoloji, yaşlı bireylerin sağlığını da desteklemektedir (Rogers, Stronge, & Fisk, 2005). Yaşlı bireylerin teknolojiye yönelik tutumları, bir diğer engeli oluşturmaktadır. Teknolojinin tehlikeli, güvensiz, pahalı, karmaşık, öğrenilmesi zor olarak algılanması yaşlı bireylerin teknolojiye adapte olma motivasyonunu düşürmektedir. Yaşlı bireylerin teknolojik ürünleri ve teknoloji kullanımı için eğitim almasına yönelik mali engeller, yeterli eğitim ve destek olanaklarının sınırlılığı yaşlı bireylerin teknolojiyi etkin bir biçimde kullanmalarının önündeki engellerden bir diğeridir. Ekonomik kısıtlılık nedeniyle teknolojik ürünlere erişememe, ekonomik engeller kapsamında değerlendirilebilmekte ve yaşlı bireylerde teknoloji kullanımını güçleştirmektedir (Özkan & Purutçuoğlu, 2010). İngiltere'de yapılan bir araştırmada 60-69 yaş aralığındaki bireylerin yarısında evde internet erişimi bulunurken bu oranın 70 yaş ve üstü kişilerde %17'ye düştüğü saptanmıştır. Yaşın artmasıyla birlikte evde internet erişim oranını düşüren tek unsur ekonomik maliyetler değildir. Yaşlı bireylerin bu tür dijital teknolojilerin kendileri ile ilgili olmadığı ve bu teknolojileri kullanarak herhangi bir kazanım sağlamayacaklarına yönelik algı ve tutumları da oranın düşmesi üzerinde etkilidir (Tuna Uysal, 2020).

### **Yaşlıların Teknolojiyle İlişisini Güçlendirme: Dijital Okuryazarlık**

Dijital okuryazarlık, teknolojiyi kullanmak için gerekli teknik bilginin ötesinde teknolojiye bilişsel, kültürel ve sosyal olarak uyum sağlamayı da içeren bir kavramdır. Kavramı ilk defa kullanan araştırmacı Paul Gilster, dijital okuryazarlığın sadece teknik becerilerle değil, aynı zamanda derinlemesine düşünme, eleştirel analiz yapma ve bilgiyi etkili bir şekilde kullanma yeteneğiyle ilişkili özel bir tür zihniyet olduğunu vurgulamıştır. Ona göre, dijital okuryazarlık sadece tuşlara basmayı öğrenmekle değil, aynı zamanda dijital ortamlarda bulunan bilgiyi

değerlendirme, yorumlama ve sentezleme becerisini içeren bir düşünce tarzını ifade etmektedir (Gilster, 1997).

Teknolojinin hızla geliştiği ve değiştiği günümüzde, bireylerin bu değişimlere uyum sağlamak amacıyla geliştirdiği beceriler dijital okuryazarlık olarak tanımlanmaktadır (Yıldırım, 2021). Dijital okuryazarlık becerileri, bireylerin teknolojiyi doğru ve faydalı bir biçimde kullanmalarını, böylelikle dijitalleşen dünyaya aktif bir şekilde katılmalarını olanaklı hale getirmektedir. Burada yola çıkarak dijital okuryazarlık, dijital çağda hayatta kalma becerisi olarak nitelendirilmektedir (Eshet-Alkalai, 2004). Yaşlı bireylerin teknolojinin faydalarından daha geniş anlamda yararlanabilmeleri ve dijital dünyaya entegre olabilmeleri için dijital okuryazarlık becerilerinin geliştirilmesi önemli bir önkoşuldur. Bu bağlamda öncelikli olarak yaşlı bireylerin temel teknoloji becerilerini öğrenmesi gerekmektedir. Telefon kullanma, bilgisayar kullanma, tablet kullanma temel düzeyde teknoloji becerilerini kapsamaktadır. Çevrimiçi güvenlik ve gizlilik ile ilgili konular da dijital okuryazarlık kapsamında yaşlı bireylere aktarılmalıdır. Yaşlı bireylerin aileleri ve sosyal çevreleri ile bağlantıda kalmasını sağlayan sosyal medya platformları, video konferans uygulamaları, çevrimiçi gruplar gibi araçların kullanılması da dijital okuryazarlık kapsamında desteklenmelidir.

### **Sonuç ve Öneriler**

Yaşlı bireyler için teknolojiye adapte olmak ve buna olanak sağlayan dijital okuryazarlık, toplumların yaşlanma sürecinin beraberinde getirdiği zorluklarla başa çıkma ve yaşlı bireylerin refahını iyileştirme için kritik bir rol oynamaktadır. Yaşlı bireylerin dijital okuryazarlık becerilerinin geliştirilmesi için yaşlı bireylere özel, eğitim programları geliştirilmelidir. Bu eğitim programları ile birlikte yaşlı dostu teknolojik arayüzler geliştirilmelidir. Büyük yazı boyutunu, kolay okunabilir metin boşluklarını içeren bu arayüzler ile yaşlı bireylerin teknolojik uygulama ve ürünleri kullanmaları kolaylaşmaktadır. Yaşlı bireylere teknoloji kullanımı konusunda bireysel destek sunulmalıdır. Teknoloji ile ilgili soruları yanıtlamak, pratik becerilerin kazandırılmasına yardımcı olmak, güvenliğe ilişkin kazanımları sağlamak amacıyla bireysel destek sunulması önem arz etmektedir. Yaşlı bireylerin teknoloji kullanımına ilişkin araştırmalar oldukça kısıtlıdır. Dijital okuryazarlık ve teknoloji kullanımı ile ilgili araştırmalar ağırlıklı olarak genç popülasyon ile yürütülmektedir. Dünya nüfusunun hızla yaşlandığı ve teknolojinin yaşlanan nüfus için barındırdığı fırsatlar göz önünde bulundurulduğunda konunun yaşlı bireyler özelinde ele alınması gerekmektedir.

**Özet**

İnsan Hakları Evrensel Beyannamesi'nin 25. Maddesine göre "herkesin kendisinin ve ailesinin sağlık ve refahı için beslenme, giyim, konut ve tıbbi bakım hakkı vardır." Barınma hakkı, insan hakları kapsamında kabul gören temel bir haktır. Bu hak, her bireyin yaşam kalitesini artırmak ve insan onuruna yakışır bir yaşam sürmesini sağlamak için temel bir ihtiyaç olan barınma ve konut edinme hakkını içermektedir. Günümüzde uluslararası arenada konut hakkı bir adım öteye taşınmış olup elverişli konut hakkı söylemi ön plana çıkmaktadır. Elverişli konut hakkı, her birey için önemli olsa da güvenli, erişilebilir ve uygun konut koşullarına sahip olmak yaşlı bireylerin yaşam kalitesi için oldukça önemlidir. Zira yaşlılık döneminde, yaralanma ve düşmelerin ağırlıklı olarak evde meydana geldiği, yaşın ilerlemesiyle birlikte karşılaşılan sağlık sorunları ve fiziksel kısıtlamalar göz önünde bulundurulduğunda konut güvenliğini yaşlı bireyler için daha hayati hale getirmektedir. Yaşlıların, bihassa yalnız yaşayan yaşlıların yaşadığı konutların yaşlı bireylerin fiziksel, bilişsel ve zihinsel fonksiyonları dikkate alınarak düzenlenmesi gerekmektedir. Konutu güvenli hale getirmek, yalnızca fiziksel güvenliği sağlamakla kalmayıp aynı zamanda yaşlı bireyin psikolojik ve sosyal iyilik halini desteklemektedir. Bu bildirinin amacı elverişli konut hakkını yaşlı hakları perspektifinden ele almak ve konutları yaşlı bireyler için güvenli hale getirmek amacıyla yapılabilecek ev içi düzenlenmelere ilişkin öneriler sunmaktır.

**Anahtar Kelimeler:** Yaşlı hakları, konut hakkı, konut güvenliği, erişilebilir konut

**SAFE. HOUSING FROM ELDERLY RIGHTS PERSPECTIVE**

**Abstract**

According to Article 25 of the Universal Declaration of Human Rights, “everyone has the right to food, clothing, housing and medical care for the health and well-being of herself/himself and her/his family.” The right to shelter is a fundamental right accepted within the scope of human rights. This right includes the right to shelter and housing, which is a basic need to improve the quality of life of every individual and to enable them to live a life worthy of human dignity. Today, the right to housing has moved one step further in the international arena and the discourse of the right to adequate housing comes to the fore. Although the right to adequate housing is important for every individual, having safe, accessible and suitable housing conditions is very important for the quality of life of older adults. Considering that in old age, injuries and falls mainly occur at home, and the health problems and physical limitations encountered with advancing age, home security becomes more vital for older adults. The residences where the elderly, especially the elderly living alone, live should be arranged taking into account the physical, cognitive and mental functions of the older adults. Making the home safe not only ensures physical safety but also supports the psychological and social well-being of older adults. The aim of this paper is to discuss the right to adequate housing from the perspective of older adults’ rights and to offer suggestions on domestic arrangements that can be made to make homes safe for older adults.

**Keywords:** Elderly rights, right to housing, housing security, accessible housing

## **Giriş**

Demografik dönüşümün yaşandığı günümüzde yaşlı nüfusu giderek artmaktadır. Artan yaşlı nüfusu ile birlikte yaşlı bireylerin yaşam kalitesini ve refahını iyileştirmek için müdahale edilmesi gereken temel alanlardan birisini konut oluşturmaktadır. Yaşlı bireylerin konutları, güvenliklerini, sağlıklarını ve refahlarını doğrudan etkileyen bir faktördür. Bu bağlamda ele alındığında, güvenli konutlar yaşlıların sağlıklı ve mutlu bir yaşlılık dönemi sürmeleri için vazgeçilmez bir gerekliliktir. Yaşlı bireyler için güvenli konut, fiziksel ve sosyal olarak yaşlı bireylerin ihtiyaçlarına uygun, erişilebilir bir yaşam alanını ifade etmektedir. Fiziksel, sosyal ve duygusal ihtiyaçları göz önünde bulundurularak tasarlanmış güvenli konutlar, yaşlı bireylerin bağımsızlıklarını korumalarını ve yaşam kalitelerini artırmalarını sağlamaktadır.

## **Yaşlanan Dünya ve Konut Güvenliği**

Konut, yaşlı bireyler için yalnızca barınmanın gerçekleştiği mekân değil, aynı zamanda yaşlı bireyin alışkanlık sağladığı, güven duyulması ve rahat edilmesi gereken bir yerdir. Konutun kalitesi yaşlı bireye sağladığı bağımsızlık ve gizlilikle ölçülmektedir (Topgül, 2023). Bağımsızlık yaşlı bireylerde konut planlamasında dikkat edilmesi gereken en önemli unsurlardan biridir. Nitekim konut düzenlemesinde, yaşlı bireylerin fiziksel yetenekleri göz önünde bulundurulmadıkça geleneksel uygulamalar yaşlı bireyler için bağımsızlık sağlamaya yetmemektedir (Kalınkara, 2016). Yaşlı bireylerin ihtiyaçları gözetilerek yapılan evlerin, yaşlanma sürecini destekleyecek biçimde yapılması önem arz etmektedir. Konut, yaşlı bireyler için önemli bir alandır. Yaşlılık döneminde sık rastlanan fiziksel kısıtlılıklar, sosyal izolasyon bireylerin bu yaşam döneminde evde daha fazla vakit geçirmesine neden olmaktadır. Konutların, yaşlı bireylerin değişen koşullarına erişilebilirlik, güvenlik ve bağımsızlık konusunda cevap vermesi gerekmektedir. Ev içinde bulunan soğuk, rutubet gibi çevresel tehditler ve uygun olmayan barınma ortamı yaşlı bireylerin sağlığını daha da kötüleştirmektedir. Bununla birlikte yaşlıların işlevsel kısıtlamaları ile ev içinde günlük yaşamı sürdürmede güçlükler ortaya çıkmakta, bu durum bağımsız yaşamı engellemektedir. Konut içindeki fiziksel uygunsuzluklar yaşlı bireylerde ev kazaları ve yaralanma riskini de artırmaktadır. Yaşlı bireylerin ev içinde dolaşırken veya tuvalet ya da banyoda kayma, düşme, merdivenlerden inip çıkarken düşme, günlük yaşam aktivitelerini yerine getirirken kaza geçirme ihtimalleri artmaktadır. Bu ihtimaller yaşlı bireyin evde bakım ihtiyacını veya kurum bakımına taşınmasını beraberinde getirmektedir (Topgül, 2023; Braubach & Power, 2011).

### **Temel Bir Hak Olarak Elverişli Konut Hakkı**

Barınma hakkı, İnsan Hakları Evrensel Beyannamesi'nin 25. Maddesinde yer alan "yeterli yaşam standardı" hakkının bir bileşeni olarak tanınmıştır. İlgili maddede, herkesin kendisine ve ailesine sağlıklı ve yeterli bir yaşam standardını sağlayacak bir barınma hakkına sahip olduğunu belirtilmektedir. Barınma hakkı yalnızca barınacak bir yerin olması değil aynı zamanda konutun kalitesi, uygun maliyeti, erişilebilirliği, güvenliği gibi birçok unsuru içermektedir. Bireylerin barınma imkânı olsa bile eğer konut güvenli barınma imkanlarından yoksunsa bireyler ciddi sağlık sorunları başta olmak üzere çeşitli zorluklarla karşı karşıya kalmaktadır. Bu bağlamda elverişli konut hakkı, tüm ekonomik, sosyal ve kültürel haklardan yararlanılması için merkezi öneme sahiptir. Bir başka ifadeyle elverişli konut hakkı, çalışma, sağlık, sosyal güvenlik, oy kullanma, mahremiyet veya eğitim hakları da dahil olmak üzere çeşitli insan haklarından yararlanmanın bir önkoşulu olarak değerlendirilmektedir (Gutterman , 2023). Elverişli konut temel bir insan hakkı olmakla birlikte refahın önemli bir belirleyicisidir. Bu nedenle yaşlı bireylerin konut ve konut çevresinin iyileştirilmesi önemlidir. Konutun değerlendirilmesi ve yaşlı bireye uygun hale getirilmesi oldukça komplike bir durumdur. Zira bu değerlendirme ve düzenleme beklentilere, ihtiyaçlara ve ekonomik duruma göre farklılık göstermektedir. Yaşlı bireylerin birçoğunun uzun süre kendi evinde yaşamak istemesi nedeniyle, gerekli değerlendirme ve düzenlemelerin yapılarak konutun yaşlı bireye uygun hale getirilmesi gerekmektedir.

### **Güvenli Konut: Yaşlı Dostu Evlerin Özellikleri**

Sağlıklı yaşlanma, ilerleyen yaşlarda bireyleri işlevselliklerini devam ettirmesi ile gerçekleşebilmektedir. Dünya Sağlık Örgütü tarafından yayınlanan Avrupa'da Yaş Dostu Ortamlar Politika Eylem Alanları El Kitabı'na göre yaş dostu ortamların üç bileşenin bir araya gelmesi ile oluşmaktadır. Bu bileşenler belediye hizmetleri, sosyal ortam ve fiziksel ortamdır. Topluluk, sağlık hizmetleri, iletişim ve bilgilendirme belediye hizmetlerinin kapsamına girerken; sivil katılım, istihdam, sosyal içerme, ayrımcılığın önlenmesi, sosyal katılım başlıkları sosyal ortam kapsamında değerlendirilmektedir. Fiziksel ortam ise dış ortamları, ulaşımı, hareketliliği, konutu kapsamaktadır (World Health Organization, 2017).

Dezavantajlı bir grup olarak nitelendirilen yaşlı bireylerin işlevsel kapasitelerini desteklemek üzere tasarlanmış yaşlı dostu konutlar, yaşam alanlarının yaşlıların işlevsel kapasitelerini göz önünde bulundurarak ve yeterli ulaşım araçlarının sağlanması yoluyla hareketliliklerini ve iletişimlerini kolaylaştıracak şekilde dizayn edilmektedir. Ev içinde yapılabilecek basit

düzenlemeler yaşı bireylerin yerinde yaşlanma süresini uzatarak bağımsız yaşamını desteklemektedir (Rowles, 2018).

### **Sonuç ve Öneriler**

Barınma hakkı, barınmayla eşit tutulan dar veya kısıtlayıcı bir anlamda yorumlanmamalıdır. Barınma hakkı, başını sokacak bir çatı ya da barınmayı yalnızca bir meta olarak görmek yerine bir yerde güvenlik, barış ve onur içinde yaşama hakkı olarak görülmelidir. Bu da konut değil aynı zamanda elverişli konut hakkına işaret etmektedir. Yaşlı dostu konutlar, yalnızca yaşlı bireylerin yerinde yaşlanmasını desteklemekle kalmayıp aynı zamanda yaşlı bireylerin ekonomik ve sosyal refahına katkı sunacaktır (Pynoos & Nishita, 2006). Yaşlıların mümkün olduğu kadar uzun süre kendi evlerinde yaşamaya devam etmelerine yardımcı olmak, bunun için gerekli konut düzenlemelerini yapmak, gerekli önlemleri almak, konutun yaşlıların işlevselliklerine uygun hale getirilmesi elverişli konut hakkına erişim için öncelikli eylem alanları olmalıdır. Yaşlı bireylerin sosyoekonomik durumları ve bağımsızlık derecelerine uygun çeşitli konut türlerinin geliştirilmesi amacıyla kamu finansmanı ve özel sektörle anlaşmalar sağlanmalıdır.

**Abstract**

The general course of consumption behaviour and shopping behaviour has undergone a significant change following the Industrial Revolution. Towards the end of the 19th century, when production was prioritised, consumption became the main paradigm, and practices that encourage consumption and create new needs became widespread. The culture industry, which has become dominant thanks to mass media, has prioritised the creation of new needs, and this has led to the formation of a sector called fashion. Fashion, which was previously only in a narrow framework and for those with high socio-economic opportunities, has become a phenomenon that shapes and directs the consumption behaviour of the masses through mass media. The most characteristic feature of fashion, which determines the creation of new needs and the way these needs are met, is change. Change is a value glorified by today's dominant mentality. Clothes, automobiles, houses, mobile phones, white goods, furniture, physical appearance and even people, friendships, values, emotions, beliefs, which are indicators of an individual's tastes and material power, are the objects of change. Therefore, fashion is about everything. In the context of all these, fashion, in the shortest terms, is what is temporary. Something becomes fashionable only for a certain/limited period of time and then quickly becomes obsolete. Essentially, the process of becoming obsolete begins with something becoming fashionable. The idea of obsolescence is what enables something to be fashionable and unfashionable, that is, the rapid change that takes place in this process, in other words, the fashion trend to start the next trend. With this research, the semantic change, formation and functioning of the concept of fashion will be discussed.

**Keywords:** Fashion, Obsolescence, Obsolescence, Consumption.

### ***Introduction***

*Capitalism, culture industry, consumer culture, fashion, advertising...* all these are situations and phenomena that have a direct and strong relationship with each other. They have enveloped individual and collective mentalities and all areas of individual and social life. Capitalism represents the most dominant phenomenon among them all. The others fulfil their functions under the influence and control of capitalism in a cause-and-effect relationship or in support of each other. To make a statement on fashion, the subject of this chapter, *fashion* cannot exist in its present meaning and function without *capitalist* mentality and practices. The *culture industry*, which is a sub-element of capitalism, makes use of *advertising* while creating and popularising fashion. The ultimate goal of all these is *the culture of consumption*. *Consumption culture* motivates *capitalist* mentality and practices.

### **Fashion And Consumption**

Now we can ask our main question: *What is fashion?* There is no standard definition of fashion that is accepted by everyone. Because it can have different definitions according to its scope and function. For this reason, many definitions have been made. New definitions continue to be made. The meaning and function of fashion may differ in different social structures according to the dominant mentality and lifestyles there. For example, socioeconomic status and situations can significantly change the meaning and function attributed to fashion. Similarly, changes in the acceptance and understanding of "consumption" can lead to changes in the meaning and function of fashion. Nevertheless, by taking into account the common features and commonly accepted meanings of the definitions, some determinations can be made about what fashion is, even in a general sense. Fashion, in the most general sense, refers to what is accepted and/or used by a certain group of people at a certain time and in a certain place. For this reason, the definition of *style and form in force* in dictionaries is meaningful. The determination of the *rule that temporarily regulates the use and shapes of ornaments, clothing, furniture, etc.* expressed by another definition expresses one of the common views on the scope of fashion. Many more definitions can be expressed based on different dictionaries and encyclopaedias. The origin of the word fashion can be seen as the right starting point to determine the meaning of fashion in order to reach the result in a short way without wandering between definitions. According to the common opinion, the origin of fashion is *mod*, which is a statistical term. *Mode refers to the most repeated number among the numbers in a certain sequence*. Therefore, fashion refers to the *most repeated thing, the common thing*. It is important that fashion expresses the state of "prevalence". While a work, behaviour or appearance that is

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

*April 09-16, 2024 / Lisbon, Portugal*

done by a person or a few people in a society and is out of the ordinary may be considered strange, the fact that that thing *becomes widespread and* is done/adopted by many people can lead to the normalisation of that thing. This situation points to fashion. Of course, there are some important criteria that shape the transformation of something from being considered strange to being liked and widely adopted. Personalities who are respected by the society/mass and therefore are models are the most important tools of this transformation. For this reason, *the culture industry*, since it is the shortest and easiest way to include a product in the consumption process, first of all produces model personalities or "star" individuals with popular nomenclature, and through these, it puts its products on the consumption market. The product is easily accepted through "stars". There are significant differences between being a person respected by society in the traditional sense and being a "star", which is a phenomenon of modern times. In traditional society, reputation is a requirement of being an exceptional personality that is appreciated and admired by the members of the society in line with the value judgements of the society. For example, a person can be a respected artist of the society with his/her long-standing and outstanding achievements. In the traditional mentality and society, being an artist is a characteristic that is a combination of special talent, great labour and outstanding achievement. Today, however, being a "star" does not require special talent, labour and success. When mass media advertise a person as a "star", it is possible to become a "star". In fact, most of the time, a person with no special talent, labour and achievement can suddenly be remembered as a "musician", "singer", "voice artist", "model", "mannequin" .... However, this in no way means that the "artist" or other titles of that person will have a long-lasting continuity. A person can shine in one moment and fade away in the next. For example, a person chosen by the culture industry can become a "star" with a song and then disappear after fulfilling the functions expected of him/her by the culture industry. As no one knew before, no one remembers him/her after he/she fades out. This "star's" being remembered and continuing his/her "stardom" is related to and limited to what the culture industry expects from him/her. There is a linear relationship between the role of the culture industry in producing "stars" and fashion, which is the most important motivational tool of consumption that capitalism wants to make uninterrupted. Because there is a strong relationship between *fashion* and *being widespread*. However, although the fact that something is preferred by many people is important for it to be fashionable, this feature may not be enough to ensure that what is desired to be widely consumed is fashionable. An example of this is the torn/worn jeans that are in fashion today. When the blouse was first invented in the USA, it was used by mine workers.

The blousins used by the workers and worn out during long periods of hard labour were not considered fashionable in any way. Moreover, despite the fact that they were worn by a large mass of workers. However, as relatively high status groups, especially young people, began to dress more widely, the torn jeans became fashionable. This was done through "star" personalities who were modelled. Through them, young people and even non-young people started to wear torn/worn jeans and this became a widespread consumption behaviour. People could be directed to the desire of owning torn/worn jeans by paying more for them than for the good ones. A similar situation can be said for "old" clothes. In the old times, the torn, worn, partially dismantled clothes that the poor had to wear were not fashionable although they were worn by the poor on a mass level. This condition of those items was a result of unfavourable economic conditions. Today, however, torn, frayed and partially dismantled clothes have become fashionable through role models and individuals with high socio-economic conditions have been made to wear torn and dismantled clothes. Perhaps patched clothes will soon face a similar situation. Of course, if the people or businesses who decide what is fashionable decide to do so. If one of the important references in determining the meaning of fashion is "mod", the other is *modus*, which means "unformed border" in Latin. *Modus* contributes to understanding the meaning of fashion as well as its function. As it is known, fashion is something that changes easily and does not remain fixed/the same in any way. In the shortest terms, fashion is something that is temporary. Something becomes fashionab/e only for a certain/limited period of time and then quickly becomes *obso/ete*. In fact, when something becomes fashionable, the process of becoming obsolete also begins. The idea of *obso/escence* is what enables a thing to become fashionable and unfashionable, that is, the rapid change that takes place in this process, in other words, the fashion trend to start the next trend. For example, objects physically wear out over time depending on their qualities and usage. This is an expected and familiar situation. However, the traditional mentality and the modern mentality's understanding of *obso/escence* do not refer to the same meaning. From the point of view of the traditional mentality, the obsolescence of an object is due to the fact that it is physically unable to fulfil its basic function and deteriorates. However, from the point of view of this mentality, the obsolescence of an item does not require that the item be immediately thrown away or considered as "rubbish". The *old* item can be repaired and used again and again. Understandings that control consumption, such as *waste* and *saving* with the limited means available, can contribute to transforming the *worn-out* item and maintaining its functionality, even if it has completed its actual useful life. In this respect, some familiar examples are clothes that are patched and worn, furniture that is repaired

and sweaters that are dismantled and put back into use by mopping. It is understandable for elderly individuals with a traditional mentality to continue to keep any item that has lost its function with the understanding that "it will be needed one day". Because from the point of view of this mentality, throwing away items that can be repaired or throwing away objects that have economic value is considered as "rubbish" and is considered as *waste*. Waste is a behaviour that should be avoided. Therefore, according to this view, every item, even if *it is old*, has a use value. This is the requirement of the mentality in which *consumption* is not a value, instead *saving is recognised* as a value. On the other hand, the meaning attributed to "obsolescence" by the modern mentality, which represents the transition from the *old* to the *new* and makes *change* a fundamental value in this context, is completely different from the meaning attributed by the traditional mentality. In the modern mentality, it is not the case that things lose their physical function, wear out and become unusable. The meaning attributed to *obsolescence* by the modern mentality is directly related to the course of development of the capitalist mentality. In the early 20th century, as a result of the replacement of the principle of *production* with the principle of *consumption*, "spending" rather than "saving" or "preserving" was encouraged, while values such as "frugality" began to be perceived as *stinginess*. The thrifty, wasteful individuals of the past have been replaced by individuals with the mentality of "*I consume, therefore I exist*" and the masses formed by these individuals. Instead of *stability*, *permanence* and *order*, *transience* and *change* have become the basic principle. The idea of *impermanence* and *disposability* has been developed and reinforced through adverts that manifest themselves at every corner of daily life with calls to *bring the old and take the new*. Being "disposable" and "discontinuous", which comes with the idea of *obsolescence*, has become a feature that reveals itself in its full form not only in clothes, household appliances, cars, accessories, furniture and houses, but also in human relations and preferences. The minds are now dominated by a distinction between what is appropriate and inappropriate for the times and conditions. When this idea is engraved in the consciousness with the concepts of "new" and "change", individuals who are motivated by the discourses of infinite *freedom of choice can*, for a small reason, remove friends, people or relationships that they do not like or that are no longer useful from their agenda and minds, and continue their lives as if they had never happened by opening a new page. As in the Greek philosopher Heraclitus' statement that the *only thing that does not change is change itself, change/abandonment is at the centre of the mentality of today's individuals and life in today's societies*.

### **Fashion And Change**

*Change* is a value glorified by today's dominant mentality. Clothes, automobiles, houses, mobile phones, white goods, furniture, physical appearance and even people, friendships, values, emotions, beliefs, which are indicators of the individual's tastes and material power, are objects of change. For today's individual, none of these have the importance and meaning to deserve to stay for a long time. Fashion is an important motivational tool that manages the process. Fashion keeps the desire for change alive through the understanding of *obsolescence* in a way that can be called continuous. Sociologist Roland Robertson (1938-2022) considered the adoption and spread of fashion as a five-stage process supported by social motivations. These stages consist of the following:

- 1) The adoption of what will become fashionable by agents, i.e. change leaders,
- 2) Social visibility and communicability,
- 3) Harmony within and between social systems,
- 4) Social cohesion and the market,
- 5) Becoming obsolete with the emergence of new fashion alternatives.

In addition, fashion represents the logic of planned obsolescence. Fashion is not only a necessity for the survival of the capitalist market, but also an important tool for the expansion of capital. Werner Sombart (1863-1941), who analysed the economic dimension of fashion within the capitalist system, defined fashion as the *favourite child of capitalism* in his work *Economy and Fashion* (Wirtschaft und Mode) published in 1902. According to him, fashion is a necessity to offer new fields and products to the capitalist market. It is a highly functional mechanism for making profit by making things, ideas, values, lifestyles, attitudes and behaviours, personalities, identities... constantly "obsolete". Within the scope of all these, the main characteristics of the fashion sector can be expressed under five headings: *Being short-lived*: Fashion products are generally short-lived. The life of a fashion product is expressed in weeks or months. Fashion is recognised as a temporary and cyclical phenomenon. For this reason, it is known that the life curve of fashion clothing products is shorter than other industries. *High variability*: The demand trend for fashion products is rarely constant or linear. Fashion products can be affected by seasons, famous people, trends. *Low predictability*: Due to the variability of demand, it is difficult to make sales and demand projections. *Highly motivated buying tendency*: Most of the purchasing decisions of consumers are made at the point of purchase. When the consumer encounters the product, he/she is encouraged to buy it. *Being similarising*: Today, although the fashion industry is multidimensional, multicultural, multicoloured and multivocal, as a result

of globalisation, clothing and fashion culture has evolved into a similar structure among countries. In this respect, brands such as Zara, Berschka, Pull&Bear, H&M, Stradivarius, Mango, Vero Moda, TopShop, Koton and Batik function as actors of similarity of appearance. Attitudes and behaviours, preferences and tendencies that can be considered within the scope of fashion have been one of the unchanging features of social life. In all societies, senior executives and the people around them, especially family members, members of the socio- economically high class, and especially women have had different and variable preferences from the majority of the society. Fashion is a sociological phenomenon related to power holders and rich people before the 19th century. In the first quarter of the 20th century, it gained a mass character with a form and scope unprecedented in history. Class fashion has been replaced by consumer fashion. Instead of a single type of fashion determined by the upper classes, a fashion understanding that tends to include all layers of society has emerged. In the 20th century, developments in mass communication technologies led fashion to become widespread and prestigious in a way never seen in any period of history. In the 20th century, the phenomenon of dressing has covered the whole social life in a way that goes beyond culture and has become a part of the material and spiritual dimension of consumer culture. Through mass media, it has become an element that mobilises social change as well as a mirror of social life. However, in addition to fashion shows, fashion blogs and fashion magazines, other channels that are as effective as them have emerged in the dissemination of fashion. One of these channels is fashion magazines. In addition, the internet and social media platforms have assumed important functions in terms of the opportunity to spread fashion trends rapidly and to deliver visual images to wider audiences. Fashion influencers and celebrities who are effective on platforms such as Instagram, YouTube and TikTok popularise a certain body type, clothing style and beauty standards in a short time and have a strong influence on their followers to adopt these idealised images.

### **Scope of Fashion**

The most basic expression of fashion is recognised as *clothing*, *dress* and *ornamentation*. Clothes are the most classic and basic product of fashion. Being a manifestation of people's personality and character, clothes are an observable form of behaviour. However, although clothes are the most visible form of fashion, fashion is a broader phenomenon. It is related to many different material and non-material contexts. The most important tool and even lever of fashion is advertising. Every day people are bombarded by visual advertisements that encourage them to buy certain products or services, which in turn creates and popularises fashion.

However, these images also function as factors that influence attitudes, values, beliefs and behaviour. Fashion is inherently related to material contexts (furniture, architecture and automobiles, etc.) as well as non-material contexts (child-rearing techniques, art appreciation, etc.). In essence, fashion is not only concerned with the appearance of a person's body, but also with their behaviour, thoughts, feelings, emotions, knowledge, speech, agenda, interests... in short, the way they present themselves. For example, making personality analyses based on horoscopes, using slang words or gesticulating while speaking under the influence of some TV series and films can be things that are encountered as fashion elements. In this respect, the words of the famous fashion designer Coco Chanel (1883-1971) are important in terms of expressing the scope of fashion: *Fashion is not something that exists only in clothes, fashion is something in the air we breathe. It is a wind, you feel it coming, you smell it. Fashion is about ideas, lifestyles, what is happening.* The basis of fashion culture is capitalism, which is driven by an unlimited and irresponsible drive for material profit. The rulers of the capitalist mentality, who deliberately declare the contents of existing wardrobes *obsolete* and *outdated*, have succeeded in turning people into slaves dependent on themselves through fashion; they have first and foremost influenced young people and women. Nowadays, even young people who do not have enough money for a bagel to fill their bellies consider following fashion as an indispensable condition and try to follow fashion as much as possible. Young people with no economic means walk around hungry, they feel cold because they have no clothes to protect themselves from the cold, but they try to have something fashionable; sometimes it is perfume, sometimes it is a branded clothing, and lately most of the time it is a mobile phone. Because it is through these that the young person feels his/her existence and makes his/her peers feel it.

The modern mentality and lifestyle has placed the human being as the "subject" at the centre of the "God-centred" existence and lifestyle of the previous, traditional period. This subject, on the other hand, manifests the things constructed and characterised by the culture industry in all the units of the system at the centre of which it sits. For this reason, the mass society and its individuals value fragmentation instead of unity and harmony, pleasure and desire instead of reason. In addition, modernity prefers not the sacred but the profane embodied in itself. In this respect, while entering into a conflict with the sacred, it also presents itself as a taboo. This presentation manifests itself most clearly in fashion rituals. For example, the fact that fashion shows are presented in a ritual/ritual atmosphere, that fashion provides its followers with a belonging with transcendental references, that the members of this belonging display the appearance of a "faith community", that they think, dress and live in the same style... points to

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

**April 09-16, 2024 / Lisbon, Portugal**

fashion's effort to create a *sacred* space around itself. Through fashion, the profane is given a sacred spirit and appearance. For this reason, Barnard's definition that *fashionable clothing and clothing items are the most fetish products produced and consumed in capitalist society* is very meaningful. According to Andrew Greeley, an American clergyman, it is enough to visit any car fair today to watch a religious ritual. When one goes to the place where automobiles are exhibited, it will be seen that fashion presenters are treated as people with immunity like clergymen, and the products are treated as aesthetically and ethically indisputable taboos.

**Conclusion**

In addition to all these, the following should also be stated: The planned rapid *obsolescence* of consumer goods through fashion provides capitalist capital with billions of dollars every year. This makes capitalism always strong and effective. It is possible to clearly see how this process works in the individuals of the consumer society who see consumption as the only way of expressing themselves and use the brands they use instead of their identity. It would be misleading to see this as merely a situation that enables consumers to prefer the products they need. This operates through an idea/value that is embedded in the consciousness of consumers in their human relations and perspectives on life, and is reflected in their behaviour. The philosophy of *carpe diem*, which invites individuals to cut their ties with the past, not to take the future into account and to turn towards the present moment, and to enjoy the moment, drags consumers to further stages and contributes to the establishment of the *disposable* logic from products to human relations, from nature to working life.

**Abstract**

Among the places where people's shopping activities were shaped before the Industrial Revolution, the agora of Ancient Greece, the market area or city squares of the Middle Ages are important in terms of the functions they fulfil. In addition to being places where commercial activities were carried out and shopping was carried out to meet needs, they were also places where political or cultural activities were carried out and where individuals socialised extensively. They were the heart of social life. In fact, this situation has never completely ended, and especially city squares, with their increasingly narrower and shallower functions, have maintained the features they inherited from history until today, albeit in a diminishing form. However, with the Industrial Revolution, the first signs of change began to be seen in the primary space of production-consumption relations. In the first stage, department stores, which can be considered as the pioneers of shopping centres, started to be seen. These stores fulfilled important functions for a while as places where comfortable shopping could be done, where the products offered for sale were offered to the consumer under favourable conditions and exhibited to encourage consumption. As of today, shopping malls, which have become a centre of attraction with their many elements, are living centres that host many of the activities that individuals and masses feel the need for or feel the need for. These places have become places where the heart of urban life beats with their multifaceted functionality such as shopping, entertainment, eating and drinking, worshipping, doing sports, leisure time, watching movies in the cinema, spending time with friends, spending the weekend with the family, window shopping, socialising, following fashion with their units such as shops, cinema, bank, restaurant, patisserie, cafeteria, hairdresser, pharmacy, place of worship, entertainment or sports venue, playground. With these multifaceted functions, they appeal to all segments of the society from the highest income level to the lowest income level and attract everyone's attention. In this respect, they are micro spaces of daily life. With this research, the meaning and functions of shopping centres, which represent the last stage of the change process of shopping spaces, in the context of consumption culture will be discussed and evaluations will be made regarding the process.

**Keywords:** Shopping, Consumption, Shopping places, Shopping centres.

### **Introduction**

The Industrial Revolution has an important place in the formation of the modern mentality and lifestyle, to put it in terms of shaping the process, disregarding the philosophical and scientific heritage of several centuries. The Industrial Revolution, which led to many changes in people's mentality and in their individual and social lives, and the urban life that accelerated and intensified thanks to it, significantly changed the production-consumption relations and caused these relations to be reflected in other areas of individual and social life, rather than being limited to the economic field as before. Changes in working life, the emergence of the traffic problem, new meanings attributed to consumption, the emergence of the concept of "leisure time" and proposals and initiatives regarding its content, the search for alternative spaces for the needs shaped by the new mentality and lifestyle... have been the determinants of radical changes and innovations in the course of humanity.

### **Emergence of Shopping Centres**

Before the Industrial Revolution, among the places where people's shopping activities were shaped, the agora of Ancient Greece, the market area of the Middle Ages or the city squares are important in terms of the functions they fulfil. In addition to being places where commercial activities were carried out and shopping was carried out to meet needs, they were also places where political or cultural activities were carried out and where individuals socialised extensively. They were the heart of social life. In fact, this situation has never completely ended, and especially city squares, with their increasingly narrower and shallower functions, have maintained their features inherited from history until today, albeit in a diminishing form. However, with the Industrial Revolution, the first signs of change began to be seen in the primary space of production-consumption relations. In the first stage, *department stores*, which can be considered as the pioneers of shopping centres, started to be seen. These stores fulfilled important functions for a while as places where comfortable shopping could be done, where the products offered for sale were offered to the consumer under favourable conditions and exhibited to encourage consumption. The growth of cities, the increase and intensification of the population, the emergence of the traffic problem, the emergence of the concept of leisure time in general and holidays in particular due to the regulations in working life, the emergence of the need to engage in as many activities as possible in limited free time... all these have led to the inadequacy of city centres and the search for alternative spaces has emerged. Although the spaces that were the product of these searches responded to the needs, albeit with difficulty, until the 1950s, this was not found sufficient. Victor Gruen (1903-1980) was the planner of the

first shopping centre with its present form and function in the United States based on the existing problems and demands. According to him, there was a need for a place of escape for people who were overwhelmed by the traffic problem and the boredom of daily life. Due to the fact that the city centres had lost their functions to a great extent with the division of life and spatial construction into different activity areas in cities, he thought that there was a need for places where new social activities were concentrated and designed the first shopping mall. In 1954, he designed the first suburban open-air shopping facility called Northland Mall. In addition to shops, it was designed as a complex of apartment blocks, schools and health facilities, with its own large park and lake. This complex was never completed, but the idea of this complex space design was original. Victor Gruen continued to design new spaces with some additions and subtractions. The second mall Gruen designed was the Southdale Shopping Centre in Minnesota. He designed it as an enclosed space for both vendors and consumers, where social activities were carried out together, going beyond mere shopping activities. Others followed. By the mid-1970s he had designed more than fifty shopping centres in the USA. Each space was planned in more detail than the previous ones. Thus, he reached the shopping centre design that brings together the functions that the busy and complex lifestyle of today's modern city makes individuals feel the need or desired to feel in their daily lives under a single homogeneous roof.

### **Structural Features of Shopping Centres**

As of today, shopping malls, which have become centres of attraction with their many elements, are living centres that host many of the activities that individuals and masses need or feel the need for. These places have become places where the heart of urban life beats with their multifaceted functionality such as shopping, entertainment, eating and drinking, worshipping, doing sports, leisure time, watching movies in the cinema, spending time with friends, spending the weekend with the family, window shopping, socialising, following fashion with their units such as shops, cinema, bank, restaurant, patisserie, cafeteria, hairdresser, pharmacy, place of worship, entertainment or sports venue, playground. With these multifaceted functions, they appeal to all segments of the society from the highest income level to the lowest income level and attract everyone's attention. In this respect, they are micro spaces of daily life. The main factor that is often unrecognised in the functioning of shopping malls is the phenomenon of *leisure time*, which is a product of the Industrial Revolution. While *production* and *work* were at the forefront in the early days of the Industrial Revolution, *leisure time* based on consumption was built as an important living space in the following period. Following the Industrial

Revolution, *working time* and *rest time* were completely separated from each other as two separate living spaces. However, in traditional life, working life and rest time were intertwined; there was no such separation. With this separation, the social structure based on production and work was replaced by a new social structure based on consumption and leisure time. Capitalism, which is the subject of the process, while reshaping production and consumption through its own paradigm, has designed that individuals who use their time for production should also have private time for consumption. Non-working time, which is created through regulations on working life, is designed as a field of activity based on consumption. For this reason, leisure time activities have been commodified and functioned as a tool of hegemonic planning rather than being seen as a time to spend leisure time resting. Consumption became the main activity of the process. In this respect, thanks to *the institution of leisure time* built under the conditions of the Industrial Revolution, *consumption* has ceased to be a means of sustaining life and has become an end in itself. This has functioned as an important means of dominating the understanding that people should *live to consume rather than consume to live*. Today, the act of shopping and consumption has social and symbolic contents such as having fun, leisure time, acquiring status, achieving an idealised lifestyle and obtaining prestige. In terms of the modern mentality, consumption has emphasised the meanings attributed to products rather than their properties and functions, and in some cases even completely. The "mass society", which is constructed with the help of mass media and is open to all kinds of manipulation, and whose sociality is questionable in every respect, has been transformed *into a society of consumption*. The *consumer society*, which is constructed with the desires of large companies engaged in mass production and through the advertising-fashion tools of mass media, gains meaning as the name of an extremely shallow and largely formal structure compared to the natural/real social structure. This structure is a structure whose main function is to consume, where not only consumption commodities but also identities, spaces, lifestyles, cultural elements, images, meanings, values, time and almost everything else are perceived as objects of consumption. Consumption has ceased to be the result of an act of shopping to satisfy mostly physiological needs and has become a phenomenon that is supported and directed through fashion and advertisements in line with the aims of the capitalist economy, and in which consumed objects are used as identity and status indicators. Both the constructor and the supporter of this phenomenon is the capitalist mentality. Just as every society has a culture, a culture has been invented for *the consumption society*, and unlimited consumption tendencies to obtain the symbols dressed in consumption objects, and the lifestyle shaped around consumption

behaviours that diversify every day have formed the basis of this culture. The modern urban individual has become the ideal type of *consumption society* and *consumption culture*. This individual consumes in order to have the sense of identity offered to him/her and to live according to who he/she wants to be perceived as. *Consumption culture* is a necessity of not seeing consumption activity only as the consumption of commodities. Consumption culture refers to a mentality and lifestyle related to the purpose and manner of obtaining the commodities consumed, the way they are used and the norms and value system emerging in this process. The use of an object because of its ability to satisfy a need and being found valuable in this respect is a very normal and routine feature in terms of human behaviour. Here, the subject is the human and the object is the product consumed. However, consumer culture gains meaning as the name of a situation that disrupts this hierarchy. In this case, people become objectified and things become subjectified. Karl Marx's (1818-1883) conceptualisations of alienation and fetishism are important as one of the first to recognise this situation. Another social scientist György Lukacs (1885-1971) made a similar evaluation while reaching the concept of *reification* through what Marx expressed with alienation and fetishism. Whatever the conceptualisations expressing the subversion of the hierarchy in question, what is expressed expresses the differentiation of the connection that should be in the relationship between man and things. In other words, while the thing produced for use becomes the basic reference of a system of values, the human being, who should be the subject, becomes objectified and ordinary. However, the thing that becomes subjective in consumer culture is essentially the thing produced by human beings for human beings. To give an example of how this happens; when a person sees a state-of-the-art technological product, if he starts to see that technological product as a value in itself, as a basic reference that will increase his own value if he owns it, rather than the feature related to the function of that product, this is a problematic relationship and corresponds to *the culture of consumption*. In Marx's conceptualisation, the person in this situation becomes "alienated" from his/her own essence/humanity, and the object that enables this alienation gains the quality of a fetish. In the same way, the fact that money, which is an intermediary in the purchase of commodities, becomes a measure of value is shaped according to the functioning of the process envisaged by the consumption culture. At this stage, it is meaningful that Ivan Illich (1926-2002) defines *consumer society* as a type of society in which life is organised around commodities and social progress is measured by the power of access to these commodities, or Zygmunt Bauman considers *consumer culture* as a type of society in

which the exchange value of commodities disappears and the function of commodities as indicators comes to the fore instead of their utility function.

### **Consumption Culture and Shopping Centres**

For the modern and therefore urban individual, being different from everyone else, and demonstrating this difference with his appearance, especially in terms of clothing and attire, eating and drinking places, the tools and equipment he uses, and the social environment he is in contact with, constitutes one of the targeted goals of the idealised lifestyle. He strives to be different from those around him with the visible brand name of his clothing, the neighbourhood of his residence, the brand and model of his car, the country and region he goes on holiday, the popularity of the food he eats, the subjects he is interested in, his circle of "friends", the way he speaks... This situation leads to an endless struggle to *be recognisable*, and all their efforts are shaped on the axis of being different and staying different. As a result of the increased accessibility of consumption commodities and the tendency to spread to all segments of the society, the current situation of the socioeconomically upper segments has become questionable, which has necessitated the continuous reconstruction of *differentiation* tendencies through fashion, which triggers and accelerates *being different*. The widespread access to all kinds of clothes as a stage of this situation has pushed *the privileged segments* who tend to be different to expose themselves with a nudity in which only the genitals are covered, or to exhibit behaviours that reveal their differences through appearing in such art activities. The paradox of *differentiation* and *sameness* leads to an endless consumption motivation. In this respect, shopping malls function as spaces of the capitalist commodity system cycle *that both segregates and replicates*. As places where an *ostentatious* lifestyle is embodied in all its dimensions in accordance with *the requirements of the consumption culture*, shopping malls make life easier for the members of the consumption culture by offering all the products required by *ostentatious symbolic consumption as well as* products that will meet all the needs that can be considered as *compulsory* such as food and clothing. Offering a wide variety of products in different stores that meet all kinds of needs together allows people to shop in accordance with their lifestyles, identities and status. Special security personnel, devices and inspections create a safe environment and provide protection from external factors that may harm individuals. People have the understanding and confidence that they breathe in a highly controlled and disciplined life during their stay there. In shopping centres, it is clear where to enter and exit and what to do. These are dictated to individuals in the form of unwritten rules. In these places where individuals stay as long as they can, showcases create a visual space that they cannot break

away from. The perception that the individual can spend his whole life if he wants is successfully dictated. There is something for everyone. People's interests, feelings of pleasure and desires are constantly provoked. In addition to these, the fact that shopping malls offer colourful brands and different lives causes people to be psychologically affected; shopping malls function as a means to get away from external problems. Individuals numb their problems or take a break by visiting the colourful showcases in the shopping malls. In shopping centres, there is virtually "nothing to find", all stores and "needs" are waiting for their customers in magical boxes.

### **Shopping Centres and Religious Rituals**

The fact that shopping malls have become a centre of attraction of consumption that constantly renews itself and does not lose anything from its attractiveness in this respect has been possible thanks to planning carried out in a highly rational manner. Among the objective, emotional and functional elements that make shopping malls the centres of attraction of consumption culture, the fact that they are gigantic and easily accessible places, their eye-catching showcases that stimulate feelings of need, the fact that they are offered with opportunities to meet many different needs at the same time, and the use of credit card shopping facilities that facilitate spending and transfer payments to the future are important attraction features. In a sense, the roads in shopping centres, which have the appearance and function of a micro city, constantly direct people to the stores depending on the architectural tricks that highlight the showcases of the stores and present them to the attention of the consumer. The arrangement of the space is realised in such a way that the individual will increase the time he/she will spend in the shopping mall and thus, he/she will feel the need by seeing what he/she does not need. The internal flow in the space is realised through labyrinth-like circulation areas, enabling consumers to encounter the maximum number of products and shopping opportunities. The escalators, which are located in the same direction but not end-to-end and used for vertical connection, are planned to allow people to walk around and thus see more stores. What is more important and interesting is that consumption is not directly presented in these spaces. Entertaining activities and shows are attached before and next to the consumption activity, and campaigns presented as special opportunities successfully fulfil the functions of directing consumption. Shopping in shopping centres is no longer just an act of purchasing. Entertainment, aesthetics, image and belonging have become effective elements of purchasing. With the addition of entertainment to the meaning of shopping, the distinction between shopping and entertainment has almost disappeared. Thus, consumption is transformed into an act of pleasure, a recreational activity.

## VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY SCIENTIFIC STUDIES

April 09-16, 2024 / Lisbon, Portugal

With the establishment of shopping centres, shopping has become an effective element of purchases such as entertainment, aesthetics, image and belonging. With the addition of entertainment to the meaning of shopping, the distinction between shopping and entertainment has almost disappeared.

A *lifestyle* is offered to individuals in shopping centres. This is a lifestyle envisaged by capitalism and designed by the culture industry. The masses are directed towards the modern mentality and lifestyle through these places, the relations and transactions in these places. These spaces of production-consumption relations, which seem to put the human being at the centre, but where the intellectuals and representatives of the consumer culture are the subjects and the masses are the objects, are places where rationalism, hedonism, change, individualism, materialism, secularism... appear in accordance with the requirements of modernity. With these characteristics, they are concrete and functional examples of modernity's function of being an "anti-religion religion". Modernity, which is built on anti-religion (Catholicism/Church) and presents itself as a religion in many respects by taking its "enemy" as a model, transforms itself into a "religion of science" in educational institutions, a "religion of pleasure/entertainment" in daily life, or a belief/religion system of "sexuality", "violence", "physical power" ... in different places and environments. In this respect, Ivan Illich was one of the first and important figures to draw attention to the functions of shopping centres outside the production-consumption relationship. While defining the consumer society as a type of society in which life is organised around commodities and social progress is measured by the ability to access these commodities, he emphasised the "slavery of consumption", although the implication of "religion" is also quite strong in this determination. The American sociologist George Ritzer, on the other hand, used the term "religion" directly. As Ritzer expressed in his book *Enchanting the Disenchanted World*, shopping centres are the "cathedrals" of the "religion of consumption". He had no difficulty in finding traces of the forms and worship of the Abrahamic religions (Judaism-Christianity-Islam) in shopping centres. He likened shopping centres to places of pilgrimage. To extend his metaphor a bit; shopping malls function as the place of worship of the modern/secular individual. In the standardised rituals here, it is possible to find traces of the weekly prayers and pilgrimages of the three Abrahamic religions. Individuals who are believers *of the religion of consumption* have a feeling of spiritual emptiness if they do not visit the shopping centre one day a week, similar to the worship of Jews on Saturday, Christians on Sunday and Muslims on Friday. Due to the conditions of working life, this is usually at the weekend. This situation is important in terms of giving the shopping centre "visit" the form of

weekly worship. However, the similarity in question is by no means due to the fact that the visit in question is made once a week, but due to the meaning and function attributed to that "visit". The modern/secular individual, who is restless when he/she does not perform his/her "weekly worship"<sup>M</sup>, returns home after his/her "worship" in a state of "peace of mind". The relationship of the modern individual with shopping centres is also reminiscent of the pilgrimage rituals of the three Abrahamic religions. In the pilgrimage worship of all three religions, there are rituals such as walking around (tawaf) the object/place of pilgrimage (e.g. the Kaaba), venerating a certain building or object in the centre of the pilgrimage site with respect and love (contemplation/zikr), anointing the building or object in the centre of the pilgrimage site (Hajar al-Aswad) .... The modern individual also walks around the shops in shopping centres, which are the "cathedrals" of the "religion of consumption", admires the shop windows/items (reverence), anoints the objects (touching them, trying them on...) and leaves the place in a "purified" way.

### **Conclusion**

Shopping centres are the *magical* places of today. It represents an association in which "magic", which is thrown out of life due to rationality and secularism, the basic principle of modernism, is also activated where necessary. Those who look into its "eyes" fall under its influence and follow it unconsciously. For this reason, George Ritzer (b.1940) likened being in places of consumption such as shopping malls to the situation of a child who imagines himself in a place where everything is made of sugar and can easily reach those candies, and emphasised the *fascinating* aspect of shopping malls. However, there is also a negative side to this; just like the spooky things, ghosts and witches in the child's imaginary space, there are things in this space that have the potential to turn beautiful dreams into nightmares. These are personal impossibilities that exceed the means and power of purchase and therefore can only be watched, which in turn leads to the destruction of the integrity of the psyche. This castle of dreams, where almost every product and service of the world of consumption can be accessed, represents the realm of nightmares with its unaffordability as well as its accessibility.

**ÖZET**

Ağır metallerin toksik özelliklerinden dolayı, atık sulardan uzaklaştırılması çevre ve insan sağlığı için oldukça önemlidir. Sulu ortamda ağır metal iyonlarının uzaklaştırılmasında kimyasal çöktürme, membran ile filtrasyon, iyon değişimi ve absorpsiyon gibi yöntemler kullanılmaktadır. Günümüzde çevre kirliliğinin nedenlerinden biri olan sulu ortamlardaki ağır metaller genellikle maden, metal ve kimya endüstrisi atık sularında bulunur. Zamanla doğal kaynak sularına karışan bu atık suların, ekolojik dengeyi bozduğu ve canlı organizma üzerinde zararlı etkiler bıraktığı gözlenmiştir. Ağır metaller içerisinde bakır, oldukça fazla çalışma yapılan toksik özelliğe sahip bir ağır metaldir. Bu çalışmada bakır (II) nitrat trihidrat 'Cu(NO<sub>3</sub>)<sub>2</sub>.3(H<sub>2</sub>O)' katısı ile hazırlanan ana stok çözelti kullanılmıştır. Stok çözelti 1000 ppm 250 mL olarak hazırlanmıştır. Hazırlanan stok çözelti seyreltilerek balon jöjelere alınmıştır ve kalibrasyon grafikleri hazırlanmıştır. Cu(II) adsorpsiyonu APN polimeri kullanılarak incelenmiştir. 20 mL viallere 0,01 g APN polimeri tartılmıştır. Üzerlerine 1000 ppm Cu<sup>+2</sup> çözeltisi eklenerek oda sıcaklığında 24 saat bekletilen çözeltiler UV-VIS absorpsiyon spektroskopisi kullanılarak 312 nm'de ölçüm alınmıştır. Ölçüm sonuçlarına bakıldığında APN polimerinin en iyi pH 4'te çalıştığı sonucuna varılmıştır.

**Anahtar kelimeler:** Ağır metaller, Cu(II), APN polimeri, Adsorpsiyon, UV-VIS spektroskopisi, pH

**INVESTIGATION OF THE PH EFFECT ON APN POLYMER**

**ABSTRACT**

The toxic properties of heavy metals necessitate their removal from wastewater for the protection of both the environment and human health. Various methods, including chemical precipitation, membrane filtration, ion exchange, and absorption, are employed for the removal of heavy metal ions in aqueous environments. Heavy metals in aquatic environments, which are a significant contributor to environmental pollution, are commonly found in wastewater from mining, metal, and chemical industries. It has been observed that the mixing of wastewater streams with natural water sources can disrupt the ecological balance and have harmful effects on living organisms. Among heavy metals, copper is a metal that has been extensively researched due to its toxic properties. In this study, a main stock solution was prepared using copper (II) nitrate trihydrate, which is also known as  $\text{Cu}(\text{NO}_3)_2 \cdot 3(\text{H}_2\text{O})$ . The stock solution was prepared at a concentration of 1000 ppm in 250 mL. The prepared stock solution was diluted and transferred into volumetric flasks, and calibration curves were prepared. The adsorption of Cu(II) was investigated using APN polymer. 0.01 g of APN polymer was weighed into 20 mL vials. Subsequently, 1000 ppm  $\text{Cu}^{2+}$  solution was added to the vials, and the solutions were left at room temperature for 24 hours. Measurements were taken at 312 nm using UV-VIS absorption spectroscopy. The results indicated that the optimal pH for APN polymer was 4.

**Key words:** Heavy metals, Cu(II), APN polymer, Adsorption, UV-VIS spectroscopy, pH

## **GİRİŞ**

Atık sularda tespit edilen her türlü madde kimi zaman eser miktarda kimi zaman da belirli bir derişim üzerinde sağlık için zararlıdır. Zehirlilik etkisine sahip maddeler düşük konsantrasyonlarda bulunmaları halinde bile insan sağlığına zarar vererek hastalıklara ve hatta ölümlere neden olabilirler. Eser miktarda bile riskli olan bu maddeler arasında en önemli grubu ağır metaller oluşturur. Cd, Cr, Cu, Co, Pb ve Zn elementleri ağır metallere örnek olarak verilebilir. Doğadaki su kaynaklarının ağır metal kirliliği; insanlara, çevredeki diğer hayvanlara ve bitkilere toksik etkisi nedeniyle zarar vermektedir. Ağır metal numunelerinin ana kaynakları genellikle madencilik, metal kaplama, tekstil, kimya, otomotiv ve elektrikli cihaz imalatı gibi birçok endüstriden gelmektedir (Zalloum ve ark., 2008).

**Şekil 1.1:** Atık sularda bulunan ağır metaller

Toksik metal iyonlarının uzaklaştırılmasında adsorpsiyon, kimyasal çökeltme, fitoekstraksiyon, ters ozmoz, ultrafiltrasyon, elektrodializ, solvent ekstraksiyonu ve iyon değişimi gibi birçok yöntem kullanılmaktadır. Adsorpsiyon, atık suların arıtımında uygulanabilen yüksek verimliliği, uygun hızı ve çalışma kolaylığı nedeniyle ağır metallerin gideriminde en çok tercih edilen yöntemlerden biridir. Çalışmamızda, atık sularda sıkça karşılaşılan ağır metallere biri olan Cu(II) iyonunun giderimi adsorpsiyon yöntemiyle gerçekleştirilmiştir. Cu(II) iyonları canlı organizmaların yapısında ve vücut fonksiyonlarında önemli yere sahiptir. Fakat fazla miktarda Cu(II) iyonuna maruz kalınması durumunda olumsuz etkiler gözlemlenir. Aşırı Cu(II) iyonu alımı olumsuz etkileri; hepatit, karaciğer sirozu, böbrek

hastalığı, anemi, kemik bozuklukları ve parkinson gibi bir dizi hastalıkla ilişkilendirilir. USEPA tarafından belirlenen içme suyunda izin verilen maksimum limit 1,30 mg/L'dir. WHO'nun içme suyundaki Cu(II) iyonları için kısıtlaması ise 0,05 mg/L'dir. Bu nedenle Cu(II) iyonlarının tespiti ve uzaklaştırılması, su kalitesinin ve insan sağlığının kontrolünün sağlanması açısından önemlidir (ABD Çevre Koruma Ajansı Raporu, 2004). Atık su örneklerindeki Cu(II) iyonlarının incelenmesi ve adsorplanmasında uygulanabilecek yöntemlerin geliştirilmesi büyük önem taşımaktadır. Özellikle bu örneklerin spektrofotometrik yöntemler kullanılarak belirlenmesi; basitliği, kolay kullanımı ve düşük maliyetli teknolojilerin kullanılması nedeniyle pratik açıdan birçok avantaja sahiptir (Bereli ve ark., 2021). Tüm bunlar göz önüne alındığında sulardaki atık maddelerin temizlenmesi düşüncesi daha da yaygınlaşmaktadır. Çalışmamızda APN polimeri ile Cu<sup>+2</sup> elementinin adsorpsiyonunu inceleyerek pH bağlı olarak nasıl çalıştığı gözlemlenmiştir.

## **2.ARAŞTIRMA VE BULGULAR**

### **2.1. Deneysel Çalışmalar**

Bu deneyde Cu(NO<sub>3</sub>)<sub>2</sub> .3(H<sub>2</sub>O) (Bakır (II) nitrat trihidrat) kullanılarak stok çözelti hazırlanmıştır.

**Molekül Formülü:** Cu (NO<sub>3</sub>)<sub>2</sub> .3(H<sub>2</sub>O)

**Molekül Ağırlığı:** 241.6 g/mol

#### **Şekil 2.1.1:** Bakır (II) nitrat trihidrat katısı

Stok çözelti hazırlamada kullanılacak pH 2,3,4 suları distile suya; asit(HCl) ve baz(NaOH) çözeltileri eklenerek hazırlanmıştır. Stok çözeltilerimiz 1000 ppm 250 mL olarak hazırlanmıştır. Bakır (II) nitrat trihidrat katısı beherde çözüldükten sonra 250 mL'lik balon jodede hazırlanan pH suları ile tamamlanmıştır. Hazırlanan stok çözeltilerden balon jodelere çeşitli derişimlerde seyreltilerek kalibrasyon grafikleri incelenmiştir.

**Şekil 2.1.2:** Stok çözelti hazırlama aşaması

20 mL viallere 0,01 g APN polimeri tartılmıştır. pH 2, 3 ve 4 sularından 10 mL eklenerek oda sıcaklığında ve karanlık ortamda 24 saat bekletilen çözeltiler UV-VIS absorpsiyon spektroskopisi kullanılarak 312 nm’de ölçüm alınmıştır. pH 2,3 ve 4 için absorbans-konsantrasyon kalibrasyon grafikleri çizilmiştir.

**Şekil 2.1.3:** APN polimeri UV-VIS absorpsiyon deney basamakları

## **2.2. Deneysel Bulgular**

Deneysel çalışmalar sonucunda pH 2, 3 ve 4 için elde edilen değerler ile çizilen Absorbans – Konsantrasyon grafikleri aşağıda verilmiştir.

Şekil 2.2.1: pH 2 için kalibrasyon grafiđi

Şekil 2.2.2: pH 3 için kalibrasyon grafiđi

Şekil 2.2.3: pH 4 için kalibrasyon grafiği

### 3.SONUÇ

Yapılan çalışma sonucunda elde edilen değerler ile oluşturulan pH –  $Q_e$  grafiğine bakıldığında APN polimerinin Cu(II) iyonları adsorpsiyonunda optimum pH 4'te çalıştığı gözlenmiştir.

$$Q_e = ((C_0 - C_{son}) \cdot V) / m$$

$$Q_e = C_0 - C_{son}$$

Bu denklemde;

$C_0$ : Başlangıç konsantrasyonunu (mg/L),

$C_{son}$ : Çözeltinin son konsantrasyonunu (mg/L),

$v$  : Çözeltinin hacmini (mL)

$m$ : Kullanılan polimer miktarını (g) , temsil etmektedir.

pH değeri	$C_0$ (ppm)	Absorbans değeri (24 Saat)	$C_{son}$ (ppm)	Polimer Miktarı(g)	$Q_e$
2	1000	0,189	810,5	0,01	189,5
3	1000	0,085	629	0,01	371
4	1000	0,098	431	0,01	569

Tablo 1: 1000 ppm için 312 nm de 24 saatlik süre sonucu

Şekil 3.1: Adsorpsiyon kapasitesinin pH etkisi

**ÖZET**

Çevre kirliliği temiz ve sağlıklı bir gelecek açısından dünyada ortak endişe haline gelmiştir. Yaşamakta olduğumuz sanayi ve teknoloji çağında mevcut üretim döngüleri, nüfus artışındaki yoğunluk, çarpık kentleşme, doğal alanların tahribi gibi faaliyetler sonucunda su kaynakları da hızla kirlenmektedir. İnsanların ihtiyaçlarının artması ile sanayileşmedeki gelişmeler, atık su miktarını ve buna bağlı olarak da ağır metal yükünü artırmıştır. Madencilik, metal sanayi, petrol rafinerileri, deri sanayi, tekstil sanayi ve otomotiv sanayi ağır metal kirliliğine katkıda bulunan başlıca kaynaklardan bazılarıdır. Bunların yanı sıra evsel atık sular, çöp depolama alanları sızıntı suları ve asit yağmurları da atık sulardaki ağır metal konsantrasyonlarında artışa neden olmaktadır. Bu çalışmada bakır (II) nitrat trihidrat katısı ile hazırladığımız ana stok çözelti kullanılmıştır. Deneyde kullanılan Cu(II) için  $Cu(NO_3)_2 \cdot 3(H_2O)$  (Bakır(II) nitrat trihidrat) kullanılarak stok çözeltisi hazırlanmıştır. Stok çözelti, 1000 ppm konsantrasyonunda ve 250 mL hacminde olacak şekilde hazırlanmıştır.  $Cu(NO_3)_2 \cdot 3(H_2O)$  katısı beher içinde çözüldükten sonra, 250 mL'lik balon jode hazırlanan pH 4 suyu ile tamamlanmıştır. 20 mL'lik viallere 0,01 gram APN polimeri tartılarak üzerlerine hazırlanan stok çözeltisinden 10 mL eklenmiştir. APN polimerinin çalışması, sıcaklığa bağlı olarak 4°C, 25°C, 45°C ve 65°C'de zamanla incelenmiştir. Sonuçlar, APN polimerinin en iyi performansını 25°C'de sergilediğini göstermektedir.

**Anahtar kelimeler:** Ağır metaller, Cu(II), APN polimeri, Adsorpsiyon, UV-VIS spektroskopisi, Sıcaklık

**INVESTIGATION OF THE TEMPERATURE EFFECT ON APN POLYMER**

**ABSTRACT**

The issue of environmental pollution has become a significant global concern, particularly in relation to the need for a clean and healthy future. In the context of the industrial and technological era, a number of factors have contributed to the contamination of water sources, including existing production cycles, population density increases, unplanned urbanisation, and the destruction of natural areas. The growing needs of people and advancements in industrialisation have also led to an increase in the amount of wastewater, which in turn has placed a greater burden on the environment in terms of heavy metals. Mining, metal industry, petroleum refineries, leather industry, textile industry, and automotive industry are among the primary sources contributing to heavy metal pollution. Additionally, domestic wastewater, leachate from landfills, and acid rain also contribute to increased concentrations of heavy metals in wastewater. In this study, a main stock solution was prepared using copper (II) nitrate trihydrate solid. The copper(II) nitrate trihydrate ( $\text{Cu}(\text{NO}_3)_2 \cdot 3(\text{H}_2\text{O})$ ) was employed to prepare the stock solution, which was prepared at a concentration of 1000 ppm and a volume of 250 mL. Once the  $\text{Cu}(\text{NO}_3)_2 \cdot 3(\text{H}_2\text{O})$  solid had been dissolved in a beaker, the pH 4 water prepared in a 250 mL volumetric flask was added. Subsequently, 0.01 grams of APN polymer were weighed into 20 mL vials, and 10 mL of the prepared stock solution was added to them. The performance of the APN polymer was evaluated over time at temperatures of 4°C, 25°C, 45°C, and 65°C. The results demonstrated that the APN polymer exhibited optimal performance at 25°C.

**Keywords:** Heavy metals, Cu(II), APN polymer, Adsorption, UV-VIS spectroscopy, Temperature

## **GİRİŞ**

Son zamanlarda, atık su arıtma sistemleri, endüstriyel atıklardaki toksik ve kanserojen ağır metallere ilişkili sağlık ve çevre risklerini azaltmak ve ortadan kaldırmak amacıyla geliştirilmiştir. Endüstriyel işlemler sonucunda ortaya çıkan atık suları temizlemek için en yaygın tercih edilen yöntem, yüksek etkinlik, düşük maliyetler ve kolay işletilebilirlik gibi özellikleri nedeniyle adsorpsiyon yöntemidir (Hamis ve ark., 2024). Endüstriyel atık sulardaki zehirli ağır metaller hem insan sağlığı hem de su ekosistemi için önemli bir tehdit oluşturabilir. Atık sular genellikle tekstil, kimya, petrol, kozmetik, plastik, gıda ve kâğıt imalatı gibi çeşitli endüstriler tarafından üretilmektedir (Lan ve ark., 2022). Polimer malzemeler (akıllı adsorbanlar) ağır metallerin sudan gideriminde önemli yere sahiptir. Bunlar sıcaklık, pH, ışık şiddeti, çözeltinin iyonik kuvveti ve manyetik alan gibi çeşitli çalışma koşullarına farklı tepki verir. Yoğunluğu  $4,5 \text{ g/cm}^3$ 'ten fazla olan metaller (altın (Au), gümüş (Ag), bakır (Cu), cıva (Hg), kurşun (Pb), kadmiyum (Cd) vb.) ağır metal olarak adlandırılır. İnsan vücudunda her ne kadar Cu(II) gerekli bir iyon olsa da, vücuttaki fazla Cu(II) yavaş tepki, anemi, akciğer ödemi, halsizlik, sarılık ve ülser gibi semptomlara neden olabilir. Ağır metal iyonları insan vücudunda dolaşım sistemine girdikten sonra bazı proteinler, enzimler ve biyomoleküller ile etkileşime girerek bunların inaktivasyonuna neden olurlar (Ma ve ark., 2023). Ayrıca bazı organlarda zamanla birikebilir ve sonuçta insan vücudunda ağır metal iyonlarının kronik zehirlenmesine neden olabilir. Bu yüzden sulardaki atık maddelerin temizlenmesi düşüncesi daha da yaygınlaşmakta ve önem kazanmaktadır. Bu çalışmada APN polimeri ile Cu elementinin adsorpsiyonunu sıcaklığa bağlı olarak nasıl çalıştığı araştırılmıştır.

Yöntem	Avantajlar	Dezavantajlar
Kimyasal Çöktürme ve Filtrasyon	Kullanımı kolay ve maliyeti düşük	Yüksek derişimlerde ayrılma güçlüğü ve performans etkinliğinin yetersizliği, toksik çamur üretimi.
Elektrokimyasal Yöntemler	Metalik giderimi yüksek	Maliyeti yüksek malzeme (elektrot) kullanımı ve yalnızca yüksek derişimlerde etkili olması.
Ters Osmoz	Kullanımı kolay ve maliyeti düşük	Yüksek basınçlı sistemler gerektirir.
İyon Değişimi	Metal giderim etkinliği yüksek ve saf atık geri kazanımı	Partiküllere karşı hassasiyet ve yüksek maliyetli reçine.
Buharlaştırma	Saf atık kazanımı	Yüksek enerji ihtiyacı, yüksek maliyet gereksinimi, toksik çamur üretimi.
Membran	Saf atık kazanımı	Yüksek basınçlı sistemler, membran boyutu ve uygulanabilirlik için yüksek maliyetler.
Adsorpsiyon	Ucuz, etkin kullanılabilirlik ve bütün metallerde uygulanabilirlik	Düşük derişimlerde etkin olmama.

## 2.ARAŞTIRMA VE BULGULAR

### 2.1. Deneysel Çalışmalar

Bu çalışmada bakır (II) nitrat trihidrat katısı ile hazırladığımız ana stok çözelti kullanılmıştır. Denejde kullanılacak Cu (II) için  $Cu(NO_3)_2 \cdot 3(H_2O)$  (Bakır (II) nitrat trihidrat) kullanılarak stok çözelti hazırlanmıştır.

**Molekül Formülü:**  $Cu(NO_3)_2 \cdot 3(H_2O)$

**Molekül Ağırlığı:** 241.6 g/mol

### Şekil 2.1.1: Bakır (II) nitrat trihidrat katısı

Stok çözeltimiz 1000 ppm 250 ml olarak hesaplanmıştır. 0,6737 g Bakır (II) nitrat trihidrat tartılmıştır. Beherde çözüldükten sonra 250 ml'lik balon jodede hazırlanan pH 4 suyu ile tamamlanmıştır.

Şekil 2.1.2: Stok çözelti hazırlama

20 ml'lik viallere 0,01 gram APN polimeri tartılarak üzerlerine hazırlanan stok çözeltilerden 10 ml eklenmiştir. Sıcaklığa bağlı olarak APN polimerinin çalışması 4 °C, 25 °C, 45 °C ve 65 °C'de zamana göre incelenmiştir.

Şekil 2.1.3: APN polimeri farklı sıcaklıkta UV- VIS absorpsiyonu

## 2.2. Deneysel Bulgular

Uygun koşullarda bekletilen numunelerden 10, 20, 30, 45, 60, 90, 120, 180, 240 dk'larda 312 nm'de ölçüm alınmıştır. Ölçüm sonucu elde edilen değerler pH 4 kalibrasyon grafiğinden yararlanılarak Zaman-Qe grafikleri çizilmiştir.

**Özet**

Akciğer kanseri (AK) dünya çapında kansere bağlı ölümlerin önde gelen nedenidir. Akciğer karsinomu olarak da bilinen ve epitelyal hücrelerden köken alarak akciğer dokularında kontrolsüz hücre büyümesi ile karakterize edilen kötü huylu bir akciğer tümörüdür. Meme kanseri (MK) kadınlar arasında hem en sık görülen hem de kanserden ölümlerin en yaygın nedeni olup insidansı ve mortalitesi yaşla orantılı olarak artmaktadır. Bu vakaların yaklaşık %5 ile %10' unun kalıtsal olduğu kabul edilmektedir. Gastrointestinal sistem (GİS) kanserleri küresel kanser vakalarının dörtte birinden fazlasını temsil etmekte olup kolon, rektum, mide, pankreas, yemek borusu, anüs, safra kesesi, karaciğer ve safra kanalı tümörlerini içermektedir. Telomeraz reaktivasyonu ve insan telomeraz ters transkriptaz (hTERT) gen ekspresyonu kanser hücrelerinin sınırsız çoğalma potansiyelinin ayırt edici özelliğidir. Bu gen hTERT geni 5p15.33 bölgesinde bulunur ve hücre bölünmesiyle kısalan kromozom uçlarını uzatan bir ribonükleoprotein enzimini kodlar. hTERT geninin kodlama bölgelerinde meydana gelen mutasyonların telomeraz aktivitesi ve telomer uzunluğu üzerinde önemli etkileri bildirilmiştir. Bu çalışmada hTERT geninin MNS16A değişken sayı tandem tekrarı (VNTR) varyantının Türk popülasyonundaki solid tümörlerde (AK, MK ve GİS) bir ilişkisinin olup olmadığının belirlenmesi amaçlanmıştır. Çalışmaya 95 AK, 36 MK, 48 GİS kanseri tanısı almış hasta ile 85 sağlıklı kontrol olmak üzere toplam 264 gönüllü birey dahil edilmiştir. hTERT-MNS16A-VNTR analizi PCR yöntemiyle gerçekleştirilmiş ve agaroz jel elektroforezde analiz edilmiştir. AK, MK ve GİS tanısı almış kanser hastaları ile sağlıklı kontroller genotip ve allel frekansları açısından karşılaştırıldığında hTERT-MNS16A-VNTR varyantının genotip ve allel frekansında

istatistiksel olarak anlamlı bir farklılık saptanmamıştır. Çalışmamız üç farklı kanser türünde hTERT-MNS16A-VNTR ilişkisinin incelendiği literatürdeki ilk çalışma olup bu varyantın Türk popülasyonunda AK, MK ve GİS ile ilişkili olmayabileceğini göstermektedir. Ancak, daha büyük çalışma grupları ve farklı etnik kökenli hasta gruplarında yapılacak çalışmalar kanser ile hTERT-MNS16A-VNTR ilişkisinin daha ayrıntılı olarak aydınlatılmasını sağlayacaktır.

**Anahtar Kelimeler:** Akciğer, Meme, GİS, hTERT geni, VNTR, PCR.

**INVESTIGATION OF THE hTERT GENE MNS16A VNTR VARIANT IN LUNG,  
BREAST AND GASTROINTESTINAL CANCER PATIENTS**

**Abstract**

Lung cancer (LC) is the leading cause of cancer-related deaths worldwide. It is a malignant lung tumor, also known as lung carcinoma, characterized by uncontrolled cell growth in lung tissues originating from epithelial cells. Breast cancer (BC) is both the most common and the most common cause of cancer deaths among women, and its incidence and mortality increase with age. Approximately 5% to 10% of these cases are considered to be hereditary. Gastrointestinal system (GIS) cancers represent more than a quarter of global cancer cases and include tumors of the colon, rectum, stomach, pancreas, esophagus, anus, gall bladder, liver and bile duct. Telomerase reactivation and human telomerase reverse transcriptase (hTERT) gene expression are hallmarks of the unlimited proliferative potential of cancer cells. The hTERT gene is located in the 5p15.33 region and encodes a ribonucleoprotein enzyme that elongates chromosome ends that shorten during cell division. Mutations occurring in the coding regions of the hTERT gene have significant effects on telomerase activity and telomere length. This study aimed to determine whether the MNS16A variable number tandem repeat (VNTR) variant of the hTERT gene is associated with solid tumors (LC, BC and GIS cancers) in the Turkish population. A total of 264 volunteers, including 95 patients with LC, 36 BC, 48 patients diagnosed with GIS cancer, and 85 healthy controls, were included in the study. hTERT-MNS16A-VNTR analysis was performed by PCR method and analyzed in agarose gel electrophoresis. When cancer patients diagnosed with LC, BC and GIS and healthy controls were compared in terms of genotype and allele frequencies, no statistically significant difference was detected in the genotype and allele frequency of the hTERT -MNS16A-VNTR variant. Our study is the first study in the literature to examine the hTERT-MNS16A-VNTR relationship in three different cancer types and shows that this variant may not be associated with LC, BC and GIS in the Turkish population. However, studies to be conducted in larger study groups and patient groups of different ethnicities will provide a more detailed elucidation of the relationship between cancer and hTERT-MNS16A-VNTR.

**Keywords:** Lung, Breast, GIS, hTERT gene, VNTR, PCR.

## **Giriş**

Akciğer kanseri (AK) dünya çapında kansere bağlı ölümlerin önde gelen nedenidir. AK için en önemli risk faktörü, akciğer kanserine bağlı ölümlerin %75-80'inden sorumlu olan sigaradır (Cersosimo R. J.,2002). Akciğer karsinomu olarak da bilinen ve epitelyal hücrelerden köken alarak akciğer dokularında kontrolsüz hücre büyümesi ile karakterize edilen kötü huylu bir akciğer tümörüdür. Küçük hücreli akciğer kanseri ve küçük hücreli dışı akciğer kanseri olmak üzere iki geniş kategoriye ayrılır. Küçük hücreli akciğer kanseri, nöroendokrin özellikler sergileyen hücrelerden türetilen oldukça kötü huylu bir tümördür ve akciğer kanseri vakalarının %15' ini oluşturur. Vakaların geri kalan %85' ini oluşturan küçük hücreli dışı akciğer kanseri, adenokarsinom, skuamöz hücreli karsinom ve büyük hücreli karsinom olmak üzere 3 ana patolojik alt tipe ayrılır. Adenokarsinom tek başına tüm akciğer kanseri vakalarının %38,5'ini oluşturmaktadır (Dela Cruz et al., 2011). Çevresel faktörler ve somatik olaylar, sporadik akciğer kanserinin gelişimine katkıda bulunan başlıca faktörlerdir. Ayrıca aile öyküsü ve genetik faktörlerde akciğer kanserinin gelişiminde rol oynamaktadır (Kanwal et al., 2017).

Meme kanseri (MK), kadınlarda en sık görülen kanserdir ve küresel olarak kadınlar arasında kansere bağlı ölümlerin önde gelen nedenidir (Fisusi et al., 2019). MK genetik ve çevresel faktörlerin rol oynadığı heterojen bir hastalıktır (Barzaman et al., 2020). MK vakalarının çoğunluğu adenokarsinomlardır; adenokarsinom vakalarının %85'i göğüs kanallarından ve %15'i lobüler epitelden kaynaklanmaktadır (Katsura et al., 2022). MK vakalarının yaklaşık %5-10'u kalıtsal olarak kabul edilmekte ve bilinen meme kanseri genleri bunların %3-4'ünü oluşturmaktadır. Bilinen meme kanseri genlerinin yanı sıra, genom çapında ilişkilendirme çalışmaları (GWAS'ler) ile meme kanseri riskiyle ilişkili 170'den fazla genetik varyant tanımlanmıştır (Huss et al., 2018).

Gastrointestinal sistem (GİS) kanserleri tüm kanser teşhislerinin yaklaşık %20'sini oluşturur ve dünya çapında kanser ölümlerinin %22,5'inden sorumludur (Kuntz et al., 2021). GİS kanserleri kolon, rektum, mide, pankreas, yemek borusu, anüs, safra kesesi, karaciğer ve safra kanalı tümörlerini içermektedir. GİS kanserlerinin farklı türlerinin altında yatan nedenler farklılık göstermekle birlikte temel risk faktörlerinden bazıları arasında sigara içmek, aşırı alkol tüketimi, artan yaş, viral ve bakteriyel enfeksiyonlar, kronik pankreatit ve obezite yer almaktadır (Link et al., 2013). Bu kanserlerin çoğu sporadiktir. Ancak bazı hastalar ailede GİS kanser öyküsü olması nedeniyle yüksek risk altındadır (Malkani et al., 2023).

Telomeraz reaktivasyonu ve insan telomeraz ters transkriptaz (hTERT) gen ekspresyonu kanser hücrelerinin sınırsız çoğalma potansiyelinin ayırt edici özelliğidir (Hofer et al., 2011). hTERT

geni 5p15.33 bölgesinde bulunur ve hücre bölünmesiyle kısalan kromozom uçlarını uzatan bir ribonükleoprotein enzimini kodlar. hTERT geninin kodlama bölgelerinde meydana gelen mutasyonların telomeraz aktivitesi ve telomer uzunluğu üzerinde önemli etkileri vardır (Anwar et al., 2021). MNS16A gen varyantı, hTERT genindeki ekson 16'nın aşağısında bulunur ve bir transkripsiyon faktörü bağlama bölgesini barındıran CAT trinükleotidi ile ayrılan 23 bp'lik çekirdek tandem tekrarlarını oluşturur. VNTR alellerine göre MNS16A varyantları, farklı kanser türlerine sahip bireylerde incelenmiştir (Huda et al., 2021).

Bu çalışmada hTERT geninin MNS16A değişken sayı tandem tekrarı (VNTR) varyantının Türk popülasyonundaki solid tümörlerde (AK, MK ve GİS Kanseri) bir ilişkisinin olup olmadığının belirlenmesi amaçlanmıştır.

### **Materyal ve Metod**

Çalışmaya 95 AK, 36 MK, 48 GİS Kanseri tanısı almış hasta ile 85 sağlıklı kontrol olmak üzere toplam 264 gönüllü birey dahil edilmiştir. Bireylerden alınan periferik kandan lökosit izolasyonu gerçekleştirilmiştir. Elde edilen lökositlerden ticari kit ile üreticinin yönergeleri doğrultusunda genomik DNA izolasyonu yapılmıştır. (ELK Biotech DNA izolasyon kiti).

hTERT-MNS16A-VNTR analizi PCR yöntemiyle gerçekleştirilmiştir. Analiz edilecek olan bölge için uygun primerler kullanılarak uygun PCR koşullarında DNA örnekleri çoğaltılmıştır. Ardından örnekler jel elektroforezinde yürütülerek, UV ışık altında genotiplenmeleri yapılmıştır. L alleli 302 bp ve 332 bp, S alleli ise 243 bp ve 272 bp uzunluklarında bantlar göstermiştir (Anwar et al., 2021).

İstatistiksel analizler SPSS (versiyon 29.0) istatistiksel analiz yazılımı kullanılarak yapılmıştır. İncelenen varyantın genotip dağılımları, Hardy-Weinberg dengesi (HWE) açısından ve ki-kare testleri ile analiz edilmiştir.

### **Bulgular**

AK, MK ve GİS kanseri tanısı almış hastalar ile sağlıklı kontroller genotip ve allel frekansları açısından karşılaştırıldığında hTERT-MNS16A-VNTR varyantının genotip ve allel frekansında istatistiksel olarak anlamlı bir farklılık saptanmamıştır. Bu varyant için hem hasta hem de sağlıklı kontrol grubunda HWE'den (Hardy-Weinberg Equilibrium) sapma bulunmamaktadır.

### **Tartışma ve Sonuç**

Çalışmamızda AK, MK ve GİS tanısı almış kanser hastalarında ve sağlıklı kontrol grubunda hTERT-MNS16A-VNTR varyantı analizi gerçekleştirdi. Hastalar ve sağlıklı kontroller genotip/allel frekansları açısından karşılaştırıldığında; hTERT-MNS16A-VNTR varyantının genotip ve allel frekansında istatistiksel olarak anlamlı bir farklılık olmadığı saptandı.

Akciğer kanserinde yapılan bir çalışmada 53 akciğer kanseri hastası ve 72 sağlıklı kontrolde hTERT-MNS16A-VNTR varyantı değerlendirilmiştir. Çalışmada LL genotipi SS+LS genotipi ile karşılaştırıldığında yaş, cinsiyet, etnik köken ve sigara içme durumuna göre iki kattan fazla akciğer kanseri riskiyle ilişkilendirilmiş fakat genel olarak akciğer kanseri hastaları sağlıklı kontroller ile kıyaslandığında genotip frekansı açısından istatistiksel olarak anlamlı bulunmamıştır (Wang et al., 2003). Güneydoğu İran popülasyonunda 266 meme kanseri hastası ve 225 sağlıklı kontrolün dahil edildiği bir çalışmada ise LS genotipinin, LL ile karşılaştırıldığında meme kanseri riskini azalttığı gösterilmiştir. Ayrıca tümör evresi, tümör derecesi, östrojen ve progesteron reseptörleri, tümör boyutu ve insan büyüme faktörü reseptörü 2 dahil olmak üzere klinikopatolojik parametreler arasında anlamlı bir ilişki gözlenmemiştir (Hashemi et al., 2014). Hofer ve ark. Kafkas kökenli 1330 kolorektal kanser hastası ve 1822 sağlıklı kontrolü dahil ettikleri çalışmalarında SS alelini kolorektal kanser riski ile ilişkilendirmişlerdir. hTERT-MNS16A-VNTR SS alelinin kolorektal kanser riskinin değerlendirilmesi için potansiyel bir biyobelirteç olabileceğini belirtmişlerdir (Hofer et al., 2011). Çalışmamız üç farklı kanser türünde hTERT-MNS16A-VNTR ilişkisinin incelendiği literatürdeki ilk çalışma olup bu varyantın Türk popülasyonunda AK, MK ve GİS kanseri ile ilişkili olmayabileceğini göstermektedir. Ancak, daha büyük çalışma grupları ve farklı etnik kökenli hasta gruplarında yapılacak çalışmalar kanser ile Htert-MNS16A-VNTR ilişkisinin daha ayrıntılı olarak aydınlatılmasını sağlayacaktır.

**Özet**

Piroptoz; bağışıklık ve hastalıkla yakın ilişkisi nedeniyle yeni öğrenilen bir programlanmış hücre ölümü çeşididir. İnflamasyondan kaynaklanan ateş anlamına gelen “pyro” ve programlanmış diğer hücre ölümlerinde olduğu gibi dökülme/düşme anlamına gelen “ptosis” kelimelerinden oluşmaktadır. Apoptoz ile benzer bazı karakteristik özellikler göstermesine rağmen sahip olduğu bazı morfolojik özellikler ile diğer programlanmış hücre ölümlerinden ayrılmaktadır. Piroptoz inflamatuvar kaspazlara bağlıdır ve inflamatuvar hastalıklardan kaynaklanan hücre ölümlerinde görülür. İnflamatuvar hastalıklar dışında piroptoz kardiyovasküler hastalıklar, merkezi sinir sistemi hastalıkları ve kanserde de kullanılan bir hücre ölüm çeşididir. Piroptoz yollarına bakıldığında hem doğal hem de adaptif bağışıklık sistemleri ile kullanılmaktadır. Gasdermin ailesi üyelerinin farklı dokulardaki fonksiyonları üzerine yapılan çalışmalar sonucunda Gasdermin D (GSDMD) piroptozun en önemli yürütücüsü olarak tanımlanmıştır. Piroptoz mekanizmasının aktivasyonunda en az iki yolak bulunmaktadır. Piroptoz süreçlerinin yürütülmesinde hem kanonik hem de kanonik olmayan yollar üzerinde inhibitör ve aktivatör etkisi bulunan bileşenler mevcuttur. Ayrıca piroptozun kendi olumsuz geri bildirim düzenleme mekanizması, inflamasyon meydana gelmesini zamanında önleyebilmektedir. Piroptozun aktivasyonunda gasdermin ailesinden GSDMD’ nin parçalanmasıyla hücre membranında oluşan porlardan inflamatuvar sitokinler salgılanmaktadır. Hücre döngüsü kontrol yollarıyla da etkileşim içinde olan bu mekanizmanın bozukluklarında hücre ölümü gerçekleşmemekte ve inflamatuvar hastalıklar ile kanser gibi progresif hastalıklar tetiklenebilmektedir. Son literatürlerde, piroptozun kardiyovasküler hastalıklar, kanser, nörolojik hastalıklar ve metabolik hastalıklar gibi inflamatuvar durumlarda çok önemli bir rolü olduğu gösterilmekte ve bu durum da hücre ölümünü hedeflemenin tedavi için potansiyel bir müdahale olabileceği bildirilmiştir. Bu çalışmada, piroptozun moleküler mekanizmaları ve çeşitli hastalıklarla ilişkisinde son gelişmeler gözden geçirilecektir.

**Anahtar Kelimeler:** Piroptoz, Moleküler Mekanizması, İnsan Hastalıkları.

**MOLECULAR MECHANISMS OF PYROPTOSIS AND ITS RELATIONSHIP WITH  
DISEASES**

**Abstract**

Pyroptosis; It is a newly learned type of programmed cell death due to its close relationship with immunity and disease. It consists of the words "pyro", which means fever caused by inflammation, and "ptosis", which means shedding/falling, as in other programmed cell deaths. Although it shows some similar characteristics with apoptosis, it differs from other programmed cell deaths with some morphological features. Pyroptosis depends on inflammatory caspases and is seen in cell death resulting from inflammatory diseases. Apart from inflammatory diseases, pyroptosis is a type of cell death used in cardiovascular diseases, central nervous system diseases and cancer. Considering the pyroptosis pathways, it is used by both innate and adaptive immune systems. As a result of studies on the functions of Gasdermin family members in different tissues, Gasdermin-D (GSDMD) was identified as the most important executor of pyroptosis. There are at least two pathways in the activation of pyroptosis -mechanisms. There are components that have inhibitory and activating effects on both canonical and non-canonical pathways in the execution of pyroptosis processes. In addition, the own negative feedback regulation mechanism of pyroptosis can prevent inflammation from occurring in time. In the activation of pyroptosis, inflammatory cytokines are secreted from the pores formed in the cell membrane by the breakdown of GSDMD from the gasdermin family. In disorders of this mechanism, which also interacts with cell cycle control pathways, cell death cannot occur and progressive diseases such as inflammatory diseases and cancer may be triggered. Recent literature has shown that pyroptosis has a very important role in inflammatory conditions such as cardiovascular diseases, cancer, neurological diseases and metabolic diseases, suggesting that targeting cell death may be a potential intervention for treatment. In this study, the molecular mechanisms of pyroptosis and the latest developments in its relationship with various diseases will be reviewed.

**Keywords:** Pyroptosis, Molecular Mechanism, Human Disease.

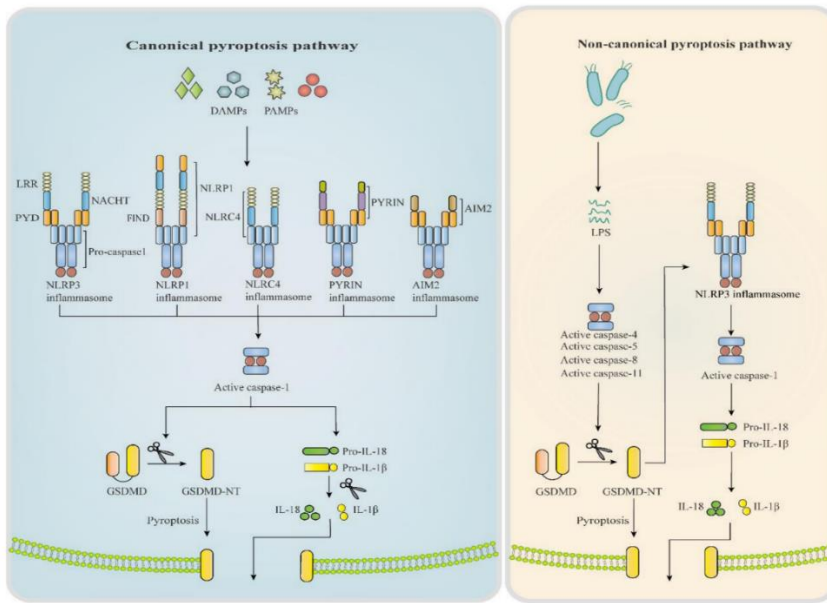

## Giriş

### Piroptoz

Piroptoz; inflamasyondan kaynaklanan ateş anlamına gelen “pyro” ve dökülme/düşme anlamına gelen “ptosis”’den oluşmaktadır. Piroptoz ve apoptoz arasında DNA hasarı ve kromatin yoğunlaşması gibi bazı benzerlikler vardır (Yu et al.,2021). Piroptoz, apoptoz ile benzer bazı karakteristik özellikler (DNA hasarı, nükleer yoğunlaşma ve kaspaz bağımsızlığı) göstermesine rağmen sahip olduğu bazı morfolojik özellikler ile diğer programlanmış hücre ölümlerinden ayrılmaktadır. Piroptotik hücrelerde, DNA parçalanması rastgele olurken çekirdek sağlam kalmaktadır (Fang et al.,2020). İnflamatuvar programlanmış hücre ölümünün bir biçimi olarak piroptozun birincil özelliği, gasdermin protein ailesinin N-terminal alanlarına bağlı olan membran gözenek oluşumudur. Bu alanlar sıklıkla aktive edilmiş kaspaz ailesi tarafından bölünmekte, bu da hücre şişmesine, yırtılmaya ve IL-1 $\beta$  (interlökin-1 $\beta$ ), IL-18 (interlökin-18) ve sitoplazmik içeriklerin dışarı akışına yol açmaktadır. Gasdermin ailesi üyelerinin farklı dokulardaki fonksiyonları üzerine yapılan çalışmalar sonucunda Gasdermin D (GSDMD) piroptozun en önemli yürütücüsü olarak tanımlanmıştır (You et al.,2022).

### Piroptoz Mekanizmaları

Piroptoz yolları hem doğal hem de adaptif bağışıklık sistemleri ile ilişkilidir. Piroptoz mekanizmalarının tetikleyicisi olarak görülen iki yolak vardır. Bunlar; Kaspaz-1’e bağımlı NLR (nükleotid oligomerizasyon alanı benzeri reseptör) aile üyelerinin katıldığı kanonik yolak ve Kaspaz-1/4/5’in aracılık ettiği kanonik olmayan yolaktır (Şekil 1) (Zheng et a.,2021).

Şekil 1. Piroptozda kanonik ve kanonik olmayan yolak (Lin et al., 2020).

### **Kanonik Yolak**

Kaspaz-1'in aktivasyonu, klasik yolak olarak da bilinen kanonik yolağın özelliğidir. Kaspaz-1 aracılı piroptozun kanonik inflamatuvar yolu, doğuştan gelen bağışıklık sisteminde kritik bir mekanizmayı temsil eder (Xu et al., 2022). Kaspaz-1, patojenik mikroorganizmaların enfeksiyonuna karşı bir savunma mekanizması olarak doğal bağışıklık sisteminin önemli bir parçasıdır. Kanonik piroptotik ölüm yolağına aktif kaspaz-1'in GSDMD'yi bölmesi ve IL-1 $\beta$  ile IL-18 salınımının gerçekleşmesiyle oluşan inflamazom yapısı aracılık etmektedir. Kaspaz-1, çoklu kanonik inflamatuvar ligandlar tarafından başlatılır ve piroptozu tetikler. İnflammasomlar, inflamatuvar yanıtları düzenleyen ve konakçının antimikrobiyal savunmasını koordine eden çoklu protein sinyal platformlarıdır. Ek olarak, inflamatuvarların mikrobiyal olmayan hastalıklarla da ilişkilendirildiği görülmüştür. Önemli kanıtlar, inflamatuvar ve bununla ilişkili sitokinlerin, tümör oluşumunda proliferasyon, istila ve metastaz gibi kritik roller oynadığını göstermektedir. İnflamatuvar düzenek, patojenle ilişkili moleküler modelleri (PAMP'ler) ve tehlikeyle ilişkili moleküler modelleri (DAMP'ler) tanıyan sitoplazmik model tanıma reseptörleri (PRR'ler) ile başlar (Pan et al., 2022).

### **Kanonik Olmayan Yolak**

Gram-negatif bakterilerin çoğu kanonik olmayan inflamatuvar yolu aktive eder. Klasik olmayan sinyal yoluna insanlarda kaspaz-4 ve kaspaz-5 ve farelerde kaspaz-11 aracılığı ile gerçekleşir. Bu kaspazlar doğrudan lipopolisakarite (LPS) bağlanarak aktive edilebilir. Aktive edilmiş kaspaz-4/5/11, piroptozu teşvik etmek için GSDMD'yi ayırır. Bununla birlikte kaspaz-4/5/11, pro-IL-18/pro-IL-1 $\beta$ 'yi parçalayamaz ancak GSDMD'yi parçalayabilir, bu da K<sup>+</sup> akışına ve NLRP3/kaspaz-1 yolu aktivasyonuna neden olabilir ve sonuçta olgunlaşmasına ve IL-18 ve IL-1 $\beta$  salınmasına yol açabilir (Liu et al., 2024). Ek olarak, kanonik olmayan inflamatuvarın NLRP3 inflamatuvarını da aktive edebilmesi, kanonik olmayan yolun kanonik yolla ilişkili olduğunu düşündürmektedir (Huang et al., 2023).

### **Piroptoz ve Hastalıklarla İlişkisi**

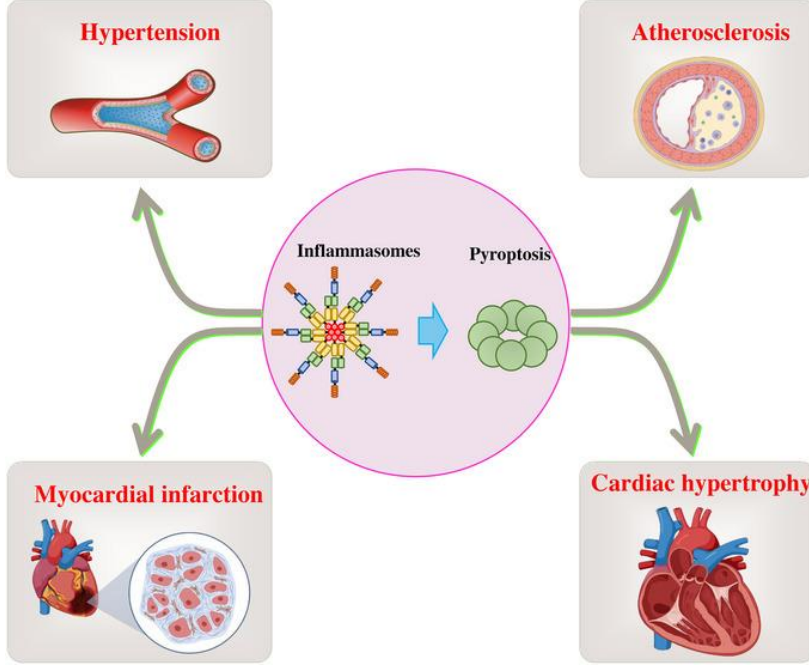

İnflamatuvar hastalıklar dışında piroptoz; kardiyovasküler hastalıklar, merkezi sinir sistemi hastalıkları, metabolik hastalıklar ve tümörler ile de ilişkilendirilmiştir (Yu et al., 2021).

### **Kardiyovasküler Hastalıklarda Piroptoz**

Yapılan çalışmalar, kardiyovasküler hastalıkların ortaya çıkmasının hücre ölümüyle yakından ilişkili olduğunu göstermiştir; bu da hücre ölümünü hedeflemenin kardiyovasküler hastalıkların tedavisi için etkili bir müdahale olduğunu düşündürmektedir. Piroptoz çoklu kardiyovasküler hastalıkların ortaya çıkmasını teşvik eder. İnflamatuvar aracılı piroptoz, ateroskleroz, miyokard

enfarktüsü, hipertansiyon ve kalp hipertrofisi dahil olmak üzere birçok kardiyovasküler hastalığın patogenezi süreçlerinde rol oynar (Şekil 2) (Jin et al., 2023).

Şekil 2. Piroptoz ve kardiyovasküler hastalıklar (Jin et al., 2023).

### 1.) Piroptoz ve Ateroskleroz

Ateroskleroz, esas olarak endotel hasarını, lipid birikimini, makrofaj aktivasyonunu, fagositozu, inflamatuvar yanıtı, köpük hücre oluşumunu, oksidatif modifikasyonları ve düz kas hücre göçünü içeren inflamatuvar bir hastalıktır (Song et al., 2022). Aterosklerozun oluşması ve gelişmesi ve plakların yırtılması, endotel hücreleri, düz kas hücreleri ve makrofajlar dahil olmak üzere vasküler hücrelerin yaralanmasıyla ilişkilidir. Ateroskleroz gelişiminde birçok risk faktörü rol oynamaktadır, ancak mekanizmalar tam olarak anlaşılamamıştır. Son araştırmalar, endotel hücreler, makrofajlar ve düz kas hücreleri dahil olmak üzere aterosklerozla ilişkili hücrelerde piroptozu tetikleyen çoklu risk faktörlerinin olduğunu göstermiştir. (Lin et al., 2022). Çok sayıda çalışma piroptozun aterosklerozun gelişiminde ve ilerlemesinde rol oynadığını ve aterosklerozdaki üç temel hücrenin (vasküler endotel hücreleri, makrofajlar ve vasküler düz kas hücreleri) piroptozuyla yakından ilişkili olduğunu ortaya çıkarmıştır (Yu et al., 2021). Endotel hücreler kardiyovasküler homeostazın korunması için gereklidir ve piroptoz, endotel fonksiyon bozukluğuna ve bütünlük kaybına yol açarak ateroskleroz patogenezi katkıda bulunur. Kolesterol kristali, oksitlenmiş düşük yoğunluklu lipoprotein (ox-LDL) gibi aterosklerotikle ilişkili çok sayıda risk faktörünün endotel hücre piroptozuna neden olduğu

bulunmuştur. Kolesterol kristalleri, aterosklerotik plak hassasiyetinin iyi bilinen önemli bir patolojik belirteçidir; çalışmalar, kolesterol kristalinin, endotel hücrelerde inflamasyonun aktivasyonunu ve ardından piroptozu indükleyerek ateroskleroza desteklediğini göstermiştir. Ox-LDL, hem ateroskleroz hem de piroptozda yer alan bir risk faktörüdür ve ateroskleroz ile piroptoz arasındaki ilişkiyi gösterir (Song et al., 2022).

## **2.) Piroptoz ve Miyokard Enfarktüsü**

Miyokard enfarktüsü, miyokard dokusunun ani iskemik ölümü olarak tanımlanır. Klinik bağlamda, miyokard enfarktüsü genellikle hassas bir plağın yırtılmasının neden olduğu koroner damarın trombotik tıkanmasından kaynaklanır (Frangogiannis, 2015). Çalışmalar piroptozun miyokard ölümüne katkıda bulunduğunu ve miyokard enfarktüsü patolojik sürecine dahil olduğunu göstermiştir (Liu et al., 2021). İnterferon düzenleyici faktör (IRF) 2, GSDMD) kaynaklı piroptoz için gerekli olan, IRF ailesine ait bir transkripsiyon faktörüdür. Miyokardiyal hücre piroptozunun azaltılması, miyokard enfarktüsünün neden olduğu kalp hasarına ve kalp fonksiyon bozukluğuna karşı koruma sağlar. GSDMD aracılı kardiyomiyositlerin ve kardiyak fibroblast piroptozunun miyokard enfarktüsü patogenezinde önemli bir rol oynamaktadır (Li et al., 2022).

## **Kanserde Piroptoz**

Piroptoz, IL-1 ve IL-18 gibi inflamatuvar sitokinlerin salınımını indükler; bu da tümör infiltrasyonunu artırarak tümör oluşumu ve metastaz olasılığını teşvik ederek inflamatuvar bir ortamı indükleyebilir (Xia et al., 2019). Ortaya çıkan kanıtlar piroptoz ve kanser arasında karmaşık bir ilişkiyi ortaya çıkarmıştır. Bir yandan inflamatuvar hücre ölümü olarak piroptoz, tümörün çoğalması için rahat bir ortam sağlarken öte yandan piroptozun aşırı aktivasyonu, tümör hücrelerinin gelişimini engelleyebilir. Piroptoz hemen hemen tüm kanser türlerinde meydana gelir ve kanserlere karşı, tümör oluşumunu güçlendirebilen veya kısıtlayabilen etki gösterir (Wang et al., 2021).

## **1.) Piroptoz ve Kolorektal Kanser**

Kolorektal kanser, dünyadaki ikinci en ölümcül kanser ve üçüncü en kötü huylu tümördür (Liu et al., 2022). Kronik inflamasyonun kolorektal kanserin kritik patojenik faktörlerinden biri olduğu, yani bunun inflamatuvar ile ilişkili bir tümör olduğu bilinmektedir. Yüksek inflamatuvar belirteçlere sahip inflamatuvar bağırsak hastalığı olan hastalarda kolorektal kanser riski önemli ölçüde artmaktadır (Tang et al., 2020). GSDMC' nin down regülasyonu, kolorektal kanser hücrelerinin proliferasyonunda ve kolorektal kanser hücrelerinde önemli azalmalara yol açarken, GSDMC aşırı ekspresyonu hücre proliferasyonunu teşvik etmektedir. Tümör oluşumu,

GSDMC' nin kolorektal kanserde umut verici bir terapötik hedef olabileceğini düşündürmektedir (Yang et al., 2023). GSDMD ise, karsinoma hücrelerinde down regüle edilirken, normal kolorektal epitelyal hücrelerde aşırı eksprese edilmiştir (You et al., 2021).

### **2.) Piroptoz ve Meme Kanseri**

Meme kanseri dünya çapında kadınlarda kanser morbidite ve mortalitesinin önde gelen nedenidir (Chen et al., 2023). Son çalışmalar, NLRP3 inflamatuvar aracılı hücre ölümünün meme kanserinde meydana geldiğini göstermiştir. Tümör baskılayıcı DRD2' nin meme kanserinde piroptozu tetiklediği gösterilmiştir. Ayrıca Sisplatin gibi bazı yaygın kemoterapötik ajanların da meme kanserinde piroptozu indüklediği bulunmuştur (You et al., 2022). Meme kanserlerinde yüksek düzeyde GSDMB, tümörün ilerlemesi ile ilişkilidir ve GSDMB' nin aşırı ekspresyonu, HER-2 (epidermal büyüme faktörü reseptörü 2) 'nin hedefe yönelik tedavisine zayıf yanıtın göstergesidir. Bu, GSDMB' nin tümörler için yeni bir prognostik belirteç olabileceği anlamına gelmektedir (Gámez-Chiachi et al., 2022). Ayrıca yapılan başka çalışmalar ile yukarı regüle edilmiş GSDMC ekspresyonu, meme kanseri hastalarında genel sağkalımın kötü olmasıyla ilişkilendirilmiştir (Yang et al., 2023).

### **3.) Piroptoz ve Akciğer Kanseri**

Akciğer neoplazmaları dünya çapında kanser insidansı ve mortalitesinin önde gelen nedenidir (Thandra et al., 2021). Piroptoz sürecine katılan birçok molekül, akciğer kanserinin oluşumu ve gelişimi ile yakından ilişkilidir. Çalışmalar, küçük hücreli dışı akciğer kanserinde GSDMD' nin ekspresyon seviyesinin çevredeki akciğer dokularından önemli ölçüde daha yüksek olduğunu göstermiştir. Ayrıca, GSDMD ekspresyonu tümör boyutu, metastaz evresi ve yüksek agresif özelliklerle ilişkilidir. GSDMD' nin akciğer adenokarsinomunun bağımsız bir prognostik belirteci olduğu düşünülmektedir (Liu et al., 2023). Ayrıca GSDMD' nin susturulması, küçük hücreli dışı akciğer kanserinde EGFR/Akt sinyal yolunu zayıflatarak tümör proliferasyonunu inhibe etmektedir (Gao et al., 2018).

### **4.) Piroptoz ve Mide Kanseri**

Mide kanseri, dünya çapında en sık görülen malignitelerden biridir ve kansere bağlı ölümlerin dördüncü önde gelen nedenidir. Mide kanseri hem çevresel hem de genetik faktörlerin oluşumu ve gelişimi üzerinde etkili olabildiği çok faktörlü bir hastalıktır (Machlowska et al., 2020). Piroptoz, enfeksiyonun ve endojen tehlike sinyallerinin antagonize edilmesinde önemli bir rol oynar. *H. pylori* gibi patojenler veya kemoterapi ilaçları mide kanserli hastalarda piroptozu neden olabilir (Shao et al., 2021). Yapılan bir çalışmada GSDMA' nın mide kanserinde tümör baskılayıcı bir gen olduğu, ancak GSDMB' nin bazı mide kanseri hücrelerinde aşırı eksprese

edildiği ve bir onkogen görevi görebileceği gösterilmiştir. GSDMB, çoğu kanserli doku örneğinde yüksek düzeyde eksprese edilmektedir, ancak normal mide örneklerinin çoğunda eksprese edilmemiştir. Ayrıca GSDMC' nin mide kanserinde down regüle edilmesi, bunun tümör önleyici bir faktör olarak işlev görebileceğini göstermektedir (Saeki et al., 2009).

### **Nörodejeneratif Hastalıklarda Piroptoz**

Nörodejeneratif hastalıklar, nöronların dejeneratif dejenerasyonu ve işlevlerinin kaybıyla karakterize edilen bozukluklardır. Nörodejeneratif hastalıkların nöroinflamasyon ve nöron ölümünün önemli faktörler olduğu karmaşık bir patofizyolojisi vardır (Liao et al., 2023). Alzheimer hastalığı, Parkinson hastalığı, felç ve amyotrofik lateral skleroz gibi nörodejeneratif hastalıklarda NLRP3 inflamatuvarının neden olduğu nöroinflamasyonun kanıtlandığı gösterilmiştir (Jin et al., 2023).

#### **1.) Piroptoz ve Alzheimer Hastalığı**

Alzheimer hastalığı ana patolojik özellikleri arasında  $\beta$ -amiloid ( $A\beta$ ) birikimi, Tau proteini hiperfosforilasyonu ve nöron kaybı yer almaktadır (Zhang et al., 2021). Yapılan çalışmalar, Alzheimer hastalığının patogenezinde inflamatuvarların önemli bir rol oynadığını desteklemektedir (Liu et al., 2024). Alzheimer hastalığında  $A\beta$  peptidinin birikmesi, mikroglia'nın aktive edilmesinin aracılık ettiği bir serebral nöroinflamasyon spektrumunu başlatır. Aktive edilmiş mikroglia, çevredeki beyin dokusunu etkileyen IL-1 $\beta$ , IL-6 ve tümör nekroz faktörü- $\alpha$  (TNF- $\alpha$ ) gibi proinflamatuvar sitokinlerin ekspresyonunu ortaya çıkararak potansiyel olarak zararlı bir rol oynayabilir (Wang et al., 2015). Yapılan bir çalışma ile hafif unutkanlık ve Alzheimer hastalığı olan hastaların periferik kan mononükleer hücrelerinde GSDMD aracılı inflamatuvarların ve piroptozun aktive edildiği gösterilmiştir (Ju et al., 2023). IL-18 mikroglia ve astrositlerde eksprese edilmiştir, mikroglialardan türetilmiş proinflamatuvar sitokinlerin Alzheimer hastalığında rol oynadığı ve IL-1 $\beta$  ve IL-18'in hastalığı ağırlaştırdığı düşünülmektedir (Jin et al., 2023).  $A\beta$ , tau kaynaklı mikroglia piroptozu ve nöroinflamasyona yol açan polarizasyon, Alzheimer hastalığının patogenezinde önemli bir rol oynamaktadır (Huang et al., 2022).

#### **2.) Piroptoz ve Parkinson Hastalığı**

Parkinson hastalığı, orta beyin dopamin nöronlarının ilerleyici kaybının, bazal ganglionlarda dopaminerjik nöronların dejenerasyonu ile sonuçlanan karakteristik semptomlara yol açan nörodejeneratif bir hastalıktır. Parkinson hastalığı gelişimine dopaminerjik nöronların kaybı ve görünümü eşlik eder (Alexander G. E., 2004). Enflamasyonun aktivasyonunun Parkinson hastalığında rol oynadığı gösterilmiştir (Pajares et al., 2020). Yapılan çalışmalar ile, IL-1 $\beta$ , IL-

2, IL-6, IL-10, TNF-a, ve NLRP3 dahil olmak üzere çeşitli piroptoz proteinlerinin Parkinson hastalarında periferik inflamatuvar biyobelirteçler olarak kullanılabileceğini göstermiştir. Ayrıca piroptoz oluşumunun engellenmesi ile davranış bozukluklarının iyileştirilebilir, nigrostriatal dopaminerjik dejenerasyonu ve nöroinflamasyonun azaltılabilir olduğu gösterilmiştir (Liang et al., 2024).

### **3.) Piroptoz ve Amyotrofik Lateral Skleroz**

Amyotrofik lateral skleroz (ALS), motor korteks, beyin sapı ve omurilikteki motor nöronların dejenerasyonu ile karakterizedir. ALS bir motor nöron hastalığı olarak görülse de nöroinflamasyon da önemli bir rol oynar. ALS hastalığı modellerindeki son kanıtlar, inflamatuvar hücre ölümünün aktivasyonunu ve ardından inflamatuvar bir hücre ölümü türü olan piroptozun başladığını göstermektedir (Van Schoor et al., 2022). ALS'nin geç evresinde GSDMD, NLRP3, aktif kaspaz-1 ve IL-1 $\beta$  esas olarak reaktif astrositler ve mikroglialarda eksprese edilir. NLRP3 inflamatuvarının aktivasyonu, ALS hastalarında ventral boynuz nöronlarının piroptozuna yol açabilir ve bu durum ALS'de motor nöron dejenerasyonu ve hastalığın ilerlemesinde rol oynayabilir (Zhang et al., 2022).

### **Metabolik Hastalıklarda Piroptoz**

Metabolik hastalıklara metabolik bozukluklar dahil olmak üzere metabolik problemler neden olmaktadır. Metabolik hastalıklar arasında başlıca diyabet, obezite ve gut yer alır (Jin et al., 2023).

#### **1.)Piroptoz ve Diyabet**

Diyabet, hiperglisemi ve insülin direnci ile karakterize metabolik bir hastalıktır. Piroptoz vücudun homeostazisi için iki farklı etki göstermektedir. Bir yandan çok hücreli organizmaların bakteriyel enfeksiyonlardan korunmasına yardımcı olurken öte yandan aşırı piroptoz da kronik inflamasyona yol açabilir. Aşırı piroptozun, plazma zarının hızlı yırtılmasına ve TNF-a, IL-1 $\beta$  ve IL-6 gibi proinflamatuvar sitokinlerin ve kemokinlerin aşırı salınmasına yol açtığı gösterilmiştir (Xu et al., 2021). Hiperglisemi, diyabetik periodontal hastalığın patogenezinde önemli bir rol oynayan makrofaj GSDMD aktivasyonunu ve piroptozunu indükleyebilir ve NLRC4 fosforilasyonu anahtar rol oynayabilir (Zhao et al., 2021). Piroptoz, diyabetin patogenezinde önemli bir araştırma perspektifi haline gelmiştir, ancak diyabette piroptozun mekanizması hala belirsizdir (Jin et al., 2023)

#### **2.)Piroptoz ve Obezite**

Obezite, genetik ve yaşam tarzı etkileşimlerinden kaynaklanan heterojen bir durumdur ve önemli yansımaları olan çeşitli patolojik işlev bozukluklarıyla ilişkilidir (Zatterale et al., 2020).

Obezite sıklıkla birçok dokudaki metabolik infiltrasyonla ilişkilidir ve obez bireylerden alınan monositler sıklıkla yüksek inflamatuvar kaspaz aktivitesi sergiler. Doymuş yağ asidi kaspaz-4/5 yoluyla monosit piroptozunu aktive edebilir, bu da inflamatuvar mediatörlerin salınmasına ve inflamatuvar aktivasyona yol açar. Bu kaspazlar, obezite ile ilişkili inflamasyonu azaltmaya yönelik potansiyel terapötik hedefler olabilir (Pillon et al., 2016). NLRP3 inflamatuvarının, obezite ile ilişkili kaspaz-1 aktivasyonu indükleyicilerinin algılanmasında önemli bir rol oynadığı ve bu nedenle inflamasyonun büyüklüğünü ve bunun insülin sinyalleşmesi üzerindeki aşağı yönlü etkilerini düzenlediği gösterilmiştir (Vandanmagsar et al., 2011).

### **Sonuç**

Piroptoz, inflamatuvar kaspaz ve gasdermin proteinleri tarafından tetiklenen yeni bir inflamatuvar programlı hücre ölümü türüdür. Son kanıtlar piroptozun hastalıkların ortaya çıkmasında önemli bir rol oynadığını ve hastalık gelişimiyle yakından ilişkili olduğunu doğrulamıştır. Birçok hastalığın patogenezi süreçlerinde piroptozun bulunduğu gösterilmiştir. Bu durum da hücre ölümünü hedeflemenin tedavi için potansiyel bir müdahale olabileceği bildirilmiştir.

**Özet**

Arıcılık bir taraftan insan beslenmesinde önemli bir yer tutan bal üretimini sağlayan, diğer taraftan tarımsal üretimin sürdürülebilirliği açısından arıların polinasyon sürecine aktif rol almasıyla biyoçeşitlilik ve verimliliğe önemli katkılar sunan bir faaliyettir. Bu çalışma arıcılığın dünya ve Türkiye'deki durumunu yıllar itibariyle ortaya koymayı amaçlamıştır. Bu amaç için 2008-2022 yıllarını kapsayan verilerle son 15 yıllık değişimler incelenmiştir. Veriler arıcılık sektörü küresel üretim değerinin 9,2 milyar doları geçtiğini göstermektedir. 2020-2022 döneminde Çin, 1.800.089 ton olan dünya bal üretiminin %25,79'unu karşılayarak ilk sırada yer alırken, Türkiye 106.239 tonluk üretimiyle ikinci sırada yer almıştır. Türkiye'yi İran, Hindistan, Arjantin ve Rusya Federasyonu takip etmiştir. Koloni varlığı bakımından Hindistan, Çin ve Türkiye ilk üç sırayı paylaşmaktadır. Türkiye 12,31 kg ile 18,02 kg olan dünya kovan bal verimi ortalamasının altında bir verimliliğe sahiptir. Üretimde olduğu gibi ihracatta da Çin lider konumdadır. Türkiye 11.051 ton ihracatıyla dünya ihracat sıralamasında 11. sırada yer almıştır. Türkiye ihracatının %43,55'ini ABD'ye yaparken, ihracat yaptığı başlıca ülkeler ABD, İspanya, Almanya ve Suudi Arabistan'dır. ABD dünyada en fazla ithalat yapan ülkedir. ABD'yi Almanya, İngiltere, Japonya, Polonya ve Belçika takip etmektedir. Türkiye'de 81 ilde bal üretimi yapılabilmekle birlikte Ordu, Adana, Muğla, Sivas ve Kocaeli illeri üretimin en fazla yapıldığı illerdir. Farklı iklim ve coğrafi özelliklere sahip olması Türkiye'yi arıcılık açısından avantajlı konuma getirirse de arıcılıktaki düşük verimlilik çözülmesi gereken en önemli sorun olarak değerlendirilmektedir. Bu konuda yapılacak Ar-Ge çalışmalarına öncelik verilerek gerekli destek sağlanmalıdır.

**Anahtar Kelimeler:** Arıcılık sektörü, Bal, Biyoçeşitlilik, Tarım Ekonomisi

**A GLOBAL VIEW OF BEEKEEPING FROM TURKEY**

**Abstract**

Beekeeping is an activity that, on the one hand, provides honey production, which has an important place in human nutrition, and on the other hand, it is an activity that makes significant contributions to biodiversity and productivity with the active role of bees in the pollination process in terms of the sustainability of agricultural production. This study aimed to reveal the status of beekeeping in the world and Türkiye. For this purpose, the changes in the last 15 years were analyzed with data from 2008-2022. The data showed that the global production value of the beekeeping sector exceeds 9.2 billion dollars. In the 2020-2022 period, China ranked first with 25.79% of the world's honey production of 1,800,089 tons, while Türkiye ranked second with 106,239 tons. Türkiye was followed by Iran, India, Argentina, and the Russian Federation. India, China, and Türkiye share the first three places regarding colony size. Türkiye has a productivity of 12.31 kg, which is below the world hive yield average of 18.02 kg. China is the leader in exports as in production. Türkiye ranked 11th in the world export ranking with 11,051 tons of exports. Türkiye exported 43.55% of its exports to the USA, while the main export destinations were the USA, Spain, Germany, and Saudi Arabia. The USA was the country that imports the most in the world. The USA was followed by Germany, the UK, Japan, Poland and Belgium. Although honey is produced in 81 provinces Türkiye, Ordu, Adana, Muğla, Sivas and Kocaeli are the provinces with the highest production. Although having different climatic and geographical characteristics makes Türkiye advantageous in terms of beekeeping, low productivity in beekeeping is considered the most important problem to be solved. R&D studies on this issue should be prioritized and necessary support should be provided.

**Keywords:** Beekeeping Industry, Honey, Biodiversity, Agricultural Economics

## **Giriş**

Arılar, dünyada ekonomiler ve ekosistemler için vazgeçilmez unsurların başında gelmekte, bitkilerin tozlaşmasından, bal ve balmumu üretimine kadar birçok konuda önemli görevleri üstlenmektedir. Arıcılığın tarımsal faaliyetler içinde ayrıcalıklı bir yere sahip olmasının en önemli nedenlerinin başında bitkisel üretimin devamlılığı açısından tozlaşmada oynadığı rol, yatırımın geri dönüş süresinin kısalığı, düşük sermaye ihtiyacı ve toprağa bağımlı olmaması gelmektedir (Uzundumlu vd., 2011; Ceyhan vd., 2016). Bu özellikleri ile arıcılık uğraşı MÖ'ye ait kanıtlarla insanlık tarihinde eski bir geçmişe sahiptir (Koday & Karadağ, 2020). Arıcılık sadece bal, polen, balmumu, propolis ve arı sütü gibi ürünler aracılığıyla gelir artışına katkıda bulunmamakta, aynı zamanda tarımsal ürünlerin verimini artırmakta, biyoçeşitliliği korumakta ve ekosistem hizmetlerine ekonomik değer katmaktadır (Gratzer vd., 2021; Vrabcová & Hájek, 2020). Üretilen ürünlerin hammadde kaynağının doğanın kendisi olması ve arıların yetiştirilme şekli dikkate alındığında arıcılık doğaya en fazla bağımlı ve ekstrem hava koşullarından en fazla etkilenen hayvancılık faaliyetidir (Ceyhan vd., 2016). Arıcılık küresel olarak değerlendirildiğinde milyonlarca insan için bir geçim kaynağıdır. Dünyada yaygın olarak yapılan arıcılık, genel yapısı itibarıyla küçük aile işletmesi olarak göze çarpmakta ve ana tarımsal faaliyetlerin yanında gelir getirici ikincil bir faaliyet olarak yapılmaktadır (Erdal & Tipi, 2022). Ayrıca, gelişmekte olan ülkelerin kırsal nüfusu için iş, gelir ve beslenme kaynağı olup ekonomiye önemli katkılar sunmaktadır (Uysal, 2022). Arıcılık Türkiye, İran ve Rusya Federasyonu gibi ülkede kırsal geliri artırıcı bir faaliyet iken, Çin, Yeni Zelanda, Arjantin ve Hindistan gibi ülkeler için de önemli bir gelir kaynağıdır. Arıcılık genel olarak değerlendirildiğinde; gelir desteği, ekolojik katkılar, sürdürülebilir kalkınma, yoksulluğun azaltılması ve koruma çabalarını kapsayan çok yönlü faydalarının olduğu önemli bir faaliyettir. Türkiye sahip olduğu farklı iklim koşulları, florası, kovan sayısı ve genetik olarak çeşitli bal arısı varlığı açısından önemli bir arıcılık potansiyeline sahiptir. Özellikle bal üretiminde hayati öneme sahip ballı bitki türlerinin büyük bir çoğunluğunun Türkiye'de mevcut olması ve bu bitkilerin farklı bölgelerde farklı zamanlarda çiçeklenmesi, Türkiye arıcılığının gelişimi için büyük bir şans olarak değerlendirilmektedir (Sıralı, 2010). Bu çalışma küresel bal üretimi ve ticaretinde söz sahibi ülkelerin mevcut durumundan hareketle Türkiye'nin bu sektördeki yerini belirlemeyi amaçlamıştır. Bu amaç doğrultusunda bal üretimi, bal verimi, koloni sayısı, ihracat ve ithalat değerlerinin 2008-2022 yıllarındaki değişimi incelenmiştir.

### **Materyal ve Metot**

Bu arařtırmada bal üretim miktarı, koloni sayıları, ithalat ve ihracat deęer ve miktarları materyal olarak kullanılmıřtır. Analizler için kullanılan veriler Birleřmiř Milletler Tarım ve Gıda Örgütü (FAO) ve Türkiye İstatistik Kurumu (TÜİK) veri tabanından elde edilmiřtir. Çalışmada bal üretiminin dünya ve Türkiye açısından potansiyeli genel olarak ele alınmıř, bu çerçevede son 15 yıllık verilerin (2008-2022) üçer yıllık ortalamaları alınarak; üretim miktarları, koloni sayıları, verim, ihracat ve ithalat deęerleri amaca uygun olarak düzenlenmiř, basit indeksler oluşturulmuř ve elde edilen bulgular yorumlanmıřtır.

### **Bulgular ve Tartıřma**

#### **Dünya Bal Üretimindeki Geliřmeler**

Binlerce yıl boyunca insanlar arıcılıęın potansiyelini fark etmiř ve kullanmıř, onu ilkel bir uygulamadan geliřmiř bir endüstriye dönüřtürmüřtür. Balın son yıllarda talep artıřı ile birlikte yüksek fiyatlardan alıcı bulması, kolay depolanabilir olması ve dięer arı ürünlerinin (balmumu, polen, arı sütü, propolis ve arı zehiri) farklı amaçlarla kullanılıyor olması arıcılık faaliyetinin geliřmesinde rol oynayan en önemli faktörlerdir. 2020-2022 yılı ortalamasına göre dünya ortalama bal üretimi 1.800.089 ton olarak gerçekteřmiřtir (Çizelge 1). Bu üretimin yaklaşık %48'i Asya kıtasında yapılmaktadır. Asya kıtasının iklimsel olarak uygunluęu ve dünyada en fazla bal üreten Çin'in kıtada bulunması bu sonucu doğurmuřtur. Asya kıtasını %22,6'lık payla Avrupa ve %19,9'luk üretim payıyla Amerika takip etmiřtir. Dünya bal üretimi son 15 yılda %18,41 artmıř, bu artıřın %22,6'sı Çin'deki, %11,9'u İran'daki ve %8,8'i Türkiye'deki üretim artıřından kaynaklanmıřtır. Ukrayna ve ABD hariç tutulduęunda dünyada en fazla bal üreten ilk on ülkenin üretimlerinin belli oranda artırdıęı Çizelge 1'den görölmektedir. Özellikle İran, Türkiye ve Hindistan'daki üretim artıř oranları dikkat çekicidir. Çin, Türkiye ve İran dünya bal üretiminde ilk üç sırayı paylařırken Çin'in toplam üretimden aldıęı pay %25,79'dur. Türkiye ortalama 106.239 tonluk üretimiyle %5,9'luk bir pay olarak dünyada en fazla bal üreten ikinci ülke konumundadır. Dünyada en fazla bal üreten on ülke dünya bal üretiminin %61,17'sini gerçekteřirmiřtir (Çizelge 1). Türkiye İstatistik Kurumu (TÜİK) verilerine göre Türkiye'de 2023 yılında 114.886 ton bal üretilmiřtir. Bu üretim 81 ilde gerçekteřtirilmekle beraber en fazla üretim yapılan iller Ordu (%16,54), Adana (%10,69), Muęla (%7,03), Sivas (%5,56), Kocaeli (%3,69), İzmir (%3,16), Mersin (%2,98) ve Aydın (%2,97)'dir (TÜİK, 2024).

ABD	73.583	66.550	75.100	69.544	60.429	3,36	-17,88
İlk 10 Ülke Toplamı	944.051	1.030.611	1.109.991	1.110.617	1101.072	61,17	16,63
Diğer Ülkeler	576.220	615.837	705.021	715.253	699.016	38,83	21,31
Dünya	1.520.271	1.646.448	1.815.011	1.825.871	1.800.089	100,00	18,41

<sup>a</sup>Üç yılın ortalaması

<sup>b</sup>2008-2010 dönemine göre 2020-2022 dönemindeki değişimi ifade etmektedir.

Koloni varlığı bakımından karşılaştırıldığında Hindistan en fazla arı kolonisine sahip ülkedir (Çizelge 2). Etiyopya, Tanzanya ve İspanya dünya bal üretiminde ilk on ülke arasında yer almamasına rağmen koloni varlığı bakımından ilk on ülke içinde olması dikkat çekicidir. Bu durum söz konusu ülkelerin verimliliğinin düşük olduğunun göstergesidir. Son 15 yıllık veriler ışığında koloni varlığında dünyada %27,11'lik artışın olduğunu söylemek mümkündür. Rusya Federasyonu'nda koloni sayısının azalmasına rağmen üretimin artması en önemli bulgulardan biridir. Türkiye'de ise koloni sayısının artış oranı üretim artış oranından daha yüksek gerçekleşmiştir. Son 15 yılda koloni sayısında 21 milyon adetten fazla bir artış söz konusudur. Bu artışın %15,75'i Türkiye'deki artıştan kaynaklanmıştır.

**Çizelge 2. Ülkelere göre koloni varlığı (adet) ve değişimleri (%) (FAO, 2024)**

<sup>a</sup>Üç yılın ortalaması

<sup>b</sup>2008-2010 dönemine göre 2020-2022 dönemindeki değişimi ifade etmektedir.

Kovan başına bal verimi, çeşitli faktörlerden etkilenen kritik bir ölçüttür. Arı türleri, kovan yeri, nektar kaynakları, kovanın genel sağlık durumu ve arıcılık teknikleri gibi faktörler kovan başına bal veriminin belirlenmesinde önemli rol oynar (Akyol vd., 2014). Bal üretiminde önde gelen ülkelerin kovan başına bal verimleri Çizelge 3'te sunulmuştur. Dünya ortalamasına göre kovan başına yaklaşık 18 kg bal üretilmektedir. Çin verimlilikte başı çeken ülkedir. Bal üretiminde ilk ona giren ülkeler arasında kovan başına bal veriminde Hindistan, İran ve Türkiye dünya ortalamasının altında kalan ülkeler olmuştur. Türkiye'de zaten düşük olan kovan başı verim son 15 yılda %20'den fazla düşmüştür. Bu verim düşüklüğünün nedenlerini tespit etmek ve gerekli önlemleri almak arıcılık sektörünün gelişmesi açısından en önemli konulardır.

### **Dünya Bal Ticaretindeki Gelişmeler**

Dış ticarete konu olan bal miktarının üretime oranı diğer hayvansal ürünlerle karşılaştırıldığında oldukça yüksektir. Son 15 yıllık veriler incelendiğinde yıldan yıla değişmekle beraber dünya bal üretiminin %28-42'si uluslararası ticarete konu olmuştur (FAO, 2024).

Dünya bal ihracatında önde gelen ilk on ülke ve Türkiye'ye ait ihracat istatistikleri Çizelge 4'te verilmiştir. Bal üretiminde olduğu gibi ihracatında da Çin lider ülkedir. Dünya bal ihracat miktarı 2008-2010 döneminde 444.543 ton iken 2020-2022 döneminde %70,50 artarak 757.929 tona ulaşmıştır. İhracata konu olan bal miktarı bakımından Çin %19,10'luk pay alırken Çin'i sırasıyla %9,30'luk payla Hindistan, %8,85'lik payla Arjantin takip etmiştir. İhracatta ilk on ülkenin küresel ihracatın yaklaşık %70'ini gerçekleştirmiştir. Türkiye üretimdeki potansiyelini ihracata yansıtamamıştır. Türkiye'nin dünya bal ihracatındaki payı %1,46 olurken arzu edilen seviyede olmadığını belirtmek gerekir. Son 15 yıllık ihracat verilerine göre ihracat miktarını mutlak olarak en fazla artıran ülkeler Çin, Ukrayna ve Hindistan'dır.

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

**April 09-16, 2024 / Lisbon, Portugal**

Türkiye 2020-2022 döneminde ortalama 11.051 ton balı yaklaşık 34 milyon dolara ihraç etmiştir. Çok sayıda ülkeye ihracatımız söz konusu olmakla birlikte en fazla ihracat yaptığımız ülkeler Almanya, ABD, İspanya ve Suudi Arabistan'dır.

Dünya bal ithalatında önde gelen ilk on ülke ve Türkiye'ye ait ithalat istatistikleri Çizelge 5'te verilmiştir. ABD en fazla bal ithalatı ülke konumundadır. Almanya, Birleşik Krallık ve Japonya ABD'yi takip eden ülkelerdir. Son 15 yıllık veriler ithalatını mutlak olarak en fazla artıran ülkenin ABD (102.489 ton) olduğunu göstermiştir. ABD bal ithalatının yaklaşık %80'ini Hindistan, Arjantin, Brezilya, Vietnam ve Meksika'dan yapmaktadır. Almanya ise ithalatının yaklaşık yarısını Ukrayna, Arjantin, Meksika, Romanya ve Brezilya'dan karşılamaktadır. Türkiye ABD pazarından %3,22, Almanya pazarından %1,12 pay alabilmiştir.

## **Sonuç ve Öneriler**

Arıcılık, insanlar için önemli bir gıda olan balın üretimi ve bitkisel üretimin sürekliliği açısından hayati öneme sahip bir sektördür. Bu çalışmada, dünya ve Türkiye bal üretim ve ticaretindeki son 15 yıldaki gelişmeler değerlendirilmiştir. Nitekim son 15 yıllık veriler değerlendirildiğinde bal üretim ve ticaretinde önemli gelişmeler olduğunu söylemek mümkündür. Bu artış beraberinde küresel anlamda bal ticaretinin de gelişimini sağlamıştır. Türkiye iklimi ve coğrafi konumu nedeniyle önemli bir arıcılık potansiyeline sahip olmasına ve bal üretiminde dünya sıralamasında önemli bir konumda olmasına rağmen, sektörde önemli sorunlarla karşı karşıyadır. Özellikle bal üretimindeki düşük verimlilik en önemli sorundur. Verimliliğin artırılmasına yönelik eğitim, bilinçlendirme ve Ar-Ge çalışmalarına hız verilmeli, modern tekniklerin ve teknolojik yeniliklerin benimsenmesi teşvik edilmelidir.

Türkiye potansiyelinin aksine küresel bal ticaretinde arzu edilen seviyede değildir. Bal ihraç ettiğimiz ülkelerin pazarından aldığımız pay çok düşük oranlarda kalmaktadır. Bunun en büyük nedenlerinden biri dış pazarın istediği kalitede bal üretimimizin olmamasıdır. Bu nedenle

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

*April 09-16, 2024 / Lisbon, Portugal*

kaliteli bal üretiminin artırılmasına yönelik inisiyatiflerin harekete geçirilmesi, beraberinde coğrafi işaret ve kalite standartlarının devreye alınması, bal ihracatının değerini artırmada en önemli konular olarak değerlendirilmektedir.

**ÖZET**

Tıbbi ve aromatik bitkiler kavramı hem bitkileri, hem bitkilerde ki etken maddeleri ve hem de bunların kullanım alanları bakımından çok büyük bir alanı kapsamaktadır. Tıbbi aromatik bitkiler, beslenme, kozmetik, vücut bakımı, tütsü veya dini törenler, gıdalara güzel koku ve tat vermek için kullanılmaktadır. Gıdaların depolama ve raf ömürlerini uzatma, gıdaların ve doğal liflerin boyanması gibi daha pek çok alanda da kullanım sahası vardır. Bitkilerin tedavide kullanımları insanlık tarihiyle birlikte başlamıştır. Binlerce yıl önce insan, bitkilerin tedavi edici gücünü tanımış ve sağlıklı yasayabilmek için ondan yararlanmıştır. İnsanlık tarihi boyunca birçok hastalığı tedavi amacıyla bitkiler kullanılarak tedavi edilmeye çalışılmış ve çalışılmaktadır. WHO (Dünya sağlık örgütü) raporuna göre dünyada 70000 bitkinin 21000 kadarı ilaç sanayinde kullanılmakta, ülkemizde yetişen ve çoğunluğu doğal olarak bulunan türlerin sadece 1000 kadarı tıbbi amaçla kullanılmaktadır.

**Anahtar kelimeler:** tıbbi bitkiler, aromatik bitkiler, baharat, geçmişten günümüze

**MEDICINAL AND AROMATIC PLANTS FROM PAST TO PRESENT**

**ABSTRACT**

When medicinal and aromatic plants are mentioned, they cover a very large area in terms of plants, active ingredients and consumption areas. While medicinal plants are used in areas such as nutrition, cosmetics, body care, incense or religious ceremonies, aromatic plants are used to give pleasant smell and taste. Aromatic plants also have wide usage areas in the food, cosmetics and perfumery industries. The use of plants in treatment began with the history of humanity. Thousands of years ago, people recognized the therapeutic power of plants and used them to live a healthy life. Throughout human history, many diseases have been tried and are being treated using plants. According to the WHO (World Health Organization) report, approximately 21,000 of the 70,000 plants in the world are used in the pharmaceutical industry, and only about 1,000 of the species that grow in our country, most of which occur naturally, are used for medicinal purposes.

**Keywords:** medicinal plants, aromatic plants, spice, from past to present

## **INTRODUCTION**

All living and non-living entities on Earth maintain their existence as a product of an extraordinary balance. Perhaps the most significant among these entities are undoubtedly plants. So much so that plants have an indispensable place, especially for human and animal life. This indispensability has continued without losing its importance since the first day humans appeared on Earth. Throughout history, humans have benefited from plants in various ways, such as for shelter, clothing, nutrition, and treatment. The beginning of the relationship between plants and humans is considered to be the findings in a Neanderthal grave at Shanidar Cave in Northern Iraq, during excavations between 1957 and 1961. Dating back 60,000 years and believed to belong to a shaman, this grave contained types of plants like yarrow, canary grass, purple hyacinth, rose mallow, passionflower, and ephedra. In a society that had begun burying its dead, it is thought that these plants were placed in the grave with the idea that the deceased might use them upon returning to life. This might indicate the beginning of differentiating between edible and medicinal plants since these plant types are still important today, especially as medicinal plants (Lewin, 2000; Heinrich et al., 2004). The bond between humans and plants over the centuries has given rise to the field of ethnobotany, which is recognized and researched worldwide today (Koçyiğit, 2005). The knowledge of ethnobotany, gained through trial and error over a long period and transmitted from generation to generation, contributes significantly to the scientific evaluation of plants. In France, Chauvet Cave contains Paleolithic period archaeological findings and remnants from around 30,000 BCE, including fossil remnants of some medicinal plants used today. The well-preserved "Ice Man Ötzi," discovered accidentally in the Austrian Alps in the 1990s and dating back to 3,300 BCE, had plants with him that are thought to have been used for protective and medicinal purposes (Megep, 2010). Among the earliest written texts about the uses of plants are agricultural and medicinal recipes inscribed in cuneiform on clay tablets by the Sumerians around 3,500-3,000 BCE. It is claimed that the roots of traditional Chinese medicine originate from the legendary Chinese Emperor Shennong, who lived around 3,000-2,700 BCE. His writings on medicinal plants and agriculture have been handed down through the centuries. Around 1,700 BCE, Hammurabi, the king of Babylon, immortalized health-related laws and information about medicinal and aromatic plants on a monumental stone inscription. The Ebers Papyrus, believed to be written around 1,500 BCE and containing information from at least 1,000-1,500 years earlier, is one of the oldest and most important written sources on medicinal and aromatic plants (Bayramoğlu and Toksoy, 2008).

The term "Phytotherapy," meaning treatment with medicinal plants, was first used by French physician Henri Leclerc (1870-1955) (Faydaoğlu and Sürücüoğlu, 2011).

Throughout human history, many diseases such as diabetes, jaundice, and respiratory issues have been treated using plants. According to the World Health Organization (WHO), approximately 4 billion people (80% of the world's population) initially address health problems using herbal drugs. Additionally, about 25% of prescription medications in developed countries are made up of active ingredients derived from plants (Farnsworth et al., 1985).

### **CONCLUSION**

Medicinal and aromatic plants have been an essential component of health since the existence of humanity. They continue to be a vital source of compounds capable of treating many diseases, even amidst modern medical advancements. Despite the development of medical drugs and treatment methods, the treatment with medicinal plants still retains its importance. Traditional treatment methods are preferred before medical treatment, especially during the fall and winter seasons when flu, colds, and respiratory diseases caused by viruses are more common. Additionally, people who want to strengthen their immune system or mitigate the symptoms of diseases often prioritize herbal treatments over medical drugs. Extensive studies have been conducted and continue to be necessary worldwide on the antimicrobial activities of extracts obtained from various plant species belonging to many families against various pathogens.

**Özet**

İşletmeler, küresel ekonomi ve bilgi teknolojilerindeki ilerlemeler sebebi ile muhasebe denetim süreçlerini geliştirmişlerdir. Hatta, iç kontrol de bu durumdan etkilenmiştir. Günümüzde, muhasebe ile teknolojinin entegrasyonu daha önce hiç olmadığı kadar yüksektir ve ivme devam etmektedir. Covid-19 salgını ise bu süreci daha da hızlandırmıştır. Bu çalışmada, öncelikli olarak sürekli güvence denetimi (Continuous Assurance Auditing - CAA) kavramı açıklanmış ve bilgisayar destekli muhasebe denetim süreçleri üzerinde durulmuştur. Aynı zamanda, sürekli güvence denetimi (Continuous Assurance Auditing - CAA) kavramının uygulanmasını sağlayan ve süreci kolaylaştıran Bilgisayar Destekli Denetim Araç ve Teknikleri (Computer-Assisted Audit Tools - CAATs) incelenmiştir. Bahse konu olan teknikler, muhasebe hata ve hilelerinin önlenmesinde önemli araçlardır. Ek olarak, riski azaltıcı ve işletme performansını artırıcı etkiye sahiptirler. Araştırma, sürekli güvence denetimi (Continuous Assurance Auditing - CAA) ve bilgisayar destekli muhasebe denetim süreçlerinin ayrıntılı ile derin bir yapı arz ettiğini göstermektedir. Aynı zamanda denetimde sorgulama ve analiz araçları kapsamında programlar (yazılımlar), programlama dilleri ve denetime yönelik araç setleri de çeşitliliğe sahiptir. İşletmeler muhasebe denetiminde kullanılmak üzere büyük veri analiz tekniklerine ve yapay zeka uygulamalarına yatırım yapmak zorundadırlar. Bunun yanında muhasebe, denetim ve iç kontrolün geleneksel yapılarından sıyrılarak yeniden şekillenmeleri, işletmelerin genel olarak entelektüel sermayeye, spesifik olarak ise insan sermayesine de yatırım yapmalarını zorunlu hale getirmiştir. Gelecek çalışmalarda iç ve dış (bağımsız) denetimde robotik, makine öğrenmesi veya derin öğrenme tekniklerinin denetime etkileri incelenebilir. Güncel programlar (yazılımlar), programlama dilleri ve denetime yönelik araç setleri mercek altına alınabilir. Aynı zamanda, işletmeler üzerinde uygulama ve örneklere odaklanılabilir.

**Anahtar Kelimeler:** Muhasebe, Denetim, Teknoloji, Sürekli Güvence Denetimi, Bilgisayar Destekli Muhasebe Denetim Süreçleri

**CONTINUOUS ASSURANCE AUDITING AND COMPUTER-ASSISTED  
ACCOUNTING AUDITING PROCESSES**

**Abstract**

Businesses have improved their accounting audit processes due to advances in the global economy and information technologies (IT). In fact, internal controls were also affected by this situation. Today, the integration of accounting and technology is higher than ever before and the momentum continues. The Covid-19 epidemic has accelerated this process even further. In this study, primarily the concept of Continuous Assurance Auditing (CAA) is explained and computer-aided accounting auditing processes are emphasized. At the same time, Computer-Assisted Audit Tools and Techniques (CAATs), which enable the implementation of the CAA and facilitate the process, were examined. The techniques in question are important tools in preventing accounting errors and frauds. In addition, they have the effect of reducing risk and increasing business performance. The research shows that CAA and computer-aided accounting auditing processes have a detailed and deep structure. At the same time, programs (software), programming languages and audit tool sets within the scope of auditing investigation and analysis tools also have diversity. Businesses must invest in big data analysis techniques and artificial intelligence (AI) applications to be used in accounting auditing. In addition, the reshaping of accounting, auditing and internal controls by breaking away from their traditional structures has made it necessary for businesses to invest in intellectual capital in general and human capital specifically. In future studies, the effects of robotics, machine learning or deep learning techniques on internal and external (independent) auditing can be examined. Current programs (software), programming languages and control tool sets can be taken into consideration. At the same time, the focus can be on applications and examples on businesses.

**Keywords:** Accounting, Auditing, Technology, Continuous Assurance Auditing, Computer-Assisted Accounting Auditing Processes

## **Giriş**

Küreselleşme ve bilgi teknolojilerinde (informaton technologies - IT) yaşanan gelişmeler, klasik işletme kavramından dijital işletme kavramına geçişe yol açmıştır (Aksel ve diğ, 2013). Hiç şüphesiz, muhasebe ve denetim de tecrübe edilen bu değişimden etkilenmiştir. Muhasebe zaman içerisinde çok daha kapsayıcı bir karaktere sahip olmuş, paydaşlar nezdinde daha da önemli bir konuma yükselmiştir. Muhasebe, denetim ve iç kontrolde teknoloji ile entegrasyon hızlanmıştır. Covid-19 döneminin ise bu bağlamda katalizör görevi gördüğünü ifade etmek yanlış olmayacaktır. Covid-19 salgını, aslında muhasebe, denetim ve iç kontrolde gerçekleşmekte olan değişim ile yeniden şekillenmeleri daha erken bir tarihe çekmiştir. Bu çalışmada Giriş bölümünden sonra Sürekli Güvence Denetimi (Continuous Assurance Auditing - CAA) bölümü yer almıştır. Bu kısmı Bilgisayar Destekli Denetim Araç ve Teknikleri (Computer-Assisted Audit Tools - CAATs) bölümü takip etmiştir. Araştırma, Sonuç ve Öneriler bölümü ile noktalanmıştır.

## **Sürekli Güvence Denetimi (Continuous Assurance Auditing - CAA)**

Sürekli güvence denetimi, kontrolle ilgili sistemlerin bilgi teknolojileri (information technologies - IT) içerisinde kurulmasıdır. Bu sistemler genellikle iç denetçi olmak üzere, denetçiye herhangi bir denetim limiti veya parametresinden sapma meydana gelirse denetimle ilgili mesaj veya uyarı gönderirler. Günümüzde, iç denetimin riskleri minimize etme ve fırsatlardan yararlanma hususlarındaki etkisi göz ardı edilemez (Deloitte, 2024). Teknoloji ise, sürekli denetimin uygulanmasını çok daha kolay bir hale getirmiştir (Moeller, 2016). Çağımızda işletmelerin, bilgi sistemleri veri tabanlarında depolanan her türlü operasyonel ve geçmişe yönelik bilgiyi saklamaya ihtiyacı vardır. Eğer bu depolanmış veri büyük, karmaşık ve birbirleri ile ilişkili veri tabanlarında saklanıyorsa bu kavram veri ambarı (data warehouse) olarak tanımlanmaktadır. Veri ambarı, veri madenciliği ve çevrimiçi analitik işlem araçları gibi, sürekli güvence denetimini uygulamak için gerekli bir unsurdur (Moeller, 2016). Bilgisayar destekli muhasebe denetim süreçlerinin etkin olarak işleyebilmesi için yeterli bilgiye sahip denetçiler istihdam edilmeli ve teknik altyapı oluşturulmalıdır (Gönen ve Rasgen, 2015). İşletmelerin, bilgisayar teknolojileri altyapılarının kurulmasına ve denetçilerin bu teknolojileri kullanmalarına yönelik eğitimlerine bütçelerinde pay ayırmaları önemli bir gerekliliktir. (Orhan ve Serçemeli, 2015). Denetimde kullanılan bilgi teknolojilerinin denetçilerin iş tatmini ve motivasyonlarını arttırdığı ve deneyimli denetçilerin riskli ile teknik konulara daha iyi odaklanabildikleri belirlenmiştir (Ertaş ve Güven, 2008). Bu noktada, günümüzde hem bir alt küme olarak insan sermayesine, hem de bu bağlamda insan sermayesini de kapsayan bir üst

küme olarak entelektüel sermayeye değinilmelidir. Hiç şüphesiz, insan sermayesi ve genel anlamda entelektüel sermaye, işletmelerin gerçek değerlerinin farkına varıp bunları yansıtabilmeleri için kritik bir faktördür (Arslan ve Kızıl, 2019).

### **Sürekli Güvence Denetiminin (Continuous Assurance Auditing - CAA) Özellikleri**

- Tekrarlanan yazılım denetim monitörleri (izleyici programlar) bilgi teknolojileri uygulamalarına yerleştirilmiştir. Örneğin, eğer işletmenin iç denetim departmanı, özellikle bir büyük defter (defteri kebir) hesabındaki belirli bir limitin üzerindeki finansal işlemlerle ilgileniyorsa, bu durumu karşılayan her aktiviteyi izleyecek bir yazılım değişikliğini sisteme yükleyebilir.
- İşletmenin bir alanını gözden geçirmek için periyodik iç denetimler planlamak yerine, sürekli güvence denetimi (Continuous Assurance Auditing - CAA) iç denetimin dikkatini çekebilecek potansiyel ilgi alanlarını kaydeder. Daha sonra ise bunları takip etmek, iç denetimin sorumluluğundadır (Moeller, 2016).

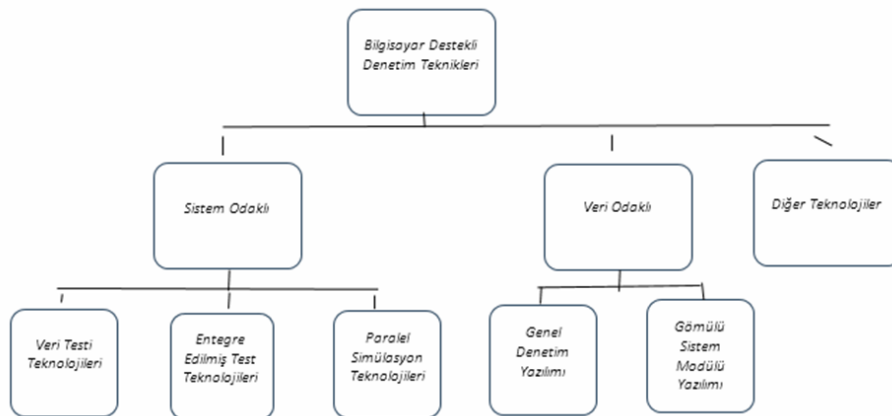

**Şekil 1.** Ödeme Sistemi Sürekli Denetim İzleme Örneği (Moeller, 2010)

Şekil 1’de ödeme sistemi sürekli denetim izleme örneği yer almaktadır. Sürekli izleme uygulaması, tüm ödemeler işlem dosyasındaki faaliyetleri periyodik olarak izleyen, ayrı ve paralel yazılım setlerinden oluşmaktadır. Faaliyet özetleri periyodik olarak raporlanır ve herhangi bir olağandışı öge, bir sapma raporuyla e-posta şeklinde iletilir. Bu sistem birçok işletmede bulunan şifre güvenlik izleme sistemlerine çok benzerdir. Sapma faaliyeti düzenli aralıklarda rapor edilir, aynı zamanda herhangi bir kırmızı bayrak ihlali hemen dikkate alınacak şekilde denetçiye bildirilmektedir (Moeller, 2010). Sürekli İzleme (Continuous Monitor - CM) ve Sürekli Güvence Denetimi (Continuous Assurance Auditing - CAA) kavramları benzerdir,

ancak amaçlarında farklılar mevcuttur. Bir bilişim teknolojileri denetçisi, sürekli izleme hakkında temel bir anlayışa ve sürekli güvence denetimi temel özellikleri hakkında bilgiye sahip olmalıdır. Sürekli izleme bir risk ve kontrol izleme sistemi iken, en temel tasarımında sürekli güvence denetimi diğer kritik uygulamaları izleyen bağımsız bir uygulamadır. CM uygulaması bir ödeme işlem dosyasındaki etkinliği, ayrı ve periyodik incelemeler yoluyla tüm ödeme faaliyetleri bazında izleyen paralel yazılım setidir. Faaliyet özetleri periyodik olarak raporlanmaktadır ve fark edilen olağandışı öğeler, bir e-posta aracılığıyla bir istisna raporunda vurgulanmaktadır (Moeller, 2010).

### **Bilgisayar Destekli Denetim Araç ve Teknikleri (Computer-Assisted Audit Tools - CAATs)**

Bilgisayar Destekli Denetim Araç ve Teknikleri, iç veya dış (bağımsız) denetçiler tarafından kullanılmaktadır ve bir işletmenin bilgi sistemi içerisinde bulunan, denetim için önemli olan verinin işlenmesine yönelik denetim prosedürlerinin bir parçası olarak bilinmektedir. Denetçiler tarafından en çok kullanılan teknik ve araçlar literatürde, elektronik çalışma belgeleri, hile tespiti, bilgi toplama ve analiz için destekleyici görevi bulunan genel denetim yazılımı, ağ güvenlik testi, sürekli izleme, denetim raporlaması, denetim geçmiş veri tabanları, bilgisayar tabanlı eğitim, elektronik ticaret ve internet güvenliği olarak yer almaktadır (Mahzan ve Lymer, 2014). Denetimin konusunu ise artık sadece finansal veriler oluşturmamaktadır. Bahse konu olan değişim, denetim teknoloji ve metotlarında da değişime sebep olmuştur. Şekil 2’de bilgisayar destekli denetim teknikleri (teknolojileri), uygulama durumlarına göre sınıflandırılmıştır (Jiang, 2019).

**Şekil 2.** Bilgisayar Destekli Denetim Tekniklerinin (Teknolojilerinin) Sınıflandırılması (Jiang, 2019) Bilgisayar destekli denetim teknikleri (teknolojileri) ile gerçekleştirilen bazı faaliyetler ise aşağıda sıralanmıştır: (Handoko, Lindawati ve Mustapha, 2020)

- Denetim örneklemesinden bilgisayar parametrelerinin seçilmesinde, hesaplanmasında ve örnek sonuçlarının değerlendirilmesinde yararlanılması
- Simülasyon ve yazılımların değerlendirilmesinde bilgisayar kullanımı
- Test edilecek verinin toplanması
- Denetim çalışma kağıtlarının hazırlanması
- Verinin hesaplanması ve karşılaştırılması
- Hesaplamaların analizi
- Bütçe ve zaman takibi
- Standart denetim yazışmaları
- Verilerin eksiksizliğinin, tutarlılığının, tahsisinin ve doğruluğunun kontrolü
- Formüllerin kontrolü
- Veri bütünlüğünün karşılaştırılması
- Veri analizi için genel gözden geçirme, sıralama, birleştirme, bölme ve oranlama
- Gerçekleştirilen çeşitli denetim prosedürleri arasındaki verilerin karşılaştırılması

Genelleştirilmiş denetim yazılımları (Generalized audit software - GAS) olarak bilinen ve kolayca erişilebilen, denetçinin bilgi teknolojileri konusunda uzmanlığını gerektirmeyen bilgisayar denetim programları da sıkça kullanılmaktadır. Genelleştirilmiş denetim yazılımları, bilgisayar depolama ortamında tutulan verilere erişim elde etmek ve bunları değiştirmek için bir araç sunan tamamlanmış programlardır. Bu yazılımlar, matematiksel hesaplamalar, tabakalandırma, istatistiksel analiz, sıra denetimi, çift kontrol, yeniden hesaplamalar vb. tüm özelliklere sahiptir. Denetçiler, başvuru sistemleri tarafından üretilen ve tutulan kayıtların kalitesi hakkında doğrudan onay alabilirler. Buna karşılık, kayıtların kalitesine ilişkin vardıkları sonuçlar, bu kayıtları işleyen başvuru sisteminin kalitesi hakkında yargıda bulunmalarını da sağlayacaktır. Genelleştirilmiş denetim yazılımları (GAS), denetimi gerçekleştiremez. Fakat, müşterilerin gereksinimlerine göre bilgilerin seçilmesini ve işlenmesini kolaylaştırabilir. En sık kullanılan iki GAS ise, ACL (Audit Command Language) ve IDEA'dır (Interactive Data Extraction Analysis). ACL aslında bir programlama dili ve denetime yönelik araçlar setidir. IDEA ise aslında denetime yönelik bir veri analiz yazılımı ve teknolojisidir. Denetimde sorgulama ve analiz araçları örnekleri Tablo 1'de belirtilmiştir (Serpeninova, Makarenko, Litvinova, 2020). Hile denetiminde kullanılan yazılımlar ve programlama dillerine de örnek olarak ACL, IDEA ve Excel gösterilebilir. Yapılacak hile denetim testlerini ana başlıklara ayıracak olursak ticari alacaklar, ticari borçlar, büyük defter, maaş ve ödemeler ile satın alma

emirleri yönetimi şeklinde sınıflandırmak mümkündür. Hiç şüphesiz, hile denetimi testlerinin aslında daha kapsamlı olduğunu da bu noktada vurgulamak gereklidir (Coderre, 2009).Genelleştirilmiş denetim yazılımlarının yanı sıra denetçiler, verilere erişmek ve bu verileri işlemek için bir programlama dili kullanabilirler. Özellikle birçok denetçi, sistem güvenilirliğine ilişkin kanıt toplamak için C, C++, JAVA, SQL, Python, PHP gibi programlama dillerini ve ACL ile IDEA'yı kullanmaktadır. Genel destek araçlarından bazıları ise şunlardır: MS Office, Oracle, Webmetrics 3.0, MS Access ve MS Excel (Serpeninova, Makarenko, Litvinova, 2020).

**Tablo 1.** Denetimde Sorgulama ve Analiz Araçları Örnekleri (Serpeninova,Y., Makarenko, S., Litvinova, M., 2020)

<b>Program / Programlama Dili / Denetime Yönelik Araç Seti</b>	<b>Özellikler</b>
MS Access	Veri seçimi, analizi ve raporlaması sağlayan Microsoft'a ait bir veri tabanı programı.
ACL	Çoğu formattan (Örnek: EBCDIC, TXT) dosyaları okuyan ve veri seçimi, analizi ve raporlaması sağlayan programlama dili ile denetime yönelik araçlar seti.
MS Excel	Analiz, hesaplama, grafik ve raporlama sağlayan Microsoft'a ait elektronik tablo yazılımı.
CA-Examine	Veri seçimi, analizi ve değerlendirmesi sağlayan interaktif bir yazılım.
CA-Easytrieve	Veri seçimi, analizi ve değerlendirmesi sağlayan rapor oluşturma yazılımı.
C, C++, JAVA, SQL, Python, PHP	Veri seçimi, analizi ve değerlendirmesi sağlayan programlama dilleri.
SAS, SPSS	Veri seçimi, analizi ve değerlendirmesi sağlayan istatistik programları.

Bilgisayar destekli denetim teknolojisi, ortaya çıkan bilgi sistemleri ve denetim risklerini azaltmak için önemli bir araçtır. Audit Command Language (ACL) gibi programlama dilleri ve denetime yönelik araç setlerinin kullanımı, işletmelerin performanslarını arttırmaktadır. İç Denetçiler Enstitüsü'ne (Institute of Internal Auditors - IIA) göre, bilgisayar destekli denetim yazılımları, birçok denetçinin denetim prosedürünü yürütmesi için bir araç haline gelmiştir (Chou, 2018). İç denetimde bilgisayar destekli denetim araçlarının kullanmanın ise, satın almadan ödemeye kadar olan işletme süreçlerinde yaşanabilecek hileli işlemlerin tespitinde çok önemli bir rolü bulunmaktadır (Samagaio ve Diogo, 2020). Bilgisayar destekli muhasebe denetim süreçlerinin, özellikle Covid-19 döneminde de ön plana çıktığını vurgulamak gerekir. Hatta, Covid-19 döneminde iç kontrol süreçleri dahi yeniden şekillenmiştir (Kızıl, Kızıl ve Dolaz, 2021).

### **Sonuç ve Öneriler**

Günümüzde muhasebe ve denetimin teknoloji ile entegrasyonu geçmiş yıllara göre çok daha hızlı bir şekilde devam etmektedir. Sürekli güvence denetimi ve bilgisayar destekli muhasebe denetim süreçleri ise, iç ve dış (bağımsız) denetim faaliyetleri sırasında işletmelerde olabilecek hata ile hilelerin belirlenip önlenmesinde büyük bir öneme sahiptir. Sürekli güvence denetimi ve bilgisayar destekli muhasebe denetim süreçleri, hataları ile hileleri sıfırlayamaz ve riskleri tamamen bertaraf edemez. Fakat, bu hususlarda büyük avantajlar sunmaktadır. Bilgisayar destekli muhasebe denetim süreçlerinin son yıllarda daha da işlerlik kazanarak uygulama sahasının genişlemesi, teknolojinin hızla gelişimi ile küreselleşmenin bir sonucudur. Covid-19 dönemi ise bu süreci hızlandırmıştır. Muhasebe ve denetimin yanında, iç kontrol de her geçen gün klasik kimliğinden uzaklaşarak yeniden şekillenmektedir. Muhasebe, denetim ve iç kontrol alanlarında yeni trendler gözlemlenmektedir. Son olarak, günümüzde işletmeler denetimde büyük veri analizine yönelik çalışmalara yatırım yapmak ve veri analistlerine istihdam sağlamak zorundadırlar. Gelecek çalışmalarda, yapay zeka uygulamalarının gelişmesi sebebi ile iç ve dış (bağımsız) denetimde robotik, makine öğrenmesi veya derin öğrenme tekniklerinin denetim kalitesi ile güvencesine etkileri incelenebilir. Güncel programlar (yazılımlar), programlama dilleri ve denetime yönelik araç setleri mercek altına alınabilir. Aynı zamanda, işletmeler üzerinde uygulama ve örneklere odaklanılabilir.

**Özet**

**Amaç:** Araştırma kadınların jinekolojik kanserlere yönelik farkındalıklarını belirlemek amacıyla yapılmıştır. **Gereç ve Yöntem:** Araştırma analitik-kesitsel olarak, Aralık 2020-Aralık 2021 tarihleri arasında, Denizli il merkezine bağlı 65 adet Aile Sağlığı Merkezine kayıtlı olan 20-65 yaşları arasındaki 650 kadınla yürütülmüştür. Araştırmanın verileri Tanıtıcı Bilgi Formu ve Jinekolojik Kanserler Farkındalık Ölçeği kullanılarak toplanmıştır. Araştırma verileri Statistical Package For Social Science (SPSS) 25.0 paket programı ile analiz edilmiştir. Verilerin değerlendirilmesinde tanımlayıcı istatistikler, değişkenlerin karşılaştırılmasında Pearson ki-kare, Mann Whitney U, One Way ANOVA ve Kruskal Wallis testleri ile post-hoc analizinde Bonferroni testi kullanılmıştır. **Bulgular:** Kadınların yaş ortalaması 41,06±12,15, %37,80'i ilkokul mezunu, %57,70'i bir işte çalışmaktadır. Jinekolojik Kanserler Farkındalık Ölçeği toplam puan ortalaması 158,34±16,84, "Jinekolojik Kanserlerde Erken Tanı ve Bilgi Farkındalığı" alt ölçek puan ortalaması 17,30±2,09, "Jinekolojik Kanser Riskleri Farkındalığı" alt ölçek puan ortalaması 29,97±4,93, "Jinekolojik Kanserlerden Korunma Farkındalığı" alt ölçek puan ortalaması 23,80±3,32, "Jinekolojik Kanserlerde Rutin Kontrol ve Ciddi Hastalık Algısı Farkındalığı" alt ölçek puan ortalaması 87,28±12,10 olarak bulunmuştur. Kadınların jinekolojik kanserlere yönelik farkındalıklarını yaş, eğitim, çalışma durumu, sosyal güvence, gebelik sayısı, menopoz durumu, kanserlere ilişkin bilgi sahibi olması, tarama testi yaptırma durumunun etkilediği tespit edilmiştir (p<0,05). **Sonuç:** Bu çalışmadaki kadınların jinekolojik kanserlere yönelik farkındalıklarının sosyo-demografik ve jinekolojik-obstetrik özelliklerinden etkilendiği tespit edilmiştir. Kadınların jinekolojik kanserlere yönelik farkındalığını artırmak için toplumdaki kadınların statüsünün artırılması ve sağlıklı yaşama yönelik davranışların kazandırılması gerekmektedir.

**Anahtar kelimeler:** Ebe, Farkındalık, Jinekolojik kanser, Kadın, Kanser tarama.

**WOMEN'S AWARENESS TOWARDS GYNECOLOGICAL CANCERS: THE  
EXAMPLE OF DENIZLI PROVINCE**

**Abstract**

**Objective:** The research was conducted to determine women's awareness of gynecological cancers. **Materials and Methods:** The research was conducted analytically-cross-sectionally with 650 women aged 20-65 who were registered in 65 Family Health Centers in Denizli city center between December 2020 and December 2021. The data of the study were collected using the Introductory Information Form and the Gynecological Cancers Awareness Scale. Research data were analyzed with the Statistical Package for Social Science (SPSS) 25.0 package program. Descriptive statistics were used to evaluate the data, Pearson chi-square, Mann Whitney U, One Way ANOVA and Kruskal Wallis tests were used to compare variables, and Bonferroni test was used for post-hoc analysis. **Results:** The mean age of women is  $41,06 \pm 12,15$ , %37,80 of them are primary school graduates, %57,70 of them are working in any job. Gynecological Cancers Awareness Scale total score average is  $158,34 \pm 16,84$ , "Early Diagnosis and Information Awareness in Gynecological Cancers" subscale score average is  $17,30 \pm 2,09$ , "Gynecological Cancer Risk Awareness" subscale score average is  $29,97 \pm 4,93$  The mean score of "Awareness of Prevention from Gynecological Cancers" was  $23,80 \pm 3,32$ , and the mean score of "Awareness of Routine Control in Gynecological Cancers and Perception of Severe Disease Perception" was  $87,28 \pm 12,10$ . It has been determined that women's awareness of gynecological cancers is affected by age, education, employment status, social security, number of pregnancies, menopause status, having knowledge about cancers, and having a screening test ( $p < 0.05$ ). **Conclusion:** The women in this study's awareness of gynecological cancers it has been determined that socio-demographic and gynecological-obstetric characteristics affect. In order to increase women's awareness of gynecological cancers, it is necessary to increase the status of women in the society and to gain healthy lifestyle behaviors.

**Keywords:** Awareness, Cancer screening, Gynecological cancer, Midwife, Woman.

## **Giriş**

Kadınları etkileyen sağlık ile ilgili problemler sadece kadınları değil aile bireylerini ve içinde yaşadığı toplumu da yakından etkilemektedir. Jinekolojik kanserler tıpta bilimsel ilerlemeler olmasına rağmen dünyanın ve ülkemizin en önemli sağlık sorunlarından biri olup, insidans hızının artış göstermesi ile gündemdeki yerini korumaktadır (Sağlık İstatistikleri Yıllığı, 2020; THSK Kanser Daire Başkanlığı, 2021). Jinekolojik kanserler kadınların mortalite ve morbidite hızını etkilemektedir. Jinekolojik kanserler bireylerde sakatlıklara, ekstremitte kayıplarına, ruhsal çöküntülere neden olmakta ve iş veriminin düşmesini etkilemektedir. Jinekolojik kanser tedavilerinin pahalı olması ve sürecin uzun sürmesi ise ülke ekonomisi açısından önemli bir sorun teşkil etmektedir (Erdem ve diğerleri, 2017; Ismail ve diğerleri, 2017). Jinekolojik kanserlerin prevalansının belirlenmesi, neden olan risk faktörlerinin bilinerek saptanması, korunma yolları ve uygun tedavi protokollerinin geliştirilmesinin önemi gün geçtikçe artmaktadır (Sağlık İstatistikleri Yıllığı, 2020; THSK Kanser Daire Başkanlığı, 2021; The Global Cancer Observatory, 2021). Dünyada jinekolojik kanser yükü giderek artmakta olup, orta ve düşük gelirli ülkeleri daha fazla etkilemektedir. Bu durumda orta ve düşük gelirli ülkelerde jinekolojik kanserlerin önüne geçmek daha da önemli hale gelmektedir (THSK Kanser Daire Başkanlığı, 2021). Uluslararası Kanser Araştırma Ajansı (IARC) tarafından yayınlanan Global Cancer Statistics (GLOBOCAN) 2020 verilerine göre dünyada kadınlarda jinekolojik kanserlerin görülme sıklığı en fazla serviks, uterus ve over kanseri şeklinde bulunmuştur (The Global Cancer Observatory, 2021). Ülkemizde beş yılda bir yayınlanan 2017 yılında yapılan “Türkiye Kanser İstatistikleri” verilerine göre kadınlarda jinekolojik kanserlerden uterus korpusu % 5,6 ile 5. sırada, over kanseri % 3,3 ile 7. sırada, serviks kanseri %2,3 ile 9. sırada yer almaktadır (Sağlık İstatistikleri Yıllığı, 2020). Jinekolojik kanserlerdeki risk faktörleri kanserin türüne ve kişiye göre farklılık gösterebilmektedir. Yaş, zararlı madde kullanımı (alkol, sigara vb.), hormonal, çevresel ve bireysel faktörler, kilolu olmak, aile öyküsü, sedanter (hareketsiz) yaşam, Human Papilloma Virüs (HPV) enfeksiyonu, onkolojik virüsler, sosyo-ekonomik düzey kişilerde jinekolojik kanserlere zemin hazırlamaktadır (Alp Dal ve Ertem, 2017; Aydoğdu ve Özsoy, 2018; Rieck ve Fiander, 2006). Yaş kontrol edilemeyecek bir risk faktörü iken diğer risklerden korunabilmek ise mümkündür (Alp Dal ve Ertem, 2017). Jinekolojik kanserlerin önlenmesinde birincil, ikincil ve üçüncül koruma yöntemleri dikkate alınmalıdır. Birincil korunmada jinekolojik kanserlere yönelik bireylere farkındalık kazandırmak önemlidir. Kanser kontrol programında ebeler jinekolojik kanserlerden korunmada, taramalarda, erken tanıda aktif rol oynamaktadır. Ebelerin birincil korumadaki

görevi jinekolojik kanserlere yönelik farkındalık oluşturarak kadınlara davranış değişikliği kazandırmaktır (Dal ve diğerleri, 2020). Ebeler kadınlara farkındalık oluşturmak için eğitici, danışman, rahatlatıcı, bakım verici, araştırmacı rollerini aktif kullanmalıdır (Gedük, 2018). Bu rollerin ışığında ebeler gerekli eğitimleri planlayarak jinekolojik kanserlerden korunmak için neler yapılacağı, risk faktörleri, sağlıklı yaşam şekli, erken tanı ve tedavinin önemini vurgulamalıdır (Dal ve diğerleri, 2020; Eroğlu ve Koç, 2014). Jinekolojik kanserden korunmada, risk altındaki kadınların saptanması ve erken tanı önemlidir. Erken tanı, hastalığın klinik belirtileri görülmediği dönemde teşhis edilmesidir. Erken tanının amacı, hastalığın erken teşhisi ile vücutta yayılmanın önüne geçilerek, tedavinin başarılı olması için zaman kazanmayı sağlamaktır. Ebeler risk altındaki kadınları daha dikkatli gözlemleyerek kendi sağlığı ile ilgili sorumluluk almasını, vücudundaki değişimleri erken fark etmesini sağlamalıdır (Açıkgöz ve diğerleri, 2011; Özçam ve diğerleri, 2014). Jinekolojik kanserlere yönelik risk faktörlerinin değiştirilebilenler (sağlıklı beslenmek, aile planlaması yöntemi kullanmak, HPV enfeksiyonu, sigara ve alkol kullanmamak) ve değiştirilemeyenler (yaş, genetik, aile geçmişi) üzerine odaklanmak farkındalık için önemlidir. Jinekolojik kanserden korumak için değiştirilebilen risk faktörlerine yönelik sağlık algısının artırılması gereklidir. Değiştirilemeyecek risk faktörlerini bilmek jinekolojik kanserlerin erken tespitinde ve jinekolojik kanser taramalarında önemli yer tutmaktadır (Kaya ve diğerleri, 2021). Kadınların jinekolojik kanserlerden korunmalarının en etkin yolu erken tanı ve taramalarını zamanında yaptırmalarıdır. Literatürde, kadınların jinekolojik kanserlere yönelik farkındalıklarını etkileyen faktörler konusu ile ilgili sınırlı sayıda çalışma olduğu görülmüş ve yapılan çalışmaların çoğunlukla serviks kanseriyle ilgili çalışmalar olduğu dikkat çekmektedir. Kadınların jinekolojik kanserlere yönelik farkındalıklarının belirlenmesi ve farkındalıklarını artırmaya yönelik öneriler sunulmasını amaçlayan çalışmalara ihtiyaç olduğu saptanmış ve bu çalışmanın yapılmasına karar verilmiştir. Çalışmamızın sonucundaki verilerin bilime katkı sağlayarak ebelerin eğitici ve danışman rollerini tekrar gözden geçirmelerini ve sağlık kurumlarındaki yöneticilerin kararlarına yardımcı olabileceği düşünülmektedir.

## **Gereç ve Yöntem**

### **Araştırmanın Tipi**

Araştırma analitik-kesitsel olarak yapılmıştır.

### **Araştırmanın Evreni ve Örneklemi**

Araştırma evrenini, Denizli ili merkezinde yaşayan 20-65 yaşları arasındaki 199 877 kadın oluşturmuştur. Araştırmanın örneklemini ise evreni belirli örneklem yöntemine göre %99

güven aralığında, kabul edilebilir hata 0,05 ve N=199877 evren sayısı ile hesaplandığında 540 bulunmuştur. Araştırma olası vaka kayıpları (yaklaşık %15) dikkate alınarak 650 kadın ile tamamlanmıştır. Araştırma Aralık 2020- Aralık 2021 tarihleri arasında, Denizli İl Sağlık Müdürlüğü'ne bağlı 65 adet Aile Sağlığı Merkezine (ASM) kayıtlı, 20-65 yaşları arasında, ilkököl ve daha fazla eğitimi olan 650 kadınla yürütülmüştür. Araştırmanın tüm Denizli il merkezini kapsamı bakımından her ASM'den 10'ar kadına ulaşılmıştır.

### **Araştırma Verilerinin Toplanması**

#### **Veri Toplama Araçları**

Araştırmada kadınların özelliklerini belirlemek için Tanıtıcı Bilgi Formu ve Jinekolojik Kansere Yönelik Farkındalık Ölçeği (JİKFÖ) kullanılmıştır.

#### **1. Tanıtıcı Bilgi Formu**

Araştırmada konu ile ilgili literatürden faydalanılarak "Tanıtıcı Bilgi Formu" oluşturulmuştur. Bu form araştırmacı tarafından hazırlanmıştır. Formda kadınların sosyo-demografik özelliklerini içeren 8 soru, (yaş, eğitim durumu, çalışma durumu, mesleği, eşinin eğitim durumu, eşinin mesleği, gelir gider durumu, sosyal güvencesi) obstetrik öykülerini içeren 12 soru, (gebelik sayısı, doğum sayısı, kaçınıcı evliliği, evlilik süresi, ilk evlenme yaşı, ilk cinsel ilişki yaşı, ilk adet yaşı, ilk gebelik yaşı, menopoz durumu, kullandığı aile planlaması yöntemi) kansere yönelik 11 soru olmak üzere toplam 39 sorudan oluşmaktadır (Dal ve Ertem, 2017; Şirin ve Kavlak, 2015; Taşkın, 2016). Bu form araştırmaya katılan kadınlarla yüz yüze görüşülerek araştırmacı tarafından doldurulmuştur.

#### **2. Jinekolojik Kansere Yönelik Farkındalık Ölçeği**

Jinekolojik Kansere Yönelik Farkındalık Ölçeği (JİKFÖ) Dal ve Ertem (2017) tarafından 20-65 yaş arası evli kadınların jinekolojik kansere ilişkin farkındalıklarını değerlendirmek amacıyla geliştirilmiştir (Dal ve Ertem, 2017). Geçerli, güvenilir olduğu saptanan JİKFÖ 41 maddeden ve dört alt boyuttan oluşan 5'li likert tipte bir ölçektir. Ölçekte her soru maddesi için kadınların "Kesinlikle Katılmıyorum", "Katılmıyorum", "Kararsızım", "Katılıyorum", "Kesinlikle Katılıyorum" seçeneklerinden kendisine uygun olan seçeneği işaretlenmesi beklenmektedir. Ölçeğin alt boyutları ve ilgili maddeleri aşağıda verilmiştir:

Jinekolojik Kansere Riskleri Farkındalığı: 3, 4, 5, 6, 7, 8, 9, 10, 11. Maddeleri

Jinekolojik Kanserde Erken Tanı ve Bilgi Farkındalığı: 1, 2, 12, 13. Maddeleri

Jinekolojik Kansere Korunma Farkındalığı: 14, 15, 16, 17, 18, 19. maddeleri

Jinekolojik Kanserde Rutin Kontrol ve Ciddi Hastalık Algısı Farkındalığı: 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41. maddeleri kapsamaktadır.

Ölçek değerlendirilirken en düşük puan 41, en yüksek puan 205'tir. Araştırmaya katılanların ölçek puanlarının yüksek olması farkındalık düzeylerinin de yüksek olduğunu göstermektedir. Bu ölçeğin bir kesme değeri bulunmamakta olup, kadınların JİKFÖ 'inden aldıkları puan arttıkça farkındalıkları artmaktadır. Bu formu araştırmaya katılanların kadınların kendileri tarafından doldurmuştur. Dal (2017)'in çalışmasında JİKFÖ'nin cronbach alpha değeri 0,944 olup, çalışmamızda 0,927, "Jinekolojik Kanser Riskleri Farkındalığı" alt boyutunun cronbach alpha değeri 0,843 iken, çalışmamızda 0,753, "Jinekolojik Kanserlerden Korunma Farkındalığı" alt boyutunun cronbach alpha değeri 0,778 çalışmamızda 0,551, "Jinekolojik Kanserlerde Erken Tanı ve Bilgi Farkındalığı" alt boyutunun cronbach alpha değeri 0,708, çalışmamızda 0,676, "Jinekolojik Kanserlerde Rutin Kontrol ve Ciddi Hastalık Algısı Farkındalığı" alt boyutunun cronbach alpha değeri 0,979 çalışmamızda 0,939 olarak bulunmuştur (Dal ve Ertem, 2017).

#### **Verilerin Değerlendirilmesi**

Araştırmadan elde edilen veriler, SPSS paket programı (Statistical Package for Social Sciences; IBM SPSS Statistics for Macintosh, Armonk, NY) versiyon 25,0 kullanılarak analiz edilmiştir. Çalışmada tanımlayıcı analizler; kategorik verilerde sayı (n) ve yüzde (%) olarak, sürekli verilerde ise ortalama±standart sapma (ort±standart sapma) olarak gösterilmiştir. Sürekli değişkenlerin normal dağılıma uygunluğu Kolmogorov-Smirnov testi ile değerlendirilmiştir. Normal dağılmayan değişkenlerin iki grupta karşılaştırılmasında Mann Whitney U-testi kullanılmıştır. İki'den fazla grup karşılaştırılmasında parametrik değişkenlerde One Way ANOVA testi, nonparametrik değişkenlerde Kruskal Wallis testi kullanılmıştır. Birden fazla olan grup karşılaştırmalarında anlamlı farkın hangi gruptan kaynaklandığını belirlemek için Bonferroni testi kullanılmıştır. Analizlerde istatistiksel anlamlılık düzeyi  $p<0,05$  olarak kabul edilmiştir.

#### **Araştırmanın Etik Yönü**

Araştırma Helsinki Deklarasyonu maddeleri dikkate alınarak yapılmıştır. Araştırma için Aydın Adnan Menderes Üniversitesi Sağlık Bilimleri Fakültesi Girişimsel Olmayan Klinik Araştırmalar Etik Kurulundan ön onay (Sayı: 03/03/2020-E.15229, Protokol No: 2020/012) alınmıştır. Araştırmanın Denizli İl Sağlık Müdürlüğüne bağlı Denizli merkezinde bulunan ASM'lerde yürütülebilmesi için yazılı izin alınmıştır. Araştırmada kullanılan JİKFÖ için Doç. Dr. Nursel Alp Dal'dan e-posta yoluyla iletişime geçilerek izin alınmıştır. Araştırmaya dahil edilen kadınlara çalışma ile ilgili bilgi verilmiş, sözlü ve yazılı onamları alınmıştır.

**Araştırmanın Sınırlılıkları**

Araştırma araştırmaya katılan kadınları temsil etmektedir.

**Araştırmanın Güçlükleri**

Araştırmanın veri toplama süreci Covid-19 pandemisinden etkilenmiş ve poliklinik hizmetlerinde esnek mesaiye geçilmesi, formları doldururken ASM'lerin kalabalık olması, gürültü olması, sosyal mesafeyi koruyarak iletişim kurmaya çalışmak, poliklinik sırası gelenlerin formu doldurmak istememeleri sorulara cevap vermeyi zorlaştırmıştır.

**Bulgular**

**Tablo 1:** Kadınların tanıtıcı özelliklerine göre dağılımı (n= 650)

Sosyo-demografik özellikler	Sayı (n)	Yüzde (%)
<b>Yaş ortalaması: 41,06±12,15 (min=20 max=65)</b>		
<b>Yaş grupları</b>		
20-29	145	22,30
30-39	162	25,00
40-49	166	25,50
50-65	177	27,20
<b>Beden kitle indeksi</b>		
Zayıf (<18,5)	21	3,20
Normal (18,5-24,9)	247	38,00
Fazla kilolu (25,0-29,9)	256	39,40
Obez (>30)	126	19,40
<b>Eğitim durumu</b>		
İlkokul	246	37,80
Ortaokul	93	14,30
Lise	119	18,30
Üniversite	158	24,30
Lisansüstü Eğiti	34	5,30
<b>Çalışma durumu</b>		
Evet	375	57,70
Hayır	275	42,30
<b>Meslek</b>		
Ev hanımı	270	41,50
İşçi	125	19,20
Memur	101	15,60
Serbest Meslek	89	13,70
Diğer (temizlikçi, kasiyer, güvenlikçi vb)	65	10,00
<b>Sosyal Güvence Durumu</b>		
Var	589	90,60
Yok	61	9,40
<b>Toplam gebelik sayısı ortalaması: 2,18±1,68 (min=0 max=10)</b>		
<b>Toplam gebelik sayısı (n=524)</b>		
1	96	18,32
2	179	34,16
3 ve üzeri	249	47,52
<b>Menopoz yaş ortalaması (n=177): 48,33 ±3,88 (min=33 max=56)</b>		
<b>Menopoza girme durumu</b>		
Evet	177	27,20
Hayır	473	72,80

<b>Tarama testi yaptırma durumu</b>		
Evet	188	28,90
Hayır	462	71,10

Kadınların tanıtıcı özelliklerine göre dağılımı incelendiğinde yaş ortalamaları 41,06±12,15 yıl ve %27,20'si 50 yaş ve üzeri olduğu belirlenmiştir. Beden kitle indeksine göre yapılan

sınıflandırmada kadınların en çok %39,40 ile fazla kilolu grupta yer aldığı tespit edilmiştir. Kadınların eğitim durumlarına bakıldığında %37,80'i ilkokul mezunu ve %24,30 üniversite mezunudur. Çalışmamızdaki kadınların %57,70'i aktif olarak çalışırken, %42,30'u çalışmamaktadır. Kadınların %90,60'nın sosyal güvencesi olup, %19,20'sinin işçi, %15,60'nın memur olarak çalıştığı belirlenmiştir. Kadınların toplam gebelik sayısı ortalaması  $2,18 \pm 1,68$  yıl olarak bulunmuştur. Kadınların %34,61'inin üç ve üzeri gebeliği bulunmaktadır. Menopoza giren kadınların (n=177) menopoza girme yaş ortalaması  $48,33 \pm 3,88$  yıldır. Kadınların %60,00'ı aile planlaması yöntemi kullanmaktadır. Kadınların, %68,00'nin kansere ilişkin bilgilerinin olduğu saptanmıştır. Kadınların %78,50'si hangi kanser türlerine ilişkin tarama testleri yapıldığını bildiklerini ifade etmişlerdir. Kadınların %71,10'u herhangi bir tarama yaptırmamışken, %28,90'ı ise tarama yaptırdığını belirtmiştir.

**Tablo 2:** Kadınların JİKFÖ toplam ve alt ölçeklerinden almış olduğu puanlar (n= 650)

JİKFÖ ve Alt Ölçekler	Ortalama	SS*	Çalışma Min-Max	Ölçek Min-Max	Cronbach's Alpha
Jinekolojik kanserlerde erken tanı ve bilgi farkındalığı alt ölçeği	17,30	2,09	10-20	4-20	0,676
Jinekolojik kanser riskleri farkındalığı alt ölçeği	29,97	4,93	14-45	9-45	0,753
Jinekolojik kanserlerden korunma farkındalığı alt ölçeği	23,80	3,32	9-30	6-30	0,551
Jinekolojik kanserlerde rutin kontrol ve ciddi hastalık algısı farkındalığı alt ölçeği	87,28	12,10	52-110	22-110	0,939
JİKFÖ toplam puanı	158,34	16,84	108-204	41-205	0,927

\* Standart Sapma

Tablo 2'de kadınların toplam JİKFÖ ve alt ölçeklerinden almış oldukları puanlar verilmiştir. Buna göre kadınların JİKFÖ toplam puanlarının ortalaması  $158,34 \pm 16,84$  olup, en düşük puan 108 en yüksek puan 204 olarak hesaplanmıştır. JİKFÖ'nin "Jinekolojik Kanserlerde Erken Tanı ve Bilgi Farkındalığı" alt ölçeğine bakıldığında ortalama puanları  $17,30 \pm 2,09$  ve en küçük puan 10 iken en yüksek puan 20 olduğu görülmüştür. "Jinekolojik Kanser Riskleri Farkındalığı" alt ölçeğinde kadınların ortalama puanlarının  $29,97 \pm 4,93$ , en küçük puan 14, en yüksek puan 45'tir. "Jinekolojik Kanserlerden Korunma Farkındalığı" alt ölçeği ortalama puanları

VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES

April 09-16, 2024 / Lisbon, Portugal

23,80±3,32, en küçük puan 9, en büyük puan 30 olarak bulunmuştur. “Jinekolojik Kanselerde Rutin Kontrol ve Ciddi Hastalık Algısı Farkındalığı” alt ölçeği ortalama puanları 87,28±12,10 en küçük 52 iken en yüksek puanın 110 olduğu hesaplanmıştır.

Tablo 3: Kadınların Tanıtıcı Özelliklerine göre JİKFÖ Puan Ortalamalarının Karşılaştırılması

Kadınların yaş gruplarına göre yapılan karşılaştırmada JİKFÖ toplam ölçek puanı, “Jinekolojik Kanserlerden Korunma Farkındalığı ve “Jinekolojik Kanserlerde Rutin Kontrol ve Ciddi Hastalık Algısı Farkındalığı” alt ölçek puanları arasında anlamlı farklılık mevcuttur (p değerleri sırasıyla p= 0,001, p= 0,011 ve p= 0,001). Yaş grupları açısından anlamlı farklılık saptanan gruplarda, farklılığın hangi gruplardan kaynaklandığını tespit etmek üzere post-hoc analiz yapılmıştır. Buna göre JİKFÖ toplam puanı için gruplar arası farklılık, 50-65 yaşları arasındaki kadınların aldıkları düşük puanlardan kaynaklanmıştır. Kadınların eğitim durumuna göre yapılan karşılaştırmada kadınların eğitim durumu ilkokuldan lisansüstü eğitime doğru arttıkça JİKFÖ toplam puanında anlamlı düzeyde artış görülmektedir (p= 0,001). Post-hoc analizi sonucunda farklılık nedeni eğitim durumu ilkokul olan gruptaki kadınların aldıkları düşük puanlardan kaynaklandığı görülmüştür. Çalışan gruptaki kadınların JİKFÖ toplam ve alt ölçek puanları anlamlı oranda daha yüksek olarak bulunmuştur. Sosyal güvencesi olan kadınların “Jinekolojik Kanserlerden Korunma Farkındalığı” alt ölçeği haricindeki bütün alt ölçekler ve JİKFÖ toplam puanlarının sosyal güvencesi olmayan kadınlara kıyasla anlamlı oranda daha yüksek bulunmuştur (sırasıyla p<0,001, p<0,001, p= 0,006 ve p<0,001). Gebelik sayısı arttıkça JİKFÖ toplam puanı, ilk iki alt ölçekte “Jinekolojik Kanserlerde Erken Tanı ve Bilgi Farkındalığı” ve “Jinekolojik Kanser Riskleri Farkındalığı” puanları anlamlı oranda azalmaktadır (p değerleri sırasıyla p= 0,001, p= 0,002, p= 0001). Post-hoc analizleri sonucunda farklılığın üç ve üzeri gebeliği olan kadınların puanlarının düşük olmasından kaynaklandığı saptanmıştır. Menopoza giren kadınların JİKFÖ toplam ölçek puanı, “Jinekolojik Kanserlerden Korunma Farkındalığı” ve “Jinekolojik Kanserlerde Rutin Kontrol ve Ciddi Hastalık Algısı Farkındalığı” alt ölçek puanları, menopoza girmemiş kadınlardan anlamlı oranda daha yüksektir (p değerleri sırasıyla p= 0,001, p= 0,013 ve p= 0,001). Kansere ilişkin bilgisi olan

kadınların “Jinekolojik Kanselerde Erken Tanı ve Bilgi Farkındalığı” alt ölçeği hariç tüm alt ölçek puanları ile JİKFÖ toplam ölçek puanı anlamlı olarak daha yüksek saptanmıştır. Kansere yönelik tarama testi yapıldığını bilen kadınların, “Jinekolojik Kanselerde Erken Tanı ve Bilgi Farkındalığı” hariç tüm alt ölçekler ile JİKFÖ toplam puanı anlamlı olarak daha yüksek bulunmuştur. Kansere taraması yaptıran kadınların JİKFÖ puanları daha yüksektir.

#### **4. Tartışma**

Kadınların jinekolojik kansere yönelik farkındalıkları arttırmak için kansere neden olan risk faktörlerini bilmeleri ve taramalara katılmaları önemlidir ((THSK Kansere Daire Başkanlığı, 2021). Yapılan çalışmada 40-49 yaşları arasındaki kadınların jinekolojik kansere yönelik farkındalık puanları yüksek bulunmuştur. Yapılan araştırmaların sonucunda kadınların jinekolojik kansere yönelik farkındalıklarının farklı yaş aralıklarında yüksek olduğu saptanmıştır (Atlas, 2020; Dal, 2022; Gözüyeşil ve diğerleri, 2020; Kaya Şenol ve diğerleri, 2021). Gözüyeşil ve diğerlerinin (2020) çalışmasında 30-39 yaş aralığındaki kadınların, Kaya Şenol ve diğerlerinin (2021) çalışmasında 36-50 yaşları arasındaki kadınların, Atlas ve Güneri (2022)'nin çalışmasında 18-29 yaşları arasındaki kadınların, Atlas (2020)'in çalışmasında 29 yaşından küçük kadınların jinekolojik kansere yönelik farkındalık puanları yüksek olarak saptanmıştır. Teşkereci ve diğerlerinin (2021) çalışmasında jinekolojik kansere yönelik farkındalık puanlarının yaş ile birlikte arttığı sonucuna ulaşmışlardır. Fonnes ve diğerlerinin (2021) yaptığı çalışmada kadınların serviks kanserine yönelik farkındalık düzeylerinin 18-29 yaşları arasında en yüksek olduğu bulunmuştur. Yaşlar arasındaki jinekolojik kansere yönelik farkındalık puanlarındaki değişikliğin nedeni bölgesel kaynaklı olabilir. Karşılaştırılan çalışmalarda kadınların sosyo-demografik özelliklerinin farklı olması farklı yaş aralığındaki kadınların farkındalıklarının yüksek olduğunu göstermektedir.

Yaptığımız çalışmada kadınların eğitim durumunun artması ile JİKFÖ puanlarının arttığı görülmektedir. Çelebi (2021)'nin ve Dal (2022)'in çalışması çalışmamızla benzerlik göstermektedir. Öz (2021)'ün çalışmasında üniversite mezunu olan kadınların JİKFÖ ve alt ölçek puanları daha yüksek bulunmuştur. Yurtdışı çalışmalarında eğitim durumu ile serviks kanseri farkındalığı arasında anlamlı bir ilişki saptanmıştır (Gyamfua ve diğerleri, 2019; Mbachu, ve diğerleri, 2017; Moshi ve diğerleri, 2018). Nijerya'da yapılan çalışmada yüksek eğitim düzeyine sahip kadınların, yumurtalık kanseri risk faktörleri ve semptomları hakkında daha bilgili olduğu bulunmuştur (Okunowo ve Adaramoye, 2018). Eğitim düzeyi yüksek kadınların sağlıkla ilgili konuları daha fazla araştırarak doğru bilgilere ulaştığı ve ulaştığı bilgileri daha iyi anladığı söylenilebilir.

Çalışmamızdaki çalışan kadınların JİKFÖ toplam ve alt ölçek puanları anlamlı oranda yüksek bulunmuştur. Yapılan çalışmaların sonucu benzer olup, çalışma hayatı olan kadınların JİKFÖ toplam ve alt ölçek puanlarının yüksek olduğu saptanmıştır (Atlas ve Güneri, 2022; Kaya Şenol ve diğerleri, 2021; Öz, 2021). Nijerya’da yapılan çalışmada çalışan kadınların yumurtalık kanseri semptomları ve risk faktörleri konusunda daha fazla bilgi sahibi olduğu görülmüştür (Okunowo ve Adaramoye, 2018). İş ortamındaki kadınların iletişim içinde olmaları sağlık arayışlarını arttırarak jinekolojik kanserlere yönelik farkındalık konusunda birbirlerini olumlu yönde etkilediği düşünülebilir. Sosyo-demografik durumu iyi olan kadınların hastanelere veya özel kliniklere kolay gidebilecek olması farkındalığı arttırabilir.

Çalışmamızda sosyal güvencesi olan kadınların JİKFÖ puanları yüksektir. Şahin (2009)’in çalışmasında sosyal güvencesi emekli sandığı olan bireylerin jinekolojik kanserlerle ilgili bilgi puanları yüksek bulunmuştur. Akkoyun (2020)’un çalışmasında sosyal güvencesi olan kadınların kadın üreme organları kanserlerinden korunmaya ilişkin bilgi düzeyleri sosyal güvencesi olmayanlardan yüksek bulunmuştur. Sosyal güvencesi olmayan kadınların ücret karşılığı muayene olması, herhangi bir semptom varlığında direkt doktora gitmeyi ertelemesine neden olarak farkındalığı etkileyebilir.

Sosyo-ekonomik durum jinekolojik kanserlerde insidans ve sağ kalım hızını etkilemektedir. Sosyo-ekonomik durum, kadınların sağlık hizmetlerine ulaşımını, sağlık ve kanser hakkında farkındalığını, belirtileri zamanında çözümleyebilmesini, yaşam şeklini, ek hastalıklarını etkileyerek kanserler için risk faktörü oluşturmaktadır (Booth ve diğerleri, 2010). Avustralya’da 2001-2015 yılları arasında kansere yakalanan kadınların incelendiği bir çalışmada; kırsal kesimde yaşayan gelir durumu düşük olan kadınlarda yumurtalık, serviks, uterus kanserlerinden ölümlerin yüksek olduğu sonucuna ulaşılmıştır (Afshar ve diğerleri, 2020). Amerika Birleşik Devletleri, Yeni Zelanda ve Danimarka’da yapılan çalışmalardan elde edilen bulgular Afshar ve diğerlerinin çalışması ile tutarlıdır (Dalton ve diğerleri, 2019; Singh ve Jemal, 2017; Soeberg ve diğerleri, 2015). Çalışmamızda çalışan ve sosyal güvencesi olan kadınların farkındalıkları daha yüksek bulunmuştur. Gelir durumu iyi olan kadınların finansal durum sağlık hizmetlerine erişimi attırması sebebiyle JKFÖ’nün yüksek olması ön görülen bir durumdur.

Çalışmamızdaki toplam gebelik sayısı arttıkça JİKFÖ toplam puanı, “Jinekolojik Kanserlerde Erken Tanı ve Bilgi Farkındalığı” ve “Jinekolojik Kanser Riskleri Farkındalığı” alt ölçek puanları azalmaktadır. Atlas ve Güneri (2022)’nin çalışmasında gebelik sayısı 1-2 olan kadınların JİKFÖ puanları yüksek bulunmuştur (20). Dal (2022) ve Atlas (2020)’in çalışmaları

benzer olup; 2 ve altı gebeliği olan kadınların, 3 ve üstünde gebeliği bulunan kadınlara göre JİKFÖ puanları anlamlı olarak daha yüksek bulunmuştur. Gebelik sayısının fazla olması farkındalığı ters yönde etkilemektedir.

Çalışmamızda JİKFÖ puanı menopoza girmemiş kadınlardan anlamlı oranda daha yüksektir. Yapılan bazı çalışmalar çalışmamızla benzerlikler göstermektedir (Atlas, 2020; Dal, 2022; Kaya Şenol ve diğerleri, 2021). Gözüyeşil (2020)'in çalışmasında menopozdaki kadınların puanları arasında fark bulunmamıştır. Öz (2021)'ün çalışmasında menopozda olan kadınların "Jinekolojik Kanser Riskleri Farkındalığı" alt ölçek puanu yüksek, Gökgez ve Aktaş (2015)'in çalışmasında menopozda olan kadınların serviks kanserine yönelik taramalar konusunda farkındalıklarının yüksek olduğu saptanmıştır. Öztürk ve diğerlerinin (2021) çalışmasında menopozal dönemdeki kadınların jinekolojik kanser farkındalığı yüksek olmasına rağmen yeterli bilgi sahibi olmadıkları, tarama ve korunma yöntemlerine uymadıkları ve sağlıklı yaşama yönelik alışkanlıkları orta düzeyde bulunmuştur. Çalışmalardaki farklılığın sebebi bölgesel kaynaklı ve sosyo-demoğrafik özelliklerinin farklılığından kaynaklı olabilir.

Çalışmamızda kansere ilişkin bilgisi olan kadınların, Jinekolojik Kanserde Erken Tanı ve Bilgi Farkındalığı alt ölçeği hariç tüm alt ölçek puanları ile JİKFÖ puanı anlamlı olarak daha yüksek saptanmıştır. Çalışmamız Öz (2021)'ün çalışması ile benzerdir. Jinekolojik kanserlerden korunma yolları hakkında fikri olan kadınların farkındalıkları yüksek olarak bulunmuştur (Kaya Şenol ve diğerleri, 2021). Kadınların kansere ilişkin bilgisinin olması farkındalığı pozitif yönde etkileyebilir.

Çalışmamızda hangi kanser türlerine yönelik tarama yapıldığını bilen kadınların "Jinekolojik Kanserde Erken Tanı ve Bilgi Farkındalığı" hariç tüm alt ölçekler ile JİKFÖ puanı anlamlı olarak daha yüksektir. Literatürde de kanserlere yönelik taramalar hakkında bilgisi bulunan kadınların jinekolojik kanserlere yönelik farkındalık puanları anlamlı şekilde yüksek saptanmıştır (Atlas, 2020; Çelebi, 2021; Dal, 2022). Kamboçya'da yapılan çalışmada pap smear testini bilen kadınların serviks kanserinden korunma konusunda bilgilerinin yüksek olduğu bulunmuştur ((Touch ve Kyoung Oh, 2018). Yapılan çalışmalardaki sonuçlar benzerdir.

Çalışmamızdaki kanser taraması yaptıran kadınların puanları daha yüksek saptanmış olup, düzenli pap-smear taraması yaptıran kadınların, JİKFÖ toplam ve alt ölçek puanları istatistiksel olarak daha yüksek bulunmuştur (Atlas, 2020; Çelebi, 2021; Dal, 2022; Öz, 2021). Kamboçya'da yapılan bir çalışmada pap smear tarama testini bilen kadınların serviks kanseri konusunda farkındalık ve bilgi düzeylerinin yüksek olduğu görülmüştür (38). Kansere taraması

yaptıran kadınların sağlıklarına dikkat ederek (pap-smear taraması yaptırmak) farkındalıklarını davranışlara dönüştürdükleri düşünülebilir.

Çalışmamızdaki kadınların “Jinekolojik Kanserler Farkındalık Ölçeği Ortalaması” 158,34±16,84 iken; Alp Dal ve Ertem (2017) çalışmasında 155,8±17,5, Atlas (2020)’ın çalışmasında 160,31±22,42’dir. Çelebi (2021)’nin çalışmasında 149,26±14,69, Öz (2021)’ün çalışmasında 156,3±13,81, Dal (2022)’in çalışmasında 148±25,71’dir. Çalışmamızdaki JİKFÖ’nün, “Jinekolojik Kanser Riskleri Farkındalığı” alt ölçek puanı 29,97±4,93 diğer çalışmalarda 28,01±6,69, 29,25±5,16, 30,1±5,1, 30,76±6,59, 29,25±5,16 bulunmuştur. “Jinekolojik Kanserlerden Korunma Farkındalığı” alt ölçek puanı çalışmada 23,80±3,32 iken diğer çalışmalarda 19,40±4,79, 23,02±2,97, 22,0±3,9, 23,04±4,29, 23,02±2,97 bulunmuştur. “Jinekolojik Kanserlerde Erken Tanı ve Bilgi Farkındalığı” alt ölçek puanı 17,30± 2,09 iken, diğer çalışmalarda 15,87±2,97, 16,35±1,88, 16,4±1,9, 16,76±3,29, 16,35±1,88 arasındadır. “Jinekolojik Kanserlerde Rutin Kontrol ve Ciddi Hastalık Algısı Farkındalığı” alt ölçek puanı 87,28 ±12,10 iken diğer çalışmaların puanları 80,92±16,84, 87,67±7,98, 89,74±14,11, 91,1±12,6, 87,67±7,98 arasında değişmektedir. Çalışma bulgularımızla diğer çalışma bulguları benzerlik göstermektedir.

### **5. Sonuç ve Öneriler**

Kadınların jinekolojik kanserlere yönelik farkındalıklarını; yaş, eğitim durumu, çalışma durumu, gelir durumu, sosyal güvencesi, gebelik sayısı, ,menopoz durumu, kanserlere ilişkin bilgi sahibi olması, tarama testi yaptıırma durumunun etkilediği sonucuna ulaşılmıştır.

Kadınların sosyo ekonomik, eğitim ve sağlıklı yaşama yönelik davranışları jinekolojik kanserlere yönelik farkındalıklarını etkilediği sonucundan yola çıkarak; toplumdaki kadınların statüsünün artırılması ve sağlıklı yaşam biçimi davranışlarının kazandırılması önemlidir. Jinekolojik kanser risk faktörleri, semptomları, erken tanı yöntemleri, HPV aşısı, KKVM uygulaması, jinekolojik kanserlerden korunma konusunda eksiklikleri belirlenerek bunlara uygun eğitimlerin planlanması, bu eğitimlerin farklı görsel, işitsel ve yazınsal araçlarla desteklenmesi gereklidir. Kadınlara jinekolojik kanserlere yönelik farkındalık kazandırmak için sahada çalışan ebe ve hemşirelerin uzmanlaşarak eğitici ve danışman rolünü ön planda tutularak özellikle 50 yaş ve üzerindeki kadınlara eğitim ve danışmanlık hizmetinin sunulmalıdır. Kadınların jinekolojik kanserlere yönelik farkındalıklarının belirlenmesi üzerine yapılan çalışmalar yeterli düzeyde olmayıp, yeni çalışmaların yapılması önerilebilir.

### **Çıkar çatışması**

Yazarlar herhangi bir çıkar çatışması olmadığını beyan etmişlerdir.

**Maddi destek**

Yazarlar bu çalışma için finansal destek ve bağış almadıklarını beyan etmişlerdir.

**Teşekkür**

Çalışmamıza katılan tüm kadınlara teşekkür ederiz.

### **ÖZET**

İşyerleri ile ilgili stres kaynakları içerisinde yer alan görev ve sorumlulukların belirsiz olması rol karmaşıklığına sebep olmaktadır. Çalışmanın amacı görev ve sorumluluk kavramlarına vurgu yapmak, mevzuat kapsamında yer alan hususların yetkililerce yerine getirilmesi ve uygulanmasını sağlamaktır. Nitel araştırma metodu kapsamında literatür taraması yapılarak iş sağlığı ve güvenliği kapsamında görev ve sorumluluk kavramlarının önemine dikkat çekilmiştir. Elde edilen bulgular yorumlanarak görev ve sorumluluğun iş güvenliğindeki rolü üzerinde değerlendirmeler yapılmıştır. Kişinin rol beklentilerine ilişkin bilgi sahibi olmayışı, diğer bir ifadeyle rol sonucunun ne yapılması gerektiği konusunda eksik bilgiye sahip olarak tanımlanan Rol Belirsizliği ile iki veya daha fazla rol temsiline aynı anda uymak ve başka bir rol temsiline bağlı kalmanın zor olması durumunda ortaya çıkan Rol Çatışması gibi iş güvenliği kapsamında yer alan ve stres kaynaklarının temelini oluşturan görev ve sorumluluk terimlerinin önemi vurgulanmıştır. Bu çalışmada rol karmaşasına neden olabilen görev ve sorumluluk kavramlarının yetkililerce mevzuata uygun olarak yapılması ve sınırların belirlenmesi için önerilerde bulunulmuş ve örnek bir form rehberlik etmesi için hazırlanmıştır. İş güvenliği çerçevesinde görev ve sorumluluklarının tehlike sınıfına uygun olarak yapılması ve belgelendirilmesi önem arz etmektedir. Sonuç olarak görev ve sorumlulukların tebliğ tebellüğ belgeleriyle özlük dosyalarında arşivlenmesi önerilmektedir.

**Anahtar Kelimeler:** Rol Yetersizliği, Psikososyal Risk Etmenleri, Görev ve Sorumluluk, Rol Çatışması, Rol Belirsizliği

**THE IMPORTANCE OF DUTIES AND RESPONSIBILITIES IN THE AREA OF  
HEALTH AND SAFETY AT WORK**

**ABSTRACT**

Uncertainty about duties and responsibilities, among the sources of stress in the workplace, leads to role complexity. The study aims to highlight the concepts of duty and responsibility and to ensure that the issues are met and implemented by authorities within the framework of legislation. Through a literature review using the qualitative research method, attention was drawn to the importance of the concepts of duty and responsibility in occupational health and safety. The findings were interpreted and assessments were made on the role of duty and responsibility in occupational health and safety. Role ambiguity, which is defined as a person's lack of knowledge about the role expectations, i.e. incomplete information about what to do based on the role, and role conflict, which occurs when it is difficult to fulfill two or more role representations simultaneously and to adhere to another role representation. The importance of the concepts of duty and responsibility, which fall within the scope of safety and form the basis of sources of stress, is emphasized. Suggestions have been made in this study to ensure that the concepts of duty and responsibility, which may cause role confusion, are defined by the authorities in accordance with legislation, and a model form has been produced to provide guidance. In the context of occupational health and safety, duties and responsibilities must be carried out and documented according to the hazard class. It is therefore recommended that the duties and responsibilities are archived in personnel files with notification documents.

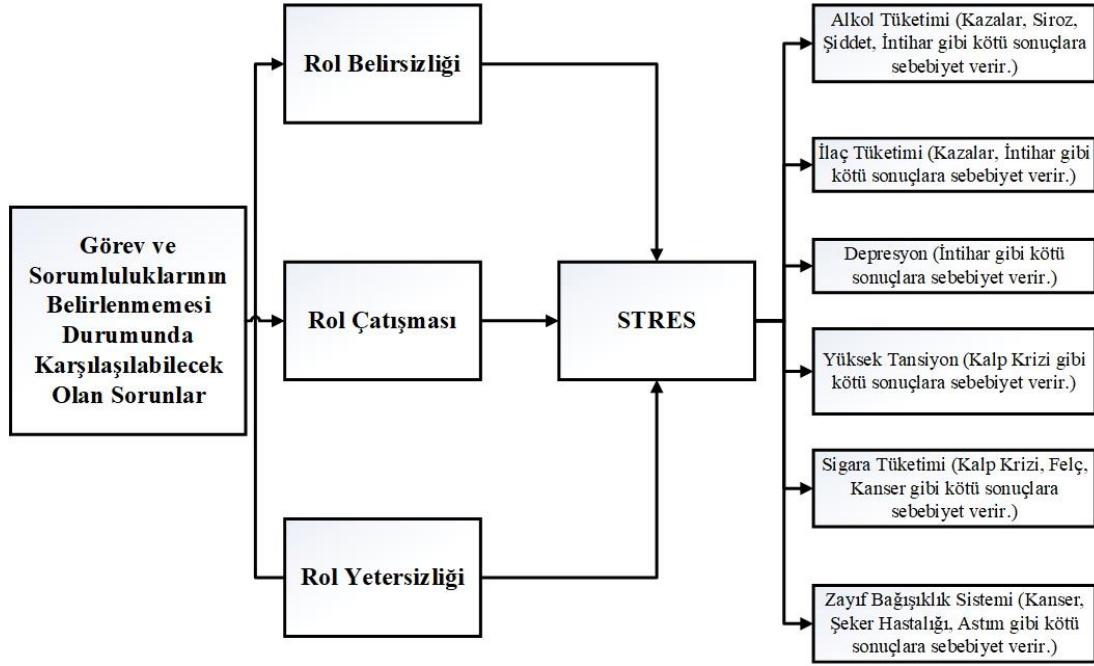

**Keywords:** Role Inadequacy, Psychosocial Risk Factors, Duty and Responsibility, Role Conflict, Role Ambiguity

## **GİRİŞ**

Günümüzde çalışma hayatı; çalışma koşullarındaki olumsuz değişiklikler (rekabet koşulları, artan iş yükü ve çalışma temposu, uzun çalışma saatleri, azalan iş güvencesi ve olumsuz yönetim politikaları gibi) çalışanların sağlığını olumsuz etkilemektedir. Çalışanların sağlığını ve iş ortamındaki disiplin ortamını bozan temel nedenlerden biri olarak görev ve sorumluluk formlarının imzalatılmaması veya çalışanların bu hususta bilgilendirilmemesi ön görülebilir. Çalışma formları her bir çalışanın ne yapması gerektiğini ve işyerinde nasıl hareket etmesi gerektiğine dair rehberlik görevi görmektedir (URL 1).Görev, kişinin yerine getirmesi gereken bir yükümlülük iken sorumluluk, size verilen bir görevi kabul etme ve yerine getirme eylemidir. Görev; Yasal veya ahlaki bir zorunluluk olarak görülür. Gerçekleştirilmesi gereken bir görev olup genellikle çalışanın işinin bir parçasıdır. Yani çalışanın yapmak zorunda olduğu ve yapmaması durumunda tepki alabileceği hususların bir bütünüdür. Sorumluluk ise; birisi veya bir görev üzerinde kontrol sahibi olmayı, bir şeyle uğraşmayı içermektedir. Bir şeyden sorumlu olmak ve yetki altındaki süreçlere göre doğru kararların alınması anlamını taşımaktadır. Görev'in en yaygın kullanılan anlamı hukuki veya ahlaki yükümlülüktür. Sorumluluk aynı zamanda bir şey üzerinde kontrol sahibi olmayı veya bir şeyle uğraşma ihtiyacını da ifade eder (URL 2, URL 3).6331 sayılı İş Sağlığı ve Güvenliği Kanunu, işyerinde alınan koruyucu tedbirler konusunda işverenlere çeşitli sorumluluk ve yükümlülükler yüklemektedir. İş sağlığı ve güvenliği mevzuatı kapsamında işyerleri çalışan sayısına ve tehlike kategorilerine göre sınıflandırılmaktadır. Meri mevzuat, 50'den az çalışanı olan ve az tehlikeli olarak sınıflandırılan işyerleri için daha basit yükümlülükler tanımlarken, tehlike kategorisi veya çalışan sayısı arttıkça işyerlerinin benimsediği iş sağlığı ve güvenliği tedbirlerinin kapsamı ve detayı genişlemektedir. Yükümlülük ve sorumluluk biçimlerinin kapsamı da bu çerçevede belirlenmektedir (URL 1; URL 2, URL 3; Ceylan ve Ulutürk, 2006). Bu nedenle her bir çalışanın yapması gerekenler veya sahip olması gereken kriterlerin yer aldığı bu formların yetkililerce doldurulması ve imzalanması gerekmektedir. İmzalanan bu formlar çalışanın istihdam edildiği konumda çalıştığı müddetçe özlük dosyasında bulundurulması ve bir nüshasının da çalışanda bulundurulması sağlanmalıdır. Deneyim sonucu kariyer ilerlemesinden dolayı konumunun değiştirilmesi durumlarında yeni konuma uygun görev ve sorumluluk formlarının mevzuata uygun şekilde yeniden doldurtulup imzalatılması sağlanmalıdır. Bu çalışmada ileride yapılacak olan benzer çalışmalara öncülük etmek ve her bir işyerinde bulundurulması gerekliliğine dikkat çekmek amacıyla Ek-1'de yer alan form hazırlanmış ve ayrıca farklı iş türlerine göre geliştirilmesi önerilmiştir. Hazırlanan bu formun hem alan yazına

kazandırılması hem de iş sağlığı ve güvenliği (İSG) uygulamaları kapsamında İSG profesyonellerine rehberlik etmesi hedeflenmiştir. Çünkü formda yer alan bilgiler işverenlere ve çalışanlara ilişkin tüm kural, düzenleme ve sorumlulukları içerebilir. İçerikler tehlike sınıfı veya işyerinin özelliklerine göre şekillenebilir veya sahaya özgü hazırlanabilir. İş kanunu ve ilgili diğer mevzuat hükümleri, çalışanların bilgi sahibi olması veya yetkililere başvurabilmesi için her işverenin bir kopyasını çalışana vermesi ve bir nüshasının da insan kaynakları biriminde özlük dosyasında bulundurmasını zorunlu kılmaktadır. Çalışanların İş Kanunu ve diğer istihdam mevzuatına uygun olarak faaliyet gösterebilmeleri için yürütülen uyum süreçlerinde iş sağlığı ve güvenliği gereklilikleri çoğu zaman ihmal edilmektedir (Ünsar ve Oğuzhan, 2009; Adıgüzel, 2012; Ertem Eray, T., 2017; Tepe, 2018; Sayğan Tunçay ve Çıraklar, 2020; Demirci, 2021; Çivilidağ ve Durmaz, 2022; Eren Bana ve Bekaroğlu, 2022; Altan ve ark. 2022).Görev ve sorumluluk formlarının hazırlanmaması durumunda çalışanların rollerinde psikososyal risklere sebebiyet verebileceği düşünülmektedir. Vardiya sisteminde sorunların yaşanabileceği, çalışanların rollerinde çatışmaların, yetersizliklerin veya belirsizliklerin yaşanabileceği ihtimalleri bulunmaktadır. Ulusal veya uluslararası literatürde bu terimlere sık sık değinilmiş ve açıklık kazandırılmaya çalışılmıştır. Bu yönde kullanılan ve literatür taramalarında kayda değer sayıda çalışmanın yürütüldüğü terimleri aşağıdaki gibi tarif etmek mümkündür.*Rol belirsizliği*, Çalışanların işteki rollerini tam olarak anlamadıkları ve hedefler, beklentiler, amaç ve sorumluluklar konusunda belirsizlik olduğu zaman ortaya çıkacağı ifade edilmiştir. İş doyumunun azalmasına, stresin artmasına ve işten ayrılma niyetlerinde artış olabileceği ele alınmıştır. *Rol belirsizliği*, kişinin rol beklentilerine ilişkin açık ve performans bilgi sahibi olmayışı, diğer bir ifadeyle rol sonucunun ne yapılması gerektiği konusunda eksik bilgi olarak tanımlanabilir (Pearce, 1981; King ve King, 1990; Bauer, ve Simmons, 2000; Eys ve Carron, 2001).*Rol çatışması*, Çalışanlardan kendi değerleriyle çatışan veya birbirleriyle uyumsuz roller üstlenmeleri istendiğinde ortaya çıkan bir durum olarak değerlendirilmiştir. Rol çatışmalarının artması sonucu iş tatmininin de azalacağı vurgulanmıştır. Rol çatışması, iki veya daha fazla rol temsilinden birinin aynı anda uyulması ve başka bir rol temsiline bağlı kalmanın zor olması durumlarında ortaya çıkacağı ifade edilmiştir. (Stouffer ve Toby, 1951; Getzels ve Guba, 1954; King ve King, 1990; Creary ve Gordon, 2016; Ürü Şimşek, 2022).*Rol Yetersizliği*, Bir kuruluşun çalışanlarının becerilerinden ve eğitiminden yararlanamaması durumunda ortaya çıkacağı ve iş tatminini azaltıp stresi artırdığı vurgulanmıştır ( Pestonjee ve Azeem, 2001; Kurt, 2010; Rohit, Singh, Sangeetha, ve Kumbhare, 2017; Yadav, 2017; Öztürk, ve Gezer, 2021).Yapılan işlerin sürekli olarak iş görülen ve bu nedenle birbirini takip eden postalar

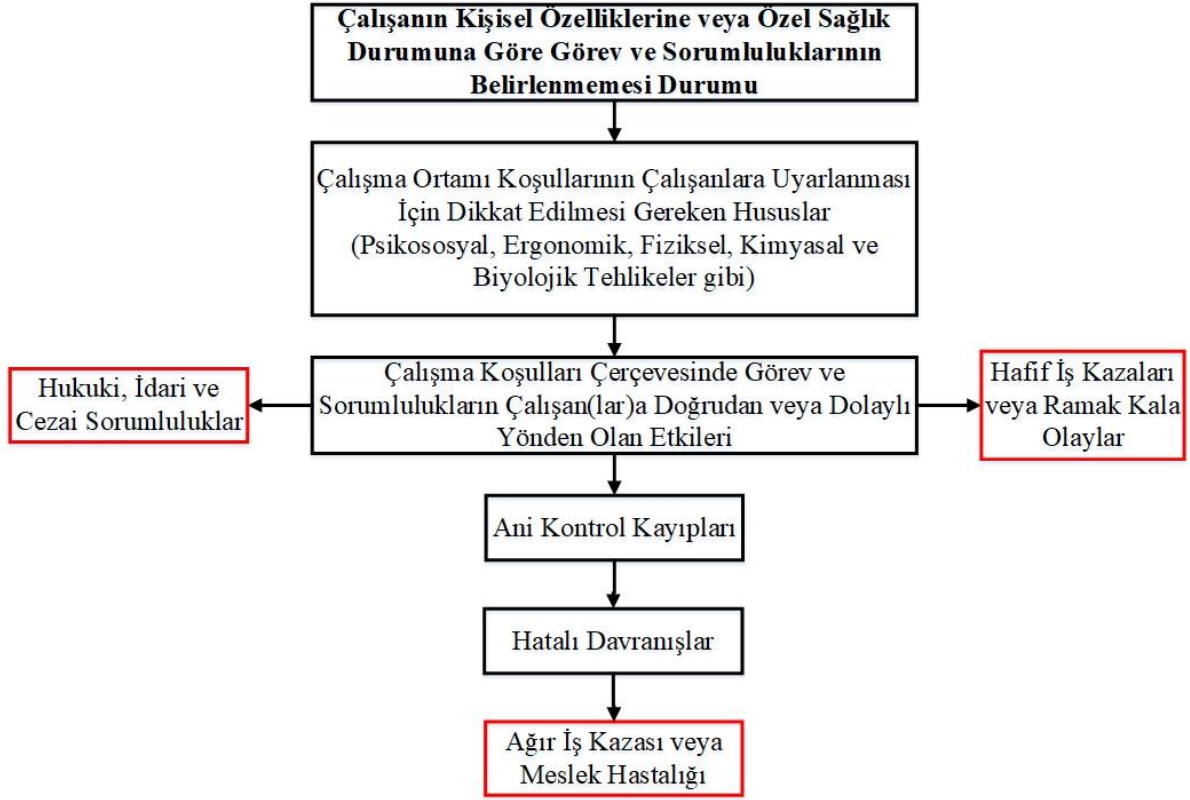

halinde çalışan çalıştıran, ya da nöbetleşe çalışan postaları ile tutulan işlemler olarak tanımlanan *vardiyalı çalışmaların* da görev ve sorumlulukların belirlenmemesi durumunda işlerinde hassasiyet gösterenlerde ağır iş yüküne sebebiyet verebileceği gibi hususlar değerlendirilmiştir (Scott, 2000; Shields, 2002; Wright ve ark. 2013).Psikososyal risk etmenlerinin kapsamının geniş olmasından dolayı bu çalışmada sadece görev ve sorumlulukların neden olabileceği durumlar ele alınmaya çalışılmıştır. İşyerleri ile ilgili stres kaynakları içerisinde yer alan görev ve sorumlulukların belirsiz olması rol karmaşıklığına sebep olmaktadır. Çalışmanın amacı görev ve sorumluluk kavramlarına vurgu yaparak mevzuat kapsamında yer alan hususların sorumlularca yerine getirilmesi ve uygulanmasının sağlanması yönündedir. Nitel araştırma metodu kapsamında literatür taraması yapılarak iş sağlığı ve güvenliği kapsamında görev ve sorumluluk kavramlarının önemine dikkat çekilmiştir. Elde edilen bulgular yorumlanarak görev ve sorumluluğun iş güvenliğindeki rolü üzerinde değerlendirmeler yapılmıştır. Görev ve sorumluluk kavramlarının belirlenmemesi durumunda rol belirsizliği, rol çatışması veya rol yetersizliği gibi stres kaynaklarına sebep olabileceği aşikârdır. Bu yüzden iş güvenliği çerçevesinde görev ve sorumluluklarının tehlike sınıfına uygun olarak yapılması ve belgelendirilmesi büyük önem arz etmektedir (Sabuncuoğlu, 2016; Adıgüzel ve Küçüköğlü, 2019; Gedik ve Çet, 2020; Öztürk ve Şeremet, 2021).Şekil 1’de görev ve sorumluluklarının belirlenmemesi durumunda neden olabileceği stres kaynaklarına görsellik kazandırılmıştır. Amaç bu çalışmaya bir bütün olarak bakmak ve stres kaynaklarının temelinde görev tanımlarının yapılmamış olmasıdır. Görev ve sorumlulukların belirlenmesi çok çalışan personel(ler)in iş yükünü hafifletirken çalışmayan veya işini önemsemeyen personel(ler)e de sorumluluklar yüklemektir. Psikososyal risk etmenleri çerçevesinde stres kaynakları geniş bir yelpazeye sahip olmaktadır. Ayrıca stres kaynaklarında domino etkisini de görebiliriz. Yani bir stresin veya hastalığın kaynağı bir diğer stres kaynağına bağlanabilir. Örneğin fazla çalışmanın veya yoğun tempoda çalışılan bir ortamda personel sırt veya bel incinmeleri yaşayabileceği gibi sosyal aktivite gibi olanaklardan da uzak kalacağı için kendisi sigara içme, alkol tüketme, uyuşturucu madde veya hap kullanma gibi zararlı maddeleri de tüketebilir.

Şekil 1. Görev ve Sorumlulukların Neden Olabileceği Psikososyal Nedenler

Şekil 1’de görselleştirilen stres kaynaklarının iş örgütlenmesi ve yönetimi kapsamında kişisel özelliklerin esas tutulması sonucu tedbirlerin zamanında alınması ve işyerlerinin çalışma türüne özgü olarak kapsamının genişletilmesi gerekmektedir. İşyerinde görev ve sorumluluklarının etkili yönetimi için; problemlerin tespit edilmesi, alınması gereken tedbir ve eylemlere karar verilmesi, eylemlerin yerine getirilmesi ve yapılan faaliyetlerin kontrol edilmesi neticesinde olumlu sonuçların alınabileceği düşünülebilir. Liyakat esaslı görevlerin ve sorumlulukların belirlenmemesi durumunda Şekil 2’ de yer alan sorun ve olaylar netice verebilir. Sistematik olarak yapılan mobbing, iş vermemek ve aşırı iş vermek, diğer çalışanlara verilen haklardan eşit yararlanmamak gibi psikososyal baskılar çalışanları yalnızlaştırır ve meslek hastalığı, iş kazası, hukuki, idari ve cezai sorumluluklar gibi sonuçlara sebebiyet verebilir (URL 4). Bu yüzden hem çalışanların hem de işverenlerin bu hususta eğitim almalarının sağlanması gerekmektedir (Akşit ve Gür, 2022). İş sağlığı ve güvenliği çerçevesinde verilmesi gereken eğitimlerde görev ve sorumluluklar hakkında tarafların veya tüm paydaşların bilgilendirilmesi gerekmektedir. İşlerin havalecilikten kurtulması ve görev karmaşıklığına son verilmesi için bu tarz bilgilendirmeler büyük önem arz etmektedir. Çalışanların kişisel ve sağlık özellikleri esas alınarak görev ve sorumluluklarının belirlenmemesi durumunda yetkililerin veya gerekli mevzuat hükümlerinin yerine getirilmesi durumunda görev ve sorumlulukları çerçevesinde hareket etmeyen çalışanlar hukuki, idari ve cezai yaptırımlarla karşılaşabilir. Bu yüzden tarafların bilgilendirilmesi ve belgelendirilmesi önemlidir.

**Şekil 2.** Kişisel özelliklere uygun görev ve sorumlulukların belirlenmemesi durumunda netice verebileceği sorunlar

## **ARAŞTIRMA VE BULGULAR**

Nitel araştırma, algıları ve olayları doğal ortamda gerçekçi ve bütüncül bir şekilde ortaya çıkarmak için gözlem, görüşme, doküman analizi gibi nitel veri toplama yöntemlerini kullanan bir süreçtir. Sosyal bilimler bağımsızlaştıkça ve kendine özgü araştırma yöntemleri geliştikçe ve nicel araştırma yöntemleri toplumsal gerçekliği açıklamakta yetersiz kaldıkça, nicel araştırma yöntemlerinin sosyal bilimlerdeki etkinliği azalmaya başlıyor ve nitel araştırmanın önemi artıyor. Sosyal olgular, sosyal davranışı belirleyen genel kanunlar üretmek yerine, durumların spesifik boyutlarının araştırılmasıyla anlaşılabilir. Nitel veri analizi, insanların kendilerini ve çevrelerini nasıl algıladıklarını veya tanımladıklarını anlamayı amaçlayan kişi merkezli bir yaklaşımdır. Çalışan merkezli bu çalışmada da bu yüzden nitel araştırma metodu kullanılmıştır (Aydın, 2018; Yıldırım ve Şimşek, 2021). Nitel araştırma, çeşitli disiplinlere dayanan sağlam bir teorik temele sahiptir. Sosyoloji, antropoloji, psikoloji, felsefe, dilbilim, iş sağlığı ve güvenliği gibi disiplinlerin tümü nitel araştırmaya bakış açıları ve yöntemleri ile katkıda bulunur. Tüm bu disiplinlerin ortak amacı insan davranışını ve onun içinde bulunduğu çevresel durumu çok yönlü olarak anlamaya çalışmaktır. Nitel araştırma tasarımı, bir araştırma

yöntemini tanımlayan ve çeşitli aşamaların bu yöntem etrafında hizalanmasına rehberlik eden bir strateji olarak tanımlanabilir. Nitel araştırma tasarımı, araştırmacılara araştırma faaliyetlerini tutarlı ve amaçlı bir şekilde yürütme konusunda rehberlik eder (Yıldırım ve Şimşek, 2021). Bu çalışmada da ulusal ve uluslararası çalışmalarda yer alan görev ve sorumluluk ile ilgili çalışmalar araştırılmıştır. Ancak yapılan literatür taramasında görev ve sorumluluğun iş sağlığı ve güvenliği yönünden önemi hakkında yapılan her hangi bir çalışmaya rastlanmamıştır. Araştırma neticesinde çalışanların görev ve sorumlulukları ile ilgili çalışma bulunmazken psikososyal risk etmenlerinin temel unsurlarından sayılabilecek olan rol belirsizliği, rol çatışması, rol yetersizliği, vardiya çalışmaları, stres gibi hususlarda çalışmaların sıklıkla yapıldığı bulgularına rastlanmıştır. Kayda değer düzeyde yapılan bu tür çalışmalarda görev ve sorumluluklar hakkında araştırmalara ağırlık verilmemesinden dolayı literatürde bu yönde bir boşluk olduğu ortaya çıkmaktadır. Bu yüzden çalışanların çalışmalarını belli bir plan ve program çerçevesinde yapabilmesi için her mesleğe uygun olarak görev ve sorumluluk ile ilgili çalışmaların yapılması literatüre katkı sunacağı düşünülmektedir. Araştırma neticesinde mobbing veya stres'e neden olan hususlar hakkında elde edilen bulguları; çalışan(lar)ın işyerlerinde yalnızlaştırılması, iş yapma olanaklarının zorlaştırılması, çalışanın yok sayılması veya dikkate alınmaması, çalışan ile alay edilmesi, yaptığı işin küçümsenmesi veya aşağılanması, statüsünün küçümsenmesi, çalışma isteğinin kırılmaya çalışılması, sürekli suçlanması veya eleştirilmesi, arkasından konuşulması veya dedikodusunun normalleştirilmesi, işle ilgili olmayan olağandışı taleplerde bulunulması, kariyeri hakkında tehdit edilmesi ve çalışmamızın konusu olan görev tanımının dışında sorumluluklar veya işlerin verilmesi şeklinde sıralayabiliriz.

### **SONUÇ VE ÖNERİLER**

Bu çalışmada rol karmaşasına neden olabilen görev ve sorumluluk kavramlarının yetkililerce mevzuata uygun olarak yapılması ve sınırların belirlenmesi için önerilerde bulunulmuştur. Yapılan literatür taraması ve iş güvenliği uzmanı olarak saha çalışmalarından elde edilen deneyim sonucu, görev ve sorumluluk sorunlarıyla mücadele konusunda alınması gereken tedbirler için aşağıda listelenen tavsiyelerde bulunulabilir.

- ❖ Periyodik eğitimlerin verilmesi (mesleki eğitimler, kişisel gelişim eğitimleri gibi),
- ❖ İşin yürütüm koşullarında değişikliklere gidilmesi,
- ❖ Çalışma ortamının vazifenin gerektiği hale getirmek veya yeniden tasarlamak,
- ❖ Çalışan(lar)a özel danışmanlık hizmetleri sunmak,
- ❖ Çalışma koşullarında veya sürelerinde değişiklikler yapmak,

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

***April 09-16, 2024 / Lisbon, Portugal***

- ❖ Görev ve sorumlulukların çözümlene yönerge veya prosedürlerin iş ortamına / şartlarına göre oluşturmak,
- ❖ Mesleki kariyer çerçevesinde alımlar yapmak,
- ❖ Görev ve sorumluluklarla ilgili sorunlarda kime veya hangi yetkililere başvuracakları konusunda çalışanları bilgilendirmek,
- ❖ Geleceği emanet edebilecek meslek erbaplarının yetişmesini sağlamak,
- ❖ Bu çalışma kapsamında hazırlanan Ek -1 formunun sektörel bazda uygulanmasını sağlamak ve kapsamının genişletilmesi için çalışmalar yürütmek gibi birçok öneride bulunulabilir.

**ÖZET**

Tekstil veya dokuma sektörü, genellikle hayvansal, bitkisel veya kimyasal liflerin kullanılmasıyla elde edilen çeşitli ürünleri içermektedir. Bu sektör, liflerin işlenmesi ve bir araya getirilmesi suretiyle kumaşların ve tekstil ürünlerinin üretildiği karmaşık bir süreci kapsar. Türkiye'deki tekstil imalat sektöründe 2008-2021 döneminde kaydedilen 172.445 iş kazası gerçekleşmiş ve söz konusu yıllar arasındaki tüm sektörlerdeki iş kazalarının %5'i tekstil ürünleri imalatı sektöründe gerçekleşmiştir. Bu bağlamda çalışmanın amacı, tekstil sektöründe iş sağlığı ve güvenliği uygulamalarına odaklanarak, bu alanda literatüre katkıda bulunmak ve işverenler ile çalışanların iş kazaları ve meslek hastalıklarına karşı korunmasını sağlamaktır. Bu doğrultuda, sektörde uygulanmakta olan iş sağlığı ve güvenliği önlemlerine dikkat çekilerek, alınması gereken tedbirlerin önemi vurgulanmaktadır. Ulusal ve uluslararası kaynaklardan elde edilen bilgilerle tekstil işlerinin gerçekleştirildiği ortamlardaki iş güvenliği önlemleri incelenmektedir. Çalışmada nitel araştırma metodu kullanılarak tekstil atölyelerindeki risklerin kapsamlı bir değerlendirmesi yapılmaktadır. İş sağlığı ve güvenliği riskleri, tekstil sektöründe de diğer sektörlerde olduğu gibi önemli bir konudur, ancak sektöre özgü materyallerin ve işlemlerin kullanımıyla bazı riskler öne çıkmaktadır. Ergonomik, fiziksel, kimyasal, biyolojik ve psikososyal riskler, tekstil sektöründe gözlemlenen risk kategorileridir ve bu risklere karşı uygun önlemler alınmalıdır. Bu çalışma, iş sahasındaki risklerin kapsamlı bir şekilde ele alınmasını sağlayarak tekstil sektöründe iş sağlığı ve güvenliği konusunda daha bilinçli bir yaklaşımın teşvik edilmesine katkıda bulunmayı hedeflemektedir.

**Anahtar Kelimeler:** Risk, Tekstil, Dokumacılık, Atölye, İş Sağlığı ve Güvenliği

**MEASURES TO BE TAKEN WITHIN THE SCOPE OF OCCUPATIONAL HEALTH  
AND SAFETY IN THE TEXTILE INDUSTRY**

**ABSTRACT**

The textile or weaving sector includes various products generally obtained using animal, vegetable, or chemical fibers. This sector covers the complex process of producing fabrics and textile products by processing and assembling fibers. There were 172,445 occupational accidents recorded in the textile manufacturing sector in Turkey in the 2008-2021 period, and 5% of the occupational accidents in all sectors between these years occurred in the textile products manufacturing sector. In this context, the study aims to contribute to the literature in this field by focusing on occupational health and safety practices in the textile industry and to ensure that employers and employees are protected against work accidents and occupational diseases. In this regard, attention is drawn to the occupational health and safety measures implemented in the sector, and the importance of the measures that need to be taken is emphasized. Occupational safety measures in the environments where textile work is carried out are examined with information obtained from national and international sources. In the study, a comprehensive evaluation of the risks in textile workshops is made using the qualitative research method. Occupational health and safety risks are an important issue in the textile industry as in other sectors, but some risks come to the fore with the use of sector-specific materials and processes. Ergonomic, physical, chemical, biological, and psychosocial risks are the risk categories observed in the textile industry and appropriate measures should be taken against these risks. This study aims to contribute to promoting a more conscious approach to occupational health and safety in the textile industry by ensuring that risks in the workplace are comprehensively addressed.

**KeyWords:** Risk, Textile, Weaving, Workshop, Occupational Health and Safety

## **Giriş**

Tekstil sektöründe çalışanlar, iş kazalarıyla fiziksel, kimyasal, biyolojik, psikososyal ve ergonomik risklere maruz kalabilirler. Daha sağlıklı ve güvenli bir iş ortamı sağlamak için, risklerin belirlenmesi ve ortadan kaldırılması için tedbirler alınması gerekmektedir. Çalışma hayatındaki öncelikler arasında iş sağlığı ve güvenliği, kritik bir öneme sahiptir. Bu tedbirlerin ihmal edilmesi, çalışanların hayatını tehlikeye atabilir veya ciddi yaralanmalara yol açabilir; bunun yanı sıra işverenler için önemli maddi kayıplara sebep olabilir. İş sağlığı ve güvenliği alanında, tedbirlerin alınması ve bunlara riayet edilmesi, öncelikle işverenin, ardından çalışanın sorumluluğundadır. Türkiye'de en fazla istihdamın gerçekleştiği sektörlerden biri olan tekstil endüstrisi, iş sağlığı ve güvenliği açısından bir dizi risk ve tehlikeyi içinde barındırmaktadır. Bu risklerle başa çıkabilmek için, tekstil sektöründe iş sağlığı ve güvenliği ile ilgili önlemlerin alınması gerekmekte olup, bu sayede sektördeki iş kazalarının ve meslek hastalıklarının büyük ölçüde önlenebileceği vurgulanmaktadır (Değirmenci ve Bozkurt, 2018). Ülkemizde, iş sağlığı ve güvenliği sorunlarının yaşandığı sektörlerden biri yoğun emek ve zaman gerektiren Tekstil sektörüdür. Bu sektörde, üretim verimliliğini artırmakla çalışanların refahını sağlamak arasında hassas bir denge bulunmaktadır ve her iki hedefi de başarıyla elde etmek zordur. Özellikle küçük işletmelerde, iş sağlığı ve güvenliği ile ilgili alınan önlemler maalesef yeterli seviyede değildir (Özbakır, 2023). 2008 ile 2021 yılları arasında ülkemizde tekstil imalat sektöründe toplamda 172.445 iş kazası kaydedilmiştir. Kaza geçirenler arasında kadın çalışanların sayısının diğer sektörlerle kıyasla fazla olması, iş kazalarından etkilenen çalışanların %25'inin kadın olmasına neden olmuştur. Bu durum, diğer sektörlerde görülmeyen bir orandır. Söz konusu dönemde, tüm sektörlerde gerçekleşen iş kazalarının %5'i tekstil ürünleri imalat sektöründe meydana gelmiştir. İnsanoğlu giyim, süslenme, ev tekstili gibi pek çok alanda tekstil ürünlerine ihtiyaç duyduğundan dolayı bu alanlarda üretim yapmak zorundadır. Tekstil ürünlerine yönelik olarak özellikle son dönemlerde talebin artmış olmasından dolayı, tekstil ürünlerinin daha hızlı bir şekilde üretilmesi için çok sayıda makinenin yapılmasına neden olmuştur. Bu da, fabrikasyon üretim çağını başlatmış ve bu makineler de çalışanlar için, yangın, gürültü, tozlar, tehlikeli kimyasallar, hareketli aksamlar başta olmak üzere pek çok iş sağlığı ve güvenliği sorununu ortaya çıkarmıştır (Özbek, 2022). Yakın gelecekte, iş güvenliği alanında geniş bir bilgiye sahip olan ve her sektörde çalışabilecek uzmanların yanı sıra, her sektörde işe özgü uzmanların eğitimi daha da

önemli hale gelecektir. Bu, sadece çok tehlikeli ve tehlikeli kategorilerde değil, her sektörde iş güvenliği standartlarının ve gereksinimlerinin karşılanmasını sağlamak için gereklidir (Kökten ve Avinç, 2014). Kişisel koruyucu ekipmanların yeterli düzeyde kullanıldığı, ramak kala, iş kazası ve meslek hastalıkları sayısının az olduğu, risk değerlendirmelerinin yapıldığı, çalışan temsilcilerinin belirlendiği ve gerekli kayıtların tutulduğu ve raporlamaların yapıldığı iş yerleri, iş sağlığı ve güvenliği tedbirlerinin üst düzeyde uygulandığı yerlerdir. Bireysel bilgi, beceri ve yargıya göre belirlenmenin yanında, iş sağlığı ve güvenliği kurallarına uygun hareket eden bir çalışanlar grubu oluşturulmalıdır. Kazalar önenebilir olduğu için işverenlerin sorumluluk alması önem arz etmektedir (Ağırhan, 2020). Tekstil fabrikalarında makine fazlalığı ve ürün çeşitliliği farklı iş yönelimlerine yol açmaktadır. Ürünlerin ve üretim faktörlerinin çeşitliliği, işçiler üzerinde termal baskı oluşturur. Ortaya çıkan sıcaklık stresi uzun yıllar çalışan kişilerde meslek hastalıklarına da yol açmaktadır. İş sağlığı ve güvenliği önlemleri, mühendislik çalışmaları ve işgücü yönetimi sayesinde çalışanları iş kazalarından ve meslek hastalıklarından korumak mümkündür. Tekstil fabrikalarında yaz ve kış mevsiminde çalışma ortamındaki farklılıkları etkileyen memnuniyetsizlik düzeyinin belirlenmesi, meslek hastalıklarının ve sağlık sorunlarının azaltılmasına yönelik, önleyici tedbirlerin ve teknik testlerin uygulanması gerekli olacaktır. Termal konfor, mesleki hijyen önlemlerine, metabolik iş ayarlarına ve teknik standartlara göre kıyafet seçimi yapılarak düzenlenebilir (Öz ve ark., 2018). Tekstil sektöründe ergonomi, yoğun emek ve insana dayalı, sık sık tekrarlanan hareketlerin yer aldığı bir sektör olmasından ötürü büyük önem taşımaktadır. Oturarak çalışmada sandalye ve masa tasarımının özellikleri önemlidir. Sandalyelerin yüksekliğinin ve derinliğinin ayarlanabilir olması, yeterli sırt dayanağına sahip olması çalışanlar açısından faydalı olacaktır. Sandalyeler, tercihen nefes alabilen, kaymayan ve beş noktalı teması sağlayan yeterince yumuşak kumaşlardan yapılmış olmalıdır. Tekstil sektöründe, işlem yapılan veya incelenen/kontrol edilen nesne ile göz arasındaki mesafe yeterli olmalıdır. İşlem yapılan malzemenin bükülmesini ve esnemesini önlemek için kenarlıklar masalara yerleştirilebilir. Tekrarlayan hareketlerden kaçınmak için çeşitli aktiviteler kullanılabilir. Özellikle gürültü, aydınlatma, toz ve termal konfor açısından uygun olmayan bir çalışma ortamında, ölçümler yapılarak çalışanlar üzerinde olumsuz etki oluşturmaması için önlemler alınmalıdır (Aksüt ve ark., 2021). Çalışma ortamı koşulları; iş tatmini, işin verimliliği ve kalitesiyle bağlantılı bir kavramdır. Özellikle yoğun emek harcayan çalışanlar için ergonomik uyumun sağlanması,

yapılan işe doğrudan etki etmektedir. Çalışma ve dinlenme sürelerine bakıldığında, çalışanların uzun saatler çalıştıkları, molalarda ise herhangi bir fiziksel aktivite yapmadıkları görülmektedir. Dolayısıyla çalışma koşulları, çalışanlar için tüm faktörler dikkate alınarak oluşturulmalıdır (Efe ve Efe, 2015). Hem çalışma alanında hem de dinlenme alanında ergonomik uyum önemlidir. Çalışanların iş güvenliği algıları, kişiden kişiye değişen ve birçok çevresel ve bireysel faktörden etkilenen değer yargılarını temsil etmektedir. Küreselleşme ve artan rekabet, değişen sosyo-ekonomik koşullara ayak uydurmak için yapısal değişikliklere uğrayan örgütlerde, asli personel dışında çalışanlara sunulan iş güvencesinin kaybolmasına yol açmıştır. Ayrıca ekonomik durgunluk ve kriz gibi durumlar işyerlerinin kapanmasına, işsizliğin artmasına, mevcut çalışanlar için statü ve maaş kaybına, performans baskısının ve işsizlik riskinin artmasına neden olmaktadır. Bütün bu değişiklikler; durum belirsizliğini artırmış ve iş güvencesizliği çalışanlar için önemli bir sorun haline gelmiştir (Derin ve Şimşek İlkım, 2017). İş kazalarını önlemek veya azaltmak için, iş kazasına neden olan faktörlerin analiz ve değerlendirmelerle belirlenmesi, gerekli tüm önlemlerin hassasiyetle alınması ve önlemlerin etkin bir şekilde uygulanıp uygulanmadığının belirlenmesi için sıkı kontrollerin yapılması gerekmektedir (Kodaloğlu, 2024). Tekstil, kapsamı geniş olduğu kadar iş güvenliği kapsamından da riskleri de o kadar geniş bir yelpazeye sahiptir. İmalatından tasarımına mevcut olan riskler ile üretimden lojistik hizmetlerine veya tüketiciye erişim sürecine kadar yer alan riskler farklılık arz edebilmektedir. Bu çalışmada risklerin atölye kısmında bir bütün olarak görülebilmesi için şekil-2'deki görsel hazırlanmış ve mevcut süreçlerin yer alması için çalışmalar yürütülmüştür. Tüm kategoriler sığdırılmasa da risklerin bir bütün olarak görülmesi amaç edinilmiştir. Görselde tüm risklerin ana unsurlarını tespit edebilecek başlıkların görülmesine olanak tanıdığını söylemek mümkündür. Çalışmalarda kapsamın genişletilmesi, tehlike ve risklerin tanımlanması için rehberlik etmektedir. Bu yüzden benzer çalışmalarda da temsili görsellerin hazırlanması somutlaştırma adına büyük önem arz ettiği söylenebilir.

## **2. Çalışma Alanı:**

Tekstil sektöründe çalışanların karşılaştığı farklı tehlikeler bulunmaktadır. Çalışma ortamındaki tehlikelerin oluşmasından sorumlu olan farklı faktörler vardır. Tekstilde bunlar Fiziksel, Biyolojik, Kimyasal ve Ergonomik (kişisel) faktörlerdir. Vardiyalı çalışma, işyerinde sigara içme, iş yoğunluğu nedeniyle kişisel koruyucu ekipmanların uygun şekilde kullanılması gibi işyeri ortamında tehlikeler oluşturmaktan sorumlu olan birden fazla hususlar vardır.

Endüstride tehlikeli teknolojik cihazların kullanılmaya başlanması, meslek hastalıkları etkenleri ve sağlıksız çalışma ortamları gibi durumlar yüksek kaza oranlarıyla sonuçlanmıştır. Çoğu çalışan okuma yazma bilmediği için işlerinde ne gibi koruyucu önlemlerin gerekli olduğunu öğrenemiyor. İşgücünün büyük bir kısmı imalat ve endüstriyel süreçlerin oluşturduğu tehlikelerle başa çıkmaya hazır değil. Bu çalışma, tekstil endüstrisinde İş Sağlığı ve Güvenliği (İSG) konusunda tehlike kontrol önlemlerinin rolünü bilmek amacıyla tasarlanmıştır. Bu yüzden çalışma alanı olarak tekstil sektörü seçilmiştir. Tekstil sektörü üretim sürecinden tüketim sürecine kadar birçok işlem aşamasını içermektedir. Tasarım, kalıp hazırlama, elle kesim, elle serim, otomatik kesim ve makine ile serim, kesimhane, dikimhane, ütüleme, paketleme, sevkiyat, aksesuarlar gibi birden fazla süreci içermektedir. Her bir süreç kendisine özgü riskleri içermektedir. Tekstil sektöründe en sık rastlanan sırt ve bel ağrıları, kesme veya delinme, karpal tünel sendromu gibi şikayetlerdir. Tekstil sektöründe kullanılan iş ekipmanlarının çeşitliliği, risklerin de çeşidini artırmaktadır. Kullanılan bazı ekipmanları şu şekilde sıralamak mümkündür: harman hallaç makinesi, şerit birleştirme, votka birleştirme, tarak, cer, penyöz, fitil, ring, bobinleme, yıkama kurutma makinesi, melanjör makinesi, eğirme makinesi, ikileme makinesi, finisör makinesi, elyaf yağlama makinesi, germe-çekme makinesi, fikse makinesi, tekstüre makinesi, kutlama büküm aktarma, basınçla boya kazanı, boya mikseri, örme makinesi, çözgü haşılama, kasaralama makinesi, çözgü makinesi, haşıl sökme makinesi, merserizasyon makinesi, termofikse makinesi, yakma (gaze) makinesi, boya makinesi, rotasyon baskı, film baskı makinesi, rulu baskı makinesi, yaş apre halat açma makinesi, ramöz makinesi, hasırlı kurutma makinesi, sanfor makinesi, zımpara makinesi, makas-tıraş makinesi, şardon makinesi, kalandır makinesi vb. şeklinde sıralamak mümkündür (Yağımlı ve Erdoğan, 2021). Bu açıdan, tekstil sektöründe riskler kapsamı geniş olmanın yanında tedbir almanın da zorluklarından bahsetmek gerekmektedir. Bu zorluklar üretim-tüketim ve geri dönüşüm süreci çerçevesinde ele alınabilir. Çalışma alanının tekstil seçilme sebeplerini risklerinin yoğun olmasına bağlayabiliriz.

### **3. Materyal ve Yöntem**

Nitel araştırma metodu kapsamında ulusal ve uluslararası literatürden faydalanılmıştır. Materyal olarak görsel araçlar kullanılarak bir tekstil atölyesinin görseli hazırlanmıştır. Merdiven altı tekstil atölyeleri istisnadır. Yapılan çalışmada risklerin bir bütün olarak görsel üzerinde sağlanması ve elde edilen görselin çalışma sahalarında tüm çalışanlar tarafından

görülmesi sağlanmalıdır. Çalışma alanına hitap edecek şekilde risklerin mevcut olduğu görseller, birimlere hitap edecek şekilde bir yöntem kullanılarak çalışanlar bilgilendirilebilir. Bu çalışmada tekstil sektöründe ilgili tehlikelerin türünü ve yaygınlığını, sektörünün iş gücü kayıplarını tanımlamak için literatür araştırmasına başvurulmuştur.

#### **4. Bulgular ve Tartışma**

Yapılan çalışma kapsamında risklerin ortak olmasının yanında ergonomik risklerin ağırlık kazandığından bahsedilebilir. Karpal tünel sendromu ve monoton çalışma temposu sağlık açısından riskler oluşturmaktadır. Kesme-delme işlemlerinde de el kol yaralanmalarına sebebiyet verdiği söylenebilir. Bel-sırt ağrıları ve çalışma alanındaki ekipmanların uygun olmamasından dolayı ergonomik riskler ağırlık kazanmaktadır. Ancak iş temposu ve fazla mesai gibi hususların bulunmasından dolayı psikososyal risklerden de bahsedilebilir. İş yeri koşulları (özellikle ergonomik şartlar), kas-iskelet rahatsızlıklarına ve duruş bozukluklarına neden olmaktadır. Tekstil ürünlerinde meslek hastalıklarına karşı kimyasal risklere de (boya, toz, solvent vb.) tedbir alınmalıdır. Tekstil sektörü kimyasal ürünlerin yoğun kullanılması, aydınlatma ve termal konfor gibi fiziksel risklerin de yoğun olduğu bir sektördür. Hijyen ve kalabalık bir çalışma alanında çalışılmasından ötürü biyolojik risklerden de bahsedilebilir. Tekstil endüstrisinde işitme kaybı gibi sağlık problemleri de dahil olmak üzere, sağlık açısından birçok tehlike barındırmaktadır. Tekstil sektöründe iş kazaları ve meslek hastalıklarının önlenmesi kapsamında alınacak tedbirler, çok büyük maddi harcamalara gerek kalmadan basit önlemlerle veya yöntemlerle (örneğin; maske kullanımı, korucu kıyafet-teçhizat kullanımı, uyarı ve ikaz işaretlerinin belirgin olması, denetim ve kontrol işlemleri, makine ve teçhizatların kullanım kılavuzlarının okunması, eğitim eksikliklerinin giderilmesi gibi) birçok iş kazasının-meslek hastalığının meydana gelmesi önenebileceği bulgularına değinebiliriz.Hiremath ve ark. (2014) de, çalışanların çoğunun solunum problemleri, kas tonusunda artış, göz problemleri ve kas-iskelet sistemi sorunlarından etkilendiğini bulgularını elde etmişlerdir. Ayrıca iş güvencesinin veya düzenli çalışmanın, çalışanın uzun vadede vücut sağlığını da olumlu yönde etkilediğini gözlemlemişlerdir. Ancak, endüstriyel tesisler, çalışma ortamı ve iş sağlığı ve güvenliği yönergelerine ilişkin talimat ve prosedürleri içeren Hindistan Fabrikalar Yasası (OHSAS 18001/ ILO-OSH 2001) uyarınca önlemlerin benimsenmesi ve uygulanmasına yeterince sağlanmadığını ifade etmişlerdir.

Akşit ve Gür (2022)' de iş sağlığı ve güvenliği çerçevesinde verilmesi gereken eğitimler üzerine yapmış oldukları çalışmada mesleklere özgü olan nitelikli eğitimlerin verilmesi gerektiği hususu öne çıkmaktadır. Yapılan çalışmada hazırlanan form işyerlerinin tehlike sınıfı ve üretim sürecini de dikkate almak gerektiği sonucuna erişilmektedir. Böylece sektör bazlı eğitimlerin verilmesi daha etkili olacağı bulgusu ortaya çıkmaktadır. Kumie ve ark. (2016) da, Mevcut hızlı ekonomik gelişmenin Etiyopya dahil gelişmekte olan ülkelerdeki işyerlerinde değişikliklere yol açtığına değinmişlerdir. Etiyopya'daki işyerlerinde iş sağlığı hizmetlerinin boşlukları ve ihtiyaçları hakkında sınırlı bilgi bulunduğunu, İş sağlığı ve güvenliği hizmetlerinin organizasyonu, sanayileşme bağlamında çalışan sağlığına yönelik artan talepleri karşılayacak kadar dayanıklı olmadığını ifade etmişlerdir. Khan ve ark. (2015), Solunum yolu hastalığı semptomlarının (ateş, nefes darlığı, göğüste sıkışma ve öksürük) yaygınlığı genellikle pamuk endüstrisinin dokuma bölümünde en yüksek olduğu ifade etmişlerdir. Pakistan'da pamuk endüstrisinde işçilerin farklı mesleki tehlikelere maruz kaldığı kötü çalışma koşulları hala mevcut olduğu ve küçük dokuma fabrikalarından (elektrikli tezgahlar) daha fazla sağlık belirtisinin olduğu bildirilmiştir. Bu endüstriyel sektörde iş sağlığı ve güvenliği konusunda, özellikle elektrikli tezgahlara odaklanılması konusunda ciddi iyileştirmelere ihtiyaç olduğuna değinilmiştir. Abraha ve ark. (2018) de, İşe bağlı kas-iskelet sistemi bozukluklarının görülme sıklığının %53,1 olduğu, bunun ise cinsiyet, yaş, hizmet yılı, fiziksel aktivite eksikliği, ayarlanabilir sandalyenin bulunmaması, iş yükü ve yetersiz ışık gibi sorunların sırt ağrısı riskinin artmasına neden olduğuyula ilişkilendirilmiştir. Das ve Kathiresan, (2022) de, Hindistan'daki iplik eğirme endüstrileri, kırsal alanlardan vasıfsız işgücünü çekmede çok önemli olan, emek yoğun geleneksel endüstrilerdir. İplik sektörüyle ilgili tehlikeler ve riskler, daha az dikkat edilmesine rağmen diğer sektörlerle karşılaştırıldığında daha ciddidir. Kazaların büyük çoğunluğu hukuki sonuçlara yol açmıyor. İşçiler okuma yazma bilmedikleri için sağlık ve güvenlik prosedürlerinin gerekliliğinden habersizler. Ayrıca İSG'nin (iş sağlığı ve güvenliği) benimsenmesindeki zorluklar nedeniyle, yönetim bunu teşvik etmeye yüksek öncelik vermemektedir. İplik endüstrileri bir takım güvenlik ve sağlık sorunlarıyla ilgilenmektedir. Das ve Kathiresan, (2022) bu çalışmalarında Hindistan'daki iplik endüstrileriyle bağlantılı olarak bu zorlukların her birini ve bu zorluklara yönelik potansiyel çözümleri incelemeyi amaçlamaktadır.

## 5. Sonuçlar

Tekstil alanı sürecinden geçen her bir ürünün yıkanması ve içerisinde kullanılan kimyasalların türüne göre kullanım kılavuzlarında bu hususların bulundurulması önerilir. İçerisinde yer alan kimyevi maddelerin sebebiyet verebileceği hususlar hakkında tüketiciler bilgilendirilmelidir. Yetkili bir devlet kurumu tarafından denetimlerinin yapılması ve CE-TSE gibi belgelendirme işlemlerinin tamamlanmadan piyasa arzının engellenmesi tavsiye edilir. Kâr amacı ile satılan bu ürünlerin denetimi, eğitim almış yetkili, liyakatlı ve bağımsız personeller tarafından yapılmalıdır. Fabrika, atölye, hastane, otel ve ev gibi ortamlar başta olmak üzere tekstil atığının meydana geldiği ve tüm tekstil ürünlerinin kullanılamaz duruma gelmesi durumunda hem çevre sağlığı hem de gereksiz harcama ve tüketimin önüne geçmek için şekil 1’de görsel hale getirilen süreçte geri dönüşüm kaynaklarının tam olarak kullanılması önerilir.

Şekil 1. Tekstil Ürünlerinin Geri Dönüşüm Süreci

Yeterli vasıflara sahip sınırlı insan gücünün mevcut olduğu sektörlerden olan tekstil sektöründe iş güvenliği, sağlık hizmetleri ve ilgili hastalıkların durumunu araştırmak için ileride yapılması

öngörülen çalışmalar için yapılandırılmış bir kontrol listesinin hazırlanarak kullanılması önerilebilir.

**Şekil-2:** Tekstil atölyesinin çalışma sürecini ve riskleri bir bütün olarak görmek için hazırlanan temsili görsel (URL: 1,2,3)

### **Özet**

Dayanıklılığı ve ekonomikliği nedeniyle duvarcılık, antik çağlardan günümüze kadar sadece yapılarda değil, taş kuleler ve kaleler gibi birçok yapıda da kullanılmıştır. Tarihi ve geleneksel harçların çoğu kireçle yapılmıştır. Kireç harçları doğası ve işlevi gereği hava koşullarına maruz kalır ve değiştirilmesi gerekir. Portland çimentosunun geleneksel yapı malzemelerine karşı kimyasal ve fiziksel bağlayıcılığı düşüktür. Bu durum tarihi yapıların restorasyonunu ve doğal taşın kullanıldığı modern rustik mimariyi engellemektedir. Kireç bağlayıcı teknolojileri birçok bina koruma projesinde önemli bir rol oynamaktadır. Bu tür bağlayıcılar, tarihi binalardaki çok çeşitli inşaat teknolojilerinde yaygın olarak kullanılmaktadır ve bunlar arasında beton, harç, sıva, kireç ve harçlar yer almaktadır. Doğru bakım uygulamaları, yeniden oluşturulan bileşenlerin performansını garanti etmek ve iyi çalışan parçalara zarar gelmemesini sağlamak için güçlendirme malzemelerinin uygun şekilde kullanılmasını gerektirir. Tarihi binaların hassas onarımı, müdahale sonrasında daha yüksek düzeyde uyumluluk ve özgünlük sağlamak için her zaman, yapılarını oluşturan yerel malzemelerin anlaşılmasını gerektirir.

**Anahtar kelimeler:** Geleneksel yapılar, restorasyon, yığma taş, kireç

## **REPAIR OF TRADITIONAL MASONRY STONE LIME BUILDINGS**

### **Abstract**

Due to its durability and economy, masonry has been used not only in buildings from ancient times to the present day, but also in many structures such as stone towers and castles. Most historical and traditional mortars are made with lime. Lime mortars, by their nature and function, are subject to weathering and need to be replaced. Portland cement has low chemical and physical binding to traditional building materials. This situation prevents the restoration of historical buildings and modern rustic architecture using natural stone. Lime binding technologies play an important role in many building conservation projects. Such binders are widely used in a wide range of construction technologies in historic buildings and include concrete, mortar, plaster, lime and mortars. Proper maintenance practices require the proper use of retrofit materials to guarantee the performance of rebuilt components and to ensure no damage to well-functioning parts. Precision restoration of historic buildings always requires an understanding of the local materials that make up their structures, in order to ensure a higher level of compatibility and authenticity after intervention.

**Keywords:** Traditional buildings, restoration, masonry stone, lime

### **Sürdürülebilir binalar bağlamında duvarcılık**

Herhangi bir yapının en etkili ve önemli bileşeni duvardır. Kolezyum, antik Yunan ve Roma'dan kalma binalar, Orta Amerika binaları ve Miken yapılarının tümü bu malzemeyi ana yapı unsurlarından biri olarak kullanmıştır. En eski biçim düzensiz şekilli taşlardan oluşan kuru duvarcılıktır. Masif duvarın çevresel kontrol kapasitesinin yanı sıra, çevre üzerinde düşük etkiye sahip bir onarıcı malzeme olarak duvar işçiliğinin ekolojik nitelikleri, sürdürülebilirlik konusundaki güncel kaygılar bağlamında, duvar işçiliğini sürdürülebilir bina mimarlığı için uygun bir malzeme olarak tekrar dikkatleri üzerine çekmektedir (Almssad ve ark., 2022). Duvar, birimlerden ve bağlantı noktalarından oluşan heterojen bir malzemedir. Birimleri tuğla, blok, kesme taş, kerpiç, düzensiz taşlar ve diğerleridir. Harç, kil, bitüm, tebeşir, kireç/çimento bazlı harç, yapıştırıcı veya başka bir madde olabilir. Birimlerin geometrisi, doğası ve düzeninin yanı sıra harçların özelliklerinden kaynaklanan çok sayıda olası kombinasyon, "kagir" teriminin doğruluğu konusunda şüpheler uyandırmaktadır. Bununla birlikte, farklı duvar türlerinin mekanik davranışı genel olarak ortak özelliklere sahiptir: yüksek özgül kütle, düşük çekme ve kesme mukavemetleri ve düşük süneklik (kırılgan davranış). Genel olarak antik yığma yapılar, depremlerin neden olduğu yüksek eylemsizlik yükleri dikkate alınmadan düşey statik yükler (basınç davranışı) için tasarlanmıştır (Lourenço ve ark., 2011). Teknik olarak "Duvarcılık", belirli bir düzende döşenen ve harçla birleştirilen duvar birimlerinin bir araya getirilmesidir. Donatılı duvar olarak kabul edilecek kadar yeterli takviye içermeyen bir duvar "donatısız duvar"dır. Çubukların veya ağın harç veya betona gömüldüğü ve böylece tüm malzemelerin etkilere karşı birlikte direnç gösterdiği duvarcılık "güçlendirilmiş duvarcılık"tır. "Öngerilmeli duvar", gerilmiş takviye ile kasıtlı olarak iç basınç gerilimlerinin oluşturulduğu bir duvardır. "Sınırlı yığma", dikey ve yatay yönde betonarme veya güçlendirilmiş yığma sınırlayıcı elemanlarla donatılmış bir duvardır. "Duvar bağı", ortak eylemi gerçekleştirmek için duvardaki birimlerin düzenli bir düzende yerleştirilmesidir. Bir "yığma birim", yığma inşaatta kullanılması amaçlanan, önceden oluşturulmuş bir bileşendir. "Duvar harcı", duvar işçiliğinin yataklanması, birleştirilmesi ve sivriltilmesi için bir veya daha fazla inorganik bağlayıcı, agrega ve su karışımı ve bazen ilaveler ve/veya katkılarıdır (AB Direktifi (2004). Harç, bina teknolojisi açısından temel öneme sahiptir. Duvar birimlerini birbirine bağlamak ve inşaat sürecini kolaylaştırmak için kullanılır. Harçların yapışkanlığı artırma ve sağlam yapılar oluşturma kapasitesinden yararlanmak için çeşitli inşaat teknikleri geliştirilmiştir. Alçı harçları, yapışma özellikleri ve çabuk sertleşmeleri nedeniyle çeşitli avantajlar sunar. Alçıtaşı açısından zengin bölgelerde yapısal bağlayıcı madde olarak kullanımları gelişmiş ve özellikle tonoz yapımında

önemli olmuştur. Kireç harçları, özellikle mekanik direnç ve nemli koşullara dayanıklılık açısından alçı harçlara göre farklı avantajlar sunuyordu. Kireç harçlarının yoğun kullanımı antik Romalılar dönemine denk gelir ve en önemli bağlayıcı malzeme olarak yüzyıllar boyunca kullanılmıştır. Kullanımları, on dokuzuncu yüzyılda Portland çimento harçlarının piyasaya sürülmesine kadar devam etmiştir (Vitti, 2021).

## **2. Kireç harcı**

Kalsiyum karbonatın çökmesi topraklarda (özellikle kurak bölgelerde) ve regolitlerde yaygındır. Kalkerli gözenekli kil aynı zamanda dünyanın kurak bölgelerinde de bulunur. Tuğla duvarlar genellikle yapıların dış duvarlarını, korkulukları, iç bölmeleri, bağımsız duvarları, istinat duvarlarını ve diğer dikey yapı elemanlarını oluşturmak için kullanılır. Duvar işçiliğini kısaca tuğlayla inşa etme sanatı olarak tanımlayabiliriz. Bu, biri tuğla olmak üzere iki tür duvar işçiliği olduğunu ima eder. Derzleri doldurmak ve duvar inşa etmek için kil ve çimentonun kullanıldığı kil işi ve çimento işi olarak daha alt kategorilere ayrılabilir. Duvarın gücü, üzerindeki yapısal elemanların uyguladığı yükü destekleme yeteneğidir. Buna karşılık yatay yükleme altında konumunu koruyabilmesine stabilite denir. Yüklerin duvarlara uygulanması iç gerilimlere ve deformasyonlara neden olur. Harç ve tuğlanın tipi, duvar malzemelerinin şekli ve boyutu, harç katmanlarının kalınlığı ve yoğunluğu birlikte duvar işçiliğinin gücünü belirler (Almssad ve ark., 2022). Kireç, çok sayıda kategori ve alt kategori olmasına rağmen, kalsiyum hidroksite verilen genel addır. Binalarda farklı uygulamalar için farklı türdeki kireçler kullanılabilir ve spesifik fiziksel özellikleri ve performans özelliklerine göre seçilirler. Kireç harcının özellikleri, onu üretmek için kullanılan kireç bağlayıcının doğasına ve ayrıca karışıma katılan katkı maddelerinin etkilerine bağlıdır (Snow ve Torney, 2014). Kireç harcı, bağlayıcı olarak kullanılan kireç ve agreganın (normalde nehir kumu ve su) bir karışımıdır. Kireç harçları çok eski çağlardan beri yapı malzemelerinde kullanılmaktadır. Bunların kullanımının ilk örnekleri Filistin ve Türkiye'de bulunmuş ve M.Ö. 12.000 yıllarına kadar uzanmaktadır. Daha sonra Antik Yunan ve Roma İmparatorluğu'nda rastlanılmaktadır (Degryse ve ark., 2002; Genestar & Pons, 2003; Maravelaki-Kalaitzaki ve ark., 2003). 'Yağlı kireç' veya 'hidrolik olmayan kireç' olarak da adlandırılan havada sönmüş kireçler iki kategoriye ayrılabilir: kalsiyum kireci ve dolomitik kireç ve bunların spesifik kimyasal bileşimlerine ilişkin başka alt bölümler. Bu kireçler, 'saf' olduğu kabul edilen, yani herhangi bir silikat veya alüminat 'kirliliği' içermeyen kireçtaşının yakılmasıyla oluşan doğal kireçlerdir. Kalsiyum kireçtaşından oluşan kalsiyum kirecinin aksine, dolomitik kireç, kalsiyumun bir kısmının magnezyum ile değiştirildiği bir kireç taşı olan dolomitin (magnezyum kireçtaşı) yakılmasıyla oluşur. Bu tip
