kireçtaşı, kalsiyum kireçtaşından daha düşük bir yanma sıcaklığı gerektirir. Bunun dikkate alınmaması, aşırı yanmış sönmemiş kirecin oluşması riskini arttırır, bu da sönme ve olgunlaşma sürelerini uzatabilir. Sönmemiş kirecin gecikmiş hidrasyonu, harcın döşendikten sonra genleşmesine ve dolayısıyla başarısızlığa yol açabilir. Havada sönmüş kireç bir harç içinde kullanıldığında yalnızca karbonatlama ve kurutma yoluyla sertleşir. Bu reaksiyonun ilerlemesi için havadaki karbondioksit gereklidir. Az miktarda nem de gereklidir ki harçtaki ve havadaki nem genellikle yeterlidir. Havada sönmüş kireçler ıslak koşullarda sertleşemez ve duvarın kalıcı olarak doymuş kalması, uzun süre doyumluğa maruz kalması veya su altında kalması muhtemel durumlarında kullanılmamalıdır. Havada sönmüş kireç üç fiziksel formda mevcuttur: taş kireç, kuru sönmüş kireç tozu ve sulu kireç macunu. Sönmemiş kireç (topak kireç olarak da bilinir), kireçtaşının bir fırında yakılmasının ürünüdür. Sönmemiş kireç, diğer kireç türlerini (hidratlı kireç, kireç macunu) üretmek için gerçekleştirilebilecek sonraki değişiklikler/işlemlerden önce fırından çıkarılan malzemedir. Sönmemiş kireç, dikkatle kullanılması gereken oldukça reaktif bir malzemedir. Erken sönmeyi önlemek için kuru ve hava geçirmez kaplarda saklanmalıdır (Snow & Torney, 2014). Sönmüş kireç (aynı zamanda torbalı kireç, inşaat kireci veya kuru hidrat olarak da adlandırılır), kuru bir toz üretmek için sönmemiş kirecin yeterli suyla söndürülmesiyle üretilen bir kireçtir. Doğru şekilde saklanmadığı takdirde, havadaki karbondioksit ve nem nedeniyle sönmüş kireç hala torbanın içindeyken karbonatlaşmaya başlayabilir. Bu haldeki kireç kullanılmamalıdır. Sönmüş kireç, yine kuru toz formunda da temin edilen 'hidrolik kireç' ile karıştırılmamalıdır. Sönmüş kireç, malzemenin işlenebilirliğini arttırdığı için çimento harçlarında sıklıkla 'plastikleştirici' olarak kullanılır. Bir çimento karışımına sönmüş kirecin eklenmesi, ortaya çıkan ürünü bir 'kireç harcı' haline getirmez, bunun yerine kireçle işlenmiş bir çimento karışımı haline getirir (Snow ve Torney, 2014). Kireç macunu (yağlı kireç olarak da bilinir), sönmemiş kirecin aşırı su içinde söndürülmesiyle üretilir. Kireç macunu tamamen söndürülür ve genellikle kireç harcında kullanılmadan önce en az 48 saat "şişmesine" izin verilir. Macunun olgunlaşması veya "şişmesi" zamanla giderek daha ince kireç parçacıklarının oluşmasıyla sonuçlanır (Hansen ve ark., 2000). Macunu tüm kireç türleri arasında en yumuşak, geçirgen, esnek ve işlenebilir hale getiren de bu işlemdir. Macun genellikle kuru hidratlı kireçlere göre daha üstün bir ürün olarak kabul edilir. Kuru hidratın fazla su ile söndürülmesi yoluyla kireç macunu elde edilmesi uygulaması tavsiye edilmez. Bu, sönmemiş kireçten oluşan kireç macununa göre daha düşük özelliklere sahip bir malzemenin oluşmasıyla sonuçlanır. Tarihsel olarak inşaat işlerinde kullanılan harçlar ya sıcak kireç karışımları ya da kireç macun karışımları olarak hazırlanırdı.

Torbalanmış sönmüş kireç (toz halinde), öncelikle ölçülü çimento harçlarında plastikleştirici olarak kullanılan daha yeni bir üründür (Snow & Torney, 2014).

### **Yığma duvarları değerlendirme testleri**

Duvarcılık, genellikle harç veya bloklar arasındaki sürtünme kuvvetleri aracılığıyla birbirine sağlam bir şekilde yerleştirilen ve birbirine bağlanan bireysel birimlerden oluşan yapıların inşasıdır. Betonun gelişmesinden önce, 19. yüzyıla kadar en dayanıklı mimari form duvarcılıktı. Ancak kullanılan malzemeler, işçiliğin kalitesi ve birimlerin yerleştirildiği desen, genel yığma yapının dayanıklılığını güçlü bir şekilde etkileyebilir. Duvar işçiliğinin direnciyle ilgili çok sayıda parametre vardır: bileşen malzemeleri, birimlerin az çok düzenli geometrisi, bunların yerleştirilme şekli, harç derzlerinin kalınlığı, duvar elemanının farklı yapıları arasındaki bağlantı vb. (Garcia ve ark., 2012). Her bir tipolojinin tanımı, coğrafi konumuna, dönemine, orijinal amacına ve ekonomik gücüne dayanmaktadır. Bu nedenle, farklı yığma inşaat teknikleri, yapıyı güçlendiren veya zayıflatan çeşitli faktörler sunar. Düzensiz taş duvarcılık durumunda kesinlikle çok zor olan duvar işçiliğinin nihai mukavemetini ve deforme olabilirliğini tahmin etmeye yönelik tüm bu çabalara rağmen, daha kesin değerler yalnızca belirli bir duvar işçiliğinin önemli ve temsili hacimleri üzerinde yapılan, aynı düzen ve geometrik oranlarda yapılan testlerden elde edilebilir (Oliveira, 2003). Bu verileri elde etmek için tam boyutlu testler yapılabilir, ancak tam boyutlu test programları genellikle çok pahalıdır ve bazı durumlarda diğer sınırlamalar nedeniyle pratik değildir. Daha büyük boyutlu numunelerin çıkarılması genellikle çok zordur, hatta kültürel miras anıtları söz konusu olduğunda imkansızdır. Geçmişte prizma testinin uygun maliyetli olduğu ve tam boyutlu testlerle bir dereceye kadar korelasyon sağladığı kanıtlanmıştır (Garcia ve ark., 2012). Avrupa Standartları (Eurocode 6 - Yığma yapıların tasarımı - Bölüm 1-1: Güçlendirilmiş ve takviyesiz yığma yapılar için genel kurallar) ayrıca bu test yönteminin, duvar elemanının basınç dayanımını ve elastiklik modülünü yansıttığını da belirtir. Bütün yığma duvarların davranışının laboratuvarında tahribatlı testler yoluyla değerlendirilmesinin çeşitli yolları vardır. Orijinal yapıdan kesilmiş büyük numuneler veya çekirdekler, yeniden oluşturulmuş duvarların numuneleri, yığın bağ prizmaları ve/veya laboratuvarında inşa edilen ölçekli duvarlar numune olarak kullanılmaktadır. Monotonik veya döngüsel yükler kullanılarak, eksenel yer değiştirme veya yük izlenerek ve farklı sınır koşulları uygulanarak bu tür numuneler üzerinde hem malzeme hem de yapısal testler yapılabilir. Tüm bu olasılıklar, duvar özellikleriyle birlikte bir hasar modunu tanımlayacaktır. Duvar prizmalarında basınç dayanımı deneyleri kolaylıkla yapılabilir. RILEM test numunesi (RILEM, 2004) gibi yığın bağ prizmaları, duvarın tek eksenli

basınç dayanımını değerlendirmek için sıklıkla kullanılır. Tek eksenli sıkıştırma ile yüklenen istiflenmiş bir prizmada, harç, ilgili elastik özelliklerinden dolayı, taşa göre yanal olarak daha fazla genleşme eğilimindedir. Taş ve harç arasındaki uyum ve sürtünme ile sağlanan süreklilik, harcın yanal hapsolmesine yol açar. Sonuç olarak, harç-taş ara yüzeyinde kayma gerilmeleri gelişir ve harçta üç eksenli bir basınç gerilimi durumu ve taştaki tek eksenli sıkışma ile birlikte iki taraflı gerilim meydana gelir. Sonuç olarak başarısızlık durumu genellikle taşlarda yükleme yönüne paralel çatlakların oluşması nedeniyle meydana gelir (Oliveira ve ark., 2006). Genestar & Pons, (2003) tarafından İspanya'da Palma de Mallorca'daki saray, manastır ve konaklardan alınan İslami, Gotik ve daha sonraki dönemleri içeren tarihi harçların analizi yapılmıştır. Enerji dağılımlı X-ışını spektrometresine (EDX) bağlı taramalı elektron mikroskobu (SEM), Fourier dönüşümü kızılötesi spektroskopisi (FTIR) ve X-ışını kırınımı (XRD) teknikleri, analiz edilen numunelerin morfolojisini ve analitik bileşimini karakterize etmek için kullanılmıştır. Genel olarak kaplama sıva harçlarının düşük oranda küçük boyutlu agrega içerdiği görülmüştür. İncelenen kaplama sıva harçlarının büyük çoğunluğu kireç harcı grubuna aittir. Karışık alçı-kireç harçları arasında bulunan kalsit-alçıtaşı oranları, eski eserlerde belirtilen oranlarla iyi bir uyum içindedir. 11. yüzyıl analitik kompozisyonu ile 15. yüzyıl kireç harçlarının karşılaştırılmasında herhangi bir farklılık görülmemiştir. Alçı bakımından zengin harçların kalsit harçlarından çok daha sert ve kompakt olduğu bulunmuştur. Sonuçlar, karışık ve kireçli harçların kullanıldığını, dolayısıyla kullanılan harcın türü ile yaşı arasında bir ilişki kurmanın mümkün olmadığını göstermiştir. Boyalı harçlarda çok renklilik de incelenmiştir. Bulunabilen en yaygın pigmentler doğal topraklar olmuştur.

### **Tarihi yapı restorasyonu**

Dünyanın her yerindeki hem mimari anıtlarda hem de şehir merkezlerinde birçok tarihi yapıda duvar işçiliği kullanımı çok yaygındır. Bu duvarcılık genellikle farklı tipolojilerle karakterize edilen çeşitli ve çok zayıf malzemelerden yapılmıştır. Bu heterojen malzemenin kırılabilirliği, günümüzde insan yaşamının korunmasına yönelik yapısal tasarımın güvenlik ilkelerini oluşturan enerji dağılımına dayalı süneklik kriterleriyle çatışmaktadır (Angiollilli ve Gregori, 2020). Sismik hareketlerin yol açtığı felaketler, antik çağlardan modern çağa kadar takviyesiz duvarların kullanımını engellemiştir. Güçlendirme sistemlerinin benimsenmesinin, geleneksel depreme dayanıklı ahşap çerçeveler gibi ilkel uygarlıkla başladığını söylemek yeterli olacaktır (Aloisio ve ark., 2019). Yığma yapılar için kireç harçlarının seçimi, bir onarım veya yeni inşaat projesinin önemli bir bileşeni olabilir. Karar verme sürecinde dikkate alınması gereken değişkenlerin sayısı ve materyallerin algılanan doğal karmaşıklığı nedeniyle bu seçimin zor

olduđu düşünölmektedir. Dayanıklılıđa iliřkin nispeten yeni üretilmiř çeřitli veri setlerinin kullanılması, kireç harçlarının uygun seçimine yardımcı olabilir. Ancak bu belirleyicilerin, maruz kalma seviyelerinin, bina detaylarının ve nem tutma performansının geleneksel değeriendirilmesiyle iliřkilendirilmesi gerekir. Bu harçların seçim sürecinin iyileřtirilmesini sađlamak için mevcut yapının yapı durumu arařtırması esastır (Forster ve Carter, 2011). 21. yüzyıla kadar inřaatlarda sürekli olarak kireç harçları kullanılmıřtır. 19. yüzyılın ikinci yarısında Portland çimentosunun ortaya çıkıřı, kireç harçlarının kullanımında önemli bir düşüře yol açmıřtır; çünkü çimento, hızlı prizlenme süresi ve yüksek mekanik direnç gibi bazı önemli avantajlar sunuyordu. Son yıllarda Portland çimentosunun bazı yetersiz özelliklere sahip olduđu ve pek çok dođal tařla uyumsuz olduđu keřfedilince, tarihi binaların restorasyonunda kireç harçlarının kullanımı yeniden canlanmıřtır (Moropoulou ve ark., 2005). Kalsiyum sülfatlar ve sodyum tuzları gibi çözüner tuzlar bazen Portland çimentosunda bulunur ve zamanla sızabilir. Bu meydana gelirse, yakın çevresindeki malzemelere hızla zarar verebilir. Kireç harçlarıyla ilgili gelenek ve teknikler, sanayi devriminden sonra birçok batı ülkesinde neredeyse tamamen kaybolmuřtur. Ayrıca, restorasyonlarda ve dođal tařın kullanıldıđı modern mimaride çimento esaslı harçların kullanımının dezavantajlarına rađmen kireç harçlarının yeni kullanımları, Portland karıřımlarıyla aynı řekilde iřlendiđinden her zaman başarılı olmamıřtır. Antik çağlarda ve aslında 19. yüzyıla kadar kirecin özelliklerini iyileřtirmek ve deđiřtirmek için birçok farklı katkı maddesi karıřtırılmıřtır. İyileřtirilmek istenen bu özellikler arasında sertleşme süresi, yapıřma, geçirimsizlik ve sertlik sayılabilir. Bu karıřımlar, kireç harçlarının modern "yeniden keřfi" sırasında tamamen kaybolmuř, reçineler ve sentetik organik malzemeler içeren ticari karıřımlar ise eski tekniklerin geleneksel uygulamaları etrafında çokça "gürültülü" řekilde piyasaya çıkmıřtır (Ventola ve ark., 2011). Hem kireç hem de çimento harçları uygun řekilde kullanıldıđında iyi performans gösterebilir. Çođu durumda, geleneksel olarak inřa edilmiř yıđma yapıların onarımı için kireç harcı gerekli olacaktır. Uyumsuz harçların kullanılması duvar çürümesinin hızlanmasına ve nem sorunlarına yol açabilir. Uygun becerilere sahip bir bina danıřmanı veya tař ustası, önlenebilir duvar çürümesinin ve ilgili sorunların önlenmesi amacıyla dođru malzemelerin kullanıldıđından emin olmak için herhangi bir koruma çalıřmasında erken bir aşamadan itibaren onarım malzemelerinin belirlenmesi sürecine dahil edilmelidir (Mitchell & Torney, 2015).

**Şekil 1.** Başarısız çimento kaplamasında kopmanın alttaki orijinal kireç harcını ortaya çıkarması durumu (Mitchell & Torney, 2015).

Fiber bazlı güçlendirme sisteminin geliştirilmesi, beton malzemenin sünekliğini arttırmak için çelik fiberlerin eklenmesi potansiyelinin fark edildiği 1960'lı yıllarda başlamıştır. Ancak bu teknoloji, harç enjeksiyonu, güçlendirilmiş delme ve betonarme sıva gibi geleneksel sistemlere alternatif olarak ancak son on yılda yığma yapıların güçlendirilmesi için yaygın olarak benimsenmiştir. Gerçekten de, tarihi yapıların korunmasına ilişkin katı kurallar nedeniyle, koruma komiteleri genellikle tarihi yapıları korumak için yapısal olarak verimli ancak daha az müdahaleci teknikler talep etmektedir. Mevcut yapılara modern ve yenilikçi müdahale çözümleri arasında, Fiber Takviyeli Polimerler (FRP) veya Fiber Takviyeli Çimentolu Matris (FRCM) gibi kompozit malzemeler, Hem modern hem de tarihi yığma yapıların (binalar, köprüler, kuleler) ve yapısal bileşenlerin (duvarlar, kemerler ve tonozlar, sütunlar ve sütunlar)

güçlendirilmesi ve onarımı için giderek daha fazla dikkate alınmaktadır. Bu teknolojiler, tek veya çift yönlü uzun liflerle karakterize edilen kompozit malzemenin kullanımından oluşur. Bu malzemelerin, yığma elemanların yük taşıma kapasitesinin artırılmasında ve kritik gevrek kırılma modlarının azaltılması yoluyla yapısal davranışlarının iyileştirilmesinde etkili olduğu kanıtlanmıştır. En önemlisi, geleneksel olanlara (örneğin betonarme sıva) kıyasla, yapısal ağırlık artışının daha düşük olmasıyla mukavemet artışı elde edilir (Angiolilli ve ark., 2020).

FRP teknolojisi laminat ve çubukların uygulanmasından oluşur. Laminatların kullanımı, önceden kumlama ve macunlama prosedürüyle hazırlanmış olan yığma panellerin yüzeyine fiber levhaların manuel olarak döşenmesi yoluyla uygulanmasını içerir. Elyaf, sertleştikten sonra yeni oluşturulan laminatın güçlendirilmiş elemanın ayrılmaz bir parçası haline gelmesini sağlayan bir epoksi reçine ile emprenye edilir. Öte yandan, pultrüzyon çubukların kullanımı, bunların güçlendirilecek elemanın yüzeyinde kesilen oluklara yerleştirilmesinden oluşur. Oluk, epoksi bazlı bir macunla doldurulur ve daha sonra çubuk oluğun içine yerleştirilir ve macunun çubuğun etrafında akmasını sağlamak için hafifçe bastırılır. Daha sonra oluk daha fazla macunla doldurularak yüzey düzeltilir (Tumialan ve ark., 2001). Tarihi yapıların restorasyonunda genellikle duvar harcının değiştirilmesi veya onarılması gerekir, ancak uygun harcın seçimi genellikle sorundur. Uygunsuz bir seçim, restorasyon çalışmasının başarısız olmasına ve belki de daha fazla hasara yol açabilir. Bu nedenle, orijinal harc teknolojisinin tam olarak anlaşılması ve uygun yedek malzemelerin üretilmesi önemli araştırma hedefleridir. Duvar harçlarında yıllar içinde pek çok çeşit malzeme kullanılmış ve teknoloji, eski zamanların tek bileşenli harcından, çeşitli bileşenler içeren hibrit versiyonlara doğru yavaş yavaş gelişmiştir. Avrupa'da M.Ö. 2450'den itibaren kireç duvar harcı olarak kullanılmaya başlandı. Roma döneminde kireç harcına öğütülmüş volkanik kül, tuğla tozu ve seramik parçacıkları eklenerek performansı büyük ölçüde artırıldı. Üstün özellikleri nedeniyle bu hidrolik (yani su altında priz alabilen) harcın kullanımı tüm Avrupa'da ve Batı Asya'da yaygınlaşmış ve benimsenmiştir. Belki de antik Çin'de volkanik kül gibi doğal malzemelerin bulunmamasından dolayı hidrolik harc teknolojisi gelişmemiştir. Ancak özel bir inorganik-organik kompozit yapı malzemesi olan yapışkan pirinç-kireç harcı geliştirilmiştir. Bu teknoloji, mezarlar gibi binalarda, kentsel inşaatlarda ve hatta su koruma tesislerinde yaygın olarak kullanılmıştır. Yapışkan pirinç-kireç harcı, dünyada yaygınlaşan ilk inorganik-organik kompozit harc teknolojisi haline gelebilir (Yang ve ark., 2010). Yeterli miktarda boşluk içeren çok parçalı taş yığma duvarlara harc enjeksiyonu, bu tür duvarların sismik güçlendirilmesi için etkili bir teknik olabilir. Çimento-kireç enjeksiyonu kombinasyonu kullanılarak yeterli düzeyde sismik direnç

elde edilebilir, ancak çimento enjeksiyonu daha yüksek sismik direnç sağlayabilir (Uranjek ve ark., 2012).

1990 yılından bu yana, Roma kenti Sagalassos'ta (Türkiye'nin güneybatısı) Leuven Katolik Üniversitesi (Belçika) tarafından düzenli arkeolojik kazılar yapılmaktadır. Sagalassos topraklarında bulunan mineral hammaddelerin kaynağının araştırılması kapsamında, Sagalassos'taki kireç harçlarının mineralojisi ve petrografisi ayrıntılı olarak incelenmiştir. Uygun bir tamir harcı tasarlamak için numuneler ince kesitler üzerinde optik mikroskopla analiz edilmiş ve ardından XRD analizleri yapılmıştır. Bağlayıcı olarak kullanılan kireç yerel Triyas kireçtaşlarından yakılarak kuru söndürülerek hazırlanmıştır. Üç ana agrega türü tanımlanmıştır: yerel Mesozoyik kireçtaşlarından elde edilen kireçtaşı, yerel olarak üretilen kaba kırılmış seramikler ve yakındaki bir volkanik bölgeden gelen volkanik tüf. Kazıdan çıkan kalıntıları çok sert iklim koşullarında korumak için, restorasyon harcının deneysel karışımları, eski zamanlarda olduğu gibi benzer hammaddeler kullanılarak dayanıklılık ve donma dayanıklılık açısından test edilmiştir. Yerinde daha fazla koruma ve restorasyon için önerilen harç, Isparta bölgesinden gelen kırılmış volkanik kaya ile kireç karışımından oluşmaktadır. Bu bileşim orijinal Roma malzemesine çok benzerdir ve donma-çözülme testlerinde yüksek donma direnci göstermiştir (Degryse ve ark., 2002). Minos'tan günümüze kadar Girit'teki çeşitli dönemlere ait anıtlardan alınan harçlar, deniz ve nemli ortamda dayanıklılıklarını değerlendirmek amacıyla (mineralojik ve kimyasal bileşim, tane büyüklüğü dağılımı, hammaddeler, çekme mukavemeti açısından) Maravelaki-Kalaitzaki ve ark., (2003) tarafından incelenmiştir. Kireç teknolojisi ve hammaddeleri çeşitlidir: (a) kireç, (b) hidrolik kireç, (c) kırma tuğlalı kireç ve (d) puzolanikli kireç malzeme. Bunlar, %22 (puzolanik harçlar) ile %29 (kireç harçları) arasında değişen miktarlarda bağlayıcılar içerir. Kalsiyum silikat/alüminat hidratlar gibi hidrolik bileşikler ve çekme mukavemeti puzolanik harçlarda daha yüksek olup bunu kırılmış tuğla kireci, hidrolik kireç ve kireç harçları takip etmiştir. Kireç harçlarında tespit edilen suda çözünebilir tuzların yüksek miktarları bunların parçalanma riskini göstermiştir. Büyük olasılıkla, hava koşullarına bağlı olarak kalsitin sızması, düşük miktarlarda bağlayıcı malzemeyi açıklamaktadır. Harçların ölçülen çekme mukavemeti değerleri hidroliklik düzeyleriyle doğru orantılıdır. Kireç harçları yerel kalkerli tortul taşların kırılması veya deniz kumu kullanılmasıyla hazırlanmıştır. Bağlayıcılar tamamen karbonatlı, ince kristalize kalsittir. Bu harçlar, ince kumların kullanılmasıyla birlikte ortalama %30 oranında bağlayıcı malzeme sağlar. Ayrıca, bu harçların suda çözünen kısmında tespit edilen yüksek miktarlardaki Ca<sup>2+</sup>, Cl ve SO<sub>4</sub><sup>2-</sup>, bunların bozulmaya karşı duyarlılığının yüksek olduğunu göstermektedir. Çalışma, tam kimyasal analiz

sonuçlarının, harçların asitte çözünen/çözünmeyen fraksiyonunun kimyasal analizlerinin ve toplam harçla ilişkili olarak bağlayıcının ağırlık faktörüne ilişkin mineralojik veri bilgilerinin birleştirilerek elde edilebileceğine işaret etmektedir.

### **5. Sonuç**

Kireç, binlerce yıldır duvar harçlarında kullanılmaktadır ve çimentoyla karşılaştırıldığında düşük basınç dayanımına rağmen birçok eski bina, tamamen kireç teknolojisiyle bugün ayakta kalmaktadır. Modern yaklaşımlar, onarım döngülerini ve işçilik maliyetlerini en aza indirmek için daha güçlü ve daha dayanıklı malzemelere yöneliyor ancak bu, geleneksel binaların zararına oluyor. Tarihi duvarların onarımında kullanılan çimento bazlı harçlar, onlarca yıldır makul durumda olan eski binaların çürümesini hızlandırdı. Bu, koruma endüstrisinin kireç teknolojilerini masif yığma binalar için daha uyumlu bir çözüm olarak değerlendirmeye geri dönmesine neden oldu. Fiber bazlı güçlendirme sistemi teknolojisi, mirasın korunması için koruma komitelerinin gerektirdiği giderek daha katı kurallar nedeniyle duvarcılıkta yaygın olarak ancak son on yılda benimsenmiştir. Güçlendirme sisteminin verimliliği güçlendirme çözümünün düşük invazivliği ve orijinal yapılarla yüksek uyumluluk ile birlikte gereklidir.

### **Özet**

Bu çalışmanın amacı, gözlerden kaynaklı elektriksel aktiviteye dayanan bir göz hareketi kayıt tekniği olan elektrookülografi (EOG) işaretinin, çoklu-fraktal davranışını incelemektir. Bu amaçla, elektrookülografi zaman serisinden güç yasası üslerinin çoklu-fraktal spektrumunu belirleyebilen, çoklu-fraktal eğilimsiz dalgalanma analizi isimli yöntem kullanılmaktadır. Elektrookülografi, insan bilgisayar arayüzlerini geliştirmek için kullanılabilir bir biyomedikal işarettir. Biyomedikal işaretlerin yapısal özellikleri genellikle görsel olarak belirgindir ancak bu yapısal özellikler sinyalin ortalama genliği gibi geleneksel ölçümlerle yakalanamaz. Biyomedikal bir işaret, işaretin alt aralıklarındaki yapılar kendini tekrarladığında ölçekten bağımsız değişmez bir yapıya sahiptir. Fraktal analiz, biyomedikal sinyalin belirli türde ölçekten bağımsız değişmez yapısını tanımlayan güç yasası üsünü tahmin eder. Fraktal analizler, biyomedikal işaret işleme (EKG, EEG, MR ve X-ışını görüntülerinde) işaretin ölçekten bağımsız değişmez yapısını tanımlamak için sıklıkla kullanılır. Fraktal analiz, sinir hücrelerinin aksiyon potansiyelleri arasındaki aralığı, insan yürüyüşünün adımlar arası aralığı, insan solunumunun nefesler arası aralığı ve insan kalbinin atışlar arası aralıklarının ölçek değişmez yapılarını, sağlıklı ve patolojik durumlar arasında ayırım yapılabilmesine imkan sağlamaktadır. Bununla birlikte, biyomedikal işaretlerin ölçekle değişmeyen yapısında uzamsal ve zamansal farklılıklar sıklıkla ortaya çıkar. Bu uzamsal ve zamansal değişimler, biyomedikal işaretin, güç yasası üslerinin çoklu-fraktal spektrumu tarafından tanımlanan çoklu-fraktal bir yapısını gösterir. Biyomedikal işaretin tek-fraktal ve çoklu-fraktal yapıları, belirli bir ölçekte değişmez yapılardır. En yaygın olarak, biyomedikal sinyallerin tek-fraktal yapısı, tek bir kuvvet kanunu üssü ile tanımlanır ve ölçek değişmezliğinin zaman ve mekandan bağımsız olduğunu varsayar. Bununla birlikte, biyomedikal sinyalin ölçekle değişmeyen yapısında uzaysal ve zamansal farklılıklar sıklıkla ortaya çıkar. Bu uzaysal ve zamansal varyasyonlar, biyomedikal sinyalin, güç yasası üslerinin çoklu-fraktal spektrumu tarafından tanımlanan bir yapısını gösterir. Bu çalışmada, insan deneklerden alınan EOG işareti, çeşitli ölçeklerde çoklu-fraktal eğilimsiz dalgalanma analizi yöntemiyle incelenerek, EOG işaretinin çoklu-fraktal yapısı gösterilmektedir.

## **MULTI-FRACTAL BEHAVIOR OF ELECTROOCULOGRAPHY SIGN**

### **Abstract**

The aim of this study is to examine the multi-fractal behavior of the electrooculography (EOG) signal, which is an eye movement recording technique based on electrical activity originating from the eyes. For this purpose, the method called multifractal detrended fluctuation analysis is used, which can determine the multi-fractal spectrum of power law exponents from the electrooculography time series. Electrooculography is a biomedical signal that can be used to improve human-computer interfaces. Structural features of biomedical signals are often visually evident, but these structural features cannot be captured by traditional measurements such as the average amplitude of the signal. A biomedical signal has a scale-invariant structure when structures in subranges of the signal repeat themselves. Fractal analysis estimates the power law exponent that describes certain types of scale-invariant structure of the biomedical signal. Fractal analyzes are frequently used in biomedical signal processing (ECG, EEG, MR and X-ray images) to define the scale-independent invariant structure of the signal. Fractal analysis enables the discrimination between healthy and pathological conditions by using the scale-invariant structures of the interval between action potentials of nerve cells, the interval between steps of human walking, the interval between breaths of human respiration and the intervals between beats of the human heart. However, spatial and temporal differences in the scale-invariant structure of biomedical signals often occur. These spatial and temporal variations indicate a multi-fractal structure of the biomedical signal defined by a multifractal spectrum of power law exponents. The monofractal and multifractal structures of the biomedical signal are invariant structures at a certain scale. Most commonly, the monofractal structure of biomedical signals is described by a single power-law exponent and assumes scale invariance to be independent of time and space. However, spatial and temporal differences in the scale-invariant structure of the biomedical signal often occur. These spatial and temporal variations indicate a structure of the biomedical signal defined by a multifractal spectrum of power law exponents. In this study, the EOG signal taken from human subjects is examined by the multifractal detrended fluctuation analysis method at various scales and the multifractal structure of the EOG signal is shown.

## **Giriş**

Çoklu-fraktal analiz, ölçekleme davranışlarında değişkenlik sergileyen daha karmaşık sistemleri tanımlamak için geleneksel fraktal analizin ötesine geçen bir matematiksel çerçevedir. Kökeni fizik ve matematik alanlarından gelen bu yaklaşım, meteoroloji, jeofizik, ekonomi gibi farklı disiplinlerde ve hatta insan fizyolojisinin analizinde geniş kapsamlı uygulamalar bulmuştur. Multifraktal analiz, özünde, bir sistem içinde mevcut olan heterojenliğin veya düzensizliğin derecesini ölçmeye, sistemin dinamik ve çoğunlukla kaotik doğasının özünü yakalamaya çalışır. Tek bir ölçeklendirme kuralı veya fraktal boyutla karakterize edilen basit fraktalların aksine, çoklu-fraktal sistemler, sistemin farklı bölümleriyle ilişkili ölçeklendirme davranışları spektrumuna sahiptir. Bu çok yönlü ölçeklendirme, sistem içinde mevcut olan ve tek bir üs veya boyutla yeterince tanımlanamayan karmaşık hiyerarşik yapıların ve değişen derecelerdeki kendi kendine benzerliğin göstergesidir. Bu nedenle, çoklu-fraktal analiz, karmaşık sistemlerin daha incelikli ve ayrıntılı bir karakterizasyonunu sağlayarak araştırmacıların, bir sistemi yöneten temel kalıpların veya dinamiklerin ortaya çıkarılmasına ve anlamasına olanak tanır. Fraktal analizler biyomedikal işaret işlemede EKG, EEG, MR ve X-ışını resimlerinde ölçek değişmez yapısını tanımlamak için sıklıkla kullanılır (Lopes ve Betrouni, 2009). Fraktal analiz, sinir hücrelerinin aksiyon potansiyelleri arasındaki aralığı, insan yürüyüşünün adımlar arası aralığı, insan solunumunun nefesler arası aralığı ve insan kalbinin atışlar arası aralıklarının ölçek değişmez yapılarını, sağlıklı ve patolojik durumlar arasında ayırım yapılabilmesine imkan sağlamaktadır (Ivanov vd., 1999; Peng vd., 2002; Zheng vd., 2005; Hausdorff, 2007; Wang vd., 2007). Çoklu-fraktallar, fraktalların bir uzantısı olarak görülebilir. Biyomedikal işaretin tek-fraktal ve çoklu-fraktal yapıları, belirli bir ölçekte değişmez yapılardır. En yaygın olarak, biyomedikal işaretlerin tek-fraktal yapısı, tek bir kuvvet kanunu üssü ile tanımlanır ve ölçek değişmezliğinin zaman ve mekandan bağımsız olduğunu varsayar. Bununla birlikte, biyomedikal işaretin ölçekle değişmeyen yapısında uzaysal ve zamansal farklılıklar sıklıkla ortaya çıkar. Bu uzamsal ve zamansal varyasyonlar, biyomedikal işaretin, güç yasası üslerinin çoklu-fraktal spektrumu tarafından tanımlanan bir yapısını gösterir. Çoklu-fraktal analizler bu nedenle biyomedikal işaret işleme bilgisayar destekli bir araç olarak önemlidir. Son yıllarda eğilimsiz dalgalanma analizi (EDA) yöntemi (Peng vd, 1994; Ossadnik vd, 1994), bir zaman serisinin tek-fraktal ölçeklendirme özelliklerinin belirlenmesi ve gürültülü, durağan olmayan zaman serilerinde uzun dönemli korelasyonların tespiti için yaygın olarak kullanılan bir teknik haline gelmiştir (Kantelhardt vd, 2001; Hu vd, 2001). DNA dizileri (Peng vd, 1994; Ossadnik vd, 1994), kalp atış hızı dinamikleri (Ashkenazy vd, 2001),

nöron ateşlemesi (Bahar vd, 2001) ve insan yürüyüşü (Hausdorff vd, 1997), gibi çeşitli alanlara başarıyla uygulanmıştır. EDA yöntemini kullanmanın bir nedeni, zaman serisindeki durağan olmayan durumların eseri olan korelasyonların sahte tespitini önlemektir. Çoğu zaman serisi, tek bir ölçeklendirme üssüyle açıklanabilecek basit bir tek-fraktal ölçeklendirme davranışı sergilemez. Bazı durumlarda, farklı ölçeklendirme üslerine sahip  $\tau_x$  zaman ölçekleri rejimleri mevcuttur (Kantelhardt vd, 2001; Hu vd, 2001). Örneğin,  $\tau \ll \tau_x$  için küçük ölçeklerde uzun dönemli korelasyonlar ve  $\tau \gg \tau_x$  için daha büyük ölçeklerde başka türde korelasyonlar veya ilişkisiz davranışlar gözlemlenebilir. Diğer durumlarda ölçeklendirme davranışı daha karmaşıktır ve serinin farklı bölümleri için farklı ölçeklendirme üsleri gerekir (Chen vd, 2002). Bu, örneğin, serinin ilk yarısındaki ölçekleme davranışının ikinci yarıdaki ölçekleme davranışından farklı olması durumunda meydana gelir. Daha da karmaşık durumlarda, zaman serisinin birçok iç içe geçmiş fraktal alt kümesi için bu tür farklı ölçeklendirme davranışı gözlemlenebilir. Bu durumda, ölçeklendirme davranışının tam bir açıklaması için çok sayıda ölçeklendirme üssü gereklidir ve çoklu-fraktal bir analiz uygulanmalıdır. EDA yönteminin genelleştirilmiş bir hali olan çoklu-fraktal eğilimsiz dalgalanma analizi (ÇF-EDA) çok sayıda ölçeklendirme üssü kullanarak, zaman serisinin çoklu-fraktal davranışını ortaya çıkararak daha doğru bir analizine imkan tanır (Kantelhardt vd, 2002). Göz tabanlı insan-bilgisayar arayüzünün gelişimi temel olarak, kullanıcının hareketlerini kaydetmek ve kullanıcının oküler durumunu tahmin etmek için bir kamera ve görüntü işleme algoritmalarının kullanımını içeren bir göz hareketi kayıt tekniği olan video okülografiye (VOG) dayanmaktadır. Bu teknik genellikle hesaplama açısından karmaşıktır ve diğer sınırlamaların yanı sıra değişen ortam aydınlatma koşullarına ve kullanıcı hareketlerine karşı hassastır. Hesaplama açısından daha kolay bir alternatif ise elektrookülografinin (EOG) kullanılmasıdır. Bu yöntem, insan gözünün ürettiği elektriksel aktiviteyi kaydeden bir göz hareketi kayıt tekniğidir (Miyashita vd, 2013). Bu çalışmada, gözlerden kaynaklı elektriksel aktiviteye dayanan bir göz hareketi kayıt tekniği olan elektrookülografi (EOG) işaretinin ÇF-EDA yöntemi ile çoklu-fraktal davranışı incelenmektedir.

## **1. Yöntem**

### **1.1. Çoklu-fraktal Eğilimsiz Dalgalanma Analizi (ÇF-EDA)**

ÇF-EDA prosedürü beş adımdan oluşmaktadır (Kantelhardt vd, 2002). İlk üç adım aslında geleneksel EDA prosedürüyle aynıdır (Peng vd, 1994; Ossadnik vd, 1994).  $x_k$ 'nin  $N$  uzunluğunda bir zaman serisi ve bu serinin kompakt destekte olduğunu varsayalım. Destek,

sıfırdan farklı  $x_k$  değerlerine sahip  $k$  endekslerinin kümesi olarak tanımlanır ve serinin yalnızca önemsiz bir kısmı için  $x_k = 0$  ise kompakttır.  $x_k = 0$  değeri bu  $k$ 'da hiçbir değerin olmadığı şeklinde yorumlanır. Kantelhardt vd. (2002) tarafından geliştirilen ÇF-EDA prosedürünün adımları ve yöntemle ilişkin detaylar aşağıda verilmektedir:

- Birinci adım, zaman serisinin profilinin tanımlanmasını içerir ve bu aşağıdaki şekilde gösterilir.

$$Y(i) = \sum_{k=1}^i [x_k - \langle x \rangle], \quad i = 1, \dots, N \quad (1)$$

Burada  $\langle x \rangle$  ortalamayı göstermektedir.

- İkinci adımda,  $Y(i)$  profili,  $N_s \equiv \text{int}(N/s)$  olan  $s$  eşit uzunluğunda örtüşmeyen parçalara bölünür. Serinin  $N$  uzunluğu, çoğu zaman dikkate alınan zaman ölçeğinin (veri boyunun)  $s$  katı olmadığından, profilin sonunda kısa bir veri kalabilir. Serinin bu kısmını atlamamak için aynı işlem karşı uçtan başlayarak tekrarlanır. Böylece toplam  $2N_s$  parça elde edilmiş olur.
- Üçüncü adımda,  $2N_s$  'lik bölümlerin her biri için yerel eğilim, söz konusu parçalara en küçük kareler yöntemiyle uydurulan  $m$  dereceli polinom yardımıyla hesaplanır ve daha sonra varyans belirlenir.

$$F^2(v, s) \equiv \frac{1}{s} \sum_{i=1}^s \{Y[(v-1)s + i] - y_v(i)\}^2 \quad (2)$$

(2) eşitliğinde her  $v$  parçası için  $v=1, \dots, N_s$  dir.  $v=N_s+1, \dots, 2N_s$  için aşağıdaki şekildedir.

$$F^2(v, s) \equiv \frac{1}{s} \sum_{i=1}^s \{Y[N - (v - N_s)s + i] - y_v(i)\}^2 \quad (3)$$

Burada  $y_v(i)$ ,  $v$  parçasındaki verilere uydurulan polinomdur. Eğri uydurma prosedüründe doğrusal, ikinci dereceden, kübik veya daha yüksek dereceli polinomlar kullanılabilir. Zaman serisini eğiliminden arındırma, uydurulan polinomların profilden çıkarılmasıyla yapıldığından, farklı dereceli ( $m$ ) polinomlarla uygulanan EDA 'nın serideki trendleri ortadan kaldırma yetenekleri farklılık gösterir. Örneğin, ÇF-EDAm [ $m$ 'inci dereceli ÇF-EDA] ile profildeki  $m$  dereceli eğilimler ortadan kaldırılmış olur. Bu nedenle, EDA'nın farklı dereceleri için sonuçların karşılaştırılması, zaman serisindeki polinom eğiliminin tipinin tahmin edilmesine olanak sağlar (Hu vd, 2001).

- Dördüncü adımda,  $q$ 'uncu dereceden dalgalanma fonksiyonunu elde etmek için tüm parçaların ortalaması aşağıdaki şekilde hesaplanır.

$$F_q(s) \equiv \left\{ \frac{1}{2N_s} \sum_{v=1}^{2N_s} [F^2(v, s)]^{q/2} \right\}^{1/q} \quad (4)$$

Burada, genel olarak,  $q$  değişkeni herhangi bir gerçektek sayı olabilir.  $q = 2$  durumu için standart EDA prosedürü elde edilmiş olunur. ÇF-EDA yönteminde ise genelleştirilmiş  $q$  'ya bağlı  $F_q(s)$  dalgalanma fonksiyonlarının,  $q$ 'nun farklı değerleri için zaman ölçeği  $s$ 'ye nasıl bağlı olduğuyla ilgilenilmektedir. Bu nedenle, birkaç zaman ölçeği için 2'den 4'e kadar olan adımları tekrarlamak gerekmektedir. Artan  $s$  ile  $F_q(s)$ 'nin artacağı açıktır. Elbette  $F_q(s)$ , aynı zamanda  $m$  dereceli EDA 'ya da bağlıdır. Yapı itibarıyla  $F_q(s)$  yalnızca  $s \geq m + 2$  için tanımlanır.

- Beşinci adımda, Her  $q$  değeri için  $s$  'ye karşı çizilen  $F_q(s)$  log-log grafiği analiz edilerek dalgalanma fonksiyonlarının ölçeklendirme davranışı belirlenir. Eğer  $x_i$  serisi uzun dönemli kuvvet kanunu ile korelasyonlu ise,  $F_q(s)$ , büyük  $s$  değerleri için aşağıdaki kuvvet kanununa uyumlu olarak artar,

$$F_q(s) \sim s^{h(q)} \quad (5)$$

Çok büyük ölçekler için ( $s > N/4$ );  $F_q(s)$  istatistiksel olarak güvenilir hale gelir çünkü 4. adımdaki ortalama prosedürü için  $N_s$  segmentlerinin sayısı çok küçük olur. Bu nedenle,  $h(q)$ 'yu belirlemek için genellikle  $s > N/4$  ölçekleri eğri uydurma prosedürünün dışında tutulur. Bunun yanı sıra, (5) denklemindeki ölçeklendirme davranışından sistematik sapmalar, çok küçük ölçekler için ( $s \approx 10$ ) ortaya çıkar ve düzeltilebilir. Genel olarak (5) denklemindeki  $h(q)$  üssü  $q$  'ya bağlıdır. Durağan zaman serileri için  $h(q=2)$ , iyi bilinen Hurst üssü  $H$  ile aynıdır (Feder, 1988). Böylece  $h(q)$  fonksiyonuna genelleştirilmiş Hurst üssü adı verilir.

$q \rightarrow 0$  için  $h(q)$  limitine karşılık gelen  $h(0)$  değeri, iraksak üs nedeniyle (4) denklemindeki ortalama alma prosedürü kullanılarak doğrudan belirlenemez. Bunun yerine (6) denkleminle verilen logaritmik ortalama alma prosedürü kullanılır.

$$F_0(s) \equiv \exp \left\{ \frac{1}{4N_s} \sum_{v=1}^{2N_s} \ln[F^2(v, s)] \right\} \sim s^{h(0)} \quad (6)$$

$h(0)$ 'ın fraktal destekli zaman serileri için tanımlanamayacağına dikkat edilmelidir. Burada  $h(q)$   $q \rightarrow 0$  için iraksar.

Kompakt destekli tek-fraktal zaman serileri için  $h(q)$ ,  $q$ 'dan bağımsızdır, çünkü  $F^2(v, s)$  varyanslarının ölçeklendirme davranışı tüm  $v$  bölümleri için aynıdır ve (4) denklemindeki ortalama alma prosedürü  $q$ 'nun tüm değerleri için tam olarak aynı ölçeklendirme davranışını verecektir. Ancak küçük ve büyük dalgalanmalar farklı ölçeklenirse,  $h(q)$ 'nun  $q$ 'ya önemli bir bağımlılığı olacaktır: Eğer  $q$ 'nun pozitif değerleri dikkate alınırsa, büyük  $F^2(v, s)$  varyansına sahip  $v$  parçaları (yani, karşılık gelen eğri uydurmadan kaynaklı büyük değişimler) ortalama  $F_q(s)$ 'i büyük oranda etkiler. Dolayısıyla  $q$ 'nun pozitif değerleri için;  $h(q)$ , büyük dalgalanmalara sahip bölümlerin ölçeklenme davranışını açıklar. Tersine,  $q$ 'nun negatif

değerleri için, küçük  $F^2(v,s)$  varyansına sahip  $v$  bölümleri ortalama  $F_q(s)$  üzerinde büyük etkiye sahip olacaktır. Dolayısıyla,  $q$ 'nun negatif değerleri için  $h(q)$ , küçük dalgalanmalara sahip bölümlerin ölçeklenme davranışını tanımlar. Genellikle büyük dalgalanmalar, çoklu-fraktal seriler için küçük dalgalanmalardan daha küçük  $h(q)$  ölçeklendirme üssü ile karakterize edilir. Maksimum ölçek  $s=N$  için dalgalanma fonksiyonu  $F_q(s)$   $q$ 'dan bağımsızdır, çünkü (4) denklemindeki toplam yalnızca iki özdeş bölüm üzerinden çalışır ( $N_s \equiv [N/s] = 1$ ). Daha küçük ölçekler için ( $s \ll N$ ) ortalama alma prosedürü birkaç bölüm üzerinde uygulanır ve eğer  $q < 0$  ise,  $F_q(s)$  ortalama değeri, küçük dalgalanmalara sahip bölümlerden kaynaklı  $F^2(v,s)$  tarafından etkilenecektir. Benzer şekilde,  $q > 0$  için,  $F_q(s)$  ortalama değeri, büyük dalgalanmalara sahip bölümlerden kaynaklı  $F^2(v,s)$  tarafından etkilenir. Bu nedenle,  $s \ll N$  için;  $q < 0$  olan  $F_q(s)$  değeri,  $q > 0$  olan  $F_q(s)$ 'den daha küçük olacaktır.  $s=N$  için her ikisi de eşittir. Dolayısıyla,  $F_q(s)$ 'nin (5) denklemini takiben homojen bir ölçeklendirme davranışı olduğunu varsayılırsa,  $q > 0$ 'a karşılık gelen  $s$  'ye karşı çizilen  $F_q(s)$  log-log grafiğindeki  $h(q)$  eğimi,  $q > 0$  olan  $F_q(s)$ 'nin karşılık gelen eğiminden daha büyük olmalıdır. Böylece,  $q < 0$  için  $h(q)$ , genellikle  $q > 0$  için  $h(q)$ 'dan daha büyük olacaktır.

## **1.2. Elektrookülografi (EOG) işareti**

İnsan gözünün, kornea ve retinanın sırasıyla pozitif ve negatif kutupları oluşturduğu bir elektriksel dipol gibi davrandığı düşünülebilir. Bu dipolün eksenleri gözün optik eksenlerine göre yönlendirilir ve dolayısıyla gözle birlikte döner. Aslında gözün ön ve arka bölgesi arasında korneo-retinal potansiyel adı verilen ve büyüklüğü 0,4-1,0 mV arasında değişen bir potansiyel farkı vardır. Bu, bir elektrik alanı yaratır ve bu alan tarafından üretilen elektriksel aktivite, gözlerin yakınına yerleştirilen elektrotlar kullanılarak invaziv olmayan bir şekilde yakalanır (Heide vd, 1999; Bulling vd, 2011). EOG işaretleri, taban çizgisi tipik olarak sabit olmadığından ve kaymaya maruz kaldığından, taban çizgisi gezinme etkisinden dolayı bozulmaktadır (Heide vd, 1999; Bulling vd, 2011). Özellikle, bu kayma, edinilen EOG işaretlerine müdahale eden ve esas olarak arka plan işaret girişiminin bir sonucu olan düşük frekanslı bir işaret olarak elektrot polarizasyonu, değişen elektrot temas basıncı ve terlemeye bağlı olarak cilt direncindeki değişiklikler şeklinde kendini gösterir (Heide vd, 1999; Bulling vd, 2011; Huda vd, 2015; Marandi vd, 2015). Bu çalışmada kullanılan EOG işareti Barbara ve arkadaşlarının kaydettikleri EOG verilerini temel almaktadır (Barbara vd, 2020). EOG işaretinin kaydedilmesi sırasında kullanılan elektrot yerleşimi Şekil 1 'de verilmektedir.

Şekil 1. EOG elektrot yerleşimi (Barbara vd, 2020).

Şekil 1 ile verilen elektrot yerleşimi temel alınarak kaydedilen yatay ve dikey OEG işaretleri aşağıdaki şekilde tanımlanmaktadır. Şekil 1'de "G" ile gösterilen alın noktası işaret toprağı ve "R" ile gösterilen referans elektrodu sol kulağın arkasına takılıdır (Barbara vd, 2020).

$$EOG_h(t) = V_3(t) - V_4(t) \quad (7)$$

$$EOG_v(t) = V_1(t) - V_2(t) \quad (8)$$

(7) ve (8) nolu ifadelerde,  $V_1(t)$ ,  $V_2(t)$ ,  $V_3(t)$  ve  $V_4(t)$  EOG gerilimleri, Şekil 1 'deki sırasıyla 1, 2, 3 ve 4 numaralı noktalardan ölçülen gerilimlerdir. Yatay olarak yerleştirilen elektrotların farkı olan  $EOG_h(t)$  gerilimi, yatay EOG işareti ve dikey olarak yerleştirilen elektrotların farkı olan  $EOG_v(t)$  gerilimi dikey EOG işareti olarak adlandırılmaktadır. Söz konusu veri seti, 256 Hz örnekleme frekansına sahiptir. EOG verilerinin kaydı sırasında Barbara vd. (2020) deneklerden, bakış noktalarını ekranda vurgulanan bir işarete sabitlemelerini istemiştir. Buna göre, Şekil 2'de gösterildiği gibi bir dizi 4 saniyelik denemeler kaydedilmiştir; burada önce denekten ilk 1 saniyede ekranın ortasından rastgele bir hedef konuma doğru gözüyle bir seçirme yapması istenmiştir ("A" olayı). Bunu, sonraki 1 saniye içinde ekranın ortasına doğru karşılık gelen bir geri dönüş hareketi ("B" olayı) ve her denemenin son 2 saniyesinde bir göz kırpması ("C" olayı) izlemektedir. Her denek için üç ayrı oturumda bu tür toplam 300 deneme kaydedildiği raporlanmıştır (Barbara vd, 2020).

Şekil 2. Deneklerden alınan EOG kayıtlarının açıklaması. "A" olayı : Ekranın ortasından bir hedef konuma doğru seğirme, "B" olayı : Ekranın ortasına doğru karşılık gelen bir geri dönüş hareketi, "C" olayı : Göz kırpma.

## 2. Sonuçlar ve Değerlendirme

"A", "B" ve "C" olaylarına karşılık gelen EOG işaretlerinden rastgele seçilen bir örnek Şekil 3 'de verilmektedir.

Şekil 3. "A", "B" ve "C" olaylarına karşılık gelen  $EOG_h(t)$  ve  $EOG_v(t)$  işaretlerinden bir örnek.

EOG veri setinden rastgele seçilen ve Şekil 3'de görülen  $EOG_h(t)$  ve  $EOG_v(t)$  işaretlerinin  $N_s=1$  için, (1) denklemi ile hesaplanan  $Y(i)$  profili Şekil 4 'de görülmektedir. Kaydedilen EOG işaretlerinin sayısının çokluğu nedeniyle, basitlik adına, bu noktadan itibaren "C" olayını içeren  $EOG_h(t)$  işaretinin analizi yapılacaktır. Şekil 5 'den görüleceği üzere, (2) denklemi gereğince "C" olayını içeren  $EOG_h(t)$  işaretine,  $s=40$  için  $m=1, 2$  ve  $3$ . dereceden polinomlar uydurulmuştur. Farklı  $m$  dereceleri için varyansın değiştiği görülmektedir. Bu durum, ÇF-EDA yönteminin doğal bir sonucudur.

Şekil 4.  $N_s=1$  için, (1) denklemi ile hesaplanan  $Y(i)$  profili.

Şekil 5.  $s=40$  için, her bir örtüşmeyen  $v$  parçasına 1, 2 ve 3. dereceden polinomlarla uydurulan  $y_v(i)$  verisi (kırmızı noktalı çizgi) ile  $Y(i)$  profilindeki her bir parça için  $\pm 1 F^2(v,s)$  (kırmızı düz çizgi).

"C" olayını içeren  $EOG_h(t)$  işareti ile ilgili olarak,  $m=1$  dereceli polinom ve  $s=4, 8, 16, 32, 64$  ve  $128$  parça boyutları için hesaplanan  $F^2(v,s)$  değerlerinin değişimi Şekil 6'da görülmektedir. Şekil 6'da görüleceği üzere,  $F^2(v,s)$  genliği küçülen  $s$  için azalmaktadır.

Şekil 6. "C" olayını içeren  $EOG_h(t)$  işaretinin,  $m=1$  dereceli polinom ve  $s=4, 8, 16, 32, 64$  ve  $128$  bölüm boyutları için hesaplanan  $F^2(v,s)$  değerleri.

Şekil 7. "C" olayını içeren  $EOG_h(t)$  işareti ile ilgili olarak;  $q$  dereceli  $F_q(s)$  ve  $s=8-64$  değerleri için log-log çizimi (noktalar) ve bunlara karşılık gelen doğrusal polinom regresyonu (düz çizgiler).

Şekil 7'den görüleceği üzere, farklı  $s$  değerleri için hesaplanan  $q$  dereceli  $F_q(s)$  değerleri, log-log çiziminde, eğimleri birbirinden farklı olan doğrular üretmektedir. Bu sonuç, EOG işaretinin durağan olmayan doğası ve çoklu-fraktal yapısının bir göstergesi durumundadır. Bu sonuçları kullanarak elde edilen  $H_q(q)$  Hurst üstellerinin  $q$ 'ya bağlı grafiği Şekil 8 'de görülmektedir.

Şekil 8. "C" olayını içeren  $EOG_h(t)$  işareti ile ilgili olarak;  $q=-5$  ve  $5$  aralığı için  $H_q(q)$  Hurst üsteli.

Şekil 8 ile verilen  $H_q(q)$  Hurst üsteli grafiği,  $q$ 'ya bağlı olarak Hurst üstellerinin sabit olmadığını ve azaldığını açık bir şekilde göstermektedir. Bu durum çoklu-fraktal yapıya sahip zaman serilerinin bir özelliğidir. Dolayısıyla, "C" olayını içeren  $EOG_h(t)$  işareti üzerinden yapılan analiz, EOG işaretinin çoklu-fraktal davranışının bir delilidir. Tüm EOG işaretlerinin analizinde benzer sonuçlara ulaşılmıştır. Bu çalışmada, ÇF-EDA yöntemi kullanılarak, farklı veri ölçekleri için ( $s=4, 8, 16, 32, 64$ ) EOG işareti eğiliminden arındırıldıktan sonra,  $q$ 'ya bağlı olarak  $H_q(q)$  Hurst üstelleri elde edilmiştir. Hurst üstelleri  $q$ 'ya bağlı olarak değiştiğinden, EEG, EKG gibi EOG işaretinin de çoklu-fraktal bir davranışa sahip olduğu gösterilmiştir.

**Özet**

Bu çalışma, DC Magnetron Saçtırma yöntemi ile cam alttaş üzerine reaktif NiO ince film kaplama uygulamasını konu etmektedir. NiO, ferromanyetik malzemeler, p-tipi şeffaf iletken film, elektrokromik görüntüleme cihazlarında ve kimyasal sensörlerde fonksiyonel bir sensör katmanı olarak uygulama alanı bulmaktadır. Saçtırma, ince film biriktirmek amacıyla kullanılan bir fiziksel buhar biriktirme (FBB) yöntemidir. Bu yöntem, malzemenin, biri kaynak olan bir "hedeften" cam gibi bir "alt katmana" saçtırılmasını içerir. Saçtırma, yarı iletken endüstrisinde, entegre devre işlemede çeşitli malzemelerin ince filmlerini biriktirmek için yaygın olarak kullanılmaktadır. Optik uygulamalar için cam üzerine ince yansıma önleyici kaplamalar da saçtırma yoluyla biriktirilir. Saçtırma yönteminin en eski ticari uygulamalarından biri bilgisayar sabit disklerinin üretimidir. Kullanılan düşük alttaş sıcaklıkları nedeniyle saçtırma, ince film transistör üretiminde temas metallerini biriktirmek için ideal bir yöntemdir. Reaktif saçtırmada, hedef malzemedan saçtırılan parçacıklar (Ni), belirli bir alttaş üzerinde (cam) farklı bileşime sahip bir filmin biriktirilmesini amaçlayan kimyasal bir reaksiyona girer. Parçacıkların maruz kaldığı kimyasal reaksiyon, saçtırma odasına verilen oksijen gibi reaktif bir gazla gerçekleşerek oksit filmlerin üretilmesini sağlar. Yöntemde ilave bir unsurun, yani reaktif gazın eklenmesi, arzu edilen ince film birikmesi üzerinde önemli bir etkiye sahiptir ve ideal çalışma noktalarının bulunmasını zorlaştırır. Bu şekilde, reaktif bazlı saçtırma işlemlerinin büyük çoğunluğu, histerezis benzeri bir davranışla karakterize edilir, dolayısıyla ilgili ilave soygaz, basınç ve sıcaklık parametrelerinin uygun şekilde kontrol edilmesini gerektirir. Reaktif saçtırma yoluyla ince film birikimini kontrol eden birçok parametrenin varlığı, bunu karmaşık bir süreç haline getirir, ancak aynı zamanda oluşan ince filmin büyümesi ve mikro yapısı üzerinde büyük ölçüde kontrol sağlar. Bu çalışmada, hedef olarak yüksek saflıkta Ni hedef varlığında, Argon gazı ile farklı oranlarda karıştırılmış Oksijen (reaktif gaz), NiO ince film üretimi için kullanılmıştır. Basınç, sıcaklık ve plazmanın akım sınırı sabit tutularak üretilen NiO ince filmlerin karakterizasyonu, optik geçirgenlik, yansıma, kaplama kalınlığı ve iletkenlik ölçümleri yapılarak optimize edilmiştir.

**REACTIVE NiO THIN FILM COATING APPLICATION BY DC MAGNETRON  
SPOTTING METHOD**

**Abstract**

This study is about the application of reactive NiO thin film coating on glass substrate by DC Magnetron Sputtering method. NiO finds application in ferromagnetic materials, p-type transparent conductive film, electrochromic imaging devices and chemical sensors as a functional sensor layer. Sputtering is a physical vapor deposition method used to deposit thin films. This method involves sputtering material from a “target” one of which is the source, onto a “substrate” such as glass. Sputtering is widely used in the semiconductor industry to deposit thin films of various materials in integrated circuit processing. For optical applications, thin anti-reflective coatings are also deposited on glass by sputtering. One of the oldest commercial applications of the sputtering method is in the production of computer hard disks. Due to the low substrate temperatures used, sputtering is an ideal method to deposit contact metals in thin-film transistor fabrication. In reactive sputtering, particles sputtered from the target material (Ni) undergo a chemical reaction aimed at the deposition of a film of different composition on a specific substrate (glass). The chemical reaction that the particles are exposed to occurs with a reactive gas such as oxygen supplied to the sputtering chamber, resulting in the production of oxide films. The introduction of an additional element in the method, namely reactive gas, has a significant impact on the desired thin film deposition and makes it difficult to find ideal operating points. In this way, the vast majority of reactive sputtering processes are characterized by a hysteresis-like behavior, thus requiring appropriate control of the additional inert gas, pressure and temperature parameters involved. The existence of many parameters controlling thin film deposition by reactive sputtering makes this a complex process, but also provides a large degree of control over the growth and microstructure of the resulting thin film. In this study, Oxygen (reactive gas) mixed with Argon gas in different proportions was used to produce NiO thin film in the presence of high purity Ni target as the target. The characterization of NiO thin films produced by keeping the pressure, temperature and plasma current limit constant was optimized by measuring optical transmittance, reflectance, coating thickness and conductivity.

## **Giriş**

Saçtırma, ince film biriktirmek amacıyla kullanılan bir fiziksel buhar biriktirme (FBB) yöntemidir. Bu yöntem, malzemenin, biri kaynak olan bir "hedeften" cam gibi bir "alt katmana" saçtırılmasını içerir. Saçtırma, yarı iletken endüstrisinde, entegre devre işlemede çeşitli malzemelerin ince filmlerini biriktirmek için yaygın olarak kullanılmaktadır. Optik uygulamalar için cam üzerine ince yansıma önleyici kaplamalar da saçtırma yoluyla biriktirilir. Saçtırma yönteminin en eski ticari uygulamalarından biri bilgisayar sabit disklerinin üretimidir. Kullanılan düşük alttaş sıcaklıkları nedeniyle saçtırma, ince film transistör üretiminde temas metalleri biriktirmek için de ideal bir yöntemdir (Frey H. ve Khan H. R. (Eds.), (2015)).Reaktif saçtırma, hem saçtırılan hedef malzemeyle hem de hedef yüzeyle kütleli reaksiyona giren kimyasal olarak reaktif gazların varlığında hedeflerin saçtırılması olarak tanımlanabilir. Reaktif saçtırma, oksitler, nitrürler, karbürler, florürler veya arsenitler (Graham vd., 1994) dahil olmak üzere çok çeşitli bileşik ve alaşım ince filmlerinin biriktirilmesi için günümüzün yeni malzeme özellikleri arayışında çok popüler bir teknik haline gelmiştir. Reaktif olmayan saçtırma yöntemi ile üretilen filmlerin gelişmiş özelliklerinin yanında, temel hedeflerden (yani tek bir öğeden oluşan bir hedeften) DC reaktif saçtırmanın popülaritesinin artması, birkaç faktöre atfedilebilir: (a) Endüstriyel ölçekte (Rizk vd., 1988; Vossen vd., 1991) yüksek biriktirme hızlarında ve kontrol edilebilir bileşime (Larsson vd., 1988) sahip ince bileşik filmler üretme kapasitesine sahiptir. (b) elementsel hedefler genellikle daha kolay saflaştırılır ve dolayısıyla yüksek saflıkta filmler üretilebilir (Okamoto ve Serikawa, 1986); (c) metalik hedefler elektriksel olarak iletken olduğundan RF sistemlerinin karmaşıklığı ve pahalılığına gerek kalmayabilir ve dolayısıyla DC güç uygulanabilir; (d) temel hedeflerin işlenmesi genellikle kolaydır; (e) metalik hedefler termal olarak iletkenidir, bu da bu hedeflerin soğutulmasını daha verimli hale getirir. Böylece uygulanan gücün aralığı genişletilebilir; hedefte çatlama korkusu olmadan 50 W/cm<sup>2</sup> ve üstüne kadar çıkılabilir; ve (f) ince filmler 300 °C'nin altındaki sıcaklıklarda biriktirilebilir (Kadlec vd., 1986).Reaktif saçtırma kavramsal olarak basit olmasına rağmen aslında birbirine bağlı birçok parametreyi içeren karmaşık ve doğrusal olmayan bir süreçtir (Tsiogas ve Avaritsiotis, 1992). Hem katot yüzeyinde hem de alttaşta reaktif gazın varlığı, reaktif gazın yalnızca yoğunlaşan malzemeyle değil aynı zamanda katot yüzeyiyle de güçlü etkileşimlerine neden olur; buna "hedef zehirlenmesi" denir. Bu katot reaksiyonlarının, belirli bir reaktif gaz akışı hızında aniden arttığı görülmektedir. Reaktif gazın akışı kontrol altında tutulursa, bu tür reaksiyonlarda, plazmanın empedansında bir değişiklik, sistem basıncında veya daha kesin olarak reaktif gaz basıncında ani bir artış, biriktirme oranında ciddi bir düşüş ve filmde metal açısından zenginden

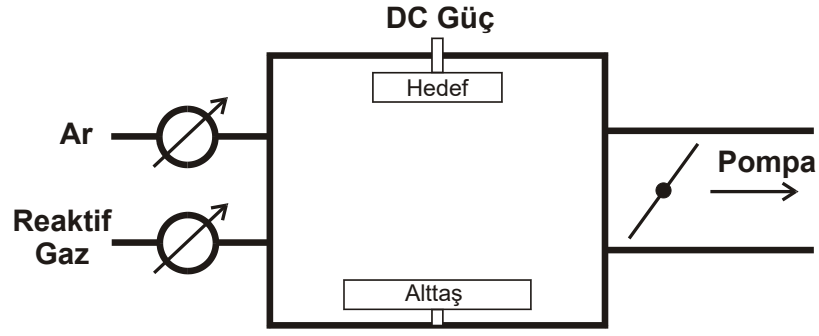

gaz açısından zengine geçiş, yani stokiyometride bir değişiklik gözlenebilir. Bu nedenle, reaktif gazın sağlanmasıyla kontrol edilen reaktif saçtırma işlemleri oldukça karmaşık bir davranış sergiler (Glocker ve Shah, 2018). Bu çalışma, DC Magnetron Saçtırma yöntemi ile cam alttaş üzerine reaktif NiO ince film kaplama uygulamasını konu etmektedir. NiO, ferromanyetik malzemeler (Fujii vd., 1996), p-tipi şeffaf iletken film (Sato vd, 1993), elektrokromik görüntüleme cihazlarında (Yoshimura vd, 1995) ve kimyasal sensörlerde fonksiyonel bir sensör katmanı (Bögner vd., 1998) olarak uygulama alanı bulmaktadır. Reaktif saçtırma yoluyla ince film birikimini kontrol eden birçok parametrenin varlığı, bu yöntemi karmaşık bir süreç haline getirir, ancak aynı zamanda oluşan ince filmin büyümesi ve mikro yapısı üzerinde büyük ölçüde kontrol sağlar (Glocker ve Shah, 2018). Bu çalışmada, hedef olarak yüksek saflıkta Ni hedef varlığında, Argon gazı ile karıştırılmış Oksijen (reaktif gaz), reaktif NiO ince film üretimi için kullanılmıştır.

## **1. Yöntem**

### **1.1. Reaktif Saçtırma Yöntemi**

Benzerliklere rağmen reaktif saçtırma işlemi, temel soygaz saçtırma işleminden önemli ölçüde farklı davranır. Davranıştaki bu büyük farklılığın temel nedeni, reaktif saçtırmaya dayalı biriktirme prosesinin, reaktif gazın kısmi basıncına son derece duyarlı olmasıdır. Bu kısmi basınç, hem katoda sağlanan elektrik gücünden hem de reaktif gazın beslenmesindeki değişikliklerden etkilenir. İlk bakışta bu çok büyük bir sorun gibi görünmeyebilir. Bununla birlikte, bu parametrelerin etkileşim şekli, reaktif saçtırma işleminin doğrusal olmayan bir şekilde davranmasına ve çoğu durumda histerezis etkileri sergilemesine neden olur (Glocker ve Shah, 2018). Reaktif saçtırmada, hedef malzemeden saçtırılan parçacıklar, belirli bir alttaş üzerinde farklı bileşime sahip bir filmin biriktirilmesini amaçlayan kimyasal bir reaksiyona girer. Parçacıkların maruz kaldığı kimyasal reaksiyon, saçtırma odasına verilen oksijen veya nitrojen gibi reaktif bir gazla gerçekleşir ve sırasıyla oksit ve nitrür filmlerin üretilmesini sağlar, Şekil 1. Proseste ilave bir unsurun, yani reaktif gazın eklenmesi, arzu edilen çökeltmeler üzerinde önemli bir etkiye sahiptir ve ideal çalışma noktalarının bulunmasını zorlaştırır. Bu şekilde, reaktif bazlı saçtırma işlemlerinin büyük çoğunluğu, histerezis benzeri bir davranışla karakterize edilir ve dolayısıyla ilgili parametrelerin uygun şekilde kontrol edilmesini gerektirir (Glocker ve Shah, 2018).

Şekil 1. Reaktif saçırma yönteminin şematik çizimi.

### 1.2 Reaktif Saçırma Yöntemindeki Kararsızlıklar

Şekil 2, reaktif saçırma prosesi (işlem sırasında sabit akımla gerçekleştirilir) için saçırma erozyon hızına karşı reaktif gaz beslemesine ilişkin tipik bir deneysel proses eğrisini göstermektedir. Bu eğrinin karakteristik özelliği histerezis etkisi sergilemesidir. Reaktif gazın beslenmesi ile birikme oranı aynı değerde azalmaz ve artmaz. Azalma ve artış arasındaki ayırım genişliği histerezis bölgesinin genişliğini belirtir (Glocker ve Shah, 2018).

Şekil 2. Reaktif saçırma işlemi için tipik bir deneysel eğri. Saçırılmış metal atomlarından kaynaklanan optik emisyon (OE), saçırma erozyon hızını temsil eder.  $Q_{toplam}$ , dakika başına standart santimetreküp (sccm) cinsinden ifade edilir.

Kısmi basınç ile reaktif gazın besleme hızı arasındaki ilişki için de karşılık gelen bir histerezis etkisi gözlemlenir, Şekil 3. Bu şekil, reaktif gaz beslemesinin artırılması ve azaltılması arasındaki farkı açıkça göstermektedir. Reaktif gaz beslemesinin artış dizisi sırasında reaktif gazın kısmi basıncı, histerezis genişliğinin üst sınır değerine ulaşana kadar çok düşük bir seviyede kalır. Reaktif gaz beslemesinin azalması sırasında kısmi basınç, histerezis bölgesinde gazın artması durumuna göre önemli ölçüde daha yüksek kalır. Bu, artış dizisi sırasında bileşik oluşumu için daha fazla gaz tüketildiğine işaret etmektedir. Bu, karşılık gelen diziler için saçırma erozyon hızı eğrisinin karşılaştırılması yoluyla anlaşılabilir. Daha yüksek saçırma erozyon oranı, bileşik kaplamalar oluşturmak için daha fazla reaktif gaza ihtiyaç duyar.

Histeresis etkisi reaktif saçtırma sistemlerinde en önemli sorunlardan biridir. (Glocker ve Shah, 2018).

Şekil 3. Şekil 1'deki eğriye karşılık gelen reaktif gazın kısmi basıncı.

Bu nedenlerle, reaktif saçtırma işleminin sonucunun tahmin edilebilmesi için güvenilir bir modele ihtiyaç vardır.

### 1.3 Reaktif Saçtırma Yönteminin Modellenmesi

İlk kez 1987'de Uppsala Üniversitesi'nde Berg ve çalışma arkadaşları tarafından önerilen, 'Berg modeli' olarak adlandırılan temel reaktif saçtırma prosesi tanımlanmıştır ve aşağıda açıklanmaktadır (Berg vd., 1987). Bu model yoluyla; biriktirme oranındaki, biriktirilen filmin bileşimindeki, reaktif gazın kısmi basıncındaki, hedef yüzeyin reaktif gaz tarafından 'zehirlenmesini', histeresis bölgesinin genişliğini ve konumunun yanı sıra hedef yüzeydeki ciddi değişiklikleri tahmin etmek mümkündür.

Şekil 4. Reaktif saçtırma işleminde saçtırılan malzemenin hedeften altaşa taşınmasının gösterimi (Berg vd., 1987).

Berg modeli Şekil 4 ile gösterilen ve aşağıda tanımlanan varsayımları içermektedir :

- Hedef, elemental bir metal malzemedir (Ni, Al, Cu, Ti vb.).
- Yalnızca soy gazdan gelen iyonlar hedefin saçtırma erozyonuna katkıda bulunur. Reaktif gazdan gelen iyonların saçtırma katkısı ihmal edilmiştir.

- Hedef yüzeyden saçtırılan bileşik molekülleri, moleküller halinde biriktirilir.
- Hedef akımı tamamen soy gazdaki iyonlar tarafından taşınır. Hedefte yayılan ikincil elektronların katkısı ihmal edilir.
- Hedefteki iyon akımı hedef yüzeyine ( $A_t$ ) eşit olarak dağılmıştır.
- Hedef yüzeyden saçtırılarak aşındırılan malzemenin tümü, 'toplayan'  $A_s$  alttaş yüzeyinde eşit şekilde biriktirilmektedir. Bu 'toplayan' yüzey hem alttaş yüzeyini hem de vakum odasındaki tüm diğer alıcı yüzeyleri temsil eder.
- İşlem sırasında, hedef metal yüzeyinin bir kısmı reaktif gazla reaksiyona girecek ve karşılık gelen metal bileşiğini oluşturacaktır. Bu bileşiğin kapsadığı hedefin kısmı  $\Theta_t$  ile gösterilir. Şekil 4'de bu durum,  $A_t$  hedef alanının iki parçaya bölünmesiyle gösterilmektedir: metal bileşiğini içeren yüzey kısmı  $\Theta_t$  ve reaksiyona girmemiş metalden oluşan yüzey bölümü ( $1 - \Theta_t$ ).
- Aynı reaksiyon  $A_s$  biriktirme alanında da gerçekleşir. Bununla birlikte, bu yüzeydeki bileşik malzeme (reaksiyona giren hedef metal) tarafından kaplanan  $\Theta_s$  bölümü, hedef yüzeydeki  $\Theta_t$  bölümünden farklı olabilir.
- Vakum odasına sağlanan reaktif gaz, oda içinde eşit olarak dağıtılan kısmi  $P_r$  basıncında yükselmeye sebep olur. Bu basınç, reaktif gaz moleküllerinin odadaki tüm yüzeylere  $\Gamma_r$  akışına neden olur.  $P_r$  ile  $\Gamma_r$  arasındaki ilişki aşağıdaki gibidir.

$$\Gamma_r = \frac{P_r}{\sqrt{2\pi mkT}} \quad (1)$$

(1) denkleminde;  $m$ , reaktif gaz molekülünün kütlesi,  $k$  Boltzmann sabiti ve  $T$  mutlak sıcaklıktır.

- Yapışma katsayısı, reaktif bir gaz molekülünün bir yüzeye çarptığında yüzeyde kalma olasılığı olarak tanımlanır. Bu olasılık, odanın bileşik kaplı kısımları ve hedef yüzeyleri için sıfır olarak alınmıştır.

Yukarıdaki varsayımlara dayanarak, reaktif sıçratma biriktirme sürecini tanımlayan üç temel denge denklemini tanımlamak mümkündür.

### **1.3.1 $A_t$ Hedef Alanındaki Şartlar**

Hedef yüzeyinde bileşik oluşumu yalnızca, reaktif gaz ve reaksiyona girmemiş hedef metali içeren ve ( $1-\Theta_t$ ) ile gösterilen hedef kısım arasındaki reaksiyonlar nedeniyle gerçekleşecektir.

Hedefte bileşik oluşum hızı (birim zamandaki molekül sayısı) aşağıdaki şekilde yazılabilir:

$$\Gamma_r \alpha_t (1 - \Theta_t) A_t b$$

Burada  $\alpha_t$ , reaktif gaz moleküllerinin metal yüzeyine yapışma katsayısıdır ve  $b$ , bir adet reaktif gaz molekülünün oluşturduğu bileşik moleküllerin sayısını tanımlayan bir faktördür. Bileşik moleküllerin hedef yüzeyden saçılma hızı şu şekilde yazılabilir:

$$\left(\frac{J}{q}\right) \Theta_t A_t \gamma_c$$

Burada  $J$  hedef yüzeydeki iyon akım yoğunluğudur (normalde argon iyonları),  $q$  temel yüküdür,  $\Theta_t A_t$  metal bileşik tarafından kaplanan hedef yüzey alanıdır ve  $\gamma_c$  gelen enerjik iyon için bileşiğin saçtırma verimidir ve  $\gamma_c$  iyonun enerjisine bağlıdır.

Kararlı durumda bileşik oluşum hızı (metal hedef ile reaktif gaz arasındaki reaksiyonlardan dolayı), bileşik malzemenin hedeften saçtırma erozyon hızıyla aynı olmalıdır. Bu,  $\Theta_t$  'nin kararlı durum değerine ulaştığı anlamına gelir. Bu bize ilk temel denge denklemini verir:

$$\Gamma_r \alpha_t (1 - \Theta_t) A_t b = \left(\frac{J}{q}\right) \Theta_t A_t \gamma_c \quad (2)$$

Denklemdaki diğer tüm parametreler kullanıcı tarafından tanımlanabildiğinden, (1) ve (2) denklemleri yardımıyla herhangi bir  $P_r$  değeri için  $\Theta_t$  'yi hesaplamak mümkündür. Hedeften saçtırma toplam erozyon oranı  $R$  şu şekilde ifade edilebilir:

$$R = \left(\frac{J}{q}\right) [\gamma_c \Theta_t + \gamma_m (1 - \Theta_t)] A_t \quad (3)$$

(3) denkleminde  $\gamma_m$ , enerjik iyonlar aracılığı ile saçtırılma nedeniyle metal atomlarının saçtırma verimidir. Buradaki erozyon hızı saniye başına birim parçacık (metal atomları ve bileşik moleküller) cinsinden ifade edilir.

### 1.3.2 $A_s$ Biriktirme Alanındaki Şartlar

Hedefteki koşullar için olana benzer bir argüman,  $A_s$  biriktirme alanındaki koşulları tanımlamak için kullanılabilir. Kararlı durumda bileşik oluşum hızı, bu yüzeyden 'bileşik eliminasyon' hızıyla aynı olmalıdır. Ancak bu yüzeyde bileşik malzemenin saçtırma erozyonu meydana gelmez. Bunun yerine 'bileşik eliminasyonu', biriktirme yüzeyi  $A_s$  'nin bileşik biriken kısmı ( $\Theta_s$ ) üzerinde toplanan ve hedeften saçtırılan metal atomları tarafından gerçekleştirilir. Bu nedenle, biriktirme yüzeyinin bileşik kaplı kısmının ( $\Theta_s$ ) üzerine bir miktar 'reaksiyona girmemiş metal' eklenir ve böylece bu, bir 'metal' yüzeye dönüştürülür. Bu etki, biriktirme yüzeyi kapsama değerinin ( $\Theta_s$ ) azalmasına neden olur.  $\Theta_s$  'deki bu azalmaya ilişkin ifade aşağıdaki şekilde elde edilebilir. 'Taze hedef metal atomlarının' toplam saçtırma erozyon hızı,  $R_m$ , şu şekilde yazılabilir:

$$R_m = \left(\frac{J}{q}\right) \gamma_m (1 - \Theta_t) A_t$$

Bu saçtırmayla aşındırılmış metal, biriktirme yüzeyi üzerinde düzgün bir  $R_m/A_s$  biriktirme oranına yol açar. Biriktirme yüzeyinin  $\Theta_s$  bileşik kaplanmış bölümü üzerinde biriken  $R_m$  miktarı  $R_m\Theta_s$  dir. Bu terim, reaksiyona girmemiş metal atomlarının birikmesi nedeniyle  $\Theta_s$  'deki azalma oranını tanımlar.  $R_m$ ,  $R_m\Theta_s$  ve  $R_m(1-\Theta_s)$  terimleri Şekil 4'de oklarla gösterilmiştir.

Biriktirme alanının metal kısmına  $(1-\Theta_s)$  biriken saçtırılmış metalin tamamlayıcı kısmı  $R_m(1-\Theta_s)$ ,  $A_s$  biriktirme yüzeyindeki metal kısmını değiştirmeyecektir. Çünkü, metalin metal üzerine biriktirilmesi bu konumdaki bileşimi değiştirmez. Aynı durum, biriktirme yüzeyindeki  $\Theta_s$  kısmı üzerinde saçtırılan bileşik malzemenin biriktirilmesi için de geçerlidir. Benzer bir şekilde, bileşik malzeme üzerine bileşik malzeme biriktirmek,  $A_s\Theta_s$  alanının bileşimini değiştirmez.

Bileşik malzeme, biriktirme yüzeyinde iki farklı işlemle oluşturulabilir. Birincisi, biriktirme yüzeyinin taze metal kısmı  $(1-\Theta_s)$  reaktif gazla reaksiyona girerek bu yüzey üzerinde bileşik malzeme oluşturabilir. Bu işlem için toplam bileşik oluşumu oranı aşağıdaki gibidir.

$$\Gamma_r \alpha_s (1 - \Theta_s) A_s b$$

Burada,  $\alpha_s$ , reaktif gazın biriktirme yüzeyindeki metal yüzeye yapışma katsayısıdır ve  $(1-\Theta_s)A_s$ , biriktirme yüzeyinin metal kısmıdır. Bileşik oluşumuna yol açabilecek ikinci işlem, biriktirme alanının  $(1-\Theta_s)$  metal kısmı üzerinde saçtırılmış bileşik malzemenin birikmesidir. Hedeften bileşik malzemenin toplam saçtırma erozyon oranı  $R_c$  aşağıdaki gibi verilmektedir:

$$R_c = \left(\frac{J}{q}\right) \gamma_c \Theta_t A_t$$

Bu saçtırılmış bileşik malzeme, biriktirme alanı  $A_s$  üzerinde eşit olarak dağılmıştır. Biriktirme yüzeyinin  $(1-\Theta_s)$  metal kısmı üzerinde biriken parça şu şekildedir:

$$R_c (1 - \Theta_s)$$

Bu terim, saçtırılan bileşik malzemenin biriktirme yüzeyinin taze metal kısmı üzerine birikmesi nedeniyle  $\Theta_s$  'deki artış oranını tanımlar. Şekil 4 'de,  $R_c$ ,  $R_c\Theta_s$  ve  $R_c(1-\Theta_s)$  terimleri oklarla gösterilmiştir.

Kararlı durumda, biriktirme yüzeyindeki bileşik oluşumuna katkıda bulunan iki terim, bu yüzeydeki bileşik eliminasyonunu tanımlayan terimi dengelemelidir. Bu, ikinci temel denge denklemini tanımlar.

$$R_c (1 - \Theta_s) + \Gamma_r \alpha_s (1 - \Theta_s) A_s b = \left(\frac{R_m \Theta_s}{d}\right) \quad (4)$$

Burada  $d$ , bir adet bileşik molekülündeki metal atomlarının sayısını tanımlayan bir faktördür. (4) denklemin sağ tarafı, her iki tarafın da aynı birimde, yani zaman birimi başına bileşik

molekül olarak ifade edilmesini sağlamak için  $d'$ 'ye bölünmüştür.  $\Theta_t$  (2) denklemi kullanılarak hesaplandığında, (4) denkleminde  $\Theta_s$  'yi hesaplamak mümkündür.

Genelde deney ekipmanları, işlem sırasında reaktif gazın kısmi basıncını izleyecek şekilde donatılmamıştır. Reaktif gaz normalde bir kütle akış kontrolörü aracılığıyla vakum odasına beslenir. Bir reaktif saçtırma işleminden bahsederken, normalde reaktif gaz beslemesinin bir girdi parametresi olarak kullanılmasının nedeni budur. Bu nedenle modelde reaktif gazın beslemesi için bir ifade bulmaya ihtiyaç olur.

Yukarıda açıklandığı gibi reaktif gaz, hem hedefte hem de biriktirme yüzeylerinde 'taze metal yüzeyler' ile reaksiyona girecektir. Bu etki nedeniyle reaktif gaz molekülleri bu yüzeylerde giderilecektir (katı bileşik molekülleri oluşturularak gaz fazından çıkacaktır). Reaktif gazın belirli bir kısmi basıncında hedef yüzeydeki giderilme oranı  $Q_t$  (birim zamandaki molekül sayısı) şu şekilde yazılabilir:

$$Q_t = \Gamma_r \alpha_t (1 - \Theta_t) A_t \quad (5)$$

Biriktirme yüzeyinde karşılık gelen reaktif gaz giderme terimi  $Q_s$  ise şu şekildedir:

$$Q_s = \Gamma_r \alpha_s (1 - \Theta_s) A_s \quad (6)$$

Deney sisteminin vakum pompası, reaktif gazın  $P_r$  kısmi basıncında  $Q_p$ 'yi, yani birim zamandaki molekül sayısını, dışarı pompalayacaktır.

$$Q_p = k_1 P_r S \quad (7)$$

Burada  $S$ , vakum pompasının pompalama hızıdır ve  $k_1$ , ifadeyi istenen birime dönüştüren bir faktördür. (5)-(7) denklemleri, vakum odasındaki reaktif gazın toplam tüketim oranını ( $Q$ ) belirler. Kararlı durumda (5)-(7) denklemlerinden elde edilen katkı, reaktif gazın toplam giriş akışı  $Q$ 'yu dengelemelidir. Bu üçüncü temel denge denklemini tanımlar.

$$Q = Q_t + Q_s + Q_p \quad (8)$$

$\Gamma_r$ ,  $\Theta_t$  ve  $\Theta_s$ , (1)-(4) denklemlerinden hesaplanabildiğinden, tüm  $P_r$  değerleri için,  $Q$  'yu (8) denkleminde hesaplamak da mümkündür. (8) denklemi, reaktif gazın sabit kısmi basıncını korumak için (kararlı durum), (5)-(7) denklemleriyle tanımlanan üç gaz giderme mekanizması nedeniyle bu gazın toplam  $Q$  kaybını telafi etmek amacıyla reaktif gaz vakum odasına  $Q$  oranında sağlanması gerektiğini ifade etmektedir.

## **2. Sonuçlar ve Değerlendirme**

Cam alttaş üzerine reaktif NiO saçtırma işlemini yapabilmek için, yukarıda açıklanan ve (1)-(8) denklemleri ile ifade edilen tüm optimizasyona işlemleri yapılarak optimal çalışma şartları elde edilmiştir. Buna göre, reaktif gaz olarak %70 O<sub>2</sub> ve %30 Ar gaz karışımı şartları altında,

vakum odasının optimal basıncı 25 mTorr olarak bulunmuş ve plazmanın akım sınırı 500 mA 'e ayarlanmıştır. NiO kaplamanın cam alttaş yüzeyi üzerinde eşit bir şekilde biriktirilmesi amacıyla, alttaş 15 rpm hızında döndürülmüştür. Sıcaklık, oda sıcaklığıdır ve bu şartlar altında, (3) denklemini gereğince hedeften saçtırma erozyon oranı ortalama olarak  $R=0.02$  nm/s hızındadır. 25 mTorr olan vakum odası basıncında reaktif gaz  $O_2$  'in kısmi akışı 7.2 sccm dir. Elde edilen NiO reaktif saçtırma ince film örneği Şekil 5 'te görülmektedir. Şekil 6 'da Şekil 5 'de görülen örnek için yapılan reflektans ölçümünün grafiği verilmektedir.

**Şekil 5.** 25.4×76.2 mm boyutlarında cam alttaş üzerine 50 nm kalınlığında reaktif NiO biriktirme.

**Şekil 6.** 190-1100 nm dalgaboyu aralığı için 50 nm kalınlığında reaktif NiO reflektans grafiği. Bu çalışmada, reaktif saçtırma parametreleri optimize edilmiş ve kararlı çalışma koşulları elde edilerek cam alttaş üzerine reaktif saçtırma yöntemiyle NiO başarıyla biriktirilmiştir.

**Özet:**

Sivil havacılık sektörü bir asrı geçen mazisi ve her geçen gün büyüyen ekonomisi ile günümüzün parlayan sektörlerindedir. Bu sektörde yer alan farklı disiplinlerdeki milyonlarca çalışan, sektörü ayakta tutmakta ve her yıl milyarlarca yolcunun emniyetli, güvenli ve zamanında bir yerden bir yere ulaşmasını sağlamak için tüm gayreti ve güler yüzü ile çalışmaktadır. Tüm bu çalışmalar süresince hiç kuşkusuz bir takım İş Sağlığı ve Güvenliği (İSG) riskleri doğmakta ve bu risklerin yönetilmesi gerekmektedir. Gerek yasal mevzuat gereklilikleri gerek ulusal ve uluslararası otoritelerin talimatları gerekse sivil havacılık firmaların inisiyatifleri ile pek çok çalışma yapılmaktadır. Yapılan bu çalışmaların temel odağı çalışma ortamlarının iyileştirilmesi ve geliştirilmesi olduğu için bunu çalışanın görüşünü almadan yapmak çok mümkün değildir. Özellikle yasal mevzuat gereği çalışanın görüşünün İSG bağlamında paylaşımı konusunda çalışan temsilcisi, destek elemanı gibi birtakım tanımlamalar yapılsa da sivil havacılık gibi çok büyük, dağınık ve özel bir sektörde bunlar yeterli olmamaktadır. Bu çalışmanın motivasyonu tespit edilen bu eksikliğin giderilmesi ve çalışan katkısının sağlanması adına ülkemizin bayrak taşıyıcı hava yolu firması olan Türk Hava Yolları Anonim Ortaklığında (THY) İSG Gönüllüsü Uçuş Ekibi (İSGGUE) olarak adlandırılan bir uygulamanın hayata geçirilmesidir. Uçuş ekibinin İSG risklerini, bu risklerin yönetimi ve İSG bağlamındaki tüm süreçlerin içerisinde olmasını, yapılan iyileştirmelerde ve saha uygulamalarında görüşlerini paylaşmasını ve alınacak kararlara bir fiil iştirak etmesini amaçlayan bu çalışma ile alana pozitif katkı sağlamak amaçlanmıştır.

**Anahtar kelimeler:** İş sağlığı, iş güvenliği, uçuş ekibi, risk, gönüllü

**ENGAGING FLIGHT CREW IN OCCUPATIONAL HEALTH AND SAFETY RISK  
MANAGEMENT: AN IMPLEMENTATION OCCUPATIONAL HEALTH AND  
SAFETY VOLUNTEER FLIGHT CREW**

**Abstract**

The civil aviation sector, with its history spanning over a century and its ever-growing economy, stands as one of the shining industries of our time. The millions of professionals within this sector work tirelessly, with dedication and a smile, to keep the industry thriving and to ensure the safe, secure, and timely transportation of billions of passengers each year. Throughout all these efforts, undoubtedly, Occupational Health and Safety (OHS) risks arise and must be managed. Various efforts are made, driven by legal requirements, national and international regulations, as well as initiatives from civil aviation companies. However, given the fundamental focus of these efforts on improving and enhancing work environments, it is hardly feasible to do so without considering the perspectives of the employees. While designations such as employee representatives or support personnel are defined, especially as per legal requirements, within a vast, scattered, and specialized sector like civil aviation, these may not be sufficient. Motivated by the recognition of this inadequacy and aiming to harness employee contributions, a practice named the Occupational Health and Safety Volunteer Flight Team (OHSTVFT) is proposed to be implemented within our country's flagship carrier, Turkish Airlines Inc. (THY). This initiative seeks to involve the flight team in all aspects of OHS, including the identification and management of OHS risks, sharing their perspectives in improvements and field applications, and actively participating in decision-making processes. Through this initiative, the goal is to make a positive contribution to the field.

**Keywords:** Occupational health, occupational safety, flight crew, risk, volunteer

## **GİRİŞ**

15. yy. da uçak kanatları ile ilgili çizimler yapan Leonardo Da Vinci ile ilk temelleri atılan havacılık sektörü, 17. yy. da Lagari Hasan Çelebi ve Hezarfen Ahmed Çelebi, 18. yy. da ise Montgolfier kardeşleri çalışmaları ile biraz daha şekillenmiştir. 20. yy. başlarında ise Henri Giffard'un kontrol edilebilir ilk hava gemisi olan zeplin ve Wright kardeşlerin ilk motorlu uçağı ile modern havacılığın temelleri atılmıştır (1). Günümüzde ise sadece Türkiye'de 2021 yılında +253.000 kişinin çalıştığı havacılık sektörü 2022 yılında yaklaşık 600 uçaklık toplam filo, 12.000 kişilik pilot, +180.000.000 toplam yolcuya hizmet verilen bir sektöre dönüşmüştür (2). ICAO'nun 2019 yılı verilerine göre Dünya'da tarifeli seferlerde taşınan toplam yolcu sayısı yaklaşık 4,5 milyar, sefer sayısı ise 38,3 milyona ulaşmıştır (3). Devasa büyüklüklere ulaşan havacılık sektörünün önemli dışlilerinden bir tanesi hava ulaştırma işletmeleridir. Hava araçlarıyla ticari amaçla, belirli hatlar üzerinde, ücret karşılığında yolcu veya yük veya yolcu ve yük taşıması yapan işletmeler ile ticari hava taşımacılığı kapsamında olmayan yolcu ve yük taşımacılığı ile ücret karşılığı olup olmadığına bakılmaksızın yapılacak hava işi ve eğitim faaliyetlerini yapan işletmeler hava taşıma işletmeleri olarak nitelendirilmektedir (4). Hava ulaştırma işletmelerinin Türkiye'deki en bilindik örnekleri ise Türk Hava Yolları (5), Pegasus (6) gibi şirketlerdir. Bu şirketlerin personel yapısına bakıldığında ise personelin yaklaşık %65'inin genel olarak Uçuş Ekibi olarak adlandırılan Kabin Memuru ve Pilotlardan oluştuğu görülmektedir (7). Yolcu taşımacılığı yapan hava araçlarında gerekli emniyet ve güvenlik önlemlerinin uygulanmasından ve yolcu konforundan sorumlu görevliler "kabin memuru" ya da "kabin görevlisi" olarak tanımlanmaktadır. Uçuşun emniyetli, güvenli ve konforlu bir şekilde gerçekleşmesi için hava aracının kabin bölümünde görev alan Kabin Memurları; Sivil Havacılık Genel Müdürlüğü tarafından yayımlanan ilgili mevzuatlarda belirtilen gereklilikleri sağlayarak eğitimlerini başarı ile tamamlayan ve bunun sonucunda "Kabin Memuru Sertifikası" almaya hak kazanmış kişilerdir (8). Pilot ise; hobi, hususi veya profesyonel olarak bir hava taşıtını kullanan, sevk ve idaresini üstlenen meslek grubunun genel adıdır. Hobi olarak uçmak için sadece bir hususi pilot lisansına sahip olmak yeterliyken meslek olarak pilotluğu seçmek istenmesi halinde hususi pilot lisanslarına yönelik uçuş eğitiminden veya sınavından ayrı olarak ticari seviyede bir lisansa sahip olmak gerekmektedir (9). 20/06/2012 tarihli ve 6331 sayılı İş Sağlığı ve Güvenliği (İSG) Kanununun 9 uncu maddesi uyarınca işyerlerinin iş sağlığı ve güvenliği açısından yer aldığı tehlike sınıfları Ek-1 'de yer alan İşyeri Tehlike Sınıfları Listesine göre Tehlikeli Sınıfta almaktadır. Bu bağlamda 6331 sayılı Kanununun ilgili tüm hükümlerine

ek olarak tüm uçuş ekipleri için aşağıda belirtilen bazı İSG süreç ve hizmetleri sağlanması gerekmektedir.

- Her 500 uçuş ekibi için tam gün çalışacak en az bir iş güvenliği uzmanı ve kalan her bir çalışan için en az 20 dk. ek iş güvenliği uzmanlığı hizmeti verilmelidir. (10)
- Her 1.000 uçuş ekibi için tam gün çalışacak en az bir işyeri hekimi ve kalan her bir çalışan için en az 10 dk. ek işyeri hekimliği hizmeti verilmelidir. (11)
- Her uçuş personeli işe girişlerinde ve takiben her 3 yılda bir periyodik sağlık muayenesine tabi tutulmak zorundadır (11).
- Her uçuş personeli işe girişlerinde ve tekraren her iki yılda bir 12 saatlik İSG Eğitimi almak zorundadır (12).
- İSG risk analizleri en geç 4 yılda bir yenilenmelidir (13).
- Her 2 ay da bir İSG kurulu toplanmalıdır (14).

Uçuş Ekipleri özelinde İSG bağlamında 2016 ve 2023 yılları arasında tam zamanlı olarak iş güvenliği hizmeti verilmiştir. Bu hizmet süresince yapılan saha gözetimleri, risk analizleri, iş kazası araştırmaları gibi saha uygulamaları ile birlikte İSG eğitimleri, etkinlikler ve kurullar gibi platformlarda elde edilen bilgiler ışığında Uçuş Ekipleri ile alakalı en önemli İSG riskleri aşağıdaki gibi belirlenmiştir.

- **Hat Bazlı Riskler:** Uçuş ekibinin gerçekleştirdiği uçuş hattı (rotası) farklılaştıkça riskleri de değişecektir. Yapılan aylık planlamalara göre bir hava yolu firması kaç farklı destinasyona uçuş gerçekleştiriyorsa bir uçuş ekibi de bu uçuşların tamamında görev alabilmektedir. Örneğin ülkemizde Türk Hava Yolları, dünyanın en çok ülkesine uçan havayolu şirketidir (15). Türk Hava Yollarının İstanbul- Ankara seferi ile İstanbul- Rio de Janeiro seferinin süresi, ikram konsepti, ekip sayısı vb. parametreler farklı olduğundan bu hatların İSG riskleri de birbirinden farklıdır. Temel olarak görev uçuş faaliyeti olsa da ilgili parametreler riskleri ve maruziyetleri farklı boyutlara taşıyacaktır.
- **Uçak Bazlı Riskler:** Hava yolu firmalarının ihtiyaçları doğrultusunda farklı marka ve modellerdeki uçaklara sahip olduğu bilinmektedir (16). Her uçağın boyutu, uçak içi ekipmanları, taşıyacağı yolcu sayısı, içinde çalışacak ekip sayısı (17), (18) vb. her uçak tipi bazında farklı olacağı için uçuş ekibinin de maruz kalacağı İSG riskleri farklılaşmaktadır. Örneğin geniş gövde uçaklarda bulunan crew rest alanları dar gövde uçaklarda

bulunmamaktadır. Bu alanlar uçuş ekibine oteldeki gibi dinlenme imkânı sağlar (19). Ancak bu alan diğer uçaklarda olmadığı için uçak bazlı İSG risklerini farklılaştırmaktadır.

- **Ekipman Bazlı Riskler:** Uçak içinde uçuş ekiplerinin çeşitli sebeplerle kullandığı trolley (uçakta yiyecek ve içecek servisi için kullanılan tekerlekli araçlar), hot jug (çay ve kahve termosları), drawer, (içeceklerin trolleyle yerleştirilmesinde kullanılan çekmeceler), fırın, kahve makinesi, su ısıtıcı, çeşitli tepsi, yemek takımları ve bardaklar gibi çok sayıda ekipman bulunmaktadır. Bu ekipmanların her birinin kendince İSG riskleri bulunmaktadır (20).

- **Servis Süreçleri Kaynaklı Riskler:** Havayolu ikram sektörü, faaliyet alanı itibariyle havacılık ve gıda sektörünün kesiştiği bir noktada konumlanmaktadır. Uçaklarda, uçuş sırasında ikram edilen tüm gıda ürünlerinin belirlenen standartlara uygun olarak hazırlanması ve uçaklara sevk edilmesi en temel faaliyet alanıdır (21). Yapılan servis süreci hava yolu firmalar bağlamında da değişiklik göstermektedir. Bazı hava yolu firmaları low cost olarak daha çok ikramı ücret ile satarken diğer hava yolları ise sınırsız ikram sunmaktadır. Bu bağlamda servis yapan uçuş ekibi servis öncesi, sırası ve sonrasındaki süreçlerde başta yanık ve kesik olmak üzere herhangi bir restoranda çalışan servis elemanı ile hemen hemen aynı İSG risklerine sahiptir.

- **Uçuş Kaynaklı Riskler:** Uçuş operasyonun ve uçak içerisinde çalışmanın İSG bağlamında özel bazı riskleri bulunmaktadır. Bu risklerin başında uçağın sürekli hareket halinde olması gerekmektedir. Özellikle kabin ekibi çalışırken üzerlerinde bulunan zemin sürekli çeşitli yönlerde hareket etmektedir. Bu durum, bir nevi standart bir personelin çalıştığı ofisin sürekli küçük çaplı depremlere maruz kalmasına ve personelin bu depremlere rağmen çalışmasına bir şey yokmuş gibi devam etmesine benzetilebilir. Sarsıntıların şiddetlenmesi sonucu daha büyük risklere sebep olacak türbülans riski ile karşılaşılabilir.

Uçuş ekibi zaman zaman jet yakıtı gazlarına maruz kalabilir. Bununla birlikte hava alma sistemi nedeniyle kabin havasına tehlikeli maddeler girebilir (22). Ayrıca kabin içerisindeki hava, kabin ekibini enfeksiyon riskine sokacak mikrop ve virüs içerebilir. Parazitlerin yanlışlıkla havayoluna yayılmasını azaltmak için bazı ülkelerin uçak kabinlerinin dezenfekte edilmesi gerekmektedir (23). Uçuş Ekibi çalışma süresi boyunca sürekli ayakta durmakta, malzeme taşımakta, indirip kaldırmakta ve çeşitli alanlara uzanmaktadır. Bu hususlarda yine İSG bağlamında özel riskler doğurmaktadır (24). Uçuş ekibi aynı zamanda hareketli uçaktan kaynaklanan gürültü ve titreşimlere de maruz kalır. Tüm vücut titreşimleri uçuş sırasında, özellikle iniş ve kalkışta veya türbülans sırasında meydana gelir. Uygun olmayan şok emilimi

olan zayıf oturma, kas-iskelet sistemi rahatsızlıkları riskini artırır. Basıncılı bir kabinde uzun saatler çalışmak, uçuş sırasında barotravmaya neden olabilir. Barotravma, en sık orta kulağı etkileyen, havacılıkta iniş ve çıkış sırasındaki basınç değişimleri ile indüklenir. Östaki borusu tıkalı ve bu nedenle orta kulaktaki hava basıncını dış kabin basıncı ile eşitleyemediğinde oluşur. Barotravma acı verebilir, uçuş ekibinin konsantrasyonunu ve çalışma kapasitesini ciddi şekilde etkileyebilir (25). Uçak motorlarından, yardımcı güç birimlerinden, kara taşıtlarından ve rampadaki ekipmandan kaynaklanan gürültü 85 desibeli geçebilir. 8 saat boyunca 85 desibel ve üzeri bir sese maruz kalmak kalıcı işitme hasarlarına sebep olabilmektedir (26). Uçuş ekibi hafta sonları ve resmî tatilleri de içeren, aile sorumluluklarını ve eğlence etkinliklerini olumsuz yönde etkileyen düzensiz çalışma saatlerine sahiptirler. Bu durum strese ve yorgunluğa neden olabilmektedir. Uzun mesafeli uçuşlarda uçan uçuş ekipleri saat değişikliklerine ve ardından sirkadiyen ritimdeki değişikliklere maruz kalır, bu da jet lag olarak bilinen belirtiyeye yol açar. Bu durum aşırı yorgunluğa ve performans düşüklüğüne sebep olabilir (27).

- **Yolcu Kaynaklı Riskler:** Uçuş ekibi temel olarak yolcuların mutluluğu ve güvenliği için uçakta bulunmaktadır. Bu bağlamda yolcular ile temas halindeyken yolcunun istemeden teması sebebiyle çeşitli İSG riskleri ortaya çıkmakta ve ekip iş kazaları yaşayabilmektedir. İstemsiz temaslara ek olarak sivil havacılık sektöründe uçuş emniyeti ve güvenliğini tehdit eden kural dışı yolcu olayları, son yıllarda giderek artmakta ve sektör açısından birçok olumsuz sonucu beraberinde getirmektedir (28). Ayrıca kabin görevlileri saldırgan ya da sıkıntılı yolcularla da karşı karşıya kalabilmektedir. Bu yolcular emniyet ve güvenlik tehlikesi oluşturabilirler. ICAO'ya kural dışı yolcular kaba veya küfürlü konuşmak, uçuş ekibinin talimatları ve otoritesine karşı gelmek/uyumamak, farklı ses tonu ya da yüz ifadeleri gibi nezaketsiz davranışlar yoluyla memnuniyetsizlik belirtmek, bir tartışmayı kışkırtarak sürdürmek, mantıksız taleplerde bulunmak veya reddedilen talebi devam ettirmek, şüpheli davranışlar (uyuşuk, tepkisiz, heyecanlı, mesafeli vb.), herhangi bir emniyet kuralının ihlalinde bulunabilir. Yolcular ayrıca uçuş ekibine açıktan veya saldırgan bir şekilde fiziksel temas veya saldırı, uçuş ekibine karşı müstehcen, cinsel içerikli ve ahlaka aykırı davranmak, uçuş ekibi veya yolcuları fiziksel şiddet uygulamakla tehdit etmek, uçaktaki herhangi bir acil durum ekipmanını kurcalamak ve gereksiz yere oynamak, uçaktaki herhangi bir ekipmana/parçaya ve mala kasıtlı olarak zarar vermek gibi davranışlarda da bulunabilir. Yolcular bu davranışlarını biraz daha arttırarak silah göstererek tehdit etmek veya silah kullanımı, yaralama niyeti ile yapılan fiziksel veya cinsel saldırı gibi ciddi hayati tehlike oluşturan davranışlarda

bulunabilirken ayrıca kokpite girmeye teşebbüs etmek gibi çok ciddi sonuçları olan davranışlarda da bulunabilir (29).

- **Konaklama ve Lokasyon Bazlı Riskler:** Uçuş operasyonun bir parçası olan konaklama süreci hava yolu firmalarının işletme ve hizmet tiplerine bağlı olsa da uçuş ekipleri için zaruri bir süreçtir. Uçuş planlamalarına uygun olarak iki uçuş arasında da uzun süreli görevlendirmelerde uçuş ekibi çok fazla otel kullanımı yapmaktadır. Gerek yurt içi gerekse de yurt dışındaki otellerde birçok riskin olduğu bilinmektedir (30). Genel oda içinden, kaygan zeminlere, banyo / wc kullanımından genel otel içi ıslak / kaygan zeminlere, otel restoranından ve otelin bahçe ve çevresine kadar pek çok faktör İSG bağlamında riskler barındırmaktadır. Uçuş ekipleri özellikle yurt dışı konaklamalarında otel risklerine bağlı olarak ilgili ülke, kıta, lokasyon vb. bazlı risklere de maruz kalmaktadır. Örneğin özellikle güney yarım kürede görülen sıtma hastalığı uçuş ekibi için ciddi anlamda İSG riski doğurmaktadır (31). Bunun yanı sıra uçuş ekiplerinin ana vatanı ile konakladıkları ülkelerdeki olası deprem, terör, yangın, sel gibi acil durumlar, meteorolojik, kültürel, siyasi, dini, sosyolojik ve trafiğin ters yönden aklaması bölgeye özgü farklılıklar aynı zamanda çeşitli İSG risklerini beraberinde getirmektedir.

- **Ulaşım Süreçleri Bazlı Riskler:** Uçuş ekibi gerek evlerinden havalimanlarına ulaşmak gerek havalimanı içinde uçağa geçmek gerekse de konaklama yapıları lokasyonlarda havalimanları ile oteller arasında çeşitli araçlar ile ulaşımını sağlamaktadır. Bu ulaşım için kullanılan kara yolu araçların için pek çok İSG boyutu olduğu bilinmektedir (32). Bu araçlar içinde yaşanabilecek olası trafik kazaları, yol veya şoför kaynaklı sorunlar, ilgili lokasyona özgü trafik sorunları, ulaşım sağlandığı araca ait problemler gibi hususlar ilgili ulaşım sürecinin İSG boyutlarını etkilemektedir.

- **Havalimanları ve Ekip Odaları Bazlı Riskler:** Uçuş ekipleri uçuşa geçmeden önce öncelikle kendilerine özgü ekip binaları /odaları ve havalimanlarını kullanmakta ve öncelikle bu alanları kullanıp bu alanlar üzerinden uçağa geçmeleri gerekmektedir. Bu alanlarda bulunan otopark, yürüme alanları ve kaygan yüzeyler, kullanılan merdiven, asansör, yürüme alanlarının kendilerine özgü İSG riskleri mevcuttur. Özellikle havalimanı kullanımlarındaki yolcu ile temas alanları ve kalabalık ortaklar ek riskler doğurmaktadır. Yine havacılık sektöründeki emniyete verilen önem gereği sürekli kullanılması gereken x-ray cihazları ve güvenlik aramaları da yine İSG bağlamında özel risklere sahiptir.

- **Kişi Kaynaklı Riskler:** İşletmelerde yaşanan iş kazaları incelendiğinde kazalanmaların büyük bir kısmı kişisel hatalar olarak değerlendirilebilir (33). Uçuş ekibinin uymaları gereken kurallara uymamaları, yapmamaları gereken faaliyetleri icra etmeleri, kişisel koruyucu donanımlarını kullanmamaları ve anlık dikkatsizlerden kaynaklı çeşitli iş kazaları yaşayabilmekte ve bu kişisel faktörler gerek kendileri gerek ekip arkadaşları gerekse yolcular için İSG bağlamında çeşitli İSG risklerine sebep olmaktadır.
- **Zaman Kaynaklı Riskler:** Sivil havacılık tamamıyla bir zaman çizelgesine oturtulmuş ve gecikmeye tahammülü olmayan bir sektördür. Uçağın zamanında hazırlanması, kapı kapatması, taxi'ye başlaması, kalkması ve inmesi gibi tüm parametreleri zamanında gerçekleşmesi temel performans göstergeleridir. Bu bağlamda bu operasyonun en büyük paydaşlarından biri olan uçuş ekibi içinde aynı hassasiyet geçerli olup uçuş ekibi kaynaklı herhangi bir gecikme olmamalı, tüm süreçler zamanında eksiksiz tamamlanmalı ve hem yolcu memnuniyeti hem de uçuş güvenliğinden taviz verilmemelidir. Bu bağlamda tüm hususların yerine getirilmesi için uçuş ekipleri büyük bir özveri ile çalışmakta ve ellerinden geldiğince hızlı hareket etmeye çalışmaktadır. Bu bağlamda işlerin hızlı yapılması ve dolayısıyla üzerlerindeki zaman baskısı zaman zaman İSG riski olarak karşımıza çıkabilmektedir.

## **1. METODOLOJİ**

### **2.1. İSG RİSKLERİNİN YÖNETİMİNDE ÇALIŞANLARIN ROLÜ**

6331 Sayılı İş Sağlığı ve Güvenliği Kanunu gereği İşveren, iş sağlığı ve güvenliği yönünden risk değerlendirmesi yapmak veya yaptırmakla yükümlüdür (34). Risk analizi öncesi risk analizi ekibi kurulmalı ve bu ekibin içinde işyeri çalışan temsilcileri ve destek elemanlarının bulunması gerekmektedir. Çalışan temsilcisi ve destek elemanına ek olarak risk değerlendirme işyerindeki bütün birimleri temsil edecek şekilde belirlenen ve işyerinde yürütülen çalışmalar, mevcut veya muhtemel tehlike kaynakları ile riskler konusunda bilgi sahibi çalışanlar da bulunmalıdır. İlgili yasal mevzuatımız gereği çalışan temsilcisi; iş sağlığı ve güvenliği ile ilgili çalışmalara katılma, çalışmalarını izleme, tedbir alınmasını isteme, tekliflerde bulunma ve benzeri konularda çalışanları temsil etmeye yetkili çalışan olarak tanımlanırken destek elemanı ise asli görevinin yanında iş sağlığı ve güvenliği ile ilgili önleme, koruma, tahliye, yangınla mücadele, ilk yardım ve benzeri konularda özel olarak görevlendirilmiş uygun donanım ve yeterli eğitime sahip kişi olarak tanımlanmaktadır (34). Yerel mevzuata ek olarak Dünya'daki uygulamalara da bakıldığında çalışan temsilcisi ya da destek elemanı gibi kavramların İSG süreçlerine çok fazla dahil edildiğini görebiliriz. Avrupa Konseyi, Uluslararası Çalışma Örgütü,

Avrupa Birliđi gibi birlikteliklere ek olarak bařta Almanya, Fransa, İsviçe bařta olmak üzere çok sayıda ÷lkede benzer uygulamaların olduđu gr÷lmektedir (35).

## **2.2. İSG GN÷LLÜSÜ ve ÇALIřMA PRENSİPLERİ**

THY, ÷lkemizin bayrak taşıyıcı firması olarak n÷m÷zdeki 10 yıl boyunca b÷y÷k bir atılım planlamaktadır. Bu bađlamda 2023 yılında 85 milyondan fazla taşıyan bayrak taşıyıcı firmamız bu rakamı 171 milyona, 435 olan uçađ sayısını 813'e, yaklaşık 82 bin olan grup personel sayısını 150.000'e çıkarmayı planlarken uçuř ekibi sayısını yaklaşık 2,5 kat arttırmayı planlamaktadır (36). Personel sayısı ve operasyonel sayısındaki artışlar İSG s÷reçlerini de direkt etkilemektedir. Bu bađlamda hali hazırda kendi b÷nyesindeki İř G÷venliđi Uzmanları, İřyeri Hekimleri, İřyeri Hemřireleri, Çalıřan Temsilcileri, Destek Elemanları bulunan řirket, uçuř ekiplerinin İSG s÷reçlerinin daha efektif ynetimi iin İSG Gn÷llüsü Uçuř Ekibi Projesini (İSGGUEP) bařlatmıřtır.

İSGGUEP pilot çalıřma olarak 2016 yılında bařlatılmıřtır. İlgili tarihte yapılacak olan İSG risk analizi çalıřması iin kurulacak olan İSG Risk Deđerlendirme Ekibinde grev almak isteyen uçuř ekipleri iin řirket ii bir duyuru yayımlanmıř ve aktif C, B veya A sınıfı İSG Uzmanlıđı belgesine sahip ya da eđitimi almıř olup bu çalıřmada gn÷llü olarak grev yapmak isteyen uçuř ekibinin gn÷ll÷l÷k usul÷ ile projeye dahil olabileceđi belirtilmiřtir. İlgili duyuruya yapılan bařvurular arasında beř kiři seilmiř olup ilgili kiřiler ncelikli olarak řirketin İSG Uzmanları tarafından detaylı bir eđitime tabi tutulmuřlardır. İlgili eđitim sonrası ayın yarısında İSG risk deđerlendirme ekibi tarafından icra edilen risk analizi çalıřmalarına katılmıřlardır. İlgili personel, risk deđerlendirme çalıřmalarına pek çok katkı sađladıđı gr÷lmüř olup temelde operasyonel s÷reçlere çok hâkim olmaları, ilgili s÷reçlerin İSG bađlamındaki etkilerini çok iyi gzlemleyebilmeleri ve riski yařıysan kiřiler olarak riskin etkisinin azaltılabilmesi adına çok kaliteli ve etkin risk azaltıcı tedbir nerileri sunabilmeleri ile n plana çıkmıřtır. Risk analizi s÷recinin bitmesi sonrası bu ekibin sađladıđı katma deđerin kaybedilmemesi adına s÷re İSGGUEP'e evrilmiř ve bu bađlamda ncelikli olarak řirket ii prosed÷r oluřturulup s÷re kayıt altına alınmıřtır. İlgili prosed÷r bađlamında İSGGUE; Tercihen Çalıřma ve Sosyal G÷venlik Bakanlıđı'ndan onaylı A, B ya da C sınıfı İř G÷venliđi Uzmanlıđı Sertifikasına sahip ve İSG gn÷llüsü olmak isteyen uçuř personeli olarak tanımlanmıřtır. Akabinde İSG birimi tarafından řirket ii ilan yayımlanmıř ve gn÷llü olarak İSG s÷reçlerine destek vermeye hazır olan uçuř ekibinden bu ilana bařvuru yapmaları talep edilmiřtir. Bařvuru s÷reci sonrası ilgili bařvurular; kiřinin CV'si ve gemiř İSG performansı gz n÷ne alınarak n deđerlendirmeye tabi tutulmuř olup n deđerlendirmeden bařarı ile geenler ile bire bir m÷lakat yapılmıř ve nihai olarak uygun

görülen uçuş ekibi idari olarak da değerlendirildikten sonra İSGGUEP'e dahil edilmektedir. Bu projeye dahil olan İSGGUE, aktif olarak uçuş görevine sıradan bir uçuş ekibi gibi devam ederken aynı zamanda İSG birimi ile koordineli olarak İSG süreçlerine destek sağlamaktadır. İSGGUEP'e dahil olan uçuş ekibi detaylı bir eğitime tabi tutulmakta ve eğitim sürecini başarı ile tamamladıktan sonra aktif olarak göreve başlamaktadır. İlgili görev tamamıyla gönüllülük usulüne bağlı kalarak, şirketin İSG biriminin koordinasyonunda yürütülmektedir. Öncelikle İSGGUE'lere her ilk ayında detaylı bir İSG birimi tarafından İSG brifingi verilip ekibin İSG bağlamındaki eksikleri tamamlanmaktadır. Ayrıca ekibin yıllık ve aylık yapacağı temel faaliyetler yıl başlarında genel olarak ekip ile paylaşılırken yine her ayın başında ise aylık olarak yapılacak çalışmalar paylaşılmaktadır. Her ay sonu yaptığı faaliyetleri bireysel olarak İSG birimine raporlayan İSGGUEP üyelerinin aylık ve yıllık performans karneleri yine İSG birimi tarafından hazırlanmaktadır. İSGGUE, dilediği zaman projeden kendi isteği ile de ayrılıp faaliyetlerini sonlandırabilmektedir. İSGGUE, İSG performansını yüksek tutması gerekmekte olup aksi takdirde projedeki görevine son verilebilir. İSGGUE olarak minimum üç yıl görev almış ve İSG farkındalığı kazandırılmış ekibin yerine yeni İSGGUE kazandırmak üzere ekibin İSG Gönüllülük süreci sonlandırılabilir. Herhangi bir sebeple görev sonlanmaları sebebiyle projede aksaklık olmaması adına en geç iki yılda bir şirket içi İSGDUEP duyurusu güncellenmektedir. Hali hazırda 25 Kabin Ekibi ve 10 Kokpit Personelinin aktif olarak görev aldığı projede personel sayısının %0,2 – 0,5'i arasındaki personelin aktif olarak bulunması adına İSG birimi tarafından süreç takip edilmektedir.

### **2.3. İSG GÖNÜLLÜSÜ FAALİYETLERİ**

İSGGUE'nin, göreve başladıktan sonra dört temel sorumluluğu bulunmaktadır. Bunlar temel olarak;

- Tespit ettiği tüm ramak kala ve İSG hususlarını İSG birimine raporlamak
- Birlikte görev yaptığı uçuş ekibinin İSG farkındalığı ve kültürüne katkı sağlamak
- Güncel İSG hususlarının sahada takip edilmesini sağlamak
- İSG birimi tarafından yapılan İSG proje ve çalışmalarına iştirak etmek

İSGGUE, çok sayıda çalışmaya imza atmıştır. Ekibin yürüttüğü faaliyetler Standart Çalışmalar ve Proje Bazlı Çalışmalar olarak iki başlık altında toplanabilir.

### **2.3.1. Standart Çalışmalar:**

Bu çalışmalar tüm İSGGUE tarafından tüm uçuş ve faaliyetlerinde gerçekleştirilmesi gereken çalışmalar olup detayları aşağıdaki gibidir.

- **Ramak kala Paylaşımları:** İSGGUE, evden çıkıp tekrar eve gelene kadarki tüm süreçlerde tespit ettiği tüm ramak kalaları İSG birimi ile paylaşır. THY, Dünyada 274 noktasına uçak bir hava yolu firmasıdır (37). Buda binlerce THY uçuş ekibinin günün herhangi bir anında havada, Dünya'nın herhangi bir havalimanında, ekip araçlarında veya otellerde olduğunu göstermektedir. Özellikle İSG profesyonellerinin bulunmadığı bu alanlardaki İSGGUE'nin paylaşımları şirketin İSG kültürünün gelişmesine çok ciddi katma değer sağlamaktadır.
  - Ev – Havalimanı arası toplu ulaşım ve ekip araçları / servisler, ulaşım yolları, şoförler vb.
  - Havalimanları ve çevreleri,
  - Uçak içi süreçler ve yolcu davranışları,
  - Otel konaklamaları, otel transfer araçları, genel oda şartları, yemekler vb.

Bu şekilde 2023 yılında 1.000'den fazla ramak kala paylaşımı yapılmıştır.

- **İSG Briefingleri:** Uçuş ekibi her uçuş öncesi uçağın Kabin Amiri ve Kaptan Pilotu önderliğinde briefing yapmaktadır. İSG birimi tarafından İSGGUE içinde periyodik olarak İSG bağlamında içerik oluşturulmaktadır. İSGGUE, kendisine İSG birimi tarafından sağlanan bu içeriği ilgili briefinglerde tüm ekibi ile paylaşmakta ve bu paylaşım ekibin İSG farkındalığı ve kültürüne nihai olarak ise şirketin İSG kültürüne pozitif olarak yansımaktadır. Pandemi öncesi 2019 yılında yapılan briefing çalışmaları ile 12.000'den fazla uçuş ekibine ulaşılmıştır.
- **İSG İyileştirme Takibi:** Şirket bünyesinde süreç içerisinde İSG ile alakalı pek çok iyileştirmeler yapılmaktadır. Bu iyileştirmeler periyodik olarak İSG birimi tarafından İSGGUE ile paylaşılmaktadır. Ekibimiz ise saha da ilgili hususları sürekli gözleyerek süreçlerdeki bir hata olup olmadığı, sürecin reel katkısı, sürekliliği ve yeni geliştirme önerileri ile İSG birimine geri dönüş sağlamaktadır.

### **2.3.2. Proje Bazlı Çalışmalar:**

Bu çalışmalar rutin çalışma olmayıp İSG ekibi tarafından yapılan proje bazlı çalışmalardır. "Riski en iyi işi yapan bilir" prensibi ile proje bağlamında İSG birimi tarafından İSGGUE'nin tamamı ya da bir kısmı proje ekibine dahil edip İSGGUE'nin ilgili konu ile alakalı görüşleri

alınır ve proje bazlı saha uygulamasında desteği istenir. Bu prensip ile yürütülen çalışmaların bazılarının detayları aşağıdaki gibidir.

- **Risk Analizleri:** Gerek İSG yasal mevzuatımız gereği (13) gerekse yaşanan iş kazaları, yeni süreçlerin gelişmesi vb. sebeplerle yapılan risk analizi revizyon süreçlerine destek verilmektedir.
- **Teknik Bilgi Paylaşımı:** Uçuş ekibi işleri itibarı ile çok teknik bir iş icra etmektedirler. Yapılan bu işin teknik boyutunun İSG süreçleri ile eşleştirilmesinde İSGGUE'nin İSG birimine verdiği teknik destek çok ciddi önem arz etmektedir. Bu bağlamda İSG birimi tarafından aylık periyodik toplantılar ve özel çalışmalar icra edilip İSGGUE bu toplantılara davet edilmekte ve ilgili konunun İSG boyutu ile alakalı İSGGUE'nin görüşlerine başvurulmaktadır.
- **Hatların Analizi:** İSG bağlamında riskli görülen hatlar vardır. Ayrıca yeni açılan hatlarında İSG bağlamında risklerinin tespit edilmesi gerekmektedir. Bu hatların değerlendirilmesi adına bir ekip oluşturulur. Ekip; hatta görevli uçuş ekibi (bu ekip tamamıyla İSGGUE üyelerinden seçilir), İSG Profesyoneli (İSG uzmanı ve işyeri hekimi) ve operasyonel birimlerden oluşan bir ekip ile o hatta aktif bir uçuş gerçekleştirilir. Bu uçuş şirket içerisinde İSG Uçuşu olarak adlandırılır ve uçuş sırası ve sonrasında hattın riskli bir hat olmasının sebepleri proje ekibi tarafından tespit edilmeye çalışılır. Bu aşamada o hatta sürekli uçuş gerçekleştiren çalışanlar olarak İSGGUE, proje ekibine geri dönüş ve teknik destek sağlayarak ilgili risklerin tespiti hususunda katma değer sağlamaktadır.
- **Uçakların Analizi:** Uçaklar, uçuş ekiplerinin işyeri olup bu alanlarda çok fazla zaman geçirmektedirler. Bu bağlamda gerek mevcut gerekse de filoya yeni katılan uçakların İSG risk ve tehlikelerini uçuş ekibinden daha iyi kimse bilememekte ve yorumlayamamaktadır. İSG Uçuşlarında olduğu gibi uçakların İSG değerlendirme süreçlerinde de İSGGUE'nin destek, teknik bilgi ve yönlendirmelerine başvurulmaktadır.
- **Konaklama ve Otel İSG Çalışmaları:** Dünya'nın en çok noktasına uçak hava yolu şirketlerinden biri olan THY'nin uçuş ekipleri yıllık milyon geceleri bulan konaklamalar yapmaktadır. Bu bağlamda Dünya'nın dört bir tarafında olan oteller ve otel – havalimanı arası transfer süreçleri de İSG bağlamında çok ciddi riskler içermektedir. Bu risklerin yönetimi konusunda İSGGUE çok ciddi rol almaktadır.

Kendilerine İSG birimi tarafından sağlanan form ve yardımcı ekipmanlar ile otel ve ulaşım süreçlerinin İSG boyutunu adeta bir İSG profesyoneli gibi analiz eden İSGGUE konaklama sonrası İSG ekibine raporlama yaparak otelin İSG boyutunda İSG birimini ve şirketini haberdar etmektedir.

- **Farkındalık Çalışmaları:** Uçuş ekiplerinin İSG farkındalığını arttırmak üzere THY bünyesinde çok çalışmalar icra edilmektedir. Bu çalışmalardan bazıları da İSG etkinlikleridir. İSG Etkinliklerinde İSGGUE'ne bu etkinliklerde rol verilmekte olup uçuş ekibinin İSG farkındalığının artırılmasında kendilerinin de desteği alınmaktadır.

## **SONUÇ**

İSG çalışmalarında çalışan desteği olmazsa olmazdır. Sivil havacılık sektörü ise endüstrileşmeye / makineleşmeye çok müsait olmayan, çok fazla regülasyon ve gerekliliği olan, emniyet – güvenlik ve yolcu memnuniyeti saç ayağı üzerine kurulu, hataya toleransı olmayan ve zaman temelli bir sektördür. Dolayısıyla çalışana diğer sektörlerden daha fazla yük binmekte ve çalışandan daha fazla beklenti söz konusu olmaktadır. Bu bağlamda mevcut İSG riskleri artmakta olup bu risklerin yönetiminde hali hazırdaki İSG profesyonellerinin tek başlarına çalışmasının yeterli olmadığı görülmüştür. Bu sebeple çalışanları İSG süreçlerinin içine çekebilmek adına İSGGUEP devreye alınmıştır. Bu proje ile THY uçuş ekibi İSG faaliyetlerinin içerisinde yer alarak İSG süreçlerinde söz sahibi olmuş ve sistematik bir şekilde görüşlerini paylaşmaya başlamıştır. Bu proje bağlamında İSGGUE, aşağıdaki beş başlık altında raporlanan hususlarda İSG birimine destek olmaktadır.

- Öncelikli olarak risk analizi çalışmalarına dahil olup risklerin belirlenmesinde etkin rol oynayıp risklerin etkilerinin azaltılması ya da yok edilebilmesi için fikirlerini paylaşmıştır.
- Herhangi bir zaman diliminde İSG profesyonellerinin orada bulunamayacağı Dünya'nın herhangi bir alanında uçak içi, otel, ekip araçları gibi alanlardaki tüm risk, tehlike ve ramak kalaları başta THY İSG birimi olmak üzere ilgililer ile paylaşım sürecin çözümünde önemli rol oynamaktadır.
- İSG birimi ile birlikte uçuş ekibinin İSG farkındalığının artırılmasında adına ekibine yaptığı bilgilendirmeler ile ekibin İSG farkındalık ve kültürünün gelişmesinde destek sağlamaktadır.

- Havacılık sektörü gibi kompleks, büyük ve detayların yoğun olduğu bir sektörde İSG biriminin ihtiyaç duyduğu tüm teknik desteği sağlamaktadır.
- İSG birimi tarafından yapılan büyük çaplı proje ve çalışmalarda İSG birimi ile birlikte çalışarak aynı zamanda çalışmanın kalite ve büyüklüğüne etki etmektedir.

THY bünyesinde tamamıyla gönüllülük esasına dayanan bu proje ekibi, İSG birimi tarafından periyodik olarak yenilenmekte ve bilgi anlamında sürekli güncellenmektedir. Sürekli geliştirilen proje katılımcılarının sayıları personel sayısının %0,5'ini geçmeyecek şekilde sistematik olarak arttırılmaya çalışılmakla birlikte ekibin sürekli zinde tutulması sağlanmaktadır. Farklı sektör ve çalışma gruplarında için yine farklı formatlarla geliştirilebilecek olan bu projenin çalışanların İSG süreçlerine dahil edilebilmesi adına önemli bir proje olduğu gerek Sivil Havacılık Sektörüne gerekse THY bünyesinde İSG bağlamında çok önemli katma değerler sağladığı görülmektedir.

**Özet**

Bu çalışmanın temel amacı sigorta acentelerinde görev yapan personellerin performansını etkileyebilecek mesleki beceri ve yetkinliklerin neler olduğunun belirlenmesidir. Bilindiği üzere, sigortacılık birey ve kurumlara güven hizmeti sağlanmasında dünyanın birçok ülkesinde en önemli sektörlerden biri olup, aynı zamanda önemli bir istihdam sağlayan sektör konumundadır. Sigorta ürünlerinin soyut özelliklerinden dolayı üretilmesi ve pazarlanmasında sigorta acentesi teknik personellerine büyük sorumluluklar düşmektedir. Sigorta ürünlerinin bir *hizmet ürünü* olarak *muamma* olmaktan çıkartıp, sigorta şirketi ve müşteriler nezdinde güveni pekiştiren bir özelliğe bürünmesi için sigorta satış temsilcilerinin oldukça özel mesleki beceri ve yetkinliklere sahip olması gerekmektedir. Çünkü sigorta ürünleri çok az kişinin anlayabileceği karmaşık bir ürün ve hizmettir. Bundan dolayı da sigorta sektöründe görev yapan sigorta satış temsilcilerinin, güvensizlik çağırabilecek her türlü olumsuz tutum ve davranışlardan kaçınması gerekmektedir. Diğer yandan da iletişim ve şeffaflık eksikliğinden kaynaklanabilecek olumsuzlukların neden olabileceği *güvensizlik* duygusunun oluşmaması ve müşteri bağlılığını güçlü bir şekilde oluşturmak için sigortacılığa has birtakım yeteneklere sahip olması önem arz etmektedir. Çalışmada nitel bir yöntem kullanılmıştır. İlgili literatürde dünyada ve Türkiye’de daha önce yapılmış ampirik ve teorik çalışmalardan konu ile ilgili olanlar incelenmiştir. Ayrıca sigortacılık ile ilgili kurum ve kuruluşlar tarafından hazırlanan standartlar incelenerek, sigorta acentelerinde görevli satış temsilcilerinin performansını etkileyebilecek mesleki beceri ve yetkinliklerin neler olduğu belirlenmeye çalışılmıştır. Çalışmanın kapsamı sigorta acentelerindeki satış temsilcileri ile sınırlandırılmıştır. Çalışmanın sonuçlarına göre, meslek standartlarında tanımlanmış olan görevler ve işlemleri yerine getirebilmek için kişilerde olması gereken bilgi ve beceriler, diğer yandan satış temsilcilerinin sahip olması gereken tutum ve davranışlar belirlenerek sektörde bulunan sigorta acenteleri satış temsilcileri için performans kriterleri de belirlenmeye çalışılmıştır. Bu çalışmanın sigorta acenteleri yöneticileri ve bu acentelerde görev yapan sigorta satış temsilcilerinin kendilerinin performanslarını değerlendirmelerinde bir kılavuz görevi görmesi beklenmektedir.

**Anahtar Kelimeler:** Sigorta, Sigortacılık sektörü, Sigorta Satış Temsilcisi, Mesleki Beceri, Mesleki yetkinlik

**A REVIEW ON PROFESSIONAL SKILLS AND COMPETENCIES AFFECTING  
THE PERFORMANCE OF INSURANCE PROFESSIONALS**

**Abstract**

The main purpose of this study is to determine the professional skills and competencies that can affect the performance of personnel working in insurance agencies. As it is known, insurance is one of the most important sectors in many countries of the world in providing trust services to individuals and institutions, and is also a sector that provides significant employment. Insurance agency technical personnel have great responsibilities in the production and marketing of insurance products due to their intangible features. Insurance sales representatives must have very specific professional skills and competencies in order for insurance products to cease being an enigma as a service product and to become a feature that reinforces trust in the insurance company and customers. Because insurance products are complex products and services that very few people can understand. For this reason, insurance sales representatives working in the insurance industry must avoid any negative attitudes and behaviors that may evoke distrust. On the other hand, it is important to have certain skills specific to insurance in order to avoid the feeling of distrust that may be caused by the negativities that may arise from lack of communication and transparency and to create strong customer loyalty. A qualitative method was used in the study. In the relevant literature, empirical and theoretical studies previously conducted in the world and in Turkey were examined. In addition, by examining the standards prepared by institutions and organizations related to insurance, it has been tried to determine what professional skills and competencies may affect the performance of sales representatives working in insurance agencies. The scope of the study is limited to sales representatives in insurance agencies. According to the results of the study, performance criteria for sales representatives of insurance agencies in the sector were tried to be determined by determining the knowledge and skills that people should have in order to fulfill the duties and transactions defined in the professional standards, as well as the attitudes and behaviors that sales representatives should have. It is expected that this study will serve as a guide for insurance agency managers and insurance sales representatives working in these agencies to evaluate their performance.

## **Giriş**

Yirminci yüzyılın ikinci yarısından bu yana teknolojik gelişmeler başta olmak üzere iş dünyasında meydana gelen değişimler, işletmelerde ve işgücü piyasalarında yaşanan gelişmeler, yöneticileri, çalışanları seçme ve geliştirme konusunda yeni yollar bulmaya zorlamaktadır (Assunção ve Goulart, 2016; Roodt ve La Grange, 2001). Bir başka ifadeyle günümüzde yeni yönetim modellerinin benimsenmesi, tüketici davranışlarında meydana gelen değişimler işletme yöneticilerinin insan kaynakları potansiyeli ve yeterlilikleri hakkında yeniden düşünmeye yöneltmektedir. Le Boterf (2003), *yeterlilik* kavramının, “karmaşıklık ve karşılıklı bağımlılığın” yoğun olarak tezahür ettiği günümüzde yeni normaldeki zorlukların anlaşılmasına izin vermediğini ifade etmektedir. İşletmelere rekabet avantajı sağlayacak iş gücü kabiliyetlerinin artırılması onlara yeni beceri ve yetkinliklerin kazandırılması konu hakkındaki akademik çalışmalara zemin hazırlamaktadır. Bu çalışma böyle bir dönemde, iş gücünün mesleki nitelik ve yeterlilik kabiliyet durumunu ve gelecekte hangi beceri ve yetkinliklerin lazım olabileceğini ele alan teorik bir çalışmadır. Bu çalışmanın temel amaçlarından biri sigorta acentelerinde görev yapan personellerin günümüz şartlarında performansını etkileyebilecek mesleki beceri ve yetkinlikler üzerine bir inceleme yapmaktır. Ayrıca bu meslek elemanlarının yakın gelecekte mesleklerini icra ederken başka hangi beceri ve yetkinliklere ihtiyaç duyabileceği hususu da çalışmanın bir diğer amacıdır. Kısaca çalışmada sigorta satış temsilcilerinin bugün ve gelecekte hangi beceri ve yetkinliklere ihtiyaç duyabileceği konusunda değerlendirmeler yaparak çeşitli öngörülerde bulunulması amaçlanmaktadır. Bilindiği üzere, sigortacılık birey ve kurumlara güven hizmeti sağlanmasında dünyanın birçok ülkesinde en önemli sektörlerden biri olup, aynı zamanda önemli bir istihdam sağlayan sektör konumundadır. Sigorta ürünlerinin soyut özelliklerinden dolayı üretilmesi ve pazarlanmasında sigorta acentesi teknik personellerine büyük sorumluluklar düşmektedir. Çünkü sigorta ürünleri çok az kişinin anlayabileceği karmaşık bir ürün ve hizmettir. Bundan dolayı da sigorta sektöründe görev yapan sigorta satış temsilcilerinin, güvensizlik çağrıştırabilecek her türlü olumsuz tutum ve davranışlardan kaçınması gerekmektedir. Diğer yandan da iletişim ve şeffaflık eksikliğinden kaynaklanabilecek olumsuzlukların neden olabileceği *güvensizlik* duygusunun oluşmaması ve müşteri bağlılığını güçlü bir şekilde oluşturmak için sigortacılığa has birtakım yeteneklere sahip olması önem arz etmektedir. Çalışmada nitel bir yöntem kullanılmıştır. İlgili literatürde dünyada ve Türkiye’de daha önce yapılmış ampirik ve teorik çalışmalardan konu ile ilgili olanlar incelenmiştir. Ayrıca sigortacılık ile ilgili kurum ve kuruluşlar tarafından hazırlanan standartlar incelenerek, sigorta acentelerinde görevli satış

temsilcilerinin performansını etkileyebilecek mesleki beceri ve yetkinliklerin neler olabileceği belirlenmeye çalışılmıştır. Çalışmanın kapsamı sigorta acentelerindeki satış temsilcileri (seviye 4) ile sınırlandırılmıştır. Çalışmanın sonuçlarına göre, meslek standartlarında tanımlanmış olan görevler ve işlemleri yerine getirebilmek için meslek elemanlarında olması gereken bilgi ve beceriler, diğer yandan bu kişilerin sahip olması gereken tutum ve davranışlar belirlenerek sektörde bulunan sigorta acentelerinde görevli satış temsilcileri için performans kriterleri de oluşturulmaya çalışılmıştır. İlgili literatürde konu hakkında fazla çalışma yapılmamış olması nedeniyle bu çalışmanın ilgili alanda önemli bir boşluğun doldurulmasına katkı yapması beklenmektedir. Ayrıca bu çalışmanın sigorta acenteleri yöneticileri ve bu acentelerde görev yapan sigorta satış temsilcilerinin kendilerinin performanslarını değerlendirmelerinde bir kılavuz görevi görmesi beklenmektedir.

### **2.1.Sigorta, Sigorta Şirketleri ve Sigorta Acenteleri**

#### **2.1.1.Sigorta**

“Sigorta” hakkında tek bir tanım olmamakla birlikte, hukuk, ekonomi, tarih, aktüerya bilimi, risk teorisi ve sosyoloji gibi çeşitli disiplinlerin bakış açısından farklı tanımlamalar mevcuttur (Rejda ve McNamara, 2014; Teale, 2008). Bu çalışmada bütün sigorta tanımlarına yer verilmeyecektir. Ancak araştırma konusu bakımından bir tanım yapılması gerekirse, Türk Ticaret Kanunu (TTK, 2011) 6.Kitabında yer alan tanımına bakılabilir. Buna göre, sigorta;

*“Sigortacının bir prim karşılığında, kişinin para ile ölçülebilir bir menfaatini zarara uğratan tehlikenin, rizikonun, meydana gelmesi hâlinde bunu tazmin etmeyi ya da bir veya birkaç kişinin hayat süreleri sebebiyle ya da hayatlarında gerçekleşen bazı olaylar dolayısıyla bir para ödemeyi veya diğer edimlerde bulunmayı yükümlendiği”*

bir sözleşme olarak tanımlanmaktadır (TTK, 1041). Amerikan Risk ve Sigorta Birliği Sigorta Terminolojisi Komisyonu da sigortayı şu şekilde tanımlamıştır (Rejda ve McNamara, 2014; Teale, 2008):

*“Sigorta, tesadüfi zararların, bu tür zararlar için sigortalıları tazmin etmeyi, meydana geldiklerinde başka maddi faydalar sağlamayı veya riskle ilgili hizmetleri sağlamayı kabul eden sigorta şirketlerine bu tür risklerin devredilmesi yoluyla bir havuzda toplanmasıdır.”*

Tanımlardan da anlaşılacağı üzere sigorta, birey ve/veya kurumlara, belli bir prim karşılığında güvence sunan bir risk yönetim uygulamasıdır. Sigortacı, önceden belirlenmiş olan bir prim karşılığında tesadüfen gerçekleşecek birtakım risklerin gerçekleşmesi sonucunda, sigorta poliçesi hükümlerine göre, sigortalıya veya sigorta ettirene tazminat ödeyerek, güvence hizmetini sunmuş olmaktadır.

### **2.1.2.Sigorta Şirketleri**

Dünya’da ve Türkiye’de finansal hizmetler sektörü, insanlara finansal ürün ve hizmet sağlayan çok sayıda kuruluştan oluşmaktadır. Bu kuruluşlardan bazıları, ticari bankalar, tasarruf ve kredi kuruluşları, kredi birlikleri, sigorta şirketleri, menkul kıymet satıcıları, özel ve devlet emeklilik fonları, finans şirketleri ve diğer kuruluşlar örnek olarak gösterilebilir (Rejda ve McNamara, 2014; Teale, 2008). Sigortacılık, ekonominin dolayısıyla finans sektörünün bir parçasıdır ve amacı şirketlerin ve bireylerin risklerini yönetmektir. Sigortacılık hizmetleri alanı, dünyanın diğer ülkelerinde olduğu gibi Türkiye’de de en dinamik ve hızla gelişen pazarlardan birisi olup, tamamıyla devletin yasal düzenlemelerine tabi olup, bu düzenlemeler sigorta sektöründe yer alan tüm paydaşları kapsamaktadır. Özetle, *sigorta şirketleri* kuruluş amaçları itibariyle risk altında bulunan birey ve kurumlara toplamış oldukları primler karşılığında risklerin gerçekleşmesi durumunda teminatlar veren iktisadi kuruluşlardır (Wagner ve Fuino, 2024). Sigortacılık sektöründe pazarlama çalışmaları hem müşterilerin hem de çalışanların kilit bir rol oynadığı bir alandır (Witkowska ve Stachowska, 2021).

Bilgi işlem teknolojileri ve genel bilgi düzeyleri arttıkça tüketici davranışları değişmekte ve müşteriler, kendilerine sigorta hizmeti sunan çalışanlara karşı giderek daha bilinçli ve daha fazla talepkar olmaktadır. Walkowiak’a (2008) göre, bunun bir diğer nedeni de uluslararası pazarlar da dahil olmak üzere yeni pazarlara girerek konumlarını genişleten sigorta şirketleri arasındaki artan rekabettir. Yeni sigorta şirketlerinin ortaya çıkışı, yeni ürünler, bu hizmetlerin sunulduğu kanallar, müşterilerin yeni ihtiyaç ve gereksinimleri, sigorta şirketlerini, müşterinin teklifinden vazgeçmemesi ve sigortayı kabul etmesi için hizmetlerini mükemmelleştirmeye zorlamaktadır. Zira, bu süreç içerisinde sigorta komisyonculuğu da önemli ve güvene dayalı bir hizmet olarak ortaya çıkmaktadır (Pieroway, 2024). Rudzewicz’e (2018) göre ortaya çıkan bu yeni durum yani sigorta pazarındaki rekabet, müşteriyle uzun vadeli ilişkiler kurabilecek ve onlara uzun dönemli uygun müşteri hizmetini sağlayarak güven sağlayan satış temsilcilerine olan ihtiyacı artırmaktadır. Bir başka ifadeyle, sigortacılıkta müşterilerin korunması, diğer şeylerin yanı sıra, sigorta dağıtımıyla ilgilenen gerçek kişilerin (satış temsilcilerinin) yetkinliği ve profesyonelliği ile sağlanabilmektedir (Korica ve Zarubica, 2021).

Pek çok müşteri için, bir komisyoncunun, özellikle de verilen fiyat karşılığında, iyi bir iş çıkardığını söylemek *neredeyse imkânsız* olabileceği ileri sürülmektedir (Pieroway, 2024). Ticari anlamda sigorta şirketlerinin çoğu sigorta acentelerine ve sigorta brokerlerine poliçe satış sürecinde güvenmek zorunda kalmaktadır. Çünkü bu söz konusu sigorta aracıları müşterilerin karşısında sigorta şirketlerini temsil etmektedirler.

### **2.1.3.Sigorta Acenteleri**

Başarılı bir satış gücü, dünyanın her yerinde finansal hizmetler sektöründe başarının anahtarlarından biridir (Rejda ve McNamara, 2014; Teale, 2008). Günümüzde satılmakta olan sigorta poliçelerinin önemli bir çoğunluğu sigorta acenteleri ve brokerler tarafından satılmaktadır (Wagner ve Fuino, 2024). Sigortacılık Kanunu'na (SK) göre, sigorta acentesi şu şekilde tanımlanmaktadır (R.G., 2024a):

*“Ticarî mümessil, ticarî vekil, satış memuru veya müstahdem gibi tâbi bir sıfatı olmaksızın bir sözleşmeye dayanarak muayyen bir yer veya bölge içinde daimî bir surette sigorta şirketlerinin nam ve hesabına sigorta sözleşmelerine aracılık etmeyi veya bunları sigorta şirketleri adına yapmayı meslek edinen, sözleşmenin akdinden önce hazırlık çalışmalarını yürüten ve sözleşmenin uygulanması ile tazminatın ödenmesinde yardımcı olan kişidir.”*

Sigorta acentesi, sigorta şirketinin nam hesabına sigorta poliçelerinin satışına bir komisyon geliri karşılığında aracılık ederek, poliçeyi tanzim edip, müşteriye sunan gerçek veya tüzel kişidir. Sigorta acenteleri Türkiye’de 5684 sayılı sigortacılık kanununa atfen çıkartılan *Sigorta Acenteleri Yönetmeliğine* göre kurulan ve her faaliyeti yasal olarak tanımlanmış olan kurumlardır. Ayrıca yine yönetmelikte tanımlandığı üzere sigorta acenteleri, sigorta şirketi adına, “acente işlemleri” olarak adlandırılan, poliçe satışı için gerekli tanıtım ve pazarlama faaliyetlerinin yapılması, müşterilerin kayıt altına alınması, sigorta sözleşmelerine yönelik hazırlıkların yapılması, sigorta sözleşmelerinin yönetilmesi, hasarlarla ilgili konularda ve acentelik işlemlerinin organize edilmesi, denetlenmesi gibi faaliyetleri bir komisyon geliri karşılığında yapmaktadırlar (R.G. (2024b).

### **2.1.4.Sigorta Acentelerinin Poliçe Satışındaki Rolü ve Önemi**

Sigorta sektöründe yaşanmakta olan ekonomik ve teknolojik değişimlerdeki süreklilik, diğer yandan sigorta şirketleri arasındaki artan rekabet ve üretkenlik baskısı, sigorta satış temsilcisine işlerini yaparken yüksek düzeyde özen göstermesini zorunlu kılmaktadır (Negrutiu ve diğ., 2020; Zadykowicz ve diğ., 2020). Witkowska ve Kucka’ya (2008) göre, bir sigorta acentesi, sigorta hizmetlerinin satışında hayati bir rol oynamaktadır. Yazarlara göre, acenteler sigortayı

teklif ederken bireysel davranışlarıyla ve katılımlarıyla müşteriye sigortayı satın almaya teşvik edebilmeli, müşterilerin farklı beklentilerini de karşılayarak mümkün olan en yüksek kalitede hizmetleri sunabilme becerisine sahip olmalıdırlar. Li vd., (2021) göre, sigorta satış temsilcisi, bir anlamda sunmuş olduğu profesyonel hizmeti sayesinde müşteriyle ilgilenen ve müşterinin özel ihtiyaçlarını tanıyabilen müşterinin mali danışmanıdır. Çünkü sigorta şirketleri, satış temsilcileri aracılığıyla müşterilerini ikna etmek için etkili yollar ararlar; bu da onları çalışanlarının, bilgi, beceri ve tutumlarına dikkat etmeye teşvik etmektedir. Bir başka ifadeyle müşterinin sunulan hizmetlerin kalitesinden hiçbir şüphesinin olmaması oldukça önemlidir. Müşteri memnuniyeti, aynı zamanda sadakatlerin korunmasına da yardımcı olur (Witkowska, 2010; Ahmed ve diğ., 2020) ve bu, olumlu bir ilişki kurmanın ve daha uzun vadeli iş birliğinin temelini oluşturmaktadır.

## **2.2.Sigortacılık Meslek Elemanlarının Performansını etkileyen Mesleki Beceri ve Yetkinlikler**

Rekabet ve bilgiye dayalı ekonomi koşullarında mesleki beceri ve yetkinliklerin önemi sürekli artmaktadır (Korica ve Zarubica, 2021). Bir ticari faaliyeti yürütme biçimindeki dinamik değişiklikler, bir şirketin pazar başarısının giderek daha sık olarak çalışanlarının uygun yetkinlikleri ve onların gelişimlerine yatırım yapılmasıyla belirlendiği anlamına gelmektedir (Macerinskiene ve Survilaite, 2019; Zygmunt, 2019). Beşerî sermayenin ekonomik büyüme üzerindeki etkisinin bu mekanizması, çalışanların bilgi ve becerilerinin tüm ekonominin gelişme kapasitesini önemli ölçüde artırdığı argümanına dayanmaktadır (De la Fuente ve Ciccione, 2002).

### **2.2.1.Yetkinlik Kavramı**

Lester, (2014) çalışmasında “yetkinlik” kavramının için genel olarak bir kişinin neler yapabileceğini ifade etmek için kullanıldığını belirtmektedir. Yazar çalışmasında ayrıca bu kavram için “görevleri ve rolleri beklenen standartta yerine getirme yeteneği” olarak tanımlamaktadır. Bir başka çalışmada Uluslararası Standartlar Organizasyonu tarafından (ILO, 2012) yetkinlik “amaçlanan sonuçlara ulaşmak için bilgi ve becerileri uygulama yeteneği” olarak tanımlamaktadır. Bir başka ifade ile “yetkinlik” “yapabilmenin” kavramsallaştırılmış şeklidir (Lester, 2014). İlgili literatür incelendiğinde “yetkinlik” için birçok tanım yapılmıştır. Bu nedenle dilbilimciler yetkinliği, planlanan görevlerin gerçekleştirilmesi için bir kurum veya bireyin uygunluğu, yetkilendirilmesi, vekalet edilmesi, kişinin bilgi, beceri ve sorumluluklarının kapsamı olarak tanımlamaktadır (Korica ve Zarubica, 2021). İngilizcede “yeterlilik” (sufficiency-yeterlilik, qualification-vasıf, competence-yeterlilik) kavramı altında,

bir şeyi gerekli olduğu şekilde olarak yapabilme yeteneği, beceri anlaşılmaktadır. Bu tanım, yeterlilikler ve beceriler arasındaki kesin ilişkiyi açıklamaktadır. Ancak bir yetenek, görevleri yerine getirmek için gerekli olan becerilerle, özelliklerle ilişkilidir. Bahsedilen tanımlar kesin değildir; yeterlilikler ve yetenekler arasındaki net ayrımı yapmak mümkün değildir. İlgili alanda yapılan çalışmalar incelendiğinde “beceri” yerine “yetenekler” ve “yeterlilik” eşanlamlı terimleri kullanıldığı görülmektedir. Bir başka çalışmada “yeteneğin” bireyin fiziksel veya ruhsal karakteri olduğu ileri sürülerek, yetkinlik kazanma sürecinin bilgi, tutum ve değer sistemi ile belirlendiği ifade edilmektedir (Kajwang, 2022). “Beceri” kavramı için ise, çalışma, iyileştirme, uygulama ve danışmanlık yoluyla kazanılabilecek, görevin gerçekleştirilmesine ilişkin davranışlar olduğu ifade edilmektedir.

Ramos, (2006) yeterliliğin üç boyutu olduğunu ileri sürmektedir. Bunlar; birincisi, mezuniyet süreçlerini diplomaların değeri ile birleştiren kavramsal boyut; ikincisi mezuniyet sürecini pozisyonun sosyal olarak tanınmasıyla ilişkilendiren sosyal boyut; üçüncüsü ise, mezuniyetin niteliklerin gelişimi ile ilişkili olduğu deneysel boyuttur. Kısacası *yetkinlik*, üstün bir performansı tanımlayacak bir dizi bilgi, beceri ve tutum olarak anlaşılmaktadır (Witkowska ve Stachowska, 2021). Çalışanlara verilen görevlerin doğru şekilde uygulanması, onların temel yetkinlikler olarak kabul edilen uygun yeterliliklerini gerektirir. Çalışanların yetkinlikleri, belirli bir faaliyet alanındaki (örneğin, satışta sunulan hizmetlerin kalitesi) etkinliğini belirler (Korica ve Zarubica, 2021). İş yerinde yetkin kişiler, belirli sonuçlara ulaşma konusundaki beklentileri karşılar, rollerine atanan hedef ve standartlara ulaşmak için bilgi, beceri ve kişilik özelliklerini kullanabilirler. Yetkin çalışanlarla bir şirket en üst düzeyde hizmet verebilir. Hizmetlerin yüksek kalitesi doğrudan müşteri memnuniyeti ve sadakatine dönüşmekte, bu da şirket için kar yaratmaktadır ve üretkenliğini ve son olarak da pazar rekabet gücünü etkilemektedir (Kajwang, 2022).

Assunção ve Goulart (2016) göre, organizasyonun strateji ve hedeflerini çalışanların gelişimi ile birleştiren insan kaynakları yönetiminde yetkinlik bazlı bir yaklaşım giderek önem kazanmaktadır. Bu yaklaşımda yetkinlikler, bir çalışanın belirli bir değere dönüştürülebilen nitelikleri (özellikleri), yani uygulanan görevlerin ve iş sonuçlarının kalitesi olarak tanımlanabilir (Korica ve Zarubica, 2021). Bu nedenle şirketler, işlerinde arzu edilen yetkinliklere sahip çalışanları kazanmaya, elde tutmaya çabalamakta ve katma değer yaratarak rekabet güçlerinin artmasına katkıda bulunmaktadır. Bu açıdan bakıldığında işin kalitesini ve etkinliğini artırmak için çalışanların temel yetkinliklerinin ve gelişimlerinin uygun düzeyde

izlenmesi, geliřtirmesi ve bunların sürdürülmesi esastır. Yetkinlik modeli iki açıdan ele alınabilir (Dingle, 1995): Bunlar, Bireysel ve Örgütsel Yetkinliklerdir.

### **Bireysel Yetkinlikler**

Bu yaklaşım, çalışanların istenen sonuçlarına ulaşmaya katkıda bulunan davranışlarını ve belirli pozisyonlarda kurumsal rollerini başarıyla yerine getirmek ve şirketin hedeflerine ulaşmasına katkıda bulunmak için sahip olması gereken bilgi ve beceri alanlarını karakterize etmektedir. Verilen görevlerin yerine getirilmesi sırasında yeterliliklerin ortaya konulması ve belirli davranışların ortaya konulması olasılığı ile ilgili olduğunu belirtmek gerekir (Kajwang, 2022).

### **Örgütsel Yetkinlikler**

Örgütün rekabet avantajını belirleyen unsurları olarak çalışanların yeterliliklerinin stratejik önemine dikkat çekilirken, ayırt edici yetenek ve süreçleri tanımlayan temel yeterlilikler benzersiz stratejik kaynaklar olarak kabul edilmektedir. Bu bakış açısıyla yetkinlik modelleri esas olarak çalışanların davranışlarını belirlemek ve istenilen iş sonuçlarına ulaşmaya katkıda bulunmak için kullanılmaktadır (Prahalad ve Hamel, 1990).

OECD tarafından yayınlanan rapora göre, (2005), 21.yüzyıl beceri ve yetkinlikleri řu şekilde belirtilmiştir:

- |                                 |                                      |
|---------------------------------|--------------------------------------|
| ✓ <i>Yaratıcılık/yenilik</i>    | ✓ <i>İletişim</i>                    |
| ✓ <i>Kritik düşünce</i>         | ✓ <i>Girişim ve öz yönlendirme</i>   |
| ✓ <i>Bilgi okuryazarlığı</i>    | ✓ <i>Verimlilik</i>                  |
| ✓ <i>Problem çözme</i>          | ✓ <i>Liderlik ve sorumluluk</i>      |
| ✓ <i>Karar verme</i>            | ✓ <i>İş birliği</i>                  |
| ✓ <i>Esneklik</i>               | ✓ <i>BİT işlemleri ve kavramları</i> |
| ✓ <i>uyarlanabilirlik</i>       | ✓ <i>Dijital vatandaşlık</i>         |
| ✓ <i>Öğrenmeyi öğrenmek</i>     | ✓ <i>Medya kur yazarlığı</i>         |
| ✓ <i>Araştırma ve sorgulama</i> |                                      |

### **2.2.2. Sigortacılıkta Mesleki Beceri ve Yetkinlikler**

Kajwang, (2022) çalışmasında sigorta şirketlerinde performans ölçümünün temel göstergeleri; çalışan memnuniyeti, çalışan eğitim süresi artış hızı, çalışan makul teklif artış hızı ve geliştirilen ürün sayısı olduğunu belirterek, sigorta sektöründe teknolojik değişimler yaşadıkça, çalışanların işe alınması ve işte tutulması için gereken istihdam edilebilirlik becerileri ve akademik niteliklerin de değiştiğini ve gelecekte de bu değişimin devam edeceğini ileri sürmektedir. Yazar çalışmasında sigorta sektörünün performansında eğitim ve becerilerin önemini arařtırmış, İK yöneticilerinin çalışanlarının genel performansa katkıda bulunan becerilerini geliřtirmek için kullandıkları çeşitli yollar hakkında tespitlerde bulunmuştur. Yazar

çalışmasında ayrıca sigorta sektöründe, çalışanların işlerini daha hızlı ve verimli bir şekilde yapmalarını ve bunun sonucunda genel performansa katkıda bulunmalarını sağlayan insurtech gibi sistemler konusunda çalışanlarına eğitim verilmesinin onların performansını arttırabileceğini ileri sürmüştür. Yazar çalışmasında “sosyal beceriler, teknik beceriler, iletişim becerileri, liderlik becerileri, organizasyon becerileri ve kişilerarası beceriler” olarak ifade edilen temel becerilerin tüm meslekleri kapsadığını belirtmekle birlikte bu becerilerin sigortacılık için de önemli olduğunu ileri sürmüştür.

Assunção ve Goulart (2016) çalışmalarında sigorta acenteleri de dahil olmak üzere müşteriyle yüksek düzeyde temas ile karakterize edilen hizmet şirketlerinde, çalışanlar ve onların yetkinlikleri özellikle önem kazanmakta olduğunu belirtmişlerdir. Çünkü müşterilerle temasın kalitesi onların memnuniyeti ve kalitenin değerlendirilmesi üzerinde önemli bir etkiye sahiptir. Literatürde (Carlzon, 1987) “gerçek anı” olarak tanımlanan bu temas, hizmet sağlayıcı ile müşteri arasında uzun süreli bir ilişki kurma olasılığını belirleyecektir. Hizmetler söz konusu olduğunda (özellikle yüksek temas halinde olanlar), müşteriler her şeyden önce ilk temasta bulunan çalışanların oynadığı rolleri (hizmet tarzı, tutum, davranışlar) hatırlar. Román ve Rodríguez (2015) de çalışmalarında müşteri odaklı olmanın satış performansını olumlu yönde etkilediğini ileri sürerek, bir satış elemanının müşteri odaklılığı arttıkça, müşterilerin çıkarları doğrultusunda çalışmaya ve onların ihtiyaçlarını karşılayan teklifleri belirlemeye daha fazla önem vereceğini belirtmektedir. Roodt ve La Grange, (2001) çalışmalarında satış elemanlarının artık sadece ürünü satmaya odaklanmadığını ayrıca güvenilir, kalite odaklı müşteri hizmetleri sunmanın yanı sıra, müşterilere sürpriz ve memnuniyet duygusu veren *müşteri memnuniyeti duygusunu* da sağlamaya çalışmalarının kendilerinin bireysel yetkinlik ve becerilerinden birisi olduğunu ileri sürmektedirler. Bunun için de satış temsilcilerinin kaynaklar, kişilerarası beceriler, bilgi, sistemler ve teknoloji konusunda yeterlilik sahibi ve kabiliyetli olmalarının gerekliliği ileri sürülmektedir (Assunção ve Goulart, 2016). Bu söz konusu hususlarda satış temsilcilerinin genel satış becerilerinin müşteri odaklı satış uygulamasında daha da başarılı olabilmesi için “temel okuma, yazma, aritmetik, konuşma ve dinleme becerilerinin yanında, problem çözme, akıl yürütmeye ilişkin düşünme becerilerine sahip olmalarının kritik öneme sahip olduğunu vurgulamıştır (Román ve Rodríguez (2015). Assunção ve Goulart (2016) çalışmalarında bireysel sorumluluk, sosyallik, öz yönetim, öz saygı ve dürüstlük gibi kişisel niteliklerinin de söz konusu yetkinliklerin kullanılmasında oldukça önemli olduğunu ileri sürmüşlerdir. Daha güçlü müşteri yeterlilik becerilerine sahip bir satış elemanının müşteri

odaklı satış yapma olasılığının daha yüksek olacağı da (Román ve Rodríguez (2015) tarafından çalışmalarında sıklıkla vurgulanmıştır.

### **3. Materyal ve Yöntem**

Çalışmada, nitel araştırma yöntemi kullanılmıştır. Yazar araştırmasında sistematik ve kapsamlı bir literatür araştırması ile ampirik ve teorik ikincil verilerden yararlanmıştır. Araştırmacı çalışmanın amacı doğrultusunda ilgili literatürde dünyada ve Türkiye’de yapılmış konuyla ilgili seçilmiş araştırma sonuçlarına göre sigorta acentelerinde görev yapan personellerin performansını etkileyebilecek mesleki beceri ve yetkinliklerin neler olduğunu hususunda incelemeler yapmıştır. Bilindiği üzere nitel veri analizi, dilsel materyalin araştırmanın amacı doğrultusunda yorumlanarak sınıflandırılmasıdır (Flick, 2022; Kara, 2015). İkincil verilerin analizi, birincil verilerin analizi kadar yaratıcı olabilir ve araştırmacının analitik hayal gücünün akıllıca kullanılmasını gerektirir (James 2012; Kara, 2015). Literatür taraması belirli amaçları gerçekleştirmek veya konunun doğası ve nasıl ele alınması gerektiği hakkında belirli görüşleri ifade etmek için belirli bir bakış açısıyla yazılmış bilgi, fikir, veri ve kanıt içeren, konuyla ilgili mevcut belgelerin seçimi, incelenmesi ve bu belgelerin önerilen araştırmayla ilişkili olarak etkin bir şekilde değerlendirilmesi sürecidir (Bowen 2009; Kara, 2015).

### **4. Bulgular ve Tartışma**

Türkiye’de 5544 sayılı Mesleki Yeterlilik Kurumu (MYK) Kanunu ile “Ulusal Meslek Standartlarının Hazırlanması Hakkında Yönetmelik” kapsamında yapılan çalışmalar neticesinde diğer meslek dallarında olduğu gibi sigortacılık alanında da meslek standartları belirlenmiştir (MYK, 2024). Bu standartlardan biri olan *Sigorta Acentesi Teknik Personeli (Seviye 4)* ulusal meslek standardı (R.G., 2024c) incelenmiş ve aşağıdaki bulgular tespit edilmiştir. Buna göre;

*“Sigorta Acentesi Teknik Personeli (Seviye 4) iş sağlığı ve güvenliği ve çevre ile ilgili önlemleri alarak, kalite sistemleri çerçevesinde; sigorta acentelerinde sigortacılık işlemlerini (pazarlama bilgilendirme ve satış) yapan ve mesleki gelişime yönelik faaliyetleri yürüten nitelikli kişidir.”*

Bu mesleğin uluslararası sınıflandırma sistemlerindeki yeri “ISCO 08:3321-Sigorta temsilcileri” olarak belirlenmiştir (ILO, 2012). Sigorta Acentesi Teknik Personeli (Seviye 4) meslek standardına göre bu kişiler, gerekli şartların sağlanmış olan ofis ortamında, işlerin yapılması için lazım gelen tüm ofis araçlarını kullanma yeterliliğine sahip olarak görevlerini yapma imkan ve kabiliyetine sahip olmalıdırlar. Ayrıca bu seviyedeki personelin gerektiğinde potansiyel sigorta müşterilere ulaşmak ve halihazırda mevcut müşterini ziyaret

etmek için ofis dışında da çalışabilmelidirler. Diğer yandan bunlara ek olarak bu personellerin gerektiği durumlarda esnek çalışma modeline uygun davranmaları gerekmektedir.

#### **4.1. Sigorta Acentesi Teknik Personeli (Seviye 4) İçin Gerekli Yetkinlikler**

Sigortacılık meslek elemanlarının performansını etkileyen mesleki beceri ve yetkinlikler üzerine yapılan araştırma sonuçlarına göre, *Sigorta Acentesi Teknik Personelinin (Seviye 4)* görev yaptığı acentede iyi bir performans elde etmek için aşağıdaki hususlarda yetkinliğe sahip olması gerekmektedir:

- 1.Önce iş organizasyonu yapma ve acentenin iş akışını planlama, görüşmelerin ve satışların raporlanması konusunda, gerekli çalışmaları yapma beceri ve yetkinliğine sahip olması gerekmektedir.
- 2.Müşteri portföyü oluşturma konusunda ve potansiyel müşterilere ulaşma, satış ve pazarlama odaklı görüşmeler gerçekleştirmek için gerekli çalışmaları yapma beceri ve yetkinliğine sahip olması gerekmektedir.
- 3.Müşterilerin ihtiyaç ve beklentilerine yönelik çalışmalar yapma, müşterinin ihtiyaç ve beklentilerini analiz etme, müşterilere çözüm önerileri geliştirme ve müşterilere fiyat teklifi verilmesi konusunda beceri ve yetkinliğine sahip olması gerekmektedir.
- 4.Sigorta şirketi/şirketleri adına sigorta sözleşmesi düzenleme, sigorta sözleşmesi düzenlemek üzere bilgi ve belge toplama, sigorta sözleşmesi hakkında müşteriyi bilgilendirme ve sigorta poliçesini müşteriye sunulması konusunda beceri ve yetkinliğine sahip olması gerekmektedir.
- 5.Mevcut müşteri ilişkilerini yönetme, mevcut müşteriler için sözleşme/poliçe takibi yapma, hasar durumunda mevcut müşterilere destek olma konusunda beceri ve yetkinliğine sahip olması gerekmektedir.
- 6.Mesleki gelişim faaliyetlerini yürütme mesleği ile ilgili mevzuatı takip etme, mesleki bireysel gelişimi konusunda çalışmalar yapması konusunda beceri ve yetkinliğine sahip olması gerekmektedir.

#### **4.2. Sigorta Acentesi Teknik Personeli (Seviye 4) İçin Gerekli Bilgi ve Beceriler**

- 1.Acil durum bilgisi
- 2.Adına poliçe düzenlediği sigorta şirketlerinin hizmet ve çalışma prosedürleri bilgisi
- 3.Araç, gereç ve ekipman bilgisi
- 4.Araştırma, veri toplama ve bilgi edinme becerisi
- 5.Beden dilini ve tüketici psikolojisini anlama becerisi
- 6.Bilgisayar ve bilgi teknolojileri okuryazarlığı (ofis programları dâhil) becerisi

- 7.Çevre koruma yöntemleri bilgisi
- 8.Dönüştürülebilen malzemelerin ayrılması ve geri dönüşüm faaliyetleri bilgisi
- 9.Hedef odaklı çalışma becerisi
- 10.İkna becerisi
- 11.İş sağlığı ve güvenliği bilgisi
- 12.İşindeki öncelikleri belirleme ve hareket etme becerisi
- 13.İşyeri çalışma prosedürleri bilgisi
- 14.MASAK mevzuatı bilgisi
- 15.Mesleki etik kurallar bilgisi
- 16.Mesleki terim bilgisi
- 17.Piyasadaki benzer ürün ve hizmet bilgisi
- 18.Raporlama bilgi ve becerisi
- 19.Sektörde yer alan düzenleyici ve denetleyici kurumlar, meslek kuruluşları, dağıtım kanalları ve diğer iş ortakları (tedarikçiler, anlaşmalı kurumlar, vb.) hakkında bilgi
- 20.Sigorta genel şartları, genel prensipleri, teminat kapsamı ve koşulları, sıkça karşılaşılan muafiyetler, özel şart ve istisnalar hakkında bilgi
- 21.Sigortacılığa ilişkin yasal mevzuat bilgisi
- 22.Sigortacılık piyasanın yapısı ve güncel piyasa uygulamaları hakkında bilgi
- 23.Sigortalanabilir risklere ilişkin bilgi
- 24.Sorun çözme becerisi
- 25.Sözlü ve yazılı iletişim becerisi
- 26.Temel çalışma mevzuatı bilgisi
- 27.Temel hukuk bilgisi
- 28.Zaman yönetimi bilgisi

#### **4.3. Sigorta Acentesi Teknik Personeli (Seviye 4) İçin Gerekli Tutum ve Davranışlar**

- 1.Bilgi, tecrübe ve yetkisi dahilinde karar vermek
- 2.Çalışma zamanını etkili ve verimli kullanmak
- 3.Çalışmalarında planlı, organize ve disiplinli olmak
- 4.Çalışmalarında yeniliklere açık ve geliştirici olmak
- 5.Çevre korumaya karşı duyarlı olmak
- 6.Çevre, kalite ve İSG mevzuatında yer alan düzenlemeleri benimsemek
- 7.Değişime açık olmak ve değişen koşullara uyum sağlamak

8. Görev tanımını, görevi ile ilgili talimatları ve sorumluluklarını bilmek ve yerine getirmek
9. Hizmet içi eğitim ve seminerlere katılma konusunda istekli olmak
10. Hizmet ve kalite odaklı yaklaşım sergilemek
11. İletişim kurduğu kişilerle etkili ve güzel konuşmak
12. İlgili kişi ve birimlere zamanında ve doğru bilgi aktarmak
13. İşyeri çalışma prensiplerine uymak
14. İşyerine ait araç, gereç ve ekipmanların kullanımına özen göstermek
15. Müşteri taleplerine karşı anlayışlı olmak ve empati kurmak
16. Kurum kültürüne ve meslek etiğine uygun davranmak
17. Sektöre ilişkin işini etkileyecek güncel olayları takip etmeye önem vermek
18. Soğukkanlı olmak ve sorunlara çözüm üretmek
19. Sorumluluğu dahilindeki iş ve işlemlerde inisiyatif almak

#### **4.4. Gelecekte İhtiyaç Duyulacak Beceri ve Yetkinlikler**

- *Yaratıcılık/yenilik*
- *Kritik düşünce*
- *Bilgi okuryazarlığı*
- *Problem çözme*
- *Karar verme*
- *Esneklik ve uyarlanabilirlik; öğrenmeyi öğrenmek*
- *Araştırma ve sorgulama*
- *İletişim*
- *Girişim ve öz yönlendirme*
- *Verimlilik*
- *Liderlik ve sorumluluk*
- *İş birliği*
- *BİT işlemleri ve kavramları*
- *Dijital Vatandaşlık*
- *Medya okur Yazarlığı*

#### **5. Sonuçlar**

Bu çalışmada, sigorta acentelerinde görev yapan personellerin performansını etkileyebilecek mesleki beceri ve yetkinliklerin günümüz ve gelecekte neler olabileceği konusu araştırılmıştır.

İlgili literatürde konu ile ilgili ikincil çalışmalar, sektör kuruluşlarının hazırlamış oldukları raporlar ve Türkiye’de MYK (Mesleki Yeterlilik Kurumu) tarafından hazırlanmış olan meslek standartları incelenerek teorik bir çalışma kapsamında söz konusu yetkinlik ve beceriler incelenmiş ve *Sigorta Acentesi Teknik Personeli (Seviye 4)* özelinde tespitler yapılmıştır.

Sigorta sektöründe prim üretiminde önemli, bir payı olan sigorta acentelerinde görev yapan personellerin performanslarını yakından etkileyebilecek söz konusu mesleki beceri ve yetkinliklerin belirlenerek başarı ölçütlerinin tanımlanması aynı zamanda acentenin de başarı performansına katkı sağlayacaktır. Bu maksatla yapılan incelemelerde sigorta acentesi teknik personellerinin görevlerini icra ederken sergilemeleri gereken mesleki beceri ve yetkinliklerin acente yönetim ve çalışanlarınca biliniyor olması, zaman zaman yapılacak gözden geçirmelerle değerlendirmelerin yapılması tüm sigorta acenteleri camiası için önemli bir kazanım olabilecektir. Örneğin bu çalışmada belirlenmiş ve tespit edilen kriterler, acente personeli işe alımlarında, çalışanların performanslarının değerlendirilmesinde, eğitim ihtiyaçlarının belirlenmesinde ve rekabet edilebilirlik gücünün artırılmasında bir yol haritası görevi görebilecektir. Çalışmada ayrıca gelecek perspektifinden sigorta satış temsilcilerinin ihtiyaç duyabileceği mesleki beceri ve yetkinlikler hususunda da değerlendirmeler yapılmış olması ayrı bir önem arz etmektedir. Zira, sigorta acenteleri mevcut personellerini geleceğe hazırlamak için söz konusu kriterleri göz önüne alarak eğitim faaliyetleri düzenleyerek hem çalışanlarının hem de acentenin performansını artırma şansını elde edebilirler.

**Ali AYGÜN**

Selçuk Üniversitesi, Ziraat Fakültesi, Zootečni Bölümü, 42130, Konya, Türkiye

**Özet**

Bu çalışmanın amacı serbest dolaşimli sistemde yetiştirilen etlik piliçlerin farklı yaşlarda gezinti alanına çıkmasının canlı ağırlık ve canlı ağırlık artışı üzerine etkisini incelemektir. Bu amaçla, etlik piliçler yaşamlarının 10., 15., ve 25. Günlerinde gezinti alanına çıkmalarına müsaade edilmiştir. Araştırma 3 grup ve her grup 4 tekerrürden oluşturulmuştur. Her alt grupta 15 adet ve her grupta 60 adet olmak üzere toplam 180 adet hızlı gelişen etlik piliç genotipi kullanılmıştır. Yem ve su serbest olarak verilmiştir. Kapalı alanda yerleşim sıklığı 11 adet hayvan/m<sup>2</sup>, gezinti alanında ise hayvan başı 2.5 m<sup>2</sup> alan oluşturulmuştur. Denemenin başında ve sonunda (42. gün) hayvanlar alt grup bazında tartılmıştır. Deneme sonu canlı ağırlık 10, 15 ve 25 gün gruplarında sırasıyla 2580 g, 2607 g ve 2688 g olarak tespit edilmiş olup gruplar arası farklılık istatistiki olarak önemsiz bulunmuştur (P>0.05). Kırkiki günlük canlı ağırlık artışı 10, 15 ve 25 gün gruplarında sırasıyla 2536 g, 2564 g ve 2645 g olarak tespit edilmiş olup gruplar arası farklılık istatistiki olarak önemsiz bulunmuştur (P>0.05). Sonuç olarak, canlı ağırlık ve canlı ağırlık artışı bakımından hayvanların gezinti alanına standart uygulamadan (25 gün) daha önce çıkarılmasında her hangi bir problem olmayacaktır.

**EFFECTS OF OUTDOOR ACCESS AGE ON THE BODY WEIGHT OF BROILERS  
RAISED IN A FREE-RANGE SYSTEM**

**ABSTRACT**

The aim of this study is to examine the effect of moving broiler chickens raised in a free-range system to the wandering area at different ages on live weight and live weight gain. For this purpose, broiler chickens were allowed to go to the wandering area on the 10th, 15th and 25th days of their lives. The research consisted of 3 groups and 4 repetitions in each group. A total of 180 fast-growing broiler chicken genotypes, 15 in each subgroup and 60 in each group, were used. Feed and water were provided freely. The settlement density in the closed area is 11 animals/m<sup>2</sup>, and in the promenade area, an area of 2.5 m<sup>2</sup> per animal is created. Animals were weighed on a subgroup basis at the beginning and end of the experiment (day 42). The live weight at the end of the trial was determined as 2580 g, 2607 g and 2688 g in the 10, 15 and 25 day groups, respectively, and the difference between the groups was found to be statistically insignificant ( $P>0.05$ ). Forty-two-day live weight gain was determined as 2536 g, 2564 g and 2645 g in the 10, 15 and 25 day groups, respectively, and the difference between the groups was found to be statistically insignificant ( $P>0.05$ ). As a result, there will be no problem in removing the animals to the excursion area earlier than the standard practice (25 days) in terms of live weight and live weight gain.

**Keywords:** Free Range System, Roaming Area, Broiler, Live Weight, Live Weight

### **Giriş**

Dünyada etlik piliç yetiştiriciliği çoğunlukla kapalı sistemlerde yapılmaktadır. Fakat son yıllarda tüketicinin tercihi yanında birçok faktöre bağlı olarak serbest dolaşımli sistemde de etlik piliç yetiştiriciliği yapılmaya başlanmıştır. Hayvanların kapalı alanda yetiştirilmesinin hayvanların doğal davranışlarının kısıtlanması ve güneş ışığından yoksun bırakılmaları hayvan haklarının kısıtlayıcı faktörlerdendir. Tüketicilerin doğal ortamlarda yetiştirilen hayvanların ürünlerin daha sağlıklı olduğu görüşü de serbest dolaşımli sistemde etlik piliç yetiştiriciliğini ön plana çıkarmaktadır. Serbest yetiştirme sisteminden elde edilen ürünlerin tüketiciler tarafından daha çok tercih edilmesi bu ürünlerin daha lezzetli olması, besleyiciliğinin yüksek olması, düşük yağ oranı, vitamin ve mineral miktarlarının yüksek olduğu ile alakalı olduğu söylenebilir (Fanatico ve ark., 2005; Wang ve ark., 2009; Michalczuk ve ark., 2014). Serbest dolaşımli sistemde özellikle açık alan ya da gezinti alanın olması mecburiyeti vardır. Gezinti alanında yeşil bitki örtüsü olması zorunlu değildir. Fakat hayvanların en az sekiz saat gezinti alanına ulaşabilme imkânı tanınması gerekmektedir. Gezinti alanının maksimum kullanımı ve ekonomik olması önemlidir. Hayvanların yeşil bitki örtüsünden maksimum şekilde faydalanabilmelidir. Etlik piliç yetiştiriciliğinde hayvanların gezinti alanına çıkmalarına genellikle yaşam sürelerinin yarısından sonrasında müsaade edilmektedir (Aksoy ve ark., 2021). Serbest dolaşımli sistemde hızlı gelişen hatlar kullanılması durumunda genel olarak 21 ile 28 günler arası gezinti alanına çıkarılmaktadır. Bu yaşlarda hayvanların canlı ağırlıkları ..... ile ..... arasında değişmekte ve hayvanlar canlı ağırlıklarından dolayı gezinti alanına çıkma ihtimali düşmektedir. Hayvanlar daha çok kapalı alanda yemlik ve suluklara yakın durmaktadırlar. Serbest dolaşımli sistemde hayvanların gezinti alanından maksimum şekilde faydalanmaları için gezinti alanında daha fazla zaman geçirmeleri sağlanmalıdır. Bu amaçla hayvanların daha aktif olduğu dönemlerde gezinti alanına çıkmalarına müsaade edilmesi gerekmektedir. Mevcut literatür araştırmalarımıza göre, yaşamla sürelerinin yarısından daha önce gezinti alanına çıkarılması ile ilgili literatür tespit edilememiştir. Bu çalışmanın da esas amacı erken yaşlarda gezinti alanına çıkmalarına müsaade edilen broylerlerin canlı ağırlık ve canlı ağırlık artışı üzerine etkisi araştırılmıştır.

### **Materyal ve Yöntem,**

Araştırma Selçuk Üniversitesi Ziraat Fakültesi Zootečni Bölümü Prof. Dr. Orhan DÜZGÜNEŞ Hayvancılık Araştırma ve Uygulama tesislerinde yürütülmüştür. Araştırma bireysel olarak sandviç panelden yapılmış 12 adet serbest dolaşımli sistem kümeslerinde yapılmıştır. Bu kümesler 2.0x1.5x2.0 m (uzunluk x genişlik x yükseklik) ölçülerindedir. Her kümes bir

tekerrürü oluşturmuştur. Araştırma 3 gruptan ve her grup 4 tekerrürden oluşturulmuştur. Her tekerrürde 15 adet broyler ve her grupta 60 adet olmak üzere toplam 180 adet hızlı gelişen Ross-308 etlik piliç genotipi kullanılmıştır. Deneme grupları; gezinti alanına 10 günlük yaşta çıkmasına izin verilen (G10), gezinti alanına 15 günlük yaşta çıkmasına izin verilen (G15), ve gezinti alanına 25 günlük yaşta çıkmasına izin verilen (G25) gruplar olarak 3 grup oluşturulmuştur. Bütün gruplarda yerleşim sıklığı kapalı alanda 10 piliç /m<sup>2</sup>, gezinti alanında ise 2.5 m<sup>2</sup>/piliç olarak düzenlenmiştir. Yem ve su serbest olarak verilmiştir. Her kümede 2 adet damlalıklı nipel ayarlanmıştır. Yem olarak başlangıç, büyütme ve bitirme yemi verilmiştir (Ross, 2022). Aydınlatma programı ilk 3 gün 24 saat aydınlatma uygulanmış ve deneme sonuna kadar 16 saat/gün olacak şekilde ayarlanmıştır (Ozkan ve ark., 2012). Hayvanlar alt grup bazında denemenin başlangıcında ve denemenin sonunda hassas terazi ile tartılmıştır. Bu verilerden canlı ağırlık değeri (g) ve canlı ağırlık artışı (g) hesaplanmıştır. Elde edilen veriler tek yönlü varyans analizi ile test edilmiştir. Gruplar arasındaki farklılıklar Tukey çoklu karşılaştırma testi ile tespit edilmiştir. İstatistik analizler MİNTAB paket programı yardımıyla yapılacaktır.

### **Bulgular ve Tartışma**

Deneme sonu (42. Gün) canlı ağırlık 10, 15 ve 25 gün gruplarında sırasıyla 2580 g, 2607 g ve 2688 g olarak tespit edilmiş olup gruplar arası farklılık istatistiki olarak önemsiz bulunmuştur (Şekil 1; P>0.05).

Şekil 1. Gezinti alanına çıkma yaşının canlı ağırlığa (g) etkisi

Çalışmamızdan elde edilen 42. gün canlı ağırlık değerleri (2580 – 2688 g) Ross-308 genotipi performans değerinden (2998 g) daha düşük bulunmuştur. Bunun sebebi Ross-308 hibrit kataloğunda (Ross, 2022) belirtilen canlı ağırlık değeri (2998 g) kapalı alanda yetiştirilen broylerlerin canlı ağırlık değeri olup, çalışmamızdan elde edilen canlı ağırlık değerleri serbest

dolaşımlı sistemde yetiştirilen hayvanlardan elde edilmiştir. Serbest sistemdeki hayvanların daha fazla hareket etme kabiliyetinde olduğu için canlı ağırlık değerleri daha düşük olmuş olabilir. Kırkiki günlük canlı ağırlık artışı 10, 15 ve 25 gün gruplarında sırasıyla 2536 g, 2564 g ve 2645 g olarak tespit edilmiş olup gruplar arası farklılık istatistiki olarak önemsiz bulunmuştur (Şekil 2;  $P>0.05$ ).

Şekil 2. Gezinti alanına çıkma yaşının canlı ağırlık artışına (g) etkisi

### **Sonuçlar**

Sonuç olarak, serbest dolaşımli sistemde yetiştirilen etlik piliçlerin gezinti alanına erken çıkarmanın canlı ağırlık ve canlı ağırlık artışı üzerine olumsuz bir etkisi olmadığı görülmüştür. Bundan sonraki çalışmalarda hayvanların erken yaşta gezinti alanına çıkmasının altlık kalitesine olumlu etkisi olabileceği düşünülmektedir. Ayrıca, hayvanların gezinti alanında doğal davranışlarını sergileyebilecekleri için hayvanların refahı ve davranışlarını olumlu etkisi olabilecektir. Benzer şekilde hayvanlardaki stress daha düşük olabilecektir. Bu faktörlerin ayrıca araştırılması faydalı olabilecektir.

### **Teşekkür**

Bu araştırma Selçuk Üniversitesi BAP tarafından 23201067 no'lu proje ile desteklenmiştir.

**Özet**

Yapay zekâ ve derin öğrenme, sağlık alanında devrim yaratmıştır. Özellikle, tıbbi görüntü analizi ve teşhis süreçlerinde, bu teknolojilerin katkısı, erken teşhis ve tedavi yöntemlerinin geliştirilmesinde kritik bir faktör olmuştur. Akciğer ve kolon kanserleri, dünya genelinde görülen en yaygın ve en ölümcül kanser türleri arasındadır. Bu kanser türlerinin doğru şekilde teşhis edilmesi ve sınıflandırılması için yöntemler geliştirmek, kanser araştırmalarında büyük bir önem taşımaktadır. Görüntü tanıma ve sınıflandırma gibi problemlerin çözümünde başarılı sonuçlar elde edilmesini sağlayan evrişimli sinir ağı (CNN) modelleri, bu bağlamda önemli bir rol oynar. CNN modelleri, bazı yapısal kısıtlamalarını aşmak ve verimliliğinin artırılması amacıyla sürekli olarak gelişmektedir. Bu gelişmelerle paralel olarak, doğal dil işleme alanında kendini kanıtlayan transformer mimarilerinin görüntü verileri üzerine uygulanmaları ile birlikte yeni bir çalışma alanı doğmuştur. Her iki mimariden de etkilenecek oluşturulan ConvNeXt modelleri, standart evrişimli sinir ağı modellerinin bazı kısıtlamalarını gidermek ve daha başarılı sonuçlar elde etmek amacıyla geliştirilen evrişimli sinir ağı modellerinden olmuştur. Bu çalışmada, akciğer kanseri patolojik görüntü verilerinin ConvNeXt modelleri ile eğitiminden elde edilen sonuçlar incelenmiştir. ConvNeXt modellerinin esin kaynağı olan Swin Transformers ve ResNet-50 modeli ile de eğitim işlemi yapılarak sonuçlar karşılaştırılmıştır. Yapılan çalışma sonucunda, ConvNeXt modellerinin parametreden bağımsız olarak ele alınan veri seti üzerinde yüksek doğrulukla eğitim işlemi gerçekleştirdiği görülmüştür. Artık ağ yapısı ile bilinen ResNet-50 modelinin de ConvNeXt modelleri gibi yüksek doğrulukla aynı işlemi gerçekleştirebildiği sonucuna varılmıştır.

**PERFORMANCE EVALUATION OF CONVNEXT, SWIN TRANSFORMERS AND  
RESNET-50 MODELS FOR CLASSIFICATION OF MEDICAL IMAGES**

**Abstract**

Artificial intelligence and deep learning have revolutionized the healthcare field. In particular, in medical image analysis and diagnostics, the contribution of these technologies has been a critical factor in the development of early detection and treatment methods. Lung and colon cancers are among the most common and deadly cancers worldwide. Developing methods to accurately diagnose and classify these cancers is of great importance in cancer research. Convolutional neural network (CNN) models, which provide successful results in solving problems such as image recognition and classification, play an important role in this context. CNN models are constantly evolving in order to overcome some of their structural limitations and increase their efficiency. In parallel with these developments, a new field of study has emerged with the application of transformer architectures, which have proven themselves in the field of natural language processing, on image data. ConvNeXt models, which are influenced by both architectures, have been one of the convolutional neural network models developed to overcome some limitations of standard convolutional neural network models and to obtain more successful results. In this study, the results obtained from the training of lung cancer pathological image data with ConvNeXt models are analyzed. The results were also compared by training with Swin Transformers and ResNet-50 models, which are the inspiration of ConvNeXt models. As a result of the study, it has been observed that ConvNeXt models perform training with high accuracy on the data set considered, regardless of the parameters. It has been concluded that the ResNet-50 model, known as the residual network structure, can perform the same operation with high accuracy like ConvNeXt models.

## **Introduction**

The advancement of artificial intelligence and the increasing digitalization of daily life make it possible to solve problems more effectively and quickly. This situation is of great importance for studies on data in the health sector [1]. The classification of image data obtained using medical imaging techniques facilitates early diagnosis. In particular, the effective detection and classification of cancer data represents an effective step in the treatment of the disease [2]. While lung cancer is the most common cause of cancer-related deaths worldwide, colon cancer is also recognized as a major health threat. Early detection plays a critical role in the treatment of these diseases and can significantly improve patient survival rates. In this context, the accuracy and efficiency of imaging technologies used in the diagnosis of lung and colon cancer are central to the diagnosis and follow-up of the disease in its early stages. This study examines the effectiveness of some deep learning methods for lung and colon cancer classification. Deep learning is a branch of artificial intelligence that is capable of learning from large and complex datasets. These methods can distinguish cancerous tissues from normal tissues by identifying patterns and abnormalities in medical images [3]. One of the most famous structures used in deep learning is Convolutional Neural Networks (CNN). CNNs are highly effective in image recognition and classification tasks and are widely used in medical image analysis. CNN-based systems have the sensitivity to detect even small lesions in the early stages of lung or colon cancer. Thus, they can detect abnormal structures that may be missed by radiologists. The use of CNNs in deep learning gained popularity after the success of the AlexNet model on a high-dimensional dataset such as ImageNet [4]. However, as the research on CNN has increased over time, some limitations of these networks have emerged. To overcome these limitations and achieve more effective results, new and improved models have been continuously designed [5]. In recent years, the successful results of transformers architectures in natural language processing have inspired the application of these architectures on image data [6]. In 2020, with the successful results of the pre-trained Vision Transformers (ViT) study on ImageNet and ImageNet-21k datasets, studies in this field gained momentum [7]. This architecture essentially applies the attention mechanism, which is used in natural language processing to understand context and access past information, to images. ViT architecture can provide more efficient results by using fewer computational resources compared to CNN models [7]. Unlike CNN, it treats the image as small fixed pieces. These image fragments are processed as a sequence as in words. These sequences are sent to the transformer encoder after being subjected to a process called positional embedding. The Transformer Encoder consists of a Normalization layer, a

Multi-Headed Self-Attention layer (MSA) and Multilayer Perceptrons (MLP). In addition, to facilitate the learning of more complex features in the model, GELU (Gaussian Error Linear Unit) was preferred as the activation function [6]. With the success of the ViT architecture in image detection and classification problems, many studies have been conducted to improve this architecture. One of these is the DeiT model [8], which applies the transformer structure to images with less data and less computational resources [8]. This model, proposed by Facebook researchers, offers a structure similar to the ResNet architecture with the Distillation token in its structure. In 2021, Microsoft researchers published the BEiT model, which implements a preliminary, self-regulated mechanism and is inspired by the Bidirectional Encoder Representations from Transformers (BERT) model [9]. Another work in 2021 is the Swin Transformer architecture, which implements the ViT architecture using a special windowing technique for images [10]. The shifted windowing technique used in this study is designed to increase efficiency by providing context with cross windows. With its structure and achievements, this model has brought a different perspective to the ViT architecture.

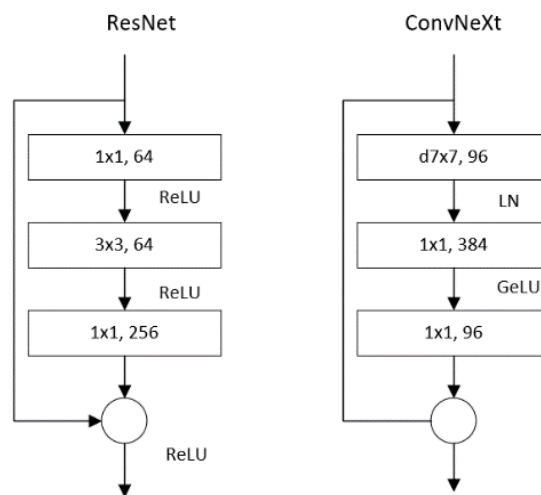

### **ConvNeXt**

ConvNeXt stands out especially among CNN models with its claim of success in computer vision applications. Inspired by the Vision Transformers (ViT) architecture, this model is designed to achieve exceptional levels of accuracy in visual classification and processing tasks. One of the most important features of ConvNeXt is its impressive accuracy in visual tasks. Even when compared to models such as Swin Transformer, this model is capable of delivering superior results [11].

As it is known, with the deepening of CNN models, the complexity of training processes increases and common problems such as optimization difficulties and gradient loss are encountered. The ResNet architecture, which was introduced in 2017 to solve such problems, has managed to overcome these difficulties thanks to its residual network structure [12]. This structure has significantly improved the learning process by enabling the efficient transmission of information even in deeper networks during training.

Based on CNN architecture and Transformers architecture, the ConvNeXt model has a residual network structure similar to ResNet [11]. This unique combination enables efficient information flow even in a deep network structure and enables the model to succeed even in complex learning tasks. This similarity is illustrated in Figure 1. The model is available in five scalable sizes, starting from Tiny to XLarge, to serve various application requirements.

**Figure 1.** Residual network similarity of ResNet and ConvNext architectures

### Materials and Methods

In this study, the LC25000 dataset [13] created from pathologic images of lung and colon cancer was used. The LC25000 dataset consists of 5 classes named lung\_aca, lung\_n, lung\_scc, colon\_aca, colon\_n. In this dataset, 250 original images for each class were subjected to various data augmentation processes and the number of images was synthetically increased to 5000. The dataset contains a total of 25000 pathology images belonging to 5 different classes. An example of the dataset is given in Figure 2.

**Figure 2.** LC25000 dataset example

In this study, ConvNeXt, Swin Transformers and ResNet-50 models were selected and set to be trained on a large dataset in order to evaluate deep learning based classification performance. Each model is pre-trained and trained iteratively with the dataset for five full epochs during the training process. The training process was carried out using the A100 GPU in the Google Colab environment. The training accuracy obtained on the dataset with these pre-trained models was analyzed. The results obtained from this study are intended to provide important insights into the use of deep learning models in medical image classification and shed light on other potential applications of these models in the healthcare domain.

### **Findings and Discussion**

As a result of the study, the training accuracies of ConvNeXt models are given in Table 1 below.

**Table 1.** Training and validation accuracy of ConvNeXt models on LC25000

<b>Model</b>	<b>Train Accuracy</b>	<b>Validation Accuracy</b>
<b>ConvNeXtTiny</b>	%99.14	%99.46
<b>ConvNeXtSmall</b>	%99.28	%99.44
<b>ConvNeXtBase</b>	%98.18	%98.46
<b>ConvNeXtLarge</b>	%98.29	%98.92
<b>ConvNeXtXLarge</b>	%98.46	%99.24

The training performance of the same dataset on Swin Transformers and ResNet-50 models is as shown in Table 2.

**Table 2.** Training and validation accuracy of Swin Transformers and ResNet-50 on LC25000

<b>Model</b>	<b>Train Accuracy</b>	<b>Validation Accuracy</b>
<b>Swin Transformers</b>	%83.72	%82.70
<b>ResNet-50</b>	%98.18	%98.60

When the results of the studies were analyzed, it was found that ConvNeXt and ResNet-50 models showed superior success in the training process. Considering that ConvNeXt models are sorted according to their size (starting with "Tiny" and ending with "XL"), all models have high training and validation performance. In conclusion, ConvNeXt models trained on LC25000 lung image data provide high accuracy rates and size does not have a significant effect on performance.

### **Conclusion and Recommendations**

The ResNet-50 network model also appears to have validation accuracy that is competitive with ConvNeXt models. This shows that ResNet-50 has a robust architecture and can still be effective in many scenarios. Here, it is observed that the performance of the Swin Transformers model remains low. On the dataset in question, ConvNeXt models and the ResNet-50 architecture lagged behind.

This work in deep learning can be replicated using a variety of datasets and algorithms, and different results can be obtained. Different datasets can provide diversity and a broad perspective in training the model, which can strengthen its adaptability to real-world scenarios.

**Abstract**

Online learning environments, which are transferred as one of the distance education methods, are the easiest and most effective environments for recording direct communication with pieces of space physically located in different places and receiving instant feedback. The purpose of this programming is to store online information about the process following a training program on the subject of Autism Spectrum Disorder (ASD). The research process includes a weekly preparation phase and a seven-week implementation phase. During the implementation phase, a different topic was discussed every week and was given simultaneously by experts in the field. This research of mixed research method includes 54 volunteer products. Participants consist of employees who are families of children known to ASD or who work with children known to ASD. During this process an evaluation formula is applied to pick parts of parts. In addition, there are interviews with four contents and half in order to determine the development of the training program after six months. The Evaluation Form includes open sections and optional questions. In the research, both the training program and the data collection process are carried out remotely. At the end of the research; These were achieved through a process in which they gained information about ASD, shared information, communicated with field members and families intensive about ASD, their legal rights, and differentiated their non-governmental services. However, it was stated that most technical problems were experienced during the process, but were resolved in a short time.

## **REFLECTIONS OF AN ONLINE TRAINING PROGRAM ABOUT AUTISM**

### **Özet**

Uzaktan eğitim yöntemlerinden biri olarak ifade edilen çevrimiçi öğrenme ortamları, fiziksel olarak farklı yerlerde bulunan alan uzmanları ile doğrudan iletişim kurmak ve anlık geri bildirim almak için en kolay ve en etkili ortamlar arasındadır. Bu araştırmanın amacı, çevrimiçi olarak gerçekleştirilen Otizm Spektrum Bozukluğu (OSB) konusunun ele alındığı bir eğitim programı sonrasında katılımcıların sürece ilişkin görüşlerini tespit etmektir. Araştırma süreci on haftası hazırlık aşaması ve yedi haftalık uygulamayı içermektedir. 7 hafta süren uygulama aşamasında, her hafta otizmli çocuğu olan ailelere yönelik farklı bir konu ele alınmıştır ve her konu o alanın uzmanı tarafından eş zamanlı olarak verilmiştir. Araştırmada hem eğitim programı hem de veri toplama süreci uzaktan yürütülmüştür. Karma araştırma yönteminin kullanıldığı bu araştırmada 54 gönüllü katılımcı yer almaktadır. Katılımcılar, OSB tanılı çocukları olan aileler ya da OSB tanılı çocuklarla çalışan öğretmenlerden oluşmaktadır. Sürecin değerlendirilmesi amacıyla katılımcı görüşleri, değerlendirme formu aracılığıyla toplanmıştır. Değerlendirme Formunda açık uçlu ve çoktan seçmeli sorular yer almaktadır. Eğitim programı tamamlandıktan altı ay sonra ise sürecin uzun süreli etkilerini tespit amacıyla dört katılımcı ile yarı yapılandırılmış görüşmeler yapılmıştır. Araştırma sonunda katılımcıların; OSB konusunda bilgi edindikleri, bilgi paylaşımı sağladıkları, alan uzmanları ve OSB konusunda deneyimli ailelerle etkileşim kurdukları, sahip oldukları kanuni hakları öğrendikleri, sivil toplum kuruluşlarının önemini fark ettikleri bir süreç geçirdikleri sonucuna ulaşılmıştır. Bununla birlikte süreç içerisinde ifade edilen tek olumsuzluk teknik sorunlar olmakla birlikte bu sorunların kısa sürede çözüldüğü ifade edilmiştir.

**Anahtar Kelimeler:** Uzaktan Eğitim, Otizm Spektrum Bozukluğu, Özel Eğitim, Çevrimiçi Eğitim Programı

## **Introduction**

Online learning, one of the methods used in distance education implementations, can be defined as the learning process in which the educator and the participant are physically in different locations, various learning resources can be accessed simultaneously over a network, and where the learning environment and learning content interact (Moore 2013). Online learning environments are among the easiest and most effective environments to communicate directly with field experts in different locations and receive/provide instant feedback. Especially for adults who cannot attend professional or personal development seminars due to working hours (Sun, et al., 2008), or who cannot stay away from home for long periods due to their different responsibilities (Kolb, 2007) or who cannot continue their education due to their/their family members' special needs (Karal et al., 2008) online seminars/courses are posing great importance. Online education programs are a good alternative for families with children with special needs and full-time teachers (Bourdeaux & Schoenack, 2016; Douglas et al., 2014; Eck et al., 2016; Hamad et al., 2010; Kokoç et al., 2010; Meadan & Daczewitz, 2016; Walsh et al., 2005) ASD in the most general sense is a developmental disability manifested by problems in social interaction, communication and behavior (APA, 2013). If the necessary training is provided, most individuals with ASD can overcome most of these problems and continue their lives by integrating with their normally developing friends, family and environment (Güleç-Aslan et al., 2009). Family plays an important role in this process. Because families know their children best, and families who spend more time with their children than a specialist can be a good reinforcement tool for their children (Cavkaytar, 2014). However, since families with children with ASD do not have sufficient knowledge, skills and experience to help their children, they need help in this regard and are left alone in coping with this situation (Yakın, 2009). Families' lack of knowledge about ASD leads them into uncertainty. These unknowns further increase the fear and anxiety of families and increase the number of families who do not know how to react to the situation encountered (Güler-Selimoğlu et al., 2014; Kaya, 2014; Kaytez et al., 2015; Murphy & Tierney, 2006; Öztürk, 2011; Şanlı, 2012). One of the most effective ways to solve these problems is family education programs. Thanks to these programs, participants can learn about ASD, better recognize their children's characteristics, and even be a part of educational programs.

Among these programs classified as home-based, institution-based or distance education, generally home-based or institution-based education programs are preferred in Turkey. However, in recent years, there has been an increase in the number of programs carried out through distance education (Erden & Nuri, 2023; Kizir, 2021; Timuçin, 2018). Family education carried out through distance education is defined as educational activities carried out to facilitate the life of the individual and the family by using online technologies that include programmed educational strategies. Program development stages in online family education programs are expressed as problem analysis, determination of program content, instructional design, program implementation and program evaluation (Hughes et al., 2012).

Figure 1. Stages of developing an online family education program (Hughes et al., 2012)

In this research, it was aimed to determine the opinions of the participants about this program at the end of an online training program on ASD developed within the framework mentioned above. Each week, a field expert participated in the sessions held over a period of 7 weeks via a video conferencing application. In this regard, answers to the following questions were sought in the research.

At the end of the online training program, participants;

- What are their opinions about the training program?
- How do they reflect the knowledge they gained from the training program into their daily lives?
- What are the negativities they encountered during the training?
- What are their suggestions regarding the training program?

### **Materials and Methods**

This research was conducted with a mixed method design in which qualitative and quantitative research methods were used together. The aim of this approach is to provide a more in-depth and comprehensive understanding of a phenomenon by combining the advantages of qualitative and quantitative designs. Process Online trainings were given voluntarily by people who are experts in their fields (4 faculty members, an expert psychologist, a lawyer and a public institution administrator). The trainings started once a week at 22.00 and lasted an average of

90 minutes. Only one session was suggested as 180 minutes by a field expert speaker and was completed this way. The research process includes a ten-week preparation and a seven-week application and training program. During the preparation process, the content of the training program, participants and field experts who will provide the training were determined, and the training. Topics were determined under the headings given in Table 1.

**Table 1.** Online Training program topics and Expert Speakers

<i>Sessio n</i>	<b>Title of the Seminar</b>	<b>Expert Speakers</b>
1	Education of Individuals with Autism	Special Education Expert, instructor, Master's
2	Behavioral Problems of Individuals with Autism	Special Education Expert, Ph.D.
3	Applied Behavior Analysis (ABA) Method in the Education of Individuals with Autism	Special Education Expert ABA Therapist, Master's
4	Sexual Development and Adolescence in Individuals with Autism	Special Education Expert, Ph.D.
5	Educational Rights of Individuals with Autism	Lawyer
6	Living with an Individual with Autism	Senior Psychologist, Ph.D.
7	State Support for Individuals with Autism	Family & Social Policies (ASP) Provincial Director

Each training topic was presented by a volunteer field expert in that field. The meetings were held in the form of presentations and questions and answers, moderated by the researchers.

***Participants***

The participant group of the research consists of families of individuals diagnosed with ASD and teachers working with these individuals. The process started with 54 volunteer participants, but ended with 31 participants after seven weeks of training.

Participants with children showing ASD PF1, PF2,

Teachers working with children showing ASD were coded as PT37, ...,PT54.

### **Data Collection Tools**

During the training process, after each training, it was determined whether there were any problems the participants experienced and improvements were made accordingly. For this purpose, the “Session Evaluation Form”, which includes Yes/No and Multiple Choice questions were used. At the end of the training program, the participants were given a “Training Evaluation Form”. The form consisting of open-ended questions and multiple choice questions was developed by the researchers. Six months after the training program was completed, four participants were follow-up interviewed to determine the reflections of the training program. For this purpose, “Semi-Structured Interview Form” was used. To ensure the clarity of all three forms, questions were asked to two people from the target audience and feedback was received. For form validity, the opinions of three educational technologies field experts were referred. Table 2 shows which data collection tools were used for respective research problem.

**Table 2.** Data collection tools

<b>Research Problem</b>	<b>Data Collection Tool</b>
What are their opinions about the training program?	Semi-Structured Interview Form

### **Data Analysis**

Content analysis was performed to analyze open-ended questions. Frequencies are included to present the frequency of repetition of the determined codes. Frequencies were used in the analysis of multiple choice questions.

### **Data Analyses**

Content analysis was performed to analyze open-ended questions. Frequencies are included to show the frequency of repetition of the determined codes. Frequencies were used in the analysis of multiple choice questions.

### Findings and Discussion

Participants were asked "What are your opinions about the Online Training Program (OTP) process?" in the Seminar Satisfaction Survey administered at the end of the OTP process. In line with the data obtained from the answers to the question, participants' opinions about the OTP process are presented in Table 3.

**Table 3.** Participants' views on online education

Theme	Codes	%	Expression
Opportunities	Getting information from experts	3	<i>"It was an effective training. I was very pleased. "I was able to get information from experts that I would not be able to reach under normal circumstances." (PT49)</i>
	It was online	3	<i>"Online seminars were a unique opportunity and I think it was a first in this field, it was very successful." (PT41)</i>
	Out of working hours	2	<i>"It was very important for me that it happened in the evening and from a distance." (PF32)</i>
	Contact with experienced families	1	<i>"The experiences of experts and experienced families who have seen many cases are very valuable to us." (PF11)</i>
	Once in a week	1	<i>It was nice to have it once a week. (PF30)</i>
	Refreshing self trust	1	<i>Participating in and watching trainings renewed my self-confidence. I tried to look at my children from different perspectives. I was able to make an evaluation independent of daily problems. I feel like I have rearranged and adjusted my thoughts and behaviors. (PF26)</i>
Usability	Useful	5	<i>I tried to watch and listen as much as I had time. It was very useful and I think there is still a lot to learn." (PT37)</i>
	Productive	3	<i>"It was very productive in terms of information. "I would like to thank everyone who contributed." (PF32)</i>
	Yol gösterici olması	2	<i>"...it has become a step-by-step guide for families new to autism." (PF12)</i>

The findings obtained from the participants' opinions as a result of the interview conducted after the training process coincide with the Usefulness theme in Table 3. Participants state that the seminars are useful (PT3, PT18, PT44). PT3's views on this subject are as follows;

*"... Of course, educators have different goals in their fields, but the priority for us was how we can be useful to our children. I think seminars provide many benefits in this field. " (PF3)* According to the interview findings, participants think that the training process offers opportunities to reach experts (PF11, PF18), be at a time convenient for them (PF18), and be online (PF3, PF18, PF44). In this regard, the participants expressed their thoughts as follows. *"Was it possible for me to meet with the teacher living in America in Turkey? I live in Zonguldak Ereğli. No way. Or was it possible for me to meet a sexual education teacher? You may say that it is possible, that I can leave the child behind, but I do not have the opportunity to leave my child behind. I do not have time. Therefore, it is really a great thing to get this information in such an environment, plus we chat with each other, meet with the camera and have the chance to talk. (PF18)*

Opportunities offered by the online education process was expressed as having online seminars, interacting with field experts and sharing with other families. This situation is compatible with the response level of the Kirkpatrick evaluation model (Kirkpatrick, 1996). Morgan and Casper (2000) stated that participant reactions could occur in different dimensions; Trainers state that the way the training is implemented and the benefits of the training program will create positive reactions in the participants. Cömert (2015) stated in his research that the participants' positive reactions to the trainers positively reflected on their learning. Üstündağ & Yalın (2014) reached similar results in their study. Other results from the current study also show that participants had positive reactions to the training process. However, the online education process offers various opportunities to both families and teachers working with individuals with autism. In his research, Kolb (2007) suggested online education programs. Kolb (2007) stated that face-to-face education programs pose a significant difficulty especially for families because these families cannot leave their children and come to the training. Similarly, Vismara et al. (2013), McDevitt, (2021), Straiton et al. (2021) and Zimmerman (2013) state that family education provided through distance education offers very favorable environments for individuals with such limitations.

**Table 4.** The participants' reflection of the knowledge they acquired during the training in their daily lives

Expressions	f*
I shared all the information I gained with other families/teacher friends.	19
I found ways to make time for myself.	8
I researched in more detail the opportunities provided by the state for individuals with ASD.	8
I did research on the Applied Behavior Analysis (UDA-ABA) method.	4
I observed the situations before and after my child/student's behavioral problems. I created charts.	3
I met again with my child's teacher/student's family about the behavioral problems. We created an evaluation plan	3
I became a member of associations working on autism.	3
I applied to benefit from the opportunities provided by the government.	2
I talked to my child's teacher/student's family about the Applied Behavior Analysis (ABA) method.	2
I realized where I was lacking in my child's sexual development process and took action to correct these deficiencies.	1
I found solutions to the problems my student experienced during his sexual development process.	1
I researched associations related to ASD.	1
No answer	6

\*Participants marked more than one inscription.

When Table 4 is examined, it is seen that the participants mostly (f = 19) shared the information they acquired with other families, teachers or friends. Other prominent topics are that the participants found ways to spare time for themselves (f=8), researched in more detail the opportunities provided by the state for individuals with ASD (f=8), conducted research on the UDA method (f=4), and examined the behavior problems of their child or student before they started to develop a research program. and observing subsequent situations (f=3), and meeting with the child's family/student's parent about behavioral problems (f=3). The findings obtained in the interviews conducted at the end of the research support the statement "I shared all the information I acquired with other families/teacher friends." Participants PF3, PF18 stated that they shared the information they acquired during the OTP process with people who have other children showing ASD, and PT44 stated that they shared this information with the families of the children studying at the institution where they work and other teachers working in the institution. PF3 and PT44 expressed their opinions respectively; "...I have several friends and acquaintances from families with children with autism. I have both families I met on social media and friends in my own social life. I shared with them. I already informed the people around me about the seminars at the beginning of the seminars. I shared the links to your seminars with my friends. "For their benefit, too." "... there was a conversation about the rights our children have. I realized that we did not have enough information about him and we informed our families about this issue. We informed them about their legal rights and at this point we learned a lot of things... I shared it not only with the family but also with my colleagues." They expressed it as above: In addition, the participants stated that they tried to solve the behavioral problems they observed in their children/students in line with the information they obtained in the seminar (PF3, PF11, PF18, PT44). PF18's and PF11's thoughts on the subject are as follows, respectively; "...identifying the antecedent of behavior was emphasized. Currently, my daughter is a teenager and she is 15 years old. Of course, we are experiencing a lot of behavioral problems. We have tantrums. In that sense, your presentation was very helpful to me. "So, I started to observe my child more carefully, wondering why this child did this, why he got angry, what happened before." "...Our child's future sexual situations and puberty-related situations are always a question mark. Getting practical information on this subject relieved us psychologically. We learned what kind of precautions should be taken regarding sexual development and adolescence so that it can adapt to society more easily, avoid problem behaviors, and perhaps avoid being abused when we are around or not. How one should behave in the toilet, or not showing one's genitals as 'shameful' rather than as a taboo,

closing the door in the toilet, and the insistence of the family on this issue. “These are the points we benefit from concretely.”The behavioral level of the Kirkpatrick evaluation model (Kirkpatrick, 1996) is how individuals reflect the knowledge and skills they have in their daily lives. Determining this situation is a little more difficult than determining reaction and learning levels. Because participants' behavioral changes may not occur immediately and this may take some time (Üstündağ & Yalın 2014). It is expected that the new behavior acquired will be reflected in the participants' lives (Kirkpatrick, 1998). In order to ensure this situation in the current research, interviews were held with the participants after the online seminars were completed and it was tried to determine whether they reflected the information they acquired in their daily lives. Among the research findings, families "sharing their information" attracted attention. In particular, there were families who re-watched the online seminar recordings with other families with ASD, and they also benefited from this opportunity. Zimmerman (2013) states that families experiencing similar problems are emotionally supported by such sharing. The trainings conducted try to help parents develop more positive interactions and increase parental knowledge and skills as well as confidence in managing problematic behaviors (O'Nions et al. 2018)The problems encountered by the participants after the online seminars were obtained by analyzing the relevant questions in the Session Evaluation Forms. The answers given by the participants to the question about whether they had problems in the seminars are presented in Table 5.

**Table 5.** Situation of participants' experiencing problems

Situation of experiencing problems	Seminar1	Seminar 2	Seminar 3	Seminar 4	Seminar 5	Seminar 6	Seminar 7
	f	f	f	f	f	f	f
I had problems	24	9	3	3	2	4	2
I had no problems	11	14	27	13	18	11	12
Toplam	35	23	30	16	20	15	14

When Table 5 is examined, it is seen that the participants had the most problems in the first seminar, Seminar 1 (f = 24). At the end of each online seminar, at least two participants stated that they had problems during the seminar sessions. After the online seminar held in the second week, there was a significant decrease in the number of participants who stated that they had problems. The answers given by the participants to the question asked to determine what the problems were are presented in Table 6.

**Table 6.** Problems experienced by participants in online seminars

<b>Problems</b>	<b>Seminar1</b>	<b>Seminar 2</b>	<b>Seminar 3</b>	<b>Seminar 4</b>	<b>Seminar 5</b>	<b>Seminar 6</b>	<b>Seminar 7</b>
<i>Audio and Video interruption</i>	22	7	2	1	2	2	2
<i>Inability to log in to the system</i>	1	-	1			2	
<i>Flow of power point presentation</i>		1					
<i>Poor Internet connection</i>				2			
<i>Inability to provide audio and video connection</i>	1	1					
<i>Total number of problems</i>	24	9	3	3	2	4	2

When Table 6 is examined, it is seen that the most common problem was "interruption of audio and video" ( $f = 22$ ) in the first seminar. Almost all of the twenty-four participants who attended the first seminar and said they had problems encountered this problem. Other problems experienced in the first seminar were expressed as "not being able to log in to the system" ( $f = 1$ ) and "not being able to provide audio and video connection" ( $f = 1$ ) to ask questions to the speaker during the presentation. In other seminar sessions, the "cutting of audio and video" situation has decreased considerably since Seminar 2 ( $f = 7$ ). Other problems expressed by the participants were "not being able to log in to the system", "not being able to provide audio and video connections" and "poor internet connection". When Table 4 is evaluated in general, it is seen that participants experience more technical problems in online seminars. In his research, Özyaydın-Özkara (2016) talked about the technical problems of the participants arising from the internet or the participants themselves, on the theme of undesirable features of online environments. Similarly, Dai et al. (2021) mention technical problems as a negative experience in their research. *Participants' Suggestions About the Training Process* Participants' suggestions regarding the training process were made through the Seminar Satisfaction Form applied at the end of the process and the question "What are your suggestions regarding the online training process?" The data regarding these suggestions were analyzed and presented in Table 5. In addition, participants' suggestions on this subject were received through semi-structured interviews at the end of the OTP process. Some of the participants responded to the question "What are your opinions about the OTP process?" in the Seminar Satisfaction Form. They answered the question by offering various suggestions. These suggestions of the participants are presented in Table 7.

**Table 7.** Participants' suggestions regarding the online education process

Codes	f	Expressions
Continuation of seminars	10	"It continues to be repeated and thus many people become aware of it. "Our children with special needs have increased in number, although the reason is unknown. As a society, we now need to know what autism is." PF36 "I recommend that it continue at regular intervals." PF18
Practical seminars	5	"I think it would be very useful if real-life sample development videos from successful applications could be published." PF26 "There should be more effective information in dealing with behavioral problems." PT38
Technical problems	4	"I have no suggestions except for technical issues, it was very well thought out in many respects." PF3
Organizing separate seminar sessions for families and teachers	3	"Families with autism seek salvation from autism no matter what seminar they take place. These seminars were held in this dimension. That's why I'm in favor of giving family and specialist seminars separately." PT36 "Special session(s) should be held for families to share their experiences." PF4
Certificate	3	"Participants should be given a certificate of participation." PT37
Organizing repeat seminars on some topics	2	"I would be happy if there was a detailed seminar series specifically for ABA" PF31 "It would be great if a longer and more intense seminar was held on sex and sex, many of our children have behavioral problems." PF17
Editing the duration	2	"The sessions could have been long." PF33
Other	5	"Seminars should be shared on social media to appeal to a wider audience" PF11 "Questions to be asked by participants should be asked before or at the end of the training". PT51

Table 7 presents that the participants expressed their opinion regarding the training process in favor of "continuing the seminars" (f=10), which are mostly held online. Participants' other suggestions regarding the OTP process; "the seminars should be practical" (f=5), "removing technical problems" (f=4), "organizing separate seminar sessions for families and teachers (f=3), "giving certificates" at the end of the education process, "the topics covered during the education process" "holding repeat seminars on some subjects" (f=2), "determining the duration of online seminars" (f=2). Some participants (f=5) who answered the relevant question in the Seminar Satisfaction survey stated that they found the seminars successful and positive, but did not make any suggestions. The suggestions of the participants in the semi-structured interviews held with the participants at the end of the online training process are similar to the suggestions in 5. One of the suggestions offered is that online seminars should be practice-oriented (PF11 and PF18). Participant PF11's thoughts on the subject are as follows; "... everything should be practical, illustrated with examples from daily life, and videos if necessary. It should be shown on children's behavior, like look, do this, look, it changes like this.... "They can use such materials." PF11 Another suggestion made by the participants was to detail the seminar topics, especially the UDA (ABA) method (PF18, PF11). PF18 expressed his views as follows; "I thought the behavior issues were great. Sexual development was very, very good. The ABA method was very good, but it was not enough. "I think a seminar just for ABA can be held." One

of the participants, PT44, commented on the duration of the seminar, addressing different topics and eliminating technical problems. PT44's opinions; "I can personally say that different issues should be discussed. He can talk about many topics. It may be a longer-term seminar. Not 8 weeks old. It may spread week by week throughout the year. Apart from that, there are problems caused by the internet environment. They can be fixed. Maybe it could be better." He expressed it as follows. PF3 stated that he could not offer any suggestions regarding the seminar as follows. "I don't have any suggestions. The contact hours, the contact topics, and the people giving the seminar were all very good. I think they were good people in their field. I don't know who is very good in the field, but after watching the seminars, I realized how good the people are. I realized what other issues there are related to autism that I wouldn't have thought of. I had no knowledge of these matters before. I never thought about these because we were newly diagnosed. That's why all the subjects were quite good for me." (PF3) Participants stated that the OTP process was useful, efficient and guiding for them and made suggestions that it should continue for a longer period of time. Dai et al. (2021) state in their research that families found the online education program useful and efficient. While discussing "Motivation and role of the instructor", one of the factors affecting the efficiency of online courses, Bayraktar (2016) drew attention to the selection of instructors from people who are willing to take part in online courses. The attitudes and sharing approaches of the speakers who gave a seminar for the first time with online applications during the seminar may have affected the positive thoughts of the participants about the efficiency of the seminars. When we look at family/professional trainings conducted online, the general opinion is in line with the research findings, and online applications are described as efficient and effective by the participants (Douglas et al., 2014; Douglas et al., 2017; Özlü, 2012; Wainer & Ingersoll, 2014).

### **Conclusion and Recommendations**

In the research conducted for the purpose of implementing and evaluating the effectiveness of seminars held online via distance education in line with the needs of families with children with autism and teachers working with individuals with autism, the following results were obtained in line with the research problems. Opportunities offered by the online education process; Gaining information, holding online seminars, interacting with field experts, and sharing with other families. Participants stated that the CAP process was useful, efficient and guiding for them and expressed their opinion that it should continue for a longer period of time. Ten percent of the participants criticized that content presentation should be more effective and that there should be more application-oriented presentations rather than theoretical explanations. The

knowledge and experiences that almost all of the participants gained during the online education process; It has been determined that they use the education provided in their daily lives by sharing it with other families/colleagues around them, applying the information they have acquired on their children/students, researching the opportunities offered by the state to individuals with autism and taking relevant initiatives. It was observed that almost all of the negative situations experienced during the online education process were technical problems arising from the participants' internet access, and these problems were solved spontaneously or by the researcher. Depending on this entire process, in future research; It may be recommended to conduct studies specifically for the participant group, families with children with autism, or teachers who work only with autism. It may be suggested to design a holistic education process in which the research period is spread over a period of one year and covers more comprehensive topics, and to compare the results. It is among the suggestions to investigate the effect of the process on skill teaching by providing simultaneous practical training in which issues related to behavior and skill training of individuals with autism are discussed.

**Thanks and Information Note**

Mechanical Engineering, Tokat-Turkey

**Email:** berkant.dindar@gop.edu.tr

### **Özet**

Bu çalışmada yüzücü paletin bazı mekanik özelliklerinde iyileşmeler sağlanmıştır. Malzeme numunesi üzerinde yapılan çekme dayanımı, burkulma dayanımı, yorulma dayanımına yönelik laboratuvar ortamındaki araştırmalar olumlu yöndedir. Yüzücü paletin nanokompozit yapısına % 0,5 oranında ilave edilen karbon nanotüpler elyaflara fiziksel bir şekilde saplanmakta ve pürüzlü bir yapı oluşmasını ve böylelikle epoksi reçine ve fiberler arasında arayüzey bağlarının gelişmesini sağlayarak bir çalışma mekanizması ortaya koymaktadırlar. Ayrıca karbon nanotüpler kimyasal olarak fonksiyonelleştirildikleri için reçine ile kimyasal olarak bağlanmakta ve ara yüzey bağının kalitesi daha da artmaktadır. Karbon nano tüplerin reçine ve elyaf arasında bir köprü görevi görerek epoksi matristen kuvveti elyaflara daha dengeli ve verimli aktarmasını sağlayarak paletin kırılma hasarına karşı daha dayanıklı olmasını sağlamaktadır.

**Anahtar Kelimeler:** Nanokompozit, epoksi, KNT, yüzücü paleti.

**CARBON FIBER REINFORCED NANOCOMPOSITE SWIMMING FINLET  
DESIGN**

**Abstract**

In this study, improvements were achieved in some mechanical properties of the swimming fins. Laboratory studies on tensile strength, buckling strength on material samples are positive. Carbon nanotubes added at a rate of 0.5% to the nanocomposite structure of the swimming fins are physically embedded in the fibers and provide a working mechanism by creating a rough structure and thus the development of interfacial bonds between the epoxy resin and fibers. In addition, since carbon nanotubes, are functionalized they chemically bond with the resin and the quality of the interfacial bond increases further. Carbon nanotubes act as a bridge between the resin and fiber, allowing the fins more resistant to breakage damage.

**Keywords:** Nanocomposite, epoxy, CNT, swimming fins.

## **Giriş**

Yüzme yüzgeçleri, su sporları aktivitelerinde (sörf, yüzme, tüplü-tüpsüz dalış, su topu vb.) suda hareket etmeye yardımcı olmak için ayağın üzerine giyilen yüzgeç benzeri ayakkabılardır. Bu faaliyetlerin farklı taleplerini karşılamak için, çeşitli yenilikçi şekillere sahip çok sayıda yüzücü paleti tasarlanmış ve literatürde bunların özel yöntemler ile testleri yapılmıştır [1]. Palet tasarımı geometri, kütle, yoğunluk ve sertlik açısından modüle edilebilmektedir. Bu parametrelerin ayarlanmasının ilerleme hızının yanı sıra yüzme ekonomisini ve verimliliğini de iyileştirdiği görülmüştür [1-4].

**Şekil 1.** Farklı tipteki paletler [1].

Önceki çalışmalarımızda nanopartikül modifiyesinin mekanik özellikler üzerindeki etkileri araştırılmış ve olumlu sonuçlar elde edilmiştir [5-9]. Bu çalışmada ise bize umut veren önceki çalışmalarımızın ticari bir ürüne uygulanabilirliği üzerinde durularak işin pratiğe dökülmesi sağlanmıştır.

## **Malzeme ve Yöntem**

Yüzücü paleti başlıca iki kısımdan oluşmaktadır bunlardan ilki ayaklık diğeri ise pala denilen itici kısımdır. Bu çalışmada ayaklık kısmı hazır olarak tedarik edilmiş olup araştırmanın konusunu pala kısmı oluşturmaktadır. Pala kısmının üretiminde 200 gr-m<sup>2</sup> ağırlığındaki karbon twill dokuma kumaşlar kullanılmıştır. Reçine olarak palet deniz suyunda çalışacağı için üstün kimyasal dayanım özelliğinden dolayı epoksi reçine tercih edilmiştir. Palanın nanokompozit özelliğini kazanabilmesi için nano partiküller gereklidir. Nano partikül olarak çoğul duvarlı karbon nanotüpler tercih edilmiştir. Reçine ve sertleştiricisi üretici firmanın önerisi doğrultusunda % 70-30 olarak karıştırıldıktan sonra bu karışıma ağırlıkça % 0,5 çoğul duvarlı karbon nanotüp ilave edilmiştir. Bu oranın seçilmesinin neden önceki çalışmalarımız da KNT oranının dayanıma etkisinin araştırılmış olması ve en ideal değer bu olduğunun tespit edilmiş olmasındandır. Karbon nanotüpler ilave edildikten sonra karışım 10 dk. mekanik karıştırılarak nano partiküllerin karışım içerisinde homojenizasyonu sağlanmıştır. Daha sonra kumaşlar Şekil 2'de verilen ölçülerde kesilerek hazırlanan bu karışım el yatırması yöntemi ile bir rulo

kullanılarak kumaşlara uygulanmıştır. Ardından kumaşlar ısıya dayanıklı yapışmaz mumlu kağıtların üstüne, ayaklığın takıldığı kısım 8 tabakalı olacak şekilde ve sonrasında kademeli olarak azalarak 6 tabaka, 4 tabaka ve son olarak uç kısmında 2 tabaka olarak istiflenmiştir. Bunun nedeni gerilmenin ayak ucunda maksimum değerini alması ve uç kısma doğru gittikçe azalmasıdır. Yüzücü paletin pala kısmına kalıp yardımı ile sıcak presleme esnasında 22° açı verilmiştir (Şekil 2).

**Not:** Tüm ölçüler mm'dir.

**Şekil 2.** Palanın teknik resim çizimi ve üç boyutlu gösterimi.

### **Bulgular ve Tartışma**

Çalışmaya ilham kaynağı olan numune bazında elde ettiğimiz deneysel çalışmalarımız çekme ve yorulma deneyleridir. Karbon nano tüp modifikasyonu ile önceki çalışmalarımızda farklı oryantasyonlardaki tabakalı karbon fiber kompozitlerde % 28'e varan çekme dayanımı artışı ve yorulma dayanımında hatırı sayılır iyileşmeler gerçekleştirilmiştir. Bu iyileştirmeler şu şekilde sağlanmaktadır; yüzücü paletin nanokompozit yapısına % 0.5 oranında ilave edilen karbon nanotüpler elyaflara fiziksel bir şekilde saplanmakta ve pürüzlü bir yapı oluşmasını ve böylelikle epoksi reçine ve fiberler arasında arayüzey bağlarının gelişmesini sağlayarak bir çalışma mekanizması ortaya koymaktadırlar. Ayrıca karbon nanotüpler kimyasal olarak fonksiyonelleştirildikleri için reçine ile kimyasal olarak bağlanmakta ve ara yüzey bağının kalitesi daha da artmaktadır. Karbon nano tüplerin reçine ve elyaf arasında bir köprü görevi görerek epoksi matristen kuvveti elyaflara daha dengeli ve verimli aktarmasını sağlayarak paletin kırılma hasarına karşı daha dayanıklı olmasını sağlamaktadır. Elde edilen olumlu sonuçlar doğrultusunda Şekil 3'deki nanokompozit karbon fiber yüzücü paleti fikri ortaya çıkmış ve uygulama olanağı bulmuştur.

**Şekil 3.** Nanokompozit yüzücü paleti.

### **Sonuç ve Öneriler**

Sonuç olarak üzerinde çalışmalar yapılarak geliştirilen bir malzeme günlük hayatta kullanılan bir ekipmana uygulanmıştır. İleri çalışma konusu olarak elde edilen bu ürünün komponent halinin mekanik deneylerinin yapılması hedeflenmektedir. Ayrıca bu ürün E-cam/epoksi/KNT üretilerek maliyeti azaltılabilir.

**Özet**

Bu çalışmada, fabrika içi lojistik sürecinde; hammadde, yarı mamul, hazır parça, yardımcı malzeme gibi malzemelerin taşınmasında kullanılan bir taşıyıcının rotasının Arı Algoritması kullanılarak optimizasyonu gerçekleştirilmiştir. Her türlü malzemenin fabrika içerisindeki depodan üretim hattına taşınması son derece önemlidir. Her geçen gün alanları büyüyen fabrikalarda malzeme taşıyıcıların verimli kullanılmaması, kat ettikleri mesafelerin uzun olması ve fabrika içerisinde sebep olduğu trafik gibi problemler sıkça gözlemlenmektedir. İster otonom isterse operatör tarafından kullanılan bir malzeme taşıyıcı olsun rotasının en uygun şekilde planlanması ile bu problemlerin üstesinden gelmek mümkündür. Bu sayede; operasyonel verimlilikte artış, üretim yeteneklerinde gelişme, aksama sürelerinde azalma ve maliyette tasarruf sağlanabilir. İhtiyaç duyulan malzemelerin doğru miktarda ve kalitede, doğru zamanda temin edilmesini sağlayan iş operasyonları dizisinin planlanmasına da yardımcı olunabilir. Bu amaçlar doğrultusunda; 150.000 metre kare büyüklüğündeki bir fabrikada malzeme taşıyıcının rotasının matematiksel modeli türetilmiş ve metasezgisel bir algoritma olan Arı Algoritması kullanılarak kat ettiği mesafe minimize edilmiştir. Malzeme taşıyıcının kat ettiği mesafede ciddi bir azalma sağlanmıştır. Sayısal uygulama ve sonuçları tablolar halinde ve grafiksel olarak verilmiştir.

**OPTIMIZATION OF MATERIAL TRANSPORTATION ROUTE DURING THE IN-  
FACTORY LOGISTICS PROCESS USING THE BEES ALGORITHM**

**Abstract**

In this study, during the in-factory logistics process, the optimization of the route for material transport, including raw materials, semi-finished products, ready-made parts, and auxiliary materials, has been achieved through the application of the Bees Algorithm. It is extremely important to transport all kinds of materials from the warehouse in the factory to the production line. In factories whose areas are growing day by day, problems such as inefficient use of material carriers, long distances they travel and traffic they cause inside the factory are frequently observed. Whether the material transport is autonomous or operator-driven, optimal route planning can address these challenges, leading to increased operational efficiency, improved production capabilities, reduced downtime, and cost savings. Additionally, it aids in planning business operations sequence, ensuring timely acquisition of materials in the right quantity and quality. To achieve these objectives, a mathematical model for the route of the material carrier in a 150,000 square meter factory has been developed, and the Bees Algorithm, a metaheuristic algorithm, has been employed to minimize the travel distance. The results demonstrate a significant reduction in the material carrier's travel distance, presented numerically and graphically in tables.

**Keywords:** In-factory logistics, Material carrier, The Bees Algorithm, Optimization, Route planning.

## **Giris**

Fabrika içi lojistik veya başka bir deyişle iç lojistik, bir şirket içerisinde malzemelerin hareketi ve destek faaliyetlerinin gerçekleştirilmesi olarak tanımlanabilir. Malzeme ve ekipman kontrolü, depolama ve otomasyon sistemleri, stok kontrolü ve iç malzeme akışlarının koordinasyonu gibi bir dizi süreci içerir. İç lojistiğin temel amacı organizasyon içindeki malzeme hareketlerini düzenlemek, ürünlerin doğru zamanda, doğru miktarda ve doğru yere teslim edilmesini sağlamaktır. Örneğin, bir şirketin dağıtım sürecinde gecikmeler varsa, iç lojistik yöneticisi sorunun temel nedenini belirlemek için şirketin dağıtım merkezini analiz edecektir. Bu analiz, verimli malzeme akışını engelleyen envanter hatalarını veya yerleşim sorunlarını ortaya çıkarabilir. Yönetici, bu sorunları ele alarak, tedarik zinciri süreçlerini optimize etmek ve genel çevikliği artırmak için ek ekipman satın almak veya düzeni yeniden düzenlemek gibi düzeltici eylemlerde bulunabilir. İç lojistik, çeşitli nedenlerden dolayı şirketlerin başarısında kritik bir rol oynamaktadır. İlk olarak, üretim sürecini destekleyerek ve eksiklikleri veya darboğazları önleyerek organizasyon içindeki malzemelerin düzgün akışını sağlar. Şirketler, dahili lojistiği etkili bir şekilde yöneterek, iyi senkronize edilmiş bir tedarik zincirini koruyabilir ve zamanında ve doğru teslimatlara yönelik müşteri taleplerini karşılayabilir. Ayrıca iç lojistik, şirket stratejilerinin uygulanması ve pazarda büyüme için hayati öneme sahiptir. Verimli iç lojistik olmadan, stratejik planların geliştirilmesi ve uygulanması zorlaşır ve şirketin etkili bir şekilde rekabet etme yeteneği engellenir. Bu nedenle, iç lojistiği iş operasyonlarının stratejik bir bileşeni olarak önceliklendirmek, uzun vadeli başarı için çok önemlidir. Günümüz dünyasında lojistiğin zorluğu her tür şirket için giderek daha önemli hale gelmektedir. Lojistikten bahsederken, günümüzün araştırmaları genellikle endüstrilere ve onların tedarik zincirlerine geniş kapsamlı bir açıdan odaklanmaktadır. Pazarın genişlemesi ve artan nüfus nedeniyle büyüme fırsatlarının önemi esastır. Mal ve hizmetlere olan talep artıyor ve bu da bir işletme içinde malların taşınması, malzeme taşıma, tam zamanında teslimat, depolama elleçleme vb. süreçleriyle ilgili malzeme ve bilgilerin daha iyi akışını ve işlenmesini gerektiriyor [1]. Bu çalışmada da fabrika içi lojistik sürecinde; önemli hususlardan birisi olan hammadde, yarı mamul, hazır parça, yardımcı malzeme gibi malzemelerin fabrika içerisindeki ilgili istasyonlara taşınmasında kullanılan bir taşıyıcının rotasının Arı Algoritması kullanılarak optimizasyonu gerçekleştirilmiştir. Malzeme dağıtımını için günlük rotaları, ulaşımı ve zamanlamayı planlamak önemlidir. Rota optimizasyonunun amacı operasyonel maliyeti azaltmak, verimliliği artırmak ve müşteri hizmetlerini geliştirmektir. Dikkate alınan faktörler miktar, zamanlama, en kısa rota planlaması, teslim alma ve teslimatların programlanması vb.

'dir. Hem dış hem de iç lojistikte kullanılmaktadır ve rota optimizasyonuna başlamanın ilk adımı, işin ihtiyaçlarını ve kısıtlamalarını belirlemek ve ardından ya matematiksel hesaplamalar yoluyla ya da bir yazılım sistemi edinerek çözümler bulmaktır. İkinci olarak optimal çözümlerin iş ihtiyaçlarına göre revize edilmesi gerekmektedir. Bu, günlük talep dalgalanması olabileceği gibi, kısıtlamalara uygun daha uzun bir zaman diliminde de olabilir. Bu çalışmada, sadece en kısa rota planlaması dikkate alınarak malzeme taşıma rotası optimize edilmiştir.

### **Gezgin Satıcı Problemi**

Bu çalışmada, fabrika içi lojistik sürecinde malzeme taşıma işi bir depodan ilgili istasyonlara tek bir malzeme taşıyıcı ile tek bir seferde malzemelerin taşınması olarak tanımlanmıştır. Bu problem gezgin satıcı probleminin benzeridir. Malzeme taşınacak istasyonlar gezgin satıcı problemindeki şehirler olarak malzeme taşıyıcı ise gezgin satıcı olarak kabul edilmiştir. Genel olarak gezgin satıcı problemi, özellikle bir şehirden başlayarak n şehri ziyaret etmek isteyen, tüm şehirlerden yalnızca bir kez geçmesi gereken ve daha sonra seyahat acentesinin toplam en kısa mesafeyi kat etmesini gerektiren ayrılış şehrine geri dönmesi gereken seyahat eden bir satıcıyı ifade eder. Dantzig–Fulkerson–Johnson formülasyonuna göre matematiksel modellenmesi şu şekildedir [2]. Ağırlıklandırılmış tamamen yönsüz bir grafikte en küçük ağırlığa sahip bir Hamilton döngüsü bulmak gerekir. Yani,  $G = (V, E)$ ,  $V = \{1, 2, \dots, n\}$  köşeler kümesini ve  $E$  kenarlar kümesini temsil etsin ve  $e = (i, j) \in E$  her kenar negatif olmayan bir  $m(e)$  ağırlığa sahip olsun. Şimdi  $C$  'nin  $M(C) = \sum_{e \in C} m(e)$  toplam ağırlığı en küçük olacak şekilde  $G$  'nin  $C$  Hamilton döngüsünün bulunması gerekir.  $c_{ij}$ ;  $i$  şehri ile  $j$  şehri arasındaki mesafeyi temsil etmek üzere;

$$c_{ij} > 0, \quad i, j \in V$$

$$x_{ij} = \begin{cases} 1 & i \text{ şehirden } j \text{ şehrine gidiliyorsa} \\ 0 & \text{diğer durumlarda} \end{cases}$$

olmak üzere gezgin satıcı probleminin matematiksel modeli aşağıdaki gibidir:

$$\min \sum_{i=1}^n \sum_{j \neq i, j=1}^n c_{ij} x_{ij}$$

Ve kısıtlar:

$$\sum_{i=1, i \neq j}^n x_{ij} = 1, \quad j \in V$$

$$\sum_{j=1, j \neq i}^n x_{ij} = 1, \quad i \in V$$

$$\sum_{i \in Q} \sum_{j \neq i, j \in Q} x_{ij} \leq |Q| - 1, \quad \forall Q \subseteq V, |Q| \geq 2$$

$$x_{ij} \in \{0, 1\}, \quad i, j \in V$$

şeklindedir. Burada  $|Q|$ ;  $Q$  kümedeki köşe sayısını temsil eder. İlk iki kısıtlama, her köşe için yalnızca bir gelen ve bir giden kenar olduğunu, son kısıtlaması ise alt tur eliminasyon kısıtlaması olarak adlandırılır. Hiçbir uygun alt küme  $Q$  'nun bir alt tur oluşturamayacağını garanti eder. Dolayısıyla döndürülen çözüm, daha küçük turların birleşimi değil, tek bir turdur. Bu, üstel sayıda olası kısıtlamalara yol açtığından, pratikte satır oluşturma ile çözülür.

### **Arı Algoritması**

Bu çalışmada, optimizasyon probleminin çözümü için meta-sezgisel optimizasyon algoritması olan Arı Algoritması kullanılmıştır. İlk olarak 2006 yılında Pham ve ark. tarafından geliştirilmiş olan Arı Algoritması, bal arılarının kaynak (nektar, su vb.) arama davranışını taklit eden sürü zekâsı temelli bir tarama algoritmasıdır [3-17]. Şekil 1 'de Arı Algoritması 'na ait akış şeması görülmektedir. Arı Algoritması optimizasyon yapılırken ayarlanması gereken bir dizi parametre içerir. Bunlar, ziyaret edilen  $n$  nokta içinden seçilen en uygun tarama bölge sayısı ( $m$ ), kâşif arı sayısı ( $n$ ), en iyi  $e$  tarama bölgesine gönderilen arı sayısı ( $nep$ ), seçilen  $m$  adet tarama bölgesi içindeki elit tarama bölge sayısı ( $e$ ), kalan ( $m-e$ ) tarama bölgesine gönderilen arı sayısı ( $nsp$ ), tarama bölgesi boyutu ( $ngh$ ) ve durdurma kriteri olarak kabul edilen iterasyon sayısı ( $itr$ )'dir. Optimizasyon problemi  $n$  adet kâşif arının tarama uzayına rastgele olarak gönderilmesi ile başlar. İkinci adımda kâşif arılarca taranan noktaların uygunlukları değerlendirilir. Üçüncü adımda  $n$  adet tarama bölgesi içerisinde daha uygun değere sahip  $m$  adet tarama bölgesi seçilir. Dördüncü ve beşinci adımda  $m$  adet tarama bölgesinde en iyi uygunluk değerine sahip elit tarama bölgeleri ( $e$ ) ve geriye kalan tarama bölgeleri ( $m-e$ ) seçilir. Bu bölgeler için komşuluk tarama boyutu ( $ngh$ ) belirlenir. Seçilen tarama bölgelerinde komşuluk taraması için, daha gelecek vaat eden çözümler olan en iyi  $e$  tarama bölgesine seçilen diğer tarama bölgelerine göre daha fazla takipçi arı ( $nep$ ), diğer tarama bölgelerine ise daha az takipçi arı ( $nsp$ ) gönderilerek daha detaylı arama yapılır. Her tarama bölgesi içerisinde en uygun değere sahip arı seçilir. Altıncı, yedinci ve sekizinci adımda ise her tarama bölgesine en uygun değere sahip arı haricindeki diğer arılar tarama uzayından ayrılır. Sürüdeki diğer arılar ( $n-m$ ) yeni potansiyel çözümler elde etmek için tekrar, rastgele olarak tarama uzayına gönderilirler. Optimizasyonun durdurulma kriteri ( $itr$ ) sağlanıncaya kadar işlemlere devam edilir. Her bir iterasyondan sonra

yeni sürü; seçilen her bir tarama bölgesinin temsilcileri ve rastgele tarama yapan kâşif arılardan oluşur.

Şekil 1. Arı Algoritması akış şeması

Bu çalışmada, malzeme taşıma rotası gezgin satıcı problemindekine benzetilerek optimize edilmiştir. Gezgin satıcı problemindeki tarama ve komşuluk tanımları sayısal problemlerden farklıdır. Genel olarak şehirlerin rota üzerindeki yerleri belirli kurallara göre değiştirilerek daha az maliyetle yeni rotalar bulunmaya çalışılır. Arılar algoritması için Ismail ve ark. yerel arama bölümünde üç farklı operatör kullanmıştır [18]. Bu süreçler benzer şekilde diğer sezgisel algoritmalarda da kullanılmaktadır. Takas işleminde rastgele seçilen iki şehrin sırası birbirleriyle değiştirilir. Araya sokma işleminde rastgele seçilen bir şehrin sıralaması yine rastgele seçilen farklı bir sıraya eklenir. Tersine çevirme ise rastgele belirlenen iki şehir arasındaki sıralama tersine çevrilir. Bu işlemler Şekil 2 ‘de basitçe gösterilmiştir [19]. Bu işlemler yerel tarama kısmında rastgele kullanılmaktadır, elit sitelerde daha fazla sayı, en iyi sitelerde ise daha az sayı bulunmaktadır.

a. Takas işlemi

b. Araya sokma işlemi

c. Tersine çevirme işlemi

### Sayısal Uygulama

Sayısal uygulama için 150.000 metre kare büyüklüğünde olan MEMAK Plastik Gıda Makina Sanayi Ticaret A.Ş. 'nin fabrikası kullanılmıştır. Fabrikanın büyük olması sebebiyle malzeme taşıma rotasının optimize edilmesi iç lojistik açıdan son derece önemlidir. Problem, depodan bir malzeme taşıyıcı ile rastgele olarak belirlenen 50 adet istasyona bir turda ve bir istasyona bir defa uğranarak malzemelerin taşınacağı şeklinde tanımlanmıştır. Optimizasyon çalışmalarında kullanılan Arı Algoritması 'na ait parametreler Tablo 1 'de verilmiştir.

**Tablo 1.** Arı Algoritması parametreleri

n	m	e	nep	nsp	ngh	itr
30	20	4	9	5	0.02	450

Fabrika içerisinde rastgele olarak belirlenen istasyonların koordinatları Tablo 2 'de verilmiştir. Optimizasyon çalışmaları neticesinde yapılacak olan turun minimum mesafede olması amaçlanmıştır. Optimizasyon sonucunda malzeme taşıma rotasının uzunluğu 2183.4 metre olarak hesaplanmıştır. Her bir iterasyonda elde edilen sonuçlar Şekil 3 'te verilen yakınsama grafiğinde görülmektedir. Yapılan optimizasyon çalışmaları sonrası istasyonların ziyaret sıralaması 1 → 36 → 4 → 18 → 24 → 10 → 12 → 20 → 39 → 13 → 9 → 2 → 23 → 44 → 15 → 25 → 21 → 37 → 29 → 43 → 26 → 50 → 31 → 48 → 8 → 47 → 14 → 38 → 7 → 45 → 16 → 35 → 32 → 11 → 3 → 40 → 34 → 22 → 6 → 30 → 33 → 17 → 28 → 42 → 41 → 46 → 5 → 49 → 27 → 19 → 1 olarak bulunmuştur. Fabrikanın içerisinde istasyonların konumları ve optimizasyon sonucunda elde edilen rota planlaması Şekil 4 'te görülmektedir.

Düzensiz ve rastgele izlenecek bir rotanın uzunluğunun 8000 metrelerin üzerine çıkabileceği Şekil 3 'te görülmektedir.

### **Sonuç**

Bu çalışmada, MEMAK Plastik Gıda Makina Sanayi Ticaret A.Ş. 'nin fabrika içi lojistik sürecinde; hammadde, yarı mamul, hazır parça, yardımcı malzeme gibi malzemelerin taşınmasında kullanılan bir taşıyıcının rotasının Arı Algoritması kullanılarak optimizasyonu gerçekleştirilmiştir. Fabrika içerisinde yapılan malzeme taşıma işini daha etkin ve üretim alanlarında bekleyen stok miktarlarını en aza indirebilmek amacıyla rota planlaması yapılmıştır. Malzeme tedarikini yapacak aracın fabrika içerisinde depodan ilgili istasyonlara kadar rotasını tespit edecek bir matematiksel model Dantzig–Fulkerson–Johnson formülasyonu kullanılarak elde edilmiştir. Rota bilgisi ve diğer kısıtlar en kısa rotayı tespit edebilmek için bir matematiksel model türetilmiştir. Malzeme taşıyıcının bir tur içerisinde her bir istasyona sadece

bir defa uğrayacağı düşünülerek matematiksel model formüle edilmiştir. Minimum tur mesafesi için elde edilen matematiksel model Arı Algoritması kullanılarak optimize edilmiştir. Elde edilen sonuçlar değerlendirildiğinde, bu yöntem ile atılan tur sayısında, toplam stok ve taşıma maliyetinde ve malzeme taşıyıcının doluluk oranında önemli iyileştirmeler yapılabileceği görülmüştür. Bu yaklaşımın, depodan istasyonlara taşımanın yanı sıra operasyonlar arası malzeme taşıma ve akışının fazla olduğu fabrikalarda düzensiz taşıma ve yarı mamul stoklarından kaynaklı maliyetlerin önemli ölçüde düşürebileceğini söylemek mümkündür. Bu çalışmada kurulan matematiksel model benzer fabrika ve malzeme akışları için etkin bir şekilde kullanılabilir. Diğer yandan problemin çözümü için metasezgisel bir algoritma olan Arı Algoritması'nın kullanımı; farklı problemlerin çözüm yaklaşımlarının geliştirilmesi ve problemlerin farklı varsayımlar ile farklı üretim süreçlerine uygulanabilirliğinin gösterilmesi bakımından alternatif bir yaklaşım olarak kullanılabileceğini göstermiştir.

### **ÖZET**

Dünyadaki kanatlı hayvan eti ve sofralık yumurta üretiminin önemli bir kısmı ticari tavuk yetiştiriciliğinden sağlanmaktadır. Hayvansal kökenli gıdaların çeşitliliğini sağlamak ve nüfus artışına paralel olarak ihtiyaç duyulan protein açığının kapatılması için ördek, kaz ve hindi gibi kanatlı hayvan türlerinden de yararlanılmaktadır. Dünya genelinde kanatlı hayvanlar içerisinde varlığı en fazla olan türler sırasıyla tavuk, ördek, kaz ve hindi şeklindedir. Dünya nüfusunun beslenmesinde ve ihtiyaç duyulan protein açığının kapatılmasında kümes hayvanları içerisinde hindiler de önemli bir yere sahiptir. Hindi yetiştiriciliğinin tavuk yetiştiriciliğine göre en önemli avantajı karkas randımanının yüksek olmasıdır. Dünya genelinde hazır gıda ve fast-food yiyeceklerin tüketici kitlesindeki artışı ve hindi etinin kırmızı etlerle birlikte sucuk, salam ve sosis gibi işlenmiş et ürünlerinin yapımında büyük oranda kullanımı hindi yetiştiriciliğini canlı tutmaktadır. Ayrıca tüm dünyadaki birçok kültürde bazı özel zamanların sofralarında özellikle tercih edilen önemli bir kanatlı hayvan etidir. Türkiye'de tavuktan sonra en fazla hindi yetiştiriciliği yapılmaktadır. Türkiye'de yetiştiriciliği yapılan kanatlı hayvan türlerinin varlığı en fazla olanlar sırasıyla tavuk, hindi, kaz ve ördek şeklindedir. Türkiye'de hindi varlığının ikinci sırada yer alması ülkenin her coğrafyasında yetiştirilmesiyle ve etinin her kesimden insanın damak lezzetine uygun olması ile açıklanabilir. Türkiye'de tavuktan sonra endüstrileşen hindi yetiştiriciliği yegane kanatlı hayvancılık sektörü haline gelmiştir. Türkiye'de hindi yetiştiriciliği en yaygın ekstansif veya yarı entansif olarak küçük sürüler halinde meraya dayalı otlatmaya uygun koşullarda da yapılmaktadır. Etlik piliç yetiştiriciliğinde olduğu gibi entansif koşullarda ticari hibritler kullanılarak hindi eti üretimine yönelik yatırımlar yapılmaya başlanmıştır. Ülkemizde ilk entegre hindi yetiştiriciliği işletmesi 1995 yılında Bolu'da kurulmuş ve izleyen yıllarda birçok işletme kurulmaya devam ederek hindi eti üretiminde ön plana çıkmıştır. Kurulan bu işletmelerde damızlık tesisi, kuluçkahane, yetiştirme kümesleri, kesimhane, parçalama, paketleme, şoklama, muhafaza tesisleri ve dağıtım firmaları ile tam entegre üretim yapılmaya başlanmıştır.

**Anahtar kelimeler:** Hindi eti, kanatlı hayvan yetiştiriciliği, Türkiye'de hindi yetiştiriciliği

## **GENERAL SITUATION OF TURKEY BREEDING IN TÜRKİYE**

### **ABSTRACT**

A significant portion of the world's poultry meat and table egg production is provided from commercial chicken breeding. Poultry species such as duck, goose and turkey are also used to ensure the diversity of animal-based goods and to close the protein gap needed in parallel with population growth. The most populated species of poultry around the world are chicken, duck, goose and turkey respectively. Turkeys have an important place in poultry farming to fulfill the protein deficit in feeding the world population. The most important advantage of turkey farming compared to chicken farming is the high carcass yield. The increase in the consumption of ready-to-eat and fast-foods throughout the worldwide and the use of turkey meat in the production of processed meat products such as sausage and salami along with red meat keeps turkey breeding alive. It is also an important poultry meat that is especially preferred on the tables of some special days in many cultures around the world. Turkey breeding is the second largest poultry species after chicken in Türkiye. The most common poultry species bred in Türkiye are chicken, turkey, goose and duck, respectively. The second place in the presence of turkey in Türkiye can be explained by the fact that it is bred in every geography of the country and its meat is suitable for the taste of all people. In Türkiye, turkey breeding has become the unique industrialised poultry sector after the chicken. In Türkiye, turkeys are the most commonly bred as extensive or semi-extensive in small flocks in conditions suitable for pasture-based grazing. Investments have begun to be made for turkey meat production by using commercial hybrids under intensive conditions as in broiler breeding. The first integrated turkey farming enterprise in Türkiye was established in Bolu in 1995 and many enterprises continued to be established in the following years and came to the forefront in turkey meat production. In these constructed enterprises, poultry breeding facility, hatchery, bird's houses, slaughterhouse, shredding unit, packaging, shocking, preservation facilities were established and fully integrated production was started to be carried out with distribution companies.

**Key words:** Poultry breeding, turkey breeding in Türkiye, turkey meat

## **GİRİŞ**

Birçok çiftlik hayvanı yetiştiriciliklerine göre kanatlı hayvan yetiştiriciliklerinin daha ekonomik ve etinin sağlıklı olması yetiştiriciliğine olan ilgiyi her geçen gün artırmaktadır. Kanatlı hayvan türleri içinde dünyada popülasyonu en fazla olanları sırasıyla tavuk, ördek, kaz ve hindi şeklindedir (FAO 2022). Kanatlı hayvan eti ve sofralık yumurta üretimi bakımından ticari tavuk yetiştiriciliği dünyada birinci sıradadır. Nüfus artışına paralel olarak hayvansal kökenli gıdaların çeşitliliğini sağlamak, ihtiyaç duyulan protein açığının kapatılması için alternatif olarak ördek, kaz ve hindi gibi kanatlı hayvanlar da yetiştirilmektedir. Bu kümes hayvanlarının yetiştirilmesinde asıl amaç et üretimi olsa da yumurta, yağlandırılmış karaciğer ve tüy üretimi gibi amaçlarla da yetiştiricilikleri yapılabilmektedir (Grzanic ve ark. 2023). Alternatif kanatlı hayvanlar içerisinde yer alan hindiler dünya nüfusunun beslenmesinde önemli bir yere sahiptir. Dünya genelinde hazır gıda ve fast-food yiyeceklere gittikçe artan talep ve hindi etinin kırmızı etler ile birlikte sucuk, salam, sosis gibi işlenmiş et ürünlerinde kullanımı yetiştiriciliğini canlı tutmaktadır. Hindi etinin dünya genelinde hemen her kültürden insanın damak tadına uygun olması ve özel gün menülerinde yer alması da yetiştiriciliğinde diğer alternatif kanatlı hayvanlara göre avantaj sağlamaktadır (Konca 2001, Ribarski ve Oblakova 2016). Hindi etini diğer kanatlı hayvan etlerinden ayıran en önemli özelliği protein içeriğinin yüksek ve yağ içeriğinin de daha düşük olmasıdır. Bu nedenle hindi eti diyet menüleri için de oldukça önemli bir yere sahiptir. Hindi etinde protein oranı %25-26, yağ oranı %0,31-%0,90 düzeyindedir (Ribarski ve Oblakova 2016). Etinin 100 gramında ise 160 kcal enerji bulunduğu bildirilmektedir (Özer ve Özbey 2013). Hindinin anavatanı Amerika kıtasıdır. Evcil hindiler; zoolojik sınıflandırmada *Galliformes* takımı, *phasianidae* ailesi ve *meleagris* cinsinden *Meleagris gallopova* olarak bilinmektedir (Brant 1998). Dünya genelinde yetiştiriciliği yapılan hindilerin birçoğu Kuzey Amerika Bronz hindilerinden köken almıştır ve ıslah çalışmaları sonucunda birçok hindi genotipi oluşturulmuştur (Brant 1998). Amerikan Bronz, Geniş Göğüslü Bronz, Geniş Göğüslü Beyaz ve Küçük Beyaz Beltsville yaygın olarak yetiştiriciliği yapılan ve çeşitli hindi genotip ve hatlarının geliştirilmesinde kullanılan hindi ırklarındandır (Brant 1998, Makarynska ve Vorona 2019, Arslan ve Çetin 2022). Hindilerin yemden yararlanma oranı yüksek olup, karkas randımanı da oldukça iyi düzeydedir (Brant 1998). Hindiler üzerinde yapılan ıslah çalışmaları sonucunda yemden yararlanma oranı ve canlı ağırlık artışında önemli gelişmeler sağlanmıştır. Islah çalışmaları sonucunda elde edilen hindi genotiplerinin neredeyse tamamının Amerika Bronz ve Geniş Göğüslü Bronz ırk hindilerden geliştirildiği bildirilmektedir (Makarynska ve Vorona 2019).

Amerika Bronz hindileri yetiştiriciliği en yaygın hindi ırkı olarak tanınmaktadır. En önemli özellikleri yüksek döl ve et veriminin yanı sıra yemden yararlanma oranının da iyi düzeyde olmasıdır. Orta cüsseli hindi ırklarındandır. Geniş Göğüslü Bronz hindiler ise yetiştiriciliği yaygın olarak yapılan bir diğer ırktır. Ağır cüsseli hindi ırkları içerisinde yer almaktadır. Bu ırkın en önemli özelliği göğüs etinin karkastaki payının yaklaşık %40 düzeyinde olmasıdır. Göğüs etinin ekonomik değerinin yüksek olması yönünden birçok hindi hattı geliştirilmiştir ve 1940'lı yıllarda İngiltere'de Geniş Göğüslü Bronz hindiler en fazla tercih edilen hindi ırkı olmalarının yanı sıra günümüzde de halen birçok ıslah çalışmalarında kullanılmaya devam etmektedir (Brant 1998, Arslan ve Çetin 2022). Hindilerde yıllık yumurta verimi 60 ve 100 adet arasındadır. Yumurtaları beyaz renkli olup üzerinde açık kahve renkli benekler vardır. Hindilerde yumurta ağırlığı ortalaması 70-90 g (Mroz ve ark. 2014, Erişir ve Yıldız 2000, Arslan ve Çetin 2022) ve şekil indeksi ortalaması ise %73 düzeyindedir (Mroz ve ark. 2014, Alaşahan ve ark. 2019). Hindi yumurtalarının kuluçka süresi 28 gün, döllülük oranı %80-90, çıkış gücü %70-90 ve kuluçka randımanı ise %70-80 aralığındadır (Byerly ve Marsden 1938, Erişir ve Yıldız 2000, French 2000, Mroz ve ark. 2014). Hindiler cüsselerine göre hafif, orta, orta ağır ve ağır olmak üzere dört grupta sınıflandırılmaktadır. Bakım ve besleme koşullarına bağlı olarak dişi ve erkek hindilerin canlı ağırlıkları ortalama; hafif gruptaki dişiler 5-8 kg ve erkekler 18 kg'a kadar çıkmakta iken; orta gruptakilerde dişiler 8-10 kg ve erkeklerde 25 kg'a kadar canlı ağırlık artışı olmaktadır. Orta ağır gruptaki hindilerde dişiler 9-11 kg ve erkekler 30 kg'a kadar çıkmakta iken, ağır gruptaki hindilerin canlı ağırlığının dişilerde 10-13 kg ve erkeklerde ise 40 kg'a kadar çıktığı bildirilmektedir (Makarynska ve Vorona 2019). Hindilerde ideal kesim yaşı canlı ağırlığa bağlı olmakla birlikte 16 ve 24 hafta arasında değişmektedir (Majumdar ve ark. 2005, Makarynska ve Vorona 2019). Genel olarak hindilerde karkas randımanının %70-75 oranında olduğu, göğüs eti oranının ise yaklaşık %30 düzeyinde olduğu bildirilmektedir (Ojewola ve ark. 2001, Majumdar ve ark. 2005). Son yıllarda yapılan ıslah çalışmaları sonucunda hibrit hindilerin yemden yararlanma oranında ve karkas randımanlarında oldukça iyi sonuçlar elde edilmiştir. Dişi hindilerin 10. haftada canlı ağırlığı yaklaşık 3 kg, yemden yararlanma oranı ise 2.1 olarak, erkek hindilerde ise 8 haftalık yaştaki canlı ağırlık 3 kg ve yemden yararlanma oranı ise 1.8 olarak bildirilmiştir (Karki 2005, Özer ve Özbek 2013). Hindilerde yemden yararlanma oranı erken yaşlarda en iyi düzeydir ve ileriki yaşlarda bu oranın düzeyi artış göstermektedir (Karki 2005). Dünya genelinde hindi varlığı 255.767.000 baş düzeyindedir (FAO 2022). Ülkeler düzeyinde hindi varlığı en yoğun Amerika Birleşik Devletleri'nde %46 düzeyinde ve Avrupa Birliği ülkelerinde %35 düzeyindedir. ABD 70

milyon baş hindi varlığı ile dünyada en büyük hindi eti üreticisi ülke konumundadır. ABD'yi yaklaşık 27 milyon baş ile Şili, 15 milyon baş ile Fransa, yaklaşık 15 milyon baş ile Polonya ve yaklaşık 14 milyon baş ile Fas takip etmektedir. Hindi, Amerikan kültür ve mutfağı için önemli bir kümes hayvanı konumundadır. ABD'inde her yıl Kasım ayında kutlanan ve gelenek haline gelmiş 'Şükran Günü' (Thanksgiving Day) için yapılan ritüel ve kutlamalarda hindi eti ile yapılan yemekler önemli bir yere sahiptir (Kurtiş ve ark. 2010, Roth 2010). ABD'de hindi sadece et elde etmek için yetiştirilmemekte bunun yanı sıra törenlerde ve dekoratif amaçlı tüy üretimi için de yetiştiricilik yapılmaktadır (Sponenberg ve ark. 2000). Dünya genelinde tavuk, ördek, hindi ve kazlardan elde edilen toplam et miktarı 139.200.561.400 tondur. Elde edilen toplam et üretimi içerisinde %88,82 oran ile tavuk eti en büyük paya sahip ve birinci sırada, %4,36 ile ördek eti ikinci, %3,65 ile hindi eti üçüncü ve %3,17'lik oran ile kaz eti dördüncü sırada yer almaktadır (FAO 2022). Dünya hindi eti ihracatında Polonya 168 bin ton ile birinci, ABD yaklaşık 134 bin ton ile ikinci ve Almanya yaklaşık 90 bin ton ile üçüncü sırada yer almaktadır. Dünya hindi eti ithalatında ise 102.6 bin ton ile Meksika birinci sırada yer almaktadır. Meksika'yı 89.6 bin ton ile Almanya, 47.4 bin ton ile Benin ve 38.7 bin ton ile ABD takip etmektedir (FAO 2022).

### **TÜRKİYE'DE HİNDİ YETİŞTİRİCİLİĞİ**

Dünya genelinde olduğu gibi Türkiye'de de kırmızı et fiyatlarının yüksekliği nedeniyle kümes hayvanları yetiştiriciliğine ilgi artmaktadır. Türkiye'de yetiştiriciliği yapılan kanatlı hayvan türlerinin varlığı en yüksekten düşüğe doğru tavuk, hindi, kaz ve ördek şeklindedir (TÜİK 2022). Dünya genelinden farklı olarak Türkiye'de ticari tavuklardan sonra hindi ikinci sırada yer almaktadır. Türkiye'de hindi yetiştiriciliğinin geçmişi uzun yıllar öncesine dayanmakla birlikte ticari hindi yetiştiriciliği çok eski değildir. Devlet Üretim Çiftlikleri (DÜÇ) tarafından yetiştiricilere palaz desteği lokomotif güç olmuştur (Eratarlar ve Bulut 2007, Arslan ve ark. 2020, İnci 2020). Çeşitli illerde kurulmuş olan DÜÇ'leri zamanla yerini modern üretim tesislerine ve özel çiftliklere bırakarak kapatılmıştır (Eratarlar ve Bulut 2007, Koyubenbe ve Konca 2010, İnci ve ark. 2018). Ülkemizde ilk özel entegre hindi yetiştiriciliği tesisi 1995 yılında Bolu'da kurulmuş ve ilerleyen yıllarda birçok işletme kurulmaya devam ederek birçok ticari firma hindi eti üretiminde ön plana çıkmıştır. Böylece biyogüvenlik standartları ve teknik kapasitesi yüksek olarak projelendirilen kümeslerde üretim yapılmaya başlanmıştır (Eratarlar ve Bulut 2007). Kurulan bu işletmelerde damızlık tesisi, kuluçkahane, yetiştirme kümesleri, kesimhane, parçalama-paketleme-şoklama, depolama tesisleri ve dağıtım firmaları ile tam entegre üretim yapılmaktadır. Bugün İstanbul, Sakarya, Bolu ve İzmir gibi illerde bulunan özel

sektöre ait işletmelerde hindi yetiştiriciliği yapılmaktadır (İnci 2020). Hindi eti üretimi yapan bu kuruluşlar 2007 yılında birleşerek 'Hindi Yetiştiricileri Platformu'nu kurmuşlardır (Eratalar ve Bulut 2007). Ayrıca bu işletmeler tavuk yetiştiricilerinin de bünyesinde bulunduğu Beyaz Et Sanayicileri ve Damızlıkçıları Birliği Derneği (BESD-BİR) üyeleridir (BESD-BİR 2024). Kaz ve ördek yetiştiriciliği yapan yetiştiriciler için henüz birliktelik sağlayan bir kuruluş bulunmazken tavuk ve hindi yetiştiricilerinin birlik içerisinde olduğu görülmektedir. Türkiye'deki hindi varlığının büyük bir çoğunluğunu yerli genotipler ile Amerikan Bronz hindiler oluşturmaktadır (Özer ve Özbey 2013, Arslan ve Çetin 2022). Türkiye'de hindi yetiştiriciliği 30-40 yıl öncesine kadar sadece küçük ailesel işletmelerde tamamen ekstansif ve ya yarı entansif koşullarda yapılmakta iken son yıllarda sanayi ile entegre olan entansif koşullarda ticari yetiştiricilik yapılmaya başlanmıştır. Bugün halen ekstansif ve yarı entansif yetiştiricilik kırsal kesimlerde yapılmaya devam etmekte ve aile ihtiyacı dışında küçük sürüler halinde yılbaşı tüketimine yönelik olarak da yetiştiricilik yapılmaktadır (Polat ve ark. 1999, Eleroğlu ve ark. 2012). Ekstansif yetiştiricilik; özellikle kırsal kesimde küçük aile tipi işletmelerde yapılmakta ve hindiler büyükbaş hayvanlar gibi sürüler halinde merada otlatılmaktadır. Kırsal kesimdeki ailesel yetiştiriciler için hindi önemli bir gıda kaynağı olmasının yanı sıra çeşitli türden kanatlı hayvan yumurtalarının doğal kuluçkasında yetiştiriciler tarafından verimli bir şekilde kullanılmaktadır. Yerli genotipten hindilerde annelik içgüdüsünün fazla olması ve yüksek gürk olma özelliği kırsaldaki yetiştiriciliğinin sürekliliğinin sağlamaktadır. Yarı entansif yetiştiricilikte de Bronz veya siyah hindi ırklarıyla küçük-orta sürüler halinde yetiştiricilik yapılmaya devam etmektedir (Arslan ve Çetin 2022). Ekstansif ve yarı entansif yetiştiricilikte 4-5 haftalık yaşta merada otlatılmaya başlayan hindi palazlarının yetiştirme maliyetinde en az %20 düzeyinde tasarruf edilmektedir. Bu iki yetiştiricilik sisteminde kesim yaşı, palazların temin edilme mevsimi veya civcivlerin kuluçkadan çıkış zamanı dikkate alınarak belirlenmektedir. Yarı entansif koşullarda yetiştirilen hindilerin kesimi 5-6 aylık yaşta, ekstansif koşullarda ise 35 haftalık (8-9 ay) yaşa kadar uzayabilmektedir (Şengül ve Ekinci 2017, İnci ve ark. 2018). Günümüzde ticari olarak daha çok entansif koşullarda ticari hibritlerin yetiştiriciliği yapılmaktadır. Entegre yetiştiriciliğin yaygınlaşması ve kurulan modern işletme sayısının artış göstermesi sonucu hindi yetiştiriciliği Türkiye'de endüstrileşmiş ve hindi besiciliği gelişme göstermiştir (Eleroğlu ve ark. 2012). Entegre yetiştiricilikte ise hindilerin kesim yaşı canlı ağırlığına bağlı olarak 16 ve 24 haftalık bir zaman periyodunu oluşturmaktadır (Majumdar ve ark. 2005, Özer ve Özbey 2013, Makarynska ve Vorona 2019). Türkiye 2022 yılında 3.670.000 baş hindi varlığı ile dünya

genelinde 12. sırada yer almaktadır (FAO 2022). 2023 yılı verilerine göre ise Türkiye’de hindi varlığı azalarak 3.378.790 baş düzeyindedir (TÜİK 2023). İller düzeyinde 936.117 baş hindi varlığı ile Bolu birinci sırada yer alırken sıralamayı, 933.811 baş ile Manisa, 210.972 baş ile İzmir, 174.184 baş ile Sakarya ve 87.658 baş ile Diyarbakır illeri takip etmektedir (TÜİK 2023). Bu iller Türkiye’de tavuk varlığı ile de öne çıkmakta ve beyaz et üretiminde öne çıkmış firmalar ile çalışmaktadır. Türkiye’de modern işletmelerin kurulması hindi varlığında artışa neden olmuş ve birçok ilimiz hindi varlığı ile öne çıkmıştır. Bu illerimiz dışında Türkiye genelinde uzun yıllardır tanınmış olan Kandıra ve Eflani hindileri oldukça popülerdir. Özellikle Kandıra hindileri ülke çapında adeta kendiliğinden marka haline gelmiş ve Kandıra hindi etine fazlaca talep bulunmaktadır. Kocaeli’nin bir ilçesi olan Kandıra’da yaklaşık 155 yıldır ekstansif koşullarda hindi yetiştiriciliği yapılmaktadır. Türkiye’de ilk kez 1980 yılında dönemin Tarım ve Köy İşleri Bakanlığına bağlı olarak Hindi Üretim Çiftliği Kandıra’da kurulmuştur. Böylece ‘Kandıra Hindisi’ olarak bilinen siyah hindi yetiştiriciliğine ilgi giderek artış göstermiştir (Anonim 2024a, Anonim 2024b). Geleneksel yöntemlerle ağırlıklı olarak merada otlatılarak yetiştirilen Kandıra hindilerinin etlerine ülke genelinde gösterilen talep fazlalığının yanı sıra dış ülkelerden de talep fazla olmaktadır. Birleşik Arap Emirlikleri başta olmak üzere Azerbaycan ve Rusya gibi ülkelere ihracat gerçekleştirilmektedir. Ayrıca hindi eti tüketiminin sadece yılbaşlarıyla sınırlı olmadığı, yıl içerisinde de tüketiminin arttığı bildirilmektedir (Anonim 2024c). Kandıra’da 11-12 kg canlı ağırlığındaki hindi fiyatları 2023 yılı Aralık ayında 1.500 ila 2.500 TL arasında, etinin kg fiyatının ise 300-350 TL/kg düzeyinde olmuştur (Anonim 2024c, Anonim 2024e). Kandıra hindisi ile meşhur olan Kocaeli 35.019 baş hindi varlığı ile 13. sırada yer almaktadır. İlin ilçeler düzeyinde hindi varlığında Kandıra ilçesi 22.070 baş ve %63 üretim düzeyi ile birinci sıradadır. İlçeler düzeyinde ikinci sırada 10.550 (%30) baş hindi varlığı ile İzmit yer almaktadır (TÜİK 2023). Ancak Kocaeli ilinin 2021 ve 2022 yılları hindi varlığı sırasıyla 112.131 baş ve 132.043 baş düzeyindedir (TÜİK 2024). Ülkemizde hindisi ile meşhur olan bir diğer yerleşim yeri ise Karabük’ün Eflani ilçesidir. Eflani hindilerine de talep fazla olmaktadır. İlçede hindiler önemli bir kümes hayvanı olup ilçe merkezinde heykeli bulunmaktadır. Ekstansif koşullarda hindi yetiştiriciliği yapılan ilçede, canlı ağırlığı 5 ila 8 kg arasında değişen hindiler 2023 yılı Aralık ayında 1600 TL’den başlayan fiyatlarla satışa sunulmuştur. İlçede hindi etinin kg fiyatı ise 300-350 TL/kg’dır (Anonim, 2024c, Anonim 2024d). Ayrıca ilçede sevilerek tüketilen ‘Eflani Hindi Bandırması’ isimli yöresel bir yemekte 12.09.2017 yılında tescillenmiş ve coğrafi işaret almıştır (Anonim 2024f). Karabük ili hindi varlığı ile ülke genelinde 53. sırada yer almaktadır. İlin ilçeler düzeyindeki hindi varlığında öne çıkan ilçesi 2.750 baş ile il genelinin %53’üne sahip olan Eflani’dir (TÜİK 2023).

Türkiye’de kümes hayvanlarından kaz ve ördek etinin üretim miktarı ile ilgili herhangi bir istatistik bilgi bulunmadığından hindi eti üretim miktarının toplam kanatlı hayvan eti üretimi içerisindeki genel payı bilinmemekle birlikte, ülke geneli hindi eti üretimi 47.575 ton düzeyindedir (TÜİK 2023). Türkiye hindi etini taze, dondurulmuş, bütün veya parçalar halinde ihraç etmekte ve ihracatta ilk 20 ülke arasına girmektedir. Dünya hindi eti ihraç eden ülkeler arasındaki sıralamada Türkiye 7.446 ton ile 16. sırada yer almaktadır. Türkiye’nin hindi eti ithalatı bulunmamaktadır (FAO 2022). Bu üretim miktarıyla Türkiye’de kişi başı hindi eti tüketimi hindi yetiştiriciliğinde öne çıkmış ülkelere göre oldukça düşüktür. Hindi yetiştiriciliğinde öne çıkmış ülkelerde kişi başı yıllık hindi eti tüketimi minimum 6 kg düzeyinde iken Türkiye’de bu değer 0,56 kg düzeyindedir (Tarım ve Orman Dergisi 2022). Türkiye’de yapılan hindi yetiştiriciliğinde sözleşmeli yetiştiricilik modeli benimsenmiştir. Yurt dışı entegre firmalar ile anlaşmalar yapıp kuluçkalık hindi yumurtalarının hepsi ithal edilerek kuluçkalanmaktadır (Tan ve Dellal 2002, Eratalar ve Bulut 2007). Hindi yetiştiriciliğinde en yaygın olarak hepsi içeri-hepsi dışarı sistemi kullanılmaktadır. Bu yetiştiricilik sisteminde kuluçkadan çıkan hindi civcivlerinin kesimine kadar aynı kümeste bakım ve beslemesi yapılmakta ve topluca kesime sevk edilmektedir. Diğer yaygın kullanılan yetiştiricilik sisteminde ise kümeslerin daha kullanışlı olması amaçlanmış ve hindi palazları belirli haftalık yaşa kadar aynı kümeste yetiştirilmekte ve daha sonra farklı bir kümese alınıp boşaltılan kümese yeni yaş grubu civcivler yerleştirilmektedir. Böylece işletme içerisinde farklı haftalık yaşta civciv ve hindi palazları bulunabilmektedir (Eratalar ve Bulut 2007). Türkiye’de hindilerin kesim ve karkas özellikleri üzerine yapılmış sınırlı sayıda çalışma bulunmaktadır. Amerikan Bronz x Betina melezi erkek hindilerin 84. gün sonunda kesim ağırlıklarının yaklaşık 8 kg civarında olduğu, karkas ağırlığının yaklaşık 6 kg ve karkas randımanının ise %75 olduğu bildirilmektedir (Değirmencioğlu ve ark. 2003). Entansif ve yarı entansif sistemlerde farklı besi şekillerinde yetiştirilen ve 8-19 hafta sonunda kesimi yapılan Beyaz ırk hindilerde dişi ve erkeklerin entansif şartlarda karkas ağırlığı ve karkas randımanları sırasıyla 5 kg ve %74 ile 6 kg ve %75; yarı entansif şartlarda aynı sıra ile 4 kg ve %76 ile 5 kg ve %76 olduğu bildirilmiştir (Özer ve Özbey 2013). Türkiye’de hindi önemli bir yere sahip kümes hayvanıdır. Karkas randımanının yüksek olması, hazır gıdalarda hammadde olarak kullanımı, yılbaşı gibi özel günlerde sofraların vazgeçilmez lezzeti haline gelmesi, son yıllarda artış gösteren kalp ve damar hastalıkları gibi çeşitli hastalıkların önüne geçebilmek için özel diyet menülerinde yer alması hindi yetiştiriciliğine bir sektör özelliği kazandırmıştır. Ancak ülkemizde hindi eti tüketimi ve ihracatının üretim düzeyine göre henüz yeterli düzeyde olmadığı görülmektedir. Bu durumun

en önemli nedenleri arasında; beslemede kullanılan yem hammaddelerinin büyük bir çoğunluğunun ve kuluçkalık yumurtaların tamamına yakınının ithal edilmesi yetiştiricilik maliyetini oldukça artırmaktadır. Bu iki konu ülkemiz hindi yetiştiriciliğinin önünde biran önce uygun politikalar ile aşılması gereken en önemli sorunların temelini oluşturmaktadır. Ayrıca ülkemizde kişi başı hindi eti tüketimi de gelişmiş ülkelerin oldukça gerisindedir. Hindi etinin tüketimine yönelik özendirici tanıtımların yapılması gerekmektedir (Arslan ve ark. 2020, Sipahi ve Cevger 2021).

### **SONUÇ**

Türkiye’de hindi yetiştiriciliği ve besiciliği hızlı bir gelişme göstererek endüstrileşmiştir. Hindi etinin lezzetli olması, yağ ve kolesterol içeriğinin düşük olması ve çoğu gıda ürünleri ile birlikte işlenebilmesi yetiştiriciliğine ilginin artmasını sağlamaktadır. Türkiye, bugün sahip olduğu modern tesisler ve uluslararası standartlara uygun üretim metotlarıyla hindi eti üretimi yapmaktadır. Ancak yem hammaddelerinde ve diğer girdilerde dışa bağımlılık üretim maliyetlerini artırmakta ve bu durum yetiştiricileri zorlamaktadır. Ülkemizde hindi yetiştiriciliğinin önündeki engellerin biran önce uygun politikalar ile aşılması gerekmektedir. Kuluçkalık yumurtaların dış ülkelere temin edilmesi yerine hindi yetiştiriciliğinin yoğun yapıldığı bölgelere damızlık işletmelerinin kurulması ticari yetiştiriciliği daha ekonomik hale getirecektir. Türkiye’de hindi yetiştiriciliği ve hindi eti üretiminde küçük aile işletmelerinin önemli bir payı bulunmaktadır. Bu işletmelerin hindi yetiştiriciliği ve hindi eti üretimine teşvik edilmesi ve desteklenmesi kırsal kesimdeki üretimin sürekliliğini sağlamak açısından önemli olacaktır. Türkiye’de hindi eti üretimini arttırmaya yönelik etkili bir politika bulunmamaktadır. Politikalar daha çok tavukçuluk açısından ele alınmakta ve hindi eti ile ilgili yapılan çalışmalar tavukçuluk alanında yapılanlarla göre sınırlı kalmaktadır. Kırmızı et tüketim açığını kapatmak için iyi bir alternatif olan hindi eti üretimine yönelik politikaların oluşturulmasının ülkemiz hindi eti üretimi ve yetiştiriciliği için önemli olacağı değerlendirilmektedir.

### **ÖZET**

Dijital dönemde mecralar kadar onu kullanan kullanıcıların da önem taşıdığı görülür. Dijital öncesi dönemde reklamveren işletmeden hedef kitleye doğru yönelen tek taraflı iletişim sona ermiş, dijitalleşmeyle daha interaktif, sesi daha çok yükselen, daha üretken, daha net bir kullanıcı yapısı karşımıza çıkmıştır. Günümüzün gelişen dijital ortamı ise, hediye verme ve alma şeklimizi değiştirmiştir. Geleneksel hediye verme uygulamaları, dijital hediye kartlarının yükselişiyle devrimsel bir etki yaratmıştır. Ulusal Perakende Federasyonu (National Retail Federation-NRF)'ndan elde edilen verilere göre son 5 yılda dijital hediye kartı satışlarında yılda ortalama %200 artış yaşanmıştır. Buna göre örneğin sadece 2022 yılında dijital hediye kartı satışlarında 15 milyar dolara ulaşılmıştır (Gu,2023).Dijital hediye vermenin sunduğu kolaylık, kişiselleştirme ve esneklik sunma özellikleri ve sosyal media alanındaki gelişmeler ise hediye alışverişi yapma şeklimizi ve hediye anlamını değiştirmiştir. Özellikle sosyal medyada ünlü fenomenlerin, video akımcıları ve influencerların yeni dijital hediyeleşme geleneğinin devamlılığında önemli bir yere sahip olduğu gözlenmiştir. Bu gelişmeler ışığında çalışmada betimsel bir yaklaşımla örnek çalışmalara dayanarak, dünyada hediyeleşme geleneğini dijitalleşmenin nasıl etkilediği ve pazarlama iletişimi çalışmalarının burada nasıl bir öneme sahip olduğu ortaya konmaya çalışılmış; gelecekte dijital mecralardaki gelişmelerden ve yeni neslin hediyeleşme geleneğine yükleyeceği anlamdan hediye kültürünün birebir etkileneceği ve sektör taraflarının buna şimdiden hazırlıklı olması gerekliliği bulgusu ortaya çıkmıştır.

**NEW CONSUMERS OF THE DIGITAL WORLD AND THE DIGITALIZATION OF  
THE GIFTING TRADITION**

**ABSTRACT**

In the digital era, it is seen that the users who use it are as important as the media. In the pre-digital era, one-sided communication from the advertiser business to the target audience has come to an end, and with digitalization, we have come across a more interactive, more vocal, more productive and clearer user structure. Today's evolving digital environment has changed the way we give and receive gifts. Traditional gift-giving practices have had a revolutionary impact with the rise of digital gift cards. According to data from the National Retail Federation (NRF), there has been an average annual increase of 200% in digital gift card sales in the last 5 years. Accordingly, for example, in 2022 alone, digital gift card sales reached \$15 billion (Gu, 2023). The convenience, personalization and flexibility offered by digital gifting, and the developments in social media have changed the way we exchange gifts and the meaning of gifts. Especially in social media, it has been observed that famous phenomena, video streamers and influencers have an important place in the continuity of the new digital gifting tradition. In the light of these developments, in the study, based on case studies with a descriptive approach, it was tried to reveal how digitalization affects the tradition of gifting in the world and what importance marketing communication studies have here. It has been found that the gift culture will be directly affected by the developments in digital media in the future and the meaning that the new generation will attribute to the gifting tradition, and that the sector parties should be prepared for this in advance.

## **GİRİŞ**

Günümüzde harcama, var olan yapıya karşı çıkma ve kendi zenginliğini karşıdakine anlatmada kullanılan önemli bir eylemdir. Çünkü birey her şeyin yeniden üretildiği ve çabucak tüketildiği bir dünyada kendini ancak yaptığı tüketim eylemiyle ifade etmekte ve tanımlamakta; güç ya da iktidara ancak harcama yapılarak erişilmektedir. Dolayısıyla modern anlayışa göre “sahip olmak” bireyi özgürleştirmektedir. Ancak her şeye ya da en iyisine sürekli sahip olma ihtiyacı bireyi metalar dünyasına hapsedmekte ve onu kölesi haline getirmektedir. Hyde'nin de dediği gibi bugünün dünyasında hediyein doğal yapısında olan “kendiliğindenlik” kuralının “zorunluluk” haline dönüşmesi, farklı bir hediye anlayışının ortaya çıkmasında bunun etkisi göstermektedir. Dolayısıyla almak, vermek ve tekrardan vermek toplumsal ve ekonomik yaşamın devamlılığında önemli bir role sahip olmuştur. Bununla birlikte arkaik toplumlardan modern toplumlara kadar geçen süre içerisinde hediye kavramının içeriksel açıdan değişime uğradığı dikkat çekmektedir. Öyle ki hediye ilişkilerinde ideal olan verilen armağan karşılığında bir şey verme zorunluluğunun olmamasına karşın, özellikle küreselleşmeyle ve dijitalleşmeyle birlikte hızla yayılan Anneler Günü, Babalar Günü, Sevgililer Günü ve Yılbaşı gibi Batı'ya özgü modern hediye geleneklerinin ve dijitalleşmenin “hediye” anlayışını önemli ölçüde etkilediği ve değiştirdiği gözlenmiştir. Bu açıdan çalışmanın amacı, öncelikle dijitalleşen dünyanın yeni tüketicilerini açıklamak ve ardından dijitalleşmenin hediyeleşme geleneğini nasıl etkilediği ve pazarlama iletişimi çalışmalarının bu alandaki rolü hakkında örnekler üzerinden değerlendirme yapmaktır.

## **DİJİTAL DÜNYANIN YENİ TÜKETİCİLERİ**

Tarihsel süreçte meydana gelen ekonomik, teknolojik ve sosyo-kültürel gelişmeler tüketici yapısında bir değişim yaşanmasına neden olmuştur. Markalar arasındaki rekabetin bugünkü kadar hissedilmediği dönemlerde “ne üretirsen satılır” anlayışı hakimdir ve satın alım kararlarında fizyolojik istekler ve gereksinimler temeldir. Burada tüketici ürünün fonksiyonel vaatlerine daha çok odaklanılmaktadır. Rekabetin yoğunlaşmaya başladığı Sanayi Devrimi ile ürünlerin fonksiyonel özelliklerinin hem rekabet söylemlerinde hem de tüketici nezdinde fark yaratmak için çok yeterli kalmadığı görülmüştür. Bu durum da, markaların tüketicileri ile psikolojik bağ kurmasına imkan verecek imaj, statü, kimlik gibi öğelerin iletişim çalışmalarında devreye girmesine yol açmıştır. Özellikle postmodern dönemde popüler kültür, gösterge ve hazcı tüketimin öne çıktığı görülmüştür. Öyle ki bu dönemde ürünlerin tüketimi yerini statü göstergelerinin tüketimine bırakmıştır. 2020 yılında başlayan Covid 19 süreci de küresel ölçekte çevrimiçi satın alma davranışlarını, ürünlerde sağlık ve hayatta kalma amaçlı ürünlere

yönelimi artırmıştır. Bununla birlikte işyerinin eve taşınması ile Zoom, Teams gibi online uygulamalar üzerinden dersler ve toplantıların yapıldığı görülmüştür. Bunun yanı sıra insanlarda sosyal medya, e-ticaret platformlarına ve çevrimiçi oyunlara yönelim ve abonelik esasına dayanan TV yayınlarına yönelim (Netflix gibi) artmıştır (Gedik ve Piro, 2022:147-149).2021 yılında Deloitte tarafından 14 ülkeyi kapsayan dijital tüketici trendleri araştırmasında yeni tüketicilerin hayatla bağımlı elektronik cihazlar üzerinden kurduğu, akıllı saat ve fitness bilekliklerine rağbet ettikleri, hızlı internet ve 5G'yi talep ettikleri belirtilmiştir. Türk tüketicilerin ise akıllı TV, robot süpürge ve akıllı ev aletlerine yönelik taleplerinin global ortalamanın üstünde olduğu kaydedilmiştir. Globalde en çok sahip olunan elektronik cihazlar ise sırayla akıllı telefon, diz üstü bilgisayar ve kablosuz kulaklıklar olarak sıralanmaktadır. Tüm akıllı nesne kategorisinde 25-34 yaş grubu katılımcıların en yüksek sahiplik ve erişim oranına sahip olduğu gözlemlenmektedir. Bununla birlikte pandemi öncesi ile global ölçekte karşılaştırıldığında Türk tüketicisinin daha çok TV izlediği ve sosyal medya kullanmaya başladığı, çevrimiçi bankacılık işlemlerinin pandemi sonrası arttığı, dolayısıyla bu evreden itibaren Türkiye’de tüketicilerin dijital alışkanlıklarının değiştiği belirtilmiştir. Katılımcıların ödeme yaptıkları hizmetler ve abonelikler değerlendirildiğinde ise ilk sırayı müzik yayın hizmetleri alırken, onu bulut tabanlı depolama araçları ve oyun hizmetlerinin aldığı gözlemlenmiştir (Önder, 2022).Son dönemlerde ise görsel odaklı kültürün popülerlik kazanmasıyla çevrimiçi sohbetlerde milenyum tüketiciler için görselliğin kayda değer bir yere sahip olduğu vurgulanmıştır. Lee bu durumu bugün “Görseller sözcüklerden daha yüksek sesle bağırılmaktadır.” Şeklinde ifade etmiştir (Lee vd.2015:552). Pek çok uygulamacı ve akademisyenin ise marka iletişimde görsel paylaşımların değerini ve müşteri katılımı üzerindeki pozitif etkisini vurguladığı ileri sürülmüştür (Kim vd., 2022:2371).

### **HEDİYE EKONOMİSİ**

Hediye alıp verme geleneğinde tüketiciler, kendileri için özenle seçilmiş ve dikkatlice paketlenmiş eşsiz bir hediyeye sahip olurlar. Bu hediyeler mağazalarda satılan ürünler olabileceği gibi, ev yapımı mallar ve hizmetler de olabilir (Solomon, 2006:552-553).Hediye alıp vermeye ekonomik bir değişim biçimi olarak bakan araştırmacılar, vericinin bu hediyeye artı bir değer kattığını ve alıcının da bu değerden etkilendiğini ortaya koymaktadırlar. Bununla birlikte hediye alıp verme, sembolik bir değişimi de içine almaktadır. Bu doğrultuda hediyeyi veren kişi, hediyeyi verdiği kişiye aslında elle tutulamayan bir anlam sunmaktadır. Bazı araştırmalarda ise hediye alıp verme, sosyal bir anlatım biçimi olarak ifade edilir. Buna göre, bir ilişkinin ilk evresinde hediye daha çok araçsal bir özellik taşımaktadır. İlişkinin gelişme

evresinde ise, hediye fedakârlık anlamına gelebilmektedir. Bugünün dünyasında ise hediye alıp vermede bir bireyin diğer bireyler üzerinde hediyein karşılığını verme konusunda baskı yarattığı gözlenmiştir. Buna göre hediye, bireylerarası ilişkileri etkileyebilme gücüne sahiptir (Solomon, 2006:552-553).Diğer taraftan hediye seremonilerine geleneksel topluluklardan itibaren bütün insan ilişkilerinde rastlanılmaktadır. Hediye seremonileri sembolik toplumsal ilişkilerin belki de en açık biçimde gözlemlendiği alışverişlere konu olması nedeniyle başka bir önem kazanmaktadır. Hediye kavramı, sosyal, ekonomik, politik, dini tapınmalar gereği vb. işlevleri olan, oldukça karmaşık bir yapıya sahiptir (Kar, 2005:63).Hediye değişimi ile ilgili aslında farklı yaklaşımlar bulunmaktadır. Klasik antropoloji yazarları hediye değişiminde toplumun, kültürün devamlılığı ve varoluşunda hediye alıp vermenin önemli bir işlevi yerine getirmiş olduğunu vurgulamaktadırlar (Komter, 1996:8).Bu yazarlar, hediye alışverişinde insanların karşılıklı hislerinin nasıl olduğu konusunda bazı örnekler vermişlerdir. Sosyologlar, hediye vermenin toplumsal fonksiyonlarını anlamada önemli kuramsal önerilerde bulunmuşlar ve konuyu “bağlılık”, “minnettarlık” ve “karşılıklık” gibi kavramlarla açıklamaya çalışmışlardır (Komter, 1996:8).Yine antropolog ve sosyologlar verilen hediyeye karşılık vermenin bir zorunluluk olması konusunda ilgilenmişlerdir. Buna göre, bireyler toplumda varlığını sürdürebilmek veya topluma uyum gösterebilmek için verilen hediyeye bir karşılık vermeye kendilerini zorunlu hissetmektedirler (Komter, 1996:8).Hediye aynı zamanda güç gibi sembolik anlamlarla örtüşen boyutlara sahiptir. Bu noktada ise hediye, söz konusu temel duyguların ifade edilme aracıdır. Onların hediyeye yükledikleri bu anlam, düzenli bir toplum içinde onlara öngörülen rolleri hakkında bilgi vermektedir. Hediye verme, kültürlerde yaygın bir fonksiyon olarak görülür. Diğer yandan ise hediye verme diğer insanlarla etkileşim kurmayı sağlayan sembolik bir etkileşim aracıdır. Burada hediye vermenin sembolik yaklaşımları üzerinde durulmakta ve yaratılmış bir aktivite olarak hediyeleşme bireyler arasındaki bağları pekiştiren bir niteliğe bürünmektedir (Komter, 1996:10).Hediye, en klasik anlamıyla gönüllü olarak bir kişiden ya da bir gruptan bir başkasına verilen mal ya da hizmettir. Bu yönüyle hediye, bir alan ve bir verenden olmak üzere iki taraf arasında gerçekleşen bir ilişkidir. Hediyein anlamı, onun fiziksel özelliklerinde değil, veren ile alan arasındaki ilişkilerde ve sunulmuş biçimlerinde yatmaktadır (Kar, 2005:63)Dolayısıyla hediyein tanımı ve işlevleri dikkate alındığında, toplumsal ilişkilerin doğasından gelen bir takım karşıtlıkları içerdiği ortaya çıkmaktadır (Kar, 2005:64);

- **Kendiliğindenlik- Zorunluluk:** Hediye ister geleneklere uygun davranmak ya da dini inançlar gereği, isterse de sosyal ilişkiler geliştirmek veya rasyonel hesaplar adına

verilsin, veren kişinin gönüllülüğünü gerektirmektedir. Bu açıdan her armağanın kendisini kurallardan bağımsız kılan ve sadece iradi bir olgu olarak yaşanmasını sağlayacak kendiliğindenlik ögesini içermesi şarttır (Godbout,148). Buna karşın, armağanın verilme amacına bağlı olarak bir beklentiye eşlik ettiği alan ve veren kişilerin açıklayamadığı ya da açıklamak istemediği bir tür zorunluluk duygusu yarattığı da bir gerçektir. Modern armağan ilişkilerinde kısmen kendiliğindenlik olgusunun ağır bastığı söylenebilir (Kar, 2005:64).

- **Çıkar Gözetmezlik –Karşılık Bekleme:** Karşılıksız hediye yoksa da, hediye hesap yapılmadan verilmesi kabul gören bir davranıştır. Bu koşula rağmen, hediye verenin dile getirmediği ancak, öyle ya da böyle karşılığında bir beklentisinin de olduğu yadsınamaz.

Marcel Mauss, döneminin tabiriyle ilkel toplumlarda, yani pazar ekonomisi ilişkisinin ve meta düzeninin izinin rastlanmadığı toplumlarda, toplumsal ilişkinin temelinde hediye ilişkisinin yattığını belirtmektedir. Marx'ın "nakit para ile ödeme sistemi olarak tanımladığı" meta düzeninde, toplumsal ilişkinin temel aracı paradır. Metanın fiyatı vardır. Değişim bu fiyata göre yapılır. Mal ve hizmet satın alındığında, karşılığında fiyatı neyse ödenir ve ilişki biter. Kapitalizm düzeninde, sermaye birikimi ve meta ilişkisi, toplumsal düzenin sinir sistemini oluşturmaktadır. Bu düzende insanlar arası ilişki, mal ve hizmet değişiminin aracıdır. İnsanın meta değişiminin aracı olma konumu, gerçekte hiçbir zaman tam olarak gerçekleşmese de, modern toplum varoluşunu bu şekilde tasarlamaktadır (Godbout, 2003:10). Bununla birlikte meta toplumunun başlıca simgesi "meta"dır. Bu çerçevede insanlar da metalaşmaktadır. Varoluş anlamlarını, diğerleriyle ilişkilerini sermaye ve metanın dilinden ifade etmektedirler. Hediye ekonomisi dolayısıyla alınan ve verilenin, karşılıklı bir eşitlik içinde düşünülmediği, katı kuralları olan ancak ucu açık bir ilişki düzenidir. Verilenin karşılığı alındığında onu alanın yeniden aynı kişiyle ya da başka bir kişiyle maddi ya da simgesel bir değişim ilişkisi içinde bulunacağını taraflar bilmektedir. Almak, geri vermek ve tekrardan vermek zorunluluğu, aslında toplumsal ilişki için gerekli görülmektedir. Bu sadece cömertlik değil, aynı zamanda güç, yarışma, diğerine üstün çıkma amaçları da taşıyan, onur ve saygınlık arayışının can verdiği çatışma ve uzlaşmayı, gönüllülük ve zorunluluğu, toplumsal beraberliği ve kişisel stratejiyi birlikte var etmektedir (Godbout, 2003:11). Hediye verme davranışı ile ilgili modellere bakıldığında karar süreci açısından en kapsamlı modelin Bank (1979) ve Sherry (1983) tarafından geliştirilen tüketim ve tüketim sonrası satın alma davranışını içeren; satın alma, etkileşim (ya da değişim ), tüketim ve iletişimden oluşan dört aşamalı model olduğu ileri

sürülür. Bu, tüketici davranışı modellerine çok benzeyen bir model olarak dikkat çekmektedir (Clarke, 2008:531-532).

Hediyeleşme, Hollenbeck vd'ne göre (2006:573) onaylanmış sosyal bir eylem ve sosyal etkileşim yaratan, markalar açısından tüketicilerin önemli olduğunu göstermenin bir yoludur ve daha güçlü bir marka-müşteri ilişkisi oluşturulmasına yardımcı olmaktadır. İşletmeler tarafından tüketicilerine sunulan hediyeler özellikle dijital mecralar aracılığı ile daha kolay ve etkili şekilde aktarılabilir. Bu bağlamda B2C hediyeleşmenin son zamanlarda kritik bir pazarlama stratejisi olduğu belirtilmektedir. İşletme perspektifinden markaların hediye vermesi karşılıklılık teorisine dayanmaktadır. Hediye vermek, alıcıları iyiliğe karşılık vermeye motive etmektedir. Bu süreçte sosyal medya uygun bir iletişim aracıdır. Diğer bir deyişle, marka ve işletmelerle tüketicileri arasında sosyal bağları ve etkileşimi geliştirmeye yardımcı olmakta; işletmelere karşı daha olumlu bir algı yaratmayı sağlamaktadır (Hollenbeck, 2006:2371). Romele ve Severo 2016 yılında yaptıkları bilimsel bir çalışmada ise, çevrimiçi sosyal medyadaki hediye değişim değerini tartışmışlardır. Buna göre hediyeleşme klasik Pazar ekonomisine alternatif bir alan olarak değerlendirilmiştir. Bugün artık hediyeleşme artık sadece somut ürün değişimi ve karşılıklılık ile ilgili bir şey demek değildir, Dijital hediyeleşmede “topluluk” ve “iletişim” kavramları arasında çok güçlü bir bağ vardır. İnternet ise iletişim ve topluluğun bir araya gelmesini sağlayan en açık kanıttır. İnternetteki topluluklar internet temelli bir iletişim yapısında yorumlar, etiketlemeler, beğenmeler vb. ile sembolik bir değişim sağlamaktadır ve bu iletişim topluluk odaklıdır. Buna göre internet üzerindeki hediyeleşme aslında anti-ekonomik bir eylemdir. Sosyal medya platformlarında hediyeleşme ise örneğin Facebook'ta “Beğenme”, Twitter'da ise “Söz Etme” butonu ile sağlanabilmektedir. O nedenle burada “Beğenme Ekonomisi (Like Economy)” diye yeni bir terimin de karşımıza çıktığı vurgulanmaktadır (Romele, ve Severo, 2016: 43-44). Dijital hediyeleşmenin ise literatürde tarihsel olarak 1990 ve 2000'ler arasında büyüdüğü ve kapitalist ekonomi hegemonyasının sonunu getirdiği ileri sürülmüştür (Romele ve Severo, 2016:46). Yine burada çevrimiçi hediyeleşmede hediye ritüel sunumu zayıftır ve hediye veren ya da bağışçıların veya alıcıların isimleri anonim olabilmektedir. Yine sosyal medya ortamındaki hediyeleşmenin sosyal bağların korunmasına, sanal kimliklerin oluşmasına ve katılımcıların sürekli varlığını sağlamaya hizmet etmektedirler. Yine dijital hediyeleşmenin emtia formunun içine dahil edildiği ve doğrudan kar elde etmek amacıyla kullanıldığı; bu bağlamda da dijital hediyeleşmenin ideolojiyi meşrulaştırma işlevi gördüğü ifade edilmektedir. Özetle dijital hediyeleşme sosyal

bağ yaratma ve inşa etmek amaçlı yazılı ve sembolik etkileşimdir (Romele, ve Severo, 2016: 47-52).

Aynı şekilde tek Tanrılı dinlerde de hediye ekonomisi; bağışta bulunmak, zekat vermek gibi uygulamalarla sürdürülmektedir. Bununla birlikte kapitalizmin gelişmesi ile zengin burjuva sınıfı zenginliklerini bankalarda saklar hale gelmiştir (Akay, 1999:14). Küçük burjuvalar ve orta sınıf, bu tip harcama biçimlerini yok eden bir tavra bürünmüştür. Çünkü kapitalist zihniyet içinde buna imkan verilmemektedir. Burada zenginlerin harcamaları “harcama ekonomisinin” oluşmasında etkili olmuştur (Akay 1999:14).18.yy’ın kapitalist ekonomisinde ise Werner Sombart’a göre, 18. yy sonunda artık Batı toplumlarında devasa boyutlara ulaşmış bir lüks tüketimden bahsetmek mümkündür. Lüks çılgınlık ve aşırılıkla ilişkilendirilmekte; harcamayı yapmanı tüketmeye doğru sürüklenmektedir (Akay, 1999:15).Ekonominin temeli bu harcama ile gelişmekte ve bu şekilde de harcama eylemi, harcamayı rahat bırakan ruhları memnun etmekte, lanetlemeyi engellemektedir. Bu açıdan bakıldığında, harcama yapmak için üretilmekte ve ürün elde edilmektedir (Akay, 1999:10). Aslında hediyeleşme geleneği, toplumsal duyguları birleştirerek güçlendirebilmektedir. Ancak yine de görece bir konu olsa da hediyeleşmenin altında metaryalist anlamın, sembolik anlamdan daha önemli olduğu dile getirilmektedir (Takayama, 2001:138). Bu noktada hediyein işlevleri ve modern hediyelerden söz etmek önemlidir.

### **Hediyein İşlevleri ve Modern Hediyeler**

Hediye vermenin sosyal, ekonomik ve tarafları yansıtmak gibi bazı işlevleri olduğu gözlenmektedir. Bunları şu şekilde detaylandırmak mümkündür:

•**Sosyal İşlevi:** Hediyein sosyal işlevleri üzerinde çalışanlar, onun toplumsal ağların kurulmasını sağlayan yollardan biri olduğunu belirtmektedirler. Bu açıdan hediye, yeni ilişkilerin kurulmasına, var olan ilişkilerin sürdürülmesine, dönüştürülmesine ya da kesilmesine aracılık etmektedir (Larsen ve Watson, 2001: 889-906). Hediyein sosyal sınırları birleştirmek, yeni bir gruba entegrasyon, sosyal farklılığı biçimlendirmek ve yansıtmak için de kullanıldığı gözlenir (Kar, 2005:65). Bir hediyein değeri kısmen ilişkinin ağırlığını yansıtırken, ilişkinin değişken doğası da hediyein değerinde yansıtılmaktadır. Yine hediyein çok fazla büyük veya tersine küçük olması ya da zamanından geç verilmesinin de ilişkilerin zedelenmesine yola açabileceği kaydedilmiştir. Hediyein ayrıca insanlar arasında hissedilmeden iyi niyet bağları ve sosyal ilişkileri kurma gibi sosyal rolleri mevcuttur (Kar, 2005:65).

•**Ekonomik İşlevi:** Hediye verilen kişi maddi olarak kazançlı bir duruma gelmiş gibi görülmektedir. Hediye ilişkilerinde ideal olan, verilen hediye için karşılığında bir şey verme zorunluluğu yaratmamasıdır. Ancak uygulamada verilen hediyeye karşılık almak baskısı, karşılıklı alışverişin diğer biçimlerinden daha fazla hissedilmektedir. Hediyeyi alan kişi, karşı tarafa karşı mahçubiyet yaşamamak için aldığı hediyeye karşılık vermektedir. Alınan hediyeye uygun bir karşılık verilmezse asimetrik ilişkiler doğabilmektedir (Kar, 2005:65). Ayrıca hediye için maliyet hesabı ancak, ona harcanan zaman ve para açısından ölçülürse taraflar arasında anlamlı hale gelmektedir. Çünkü, hediye değişimi yapan taraflar ilişkilerini arzu ettikleri mesafede tutabilmek için hediyeleri kullanabilmektedir (Kar, 2005: 66).

•**Armağan Veren ve Alan Tarafları Yansıtma İşlevi:** Hediye, alan ve veren kişilerin birbirlerinin kimliklerini nasıl algıladıklarını da yansıtmaktadır. Kişinin kendi kimliği, başkalarına aldığı armağanların formunda nesnelleşir ya da armağanın gösterişçi sunuluş şekli, veren kişinin kimliğinin karşı tarafça onaylanmasını sağlayabilmektedir. Buna göre hediye hem alan hem de onu veren kişinin kimliğini yansıtan semboller taşımaktadır (Kar, 2005: 66-67). Arkaik hediye, gruplar arasında elden ele dolaşmaktadır. Modern hediye ise doğal alanı mahremdir ve çoğu zaman bireyler arasındadır. Modern hediye her bireye, çalıştığı yerdeki ya da sıklıkla yerine başkasının geçebileceği bir rolü yerine getirdiği ticaret ilişkilerinde olanın aksine kendisinin bu kişisel ağda özel olduğunu, kendisinin özel varlıklardan oluşan bir ağda var olduğunu hatırlatmalıdır. Dolayısıyla hediye için ilkesi, önceden düşünülmemiş olanı, ele avuca sığmayan, kim bilir nereden gelen, özdeş yeniden üretim zincirini kıran, simgesi montaj bandı değil, doğum olan fazladan bir şeyi cisimleştirmektir (Godbout, 2003:214-215). Bununla birlikte hediye ile başka bir şeyin daha açığa çıktığı gözlenir: Çok büyük ihtiyaç duyduğumuz bir iyilik. Bir alıcıya sunulan her modern hediye, bu kişiyi toplumdaki bireyselleştirmeye hizmet eder ve yoksa arkaik hediye gibi, kişinin toplum içindeki bireyselleşmesini pekiştirmez. Bu noktada toplumsal ağ, özel bireyleri bir araya getirmekte ve hediye bu özel bireyleri birbirine bağlayan yörüngeleri, yolları çizmekte ve sürdürmektedir (Godbout, 2003:215). Diğer taraftan “ Hediye vermenin zamanı yoktur, her an hediye verebilirsiniz, yeter ki yaratıcı olun” sloganı, hediyelik eşya sektörünü, dünyanın en gelir getiren iktisadi alanlarından biri haline getirmiştir. Bu sektörde çalışanlar, “kimin, ne zaman, hangi hediyeyi, hangi anlamlarla / hatta hangi sözlerle” verileceğini belirler hale gelmişlerdir. Bu kapsamda hediye profesyonelleri, önce “anlamı”, daha sonra da bu anlamın sembolü olan ürünü yaratarak ve pazarlayarak / tükettirerek verimliliği ve karlılığı yüksek sektörlerini yaratmışlardır.”(Sakarya, 2006:131). Dolayısıyla hediye için sahip olduğu bu anlamsal değer ve bu değerinin aktarımının hediye

sektörünün gelişiminde kayda değer bir yere sahip olduğu söylenebilir. Kültürel hayatımıza küreselleşmeyle beraber giren gelenek dışı özel günler ise son derece fazladır. Ancak halk arasında kabul görenlerin ve kutlanan günlerin sayısı ise oldukça azdır. Buna göre kültürel bakımdan tek türleşmeden bahsetmek mümkündür. “Bizde olanı dünyaya vermek, başkasında olanı almak” olarak basit bir şekilde tanımlanan küreselleşmeye, özel günler bakımından baktığımızda sadece başkasında olanı alma konusu ile sınırlı kaldığımız (23 Nisan Çocuk Bayramı dışında) kaçınılmaz bir gerçektir. Burada önemli olan, gelenek dışından kendi kültürümüze giren bu günlerin kendi geleneklerimize göre kutlanabilirlik ölçütüdür. Eğer bu günler diğer kültürlerde kutlandığı şekilde kutlanıyor ve kendi kültürümüzden hiçbir şey katmıyor olsaydık bu özel günlerin bu kadar süre kutlanıyor olması mümkün olmazdı (Sakarya, 2006:132). Bu noktada ise ilgili sektörün dünya genelinde devamlılığını sağlamada küreselleşmenin getirdiği yeni özel günlerin de önemli bir gücü olduğu söylenebilir. Zira özellikle bugünün dijital kanalları, sosyal medya hesapları ve influencerların yönlendirme gücü ile Türkiye özelinde “Bekarlığa Veda”, “Baby Shower”, “Bebeğin Cinsiyetini Duyurma” gibi popüler etkinliklerin de hediye ekonomisi açısından önemli bir güce sahip olduğu belirtilebilir. Modern hediyeleşme geleneğinin geleneksel hediyeleşme geleneklerinden daha yaygın olarak kutlanmasının en önemli nedeni de kent kökenli hediyeleşme geleneğinin “duygusal ve zihinsel alt yapısının” kitle iletişim araçları ve pazarlama iletişimi çalışmaları ile hazırlanıyor oluşudur. Bu bağlamda kitle iletişim araçlarındaki yayınlarda kent yaşamı kökenli özel günlerde hangi hediyelerin, kime ne zaman alınması gerektiği ve ne şekilde sunulması gerektiği ayrıntılarıyla benimsenilmeye çalışılmaktadır. Günümüz köylerinde yaşayan kişilerin sevgililer gününü kutlama gereği duymalarının nedeni de, yine kitle iletişim araçlarının etkisiyle oluşmaktadır (Sakarya, 2006: 132).

### **Dijitalleşen Hediye Kültürü ve Pazarlama İletişimi Çalışmalarının Önemi**

İletişim ve pazarlama literatüründe hediyeleşmenin evriminde üç paradigmaya odaklanan holistik bir perspektif vardır. Bunlardan ilki, fiziki ürünlerin değişiminde yer alan ekonomik değişim modelidir. Burada satın alma kararı ve değişimde geleneksel yüz yüze iletişim mekanizması vardır ve hediyeleşmede sosyal ilişkilerde “karşılıklılık” prensibi vurgulanmaktadır. İkinci paradigma, ilişkileri yeniden düzenlemek için bir araç olarak hediye vermenin ilişki modeline dayanmaktadır. Sherry tarafından 1983 yılında ortaya konan bu paradigmada, ekonomik ve sosyal alışverişin önemsizleştirildiği belirtilir. Burada hediye veren, bağışçı ve diğerlerini içeren belirli ilişki etkileşimleri önemlidir. Üçüncü paradigma ise dijital hediye ağlarına ve canlı yayın mekanizmaları ile süreci kolaylaştıran topluluk odaklı

hediyeleşme modeline dayanmaktadır. Bu paradigmada hediye verenler ve bağışçılar sosyal ağlardaki hediyeleşme topluluklarına katılırlar. Bu topluluklar içinde hediyelerin deęiş-tokuş edilme sirkülasyonu vardır. Özetle buradaki hediyeleşme sadece hediyeyi alan ve veren arasında kalmaz, topluluk üyeleri arasında da paylaşılır. Bu sosyal ağlar topluluğun deęer ve normlarını yansıttığı için hediye verenin davranışlarında önemli bir role sahiptir (Chen, 2021:867).

Hediyeleşmek teknolojinin etkilediğı insan ilişkilerinin temel bir parçasıdır. İnternet teknolojisi uzak mesafelerde olan insanların son dakikada birbirlerine hediye alıp vermesini sağlamıştır. Sosyal medya ortamında çevrimiçi hediye vermenin nasıl hızla yaygınlaştığını anlamak bu anlamda önemlidir Bununla birlikte internet hediyeleşmedeki sosyal normları deęiştirmiş, hediye kartlarına eğilimi artırmıştır. Bu noktada çevrimiçi ortamda hediye almak ve paylaşmak uygulamada yaygınlaşmıştır. Örneğin arkadaşların doğum günü için Amazon birçok sayıda sosyal özelliğı, dilek listelerini hediye kartlarına entegre etmiştir. Yine Apple'ın iTunes mağazası hediye kartı alma ya da hediye özellikli albümler, film ve uygulamalar alma gibi işlemleri mümkün kılmıştır. Starbucks müşterilerine “1 Kahve Tweetleyerek” arkadaşınıza kahve hediye etmenizi sağlarken; popüler mesajlaşma uygulaması Line ve WeChat ise çevrimiçi hediyeleşmeye imkan vermiştir. Bununla birlikte çevrimiçi ortamda iTunes, Starbucks gibi elektronik hediye kartları ve çiçek /çikolata gibi fiziksel hediyelerin internet ortamında alınması gibi durumlar kullanıcıların kredi kartını kullanabilmesi için 18 yaşı ve üzeri olmasını gerekli kılmaktadır. Ayrıca hediye alan için hediyeyi gönderen hediye ile birlikte özel bir mesaj da gönderme şansına sahip olabilmektedir. Hediyeyi alan da sosyal medya üzerinden aldığı hediyeleri (fotoğrafını çekerek ve yorum yaparak ) dięer arkadaşları ile paylaşabilmektedir (Kizilcec vd., 2018).Hediyeleşmek katılımı içine alan bir süreçtir ve her yıl yeni trendler ve uygulamalarla karşımıza çıkmaktadır. Dijital hediye pazarı hızla büyürken, bu pazarın 2023 yılına kadar 1.101 milyar dolara ulaşacağı öngörülmüştür. Hediye kartları dijital ortamda (mail aracılığı ile) verilebilirken, aynı zamanda somut bir hediye kartı şeklinde de kişilere verilebilmektedir. İlk olarak dijital kartlar hediye ilişkisinde yeni bir buluştur ve fiziki somut kartların dijital karşılığıdır. Bu kartların kullanım süresi normal hediye kartlarına göre daha uzundur. İkinci olarak dijital hediye kartları fiziksel hediye kartlarından daha az kuralcıdır. Dijital kartların kullanımı için ayrıca daha az zaman ve çaba harcarsınız. Yine fiziksel hediye kartlarını birine hediye almak istediğinizde son dakika alamazsınız. Oysa dijital hediye kartlarını alabilirsiniz. Yine dijital hediye kartları fiziksel hediye kartlarına göre daha yaygın kullanılmaktadır. Fiziki hediye kartlarında sahiplenme duygusu daha yüksek olsa da, dijital

hediyeler kartlarının kullanımını daha kolay kaybetmesi ise daha zordur (Reshadi, Givi ve Das, 2022:970-972).

Bu bağlamda dijital hediyelerleşmenin pazarlama iletişimi çalışmalarını açısından faydalarını şu şekilde sıralamak mümkündür (Gu, 2023):

- **Elde Etme Kolaylığı ve Esneklik:** Dijital hediyelerleşme geleneğinin yükselmesindeki öncelikli nedenlerden biri elde etme kolaylığı ve esnekliktir. Dijital hediye kartlarının fiziksel dağıtım ihtiyacını elemine etmiş, tüketicilere hediye alma ve verme konusunda e-posta ya da mobil platformlara yerine bırakmıştır. Ayrıca dijital hediye alışverişinin son dakika alışverişi yapan tüketicileri ve aralarında uzak mesafe olan tüketiciler için de çekici geldiği görülmüştür.
- **Kişiselleştirme:** Dijital hediye kartları hem alıcıların hem de verici tarafın hediye deneyimlerini kişiselleştirmeye imkan vermektedir. Bu doğrultuda perakendeciler müşterileri için hediyelere kişisel mesajlar ekleme, çeşitli tasarım şablonları seçme ve hatta fotoğraf ya da video gibi dijital öğeler ekleme imkanı sunmaktadır. Kişiselleştirmenin seviyesi ise alıcı ve verici arasındaki duygusal bağlantıyı güçlü kılmakta, bu özellik de hediyelerleşmeyi daha anlamlı ve unutulmaz kılmaktadır (Gu, 2023).
- **Bütüncül Kanal Yaklaşımı:** Dijital hediyelerleşmenin yükselmesi perakende markalarının çevrimiçi ve çevrimdışı kanalların birlikte kullanımını benimseyen bütüncül kanal yaklaşımını özümsemelerine yol açmıştır.
- **Kusursuz Deneyimlerin Paraya Çevrilmesi:** Dijital hediye kartlarının mobil cüzdan ve ödeme platformları ile sağlanması, bu hediye kartlarının kolaylıkla çevrimiçi alanda ve mağazada kullanılabilmesine imkan vermektedir. Barkod ya da karekod entegrasyonu gibi inovatif teknolojiler de hediye kartlarını paraya çevirme süreçlerinde kullanılmaktadır.
- **Veri Yönelimli İlgörüler:** Hediyelerleşmenin dijitalleşmesi, müşterilerle ilgili çok değerli verileri eşsiz şekilde biraraya getirme fırsatı sunmaktadır. Hediye kartı satın alma ve tercih etme davranışlarının çevrimiçi alanda takip edilmesi bu verinin elde edilmesi, kişisel seçeneklerin sunulması, pazarlama kampanyasının biçimlendirilmesi ve müşteri sadakatinin yönetilmesi ve bu alandaki gelirin büyümesinde etkilidir.
- **Müşteri Katılımının Sağlanması:** Dijital hediyelerleşme perakende markaları ve tüketicileri arasındaki bağı güçlendirmekte ve uzun soluklu bir marka-tüketici ilişkisi

sağlayabilmektedir. Burada özellikle dijital platformların perakendecilere dengeli şekilde takip etme, satın alma tarihi, ekstra promosyonlar gibi ek değerli hizmetler sağlayabilmektedir. Dolayısıyla müşteri merkezli stratejiler ve veri yönelimli içgörülerin gücü müşterilerin farklı istek ve gereksinimlerinin karşılanmasını sağlamaktadır. Bu bağlamda hediyeleşmede dijitali benimsenin, sürekli değişen ve gelişen bir sektörde başarılı olmak isteyen perakendeciler için artık bir seçenek değil, bir zorunluluk olduğu vurgulanmaktadır (Gu, 2023).

Andrew Wernick ise, reklam sektörünün toplumsal yeniden üretim ve denetim süreçleriyle olan ilişkilerini incelediği “Promosyon Kültürü” adlı yapıtında, reklamın dolayimsız ekonomik yönüyle, hedef alınan toplumun değerleri, normları, amaçları ve isteklerinin karşılaştırılmasının gerekli olduğuna işaret etmektedir. Buna bağlı olarak Wernick’e göre reklamlar yalnızca metayı bir anlamla ilişkilendirecek etkili resimler ve sözlü araçlarla sunmamalı, aynı zamanda anlamı anlaşılmiş kültürel kodun unsurları üzerine kurmalıdır. Dolayısıyla reklamın unsurları, kültürel unsurlara belli imajlar yükleyerek ortaya çıkmakta ve bir sembol haline dönüştürülmekte, metalaşmış sembol ise bir promosyon işlevi görmektedir (Uyanık, 2006:79-80).2019 Covid-19 salgını bireylerin hayatını ve alışveriş davranışını “yeni normal” olarak değiştirmiştir. 2021 Küresel Tüketici İçgörülerini Araştırmaları’na göre yeni normal süreçte sosyal ve fiziksel aktivitelere yapılan harcamaların %49 oranında azaldığı kaydedilmiştir. Aynı zamanda ürün / hediye satın alımlarının %45’inin mobil, %41’inin bilgisayar, %33’ünün de tabletler üzerinde olduğu ve çevrimiçi hediyeleşme oranının arttığını ve hediye satın alma durumlarının değiştiğini ortaya koymuştur. Hediyeleşme alanındaki dijitalleşmenin tüketicilerin ihtiyaçlarını daha çok karşılamakta ve çevrimiçi hediyeleşme pazarının da büyümesine fırsat vermiştir. Burada özellikle etkileşimli bilgi alışverişi çevrimiçi platformlarda popüler markaları bulmayı da kolaylaştırmıştır. Özellikle çevrimiçi ortamda popüler olan markaların hediye olarak seçilmesi de mümkün hale gelmiştir. Buna göre hediye alan kişi popüler bir hediye seçtiğinde bunun diğer süperstar hediyelerden olup olmadığını değerlendirme imkanı vermektedir. Buna göre özellikle dijital ortamda insan markaları (ünlüler ve influencerların) e-pazarlama çalışmaları üzerinden hedef kitleleri yönlendirme gücüne sahiptirler. Etkileyicilerin bu gücü dolayısıyla hediye pazarındaki uzmanların dikkate aldıkları önemli bir konudur. Medyada popüler olma konusu geleneksel yayıncılık dönemindeki geleneksel reklamlar aracılığı ile sağlanırken; bugünün dünyasında medyada popüler olma konusu YouTube, Instagram ve Facebook gibi sosyal medya mecralarındaki popülerliğe dönüşmüştür. Hediye pazarlama uzmanları medya reklamlarını özellikle tüketiciler arasında

hediyenin satın alınmasını teşvik etme, markaya yönelik pozitif bir tutum yaratma ve hediyeye yönelik bir talep yaratmak amacıyla kullanılmaktadırlar. Burada özellikle deneyimsel hediye olarak ifade edilen bir gece otel konaklaması, bedava yemek pişirme atölyesi, akşam yemeği, konser gibi hediyelerin gençler arasında sosyal medya aracılığı ile de oldukça popüler hale geldiği belirtilmiştir (Chen, Wu ve Tai, 2022: 2199-2200). Parasal olmayan ve kâr amacı gütmeyen hediye alışverişini ifade eden hediye ekonomisi, hediyelerin karşılıklı ve zorunlu olarak değiş tokuş edildiği yer olarak tanımlanır (Mauss, 1990). Ancak dijital içeriğin hediye edilmesi çok az farklılık arz eder. İlk olarak, geleneksel ve çevrimiçi hediye verme arasındaki farklar üzerine yapılan çalışmalarda Skågeby (2010), çevrimiçi hediye verme ve geleneksel hediye vermenin farklı olduğunu vurgulamıştır. Geleneksel hediye vermede doğrudan birbirine sıkı sıkıya bağlı ve nispeten küçük "çevreler" içinde karşılıklı hediye verme söz konusudur; çevrimiçi hediye vermede ise tanımadığınız çok daha büyük ölçekte insanı bir araya getirme potansiyeli vardır. Dijital dünyada hediyeler ise her zaman bilinmeyen büyük bir gruba verilir, bu da karşılıklı yükümlülüğü daha az istenir (Kollock, 1999). İkinci olarak, hediye ekonomisinde hediye verme işlemine hediye verenin o nesneyi karşı taraf verince kaybetmesi eşlik eder. Ancak dijital hediyelerin soyut olma ve sonsuza kadar tekrarlanabilme özelliği vardır. Bununla birlikte dijital hediyeleşme geleneğinde kazanmak ve kaybetmek gibi kavramlar bulunmaz. Bu nedenle "Digi-Gratis (Ücretsiz Dijital) ekonomisi" (Booth, 2010) türetilmiştir. Ücretsiz Dijital Ekonomi terimi çağdaş medya ve kültür alanındaki Pazar ekonomileri ve hediyeleri arasında karşılıklı fayda ilişkisini anlatmak için kullanılan bir terim olmuştur (Jenkins, 2010). 2015'te Özeltürkay ve Bozyiğit tarafından yapılan araştırma ise konumuz açısından dikkat çekicidir. Y kuşağını bugünün pazar ortamında hediye vermeye iten güdüleri ortaya çıkarmak ve bu güdülerin medya araçlarındaki reklamlarla arasındaki ilişkiyi belirleme amacı taşınan araştırmada Y kuşağı üniversite öğrencilerini hediye vermeye iten deneyimsellik, zorunluluk ve pratiklik gibi 3 güdünün olduğu; onları dijital medya araçlarından kullanıcı blogları, haber siteleri, mobil uygulamalar, e-posta gibi dijital araçlarla gazete ve dergi mecralarının etkili olduğu tespit edilmiştir. Kullanıcı bloglarında kişilerin deneyimlerini aktarmaları, çeşitli ürün ve hizmetleri tanıtır tavsiye etmeleri bu genç kuşağın ilgisini yoğun olarak çekmektedir. Zorunluluk faktörü bakımından ise, öğrenciler kendilerini hediye vermeye zorunlu hissettikçe, mobil uygulamalar, özel şirket web siteleri, e-posta gibi dijital medya araçlarında ve dergide çıkan reklamların daha çok dikkatlerini çektiğini ifade etmişlerdir. Tüketicilerin kendilerini hediye vermeye zorunlu hissettikçe daha çok araştırma yapmaya yöneldikleri belirtilmiştir. Bu nedenle de, deneyimsellik güdüsünden farklı olarak burada özel

şirket web siteleriyle karşılaştığı düşünülmektedir. Pratiklik faktörü ile ne geleneksel ne de dijital medya araçlarında çıkan reklamlardan etkilenme arasında bir ilişki çıkmamıştır. İlişki çıkan her iki faktöre bakıldığında, dijital araçlardan mobil uygulamaların ve e-postanın, geleneksel medya araçlarından ise dergilerin, katılımcıların reklamlarından en çok etkilendikleri medya araçları olduğu anlaşılmaktadır. Bu nedenle, çeşitli mecralara reklam veren işletmelerin, özellikle hediye verme davranışlarının arttığı özel dönemlerde mobil uygulamalar, e-posta ve dergilere reklam vermesinin satışların artmasına yardım edeceği düşünülmektedir (Özeltürkay ve Bozyiğit, 2015: 287).

Dijital hediye kültüründe önemli gelişmelerden biri de canlı videoların hayatımıza girmesiyle gerçekleşmiştir. Buna göre özellikle Covid 19 salgını döneminde insanların eve kapanmasıyla küresel canlı video yayını akımı büyümüş, müşteriler sadece bu videoları izlemekle kalmamış; aynı zamanda yayıncılarla sanal hediyeleşme aracılığıyla etkileşim kurmuşlardır. Bu noktada sanal hediyeleşme aracılığı ile yayıncılarla etkileşim kurma işleme modelinin özellikle gelir sağlamada kritik bir ögesi olmuştur. Hsieh, Kunz ve Wu tarafından yapılan araştırmada ise toplu hediye verme ve yüz yüze müzakere teorisi perspektifinden, canlı video akımları üzerinden hediyeleşme davranışı incelenmiştir. Bu değerlendirmede sohbet (chat) odalarının rekabetçi alışveriş çevresi yarattığı ve kullanıcı üyelerdeki sanal hediye satın alma ve devamlılığı konusunda rekabet duygusunun artırıldığı sonucuna ulaşılmıştır. Burada ayrıca sanal hediye estetik ve sembolik tasarımının iyi olması, çekici olması gibi öğelere de dikkat edildiği vurgulanmıştır. Yine canlı video yayını akımlarında yayıncı karakterin çekici, imajı güçlü bir karakter olmasının da sanal hediye satın alımında yönlendirici bir özellik olduğu kaydedilmiştir. Ayrıca tekrar sanal hediye satın alımında yayıncıya duyulan bağlılığın da önemli olduğu belirtilmiştir (Hsieh, Kunz ve Wu, 2023).2021 yılında Chen tarafından yapılan başka bir bilimsel araştırmada ise “Canlı yayın akımlarındaki kişisel marka topluluklarında dijital hediyeleşme parasosyal ilişki” perspektifinden değerlendirilmeye çalışılmıştır. Sosyal devrim sosyal medya araçlarında pek çok yeni türü hayatımıza dahil etmiş, bu durum da gerçek zamanda dijital hediye ve izler kitleler arasında yeni aktarım mekanizmasının oluşmasına hizmet etmiştir. Buna göre dijital hediye bağış izleyicilerin favori akımcılardan ödüller almasına fırsat yaratırken, gerçek zamanda hem akımı yaratan, hem de onu takip edenler dikkat çeker olmuştur. Böylece video akımcıları kendi kişisel marka topluluklarında izleyicileri ile ilişkilerini yönetme ve kendilerini dijital ünlü olarak konumlayarak kendi markalarını yönetebilmektedirler. Bu konu bağlamındaki araştırmalarda ayrıca video akımı yaratan

fenomenle izleyicileri arasında parasosyal bir ilişki kurulduğu ileri sürülmüştür (865-866).2022 yılında Kim vd. tarafından yapılan bilimsel çalışmada B2C pazarındaki müşteriler üzerinde Instagram ve Snapchat gibi iki sosyal medya hesabında paylaşılan somut ve deneyimsel hediyeler açısından hediye türünün ve mesajın duygusal ya da bilgi odaklı olmasının nasıl etkilediği ortaya konmaya çalışılmıştır. Buna göre somut hediyelerin promosyonel çalışmalarının Instagram mecrasına kıyasla daha etkili olduğu; deneyimsel hediyelere yönelik promosyonel çalışmaların ise Instagram mecrasında Snapchat'e göre daha etkili olduğu kaydedilmiştir. Yine deneyimsel hediyelere yönelik promosyonel çalışmalarda duygusal mesaj çekiciliği kullanımının Instagram'da Snapchat'e göre daha etkili olduğu vurgulanmıştır. Somut hediyelere ilişkin promosyonel çalışmalarda ise bilişsel çekicilik kullanımının Snapchat üzerinde daha etkili olduğu sonucuna ulaşılmıştır (2369).Geleneksel olarak hediyein somut bir materyal olduğu görülmektedir. Hediye hediye veren tarafından alıcıya vermek üzere oluşturulan fiziki bir öge olarak değerlendirilmektedir. Fakat son yıllarda hediye alıp verme eğiliminin daha dijital hale geldiği ve hatta bazı hediyelerin de tamamen dijital olduğu ileri sürülmüştür (Hoelzl ve Faber,1).Bununla birlikte hediye alışverişinde alıcının isteğine uygun bir hediye seçme konusunda hediye verecek olanda sık sık bir endişe yaşandığı belirtilmektedir. Burada normal hediyeleşme evresinde uygun hediye bulma konusunun hediye verecek olan kişinin çok fazla zamanını alması konusu üzerinde durulmaktadır. Buna karşılık dijital hediyelerin hediye alacak kişinin arama ve hediye satın alma konusunda daha az zamanını aldığı vurgulanmaktadır. Bunun yanı sıra dijital ortamda alınan hediye, bu hediye alacak kişi üzerinde kendisine hediye alma konusunda çok ince düşünülmediği algısı da yaratabilmektedir. 200 katılımcı üzerinde yapılan bir çalışmada katılımcılara arkadaşları arasında özel bir kişi için onların boş zaman alanıyla ilgili hediye vermeleri söz konusu olsa hangisini düşündükleri sorulmuştur. Katılımcıların burada 6 aylık müzik üyeliği hakkı, ya doğum günü kartı gibi unsurlara yöneldikleri dikkat çekmiştir (Hoelzl ve Faber,1).

## **SONUÇ**

Arkaik dönemden dijital döneme uzanan yolculukta hediye özellikle bireyler arasındaki ilişkileri güçlendirmede önemli bir yere sahip olmuştur. Markalar bu gücü bugün hedef kitlenin takip ettiği mecralarda reklam aracılığı ile kullanmakta, bunun için de popüler olma yarışına girmektedirler. Bu popülerliğin sağlanmasında ise pazarlama iletişimi çalışmalarında fenomenlerin, influencerların ya da vlogger'ların kayda değer bir yeri olduğu görülmüştür. Bugünün dünyasında özellikle fenomen, influencer ya da vlogger'lar ile kendini özdeşleştiren kullanıcıların bu kişilere bağlılığı arttıkça ilgili taraflara gönderdikleri dijital hediyelerin de

yoğunluk kazandığı ifade edilmiştir. Dolayısıyla dijital mecralardaki bu kanaat önderlerinin dijital hediye kültürünün yaygınlaşmasında önemli bir yönlendirici güce sahip oldukları söylenebilir. Süreç içerisinde gönüllü olmadan, zorunluluğa doğru kayan hediyeleşme geleneğinin ise yine dijital aracılığı ile hem kişiselleştirilme hem de topluluk odaklı hediyeleşmeye yöneldiği gözlenmiştir. Dijitalleşme, geleneksel hediye ritüelini ve karşılıklı yapıyı azaltmış, egemen ekonomik sisteme karşı bir anti ekonomi modeli de sunmuştur. Bu durum da meta değeri üzerinden değerlendirilen hediye anlamını dolaylı yoldan değer değerlendirmesi yapılan bir alana kaydırmıştır. Bu noktada özellikle sosyal medya araçlarında video akımcılarının canlı yayınlarının gerçek zamanlı toplu hediyeleşme eylemini beraberinde getirmesi dikkat çekmiştir. Buna göre hediyein kendisinin ve hediye olarak ifade edilen eylemlerin (söz etme, beğenme vb.) değiştiği gözlenmiştir.

Ayrıca yapılan araştırmalarda görüldüğü üzere hediyeleşmede kitle iletişim araçları ve reklamın hediyeleşme, hediye ritüelini gösterme gibi edimlerde yönlendirici bir gücü olduğu gözlemlenmiştir. Özellikle dijital hediyeleşmeyi teşvik etmede kullanılan sosyal mecraların ve bu mecralarda verilecek olan reklamların bilişsel ya duygusal boyutta hangisinin daha etkili olacağı konusunda mecraların birbirinden farklı etkilere sahip olduğu; bu noktada verilecek olan hediyein somut ya da deneysel hediye olup olmadığı faktörü kadar hangi mecranın reklam iletişim aracı olarak kullanılacağına da dikkat etmek gerekmektedir. Yine hediye alımını teşvik etmede özellikle özel günlerde mobil mecra, e-posta ve dergilerin reklam mecrası olarak kullanımının etki sağlayacağı da vurgulanmaktadır. Bununla birlikte dijital hediyeleşme kolay erişebilme, kişiselleştirme, son dakikada alabilme gibi esnek alanlar yaratsa da, “hediyein büyüğü küçüğü olmaz” düşüncesine karşı o dönemde seçilen hediyein süper star hediye olması gibi popülerlik unsurlarına bakılması ya da alıcının kendine alınan hediyein fiyatını internette bulup, karşılık vermede aynı fiyattaki hediyeleri alması gibi etik ve sosyal ilişkiler açısından bu alanın eleştirilebilir taraflarının olduğu görülmüştür. Sonuç olarak gelecekte dijital mecralardaki gelişmelerden ve yeni jenerasyonun hediyeleşme yükleyeceği anlamdan hediye kültürünün birebir etkileneceği ve hediye sektörü taraflarının buna şimdiden hazırlıklı olması gerekliliği açıktır.

**Abstract**

Embark on an odyssey through the kaleidoscopic realm of the environment, where the symphony of nature intertwines with the harmonies of cutting-edge technology to sculpt a future of boundless possibility. This abstract unveils the dynamic interplay between humanity and the natural world, weaving a tapestry of innovation, resilience, and transformative potential. At the heart of this narrative lies biodiversity, nature's magnum opus, adorned with the hues of genetic diversity and ecological intricacy. Yet, amidst the backdrop of escalating environmental challenges, the stage is set for a technological renaissance that promises to redefine our relationship with the Earth. Venture into the frontier of conservation technology, where drones soar through the skies, mapping ecosystems with unparalleled precision and guiding conservation efforts with surgical accuracy. Witness the rise of bioremediation techniques, where microbial marvels and nano-technological wonders collaborate to cleanse polluted waters and rejuvenate degraded landscapes. Peer through the looking glass of climate tech, where carbon capture innovations harness the power of nature to mitigate greenhouse gas emissions and forge a path towards climate neutrality. Journey alongside the pioneers of agrotech, as vertical farms and aquaponics systems revolutionize food production, offering a glimpse into a future of sustainable abundance. Yet, innovation alone cannot bear the mantle of environmental stewardship. It is in the crucible of collective action and social innovation that the true alchemy of change unfolds. From block chain-powered conservation finance to citizen science initiatives leveraging the power of crowdsourcing, the abstract celebrates the catalytic role of human ingenuity in nurturing a thriving planet. As we stand at the precipice of a new era, let us embrace the convergence of nature and innovation as the catalyst for an eco-revolution. Through bold experimentation, audacious collaboration, and unwavering commitment, we illuminate the path towards a future where humanity and the environment dance in harmony, bound by a shared destiny of flourishing and resilience.

**Keywords:** Sustainability, innovation, environmental challenges, planetary healing, transformative, technology, renewable energy, sustainable development, ecological balance, biodiversity, climate change, resilience.

**Introduction:**

Sustainability 2.0 represents a paradigm shift in how we approach environmental challenges, emphasizing the integration of technology and innovation into sustainability practices. In the face of escalating environmental crises such as climate change, biodiversity loss, and resource depletion, there is an urgent need for transformative solutions. This paper explores how technological advancements can play a pivotal role in mitigating these challenges and fostering a more sustainable future.

**Overview of the Environmental Landscape:**

The current environmental landscape is characterized by a multitude of interconnected challenges. Climate change is exacerbating extreme weather events, disrupting ecosystems, and threatening livelihoods. Biodiversity loss is accelerating at an alarming rate, jeopardizing the stability of ecosystems and the services they provide. The depletion of natural resources, including freshwater and arable land, poses further risks to global sustainability. Addressing these challenges requires a comprehensive understanding of the complex interactions between human activities and the environment.

**The Role of Technology in Sustainability:**

Technology offers promising solutions to environmental challenges, ranging from renewable energy to sustainable agriculture. Innovations such as drones, bioremediation techniques, climate tech, and agro-tech have the potential to revolutionize how we manage natural resources and mitigate environmental impacts. By harnessing the power of technology, we can enhance efficiency, reduce waste, and minimize environmental harm.

**Conservation Technology:**

Drones have emerged as powerful tools for ecosystem monitoring and conservation. These unmanned aerial vehicles enable researchers to conduct high-resolution mapping of habitats, monitor wildlife populations, and detect illegal activities such as poaching and deforestation. Furthermore, drones can facilitate rapid response efforts during natural disasters, providing crucial data for disaster management and relief operations.

**Bioremediation Techniques:**

Bioremediation offers a sustainable approach to cleaning up polluted environments and restoring ecosystems. Microbial and nanotechnological innovations have been developed to target contaminants such as oil spills, heavy metals, and chemical pollutants. These techniques harness the natural processes of microorganisms to break down pollutants and detoxify

contaminated sites. By leveraging bioremediation, we can mitigate the impacts of pollution and restore the health of ecosystems.

**Climate Tech:**

Carbon capture technologies play a crucial role in mitigating greenhouse gas emissions and combating climate change. Nature-based solutions such as afforestation, reforestation, and wetland restoration sequester carbon dioxide from the atmosphere, helping to offset emissions from human activities. Additionally, renewable energy technologies such as solar, wind, and hydropower offer clean alternatives to fossil fuels, reducing our dependence on carbon-intensive energy sources.

**The Importance of Collective Action:**

Achieving sustainability requires collective action and social innovation at all levels of society. Collaborative initiatives and community-driven projects play a vital role in mobilizing resources, raising awareness, and fostering a culture of environmental stewardship. By engaging stakeholders from diverse backgrounds, we can harness the collective wisdom and creativity needed to address complex environmental challenges.

**Conclusion:**

In conclusion, Sustainability 2.0 offers a transformative vision for a more sustainable and resilient future. By embracing innovation and collective action, we can harness the power of technology to heal our planet and secure a prosperous future for generations to come. However, achieving sustainability requires a concerted effort from governments, businesses, civil society, and individuals alike. It is imperative that we work together to implement bold solutions and safeguard the health of our planet for future generations.

**Özet**

21. yüzyılda dünya, çeşitli etkileşim biçimleri nedeniyle dramatik bir şekilde değişmektedir. Önemi giderek artacak olan önemli bir faktör de kültürlerarası iletişim yetkinliğidir (ICC). Küreselleşme ve teknolojik ilerlemeler, çeşitli alanlarda iş birliği ve ekip çalışması gerektiren küresel bir manzara yaratmıştır. Kültürlerarası yetkinlik, 21. yüzyılda akademi, staj, spor, sanat, film, festival, okul, iş yeri, hastane gibi çeşitli bağlamlarda başarılı olmak için kilit becerilerden biridir. Ancak, kültürlerarası iletişim yetkinliğine (ICC) eğitim materyallerinde özellikle de müfredat geliştirmede yeterince önem ve öncelik verilmemektedir. Bu çalışmanın amacı, Heinle Cengage tarafından yayınlanan ve National Geographic ve TED'den içeriklere yer veren "World English, Second Edition for Real People Real Places Real Language" adlı İngilizce öğretimi ders kitabında yer alan "Food from the Earth" başlıklı bir üniteyi kültürlerarası yetkinlik (KİY) açısından incelemektir. Ders kitabı, A2-B1 yeterli düzeyine sahip lise öğrencileri için tasarlanmıştır. Veriler, nitel bir araştırma yöntemi olan doküman analizi tekniği ile toplanmıştır. Hem ders kitabının içeriği numaralandırılmış, hem de bir ünitenin etkinlikleri bütünlükleri açısından gruplandırılmış ve Hofstede'nin Kültürel Boyutlar Teorisi ve Deardorff'un Kültürlerarası Yeterlilik Modeli temel alınarak analiz edilmiştir. Sonuçlar, analiz edilen İngilizce öğretimi ders kitabının öğrencilerin kültürlerarası farkındalığını ve yeterliliğini geliştirme uygun olduğu belirlenmiş olup öğretimin amaç ve hedeflerini başarıyla karşılamaya yönelik olduğu belirlenmiştir.

**Anahtar Kelimeler:** Kültürlerarasılık, Kültürlerarası İletişim Yetkinliği (ICC), Eğitim Programları

## **INTERCULTURALISM AND COURSEBOOK: A CRITICAL ANALYSIS**

### **Abstract**

The world is changing dramatically in the 21st century due to various forms of interaction, and one important factor that will increasingly become important is intercultural communication competence (ICC). Globalization and technological advancements have created a global landscape that demands cooperation and teamwork across a range of domains. Intercultural competence is one of the key skills to succeed in the 21st century in various contexts such as academia, internships, sports, the arts, movies, festivals, schools, workplaces, hospitals. Yet, intercultural communication competence (ICC) is not given enough attention and priority in educational materials especially in curriculum development. This study aims to examine a unit titled "Food from the Earth" in terms of intercultural competence (ICC) in an English language teaching coursebook named "World English, Second Edition for Real People Real Places Real Language," published by Heinle Cengage, featuring content from National Geographic and TED. The coursebook has been designed for students in high school with a proficiency level of A2- B1. The data was collected through the technique of document analysis, which is a qualitative research method. Both the contents of the coursebook are numbered, the activities of a unit are grouped for their unity and analyzed based on Hofstede's Cultural Dimensions Theory and Deardorff's Intercultural Competence Model. Results suggested that the analyzed English language teaching coursebook has developed learners' intercultural awareness and competence and successfully met the aims and goals of the teaching.

## **Introduction**

Education is a process that prepares us to be standers of our choices, lifestyles, beliefs, and personal goals rather than simply being a bystander or receiver of knowledge through memorization. As Tom Hierck, an education consultant and author, highlights, "21st Century kids are being taught by 20th-century adults using 19th-century curriculum and techniques on an 18th-century calendar," Tom Hierck (2019). However, researchers and educators in all fields need to pay more attention to the power of the continually changing nature of learning and learners. The curriculum is not a fixed notion or independent of a child's experience and world; where it is a whole something unique, fluent, embryonic, and vital. It is an endless notion deriving from the child's own experience into organized truth (Dewey, 1902). 21st-century skills, including intercultural competence, critical thinking, teamwork, collaboration, problem-solving, creativity, and communication skills, are vitally essential to prepare future young adults to overcome challenges in a global world. How ready is our curriculum? How good is it? Are we really addressing the needs of the learners and helping to actualize their potential and improve their strengths, and fulfill their desires? These are some of the questions we must tackle. Suppose we do not develop a better curriculum, better teaching, and better tests. In that case, 21st-century skills will be merely words that carry no meaning and no action in reality, which also means that we sacrifice long-term gains over short-term progress (Rotherham & Willingham, 2010). In fact, developing an updated curriculum based on intercultural competence is an educational imperative in the 21st century (Fantini, 2009). It must be tackled in a wide variety of settings and contexts in all parts of the world. In this paper, as an educational scientist and curriculum developer, the researcher aims to analyze an English language teaching coursebook in terms of often neglected 21st-century skill intercultural competence (ICC) with the help of Hostede's Cultural Dimensions Theory (Hofstede, 1984) and Deardorff's Intercultural Competence Model (Deardorff, 2006). Reasons for incorporating Hofstede's Cultural Dimensions Theory into the study include the roles that the theory plays in understanding values in the context of cross-cultural understanding, communication and cooperation, global business management, human resource management, education, and policy development. This theoretical framework offers a structured approach to understanding the various values, beliefs, and behaviors that shape societies, providing insightful information about the nuances of cultural differences within the study's scope (Hofstede & Usunier, 2003). In addition, Darla Deardorff's Intercultural Competence Model is a comprehensive framework offers both theoretical and practical aspect of communication across diver cultural contexts.

Three interrelated components make up the model: attitudes, skills, and knowledge. While the knowledge component entails learning about different cultures and developing cultural awareness and understanding, the skills component emphasizes the useful strategies for facilitating successful cross-cultural interactions, such as communication, flexibility, and conflict resolution across cultural divides. Moreover, attitudes blend in open-mindedness and engagement by non-judgmental approach. The coursebook that we are going to examine is called *World English, Second Edition for Real People Real Places Real Language*, published by Heinle Cengage, featuring content from National Geographic and TED. The authors of the book are Kristin Johannsen and Rebecca Tarver Chase. High school students with a proficiency level of A2-B1 have been aimed to teach through this coursebook.

### **Historical and Theoretical Context of Interculturalism**

Despite the fact that it is now attained a great deal of attention in the 21st century, interculturalism has always been a part of world cultures since antique civilizations such as Akkadians, Achaemenids, Khazars, and Romans (Menek, 2020). Since those old times, people at the time managed to create long-lasting peaceful periods, for example, Pax Khazarica and Pax Romana. Wars, trade, and diplomatic relations were some ways to make interactions between different groups of people (Akıncı, 2019; Tite, 1995). Interestingly, however, as people of the so-called modern world, we now can learn, collaborate and work with anyone with internet access and improve ourselves with new perspectives and understanding. Thanks to the technological improvement that eased the ways to transport from one place to another, people tremendously benefitted from studying, traveling, and working together. As the world evolved into a place where everyone, regardless of personal and cultural background, religion, or race, can interact and move, interculturalism, also known as the art of living together, emerged as a new phenomenon. Since the 21st-century term, global citizenship has become more prominent, and interculturalism and intercultural competence (ICC) studies have drastically increased due to the high volume of interaction among different cultures. Intercultural competence is one of the necessary 21st-century skills that must be attained to work in today's intercultural setting (Anand & Lui, 2019; Düger, 2020). According to Hofstede, it comprises six main categories. They are, respectively, power distance, individualism vs. collectivism, masculinity vs. femininity, uncertainty avoidance, long-term vs. short-term orientation, and finally, indulgence vs. restraint.

### **A Brief Overview of Hofstede's Cultural Dimensions Theory (1984)**

According to Geert Hofstede's Cultural Dimensions Theory, the cultural dimension consists of five main dimensions identity, power, gender, uncertainty, and time. The framework presents a structural framework for cross-cultural communication to foster a better understanding among different groups through various societal and behavioral dynamics (Hofstede, 1984). Within this scope of the study, we will tackle how important it is to understand and eliminate misunderstandings that lead to possible stereotypes and enhance the positive impact of interculturalism.

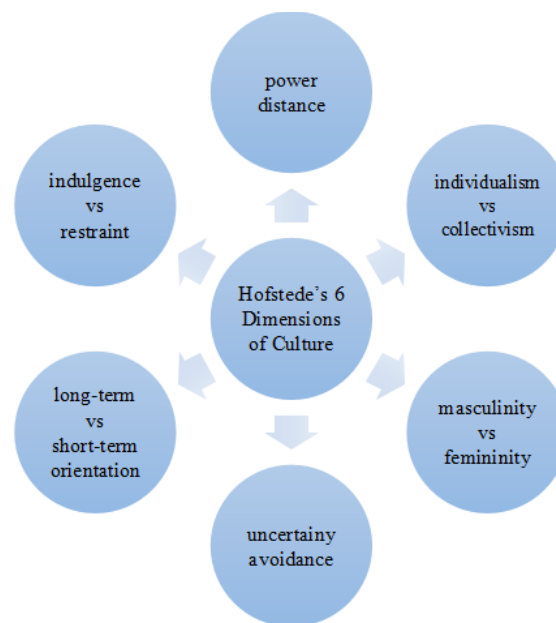

Figure 1: Hofstede's Cultural Dimensions Theory (Hofstede, 1984)

Within this scope of the study, we will tackle how important it is to understand and eliminate misunderstandings that lead to possible stereotypes and enhance the positive impact of interculturalism. Here are the brief explanations of each dimension follows (Hofstede, 1984; Hofstede, 2011).- Power Distance Index (PDI) is about how power is distributed amongst members of a society and how equal and unequal it is. Power and inequality are a feature of all societies in the world, but only the discrepancy matters.- Individualism-Collectivism (IDV) is two opposite types of social organization. While the previous one focuses on the individual's worth and prioritizes its value, the latter puts so much importance on group dynamics and the needs of a particular group of people.- Masculinity-Feminity (MAS) is about societal norms which describe to what extent ambition, wealth, assertiveness or caring, solidarity, and helping affect individuals and societies.

- Uncertainty Avoidance (UAI) portrays a culture or society's resilience to unusual and unstructured circumstances, which advises social standards, commerce practices, and human behavior.
- Long-term-short-term orientation portrays to what extent a country is more concerned about its past and present as short-term orientation values, while long-term orientation emphasizes future and future-oriented goals.
- Indulgence-restraint (IVR) deals with humans' needs and desires differently in society. For example, an indulgent society is one that emphasizes the fulfillment of human needs and wants. In contrast, a restricted society limits and controls a person's wants and withholds joys in adapting to superior acclimate to social standards.

### **A Brief Overview of Deardorff's Intercultural Competence Model (2006)**

According to Darla K. Deardorff's Intercultural Competence Pyramid Model, attitude, knowledge, skills, internal outcomes, and external outcomes are the five main components involved in Intercultural Competence (ICC) (Deardorff, 2006). This model provides a framework that guides a well-organized curriculum that advances intercultural competence and assessment of learning outcomes.

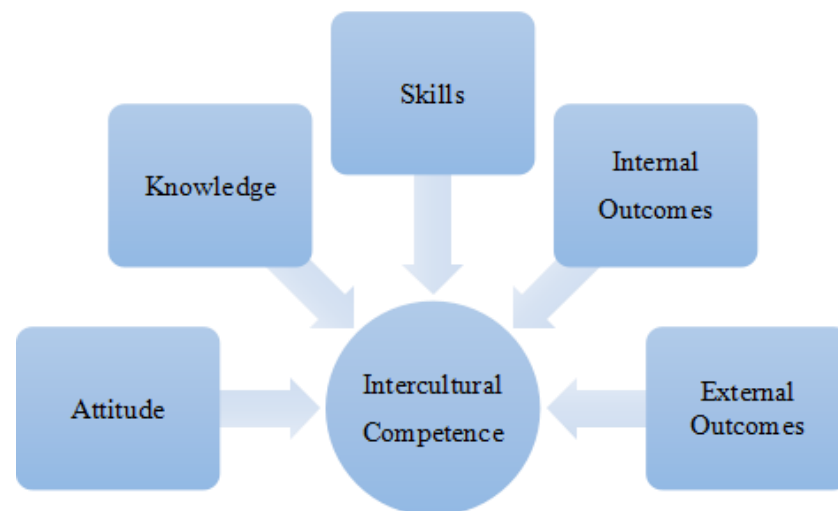

Figure 2: Deardorff's Intercultural Competence Model (Deardorff, 2006)

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

*April 09-16, 2024 / Lisbon, Portugal*

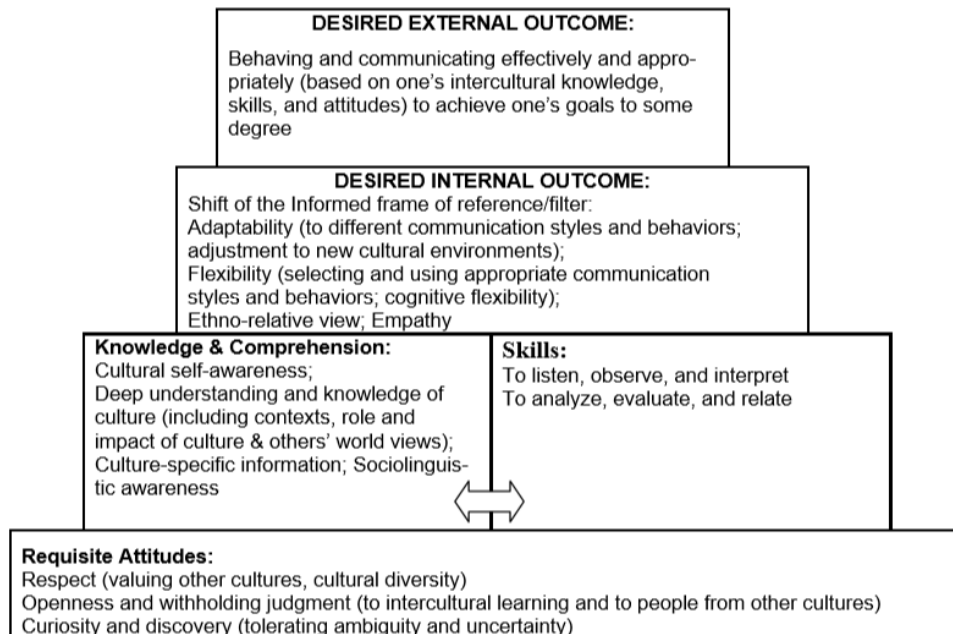

Figure 3: Pyramid model of intercultural competence (Deardorff, 2006).

Here are the brief explanations of each component follows:

**Attitudes:** There are three key attitudes: respect, openness, and curiosity.

Respect indicates that you value others from different backgrounds and who hold different views. You share openness and curiosity to appreciate their uniqueness while stepping out of your comfort zone and letting them be who they are. These three attitudes are fundamental to developing the knowledge and skills necessary for intercultural competence.

**Knowledge:** In order to achieve intercultural competence, you are required to have cultural self-awareness, culture-specific knowledge, deep cultural knowledge (understanding of other world views), and socio-linguistic awareness. Seeing the world through the lenses of others is vital to develop intercultural competence.

**Skills:** Observing, listening, evaluating, analyzing, interpreting, and relating are skills fundamental to figuring out knowledge. While interacting with others from various backgrounds, you cannot simply count on your mere knowledge. You are also required to utilize these skills to perceive and process information.

**Internal Outcomes:** The attitudes, knowledge, and skills lead to an internal outcome that consists of flexibility, adaptability, and empathy. These skills enable individuals to attain intercultural competence at some level successfully. You are able to begin to look from the

other person's perspective and respond to others according to how you would like them to be treated.

**External Outcomes:** These skills consist of behaviors and communication skills displayed by an individual found in their attitudes, knowledge, skills, and internal outcomes are the external outcomes encountered by people around them. Effective and appropriate attitude and communication are the observable external outcomes of intercultural competence.

### **Materials and Methods**

In this study, case study design, one of the qualitative research methods, was used. Case study is a method in which a single situation or event is examined in-depth longitudinally, data are collected systematically and what happens in the real environment is examined. With the results obtained, it reveals why the event occurred the way it did and what should be focused on in future studies (Davey, 1990). Additionally, document analysis was used in this study. Document analysis or analysis is a research method on its own or it can function as an additional source of information when other qualitative methods are used (Yıldırım & Şimşek, 2013). In addition to providing additional data, document analysis can also provide an additional perspective on the event, compensate for the possible bias that a single data collection method may bring, and all of these have the potential to increase the reliability of the study (Patton, 2002). In this study, a unit titled "Food from the Earth" in the English language teaching textbook "World English, Second Edition for Real People Real Places Real Language" published by Heinle Cengage, which includes content from National Geographic and TED, was analyzed in terms of intercultural competence (ICC). This study consists of a content analysis that aims to examine an English language teaching coursebook within the scope of cultural values primarily based on Hofstede's Cultural Dimensions Theory and Deardorff's Intercultural Competence. While Hofstede's Cultural Dimensions Theory examines the cultural values of diverse groups of people in their workplace through six main elements such as power distance, uncertainty avoidance, masculinity/femininity, individualism/collectivism, long-term/short-term avoidance, and indulgence/restraint, Deardorff's Intercultural Competence Theory, focuses on four main components including attitude, knowledge, skills, internal outcomes, and external outcomes. One of the goals of this article is to analyze the contents of a language coursebook with the help of these cultural theories to develop a better curriculum for future generations to reach their full potential and improve their intercultural communication competence (ICC). Articles and theses were examined within the scope of the study as categorical and theme analyses and classified according to their features.

### Interpretation of Findings

Including intercultural communication competence (ICC) as a main element in language teaching coursebooks fosters better understanding while helping learners of all ages and levels develop tolerance, respect, and empathy, and build deeper cultural awareness. Besides fostering better understanding, it also helps learners gain a deeper understanding of their own culture through an ethno-relative and comparative view. Here are two tables analyzing the unit activities:

Table 1: Analysis of the Unit based on Hofstede's Cultural Dimensions Theory

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17
Power Distance				x											x		x
Individualism/Collectivism		x									x						x
Masculinity/Femininity		x		x					x								
Uncertainty Avoidance			x	x								x				x	x
Long-term/Short-term Avoidance																	
Indulgence/Restraint				x											x	x	x

Table 2: Analysis of the Unit based on Deardorff's Intercultural Competence Pyramid Model  
(2006)

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17
Requisite Attitudes: (respect, openness, curiosity)	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
Knowledge & Comprehension: Cultural Awareness Deep Understanding Culture-Specific Information socio-linguistics Awareness	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
Internal Outcome Adaptability: Flexibility Ethnorelative view Empathy	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
External Outcome Behaving & Communicating effectively		x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

The coursebook World English, Unit Food from the Earth is analyzed through 17 main sections, including vocabulary, grammar (simple present tense vs. present continuous tense), conversation 1, listening, communication 1, pronunciation, language expansion, grammar (simple past tense), conversation 2, reading, communication 2, writing, before you watch, while you watch, video summary, after you watch, communication 3. As each section is assessed with the help of Hofstede's Cultural Dimensions Theory and Deardorff's Intercultural Competence Model (2006), relevant comments and evaluations are also shared.

**In the first activity**, the first section vocabulary, a travel blog about Argentina, highlights requisite attitudes such as respect, openness, and curiosity. Regarding knowledge and

comprehension, the activity stimulated learners' understanding by creating cultural awareness while sharing culture-specific information. It also increases appreciation, empathy, and adapting to a new country and circumstances.

**In the second activity**, grammar is taught through a short text about a staple food, enchiladas, in Mexican cuisine. Learners from all cultures can get a brief picture of eating with different people at the same table by the picture representing the collectivist values of Mexican culture. Also, a girl named Celia and her mother working together can give us a clue about gender roles in Mexican society. Moreover, the students learn to respect another culture and foster intercultural appreciation through respect and curiosity while also becoming more aware of culture-specific details and creating a deep understanding of a new culture. In addition, it fosters adaptability, empathy and flexibility. As the second part of the activity requires the learners to speak about their own experiences, they also create cultural awareness and communicate effectively in a different cultural setting.

**In the third activity**, conversation 1 starts with a listening track where two interlocutors talk about a vacation, also mentioning some of the eating habits of local people in the visited place. Besides activating the learners' schemata about their own experiences, they are also required to share traditions and formalities as uncertainty avoidance. Since indulgence vs. restraint deals with humans' needs and desires, the learners are supposed to share their beliefs about social standards while talking about the tradition and eating habits during a special day or holiday in the relevant culture. As they talk about their culture, they open up and mention the core values and beliefs of the culture, which gives them a chance to express their ethno-relative view, increase cultural self-awareness, and foster better empathy.

**In the fourth activity**, listening begins with a peer discussion where students are required to talk about farmers growing rice. Then, it follows an interview with a rice farmer talking about various issues, including rice paddy, and climate. Besides a photo of a woman working in a rice paddy in Taiwan, there is also a Welsh fisherman working; these photos can give us a clue about gender roles in different cultures. Moreover, a question on finding new ways to increase food production aims to engage the learners about the hierarchical relations, also known as power distance, between different occupations, such as farmers and scientists. While talking about rice plants and rainfall necessitates the learners to express their ideas about a culture or society's attitudes toward unpredictable and unstructured circumstances, which develops uncertainty avoidance skills and builds a new understanding of human nature. Additionally, the learners develop requisite attitudes such as respect, openness, and curiosity about different

cultures, which leads them to improve their cultural awareness and deep understanding of one another and socio-linguistic awareness through empathy, flexibility, and effective communication.

**In the fifth activity**, communication 1 is a comparison activity about two different regions in students' home countries. As the students open up more about descriptions of the land, the climate, and the food in different regions, they become more aware of the culture and develop cultural self-awareness, attaining culture-specific information about two different regions. Besides interacting about several features, they learn to see through others' perspectives and learn how to behave right by using useful intercultural communication strategies through real-life experiences.

**In the sixth activity**, pronunciation is emphasized, the students pay attention to linking words in the context of foods and cultures. As one of the goals of this activity is to help them identify some of the staple foods in their region and country, they share culture-specific information while creating socio-linguistic awareness in the target language. They learn to move out of their comfort zone, observe, listen to each other, and share ideas through empathy while communicating effectively.

**In the seventh activity**, language expansion activity about staple food crops captures the learners' attention through colorful pictures emphasizing useful words such as corn, wheat, rice, oats, millet, soybeans, lentils, black beans, red beans, potatoes, yucca, yams with the help of sentences in the context of eating habits in various places including China, South America, and India. The learners not only have a chance to talk about the staple foods they eat and also learn to respect different eating habits and become flexible as they understand why some food is available in certain countries across the world and why they consume it regularly.

**In the eighth activity**, grammar (simple past tense) focuses on improving the learners' socio-pragmatic awareness in the context of interculturalism, specifically food, travel, and past experiences. For instance, they are required to complete a dialogue about a journey to Greece, and the students learn to express past experiences with the help of specific information about cultures.

**In the ninth activity**, conversation 2 starts with a dialogue between two interlocutors talking about couscous, a food in North Africa generally eaten on special occasions. Since the details in the discussion highlight some useful expressions and culture-related information, including ingredients of traditional food couscous, when it is eaten, and why it is important, the learners understand food from its unique perspective and develop empathy. In addition, they express

ideas about a dish unique to their own local culture and increase a better intercultural awareness about cultural values.

**In the tenth activity**, a reading passage called "A Slice of History" stimulates the learners' interest in pizza, which used to be a regional food in Naples, Italy soon became one of the most famous and popular food internationally. It takes the attention and curiosity of the learners to understand cultures and appreciate the similarities and differences on a deeper level; for instance, it is mentioned in the text that Brazilians, Russians, Indians, and Japanese prefer various and diverse ingredients. With the help of these ideas, the learners develop better cultural empathy, respect different tastes and preferences and learn to behave accordingly in an acceptable manner in an intercultural setting.

**In the eleventh activity**, communication 2 requires working in a small group, where the learners are asked to come up with a new pizza invention for a pizza restaurant. They are required to agree on its toppings, sauce, and crust types, which is an excellent way to learn to negotiate and develop socio-linguistic awareness in the target language. In addition to this, they raise consciousness about respect for each other, become open and curious as well as communicate effectively.

**In the twelfth activity**, exchanging letters as a writing activity benefits the students by asking more about the eating habits of a country they will soon visit. For example, they are curious to find out what the people in the visited country eat for breakfast, what they have in restaurants, what their staple foods are, and finally, some of the things they eat for lunch and dinner. Moreover, they also introspectively tackle food from their region or country popular in other places and why they are popular and common there, which is a great way of creating cultural awareness about their own culture and having a better grasp of deep understanding about one another. With the help of this activity, they improve their communication in an effective manner through critical analysis.

According to the analysis of the *thirteenth, fourteenth, fifteenth and sixteenth activity* in the unit, a video journal is represented about a forbidden fruit in four main sections, including before you watch, while you watch, video summary, and after you watch, respectively. Firstly, the students are familiarized with some of the relevant adjectives in a context with the help of a regional map of Southeast Asia during the first main activity. After that, it is followed by a while-you-watch activity where they get a chance to watch a video and observe people's actions and reactions of hotel staff, hotel guests, and hotel cleaning staff toward a forbidden fruit called durian. And also, they become aware of cultural elements and learn the culture and location-

specific information regarding architecture, foods, animals native to that specific country, and a special kind of shopping way, a floating market through photos. Thirdly, they build a better understanding of a real-life situation in the video summary part, where the main problem is reflected in the smelly fruit durian. And finally, they critically tackle three foods popular in the learners' home culture which might be disgusting or intolerable to people from different cultures by giving reasons and commenting on them. These activities emphasize the importance and significance of intercultural competencies on requisite attitudes, deeply understanding both local and international cultures, and learning to appreciate similarities and differences simultaneously through useful phrases and expressions in the target language through first-hand experiences.

**In the seventeenth activity**, communication 3 helps the learners to solve problems aiming to prevent people from bringing durian into their rooms in hotels so that they work on effective communication styles without offending anyone and also acting out of respect and addressing people in a kind and empathetic way; it is the kind of targeted awareness level in deeply understanding various cultures while improving intercultural communication and communication strategies.

### **Conclusion and Recommendations**

As the 21st century leads us to new ways of communication, the world has been reshaped through various forms of interaction, one of the most integral elements of this interaction is undoubtedly intercultural communication competence (ICC). Globalization and multiculturalism through technological developments paved the pathway for a world where collaboration and working together are a new must in all fields. People from all backgrounds, cultural heritages, and linguistic variations come together in diverse settings such as exchange student programs, academic conferences, work opportunities, internships, sports, arts, cinema, festivals, etc (Anand & Lui, 2019; Düger, 2020). However, sadly enough, despite these interactions, conflicts, wars, and violence in all parts of the world have never been declining. In fact, according to the World Population Review (2022), an independent organization without political affiliations, many people are heavily affected by destructive causes like civil war, terrorist insurgency, drug war, ethnic violence, and political unrest, and their impacts are exacerbated to use fundamental human rights, including access to education, the right to life and liberty, freedom from slavery and torture, freedom of opinion and expression, the right to work and education. Consequently, it is tremendously crucial to implement ideas based on the universal needs and humanistic values of all people in the world. We educators, therefore, must

tackle teaching in the most suitable manner to ensure that peace and mutual understanding between one single human to another are achievable through the educational programs we develop and practice.

**Thanks and Information Note**

I would like to thank my thesis advisor Prof. Dr. Gülay Ekici at Gazi University and teacher Prof. Dr. Ritva Kantelinen at University of Eastern Finland for their assistance and discussion throughout the study.

**Özet**

Dünya üzerinde etkileşimin her geçen gün daha çok artması ulusların eğitim sistemlerini üzerinde de etkili olmaktadır. Artan etkileşim sonucunda PİSA gibi uluslararası sınavlar ile ülkeler birbirleriyle karşılaştırılmaktadır. Türkiye ve pek çok ülkenin PİSA sınavının boyutları kapsamında karşılaştırılacağı bu çalışmada PİSA sınav sonucuna etki eden çeşitli dinamiklerin varlığının incelenmesi amaçlanmaktadır. Yayınlarından elde edilen ilgili veriler içerik analizi yöntemi kullanılarak kategorize edilmiştir. Araştırma süresinde 10 makalenin sonuçları karşılaştırılmış olup araştırma bulguları sistematik olarak sınıflandırılmıştır. Çalışma kapsamında ülkelere ilişkin veriler eğitim felsefesi, eğitim projeleri, öğretmen yetiştirme programları ve okul idarecilerinin yetiştirilmesi olarak dört ana grupta incelenmiştir. Toplanan bilgiler ışığında ilgili ülke bölümünde yer verilmiştir. PİSA sonuçlarının incelenmesi ve sınav hakkında farkındalık kazanmak adına çalışmanın bilgilendiricilik yönünden önemli olduğu söylenilebilir. Çin'in, PISA sınavındaki üstün başarısında eğitim ve psikoloji gibi alanlarda yüksek lisans derecesine sahip olan okul müdürlerinin etkisi bulunmaktadır. Singapur eğitim programlarında önemi vurgulanan temel beceriler arasında öz farkındalık, eleştirel düşünme, etkili iletişim, sorgulama, başarılı ekip çalışması ve yenilikçi vatandaşların yetiştirilmesi yer almaktadır. Finlandiya eğitim sisteminde fırsat eşitliği, eşitlik, süreklilik, demokrasi ve her yönüyle eğitime bağlılığa odaklanmaktadır. 500 yıl sonra devlet ve kilisenin ayrılmasını deneyimleyen Norveç, eğitim sisteminde laikliğe ve dini kurumların özerkliğine olan bağlılığını yansıtmaktadır. İngiltere 2003-2005 yılları arasında ilk ve ortaöğretim kademelerinde teknoloji alanında 50 milyon poundluk bütçe ayırarak başarısını geliştirmiştir. Japonya'nın uluslararası değerlendirmelerdeki güçlü performansı, öğretmen eğitimine, okul liderliğine ve eğitim girişimlerine verdiği önem ile ilişkilendirilirken, Güney Kore'nin performansı eğitim felsefesi, programları ve girişimlerine bağlanabilir. Rusya'nın değerlendirmelerdeki başarısı eğitim felsefesine, program ve projeleri ile ilişkilendirilebilir. Türkiye'nin eğitim çıktılarının iyileştirilmesi amacıyla eleştirel düşünme, sorgulama ve yenilikçi vatandaşların yetiştirilmesine öncelik veren politikaların geliştirilmesinin önemi vurgulanmaktadır. Eğitim kalitesi değerlendirme sonuçlarının ilgili topluluklar ve kamuoyu ile şeffaf şekilde paylaşılması eğitimin iyileştirilmesinde etkili olacağı belirtilmektedir.

**Anahtar Kelimeler:** PISA Sınavı, Karşılaştırmalı Eğitim Çalışmaları

**A CONTENT ANALYSIS OF RESEARCH FROM DIFFERENT COUNTRIES ON  
PISA EXAM RESULTS**

**Abstract**

The increasing interaction in the world has an impact on the education systems of nations. As a result of increased interaction, countries are compared with each other through international exams such as PISA. This study, in which many countries including Turkey will be compared through the PISA exam, aims to examine the existence of various dynamics affecting the PISA exam results. The relevant data obtained from the publications were categorized using content analysis method. During the research period, the results of 10 articles were compared and the research findings were systematically categorized. Within the scope of the study, the data related to the countries were examined in four main groups as educational philosophy, educational projects, teacher training programs and training of school administrators. In the light of the information collected, the relevant country section is included. It can be said that the study is informative in terms of analyzing PISA results and raising awareness about the exam. China's superior success in the PISA exam is attributed to school principals who have master's degrees in fields such as education and psychology. Self-awareness, critical thinking, effective communication, questioning, successful teamwork and raising innovative citizens are among the basic skills emphasized in Singapore's education programs. Finland's education system focuses on equal opportunity, equality, continuity, democracy and commitment to education in all its aspects. After 500 years of experiencing the separation of state and church, Norway reflects its commitment to secularism and the autonomy of religious institutions in its education system. The UK has built on its success with a 50-million-pound budget for technology at primary and secondary levels between 2003 and 2005. Japan's strong performance in international assessments can be attributed to its emphasis on teacher training, school leadership and educational initiatives, while South Korea's performance can be attributed to its educational philosophy, programs and initiatives. Russia's success in international assessments can be attributed to its educational philosophy, programs and projects. In order to improve Turkey's educational outcomes, the importance of developing policies that prioritize critical thinking, questioning and raising innovative citizens is emphasized. Transparent sharing of education quality assessment results with relevant communities and the public is considered effective in improving education.

## **GİRİŞ**

Ekonomik Kalkınma ve İş birliği Örgütü (OECD) tarafından 1997 yılından beri faaliyette olan ve dünya genelinde eğitim kazanımlarının karşılaştırılması amacıyla oluşturulmuş olan PISA sınavı ülkemizin eğitime yaptığı yatırımların ve eğitim sistemimizin başarısı üzerine çalışma yapmamız üzerinde etkilidir. Tüm dünya ülkelerinin eğitim sisteminde sorunlar olduğu ancak bu sorunların diğer ülkelerin çalışmaları incelenerek iyileştirilebileceği düşünüldüğünde PISA gibi uluslararası sınavların önemi ortaya çıkmaktadır. Nitekim PISA web sitesindeki resmi verilere göre, 2000’li yıllarda Almanya ve Brezilya PISA sınavında OECD ülkelerinin ortalamasının altında puan almasına rağmen bu belirtilen ülkelerdeki eğitim uzmanlarının ve politika yapıcıların ortak çalışması sonucu eğitim sistemleri geliştirilmiş ve vatandaşlarının nitelikli eğitime erişimleri kolaylaştırılmıştır.

Ekonomik Kalkınma ve İş birliği Örgütü (OECD) tarafından her üç yılda bir yapılan Uluslararası Öğrenci Değerlendirme Programı olarak da bilinen PISA sınavı, aşağıda belirtilen ana boyutlardan oluşmaktadır (Savran, 2004):

- Okuduğunu anlama
- Matematik okuryazarlığı
- Fen bilimleri yazarlığı

Ana boyutların yanında, motivasyon ve problem çözme gibi temel beceriler de ölçülmektedir.

## **Yöntem**

### **Model ve Desen**

Makalelerden toplanan verileri açıklayabilmek üzere nitel araştırma yöntemlerinden durum çalışması deseni kullanılmıştır. Durum çalışması; tek bir durum ya da olayın derinlemesine boylamsal olarak incelendiği, verilerin sistematik bir şekilde toplandığı ve gerçek ortamda neler olduğuna bakıldığı bir yöntemdir. Elde edilen sonuçlarla olayın neden o şekilde oluştuğu ve gelecek çalışmalarda nelere odaklanması gerektiğini ortaya koyar (Davey, 1991).

### **Araştırmanın Çalışma Grubu**

Araştırmanın çalışma grubu oluşturulurken kolay ulaşılabilir örnekleme yönteminden yararlanılmıştır. Singleton ve Straits (2005), çalışmalarında kolay ulaşılabilir örnekleme yöntemini, araştırmacının hali hazırda var olan öğeler içerisinden yeterli miktardaki öğeyi örneklem olarak belirlemeyi sağlayan bir örnekleme yöntemi olarak tanımlamışlardır. Bu araştırmada da PISA sınavındaki durumlarını anlatır en fazla veri toplanabilecek ülkeler araştırma kapsamına alınmıştır. Araştırma kapsamında incelenen araştırmalar Google

Akademik aracılığıyla belirlenmiştir. Makalelerin seçilme kriterleri olarak şu hususlar dikkate alınmıştır:

- Makalelerin Türkçe veya İngilizce yayınlanmış olması,
- PISA sınavında ortalamının üstünde başarı sağlamış ülkelerle ilgili olması,
- Makalelerin yayın yıllarının 2004-2023 yıllarını kapsaması olarak ifade edilebilir.

Çalışmanın amacına uygun olmadığı tespit edilen makaleler inceleme dahilinde tutulmamıştır. Arzu edilen miktarda veri toplayabilmek adına diğer ülkelerin PISA sınavı kapsamında elde ettikleri sonuçlar dahil Türkiye'nin durumu hakkında bilgi verebilen çalışmalar incelenmeye alınmıştır. Makalelerde elde edilen bilgiler doğrultusunda ülkeler hakkında daha detaylı bilgilere ulaşmak adına ilgili ülkenin resmi sayfası üzerinden raporlar da incelenmeye alınmıştır.

Tarama sürecinde Türkçe makalelerden yararlanılmış olsa da özellikle İngilizce OECD countries, PISA exam, national reports, comparative education olmak üzere çeşitli anahtar kelimeler aracılığıyla araştırma yapılmıştır.

Araştırma evreni PISA sınavı ile ilgili yayımlanan Türkçe makaleler oluşturmaktadır. Örneklem olarak ise şu dergilerde yayımlanan makalelerden yararlanılmıştır; Çağdaş Yönetim Bilimleri Dergisi, Manas Sosyal Araştırmalar Dergisi, Bilgi Sosyal Bilimler Dergisi, Gazi Üniversitesi Gazi Eğitim Fakültesi Dergisi, Türk Eğitim Bilimleri Dergisi, Uludağ Üniversitesi Eğitim Fakültesi Dergisi, Akademik Bilişim Dergisi, Electronic Turkish Studies, Journal of STEAM Education, Ahi Evran Üniversitesi Kırşehir Eğitim Fakültesi Dergisi, Buca Eğitim Fakültesi Dergisi, E-International Journal of Pedandragogy olarak sıralanmaktadır.

### **Verilerini Analizi**

Araştırma kapsamında elde edilen veriler içerik analizi ile analiz edilmiştir. İçerik analizi, metin içinde tanımlanan belirli karakterlerden sistematik ve tarafsız sonuçlar çıkarmak için kullanılan bir araştırma tekniğidir (Stone vd., 1996). Krippendorff (2018) "İçerik analizi: Metodolojisine bir giriş" isimli kitabında içerik analizini Webster sözlüğünden alıntılanarak şöyle açıklamıştır: Bir iletişim materyalinde (bir kitap veya film gibi) bulunan tema ve sembolleri gruplandırarak, sayarak ve anlamını ve olası etkisini değerlendirerek analiz etme sürecidir. Bu çalışma kapsamında ülkelere ilişkin veriler dört ana grupta incelenmiştir ve toplanan bilgiler ışığında ilgili ülke bölümünde yer verilmiştir.

Bu çalışma kapsamında ilişkili bilgiler içerik analizi yöntemi göz önüne alınarak sınıflandırılmış olup yapılan araştırmalarda vurgulanan bilgiler analiz edilmiştir.

## **BULGULAR VE YORUMLAR**

Bu bölümde incelenen çalışmalar sonucunda Çin, İngiltere, Japonya, Güney Kore, Norveç, Finlandiya, Singapur ve Rusya gibi ortalama üstünde başarı sağlayan ülkelerin PISA sonuçlarına etki eden etmenler hakkında değerlendirmelerde bulunulmuş olup ülkelere ilişkin bilgiler ülkemiz Türkiye ile karşılaştırılarak aşağıda sunulmuştur.

### **Çin**

Dünyanın en kalabalık nüfusu olan ve en büyük eğitim sistemine sahip olan Çin, PISA sınavına ilk kez Şangay ile girmiş ve birinci sırada yer almış olup, ülkenin nüfusunun fazla olduğu kıyı alanlarında kırsal kesimlere bakarak ciddi farklılıklar gözlemlenmektedir (Ministry of Education MOE, 2018a; Tanrısevdi & Kırıl, 2018). Sosyo-ekonomik olarak yüksek statüde olan Şangay, Jiangsu, Guangdong ve Pekin gibi eyaletlerde katılım gösteren öğrencilerin özellikle matematik ve fen bilimleri testinde Türkiye'nin çok daha ilerisinde başarı kazandıkları çalışmalarca ortaya konmuştur (Tanrısevdi & Kırıl, 2018). Türkiye ve Çin'in arasındaki farklılıkların belirgin olmasının bir sebebi sınava giren öğrencilerin sahip olduğu bölgeler arasındaki farklılıklar olduğu gibi okul müdürleri arasındaki çarpıcı farklılıklar da gösterilebilir. Nitekim, Çin'de görevlerine atanmış müdürlerin hepsi eğitim ve psikoloji gibi alanlarda yetkinlik gösteren yüksek lisans sahibi uzmanlardır. Aynı zamanda öğretmen değerlendirmeleri belirli formlar aracılığıyla sağlanmakta olup öğretmenlere değerlendirme sonuçlarına göre terfi, ödüllendirilme ve promosyon verilmektedir. Bu durum bizlere öğretmenlerin mesleki yeterliliklerinin artırılması konusunda önem verildiğini göstermektedir (Maya & Yılmaz, 2017). Temel öğretmen eğitimi iki yıl ön lisans eğitiminden sonra lisans eğitimi ile verilmektedir (Kadıñşah vd., 2023). Öğretmenliğe yeni başlayan genç öğretmenler, üç yıl boyunca kendilerinden daha tecrübeli meslektaşları tarafından gözlem, öğretim durumları, yöntem-teknik ve sınav durumları açısından desteklenmektedir (Kadıñşah vd., 2023).

### **İngiltere**

PISA ve TIMMS gibi uluslararası sınavlarda adını duyuran ülkelerden biri olan İngiltere'nin eğitim felsefesi ilerlemeciliktir (Aydın, 2012). Teknolojinin eğitimde büyük bir rolü olduğuna inan İngiltere, 2003-2005 yılları arasında ilk ve ortaöğretim kademelerinde eğitim kurumlarını teknolojiyle donatmak adına 50 milyon poundluk bütçe ayırmıştır. Bununla birlikte öğrencilerin çağın bilgi ve donanımına sahip olabilmeleri için kodlama, programlama ve eğitim teknolojilerinin etkin kullanımına önem vermektedirler (Lai, 2010; Özerbaş & Safi, 2021).

Okul öncesi eğitimle birlikte konuşma, yazma, okuma, dinleme, matematik ve fen alanlarında resmi sınavlar yapılmaktadır. Ancak, İngiltere eğitim sisteminde en belirleyici rol GSCE

(General Certificate of Secondary Education) üstlenmektedir. Bu sınavla ve diğerleri ile öğrencilerin hangi seviyede eğitim alacakları ve hangi üniversiteyi tercih edecekleri belirlenmektedir (Eurybase, 2010). Temel öğretmen eğitimi lisans eğitimi boyunca ve pratik eğitimi ise lisans eğitiminin son iki yılının her haftasında verilmektedir (Kadıñşah vd., 2023). Öğretmenlik mesleğine başladıktan sonra üniversite hocaları ve danışman gözetiminde bir yıl süren staj eğitimi zorunludur (Kadıñşah vd., 2023).

### **Japonya**

Meiji restorasyonu ve II. Dünya Savaşı zamanlarından itibaren yapılan eğitim reformlarıyla ülkede köklü değişiklikler başaran Japonya, günümüz eğitim sistemleri arasından en yüksek standardı yakalamayı başarmış nadir ülkelerden biridir ve en yüksek okuma yazma oranlarından birine sahip olan bir ülkedir (OECD, 2015). Japonya'nın bu standardı ve başarıyı yakalamasında en büyük etken her 10 yılda bir yaptığı eğitim planlamaları olmaktadır. Merkeziyetçi bir yapıyı benimseyen Japonya'nın bu planlamaları ise Eğitim, Kültür, Spor, Bilim ve Teknoloji Bakanlığı (MEXT) tarafından yapılmaktadır (Aoki, 2017). Parvanova (2013)'dan alıntılama yapan Maya ve Yılmaz (2017)'ye göre, okulların değerlendirmesi öncelikle öz değerlendirmesi, okul paydaşlarının değerlendirmesi ve dışsal değerlendirme olmak üzere üç ana aşamadan yapılmaktadır. Bu değerlendirmelerde özellikle toplumun istek ve ihtiyaçları ön plana alınır ve velilerin ve öğrencilerin öz değerlendirme formlarıyla süreçte aktif oldukları görülmektedir (Maya & Yılmaz, 2017). Bu değerlendirmeler sonucunda öğretmenler terfi edilmekte ya da promosyon almaktadırlar. Öte yandan, Japonya'da 2009 yılında konulan bir kanuna göre, her on yıldan sonra öğretmenlerin pedagojik formasyonlarını yenilemeleri gerekmektedir (Akiba, 2013). Dünyada en önemli teknoloji devlerinden biri olan Japonya amaçladığı ideal insanı olan teknoloji okuryazarı vatandaşlarını yetiştirmek adına eğitim programlarına yapay zeka, kodlama ve robotik dersi içeren çeşitli sayıda teknoloji esaslı dersleri eklemiştir (Özerbaş & Safi, 2021). Ölçme ve değerlendirme aşaması ise etkinlik ve kısa sınavlar aracılığıyla yapılmaktadır (Türkoğlu, 1998).Dört yıllık lisans eğitiminin son döneminde dört-beş hafta olarak verilen öğretmen uygulaması dersleri ile yeni başlayan öğretmenlere deneyim kazandırılması hedeflenmektedir (Kadıñşah vd., 2023). Okul idarecileri için de çeşitli düzenlemelere sahip olan Japonya'da 20 yılı başarılı bir öğretmen olarak tamamlayan öğretmenler müdür yardımcısı olurken, müdür olmak içinse 5 yıl müdür yardımcılığı yapmış olmak gereklidir (MEXT, 2021b; Yavuz & Çakır, 2022).

### **Güney Kore**

Eğitim alanında merkeziyetçi bir politika izleyen Güney Kore, her üç yılda bir gerçekleştirdiği okul değerlendirmelerini uzmanlar, yirmi yıllık deneyime sahip öğretmenler, okul müdürleri, müdür yardımcıları, denetçiler, araştırmacılar, üniversite öğretim üyeleri ve genel yönetim personeli aracılığıyla edininip bu okul değerlendirmelerini eğitim sistemlerinin kalitesini ve başarısını arttırmada önemli bir etmen olarak görmektedir (Maya & Yılmaz, 2017). Özellikle merkezi hükümet ve il eğitim ofisleri birlikte ve uyumlu bir şekilde çalışarak planlamalarını günlük hayattaki uygulamalardan ve okullardan toplanan bilgiler doğrultusunda analiz ederek geliştirilir (KEDI, 2010). Aynı zamanda, öğretmen yeterlilikleri ve iş performansı, okul müdürü, müdür yardımcıları, meslektaşları tarafından da değerlendirilmektedir (Maya & Yılmaz, 2017). Öğretmen yetiştirme uygulaması Türkiye'ye benzeyen Güney Kore'de öğretmen adayları lisans eğitimleri süresince beş kredilik dersleri boyunca staj eğitimi almaktadır (Kadınsah vd., 2023). Zorunlu stajyerlik eğitimi olmayan Güney Kore'de diplomasını alan öğretmenler atanabilme imkanları bulunmaktadır. Atandıktan sonra buldukları okul ve profesyonel ağ gereği mesleki gelişim gerekmektedir (Kadınsah vd., 2023). Okul idarecilerinde de benzer şartlar aranmaktadır. Nitekim, okul müdürü ve müdür yardımcısı olmak için yüksek lisans ve doktora gibi tecrübe de belirleyici olmaktadır (Yavuz & Çakır, 2022).

### **Norveç**

Her ne kadar 2012 yılında ülke anayasasındaki ülkenin benimsediği belirli bir dinin olmadığı şeklinde değiştirirse de Norveç, özellikle din eğitiminin milli eğitim müfredatında özellikle Luteran perspektifinden verilmesi AB İnsan Hakları Mahkemesinin uyarısıyla daha nesnel bir anlatıma geçmiştir (Macaulay, 2021). Norveç eğitim sistemi öğretmenler arasında iş birliğinin önemini vurgularken toplum için hedeflediği ideal bireylerin düşünsel ve entelektüel olarak gelişmiş olması olarak belirtmektedir (Özerbaş & Safi, 2021). Ancak özellikle dini değerlere önem veren gelecek nesillerin yetişmesi adına Hristiyan öğretilerinden, İncil betimlemelerine yer verilmesi Norveç'teki eğitim sisteminin ne kadar laik ve evrensel değerlere özellikle eşitlik ilkesine bağlı kaldığı bağlamında incelemeye değerdir (Özerbaş & Safi, 2021). Caballero (2017) yayımlanan haber metninde Norveç Kilisesi ve Norveç hükümetinin yaklaşık 500 yıllık bir birlikteliğin ardından 2017 yılının başında yollarını ayırmaya hazırlandığını belirtmiştir. Türk eğitim sistemi ile farklılığı konusunda özellikle dikkat çekicidir ki, II. Mahmut döneminde 1824 yılında zorunlu eğitime geçen ülkemize karşısında Norveç 1937 yılında zorunlu eğitimi kabul etmiştir. Bir başka şaşırtıcı nokta ise 2012 yılına kadar herkesin kiliseye üye olması

zorunluluğunun varlığı Norveç hakkında şaşırtıcı detaylardan birkaçıdır (Özerbaş & Safi, 2021). Ancak unutulmamalıdır ki, Norveç varoluşçu teoloji ve yapılandırmacılık felsefelerini birleştiren bir ülke konumundadır. Anayasal olarak öğrenenlerin eğitim hakları gerek yaşamboyu öğrenme açısından hem de zorunlu eğitim açısından korunmuş olmakla beraber, eğitime büyük miktarda fonlar ayıran Norveç herkes için eğitim anlayışı benimsenmiştir. Söz gelimi, okulların genel yapısı açısından ele alındığında bütün öğrencilerin teknolojik olanakları eşit bir şekilde erişim sağlayabildikleri görülmektedir ve her dersin kendine ait sınıfı bulunmaktadır. Birinci ve ikinci sınıf kademesinden yedinci sınıfa kadar zorunlu sınavların yapılmadığı Norveç'te üçüncü kademe yer alan sekizinci ve onuncu sınıflarda not verme amaçlı sınavlar yapılmaktadır (Özerbaş & Safi, 2021). En düşük notun bir ve en yüksek notun altı olarak aşamalandırıldığı Norveç'te üçüncü kademe sonrasında ülke genelinde bir değerlendirme yapılmaktadır (European Commission, 2020; Özerbaş & Safi, 2021). Dört yıllık lisans eğitimine ek olarak bir yıl alan eğitimi gerektiren Norveç öğretmen yetiştirme uygulamaları ile lisans eğitiminin her yılında en az yüz olması planlandırılır ve zorunlu bir staj eğitimi bulunmamaktadır (Kadınsah vd., 2023).

### **Finlandiya**

Snellman'ın yönetimi altında, bir refah devleti olan Finlandiya önemli eğitim reformları gerçekleştirmiştir. Yaşam boyu öğrenme fikrini benimsemiş olan Finlandiya, Eğitim ve Kültür Bakanlığı'nın çabalarıyla gençlik politikaları, spor, bilim ve kültür -özellikle eğitim alanında- geliştirmekle sorumludur. Bakanlık, toplumun her üyesinin tam potansiyeline ulaşmasını ve kendi potansiyelini gerçekleştirmesini sağlamak için eğitim ve kültür hizmetleri, kişisel gelişim fırsatları ve uluslararası iş birliği sunmaktadır (EDUFI, 2022). Finlandiya dünyadaki en iyi eğitim politikalarından bazılarında sahip olmasına rağmen, öğretmen nitelikleri ve okul niteliklerinde hala bazı eşitsizlikler bulunmaktadır. Örneğin, Avrupa Komisyonu ve PISA 2012 sonuçlarına göre Finlandiya'da her beş öğrenciye bir bilgisayar düşmektedir (Özerbaş & Safi, 2021). Benzer şekilde, Finli eğitimciler arasında teknoloji kullanımı ve bilgisayar tabanlı araçların öğrenme ortamlarına entegrasyonu konusunda önemli farklılıklar bulunmaktadır. Finlandiya eğitim sistemindeki değerlendirme aşaması, farklı eğitim girdilerini ve kurumlarını karşılaştırmaktan ziyade büyüme ve gelişmeye odaklanmakta; rekabetten ziyade iş birliği ve ekip çalışması üzerine inşa edilmektedir. Üç yıllık bir lisans programını iki yıllık bir yüksek lisans programının takip ettiği Finlandiya'da, üniversite fakülteleri ve öğretmen yetiştiren kurumlar yakın iş birliği içindedir ve her bir üniversite kendi öğretim üyelerini yetiştirmek için uygulama okullarını kullanmaktadır (Kadınsah vd., 2023). Yüksek lisans derecesini aldıktan

sonra adaylar, bir danışman öğretmenin ve üniversitenin rehberliğinde isteğe bağlı olarak bir yıllık staj yapmayı tercih edebilirler (Kadınsah vd., 2023).

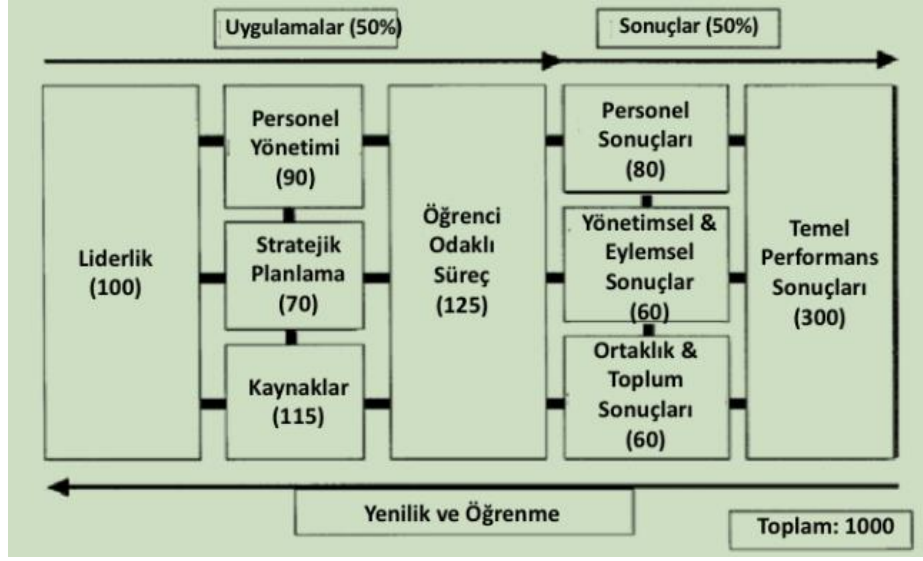

Çelen ve diğerleri (2011) Finlandiyalı öğrencilerin başarısına katkıda bulunan faktörleri kapsayan dört ana başlık belirlemiştir:

- Öğretmen hazırlama programı
- Geleneksel okullaşma
- Öğretimin kültürel statüsü
- Hizmet içi öğretmenler için eğitim

### **Singapur**

Öğrencilerin sahip oldukları gizil güçlerini ve potansiyellerini en üst düzeyde kullanabilmelerini hedefleyen Singapur, 2016 yılındaki PISA sınavında ölçülen ülkeler arasında birinci sıraya yükselmiştir (OECD, 2018). Singapur ve Finlandiya eğitim sistemlerini incelediğimizde bu iki ülkenin eğitim çıktılarının da pek çok açıdan benzediği görülmektedir. Nitekim, 1997 yılında eğitim çıktılarına ilişkin hedeflerini belirleyen Singapur'un hedefleri ile kendisine yol gösterici olarak belirlediği Finlandiya arasında eğitim programlarının temelinde yatan ana becerilerin ciddi benzerliklere sahip olduğu dikkat çekicidir. Söz gelimi, Singapur eğitim sistemi kendini tanıyan, eleştirel düşünebilen, etkili iletişim kurabilen bireylerin yanı sıra sorgulayan, takım çalışmasını başarılı bir şekilde gerçekleştirebilen ve yenilikçi vatandaşların yetiştirilmesini amaçlamaktadır. Çok uluslu bir etnik yapıya sahip olan Singapur'da eğitim ücretsizdir ve zorunlu eğitime 6-15 yaşları arasında gerçekleştirilir (Özerbaş & Safi, 2021). Bilişim teknolojilerinden eğitim durumlarının her aşamasında ve öğretmenlerin iş birliği boyutunda da yararlanmayı amaçlayan Singapur eğitim sisteminde, ilgili paydaşların dizüstü bilgisayarlar, masaüstü bilgisayarlar, tabletler, cep telefonları gibi teknolojik araçlar arasından hangilerinden yararlanmak istediği ve onların isteklerine göre planlaması yapılmaktadır. Böylece, okullar öğretmenlerin kararlarıyla hangi programları, yazılımları ve hangi çevrimiçi platformu kullanacakları konusunda aktif bir karar verici olarak görülmektedir (Özerbaş & Safi, 2021). Eğitim sisteminde kodlama, robotik ve 3D teknolojisi gibi dersleri dahil etmekte olan Singapur, teknoloji okuryazarı vatandaşlar yetiştirmeyi amaçlamaktadır (Zhao, 2017). İlkokul bitirme sınavı (PSLE) zorunlu olan Singapur eğitim sisteminde öğrenciler hiyerarşik olarak normal (teknik), normal ve akademik yeteneklilikler olarak üç ana kategoride sınıflandırılırlar (Özerbaş & Safi, 2021).

Şekil 1: Okul Mükemmellik Modeli Kategorileri ve Kalite Kriterleri

Kaynak: Okul Mükemmellik Modeli (Pak Tee, 2003; Maya & Yılmaz, 2017)

Singapur eğitim sisteminin başarısının sürdürülebilir kılan en önemli etmenlerden biri okul mükemmellik modelini benimsemiş olmasıdır. Okul mükemmellik modeli ile okulların eksiklikleri planlı bir şekilde incelenir ve eğitimin her bir boyutuna ilişkin çalışmaları bütünsel ve nesnel olarak değerlendirme sağlanır. Buna ek olarak, uzmanlarca başarılı olarak belirlenen okullara çeşitli ödüller verilir (Maya & Yılmaz, 2017). Aynı zamanda, öğretmenlerin bireysel olarak değerlendirildiği ve bu değerlendirmelerde başta öğretim faaliyetleri olmak üzere veli ve öğrenci görüş ve düşünceleri de etkili olmaktadır (Maya & Yılmaz, 2017). Öğretmen yetiştirme modeli Türkiye'deki modele benzeyen Singapur, dört yıllık lisans eğitimi boyunca ilk iki yıl sınıflarda gözlem ve son iki yıl aktif ders anlatımı gerektirmesi özelliğinden ülkemizden farklılaşmaktadır (Kadıncı vd., 2023). İş garantili meslek olarak ilan edilen Singapur'da, öğretmenlerin eğitim bakanlığı tarafından düzenlenen çalıştaylara ve eğitimlere katılma hakkı ve zorunluluğu bulunmaktadır (Kadıncı vd., 2023). Dünya standartlarında öğretmen yetiştirmek amacıyla Singapur Milli Eğitim Enstitüsü, Eğitimde Liderlik Programı (LEP) ve Okullarda Yönetim ve Liderlik Programı (MLS) programları oluşturulmuştur (NIE).

## Rusya

Tarihinde köklü değişiklikler geçirmiş devletler arasında olan Rusya, özellikle ideal insan olarak siyasal ideolojisi olan sosyalizmi temel alan yurttaşların yetişmesini amaçlamaktadır. Bu bağlamda sosyalist görüşü temel alan ve bilişsel yapılandırmacılığı ortaya atan J. P. Piaget'ye karşı çıkan L. S. Vygotsky'nin Sosyo-Kültürel Gelişim Kuramı ile Rusya'da dil ve kültür olgularının işlevselliğine dayalı bir eğitim sistemi oluşturulmuştur (Aydın, 2012).

Eđitim programına dahil ettiđi her kitabın online ortamlarda eriřimini sađlayan Rusya Eđitim ve Bilim Bakanlıđı'nın 2025 yılına kadar gerekleřtirmeyi hedeflediđi bazı projeler ařađıdaki gibidir:

- Rusya Federasyonu'nda Modern Dijital Eđitim Ortamı Projesi: Eđitimin dijitalleřmesini sađlayarak 2025 yılına kadar 11 milyon đrencinin eřitli alanlarda dersler alması ve uzmanlařmasıdır.

- İleri teknolojiler iin alıřanlar: Amacı rekabete dayanan orta mesleki eđitim sistemi sađlayarak yksek nitelikli uzman ve iři gc aracılıđıyla modern standartlara ve ileri teknolojilere uygun eleman yetiřtirmektedir.

- İnovasyon yaratma alanı olarak niversiteler: Amacı srdrlebilir kresel rekabetiliđi sađlamak adına Rus niversitelerinin niteliklerini ve kalitelerini arttırmaktır.

İlkokula bařlayan đrencilerin entelektel seviyelerinin llmesinin ardından ortađretim sonunda ortak devlet sınavı yapılmaktadır, bu sınavın sonucu ile đrencilerin yksek đretime yerleřmeleri sađlanmaktadır (elik, 2015).

### **Trkiye**

Trkiye, eđitim giriřimlerini denetlemek iin MEB yapısını kullanmakta olup politikaları iin merkezi bir yapı benimsemektedir. Eđitimde teknolojiyi kullanmak ve okul temelli eřitsizlikleri ortadan kaldırmak iin "Temel Eđitim Projesi", "Gelecek iin Intel Eđitim" ve "FATİH Projesi" gibi giriřimler kurulmuřtur. Trkiye, gen nfusun okluđu nedeniyle 2018 yılında sınav odaklı bir sisteme gemiřtir ve TYT ve AYT olmak zere iki ařamalı yksekđretim sınavları dzenlenmektedir (zerbař & Safi, 2021). Gerek anlamda zme kavuřturulmamıř sorunları ele almak iin aceleyle alınan kararlar nedeniyle Trk eđitim sistemi henz istenilen dzeye ulařmamıřtır. Gerekte, OECD lkeleri arasında ortalamanın altında bir performans sergileyen Trkiye, bařarılı lkelerin eđitim yaklařımlarını inceleyerek ve hem đrencilerin hem de okulların ihtiyalarını karřılamak iin gerekli esnekliđe izin vererek eđitim giriřimlerini modernize etmelidir (zerbař & Safi, 2021). Gncelliđini yitirmiř bir kaynak olarak kabul edilse de Savran'ın (2004) nerileri gz ardı edildiđi iin aynı hatalar hala geerlidir:- đrencilerin geliřim grevleri iřıđında, mfredat gncellenmeli ve řiir ezberleme gibi teknikler kk yařlarda seilmemelidir (Savran, 2004). Bunun sonucunda ocuklar kaınılmaz bir bařarısızlık duygusuyla byyebilirler. zellikle fen ve matematik derslerinde đretim, daimici ve zc bir bakıř aısı yerine deney, gzlem ve sorgulama zerine kurulmalıdır (Savran, 2004).

- đrencilerin ilgi ve ihtiyalarına gre đretim materyalleri oklu zeka kuramı iřıđında eřitlendirilmelidir (Savran, 2004).

Sınav odaklı eğitim sistemimizin ve ezberciliğin, diğer ülkelerin ihtiyaç duyduğu eleştirel düşünme ve sorgulama becerilerine sahip öğrenciler yetiştirmekte başarısız olduğu açıktır. PISA ve LGS gibi sınavların aynı bilişsel becerileri ölçmemesi ve okuduğunu anlamının iki sınavın birbirinden önemli ölçüde farklılaştığı bir alan olması bu durumun temel nedenlerinden biridir (Çiçek & Dilekçi, 2022). Benzer şekilde, derslerdeki ezber algısı ve matematik dersine yönelik duyuşsal engellerin yaygınlığı, PISA sınavının matematik bölümündeki başarısızlığının altında yatan nedenlerdir (Güler, 2013). Ayrıca, Ceylan'ın (2009) çalışmasından yola çıkan Çelen ve diğerlerine (2011) göre, Türkiye'de yüksek başarı gösteren okullardaki öğrenciler günlük yaşamda daha iyi performans göstermekte ve bu da eğitim programlarındaki canlılık kavramıyla örtüşmektedir. Türkiye, bir kez daha, fen bilimlerinde ortalamanın çok altında puan almıştır. Aradan geçen zamana rağmen çalışmalar arasındaki boşlukların giderilememiş olması talihsiz noktalardan biridir. Örneğin; Savran (2004) ile Çiçek ve Dilekçi'nin (2022) çalışmaları bu durumu açıkça göstermektedir. Benzer şekilde, Güler'in (2013) SBS sınavı üzerine yaptığı çalışma, sınavların isimleri değişse de içeriklerinin ve başarılarının gelişmediğini ortaya koymaktadır. Anıl'ın (2009) fen bilimleri sınavı için Çelen ve diğerlerinden (2011) aktardığına göre, babanın eğitim durumu bu durumun nedenlerinden biridir. Başarı, sosyoekonomik durumun yanı sıra okulların bölgesel konumlarından da etkilenmektedir (Çelen vd., 2011). Dünya Bankası'nın (World Bank) 2022 yılına dair paylaşılan verilerine göre Türkiye, dünyanın en büyük yirmi ekonomisinden biridir (World Bank, 2023). Daha önceki araştırmalarda ulusal eğitim harcamaları ile PISA puanları arasında bir bağlantı olduğuna dair kanıtlar bulunmaktadır. Bu ilişki, özellikle Finlandiya gibi ülkelerin GSYH ve eğitim harcamaları karşılaştırıldığında açıkça görülmektedir. Kılıçaslan ve Yavuz (2019) ise bu senaryoya katılmamış ve araştırmaları için ne kadar para harcadıklarından ziyade bu kaynakların nasıl kullanıldığının daha önemli olduğu sonucuna varmıştır. Eğitim Müfettişleri Başkanlığı, Türkiye'deki eğitim denetimi süreçlerini denetlemektedir. Saha uzmanları da rehberlik çalışmalarını denetler ve denetim grubu raporlarını gözden geçirir (Maya & Yılmaz, 2017). Eğitim kalitesinde hedeflenen standarda ulaşılması, denetim sonuçlarının şeffaf ve sürekli bir şekilde kamuoyuna, şehre ve ilgili mahalleye duyurulmasıyla büyük ölçüde desteklenebilir.

## **Araştırma Kapsamında yer alan Ülkelerin Eğitim sistemine ait Bulguların Karşılaştırılması**

İçerik kapsamına göre incelenen çalışmalar PISA sınavında ortalama üstünde başarı sağlayan ülkelerden Çin, İngiltere, Japonya, Güney Kore, Norveç, Finlandiya, Singapur ve Rusya olup bu ülkelere ilişkin bilgiler gruplandırılarak aşağıdaki çizelgede sunulmuştur.

### **Çizelge 1: Araştırma Kapsamında yer alan Ülkelerin Eğitim sistemine ait Verilerinin Karşılaştırılması**

	<b>Eğitim Felsefesi</b>	<b>Eğitim Projeleri</b>	<b>Öğretmen Yetiştirme Programları</b>	<b>Okul İdarecilerinin Yetiştirilmesi</b>
<b>Çin</b>	*	*	- Temel eğitim eğitimleri 2 yıl ön lisans eğitiminden sonra lisans eğitimi ile verilmektedir (Kadınsah vd., 2023).	- Görevlerine atanmış müdürlerin hepsi eğitim, psikoloji gibi alanlarda yetkinlik gösteren alanlarda uzmanlardır (Maya & Yılmaz, 2017). *
<b>İngiltere</b>	İlerlemecilik (Aydın, 2012).	- 2003-2005 yılları arasında eğitimde teknoloji yatırımlarına £50 milyon bütçe ayırmıştır (Lai, 2010; Özerbaş & Safi, 2021).	- Temel öğretmen eğitimi lisans eğitimi boyunca ve pratik eğitimi ise lisans eğitiminin son iki yılının her haftasında verilmektedir. Ek olarak, mesleğe başladıktan sonra üniversite hocaları ve danışman hocalar gözetiminde bir yıl süren staj eğitimi zorunludur. (Kadınsah vd., 2023).	
<b>Japonya</b>	*	- Her 10 yılda bir eğitim planlamaları yapılmaktadır (Aoki, 2017).	- Dört yıllık lisans eğitiminin son döneminde dört-beş hafta olarak öğretmen uygulaması dersleri verilmektedir (Kadınsah vd., 2023).	- 20 yılı başarılı bir öğretmen olarak tamamlayan öğretmenler müdür yardımcısı olurken, müdür olmak için 5 yıl müdür yardımcılığı yapmış olmak gereklidir (MEXT, 2021b).
<b>Güney Kore</b>	*	- Merkezi hükümet ve il eğitim ofisleri birlikte çalışarak planlamalarını günlük hayattaki uygulamalardan ve okullardan toplanan bilgiler doğrultusunda analiz ederek geliştirilir (KEDI, 2010). Her üç yılda bir gerçekleştirdiği okul değerlendirmelerini	- Öğretmen adayları lisans eğitimleri boyunca beş kredilik dersleri boyunca staj eğitimi almaktadır (Kadınsah vd., 2023). - Zorunlu stajyerlik eğitimi yoktur. - Diplomasını alan öğretmenler atanabilir imkanları bulunmaktadır, atandıktan sonra	- Okul müdürü ve müdür yardımcısı olmak için yüksek lisans ve doktora gibi tecrübeler belirleyici olmaktadır (Yavuz & Çakır, 2022). - Okul idarecilerinin görev kapsamında, öğretmen yeterlilikleri ve iş performansını değerlendirilme

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

**April 09-16, 2024 / Lisbon, Portugal**

		gerçekleştirilmektedir (Maya & Yılmaz, 2017).	buldukları okul ve profesyonel ağ gereği mesleki gelişim gerekmektedir (Kadınsah vd., 2023).	bulunmaktadır (Maya & Yılmaz, 2017).
<b>Norveç</b>	Varoluşçu teoloji ve yapılandırmacılık felsefelerini birleştiren bir ülkedir.	*	- Dört yıllık lisans eğitimine ek olarak bir yıl alan eğitimi gereklidir. - Öğretmen yetiştirme uygulamaları ile lisans eğitiminin her yılında en az yüz olması planlanır ve zorunlu bir staj eğitimi bulunmamaktadır (Kadınsah vd., 2023).	*
<b>Finlandiya</b>	Yapılandırmacılık	*	- Üç yıllık lisans eğitiminin ardından iki yıl yüksek lisans eğitimi gereklidir. - Her üniversitenin uygulama okulları vardır (Kadınsah vd., 2023). - Yüksek lisans eğitimi sonrasında isteğe bağlı bir yıl üniversite ve danışman hoca gözetiminde staj yapılabilmektedir (Kadınsah vd., 2023).	*
<b>Singapur</b>	Yapılandırmacılık	- Eğitimde teknolojiye yararlanmayı misyon edinen Singapur'da bilgisayarlar, tabletler, cep telefonları gibi teknolojik araçlar arasında hangilerinden yararlanmak istenildiği okulların ve öğretmenlerin isteğine bırakılmaktadır (Özerbaş & Safi, 2021). - Kodlama, robotik ve 3D teknolojisi gibi dersler ile teknoloji okuryazarı vatandaşlar yetiştirmeyi amaçlamaktadır (Zhao, 2017). - Eğitimde Liderlik Programı (LEP) - Okullarda Yönetim ve Liderlik Programı (MLS) programları oluşturulmuştur (NIE).	- Öğretmenlerin eğitim bakanlığı tarafından düzenlenen çalıştaylara ve eğitimlere katılma hakkı ve zorunluluğu bulunmaktadır (Kadınsah vd., 2023).	*
<b>Rusya</b>	Sosyalist görüşü temel alan ve Vygotsky'nin Sosyo-Kültürel Gelişim Kuramı ile Rusya'da dil ve kültür olgularının işlevselliğine dayalı bir eğitim sistemi	- Modern Dijital Eğitim Ortamı Projesi - İleri teknolojiler için çalışanlar için projeler - İnovasyon yaratma alanı olarak üniversiteler	*	*

<b>Türkiye</b>	oluşturulmuştur (Aydın, 2012). *	- Temel Eğitim Projesi * - Intel Gelecek için Eğitim - FATİH Projesi	- Okul idarecilerinin belirlenmesi adına yazılı sınav gereklidir. -Maarif Müfettişleri Başkanlığı aracılığıyla yürütülmekle birlikte denetim grupları raporları incelenmektedir ve aynı zamanda alan uzmanları tarafından rehberlik çalışmaları denetimi yapılmaktadır (Maya & Yılmaz, 2017).

## **SONUÇ ve TARTIŞMA**

Ülkelerin etkileşiminin arttığı günümüzde devletlerin eğitim politikalarının uluslararası sınavlarda başarılı bir noktada olan ülkelere dayanarak kendi eğitim bağamlarına aktarmaları hayati bir rol oynamaktadır. Bu çalışma Uluslararası Öğrenci Değerlendirme Programı (PISA) sınavında her ülkenin sonuçlarını etkileyen değişkenlerin kapsamlı bir analizini sunmaktadır. Çin, İngiltere, Japonya, Güney Kore, Norveç, Finlandiya, Singapur ve Rusya gibi ortalamanın üzerinde performans gösteren ülkelere odaklanarak, çeşitli ülkelerin PISA sınavında ne kadar iyi performans gösterdiklerine ilişkin verilerin analizine odaklanmaktadır. Çalışma, bu ülkelerde kullanılan etkili stratejilere dayanarak, Türkiye'ye eğitim uygulamaları ve politikaları için içgörü ve öneriler sunmayı amaçlamaktadır. Öğretmen yetiştirme programları ve okul liderliği ile ilgili on iki farklı makaleden elde edilen verileri içeriksel olarak düzenlemek ve incelemek için araştırmada içerik analizi kullanılmıştır. 21. yüzyılın taleplerini karşılayabilmek için eğitimde eleştirel düşünme, sorgulama ve yenilikçi becerilerin nasıl geliştirilmesi gerektiği de bu çalışmada incelenen kaynaklarda vurgulanmaktadır. Müreffeh ülkelerin eğitim sistemlerine ilişkin sonuçlar ve analizler, Türkiye'nin eğitim sisteminde yapılabilecek iyileştirmeler hakkında aydınlatıcı bilgiler sunmaktadır. Türkiye'nin bu ülkelerdeki iyi örnekleri inceleyerek eğitim sisteminde uygulamaya koyması oldukça önemlidir. Genç nüfusu fazla bir ülke olarak Türkiye, eğitim sistemini kısa zaman içerisinde güncellemeli ve başta PISA sınavı gibi sınavlarda başarılı sonuçlar elde eden ülkeleri örnek alarak nitelikli hedefler yönünde ilerlemelidir.

**Özet**

Suriye Arap Cumhuriyeti Orta Doğu bölgesinde sahip olduğu önemli jeopolitik konumu gereği bağımsız olduğu 1946 yılından günümüze bölgede kilit rol oynamış bir ülkedir. Soğuk Savaş döneminde bölgedeki kritik konumu sebebiyle ABD ve SSCB arasında mücadele alanlarından biri olsa da kısa zaman diliminde Suriye Arap Cumhuriyeti SSCB ile ilişkilerine öncelik verdi. Özellikle, Orta Doğu coğrafyasındaki Mısır, Suriye ve Irak gibi devletlerde hükümet olan Arap milliyetçiliği ve Sosyalizm ideolojisinin hakim olduğu BAAS Partisi döneminde SSCB bölgede önemli güç olmuş ve bu devletler tarafından ABD öncülüğündeki Batı Bloğuna karşı doğal müttefik olarak görünmüştür. Suriye ile SSCB arasında ilişkiler Soğuk Savaş döneminde ilişkilerin en üst düzeye çıkması Suriye Devlet Başkanı Hafız Esat ile gerçekleşmiştir. Soğuk Savaş sonrasında günümüze kadarda Suriye hala SSCB'nin varisi olan Rusya Federasyonu tarafından Orta Doğu jeopolitiğine en önemli müttefiki görülmektedir. Özellikle, Akdeniz'in doğusunda yer alan Suriye Rusya için aynı zamanda Akdeniz'e çıkış kapısı olarak da görünmektedir. 2011 yılında başlayan ABD ve Batı destekli Arap Baharı ile beraber Orta Doğu coğrafyasının yeniden dizayn edilmesi sonucunda Rusya Suriye'nin kaybedilmemesi için 2011-2015 yılları arasında uluslararası arenada siyasi olarak desteklemiş, 27 Eylül 2015 tarihinde Suriye Hükümetinin davet ile bölgeye yerleşerek günümüze kadar devam eden yeni bir jeopolitik denklemi yaratmıştır.

**SYRIAN ARAB REPUBLIC IN THE EURASIANISM, MIDDLE EAST AND  
MEDITERRANEAN POLICY OF THE RUSSIAN FEDERATION FROM  
HISTORICAL PERSPECTIVE TO THE PRESENT**

**Abstract**

The Syrian Arab Republic is a country that has played a key role in the region since 1946, since its independence, due to its important geopolitical location in the Middle East region. Although it was one of the areas of conflict between the USA and the USSR due to its critical location in the region during the Cold War, the Syrian Arab Republic prioritized its relations with the USSR in a short period of time. Especially during the period of the Baath Party, which was dominated by the ideology of Arab nationalism and Socialism, which was the government in the states in the Middle East such as Egypt, Syria and Iraq, the USSR became an important power in the region and was seen by these states as a natural ally against the Western Bloc led by the USA. Relations between Syria and the USSR reached their highest level during the Cold War period with Syrian President Hafez Assad. After the Cold War until today, Syria is still seen as the most important ally of the Russian Federation in Middle East geopolitics by the Russian Federation, the heir of the USSR. In particular, Syria, located in the east of the Mediterranean, also appears to be a gateway to the Mediterranean for Russia. As a result of the redesign of the Middle East geography with the Arab Spring supported by the USA and the West, which started in 2011, Russia supported Syria politically point of view in the international area between 2011 and 2015 to prevent it from being lost. It has created a geopolitical equation.

**Keywords:** The USSR, The Russian Federation, Syria, Middle East, Eastern Mediterranean

## **Giriş**

XX. yüzyıldan itibaren dünya üzerinde devam eden jeopolitik çatışmaların ana merkez bölgelerinden biri Orta Doğu coğrafyası olmuştur. Birinci Dünya Savaşı döneminde stratejik hedeflerden biri olan Orta Doğu coğrafyasının kaderi aslında Birinci Dünya Savaşı'nın bitişi sonrası Osmanlı İmparatorluğu'nun elinden çıkması ile değişti. Bölgede günümüze kadar devam eden sınır anlaşmazlıklarının temel sebeplerinden biri de 16 Mayıs 1916 tarihinde imzalanan Büyük Britanya ve Fransa arasında imzalanan Sykes-Picot antlaşması olduğunu da belirtmek gereklidir (Konu hakkında geniş bilgi için bkz: Barr, 2016). Birinci Dünya Savaşı sonrasında Fransa mandası altında kalan Suriye 1946 yılında bağımsızlığını elde ettikten sonra bölge jeopolitiğinde yeni dönüşümler yaşanmıştır. İkinci Dünya Savaşı sonrası dünyada mevcut olan 2 kutuplu düzen çerçevesinde uluslararası hareketlenmeler kendisini göstermekteydi. Kapitalist Batı Bloğunun lideri olan ABD ile Sosyalist Doğu Bloğunun lideri olan SSCB arasında jeopolitik mücadele farklı coğrafyalarda askeri, ekonomik, kültürel, ideolojik seviyede devam etmekteydi. Özellikle, iki süper gücün de nükleer silaha sahip olması sebebiyle iki devlet de birbirilerine karşı direkt savaş açmaktan çekinmekteydiler. Bu sebepten farklı bölgelerde devam eden mücadele alanlarından biri de Orta Doğu olmuştur. SSCB her ne kadar 14 Mayıs 1948 tarihinde kurulan İsrail'i ilk tanıyan devletlerden biri olsa da zamanla İsrail ve ABD yakınlığı sebebiyle Orta Doğu'da kendisine yeni müttefikler aramaya başlamıştır. Bu zaman SSCB yönetimi bölgede Suriye ile ilişkilerini güçlendirmeye karar verdi. Özellikle, Suriye'nin Akdeniz'in doğu bölgesinde denize çıkışı olması, Batı bloğu devleti olan Fransa'nın manda himayesinden kurtulması gibi faktörler SSCB'nin Suriye'ye yönelmesinde kritik faktörlerden biri olmuştur. Soğuk Savaş yıllarında Orta Doğu'da Mısır ile Suriye gibi ittifaklarla bölgede güç sahibi olan SSCB Nasır sonrası Mısır'da hükumete gelen Enver Sedat'ın Batı ile ilişkilere öncelik vermesi gibi faktörler sebebiyle SSCB bölgede Suriye Arap Cumhuriyetleri ile ilişkilerini daha da artırdı. Özellikle, BAAS partisinin Suriye'de iktidarı SSCB için büyük fırsattı. Soğuk Savaş'ın bitişine kadar SSCB ve Suriye ilişkileri en üst düzey müttefiklik seviyesinde devam etmiştir. Soğuk Savaş sonrası SSCB'nin liderlik ettiği Sosyalist Doğu Bloğunun çökmesi ile beraber ABD'nin önderlik ettiği tek kutuplu dünya düzeni çerçevesinde yeni bir jeopolitik denklem yaranmıştır. Dönemin Suriye Devlet Başkanı Hafız Esat Batı ile ilişkileri iyileştirmeye çalışsa da, 2000'li yıllardan itibaren Hafız Esat'ın oğlu Beşşar Esat'ın devlet başkanı olmasıyla bu politika yeniden değişmiş ve Rusya Federasyonu ile ilişkilerine tekrardan önem ve öncelik veren bir dış politikayı esas almıştır. Beşşar Esat'ın dış politikada

böyle bir hamle yapmasına temel sebep ABD'nin 11 Eylül 2001 olayı sonrası Afganistan'a ve 2003 yılında da Irak'a yaptığı müdahale ana sebep olmuştur.

Son olarak 2011 yılında dünya üzerinde başlayan Batı destekli 'Arap Baharı' Arap coğrafyasında hız kesmeden yayılması sonucunda Suriye'de de halk ayaklanmaları başlamış ve ülke büyük bir iç savaş yaşamıştır. Bu zaman diliminde Suriye yakın çerçevede Rusya Federasyonu ve İran İslam Cumhuriyeti ile, uzun çerçevede de Çin Halk Cumhuriyeti ilişkilerini en yüksek düzeyde tutarak mücadelesini sürdürmüştür. 2011-2015 yılları arasında Beşşar Esat'ın başkanı olduğu Suriye hükümeti rejimini destekleyen Rusya 27 Eylül 2015 tarihinde Suriye Hükümetinin daveti ile resmen askeri olarak bölgede yerini almıştır. Bununla da bölgede yeni bir jeopolitik denklem yaranmış ve günümüze kadar etkileyici bir dönem devam etmiştir. Bu çalışmamızda ilk önce SSCB'nin Soğuk Savaş döneminde Suriye Arap Cumhuriyeti ile ilişkileri ele alındıktan sonra Rusya Federasyonu'nun Orta Doğu ve Akdeniz ekseninde Suriye politikalarını incelenecektir.

### **SSCB'nin Orta Doğu Politikasında Suriye Arap Cumhuriyeti'nin Önemi**

İkinci Dünya Savaşı yıllarının sonunda dünyanın jeopolitik dengesi değişmeye başlamıştı. XIX. Yüzyıldan itibaren en büyük güç sahibi olan Büyük Britanya imparatorluğu her ne kadar İkinci Dünya Savaşı'nın galipleri arasında yer alsada, savaş sonunda büyük bir darbe alarak artık elindeki hegemonya gücünü ABD'ye devretti. Yalnızca İngiltere değil aynı zamanda Avrupa'daki ülkelerde başta Fransa olmakla büyük bir jeopolitik yıkım yaşadılar. Bu dönemde ABD özellikle SSCB'nin Doğu Avrupa'ya yerleşmesi üzerine bölgeye müdahale ederek SSCB'nin Atlantik kıyılarına yerleşmesine izin vermedi. Almanya'yı karada durduran en büyük gücün SSCB olduğunu hem Avrupa, hem de ABD çok iyi bilmekteydi. Böyle bir ortamda artık ABD ve SSCB arasında bir mücadele başlayacağını tahmin etmek zor değildi.

İkinci Dünya Savaşı sonlarında özellikle Büyük Britanya ve Fransa mandaterliği altında olan bölgelerin bağımsızlık çabaları artmaktaydı. Bu bağımsızlık arayışına giren ülkelerden biri de Suriye idi. Birinci Dünya Savaşı sonrası Fransa mandaterliği altına düşen Suriye İkinci Dünya Savaşı'nın sonlarına kadar bağımsızlığına sahip olamadı. Ancak İkinci Dünya Savaşı'nın ilk başlarında 2 hafta gibi kısa sürede Almanya ordusuna yenilen Fransa büyük bir işgal dönemi yaşamıştır. Bu şartlar altında mandaterliği altında olan bölgeleri elinde tutamayacağını anlayan Fransa başta Suriye olmakla mandaterliği altında olan diğer bölgelerden geri çekilmeye başladı. İkinci Dünya Savaşı sonrası Suriye Fransa'nın bölgeden çekilmesi sonrası artık bağımsızlığını elde etmek için hareket geçti. 1920 yılında bölgede ilk hakimiyetinin kuran Fransa'nın 25-26 yıl sonra geri çekilmesi ile birlikte Suriye 17 Nisan 1946 tarihinde bağımsızlığını ilan etmişti.

Büyük Britanya ve Fransa'nın bölgedeki mandaterliği altındaki bölgelerden geri çekilmesi sonrası Orta Doğu'daki güç boşluğu SSCB ve ABD arasında mücadele için yeni bir alan yaratmıştı. SSCB bu bağlamda ikili hareket ederek hem Suriye ile hem de bölgede yeni kurulma aşamasında olan İsrail ile ilişkilerini yüksek seviyeye getirmeye çalıştı. Bu bağlamda ilk önce daha Fransa Orta Doğu'dan resmen çekilmeden 1944 yılında Suriye'yi egemen bir devlet olarak tanımıştır. Ek olarak, yukarıda da belirttiğimiz gibi SSCB İsrail'in de tanınmasında etkin rol oynayarak bölgede güç sahibi olmak istese de İsrail'in kuruluşundan kısa bir süre sonra SSCB yerine ABD ile ilişkilerini güçlendirme çabalarını gören SSCB buna karşın bölgede Suriye Arap Cumhuriyeti ile ilişkilerine öncelik vermiştir (Dilek; 2017: 59).10 Şubat 1946 tarihinde ise SSCB ve Suriye arasında resmi antlaşma imzalanarak tanınma resmileştirilmiştir. SSCB 1950'li yıllarında Arap Coğrafyasının önemli bir kısmında resmen bir altın çağı yaşamıştır. Özellikle, Arap coğrafyalarının önemli bölgelerinde Arap Milliyetçiliği ve Sosyalizmi kendi bünyesinde barındıran BAAS Partisinin Irak, Mısır ve Suriye gibi ülkelerde iktidarı ele geçirmesi ve bu ülkelerin ABD başta olmakla Batı ülkelerine karşı duruş sergilemesi SSCB'nin bu coğrafyada altın çağı yaşamasında en önemli faktörlerin başında gelmektedir. SSCB Mısır ve Suriye'nin bölgedeki konumunu iyi analiz etmekteydi. Arap coğrafyasında çok kritik bir güce sahip olan bu iki ülke ile ilişkilerini iyi tutan bölgeye müdahale etme gücüne sahip olabilir. Bildiğimiz gibi bölge için "*Orta Doğu'da Mısrısız barış, Suriyesiz savaş olmaz*" deyimini kullanılmaktadır (Doster, 2016: 66). ABD'de de ulusal güvenlik danışmanı olan dünyaca ünlü stratejist ve uzman Henry Kissinger'in bu deyiminin altında aslında bu gerçeklik yatmaktadır. SSCB ile Suriye ilişkilerinde en önemli olaylardan biri Kuruluşu sonrası istikrarlı bir hükümet kurulamayan Suriye'de sık sık darbeler yaşanmıştır. Suriye'de bir darbe ile hükumete gelen Albay Edip Çiçekli'nin 1954 senesinde kendisinin de bir darbe ile devrilmesi sonrası Suriye'de de BAAS partisi artık iyice güçlenmeye başlamıştır. Ek olarak, Suriye Hükumeti 1954 yılında sosyalist bloğu ülkesi olan Çekoslovakya ile antlaşma imzalaması SSCB için çok önemli olmakla beraber Suriye Orta Doğu coğrafyasında sosyalist bloğu ile resmi antlaşma yapan ilk Orta Doğu ülkesi olmuştur (Çalışkan, 2016: 1). Bununla da yetinmeyen Suriye Hükumeti Savunma Bakanı Halit El-Azm'ı SSCB ile antlaşma imzalamak için Moskova'ya gönderdi. Temmuz-Ağustos 1954 tarihlerinde iki tarafın görüşmeleri sonucu mutabakat sağlanmış ve 7 Ağustos 1954 tarihinde antlaşma imzalanmıştır. Bu bağlamda Suriye'nin Doğu Akdeniz kıyısında limanlarından olan Lazkiye limanına SSCB için bir liman yapılması, SSCB'nin Suriye Arap Cumhuriyeti'ne 500 milyon dolarlık ekonomik yardım yapması ve askeri gücünü pekiştirmesinde yardımcı olunması kararlaştırıldı (Armaoğlu, 2019: 387). Bununla da

günümüze kadar devam eden Rus jeopolitik güç ve aklının Orta Doğu'da yerleşmesi planının ilk adımı atılmıştır.

Lazkiye Limanı

**Kaynak: Sputnik, 2021**

Suriye'nin SSCB ile bu yakınlaşmasını gören ABD 24 Şubat 1955 tarihinde Dwight Eisenhower doktrini çerçevesinde Orta Doğu'da yeni stratejik işbirliği yaratmak için kurduđu Bağdat Paktı'na (Sonraki ismi CENTO) dahil etmemiştir. Buna karşın Suriye'yi yalnız bırakmayan SSCB Çekoslovakya üzerinden 1956 yılında 60 askeri uzman ve 18 milyon dolarlık askeri yardım yapmış, 1957 yılında Bağdat Paktı ülkelerinin Suriye'ye yaptığı ekonomik ambargosuna karşı SSCB Suriye ile 570 milyon değerinde olan ekonomik ve teknik anlaşmalar imzalamıştır (Araz, 2018: 2). CENTO ABD'nin beklediğinin aksine bölgeyi birleştirmekten ziyade üç yere bölmüş ve SSCB'nin bölgeye girişini kolaylaştırmıştır. En önemlisi Arap Dünyası'nı birleştirmek isteyen Mısır Devlet Başkanı Cemal Abdülnasır'ın Bağdat Paktı ve 1956 yılında gerçekleşen Süveyş kanalı sorunu ile Batı karşıtı politika kurarak SSCB'ye yanaşmıştır. Ayrıca SSCB bu dönem Mısır'a silah satarak Orta Doğu ve Arap coğrafyasında prestijini büyük ölçüde yükselmiştir (Özel, 2012: 125-127). Ayrıca Suriye ve Mısır'ın da bu sürede ilişkilerini güçlendirmesi SSCB için Orta Doğu'da büyük fırsatları beraberinde getirmekteydi. Bu bağlamda en kritik dönem 1958 yılında yaşamıştır. BAAS Partisinin iktidarda olduđu Mısır ve Suriye Hükümetleri birleşme kararı olarak Birleşik Arap Cumhuriyetinin kurulmasına karar verdiler. Ancak 28 Eylül 1961 tarihinde darbe ile bu birleşme dönemi bitmiştir. Buna karşılık General Ziyad Hariri komutasında toplanmış bulunan Baasçı, Nasırcı ve Sosyalist Subaylar 8 Mart 1963 tarihinde darbe ile yeni rejime son verdiler

(Hasanzadeh, 2021). Suriye ile ilişkilerini stratejik olarak üst düzeye taşıyarak Orta Doğu coğrafyasında varlığını sürdürmek isteyen SSCB için 60'ların sonu, 70'lerin öncesi sorunlarla devam etmiştir. Suriye'de devam eden hükümetlerin istikrarsızlıkları ve darbe girişimleri, Mısır'da suikast sonucu hayatını kaybeden Cemal Abdülnasır'ın yerine devlet başkanı olan Enver Sedat'ın Nasır'ın aksine bir dış politika izleyerek ABD ve Batı ile işbirliğine öncelik vermesi SSCB'nin Orta Doğu politikalarında sorunlara sebep olmuştur. Mısır'da Enver Sedat'ın yürüttüğü dış politika sonrası Suriye SSCB için Orta Doğu coğrafyasında artık en önemli ülke haline gelmiştir. Suriye'nin SSCB ile ilişkilerini en yüksek düzeye getirmesi Hafız Esat'ın devlet başkanlığı döneminde gerçekleşmiştir. BAAS Partisinin tanınan isimlerinden olan Hafız Esat 1966 yılında savunma bakanı görevini yapmış, 1971 yılında ise devlet başkanı olmasıyla Suriye'nin iç istikrarı ve dış politikasında kritik dönem başlamıştır. Mısır'da Enver Sedat'ın Batı ile işbirliğini gören Hafız Esat artık Suriye'nin SSCB için Orta Doğu'da hayati öneme sahip olduğunu biliyordu. Devlet bakanı olduğu 1971 yılında Hafız Esat ilk devlet ziyaretini Moskova'ya yaparak SSCB ile ilişkilerini güçlendireceğinin mesajını hem SSCB'ye, hem de ABD'nin öncülük ettiği Batı Bloğuna verdi. Bu görüşme çerçevesinde alınan en kritik kararlardan biri Suriye'nin Doğu Akdeniz kıyısında kritik bir konuma sahip Tartus limanında SSCB'ye deniz üssü ve tesis kurma yetkisinin verilmesiydi. (Çalışkan, 2016: 2). Bu tesisin jeopolitik etkisi günümüze kadar devam etmektedir. SSCB'nin varisi Rusya Federasyonu en zayıf zamanlarda bile bu limanı elinden bırakmamış ve bu liman aslında Orta Doğu coğrafyasında Rus varlığının en temel sembollerinden biri olmuştur.

**Tartus Limanı**

**Kaynak: DW Türkçe, 2020**

Sonraki dönemde de Hafız Esat SSCB ile bir sıra antlaşmalar imzaladı. Bu bağlamda imzalanan antlaşmalardan biri olan 8 Ekim 1980 tarihindeki antlaşma ile Suriye ordusunun subayları askeri eğitim almak için SSCB'ye gittiler. 14 Kasım 1980 tarihinde SSCB ve Suriye Arap Cumhuriyeti arasında ilişkileri en üst düzeye çıkaran ve 20 yıllık süreyi kapsayan 15 maddelik Dostluk ve İşbirliği antlaşması imzalandı (Aslanlı, 2018: 2). 1979 yılında Camp David süreci çerçevesinde Mısır ve İsrail yakınlaşmasını kendi egemenliğine bir tehdit olarak algılayan Suriye SSCB ile bu antlaşmayı imzalaması farklı bir anlamda beraberinde taşımaktaydı. Bu antlaşma ile artık iki ülke neredeyse bir birine garantör olmuştur. Ek olarak, Suriye bu antlaşma ile 1979 sonunda başlayan SSCB'nin Afganistan işgalini tanımış, bunun karşısında SSCB'de İsrail üzerinden mevcut olan Siyonizm'i bir ırkçılık olarak tanımlamıştır (Çalışkan, 2016; 2-3). Ayrıca bu dönemde binlerce Sovyet uzmanı Suriye'ye gelerek orduyu eğitme, teknik ve ekonomik kalkınma, eğitim seviyesi gibi meselelerde görev aldılar. Ek olarak, Suriyeli öğrenciler de SSCB'nin farklı bölgelerine giderek eğitimlerine devam ettiler ve bir kısmı zamanla devlet kademesinde önemli yerlere geldiler. Bununla da SSCB Suriye üzerinden ağırlığını Orta Doğu coğrafyasında devam ettirmektedir.

### **Soğuk Savaş Sonrası Rusya Federasyonu ve Suriye Arap Cumhuriyeti İlişkileri**

1945-1990 yıllarında SSCB ve ABD arasında devam eden Soğuk Savaş'ın sonucunda SSCB ve Sosyalizm mağlup olmuş ve dünyada yeni bir jeopolitik düzen yaranmıştır. ABD öncülüğünde tek kutuplu dünya düzeninin devamı bütün dünyayı yeni bir dönemden geçirmekteydi. SSCB sonrası onun esas varisi olan Rusya Federasyonu 'Kozirev Doktrini' ile Batı karşısında teslimiyetçi bir tutum sergilemiştir. Ancak ülkede milliyetçi ve Avrasyacı toplumun tepkileri karşısında dönemin Rusya Devlet Başkanı Boris Yeltsin 'Yakın Çevre' doktrinini ilan ederek eski Sovyet coğrafyasına tekrardan yönelmiştir. Bir dönem sonra Batı ile işbirliğini hedefleyen 'Kozirev Doktrini' aksine 'Primakov Doktrini' öne çıkmış ve yeni bir dönem başlamıştır. 2000 yılında devlet başkanı olan Vladimir Putin'in Rusya'nın bir Avrasya ülkesi olduğunun altını çizmesi de Rusya için yeni bir dönemi başlatmıştır (Perinçek, 2016: 37-38; Avrasyacı yaklaşımın Rus jeopolitiğinde önemi hakkında bkz: Dugin, 2018). SSCB sonrası Rusya'nın Batı ile yakınlaşmasını gören Suriye Devlet Başkanı Hafız Esat da Batı ile işbirliğine yönelmiş ve Suriye için farklı müttefikler aramaya başlamıştır. Ölümü sonrası iktidara gelen oğlu Beşşar Esat da aynı politikalara başvursa da, kısa bir süre sonra bu politikadan dönmüştür. ABD'nin 11 Eylül 2001 olayı sonrası Afganistan'a ve 2003 yılında da Irak'a yaptığı müdahale ve sergilediği tutum Batı'nın Arap coğrafyasında imajının değişmesine sebep olmuştur. Bu bağlamda babası Hafız Esat gibi Rusya ile ilişkileri artırmak isteyen Beşşar Esat 2005 yılında

Moskova'yı ziyaret ederek Rusya ile antlaşma imzalayarak Rusya ve Suriye arasında yeni bir dönemin açılmasına sebep olmuştur. Suriye'nin Soğuk Savaş döneminde SSCB için nasıl önemli olduğunu iyi analiz eden Vladimir Putin Avrasya coğrafyasında Rusya'nın etkin olması için hem Orta Doğu'da, hem de Akdeniz coğrafyasına deniz üzerinden çıkışı olan Suriye ile ilişkileri yükseltmeye çalışmaktaydı. 2005-2010 yılları arasında Suriye'ye 3 milyar dolara yakın değerinde silah ihracatı planlayan Rusya 2006 yılında da Suriye'den Rusya'ya yapılan tekstil ürünlerine gümrük vergisini de %25 oranda indirerek Suriye ekonomisine büyük katkı sağlamıştır. Bu bağlamda İran ile de ticaretini ve ilişkilerini iyi tutan Suriye Rusya'nın silah ihracatında iki önemli devlet olmuştur. 2002-2009 yılları istatistiklerinde Rusya'nın Suriye ve İran'a yaptığı silah ihracatı dünya üzerindeki bütün silah ihracatının %10'unu kapsamaktadır. 2018 yılına geldiğimizdeyse Suriye Ortadoğu'da İran'dan sonra Rusya'dan en büyük ikinci silah ithalat eden ülkedir (Hasanzadeh, 2021).

#### **Arap Baharı çerçevesinde Rusya Federasyonu'nun Suriye'ye gelişi**

25 Aralık 2010 tarihinde Tunus'ta kendini işinin elinden alınması sebebiyle kendini yakan 26 yaşındaki Muhammed Buazizi'nin ölümü ile birlikte ilk önce Tunus'ta, sonra ise Orta Doğu coğrafyasında yeni bir dönem başlamıştır. SOROS destekli devrimler 2000'li yıllarda Gürcistan, Kırgızistan'da kazanımlar elde ettikten sonra ABD'nin yeni dünya düzeninde Orta Doğu politikalarında da önemli rol oynadı (ABD'nin Soğuk Savaş sonrası Orta Doğu politikaları hakkında bkz: Taşcıoğlu, 2009). ABD'nin Orta Doğu ve Afganistan'da 2000'li yıllarda güçlendiğini gören Rusya Arap Bahar'ının ABD lehine döndüğünü anlamıştı. Özellikle, Libya'da Kaddafi'nin devrilmesi sonrası sıranın artık Suriye'ye gelmesi Rusya için bir dönüm noktası oldu. Mart 2011 tarihinde Suriye'de başlayan halk hareketleri kısa süre sonra iç savaşa döndü. BM Güvenlik Konseyi Libya'da olduğu gibi Suriye Hükümetine de yaptırım uygulamaya çalışsa da, Rusya ve Çin'in 3 kere vetosu karşısında bu kararlar alınamamıştır (Hasanzadeh, 2021). İç savaşın başlamasıyla ilk günden Suriye Hükümetine siyasi desteğini esirgemeyen Rusya 2013 yılına kadar 600 milyon dolarlık askeri sözleşmeler ile de rejimin arkasında olduğunu ve desteğinin devam edeceğini göstermiştir (Gafarlı, 2018: 189). Suriye'nin günümüzde Rusya için önemini sıralarsak Moskova Suriye'de rejimin devrilmesi sonrası sıranın ABD ve İsrail tarafından İran'a karşı mücadelesine geleceğini ve Rusya'nın güneyinde yeni bir mücadele başlamasını istememekteydi. Aynı zamanda Sünni rejimlerin süreçte desteklenmesi Rusya'nın iç ve dış güvenliği açısından da kritik bir anlam taşımaktaydı. Ek olarak, yukarıda belirttiğimiz gibi Tartus askeri üssünün varlığı Rusya'nın Orta Doğu'da tek askeri üssü özelliğini taşımasıyla beraber Irak ile yaptığı enerji ticaretinde de kritik role

sahipti (Demirağ, 2016: 79). Ek olarak, Suriye’de %15 Ortodoks mezhebine sahip Hristiyanlığının bölgede mevcut olması da Rusya’nın bölgede var olmasının esas faktörlerindedir. Bildiğimiz gibi Rusya kendisini Ortodoks Hristiyanlığının hamisi olarak görmektedir ve bu kozu kullanarak İstanbul’da ikamet eden Fener Rum Patrikhanesine karşı da mücadele etmektedir (Ağır&Takar: 2016: 296).

Rusya’nın Suriye’ye askeri olarak yerleşmesi ise 2015 yılında gerçekleşmiştir. ABD, Batı ve İsrail tarafından kuşatma altına alınan Suriye Arap Ligası tarafından da darbe almaktaydı. 2013 yılında Suriye Hükümetine askeri yönden destek İran İslam Cumhuriyeti tarafından gelmiş ve bölgede Şii milislerin faaliyeti başlamıştır. 2015 yılında ise iyice büyüyen tehdit karşısında Suriye hükümeti Rusya’dan resmen askeri yardım talep etmiştir. Bu bağlamda Rusya 27 Eylül 2015 tarihinde bölgeye gelmiş ve Suriye rejiminin başarılarında en kritik pay sahibi olmuştur. Rusya’nın bu kararı almasında Esat’ın muhalifler ve IŞİD’e %18 oranında toprak kaybetmesi ve Temmuz 2015’de dönemin İran Devrim Muhafızları Kudüs Gücü Komutanı olan Kasım Süleymani’nin Moskova ziyareti de önemli olmuştur. Bu bağlamda Suriye’ye gönderilen Rus askeri sevkiyatının İran ve Irak üzerinden devam etmesi de dikkat çekici husus olarak karşımıza çıkmaktadır (Erşen, 2021: 75). Askeri olarak Suriye rejimine destek veren Rusya Federasyonu Suriye’nin siyasi egemenliği ve toprak bütünlüğünün mevcudiyeti için de önemli girişimlerde bulunmuştur. 23 Ocak 2017 tarihinde Rusya Federasyonu, İran İslam Cumhuriyeti ve Türkiye Cumhuriyeti kapsamında günümüze kadar devam eden görüşmelerinde, 17 Eylül 2018 tarihinde Rusya Federasyonu ve Türkiye Cumhuriyeti çerçevesindeki Soçi Görüşmesinde taraflar Suriye’nin toprak bütünlüğünü resmen tanımıştır. Suriye’nin toprak bütünlüğünün korunmasında önemli pay sahibi olan Rusya aynı zamanda Suriye topraklarında varlığı iyice artırmaktadır. 13 Haziran 2019 tarihinde Rus jeopolitik gücünün Orta Doğu’da en temel varlığı olan Tartus limanının Suriye Hükümeti tarafından Rusya’ya 49 yıllığına kiralanmasının onaylanması Rusya’nın ABD ve Batı’ya karşı büyük zafer adımıydı (Aydınlık, 2019). Doğu Akdeniz’de güç mücadelesinde Rusya için önemli bir dayanak noktası olan Tartus Limanı Rusya’nın Akdeniz ve Kuzey Afrika mücadelesinde de kritik bölge niteliği taşımaktadır. Ayrıca Libya’da var olan ve Hafter hükümetini destekleyen Rusya’nın paralı gücü olan Wagner grubu Suriye’den devamlı olarak askeri ve lojistik destek almaktadır. Aynı zamanda Mısır’da Sisi Hükümeti ile de ilişkilerini devam ettiren Rusya Doğu Akdeniz’de mevcut olan enerji mücadelesinde de önemli bir aktör rolündedir.

### **Sonuç**

Genel olarak, baktığımızda Orta Doğu coğrafyasında özellikle Arap Baharı farklı bir jeopolitik denklem yarattı. Batı destekli Arap Baharı Orta Doğu ve Arap coğrafyasında yeni dönemlerin kapısını aralamakla beraber Rusya'nın da bölgeye askeri olarak gelmesine neden oldu. Arap Baharı sonrası Tunus, Mısır ve Libya gibi ülkelerde liderlerin devrilmesi Suriye'nin de aynı akıbeti yaşayacağını düşündürse de senaryo tamamen farklı olmuştur. Özellikle, Rusya Federasyonu'nun yanında İran İslam Cumhuriyeti'nin ve Çin Halk Cumhuriyeti'nin de Suriye'deki Esat rejimine destek durması ABD ve Batı'nın planlarını büyük ölçüde sekteye uğratmıştır. Günümüzde Suriye hükümetinin en büyük garantörü olan Rusya Federasyonu Suriye'de gücünü pekiştirmek için askeri takviyelerini artırmakla beraber stratejik noktalarda da varlığı artırmaktadır. Kısa ve orta vadede Batı'ya karşı devam eden mücadele uzun vadede Suriye üzerinde Rusya-İran-Çin mücadelesine de şahitlik etmektedir. Rus Avrasyacı jeopolitiğinde eski Sovyet coğrafyasına ek olarak SSCB ile ilişkilerini üst düzey tutan Sosyalist ülkeler de yerini almaktadır. Ayrıca Doğu Akdeniz'e çıkışı olan Suriye Rusya Federasyonu'nun sıcak denizlere inmede en kritik kapısı olmağa da devam edecektir. Avrasya jeopolitiğinde devam eden büyük mücadelede Soğuk Savaş'ta olduğu gibi günümüzde de farklı coğrafyalarda devam etmektedir. Soğuk Savaş'ın sonlarında yaşandığı gibi Suriye Rusya ile ilişkilerini en üst düzeye çıkarması Batı ile mücadelesinde en temel dayanak noktası olmaktadır. Ayrıca Orta Doğu'da günümüzde Rusya-İran-Çin işbirliği aynı zamanda Avrasya coğrafyasının temel kalbi sayılan Orta Asya'da da kendisini gösterebilir ve ABD ile Batı'nın Rusya'nın Avrasya jeopolitik kavramında en hassas bölgesini zayıflatmak planlarını sekteye uğratabilir.

**Özet**

Şaside, şasinin maksimum kayma gerilmesi ve maksimum yük altında deformasyon tasarım ve analiz için önemli kriterlerdir. Formula öğrenci arabaları söz konusu olduğunda diğer şasilere göre hem daha güçlü hem de daha hafif bir tasarıma ulaşmak gerekir. Bu çalışmada Formula öğrenci araç şasisinin tasarımı ve analizi anlatılmaktadır. Araç şasisinde yüksek mukavemetli AISI 4130 ve S355 çeliklerinin yanı sıra ultra yüksek mukavemetli Usibor 1500 çeliği kullanılmış olup, Formula öğrenci arabası şasisinin yapısal analizi ve modal analizi için sonlu elemanlar analizi (FEA) yöntemi kullanılmıştır. Formula öğrenci arabasının şasi tasarımı CATIA V5R21 programıyla tasarlandı. Üç farklı yüksek mukavemetli çelik üzerinde ön yüklemeli titreşim analizi yapıldı ve on farklı modda analiz edildi. AISI 4130 ve S355 çeliklerinin frekans değerleri karşılaştırıldığında S355 çeliğinin sonuçlarında ortalama %0,53 oranında artış gözlenmiştir. Ultra yüksek dayanımlı Usibor 1500 çeliğinin frekans değerlerinde S355 çeliğinin frekans değerlerinde ortalama %1,99 oranında azalma gözlemlendi. AISI 4130 çeliğinin eşdeğer gerilme değeri 400 MPa, S355 çeliğinin 395 MPa ve ultra yüksek mukavemetli çeliğin eşdeğer gerilme değeri 396 MPa idi. Ultra yüksek mukavemetli çelik, AISI 4130 malzemesinden 2,33 kat, S355 malzemesinden 3 kat daha yüksek güvenlik faktörüne sahiptir. Titreşim analizi sonuçlarından onuncu modda en yüksek değer 256,46 Hz ile S355 çeliğinden elde edildi. Onuncu modda en düşük deformasyon, 20.263 mm ile ultra yüksek mukavemetli Usibor 1500 çeliğinden elde edildi.

**A MODAL ANALYSIS STUDY USING DIFFERENT MATERIALS IN THE  
FORMULA STUDENT CAR CHASSIS**

**Abstract**

In the chassis, the chassis maximum shear stress and deflection under maximum load are important criteria for design and analysis. When it comes to Formula student cars, it is necessary to achieve a design that is both stronger and lighter than other chassis. This study describes the design and analysis of the formula student vehicle chassis. High-strength AISI 4130 and S355 steels as well as ultra-high-strength Usibor 1500 steel were used in the vehicle chassis and the finite element analysis (FEA) method was used for structural analysis and modal analysis for the Formula student car chassis. Formula student car chassis design was designed with the CATIA V5R21 program. Preloaded vibration analysis was performed on three different high-strength steels and analyzed in ten different modes. The frequency values of AISI 4130 and S355 steels were compared and an average increase of 0.53% was observed in the results of S355 steel. The frequency values of ultra-high strength Usibor 1500 steel were observed to decrease by an average of 1.99% in the frequency values of S355 steel. The equivalent stress value of AISI 4130 steel was 400 MPa, S355 steel was 395 MPa and ultra-high strength steel was 396 MPa. Ultra-high strength steel has 2.33 times higher safety factor than AISI 4130 material and 3 times higher safety factor than S355 material. From the vibration analysis results, the highest value in the tenth mode was obtained from S355 steel with 256.46 Hz. The lowest deformation in the tenth mode was obtained from ultra-high strength Usibor 1500 steel with 20.263 mm.

**Keywords:** Formula Student Car, Chassis, Structural Analysis, FEA, Ultra High Strength Steel

## **Introduction**

The chassis is the central skeletal structure of a vehicle that must carry all its components and support all loads. The weight of each component and the forces during acceleration, deceleration, and cornering are included in these loads. A well-designed chassis becomes critical to the vehicle's safety, performance, and roadworthiness (Mat & Ghani, 2012). Formula SAE is a student competition sponsored by the Society of Automotive Engineers (SAE) in which students plan, build, and complete a small equation-style racing car. The FSAE competition was undertaken to provide students at the school with an educational experience that is practically equivalent to the kind of initiatives they would encounter in business energy (Lavanya et al., 2014). The most important point of focus in the chassis design of the Formula Student racing car is to comply with the rules and to consider the width and weight, which are the most basic problems of vehicle chassis. The chassis designed for the Formula Student race car is quite complex. This compactness leads to several ergonomics-based problems. It is very difficult to make a change or arrangement in the engine part or the pedal part located at the very tip of the nose (Oymak & Feyzullahoglu, 2021).

Patil and Chikkali (Patil & Chikkali, 2020), in their research paper, basically made an analysis of the FSAE chassis. This chassis was designed in accordance with the FSAE rules. The material of choice for the FSAE chassis is AISI4130 chromium and Molybdenum alloy, which has high strength as well as low weight. The analysis was performed on standard results to obtain the maximum possible strength and minimum weight. The software tools used for the analysis are ANSYS. Khan (Khan, 2021) defined the AISI-4130 material into the space frame chassis, resulting in a design that took structural analysis and ergonomics into consideration. Torsion analysis was performed to analyze the increasing forces acting on the chassis. After verification by a simplified version of the models and analytical comparison, the one-dimensional beam model was analyzed and the results were compared with the theoretical equations. The stress and deformation results of the design were also found by using the same parameters in the three-dimensional model analysis. Rosenow (Rosenow, 2022) worked on the development of an FSAE-EV chassis in his capstone project. The design went through several iterations, driven by analytical test results that will be discussed in this document, as well as design considerations developed by stakeholders discovered during the project. Overall, this document has provided an overview of the initial design requirements developed for the chassis concept, the design process for the development of the chassis under this project how the influencing factors were considered, and how the design was refined accordingly. Singh (Singh,

2010) in his research paper introduces various concepts related to load distributions and associated deformation modes of the chassis. Dynamic and static load distributions were calculated numerically and the boundary conditions to be applied during various FEA tests were determined. The safety factor was found by analyzing the stress distributions and lateral displacements occurring in dynamic, static, and frequency modes. Torsional stiffness was found to be 615.98 Nm/degree, which is 2.46 times that of the old design. The weight of the chassis was measured at approximately 32 kg, making it 1.13 times less than the previous chassis. As a result of the study, the ratio of the percentage increase in torsional stiffness to the percentage decrease in weight was found to be 13.15:1. Hiller (Hiller, 2020) designed and analyzed a Formula-style vehicle in his project. The carbon fiber monocoque chassis system was designed to be lightweight, considering packaging constraints, Formula SAE rules, and design parameters set by Formula SAE. The monocoque geometry was modeled using SolidWorks, the carbon composite was simulated and tested using ANSYS and quasi-static load frame testing. The newly designed monocoque chassis reduced the weight by 8.24 kg compared to the old one and reduced the cost by \$3,442.57. Anas et al. (Anas et al., 2018) worked to identify weak points and life in the design of a Formula car chassis. While the chassis design was done with the CAD program, fatigue analysis, static analysis, and modal analysis were done in ANSYS. It was stated that vibration transmission path analysis is an alternative to the modal analysis approach in determining noise and vibration problems and reflects the performance of the chassis. Hagan et al. (Hagan et al., 2014) studied a Formula-style race car designed, built, and tested by Cal Poly's Formula SAE Team. The team raced in 2012 with a heavy and underdeveloped chassis, resulting in high vehicle weight (450 lb. total, 122 lb. of which was in the chassis itself and 143 lb. in the entire chassis subsystem). It was developed with composite materials in mind for low weight and driver safety. The design, analysis, and production of a monocoque chassis were studied. Ryan (Ryan, 2008) aimed to identify methods for using an engine in a Formula SAE racing car chassis and verify the results through simulation and testing. Modal analysis with the beam web of the chassis was used to verify the increase in chassis stiffness. The results revealed that the stiffness increased with the structural support at the engine connection points of the chassis, and the initial elastic vibration mode changed from bending to torsion. Chassis deformation was determined by static analysis and it was discovered that there was a reduction in deformation by providing structural support at the engine mounting points of the chassis. Kumar et al. (Kumar et al., 2014) examined various material selection methods and design optimization techniques using ANSYS. The basic design is based on

human anthropological data and allows the racer to enter and exit the vehicle quickly. After the design decision, a static analysis of the vehicle was made. The design and analysis processes were carried out with the FSAE 2013 rule book and historical knowledge of automobile design and production.

This study aims to investigate the equivalent stresses, deformations, safety factors, and natural frequencies of the Formula car chassis under the loadings specified in the FSAE rules using three different materials for design.

### **Materials and Methods**

Material properties are taken from Azom for AISI 4130 Steel (Azom, 2024). S355 material properties are taken from MatWeb and MatMach (MatMach, 2024). AISI4130 material and Usibor 1500 material features were taken from Arcelormittal group (Arcelormittal, 2024).

The features of the materials are given in Table 1.

**Table 1.** Characteristics of materials

<b>Materials</b>	<b>Density (kg/m<sup>3</sup>)</b>	<b>Young's Modulus (GPa)</b>	<b>Poisson's Ratio</b>	<b>Tensile Yield Strength (MPa)</b>	<b>Tensile Ultimate Strength (MPa)</b>
<b>AISI 4130</b>	7850	210	0.27	460	560
<b>S355</b>	7800	210	0.3	355	630
<b>Usibor® 1500</b>	7860	205	0.29	1100	1500

In this research, CAD program and FEM software were used for design and analysis. Owing to these programs, the theoretical results of our study were presented. The image of the design created through the Keyshot 12 program is shown in Figure 1.

**Figure 1.** Formula student car design in keyshot 12

The dimensions of the Formula car chassis designed through the CATIA program are 2250 mm in length and 925 mm in height. ANSYS creates the engineering approach by combining CAD and FEA related files. ANSYS allows you to import CAD data and create geometry through a "pre-processing" process. At the same time, the mesh model required for calculation is created in the same preprocessor. Once the loadings are defined and the analysis is performed, the results can be displayed numerically and graphically (Figes, 2016). The mesh model for the chassis was created as shown in Figure 2. The optimal number of elements is 293394 and the number of nodes is 445293. The most widely used and closest to reality mesh quality criterion is skewness, i.e. curvature-based mesh quality criterion. In this analysis, the average curvature quality value was determined as 0.23846.

**Figure 2.** Isometric view of the frame after meshing

Fixed supports for the frame are placed at the swing positions. The total number of supports is sixteen. The force applied to the frame was 60 kN at the top point. FSAE standards were taken as a reference when determining the magnitude of the force. The boundary conditions determined for the analysis are shown in Figure 3.

**Figure 3.** Boundary conditions set for the analysis

**Findings and Discussion**

As a result of the analysis, the deformation value of AISI 4130 and S355 steels was obtained as 2.9 mm. In ultra-high strength steel material, this value was 3 mm. The equivalent stress value of AISI 4130 steel was 400 MPa, S355 steel was 395 MPa and ultra-high strength steel was 396 MPa. The safety factor of our AISI 4130 steel was 1.159. The lowest value was obtained in S355 steel, and the safety factor value of S355 is 0.9. The safety factor of ultra-high strength steel was 2.7 and the highest safety factor was obtained. The values obtained are shown in Table 2.

**Table 2.** Results of structural analysis

	<b>AISI 4130</b>	<b>S355</b>	<b>Usibor 1500</b>
<b>Total Deformation (mm)</b>	2.9	2.9	3
<b>Equivalent Stress (MPa)</b>	400	395	396
<b>Safety Factor</b>	1.159	0.9	2.7

The images of the three steels as a result of the analysis are indicated in Figure 4 and Figure 12.

The modes used in FEM software are based on natural frequencies. One of the most important conditions for visible differences in the change of natural frequency is the mass of the material. When the properties of materials in Table 1 are compared, it is observed that their specific masses are quite close to each other. This makes them quite similar in their vibration characteristics. Another important property is the flexibility of the material. With this feature, they have very close values with each other. There was one more factor in our analysis made through the FEM program. The fixed support boundary conditions determined for the design directly affect the frequency values obtained. Since the same boundary conditions were preferred in the analysis process of each material, no difference was obtained in this respect. The resulting frequency and deformation values are given in Table 3.

### **Conclusion and Recommendations**

In this study, a Formula car chassis was designed, and structural analysis and vibration analysis were carried out with three diverse materials, and the properties of the design, and materials were investigated. The following results were obtained during the study;

- Design with ultra-high strength steel material has a factor of safety 2.33 times higher than AISI 4130 and 3 times higher than S355.
- When the results of the structural analysis were compared, the equivalent stresses and total deformations of all three materials were very close to each other. The highest value was observed in AISI 4130 material with 400 MPa. 396 MPa followed by ultra-high strength steel and S355 with 395 MPa.

- AISI 4130 and S355 materials had a total deformation of 2.9 mm, while 3 mm was obtained from ultra-high strength steel.
- When the modal analysis results are compared, the lowest frequency values are obtained from ultra-high strength steel.

In subsequent analysis studies, weight reduction can be achieved by applying topology in the design of the chassis, and the cost can be reduced along with the topology with appropriate material combinations.

**Özet**

Ağır ticari araç şasileri, düzenli olarak geliştirilen askeri projelerde, taşımacılıkta, beton pompalarında ve benzeri sektörlerde sıklıkla kullanılan bir şasi türüdür. Bu şasi tiplerinin farklı sektörlerde tercih edilmesi, dayanıklılığın yanı sıra hafiflik ve maliyet gibi parametreleri de ön plana çıkarmaktadır. Bu çalışmada ağır ticari araç şasi tasarımında topoloji yöntemi kullanılarak şasi ağırlığının azaltılmasına yönelik tasarım değişiklikleri yapılmıştır. Tasarım için CATIA V5 R21 tasarım programı kullanıldı. Analizlerde ANSYS Workbench R23 sonlu elemanlar analiz programı kullanıldı. Şasi analizinde St-37 (yapısal çelik), Usibor 1500 (UHSS) ve S690QL çeliği olmak üzere üç farklı malzeme kullanıldı. Bu çelik gruplarının seçilmesinin nedeni, farklı şekil ve dayanımlardaki çelik gruplarının topoloji optimizasyonu yoluyla karşılaştırılmasının incelenmesiydi. Analizler sonucunda üç farklı çelik grubu toplam deformasyon, eşdeğer gerilme değeri, güvenlik faktörü ve maliyet açısından karşılaştırıldı. Çalışma sonuçları, optimize edilen parçaların ağırlığının %37,84 oranında azaldığını gösterdi. Ayrıca elde edilen veriler çelik gruplarındaki güvenlik faktörü değerlerinin 1.04 ila 1.07 kat daha iyi olduğunu yansıtmaktadır. Tasarımda topoloji optimizasyonu ile malzeme maliyetlerinin yaklaşık 1.61 kat azaldığı, şasinin bazı noktalarındaki gerilim değişimlerinin belirli noktalardan farklı bölgelere dağıtılmasıyla kritik nokta sayısının azaldığı tespit edilmiştir.

**AN OPTIMIZATION STUDY: EXAMINING DIFFERENT MATERIALS USAGE IN  
THE TRUCK CHASSIS**

**Abstract**

Heavy commercial vehicle chassis is a chassis type that is frequently used in regularly developed military projects, transportation, concrete pumps, and similar sectors. The preference of these chassis types in different sectors highlights parameters such as lightness and cost, as well as durability. In this study, design changes were made in the heavy commercial vehicle chassis design by using the topology method to reduce chassis weight. CATIA V5 R21 design program was used for the design. ANSYS Workbench R23 finite element analysis program was used for analyses. Three different materials were used in the chassis analysis, namely St-37 (structural steel), Usibor 1500 (UHSS), and S690QL steel. The reason for choosing these steel groups was to examine the comparison of steel groups in different shapes and strengths through topology optimization. As a result of the analyses, three different steel groups were compared in terms of total deformation, equivalent stress value, safety factor, and cost. The study results showed that the weight of the optimized parts was reduced by 37.84%. In addition, the data obtained reflects that the safety factor values in steel groups are 1.04 to 1.07 times better. It has been determined that material costs are reduced by approximately 1.61 times with topology optimization, and the number of critical points is reduced by distributing the stress changes at some points of the chassis from certain points to different regions in the design.

**Keywords:** Finite element method, Optimization, Ultra-high strength steel, Structural steel, S690QL

## **Introduction**

Vehicle chassis are one of the fundamental building blocks of the automotive industry and have a major impact on the durability, safety, and performance of the vehicle. With technological developments and advances in material science and engineering, chassis designs have also undergone significant changes. After ensuring that the design is safe for humans, material selection becomes one of the most important points, as well as costs such as manufacturability, part cost, labor cost, transportation cost, and transportation permitting. At this point, optimum design, accurate material analysis, and selectable potential material cost feasibilities are indispensable for the vehicle to be produced. These parameters enable optimizing the appropriate storage units to increase the loading amount of the passenger truck charger and designing suitable storage units with stress analysis, taking into account the stress distribution factor for different cross-sections under different loads. They decided to profile the most appropriate stress value of the parts to be produced with the finite parameter's method (Kengkongan et al., 2020). In the Veleso et al. study, a deformation analysis of the longitudinal beam of a prototype vehicle was carried out. During the durability analysis, deformations at the junction points of the buffer of the vehicle solutions were detected. Cracks appear in the beam and continue to grow. Stress analysis was carried out using the finite element method. The resulting result was supported by a new design. The resulting cracks were removed (Veloso et al., 2009). There are methods that include techniques for the design of automotive components. In particular, topology, tonometry, and size ranges are monitored in conjunction with FEM (Finite Element Method) analysis and for guidance to ensure optimal hardware configuration. This work combined design elements of high-performance vehicle components with a central engine at the rear (Cavazzuti et al., 2011). Optimum results were achieved by replacing steel with a potential metal matrix composite lightweight Graphite Al GA 7-230 MMC material in a heavy-duty TATA 1612 truck chassis (ladder type frame). Analysis shows about 70% weight reduction in power dissipation and overall good direct maintenance of the system (Agarwal & Mthembu, 2022). It is a study conducted to reveal the potential of design and analysis in some applications. Following the improving experience in the Mille Chili Laboratory, studies were carried out to reduce weight in automotive chassis design applications (Cavazzuti & Splendi, 2011). In these studies, analyses were carried out to find the structural, material, and modal deformation rate, optimum durability, total deformations occurring at different frequencies, etc. It has been searched what is the best material to match the required values of the truck chassis. The modeling and analysis of the Ashok Leyland 2516 model truck was carried out using

programs such as SOLIDWORKS 2016 and ANSYS 14.0. Comparing all the stresses, strains, and deformations of the relevant materials, it turned out that among the three materials (Structural steel, AISI4340, Carbon fiber) is the most optimum for modeling a chassis (Rastogi & Singh, 2019). It is a study based on the isolation of automotive conditions with fatigue, highest shear stress, equivalent stress, and maximum load and durability limitations. The numerical analysis method was used to reduce the weight. This situation was modeled with the help of computers. The chassis is modeled after the PRO-E. FEA was performed on frameworks modeled with ANSYS Workbench (Vijaykumar & Patel, n.d.). Topology optimizations of the truck chassis were made within this enclosure. Analyses were carried out with the loads that this vehicle can lift. ANSYS Workbench program was used to perform these analyses. The deformation and stress values of the chassis change. When the optimized model was compared with the first designed model, approximately 14% mass structure was decreased without exceeding the desired stress values (Doğru, 2019). These features focus on performing stress analysis of heavy-duty truck vehicles. Stress analysis is one of the most important points in the ongoing analysis of the critical point with the highest stress in estimating the fatigue distribution and life of materials. The analysis was made of a truck model using the software called ABAQUS, the finite parameters method. The length of the model is 12.35 m and the width is 2.45 m. The chassis material is ASTM Low Alloy Steel A 710 C (Grade 3) with a yield limit of 552 MPa and a tensile strength of 620 MPa. As a result, a change in the critical voltage point occurs at the points where the poles are in contact. The stress magnitude of the critical point is 386.9 MPa. This critical point was where the stresses in the crack formation began because fatigue was where the highest stress began (Abd Rahman et al., 2008). In this study, unlike the literature, topology optimization was applied to examine the structural characteristics of three different materials such as deformation, equivalent stress, and safety factor, as well as their effects on cost and chassis weight.

### **Materials and Methods**

When materials such as automotive wax, steel, alloy, and composite are generally desired to be lightened according to the condition of the part or the condition in which it will break the cost, durability, parts, and lightness must be taken into consideration and the necessary elements must be selected. It is essential to choose the right material for the critical parts that will be used continuously under static, dynamic and these loads on the vehicles. While the availability of components such as parts is very important, the price of the selected material and the performance provided are equally important. The fact that a material is very good may increase

its selection ability, but the material must meet the desired loads, with optimum durability and at optimum cost. In addition to this issue, it is also very important whether the selected material is manufacturable or not. When the material to be used in a leak has poor weldability, poor bending conditions, low resistance to abrasion, and similar features, it is not desirable to use it in weak places. In truck bodies, the heat level is the most used metal and steel group. The steels used for the truck markets modeled in this study are St-37 (Structural Steel), Usibor 1500 (UHSS), and S690QL metals.

**Table 1** Material Properties(Kumlu et al., 2023; Steel number, 2024)

Material	Density (kg/m <sup>3</sup> )	Elastic module (GPa)	Poisson ratio	Tensile strength (MPa)	Tensile ultimate strength (MPa)
St-37	7850	200	0,3	250	460
Usibor 1500	7860	205	0,29	1100	1500
S690QL	7860	210	0,29	770	810

In this study, numerical analysis was performed using computer-aided drawing program (CAD) and finite element method (FEM). The chassis designed with Catia V5 R21 was transferred to Ansys Workbench for static analysis. After examining the total deformation stress value and safety factor of the chassis, whose resistance to static loads was examined, lightened modeling of the parts coded mba\_1001, mba\_1003.1, mba\_1003.2, mba\_1003.3, mba\_1004 and mba\_1005 was carried out with topology optimization. Based on the results obtained, a lightened version of the chassis was modeled. Then, static loads were examined again. The process in which the static loads of the chassis in the initial state were examined was called Case 1, and the process in which the lightened model was examined was called Case 2. The ladder type truck chassis, which is frequently used among truck chassis models, was created in the CATIA V5 R21 modeling program using U-type profiles suitable for the truck model, as shown in Figures 1 to 7. Surface modeling, sheet metal bending, solid modeling, and assembly modules were used in the design.

**Figure 40.** Case 1 model display in different views

**Figure 41.** mba\_1000 code carrier

**Figure 42.** mba\_1002 code carrier

**Figure 43.** mba\_1001 code carrier

**Figure 44.** mba\_1003 code carriers

**Figure 45.** mba\_1004 code carrier

**Figure 46.** mba\_1005 code carrier

The wall thickness of the main carriers of the model to be used in the first analysis was determined as 20 mm as in Figure 8. Figure 9 indicates the Case 1 mba\_1001 thickness.

**Figure 47.** Case 1 mba\_1000 and mba\_1002 wall thicknesses

**Figure 48.** Case 1 mba\_1001 thickness

The thickness of mba\_1003, mba\_1004, and mba\_1005 carriers was chosen as 10 mm, as in mba\_1001. Case 2 mba\_1000 and mba1002 wall thickness was halved and determined as 10 mm. Figure 10 and Figure 11 indicate the general view of the model designed for Case 2 of the two models. Figure 10 and Figure 11 display the Case 2 mba\_1000 and mba1002 wall thickness and Case 2 mba\_1001 thickness.

**Figure 49.** General view of the model designed for Case 2: first

**Figure 50.** General view of the model designed for Case 2: second

**Figure 51.** Case 2 mba\_1000 and mba1002 wall thickness

**Figure 52.** Case 2 mba\_1001 thickness

The thickness of mba\_1003, mba\_1004, and mba\_1005 carriers was selected as 10 mm, as in mba\_1001. However, because of the results of topology optimization, circular discharges were made at points where the effect of the loads was low. The Case 1 chassis designed in Catia V5 R21 was converted to STEP format and transferred to Ansys Workbench 2023 R1. The methods followed in the analysis are respectively, the meshing process, determination of fix points, application of loads, and results. During the mesh creation process, after the mesh was updated, patch independent was applied to the lateral carriers. Then, body sizing was applied to parts mba\_1000 and mba\_1002. As a result, 829,278 node points and 448,198 element numbers were obtained. The maximum value of element quality was found to be 0.99999 and the average mean value was 0.69239. The maximum skewness value was found to be 0.99853 and the average value was 0.40746. The same procedures were applied for Case 1 and Case 2 and

approximately the same values were obtained. Fix points are determined as the points where the wheels of the vehicle are connected as in Figure 14.

Figure 53. Fixed support region

The applied loads were examined in two groups: loads on the front axle and loads on the rear axle as in Figures 15 and 16. A load of 70,000 N was applied, corresponding to a load on the front axle of 7,000 kg. The load on the rear axle was 180,000 N, corresponding to 18,000 kg.

Figure 54. Case 1 front axle load

**Figure 55.** Case 1 load

The same processes applied in Case 1 were carried out in Case 2 as shown in Figures 17 and 18. The applied loads are the same as in Case 2, as in Figures 19 and 20.

**Figure 56.** Case 2 mesh structure

**Figure 57.** Case 2 fix points

**Figure 58.** Case 2 front axle load

**Figure 59.** Case 2 rear axle load

Topology optimization of the mba\_1001 part involves first analyzing the part as a STEP file with the Ansys Workbench Static Analysis module and then analyzing it with the Topology Optimization module. The process then continued with the topology optimization of the part coded mba\_1003.1. Since the parts mba\_1003.1, mba\_1003.2, mba\_1003.3, mba\_1004, and mba\_1005 are very similar to each other geometrically, a similar process was followed in the design of the parts after the final analysis and the designs were completed. Patch independence was used when creating the mesh structure. The maximum value of element quality was found to be 0.99999 and the average mean value was 0.78402. The maximum skewness value was found to be 0.69709 and the average value was 0.29512. Figure 21 shows the mba\_1001 topology optimization overview

**Figure 60.** mba\_1001 topology optimization overview

Since the mba\_1001 part is welded to the chassis, the fix points are determined as corners as in Figure 22.

**Figure 61.** mba\_1001 topology optimization fixed points

Since the applied loads were perpendicular to the chassis, the forces came to the side surfaces of the part, and since the loads were divided, it was determined as 44,000 N as in Figure 23.

**Figure 62.** Applied loads

The process continued as in the mba\_1001 topology optimization. Patch independence was used when creating the mesh structure as in Figure 24. The maximum value of element quality was found to be 0.99999 and the average mean value was 0.70754. The maximum Skewness value was found to be 0.65139 and the average value was 0.39737. Figure 25 and Figure 26 represent the mba\_1003 topology optimization fixed points and applied forces.

A new design was made as a result of the geometry resulting from topology optimization. mba\_1001 static analysis safety factor was seen in Figure 45. Figure 46 displays mba\_1001 topology density view.

**Figure 84.** mba\_1001 static analysis safety factor

**Figure 85.** mba\_1001 topology density

As a result of topology optimization, mba\_1003 and the remaining lateral carriers were subjected to similar mitigation processes. Also, Figure 47 indicates the mba\_1003 static analysis safety factor. mba\_1003 topology density is shown in Figure 48 and Figure 49 represents the mba\_1003 new designs as a result of topology optimization.

Figure 86. mba\_1003 static analysis safety factor

Figure 87. mba\_1003 topology density

Figure 88. mba\_1003 new design as a result of topology optimization

Table 2 indicates the analysis results of Case 1 and Case 2 for three material design. In terms of total deformations in case 1, St-37 material has a deformation value that is 2.54% higher than the design with Usibor 1500 material and 5.04% higher than the design with S690QL material. The lowest value in terms of equivalent stresses in case 1 belongs to the design with St-37 material, with 132.82 MPa. In terms of safety factor in case 1, the design with Usibor 1500 material has the highest value with 6.9135, reaching 4.39 times higher than St-37 and 1.44 times

higher than S690QL. In Case 2, the lowest deformation was found in S690QL, the lowest equivalent stress in St-37, and the highest safety factor in Usibor 1500 material.

**Table 2.** Case 1 and Case 2 results

Case 1	St-37	Usibor 1500	S690QL
Total Deformation (mm)	0.93317	0.91004	0.88837
Equivalent Stress (MPa)	132.82	138.23	138.23
Safety Factor	1.5759	6.9135	4.7823
Case 2	St-37	Usibor 1500	S690QL
Total Deformation (mm)	2.8739	2.7968	2.7302
Equivalent Stress (MPa)	138.23	139.18	139.18
Safety Factor	1.69393	7.1841	4.9694

The weight results of chassis in case 1 and case 2 are given in Table 3. When looking at case 1 and case 2, a 37.84% decrease in the weight of all three materials was observed in case 2 compared to case 1. Costs per kg are given as \$150.01 for St-37, \$379.66 for Usibor 1500, and \$120 for S690QL. Average prices of materials are obtained from metal suppliers (Kumlu et al., 2023). When the cost prices were examined, it was calculated that a 37.84% decrease resulted in a cost reduction of approximately 0.62 times.

**Table 3.** Case 1 and Case 2 weight distributions

Case 1	St-37	Usibor 1500	S690QL
Weights (kg)	1429	1430.8	1430.8
Case 2	St-37	Usibor 1500	S690QL
Weights (kg)	888.25	889.38	889.38

### **Conclusion and Recommendations**

In this study, the chassis of the heavy truck model was modeled and its reactions to static loads were examined. It was examined in two cases: Case 1 and Case 2. In Case 1, after examining the total deformation, stress, and safety factor of the main model, the topology optimization of the two lateral carrier elements and their designs that could work optimally with the loads were examined. In Case 2, the resistance of the new and lighter model to static loads was examined. Then, the weights and cost feasibility of the St-37, Usibor 1500, and S690QL steels used in these designs were carried out. The results of this study are as follows.

- In Case 1, the lowest total deformation was obtained in S690QL steel and the highest total deformation was obtained in St- 37 steel.

- In Case 1, the lowest stress value was obtained in St- 37 steel, while equal stress values were determined in Usibor 1500 and S690QL steel.
- In Case 1, the highest safety factor was obtained in Usibor 1500, while the lowest was determined in St-37 steel.
- In Case 1 and Case 2, the stress values were very close to each other, although the geometry has been changed and alleviated. The reason for this is the improvements in the places where deformation and stress values were lowest in the light of topology optimization and static analysis of the chassis designed in Case 2.
- The safety factor values of the chassis developed in Case 2 increased by 1.1 times to case 1, although it was lighter.
- In the stress view observed in Case 1, the stress accumulated only on the front and rear of the chassis, while in the stress view in Case 2, it was determined that this situation spread to almost every part of the chassis, just as desired.
- In Case 2, chassis weights were reduced 1.61 times in comparison with Case 1.

### **ÖZET**

Uyku, insan yaşamında beslenme kadar önemli fizyolojik bir gereksinimdir. Vücudumuzun yeni bir güne hazırlandığı dönem olarak tanımlanmaktadır. Beslenme ise insan hayatında birçok faktöre etki etmekte ve birçok faktörden de etkilenmektedir. Uyku süresi ve kalitesi de bu faktörlerdendir. Fiziksel ve ruhsal olarak dinlenme, hücrelerin tamiri, hafıza fonksiyonlarının düzenlenerek öğrenmenin sağlanması için uyku kilit bir rol oynamaktadır. Uyku gereksinmesi yaşa, cinsiyete, fiziksel aktivite düzeyine, bireyin beslenme tarzına, çevresel koşullara, bireyin sağlık durumuna göre değişmektedir. Canlı varlıkların fizyolojisinde 24 saate dayalı gün içerisinde değişebilen günlük bir ritim söz konusudur ve bu "sirkadiyen ritim" olarak ifade edilmektedir. Işık, sıcaklık, melatonin, jetlag, vardiyalı çalışma ve beslenme sirkadiyen ritmi etkileyen faktörlerdendir. Yapılan çalışmalar sirkadiyen ritim, beslenme ve uykunun birbirlerini etkilediklerini göstermektedir. Bu faktörler kişinin iş performansını, günlük performansını ve konsantrasyon seviyesini etkileyerek yaşam kalitesi üzerinde etkili olmaktadır. Vardiyalı çalışma hem uyku hem de beslenme düzeninde değişikliklere neden olarak farklı sorunları ortaya çıkarmaktadır. Uyku zamanındaki değişimler yanlış besin seçimine neden olmakta bu da birçok kronik hastalığı beraberinde getirmektedir. Uykuyu etkileyen besinler; süt, yağlı balıklar, çay, kahve ve meyveler olarak belirtilmektedir. Makro besin öğeleri dışında bazı mikro besin öğelerinin de bu döngüyü etkileyebileceği belirtilmektedir. Yapılan çalışmalar daha çok B grubu vitaminleri ve magnezyum üzerinde durmaktadır. B grubu vitaminlerden B<sub>6</sub>, B<sub>12</sub> ve niasinle ilgili çalışmalar mevcuttur. Uyku süresinin beslenmeye yönelik etkilerinin mekanizması netleşmiş değildir. Bu ilişkinin daha iyi anlaşılabilmesi için farklı popülasyonlar ve çalışma saatleri ile daha fazla çalışmaya ihtiyaç olduğu bildirilmektedir. Bu çalışma sirkadiyen ritimde beslenmenin rolünü araştırma amacıyla yapılmıştır.

**Anahtar Kelimeler:** sirkadiyen ritim, beslenme, uyku süresi, uyku kalitesi, vardiyalı çalışma

## **THE ROLE OF NUTRITION IN CIRCADIAN RHYTHM**

### **ABSTRACT**

Sleep is a physiological need as important as nutrition in human life. It is defined as the period when our body prepares for a new day. Nutrition affects many factors in human life and is affected by many factors. Sleep duration and quality are also among these factors. Sleep plays a key role in resting physically and spiritually, repairing cells, regulating memory functions and ensuring learning. The need for sleep varies according to age, gender, physical activity level, individual's nutrition style, environmental conditions, and the individual's health status. In the physiology of living beings, there is a daily rhythm that can change during the day based on 24 hours, and this is referred to as "circadian rhythm". Light, temperature, melatonin, jetlag, shift work and nutrition are among the factors that affect the circadian rhythm. Studies show that circadian rhythm, nutrition and sleep affect each other. These factors have an impact on the quality of life by affecting the person's work performance, daily performance and concentration level. Shift work affects both sleep and sleep. It causes different problems by causing changes in the diet. Changes in sleep time cause wrong food selection, which brings about many chronic diseases. Foods that affect sleep are stated as milk, fatty fish, tea, coffee and fruits. Apart from macro nutrients, some micronutrients It is stated that elements of sleep may also affect this cycle. Studies mostly focus on B group vitamins and magnesium. There are studies on B group vitamins B<sub>6</sub>, B<sub>12</sub> and niacin. The mechanism of the nutritional effects of sleep duration is not clear. Different populations and studies are used to better understand this relationship. It is reported that more work is needed with hours. This study was conducted to investigate the role of nutrition in circadian rhythm.

**Keywords:** circadian rhythm, nutrition, sleep duration, sleep quality, shift work

## **GİRİŞ**

Uyku insan yaşamında beslenme ve nefes alma kadar önemli fizyolojik bir gereksinimdir. Vücudumuzun yeni bir güne hazırlandığı dönem olarak ifade edilmektedir (Karasu ve ark.,2021). Beslenme insan hayatında birçok faktöre etki etmekte ve birçok faktörden de etkilenmektedir.Uyku süresi ve kalitesi bu faktörlerdendir. Fiziksel ve ruhsal dinlenme, hücrelerin tamiri, hafıza fonksiyonlarının düzenlenerek öğrenmenin sağlanması için uyku kilit bir rol oynamaktadır (Gumz,2016). Uykunun evreleri ve bu evrelerin sürelerini etkileyen faktörler bulunmaktadır. Evrelerden ilki hızlı olmayan göz hareketi (Non-rapid eye movement, NREM) ve ikincisi ise hızlı göz hareketi (Rapid eye movement, REM) olarak isimlendirilmektedir. Toplam uykunun % 20-30'unu REM uykusu oluşturmaktadır. REM döneminin önemli özelliklerinden biri rüyaların uykunun bu evresinde görülmesidir. NREM dönemi kendi içinde 4 evreden oluşmaktadır. 1. ve 2. evre yüzeysel uyku; 3. ve 4. evre ise derin uyku olarak ifade edilmektedir.Yaş,cinsiyet,beslenme vb. faktörlerle birlikte uyku süresi ve kalitesi de değişmektedir. Uyku süresi ve kalitesi uyku testleriyle hatta gelişen teknolojiyle beraber üretilen cihazlarla da ölçülebilmektedir. Bunun sonucu olarak uyku kalitesi ve süresi ile ilgili çalışmalar hız kazanmıştır. Yetişkinlere oranla çocuk ve yaşlıların 3.evre NREM uyku süreleri daha fazla olduğu belirtilmektedir (Harding ve ark.,2019). 20 yaş ve üzeri 688 yetişkin bireyde yapılan bir çalışmaya göre kadınların Pittsburgh Uyku Kalite İndeksi (PUKİ) puanının erkeklerinkine göre istatistiksel olarak daha yüksek olduğu bulunmuştur(p=0.002) (Akova&Koçoğlu,2018). Adölesanlar üzerinde yapılan bir çalışmada adölesanların %54,7'sinin kötü uyku kalitesine sahip olduğu , % 9'unun aşırı uykululuk halinden şikayetçi oldukları sosyal-ailevi problem varlığı, daha önce geçirilmiş uyku bozukluğu ve iştah değişikliği uyku kalitesindeki azalmanın temel belirleyici nedenleri olarak saptanmıştır (Şenol ve ark.,2015). Yapılan bir çalışmaya göre kötü uyku kalitesinin beslenme, sigara-alkol kullanımı, fiziksel aktivite ve stres yönetimi gibi davranışları etkilediği bildirilmiştir (Hui ve ark.,2015). Canlı varlıkların fizyolojisinde 24 saate dayalı gün içerisinde değişebilen günlük bir ritim söz konusudur ve bu "sirkadiyen ritim" olarak ifade edilmektedir. Işık, sıcaklık, melatonin, jetlag, vardiyalı çalışma ve beslenme sirkadiyen ritmi etkileyen faktörlerdendir (Sözlü&Şanlier,2017). Bu çalışma da sirkadiyen ritimde beslenmenin rolünü araştırmak amacıyla yapılmıştır.

## **SİRKADİYEN RİTİM ve UYKU FİZYOLOJİSİ**

Sirkadiyen,"circa"(yaklaşık) ve "dies"(gün) kelimelerinin birleştirilmesiyle oluşturulmuştur. "Yaklaşık bir gün" anlamına gelmektedir.Canlı varlıkların fizyolojisinde 24 saate dayalı gün

içerisinde değişebilen günlük bir ritim söz konusudur bu döngü de “sirkadiyen ritim” olarak ifade edilmektedir (Poggiogalle ve ark.,2018). Sirkadiyen ritim 2 kısımdan oluşmaktadır: 1) Hipotalamusta yer alan suprakiazmatik çekirdekteki (SCN) ana saat-merkezi saat2) Dokularda bulunan periferik saat (pankreas, karaciğer, gastrointestinal sistem, adipoz doku ve iskelet kası vb.) (Glaus ve ark.,2019).Sirkadiyen ritim büyüme faktörlerini,immün fonksiyonları,gen ekspresyonunu, doku büyümesini ve kan basıncı dengesini içeren bir döğüdür (Loef ve ark.,2018). Sağlıklı kişilerde sirkadiyen ritmin kontrolü genler, hormonlar gibi endojen; ışık, çalışma düzeni , beslenme gibi ekzojen faktörler aracılığıyla sağlanmaktadır (Kandeger ve ark.,2019). Sirkadiyen ritmi etkileyen faktörler;ışık,sıcaklık,melatonin,jetlag,vardiyalı çalışma ve beslenmedir (Chattu ve ark.,2019). Uyku ve uyanıklık döngüsü beyin sapı, spinal kord ve serebral kortekste yer alan Retiküler aktivasyon sistemi (RAS) tarafından düzenlenmektedir.Aktive ve inhibe olarak uyku ve uyanıklık döngüsü düzenlenmektedir (Algın ve ark.,2016). Karanlık,sessiz ortam,gözlerin kapalı olması ve kişinin rahat pozisyonda uyku modunda olması RAS’ın(Retiküler aktivasyon sistemi) uyarılmasını azaltmakta ve uykuya geçişi sağlamaktadır. Melatonin ve seretonin uykuya geçişte görev almaktadır ve suprakiazmatik çekirdeğin (SCN) aktivasyonuna bağlı olarak salgılanmaktadır (Şekil1). Yapay ışık parlak olduğunda melatonin sentezi baskılanabilmektedir. Sıcak ortamda artış gösterdiği belirtilmektedir. Karanlığın başlaması ile fotoreseptörler hipotalamustaki suprakiazmatik çekirdeği uyarmaktadır. Uyarılmayla hücre içine alınan triptofandan melatonin sentezlenmektedir. Melatonin salınımı özellikle gece 23:00-05:00 arasında pik yapmaktadır. Gündüz saatlerindeki düzeyi gece saatlerine göre daha azdır.Melatonin düzeyleri gece 3-10 kat artarak 50-200 pg/dL düzeyine ulaşabilmektedir (Özçelik ve ark.,2013).

**Şekil 1.** Sirkadiyen bilginin sinyal yoluyla iletimi (Wahl ve ark.,2019).

\* SCN: Suprakiazmatik çekirdek; PVN: Paraventriküler çekirdek

Serum melatonin düzeyleri yaşa göre değişmektedir. Yeni doğanda kan melatonin düzeyi düşüktür. Melatonin anne sütüne de geçmektedir. Anne sütü ile beslenen bebeklerin diğer yollarla beslenenlere göre sirkadiyen organizasyonlarının daha çabuk geliştiği bildirilmektedir (Kervezee ve ark.,2018). İnsomnia gibi uyku bozukluklarında, 1 g/gün olarak L-triptofan kullanımının etkili olduğu ifade edilmektedir. 15 insomnia hastası üzerinde yapılan bir çalışmaya göre hastalara verilen 1 g'lık triptofan takviyesinin uykuya geçiş sürelerinde azalma gözlemlenmiştir (Keskin & Tamam, 2018). Brezilya'da sabit gece vardiyasında (12 saat, 19:00 - 07:00 arası) çalışan 36 aşırı kilolu kadın hemşire üzerinde yapılan bir çalışmada gece vardiyasından sonra uykuya dalma ile en yakın öğün arasındaki zaman aralığının izin günündeki uykuya dalma ile en yakın öğün arasındaki zaman aralığından daha kısa olduğu gözlemlenmiştir (Garrido ve ark.,2021). Gece vardiyasında çalışan hemşirelerde yapılan başka bir çalışmada da hipertrigliseridemi de dahil olmak üzere metabolik sendrom tanısı için risk faktörlerinin gündüz çalışanlarına göre daha yüksek prevalansta olduğu bulunmuştur (Hollanda ve ark.,2018). Başka bir çalışmada da benzer veriler bulunmuştur. 20 yaşından büyük yetişkinlerde yapılan bu çalışmada uyku süresindeki azalma ile kardiyometabolik riskin yüksek olması arasında bir ilişki olduğu gözlemlenmiştir (Kanagasabai ve ark.,2017). Gece vardiyasında çalışmak, kadınların 24 saatlik leptin seviyelerinde %7'lik bir düşüşe ve "uyanık dönemi"ndeki ghrelin seviyelerinde %8'lik bir artışa neden olurken, erkeklerin leptin seviyelerinde %11 oranında artışa neden olduğu bildirilmiştir (Quian ve ark.,2019). Uyku

gereksinmesi yaşa, cinsiyete, fiziksel aktivite düzeyine ,bireyin beslenme tarzına, çevresel koşullara, bireyin sağlık durumuna ve kişisel özelliklerine göre değişmektedir. Ulusal Uyku Kuruluşu'nun (The National Sleep Foundation) yayınladığı son rapordaki yaş gruplarına göre gerekli uyku süreleri için belirtilen değerler aşağıdaki gibidir (The National Sleep Foundation,2015).

- Yeni doğan (0-3 ay): 14-17 saat/gün
- Toddler (1-2 yaş): 11-14 saat/gün
- Okul öncesi çocuklar (3-5 yaş): 10-13 saat/gün
- Okul çağındaki çocuklar (6-13 yaş): 9-11 saat/gün
- Gençler (14-17): 8-10 saat/gün
- Yetişkinler (18-64): 7-9 saat/gün
- Yaşlı (65+): 7-8 saat/gün

Türkiye'de Erişkin Toplumda Ulusal Uyku Epidemiyolojisi Çalışmasına (TAPES,2010) göre, kişilerin %47,6'sının 7 saat ve daha az uyuduğu;uyku kalitesi kötü olanların oranının kadınlarda %26,3, erkeklerde %17 olduğu bulunmuştur (Demir,2010).

## **SİRKADİYEN RİTİM VE BESLENME İLİŞKİSİ**

### **Makro Besin Ögelerinin Sirkadiyen Ritim Üzerine Etkisi**

Uykuyu etkileyen besinler süt,yağlı balıklar,kahve ve meyve olarak ifade edilmektedir. Çay, kahve gibi kafeinli içecekleri tüketicilerin uykulu olma halinden kurtulmak için tüketmesine rağmen kafeinin sirkadiyen ritim üzerindeki etkilerinin mekanizması henüz netleşmiş değildir. Bazı hayvan çalışmalarında kafeinli içecek tüketiminin uyanıklık süresini uzatabildiği bildirilirken bazılarında ise sirkadiyen ritim dengesini bozabildiği belirtilmiştir (Liu ve ark.,2019). Yapılan bir hayvan çalışmasında yüksek yağlı bir diyetle beslenen ratların aydınlık ortamdaki ağırlık artışının karanlık ortamdakine oranla daha fazla olduğu gözlemlenmiştir. Sürekli olarak ışığa maruz bırakıldığında sirkadiyen ritimlerinin kötüleşmesiyle birlikte fiziksel aktivitelerinde azalma ve vücut ağırlıklarında artma gözlenmiştir (Kessler ve ark.,2019). Kök bitkiler, koyu yeşil yapraklı sebzeler gibi besin gruplarında melatonine ve seratonine rastlandığı belirtilmektedir. Besinlerle alınan seratonin ile ilgili kesin kanıtlar olmamakla birlikte son zamanlarda yapılan çalışmalar uyku-uyanıklık döngüsünde önemli rolü olan melatoninin supleman olarak verilmesinin uykuya dalma ve uyku halinin sürdürülmesinde yararlı olabileceğini göstermektedir (Southwell ve ark.,2016). Karbonhidrat metabolizmasının düzenlenmesi SCN(Suprakiazmatik çekirdek) ile kontrol edilmektedir. Makro besin ögelerinin uyku üzerindeki etkilerini gözlemek için dört farklı grup üzerinde yapılan bir çalışmaya

göre ilk gruba yüksek karbonhidratlı(%56 karbonhidrat, %22 protein, %22 yağ) 2.gruba yüksek proteinli(%56 protein, %22 karbonhidrat, %22 yağ),3.gruba yüksek yağlı (%56 yağ, %22 karbonhidrat, %22 protein)kontrol grubuna ise % 50 karbonhidrat % 35 yağ %15 protein içeren bir diyet verilmiştir. Diyetler 4 gün boyunca tükettirilmiştir. 4 gün boyunca uyku ölçer kullanılarak izlenmiştir. Yüksek proteinli diyet uygulanan grupta kontrol grubuna göre uyanma sayısının azaldığı gözlemlenmiştir.Ayrıca yüksek karbonhidratlı diyet tüketenlerde kontrol grubuna kıyasla uyku başlangıcındaki gecikmenin azaldığı bildirilmiştir (St-Onge ve ark.,2016). 1 ay boyunca yatmadan önce 2 kivi tüketen uyku bozukluğu olan yetişkinlerde uyku verimliliğinin önemli ölçüde arttığı bildirilmiştir.Kivinin uyku üzerindeki etkileri yüksek antioksidan kapasitesine,folat ve serotonin içeriğine bağlamaktadır.A ve E vitamini önemli antioksidanlardır ve kivide bol miktarda bulunmaktadır.Bu antioksidan vitaminler serbest radikallerin oluşumunu egellemektedir (Lin ve ark.,2011).

#### **Mikro Besin Ögelerinin Sirkadiyen Ritim Üzerine Etkisi**

Makro besin ögeleri dışında bazı mikro besin ögelerinin de uyku-uyanıklık döngüsünü etkileyebileceği belirtilmektedir. Yapılan çalışmalar daha çok B grubu vitaminleri ve magnezyum üzerinde durmaktadır. B grubu vitaminlerden B<sub>6</sub>, B<sub>12</sub> ve niasinle ilgili çalışmalar mevcuttur.Triptofan uyku üzerinde etkili olduğu bilinen serotonin ve melatoninin öncü maddesidir (Şekil 2). Niasin triptofandan sentezlenebilen bir vitamindir. B<sub>6</sub> vitamini triptofandan melatonin sentezini gerçekleştiren tepkimede 5-HTP dekarboksilaz (5-Hidroksitriptofan dekarboksilaz) enziminin koenzimi olarak görev aldığından bu vitamini daha çok içeren et,tavuk,balık,kurubaklagil,yağlı tohum ve yeşil sebzeler gibi besinlerin bu mekanizma üzerinde etkili olabileceği düşünülmektedir (Akıncı ve ark.,2016;Silber &Schmitt,2010).

Şekil 2. Pineal bezde ışık etkisiyle triptofandan melatonin sentezi (Atasoy & Erbaş, 2017).

\* SCN: Suprakiazmatik çekirdek; PVN: Paraventriküler çekirdek;

\*SCG: Süperior servikal ganglion; NA: Noradrenalin; HTP: Hidroksitriptofan.

Kandaki magnezyum seviyesinin uyku üzerine etki ettiği düşünülmektedir. Fakat bu konu üzerine yapılan çalışmalar daha çok ratlar üzerinde yapılmış olduğundan klinik kanıtlar sınırlıdır. Magnezyumun melatonin sentezinde görevli bir enzim olan serotonin N-asetiltransferaz aktivitesini stimüle ederek melatonin sentezini artırarak gösterdiği düşünülmektedir (Roskoden ve ark.,2017). Omega 3 ve D vitamini içeren yağlı balıklar bu besin öğelerinin serotoninini düzenlemesi nedeniyle uyku ile ilişkilendirilmektedir.Sınırlı güneş ışığına maruz kalan mahkumların yağlı balık tüketimlerinin uyku üzerine etkisini inceleyen bir çalışmaya göre mahkumlar 2 gruba ayrılmıştır bir gruba günlük 300 g somon,kontrol grubuna ise aynı miktarda kırmızı et verilmiştir. Kontrol grubunda uykuya dalma süresinde artış gözlemlenmiştir ancak hem kontrol grubunda hem de müdahale grubunda uyku veriminin azaldığı gözlemlenmiştir (Hansen ve ark.,2014).

## SONUÇ VE ÖNERİLER

Yapılan çalışmalar sirkadiyen ritim, beslenme ve uykunun birbirlerini etkilediklerini göstermektedir.Bu faktörler kişinin iş performansını, günlük performansını ve konsantrasyon seviyesini etkileyerek yaşam kalitesi üzerinde etkili olmaktadır.Vardiyalı çalışma şekli hem uyku hem de beslenme düzeninde değişikliklere neden olarak farklı sorunlara sebep olabilmektedir.Uyku zamanındaki değişimler yanlış besin seçimine neden olmakta bu da birçok kronik hastalığı beraberinde getirmektedir. Vardiyalı çalışan işçilerde sindirim problemleri görülebildiği için posa içeriği yüksek besinler,taze sebze ve meyveler, beyaz ekmek yerine tam

buğday ekmeği ya da esmer ekmeği, pirinç yerine bulgur tercih edilmelidir. Mesai başlamadan önce tüketilen öğünün proteinden (et,süt,balık,süt ürünleri ve yumurta vb.), esansiyel yağlardan (fındık,badem,ceviz vb.) ve kompleks karbonhidratlardan (tam buğday ekmeği,yulaf,kepekli ekmeği,bulgur vb.) zengin içeriğe sahip olması, gece boyunca kan şekerinin dengeli ve zihinsel fonksiyonların aktif olmasına katkı sağlayabileceği düşünülmektedir.Basit karbonhidratlar kan şekerinde düzensizliklere neden olabileceğinden kompleks karbonhidratlar tercih edilmelidir.Uykuyu etkileyen besinler;süt,yağlı balıklar,çay,kahve ve meyveler olarak belirtilmektedir.Makro besin öğeleri dışında bazı mikro besin öğelerinin de bu döngüyü etkileyebileceği belirtilmektedir.Yapılan çalışmalar daha çok B grubu vitaminleri ve magnezyum üzerinde durmaktadır.B grubu vitaminlerden B<sub>6</sub>, B<sub>12</sub> ve niasinle ilgili çalışmalar mevcuttur.Uyku süresinin beslenmeye yönelik etkilerinin mekanizması henüz netleşmiş değildir.Bu ilişkinin daha iyi anlaşılabilmesi için farklı popülasyonlar ve çalışma saatleri ile daha fazla çalışmaya ihtiyaç olduğu bildirilmektedir.

**ÖZET**

Afetler, doğal veya insani kökenli olayların sonucunda ortaya çıkan büyük çaplı felaketlerdir. Bu olaylar genellikle insanların hayatını, sağlığını, mülkünü ve çevreyi ciddi şekilde etkiler. Doğal afetler arasında depremler, seller, fırtınalar, tsunamiler, volkanik patlamalar ve kuraklık gibi bir dizi olay yer alırken, insani kaynaklı afetler arasında ise savaşlar, terör saldırıları, endüstriyel kazalar ve salgın hastalıklar örnek gösterilebilir. Afetler genellikle ani ve beklenmedik bir şekilde ortaya çıkarlar ve toplumlar hazırlıksız yakalandığında büyük zararlar verebilirler. Bu çalışma, sosyal medya üzerinden afet durumlarında yapılan yardım çağrılarında ilişkin internet kullanıcılarının güven ve yardım niyeti üzerine bir anket araştırmasıdır. Araştırma, 2023 yılında Türkiye'de gerçekleşen Kahramanmaraş ve Hatay merkezli depremleri baz alarak, katılımcılardan afet durumlarında sosyal medyadan yapılan yardım çağrılarında karşı güven düzeylerini, tutumlarını ve yardım niyetlerini değerlendirmek amacıyla Likert ölçeği kullanılarak gerçekleştirilmiştir. Bu araştırmaya, farklı demografik özelliklere sahip 129 gönüllü katılımcı çevrimiçi anket yoluyla katılmıştır. Katılımcıların anket yönetimiyle toplanan veriler, betimsel istatistik temelli yöntem kullanılarak analiz edilmiştir. Araştırmanın bulguları, akademik çevrelere ek olarak sivil toplum kuruluşlarına ve afet konularında politika yapıcılarına önemli bilgiler sunmaktadır. Özellikle, sosyal medyanın afet yardımı ve iletişimi için nasıl daha etkin bir şekilde kullanılabileceği konusunda önemli ipuçları sağlamaktadır. Bu araştırmanın bulguları, afetlerin yönetimi ve toplumsal dayanıklılığın artırılması için stratejik adımların belirlenmesine katkı sağlayabilir.

**Anahtar Kelimeler:** Afet, Deprem, Yardımlaşma, Sosyal Medya, İnternet

**TRUST AND HELP INTENTION OF INTERNET USERS REGARDING HELP  
CALLS IN DISASTER SITUATIONS VIA SOCIAL MEDIA: A SURVEY RESEARCH**

**ABSTRACT**

Disasters are large-scale catastrophes that occur as a result of natural or man-made events. These events often have serious effects on people's lives, health, property, and the environment. While natural disasters include earthquakes, floods, storms, tsunamis, volcanic eruptions, and droughts, examples of man-made disasters include wars, terrorist attacks, industrial accidents, and epidemics. Disasters typically occur suddenly and unexpectedly, causing significant harm when communities are unprepared. This study is a survey research on the trust and intention to help of internet users regarding aid calls made during disaster situations via social media. The research, based on the earthquakes centered in Kahramanmaraş and Hatay in Turkey in 2023, was conducted using a Likert scale to assess participants' levels of trust, attitudes, and intentions to help in response to aid calls made through social media during disasters. A total of 129 voluntary participants with diverse demographic characteristics took part in the online survey. The data collected through the survey were analyzed using descriptive statistics-based methods. The findings of the research provide important insights not only to academic circles but also to civil society organizations and policymakers in disaster-related matters. Particularly, they offer significant clues on how social media can be more effectively utilized for disaster relief and communication. The findings of this research could contribute to identifying strategic steps for disaster management and enhancing societal resilience.

**Keywords:** Disaster, Earthquake, Solidarity, Social Media, Internet

## **GİRİŞ**

Afetler, tarihin her döneminde insanoğlunun karşılaştığı ve doğal veya insani sebeplerden kaynaklanan, çevre, toplum ve ekonomi üzerinde ciddi etkileri olan olaylardır (Çamur, 2023). Depremler, sel felaketleri, yangınlar, kasırgalar, tsunamiler gibi doğal afetlerin yanı sıra, savařlar, terör saldırıları, salgın hastalıklar gibi insani kaynaklı afetler de yaşamı derinden etkileyebilir (Büyükbaş & Ormanođlu, 2013; Ceren, 2021). Afetler, milyonlarca insanın evini, geçim kaynađını, sađlığını ve hatta yaşamını kaybetmesine neden olabilir. Bu nedenle, afetlerin etkilerini en aza indirmek ve etkilenen insanlara yardım etmek için hızlı ve etkili müdahaleler gerekmektedir. Sosyal medya, modern iletişim araçları arasında önemli bir yer tutmaktadır. Facebook, Twitter, Instagram gibi platformlar, milyonlarca insanın bir araya gelmesini sađlayarak geniş kitlelere ulaşma gücüne sahiptir. Ayrıca, sosyal medya üzerinden yapılan paylaşımların anlık ve hızlı bir şekilde yayılma özelliđi, önemli olayların insanlara daha hızlı duyurulmasını sađlamaktadır. Özellikle afet durumlarında, sosyal medya platformları güncel bilgilerin ve acil yardım çağrılarının hızla yayılmasına yardımcı olabilir (Yan & Pedraza-Martinez, 2019; Muniz-Rodriguez et al., 2020; Mavrodieva & Shaw, 2021). Bu da toplumun afetlere daha hızlı ve etkili bir şekilde yanıt vermesini sađlayabilir. Ayrıca, sosyal medya, afet bölgelerindeki insanların güvende olduklarını sevdikleriyle paylaşmalarını ve yardım taleplerini iletmelerini sađlayarak, yardımın koordinasyonunu kolaylaştırabilir. Bu çalışma, sosyal medya aracılıđıyla yapılan yardım çağrılarının afet durumlarında nasıl etkili bir araç haline geldiđini ve toplumun bu çağrılara nasıl yanıt verdiđini incelemektedir. Özellikle, Kahramanmarař ve Hatay'da 2023 yılında yařanan deprem olaylarına odaklanarak, internet kullanıcılarının güven düzeyi ve yardım niyeti üzerindeki etkileri arařtırmayı amaçlamaktadır. Bu çalışma, afetlerin yönetimi ve yardım faaliyetlerinin koordinasyonu ađısından sosyal medyanın rolünü anlamamıza ve toplumun afetlere daha iyi hazırlanmasına katkı sađlayacaktır. Ayrıca, bu çalışma, sosyal medyanın afet yönetimi ve yardım koordinasyonunda nasıl kullanılabileceđi konusunda daha fazla arařtırmaya olanak sađlayabilir.

## **METOT**

Bu çalışma, internet kullanıcılarının afet durumlarında sosyal medya üzerinden yapılan yardım çağrılarına verdiđi yanıtları, güven ve tutumlarını detaylı bir şekilde incelemektedir. Özellikle, arařtırma 2023'te Türkiye'nin Kahramanmarař ve Hatay şehirlerinde meydana gelen deprem olaylarına odaklanmaktadır. Arařtırma, katılımcıların bu tür çağrılarla ilgili güven seviyelerini, tutumlarını ve niyetlerini ölçmek için Likert ölçeđini kullanmaktadır. Verileri toplamak için, sosyal bilimlerde geniş kabul gören bir arařtırma tekniđi olan anket yöntemi kullanılmıřtır. 132

kişilik bir örneklem grubundan elde edilen veriler, katılımcıların yanıtlarının sistematik olarak değerlendirilmesine olanak sağlayacak şekilde yapılandırılmış bir anket formunda toplanmıştır. Anket çevrimiçi kanallar aracılığıyla uygulanmış ve katılım tamamen gönüllülük esasına dayanmıştır. Analiz sonuçlarına göre, katılımcıların ortalama yaşı 30'dur; katılımcıların %44'ü erkek, %56'sı ise kadındır. Bu demografik profil, sosyal medya üzerinden afet yardımına yönelik tutumların ve niyetlerin çeşitliliğini anlamak için önemli bir içgörü sağlamaktadır.

## BULGULAR

### Resim 1. Sosyal Medya Üzerinden Afet Durumlarında Yapılan Yardım Çağrılarına İlişkin İnternet Kullanıcılarının Güveni

Katılımcıların, Hatay ve Kahramanmaraş merkezli depremde sosyal medya üzerinden yapılan yardım çağrılarına ilişkin güvenlerini belirlemek için beş farklı ifade incelenmiştir (Resim 1). Bu ifadeler, katılımcıların olumsuz, kararsız veya olumlu yaklaşımlarını yansıtmaktadır. Katılımcıların, sosyal medya üzerinden yapılan yardım çağrılarına ilişkin güven ifadelerini değerlendiren bulgulara göre, genel olarak olumlu bir eğilim gözlemlenmektedir. Katılımcıların %80,4'ü, bu çağrıları anlamlı bulduklarını ifade ederken, %80'i de bu çağrılarının iyi olduğunu düşündüklerini belirtmiştir. Ayrıca, %50,7'si bu çağrılara güvendiklerini vurgularken, %54,6'sı da bu çağrılarının sosyal yardım kuruluşlarına olan güvenlerini güçlendirdiğini ifade etmektedir. Ancak, bazı katılımcılar güvenilirlik konusunda kararsız veya olumsuz bir tutum sergilemektedir. Bu bulgular, sosyal medya aracılığıyla yapılan yardım çağrılarının toplumda

genellikle güvenilirlik algısını artırdığını ve yardım etme isteğini güçlendirdiğini göstermektedir.

**Resim 2.** Sosyal Medya Üzerinden Afet Durumlarında Yapılan Yardım Çağrılarına İlişkin İnternet Kullanıcılarının Tutumu

Katılımcıların, Hatay ve Kahramanmaraş merkezli depremde sosyal medya üzerinden yapılan yardım çağrılarına yönelik tutumlarını belirlemek için beş farklı ifade incelenmiştir (Resim 2). Bulgular çoğunlukla tutum açısından olumlu bir eğilim göstermektedir. Katılımcıların %85.4'ü, bu depremlerde sosyal medya üzerinden yardım çağrısı yapılmasının iyi bir fikir olduğunu düşünmektedir. Ayrıca, %80.2'si bu çağrılardan hoşlanmıştır ve %80.8'i bu çağrılara cevap vermekten mutluluk duymuştur. Katılımcıların %51.2'si, sosyal medya üzerinden yapılan yardım çağrılarında göre karar vermenin mantıklı bir yaklaşım olduğunu belirtirken, %78.1'i de bu çağrılarının yardım isteyenleri bulmayı kolaylaştırdığı için rahatladığını ifade etmektedir. Ancak, bazı katılımcılar kararsız veya olumsuz bir tutum sergilemektedir. Bu bulgular, sosyal medya aracılığıyla yapılan yardım çağrılarının toplumda genellikle olumlu bir algıya sahip olduğunu ve yardım etme isteğini artırdığını göstermektedir.

**Resim 3.** Sosyal Medya Üzerinden Afet Durumlarında Yapılan Yardım Çağrılarında İlişkin İnternet Kullanıcılarının Yardım Niyeti

Katılımcıların, sosyal medya üzerinden yapılan yardım çağrılarında ilişkin yardım niyetini belirlemek için altı farklı ifade kullanılmıştır. Katılımcıların büyük çoğunluğu (%75.8), sosyal medyadan yapılan yardım çağrılarında katılmayı planlamaktadır. Yine, büyük bir çoğunluk (%75.0), bu çağrılara yardım etmeyi umut etmektedir. Yaklaşık yarısı (%41.6), gelecekteki sosyal medya üzerinden yapılan yardım çağrılarının tamamına yardım etmeyi planlamaktadır. Başka iki önemli bulguda, yardım etmek için daha fazla para harcamaya istekli olanların (%58.3) ve felaket durumlarında sosyal medyadan yapılan yardım çağrılarında ulaşmak için çaba harcamaya istekli olanların (%73.9) çoğunluk oluşturduğu görülmektedir. Gelecekteki sosyal medya üzerinden yapılan yardım çağrılarında yardım etme niyetini değerlendiren ifadeye göre, katılımcıların çoğunluğu (%65.6), bu tür çağrılara yardım etme niyetindedir. Bu bulgular, katılımcıların gelecekte sosyal medya aracılığıyla yapılan yardım çağrılarında olumlu bir yaklaşım sergilediğini göstermektedir. Sonuç olarak, incelenen ifadelerin genelinde katılımcılar sosyal medya üzerinden yapılan yardım çağrılarında olumlu bir tavır sergilemektedir. Ancak, bazı durumlarda kararsızlık ve olumsuz tutumlar da gözlemlenmektedir. Bu bulgular, sosyal medyanın yardım çağrılarında yayılması ve toplumun bu çağrılara nasıl yanıt vereceği konusunda karmaşık bir rol oynadığını göstermektedir. Bu nedenle, sosyal medya aracılığıyla

yapılan yardım çağrılarının etkili bir şekilde yönetilmesi ve toplumun bu çağrılara güven duyması önemlidir.

### **SONUÇ VE ÖNERİLER**

Bu araştırma, internet kullanıcılarının afet durumlarında sosyal medya üzerinden yapılan yardım çağrılarına yanıt verme eğilimlerini, güven ve tutumlarını derinlemesine incelemiştir. Bulgular, genel olarak, katılımcıların sosyal medya aracılığıyla yapılan yardım çağrılarında olumlu bir tavır sergilediğini göstermektedir. Ancak, bazı durumlarda kararsızlık ve olumsuz tutumlar da gözlemlenmiştir. Özellikle, güven, tutumlar ve yardım niyeti üzerine yapılan analizler, sosyal medyanın yardım çağrılarının yayılması ve toplumun bu çağrılara nasıl yanıt vereceği konusunda karmaşık bir rol oynadığını göstermektedir.

Bu bulgular ışığında, afet durumlarında sosyal medya aracılığıyla yapılan yardım çağrılarının etkili bir şekilde yönetilmesi ve toplumun bu çağrılara güven duyması önemlidir. Bu bağlamda, şu önerilerde bulunulabilir:

1. Sosyal medya platformlarında, yardım çağrılarının güvenilirliğini artırmak için şeffaflık ve doğruluk ilkelerine daha fazla vurgu yapılmalıdır.
  2. Toplumun yardım etme niyetini güçlendirmek için, sosyal medya üzerinden yapılan yardım çağrılarının olumlu sonuçları ve etkileri hakkında daha fazla bilgi ve farkındalık oluşturulmalıdır.
  3. Afet durumlarında, sosyal medya platformlarına daha hızlı ve etkili bir şekilde erişim sağlanması için acil iletişim ve koordinasyon planları oluşturulmalıdır.
  4. Katılımcıların kararsızlık ve olumsuz tutumlarını azaltmak için, sosyal medya üzerinden yapılan yardım çağrılarının içeriği ve sunumu üzerinde daha fazla çalışma yapılmalıdır.
  5. Sosyal medya üzerinden yapılan yardım çağrılarının etkinliğini artırmak için, bu çağrılarının içeriği ve görsel unsurları profesyonel bir şekilde hazırlanmalı ve hedef kitleye uygun olarak tasarlanmalıdır.
  6. Toplumun afet durumlarına hazırlıklı olmasını teşvik etmek için, sosyal medya platformlarından afet öncesi ve sonrası önlemler hakkında düzenli hatırlatıcı ve bilgilendirici içerikler paylaşılabilir.
  7. Toplumun bilinçlendirmek ve eğitmek amacıyla, sosyal medya üzerinden afet hazırlığı ve acil durum müdahale konularında düzenli eğitim ve bilgilendirme kampanyaları düzenlenmelidir.
- Bu önerilerin uygulanması, sosyal medya aracılığıyla yapılan yardım çağrılarının etkinliğini artırabilir ve afet durumlarında toplumun dayanışma ve yardımlaşma potansiyelini maksimize edebilir.

**ÖZET**

Afet, doğal veya insan kaynaklı felaketlerin neden olduğu olağanüstü durumları ifade eder. Bu tür olaylar, depremler, sel, yangınlar, kasırgalar, salgın hastalıklar gibi çeşitli şekillerde ortaya çıkabilir ve toplumların acil müdahaleye ihtiyaç duyduğu kriz durumlarına yol açabilirler. Tarihte pek çok afet durumu yaşanmış ve bu durumlar genellikle can kaybı ve maddi kayıplarla sonuçlanmıştır. Bu nedenle, afetlerin etkilerini azaltmak ve toplumların direncini artırmak için sürekli olarak önlemler alınmalıdır. Bu çalışma, afet kavramının tanımıyla başlayarak, literatürdeki bilgi ve araştırmaların derlemesini sunmaktadır. Afetlerin etkilerini azaltma ve mücadele etme stratejileri üzerine yoğunlaşan bu çalışma, insanların afetlerle başa çıkma yeteneklerini artırmaya yönelik çeşitli yaklaşımları incelemekte ve bu alanda yapılan çalışmaların önemini vurgulamaktadır. Özellikle sosyal medyanın, afet yardımlaşması ve kriz iletişimi süreçlerindeki rolünü anlamak, günümüz iletişim ortamının dinamiklerini göz önünde bulundurmak açısından son derece önemlidir. Sosyal medya, çağdaş iletişim araçları arasında önemli bir yer tutmaktadır ve afet yardımlaşması süreçlerinde giderek artan bir rol oynamaktadır. İnsanlar, afet anlarında sosyal medya platformlarını kullanarak yardım talep edebilir, yardım sağlayabilir, kaynakları paylaşabilir ve bilgi alışverişinde bulunabilirler. Bu çalışma, sosyal medyanın afet yardımlaşması ve kriz iletişimi süreçlerindeki etkilerini detaylı bir şekilde analiz etmekte ve literatürdeki mevcut bulguları değerlendirmektedir. Sonuç olarak, sosyal medyanın afet yardımlaşması ve kriz iletişimi üzerindeki etkisi giderek artmaktadır ve bu etkinin daha da anlaşılması ve yönetilmesi önemlidir. Bu çalışma, afetlerin yönetimi ve toplumların afetlere hazırlıklı olma süreçlerine katkıda bulunmayı amaçlamaktadır.

**THE ROLE OF SOCIAL MEDIA IN DISASTER RELIEF AND CRISIS  
COMMUNICATION: A LITERATURE REVIEW**

**ABSTRACT**

Disaster refers to extraordinary situations caused by natural or human-induced catastrophes. Such events can manifest in various forms such as earthquakes, floods, fires, hurricanes, and epidemics, leading to crisis situations requiring urgent intervention by societies. Throughout history, numerous disaster situations have occurred, often resulting in loss of life and property. Therefore, continual measures need to be taken to mitigate the impacts of disasters and enhance societal resilience. Commencing with the definition of the disaster concept, this study presents a compilation of knowledge and research from the literature. Focusing on strategies for reducing and combating the effects of disasters, this study examines various approaches aimed at enhancing people's ability to cope with disasters and emphasizes the significance of research conducted in this field. Understanding the role of social media in disaster relief and crisis communication processes is particularly crucial, considering the dynamics of contemporary communication environments. Social media holds a significant position among modern communication tools and increasingly plays a role in disaster relief processes. People can use social media platforms during disasters to request assistance, provide aid, share resources, and exchange information. This study extensively analyzes the impact of social media on disaster relief and crisis communication processes and evaluates the existing findings in the literature. Ultimately, the influence of social media on disaster relief and crisis communication is growing, underscoring the importance of further understanding and managing this influence. This study aims to contribute to disaster management and societal preparedness processes for disasters.

## **GİRİŞ**

Dünya üzerinde bilinen tarihteki geçmişten günümüze kadar birçok doğal veya insan yapımı afet meydana gelmiştir ve bu afetlerin sonucunda birçok maddi kayıplar ve can kayıpları olduğu kayıtlarla sabittir. İnsan, doğası gereği komün içerisinde yaşayan ve hayatta kalan bir canlı olduğundan ötürü, bu gibi afet durumlarında birbirleri ile iletişim kurmak amacıyla çeşitli yöntemler geliştirmiştir. Tarihe bakıldığında kimi zaman duman gibi görsel araçlarla, kimi zaman doğadaki canlıları kullanarak insanlar bu iletişimi afet zamanlarında dahi canlı tutmayı başarmıştır. Modern zamana geldiğimizde ise teknolojinin gelişimi ile iletişim telefon, tablet, bilgisayar gibi son teknoloji cihazlar ile sağlanmaktadır. Bu teknolojiler beraberinde farklı şekillerde iletişim kurulabilecek birbirinden çeşitli platformları zaman içerisinde hayatımıza sokmuştur. Afet anlarında ise geçiş zamana ve çalışmalara bakıldığında görülmüştür ki toplumlar afet anlarında istedikleri yardımlar, birbirlerine yardım etmek ve kendi aralarındaki koordinasyonu sağlayabilmek için bu platformları yoğun bir şekilde kullanmaktadır. Örneğin, 6 Şubat ve 7 Şubat 2023 Tarihinde Türkiye'nin Kahramanmaraş ili Pazarcık ve Elbistan ilçelerinde meydana gelen ve Hatay, Gaziantep ve Adıyaman gibi çevresindeki illeri etkileyen depremler esnasında Twitter ve Instagram platformlarında “#Deprem, #HatayDeprem, #DepremYardım, #KahramanmaraşDeprem, #KahramanmaraşYardım, #DepremAcil...” hashtagleri vasıtasıyla milyonlarca mesaj paylaşılmış ve insanlar iletişimlerini bu platformlar vasıtasıyla kurmaya çalışmıştır. Bu bağlamdan hareketle, farklı sosyal medya platformlarının afet koordinasyonuna ve yönetimine etkisi ve bu esnada oynadıkları roller birçok araştırma tarafından konu edilmiştir (Yıldırım, 2023; Doğuç, 2022; Kumar vd., 2019; Sreelakshmi vd., 2022; Çanakçı vd., 2022). Bu çalışmada, literatürde bulunan 32 farklı kaynak detaylı ve sistematik bir şekilde incelenmiş olup, literatürde katkı sağlanabilecek alanlar, çelişen noktalar ve dikkat çekilmesi gereken alanlar sonraki bölümlerde açıklanmıştır. Araştırmanın bulguları ve sonuç kısmında literatürle ve yapılacak araştırmalarla ilgili öneriler sıralanmış olup açıklanmıştır. Ayrıca, bu çalışma, sosyal medyanın afet yönetimi ve yardım koordinasyonunda nasıl kullanılabileceği konusunda daha fazla araştırmaya olanak sağlayabilir.

## **METOT**

Bu çalışmadaki temel hedef, literatürde bulunan ve sosyal medyanın afet yardımları ve kriz iletişimindeki rolünü konu alan araştırmaları sistematik bir şekilde inceleyerek katkıda bulunulabilecek alanları belirlemek, yapılan araştırmalar içerisindeki ilişkiyi ortaya koyarak literatüre bu konu hakkında katkı sağlamak ve gelecek araştırmalara yardımcı kaynak oluşturmaktır. Araştırmada, son dört yıla ait olan özellikle afet yardımlaşmasını, kriz iletişimini

ve koordinasyonu konu alan 32 ulusal ve uluslararası kaynak sistematik bir şekilde incelenmiş ve belirli kaynaklar arasında karşılaştırmalar ve açıklamalar yapılarak detaylara yer verilmiştir. İncelenen araştırmalar, alt parçalara bölünerek sınıflandırılmış, eleştirel olarak gözden geçirilmiş, temel çıkarımlara ve yorumlara sonuç kısmında yer verilmiştir. Ayrıca literatür genelinde yapılan öneriler sonuç ve öneriler alanında ayrıca belirtilmiştir. Ayrıca, bu çalışma, sosyal medyanın afet yönetimi ve yardım koordinasyonunda nasıl kullanılabileceği konusunda daha fazla araştırmaya olanak sağlayabilir.

### **BULGULAR**

Çalışmanın ilk adımı olarak sosyal medyanın afet iletişimindeki rolüne odaklanılmış ve bu kapsamdaki çalışmalar incelenmiştir. Yapılan araştırmalar göstermiştir ki, sosyal medya platformları afet sırasında ve sonrasında yoğun bir şekilde toplum kitleleri tarafından etkin bir şekilde kullanılmaktadır. Bu kullanım, kimi zaman afet durumundaki yardım ihtiyacına ve dayanışmaya odaklanmış, kimi zaman ise haber, bilgi ve duyuru paylaşımı için sivil toplum kuruluşlarınca ve resmi makamlarca yapılmıştır (Argın, 2023). Ayrıca sosyal medyada yayınlanan bu mesajlar duygu ve düşünceleri ifade etmek amacıyla yayınlanabildiği gibi belirli zamanlarda bilgilendirme amacıyla da servis edilmektedir (Doğuş, 2022, Kumar vd., 2019). Bu amaçlarla sosyal medyada yayınlanan öğeler metinsel içerikler barındırabildiği gibi görsel veyahut işitsel içeriklerden de meydana gelmektedir. Araştırmaların büyük bir kısmı ise metinsel öğeleri kullanmaktadır. Bunun temel sebebinin, metinsel içeriklerin kolay depolanması ve güncel teknolojik imkanlar (Makine öğrenmesi, dil modelleri, doğal dil işleme uygulamaları vb.) sayesinde hızlıca incelenebilmesi olduğu düşünülmektedir. Ayrıca X(Twitter) platformu, afetler sırasında ve sonrasında, koordinasyon ve yardım içerikli gönderileri paylaşmak amacıyla en çok kullanılan sosyal medya platformudur (Dwarakanath vd., 2021). Ek olarak, X (Twitter) kullanımı üzerine bir araştırma gerçekleştiren Adba Analytics, Pazarcık ve Elbistan'da gerçekleşen depremler esnasında en çok kullanılan sosyal medya uygulamasının X(Twitter) olduğunu belirtmiştir (Yıldırım, 2023). Afetler sırasında gerçekleşen sosyal medya paylaşımlarının amaçlarından bazıları bilgi edinmek, bilgi vermek, duygu ve düşünceleri paylaşmak, organizasyonu sağlamak olmaktadır. Bu esnada kullanıcılar veya kurumlar farklı rollere bürünmekle birlikte bu roller vasıtasıyla kullanıcıları farklı şekillerde etkileyebilmektedir. Afet sırasında yapılan sosyal medya paylaşımları vasıtasıyla dört ana kullanıcı grubu tanımlanmıştır. Bunlar; (1) inovatif kullanıcılar (Faydalı olanlar), (2) reaktif kullanıcılar (etkilenen insanları yönlendirebilenler), (3) duyarlı kullanıcılar (tepki gösterenler), (4) proaktif kullanıcılar (kuruluşlar) (Dwarakanath vd., 2021). Sosyal medya

platformlarının anlık bir paylaşım kaynağı olarak, bilgi paylaşmak, kriz iletişimini yönetmek ve afet yardımlarının koordinasyonlarını sağlamak amacıyla kullanabileceği bir çok kaynakta açıkça belirtilmiş ve konu edinilmiştir. Sosyal medya, afet iletişimde geleneksel medya araçlarının ötesinde alternatif ve interaktif bir araç olarak çalışmalarda tanımlanmış ve incelenmiştir (Ata, 2023). Sosyal medya üzerinden yayınlanan içerikler üzerinde, platform idarecileri tarafından birçok filtre uygulanmakta ve suç teşkil edici içerikler engellenmektedir. Fakat, yapılan paylaşımların doğruluğunu kontrol eden bir mekanizma günümüzde bulunmamaktadır. Bu durum yayınlanan gönderilerin manipülasyona ve yanlış yönlendirmelere açık olmasını da beraberinde getirmektedir. Bilgi güvenliği üzerine duyulan bu endişelerin yanında, yaşça büyük bireylerin geleneksel medyayı sosyal medyaya nazaran afet sırasında daha fazla tercih ettiği görülmüştür. Bu kriterler dikkate alındığında sosyal medyanın afet iletişimi ve koordinasyonunda kullanılabilmesi için bilgilerin teyit edilmesi gerekmektedir (Yıldırım, 2023). Fakat yapılan araştırmalar göstermiştir ki, yayınlanan içerikler toplumsal farkındalığı artırmış ve bilinçlenmeyi sağlamıştır (Ata, 2023).

Yapılan çalışmalarda, sosyal medya iletişiminin kişiler, kurumlar ve afet personeli için bilgilendirme amacıyla etkin bir rol oynadığı ve kitlelere erişimi kolaylaştırdığına yer verilmiştir. Bunun bir örneği olarak bazı araştırmalarda gerçekleşen afetler sonrasında yardım ve koordinasyon ekiplerinde görev almış kişilerin görüşlerine yer verilmiştir (Ekşi vd., 2014).

### **SONUÇ VE ÖNERİLER**

Bu çalışma, sosyal medyanın afet yardımlaşması ve koordinasyonu üzerindeki etkisini araştıran, ayrıca afetler üzerinde sosyal medya iletişiminin etkisini konu alan birçok literatür kaynağını detaylı ve sistematik şekilde incelemiştir. İncelenen araştırmalarda, sosyal medya kullanımının afet iletişimi vasıtasıyla kullanımının günden güne arttığını, afet yardımları ve kriz iletişimindeki rolünün ve gelişen teknolojiyle beraber etkisinin yoğunlaştığını, etkisinin ise göreceli ve değişken olduğunu ortaya koymuştur. Literatürde yer alan kaynaklarda afet iletişiminde sosyal medya kullanımının manipülasyona ve yanlış yönlendirmelere açık olduğu ve bununla ilgili çalışmaların artması gerektiği gözlemlenmiştir. Ayrıca birçok kaynak bu olguyu araştırma kısıtlarına da dahil etmiş ve dikkat edilmesi gereken bir unsur olarak belgelemiştir. Fakat geleneksel kitle iletişim araçlarının yanında öneminin ve etkisinin özellikle genç bireyler özelinde gitgide arttığından kaynaklarda sıkça bahsedilmiştir. Yapılan incelemelerin büyük bir kısmında veri kaynağı olarak sosyal medya araçlarında yer alan etkileşimler kullanılmaktadır. Fakat bu etkileşimler genelde afet esnasına ve yakın tarihlere ait olup bireylerin psikolojik veya duygusal çıkarımları hakkında güncel durumlarını yansıtmadığı

düşünülmektedir ki yine yapılan medya incelemelerinde afet sonrasında uzunca bir süre afet ve yapılan yardımlar hususunda bilgiler sosyal medyada farklı kullanıcılar tarafından servis edilmiştir. Bu vasıtaıyla, anket, mülakat vb. metotların yaygınlaştırılarak hem afetlere yakın tarihlerde hem sonrasında sosyal medya kullanımının kullanıcılar üzerindeki etkisini araştıran çalışmaların artırılması gerektiği düşünülmektedir. Ayrıca, yapılan incelemelerde kaynaklarda bilgi kirliliğinin ve manipülatif paylaşımların önemine ve olumsuz etkisine dikkat çekilmiştir. Bu hususta sosyal medya kullanıcılarının bu olumsuz etkilere sahip olan paylaşımlara karşı nasıl ve ne şekilde bilinçlendirilebileceği ve bu paylaşımların engellenebileceği hakkında yapılan araştırmaların literatürde artması gerektiği düşünülmektedir. Sosyal medyanın kullanıcıları bilinçlendirme ve koordinasyon sorunlarını ortadan kaldırmasına yardımcı olması hususunda yapılabilecek çalışmaları konu alan araştırmaların literatürde eksikliği göze çarpmıştır.

**Email:** orbak@uludag.edu.tr

**Özet**

Yalın üretim, yapısında gereksiz unsur bulundurmayan, hata, maliyet, stok, fire ve müşteri memnuniyetsizliği gibi sebeplerin en aza indirildiği üretim sistemidir. Yalın üretimin genel felsefesinde sıfır hatalı, tam zamanında, küçük partiler halinde, yüksek çeşitlilikte üretim yapılması öngörülür. Yalın üretim uzun zaman alan ve çaba gerektiren bir süreç işidir. Üretime özgün nitelik kazandırır ve eldeki imkânla ile mümkün olan maksimum çıktı elde edilir. İşletmeler, teknolojinin çok hızlı bir şekilde geliştiği bu günlerde büyüyen pazarda rakipleri ile mücadele edebilmek için elindeki kaynakları en iyi biçimde kullanmak durumundalardır. Bu çalışmada, bir otomotiv yan sanayii firmasında üretimin israflarından arındırılmasını içeren montaj hattı iyileştirme çalışması gerçekleştirilmiştir. Bunun amaçla yalın üretim sistemi ve yalın üretim sistemlerinden biri olan WCM (World Class Manufacturing) sistematüğinden yararlanılmıştır. Ayrıca, World Class Manufacturing (WCM) ve Workplace Organization (WO) aktiviteleri ile katma değer oluşturmayan süreçler elimine edilmeye çalışılarak montaj hattı iyileştirme problemine farklı bir bakış açısı sağlanarak aynı zamanda yerleşim düzeni iyileştirilmesi sağlanmıştır. İyileştirme çalışmasının sonucunda verimlilik artışı da sağlanmıştır. Çalışmanın planlama aşamasında kayıpların analizi, kayıpların önceliklendirilmesi, kayıpların ayrıştırılması, öncelikli kayıp alanlarının belirlenmesi ele alınmıştır. Uygulama aşamasında ise yalın üretimin vazgeçilmezi olan Muri (aşırı yük), Mura (düzensizlik) ve Muda (atık) analizleri ve iyileştirmeleri yapılmıştır. Çalışmada ayrıca zaman etüdünden ve hareket etüdünden de faydalanılmıştır. Uygulama sonucunda hat denge kaybı yüzdesi azaltılarak çalışan sayısında düşüş sağlanmıştır. Ayrıca genel olarak üretim sisteminde % 5 gibi bir iyileşme elde edilmiştir.

**Anahtar Kelimeler:** Yalın üretim, WCM, Montaj Hattı İyileştirme

**LEAN MANUFACTURING STUDY IN INDUSTRIAL ENGINEERING –  
AUTOMOTIVE SUPPLIER COMPANY APPLICATION**

**Abstract**

Lean production is a production system that does not contain unnecessary elements in its structure, in which errors, costs, stock, wastage, and customer dissatisfaction are minimized. The general philosophy of lean production envisages zero-defect, just-in-time, small-batch, high-variety production. Lean manufacturing is a process that takes a long time and requires effort. It gives a unique quality to the production, and the maximum possible output is achieved with the available resources. These days, when technology is developing rapidly, businesses have to make the best use of their resources to compete with their competitors in the growing market. In this study, an assembly line improvement study was carried out in an automotive supplier company, which included eliminating production waste. For this purpose, the lean production system and World Class Manufacturing (WCM) systematics, one of the lean production systems were used. In addition, with WCM and Workplace Organization (WO) activities, processes that do not create added value were tried to be eliminated, providing a different perspective on the assembly line improvement problem and, at the same time, improving the layout. As a result of the improvement in work, productivity increased. During the study's planning phase, analysis of losses, prioritization of losses, separation of losses, and determining priority loss areas were discussed. During the implementation phase, Muri (overload), Mura (disorder), and Muda (waste), which are indispensable for lean production, were analyzed and improved. Time and motion studies were also used. As a result of the application, the percentage of line balance loss was reduced, and the number of employees decreased. In addition, an overall improvement of 5% was achieved in the production system.

**Keywords:** Lean manufacturing, WCM, Assembly Line Improvement

## **Introduction**

In the automotive industry, as in other industrial organizations, product diversity and customer demands constantly change and increase. To be long-lasting and run a profitable process, businesses must use these values effectively and efficiently and produce final products or services with lean production by reducing waste. For this reason, companies operating in the automotive industry have to meet customer expectations to maintain their existence in their market and compete with other competitors. At the same time, it is necessary to use resources such as energy, labor, and raw materials effectively and efficiently in a globalized world. Improving existing processes, efficient use of the workforce, ensuring and maintaining the working environment, and maintaining the health and safety of employees also increase productivity conditions. The study aims to examine the production process, reduce cycle time, eliminate movements that do not create added value, and improve layout using a lean production system and WCM tools, one of the lean production systems, in an automotive supplier company. In this way, it is aimed to increase productivity. In addition, it is aimed to bring a different perspective to line balancing studies with WCM. This study proposes balancing studies for a line producing mixed-model products. Analyzing the current situation in the business aims to reduce the cycle times and number of operators of mixed model assembly lines. Solutions developed to eliminate activities that do not create added value have been proposed during balancing. As a result of the study, minimum cycle time and minimum number of operators were obtained.

## **2. Production and Production Systems**

Production includes activities to increase the number and benefits of production and services to meet living things' needs. Production consists of three stages: inputs, processes, and outputs. Products and services are the outputs of the production process. To carry out production, the concepts of raw materials, labor force, capital, and information found in nature, which we call inputs, must be brought together.

### **2.1. Production Systems**

Types of production systems are examined under five main headings according to customer demands, production quantities, and product features. Types of production systems are;

**Project type production:** Project type production is manufacturing a product that has not been produced before according to customer wishes. (Kanat, 2016)

**Workshop-type production:** In workshop-type production, products are produced at the time and in the quantity requested by the customer. The production cost is very high. One of the advantages of this type of production is that it is more flexible since it is not serial.

**Batch-type production:** In batch-type production, products are produced at certain times to meet customer orders in variable quantities. The most crucial point is that production planning correctly meets the customer's needs. (Kanat, 2016)

**Mass production:** In mass production, all workforce, machinery, and equipment on the production line work in a coordinated manner to produce one or similar products. The most significant disadvantage of mass production is that the slightest problem in the production line slows down or pauses production. (Kanat, 2016)

**Just-in-time production:** Just-in-time production (JIT) is the whole of production activities carried out to produce the right products in the desired quantity at the right time. In this way, production quality is ensured by preventing inefficiency and waste.

Waste and loss are not only faulty production but all activities that have no added value but create costs. The seven basic wastes are unnecessary production, waiting time, unnecessary transportation, unnecessary processing, excess stock, unnecessary movement, and defective product (Woehrle and Abou-Shady, 2010)

## **2.2. Lean Manufacturing**

Lean production is a system that aims to improve product and production processes in line with customer demands, eliminate waste and losses, reduce labor, costs, scrap, and stock, and also ensure and manage supplier and customer relations. The primary purpose of lean production is to optimize the cycle time and produce with zero errors, zero inventory, and lower costs. The basic principle is to make a wide variety of products with fewer production lots just in time. It also aims to eliminate activities that do not create added value in line with customer demands. In the 1800s, the concept of production began to be considered as a process. One of those who contributed to the emergence of the idea of process in these years was Eli Whitney. Eli Whitney implemented and maintained the production system through short-cycle processes in weapons production. In the 1900s, Frederick Taylor created the concept of standard business. Frank Gilbreth introduced work and motion study and the idea of process mapping. In the 1910s, Henry Ford implemented and developed the flow production system. He made the flow system by taking an example from the slaughterhouse belt system. The foundations of the lean production system were laid in the 1950s under the leadership of Eiji Toyoda and Taiichi Ohno. Inspired by Toyota Ford's flow system, they adopted and implemented the lean production

system to maintain their market presence and adapt to changing demands. Concepts and techniques such as visual factory, 5S, kaizen, pull system, line balancing, and SMED have been developed with the Toyota production system. The most crucial goal of the Toyota production system is just-in-time production when the customer wants it and without stock. (Kılıç, 2016)

### **Lean Manufacturing Principles**

The main principle of the lean production idea is to separate the concepts of value and waste and transfer the value-free waste to the customer. These principles are Value, Value Stream, Flow, Towing, and Perfection.

#### **Value**

Value can only be defined by the end customer and has meaning only when expressed in terms of a specific product that meets customer needs at a particular price at a specific time. The customer creates the value for the producer. Therefore, value should be tailored to the customer. (<https://lean.org.tr/yalin-dusuncenin-ilkeleri/>, 2019) Processing, Control, Transportation, Waiting, and Stock create value.

#### **Value Stream**

Value stream is the second step of lean manufacturing principles. These are all the steps that create and do not create value in the process from the beginning of the raw material to the customer. Three activities create and do not create value during production. Activities for which the customer accepts the cost while creating the product are value-added activities (VAA). Semi-value-added activities (SVAA) do not create added value but are necessary to produce the customer's desired product. (Fastening the screw, fixing the part, etc.) Non-value-added activities (NVAA) are activities the customer does not consider necessary for the product he wants. (<https://lean.org.tr/yalin-dusuncenin-ilkeleri/>, 2019)

#### **Stream**

Lean production flow uses a single flow system to eliminate waste and losses. Henry Ford successfully implemented the flow throughout the process until the finished product was produced by arranging all the machines in the production line in a particular order. (<https://lean.org.tr/yalin-dusuncenin-ilkeleri/>, 2019)

#### **Pull**

Pull means pulling the product as needed by the customer rather than pushing it into another process without the customer's request. Pulling begins with the customer's demand, and then production starts as each process demands from the previous one. (<https://lean.org.tr/yalin-dusuncenin-ilkeleri/>, 2019)

The pull system ensures the production rate is the same as the customer demand rate. Thanks to the pull system, the requested products are produced in the requested quantity and quantity.

**Table 1.** Comparison of push and pull strategies (Arıcı 2017)

<b>Push System</b>	<b>Pull System</b>
The forecast of future demand guides production.	Production is driven by current demand.
Changes in demand cause excess and dead stock.	Changes in demand can be transferred from the following process to the previous one.
Safety stocks are created for possible errors.	There is no need for safety stock as errors are prevented before they occur.
Information flow between processes is fast.	Information flow between processes is slow.

### **Perfection**

Businesses must create the idea of excellence along with workforce and cost reduction by defining their values correctly, creating value flows, ensuring a continuous flow with steps that create added value, and ensuring the value flow of end customers starting from the first operation. Additionally, excellence requires direct communication with the customer. (Kanat, 2016)

### **2.3. Lean Manufacturing Tools**

#### **2.3.1. Total productive maintenance**

It eliminates and improves these losses by identifying losses and waste with the teams formed by employees at all levels. After serial mass production, operators who are qualified in maintenance and can repair their machines are generally preferred. However, with mass production and automation, the need for operators to repair the machines was eliminated. The need for maintenance management also emerged here. For this reason, the Japan Planned Maintenance Institute was established. (Bingöl, 2012)

#### **2.3.2. 5S**

These are words whose initial letters start with S in Japanese, called 5S. Table:2 shows these five steps. Its purpose is to organize the work area and environment and ensure continuity. 5S is a systematic approach that organizes and standardizes the work environment.

**Table 2.** 5S steps (Arıcı, 2017)

Japanese	English	Meaning
Seiri	Sort	It refers to the distinction between what is needed and what is not needed for production and eliminating unnecessary things.
Seiton	Set in Order	It refers to preparing an orderly working environment to easily access your needs.
Seiso	Shine	It refers to cleaning the working environment.
Seiketsu	Standardize	Creating order means maintaining order and cleanliness.
Shitsuke	Sustain	It means ensuring continuity.

### **2.3.3. Kanban and pull system**

Kanban can be defined as the definition card of the product in Japanese. The Kanban card contains all the information about the product. Kanban is an integral part of the pull system. It ensures the flow of information between operations and retrieves parts from the previous operation. The pull system is applied for continuous production without stock and interruption. In the pull system, any product not requested from the next operation is not manufactured in the previous operation. In this way, no stock is kept between operations. This system is used together with Kanban. The pull system is the most essential part of the Just-in-time production (JIT) system. (Yılmaz, 2010)

### **2.3.4. Poka – Yoke**

Poka - Yoke error prevention systems contain the Japanese words Poka and Yoke. Poka means to reduce or eliminate. It is a lean production tool that prevents the occurrence and repetition of errors in the production process and envisages continuous improvement. The primary purpose of Poka-Yoke is to make quality-oriented improvements that will prevent the production of errors and defective parts and products. (Yılmaz, 2010)

### **2.3.5. Jidoka**

Jidoka means autonomy. It also includes machines and manual operations. Jidoka detects abnormal situations during production and stops production when necessary. (Yılmaz, 2010)

### **2.3.6. SMED**

The time between the product produced in the previous production lot and the first quality product in the next production lot is called setup. The setup is divided into two. These;

- Internal Setup: These are the operations performed when production is stopped.
- External setup refers to all the preparations made after the line without stopping production.

### **2.3.7. Kaizen**

It consists of the Japanese words “KAI” and “ZEN”. The meaning of Kai is change, and the sense of Zen is improvement. In other words, kaizen can be called temporary improvement. Kaizen aims to improve the process by making small changes. (Güneş et al., 1999)

### **2.3.8. Heijunka**

Heijunka (Sequential Production) is called average. Heijunka is the sequential production of products in terms of type and volume on the production line. The purpose of Heijunka production is to increase efficiency by reducing or eliminating fluctuations in demand through sequential production. In this way, customer satisfaction is ensured. (Yılmaz, 2010)

### **2.3.9. Value Stream Mapping**

Value Stream Mapping (VSM) is an activity that shows the process and flow from supplier to customer. VSM aims to make improvements to implement lean production. It is also to eliminate NVAA.

### **2.4. World-Class Manufacturing (WCM)**

The lean production system was developed together with the Toyota production system. WCM (World Class Manufacturing) aims to continuously improve by bringing new approaches to the lean production system. WCM is an integrated model that covers all production processes and enables continuous improvement and development of quality, efficiency, safety, and delivery. WCM encompasses all processes and focuses on the most significant loss. (Tepekule, 2015) WCM consists of 20 pillars, ten administrative and ten technical pillars.

**Table 3.** Administrative and Technical Pillar

Administrative Pillar	Technical Pillars
Management's Determination	Occupational Safety (SA)
Clarity of Goals and KPIs	Cost Spread (CD)
WCM Roadmap	Focused Improvement (FI)
Allocation of Highly Qualified Employees for Model Areas	Autonomous Activities (Workplace Organization/Autonomous Maintenance) (WO/AM)
Organization's Commitment	Professional Maintenance (PM)
Competency of the Organization in Improvements	Quality Control (QC)
Time and Budget	Logistics (Log)
Propagation Level	Early Product/Equipment Management (EPM/EEM)
Level of Detail	Employee Development (PD)
Employee Motivation	Environment and Energy (EN/NRG)

Pillars are scored between 1 and 5 points and evaluated out of 100. (Koçak et al., 2011) The distribution of costs, one of the ten technical units in the structure of WCM, focuses on reporting losses. Workplace organization includes improving workstations in the workplace; Occupational safety works to ensure the safety of the working environment in the facility. (Murino, 2014) "Production system: Workplace organization is structured on quality, maintenance, and logistics. "If we look at the general structure of the system, the aim is zero waste, zero error, zero malfunction, zero stock, and zero work accidents." (Bozağaç, 2018) Autonomous Maintenance and Workplace Organization pillars form the Autonomous Activities Pillars. WO (Workplace Organization) pillar activities are generally implemented in assembly lines. In workplace organization, other pillars aim for 0 errors in quality, 0 failures in professional maintenance and autonomous maintenance, 0 stocks in logistics, and most importantly, 0 accidents in occupational safety.

### **2.5. Assembly Lines And Assembly Line Balancing**

Assembly is the process of combining multiple similar or different parts to create the product. The parts required for the assembly process may be semi-finished products or components.

Semi-finished parts are parts that are subjected to varying processes before being subjected to assembly. (Yıldız, 2015) Assembly line systems consist of two or more lined workstations that exchange information and products between each other. Products are transported between workstations within a determined cycle time, the necessary operations on the product are carried out respectively, and the finished product is obtained at the end of the line. (Yıldız, 2015) Assembly line balancing is the assignment of work to be done to workstations according to the optimum cycle time, priority relationships, capacity, and time constraints. “The most fundamental problem encountered in assembly lines is the balanced assignment of tasks to be completed to the workstations, considering one or more objectives, under certain constraints related to the production system and the product. This problem is called the assembly line balancing problem.” (Altunay et al., 2017) For assembly line balancing efforts, priority relationships must be established. To proceed with an operation, all necessary work must be completed beforehand. This situation is called the priority constraint. Each operation must be assigned strictly to any operation. While operations can be assigned to only one station, assigning more than one operation to a station is possible. This situation is called an assignment constraint. Another constraint is cycle time. No operation or station time can be greater than the cycle time. Sometimes, an operation may require skilled labor and must be done only with certain operators. Such constraints are called operator constraints. (Yıldız, 2015) The objectives of assembly lines are capacity, profit, cycle time, and cost. The aim is to maximize capacity and profit on assembly lines and minimize costs and cycle times. Costs are classified as labor, preparation, inventory, and investment costs.

### **3. Materials and Methods**

The application was made for the automotive supplier, a Turkish capital company that produces parts for the leading automotive industries. The company has applied the WCM production methodology since 2010. This study will include lean production system elements and applications regarding assembly line balancing. 5S, JIT (Just in Time Production), Kanban and pulling system, Poka-Yoke, Jidoka, Kaizen, Heijunka and WCM tools. The differences between the current and past situations and the gains achieved will be shown.

This study covers improvement works in the assembly department. The studies will be explained in the PDCA cycle.

The following processes in the planning phase will be discussed:

1. Analysis of losses, prioritization of losses, selection of loss area and facility

2. Separating the losses in the selected area, determining the priority loss areas, and choosing the priority improvement area
3. Selecting the improvement topic and determining the goals
4. Selecting team members

The following processes will be addressed during the implementation phase:

5. Muri analysis and improvements
6. Mura analysis and improvements
7. Muda analysis and improvements

The following process will be discussed during the control phase:

8. Checking the results

In the precaution phase, the following process will be addressed:

9. Standardization and Controls

**Planning Phase**

In the planning section, the functions of all processes are defined, and information about process flow, number of employees, and cycle time is obtained.

**Table 4.** Losses occurring in the entire production line

NVAA losses		Poor quality losses	Shortstops
Line density/balance	Direct material shortage losses	Losses due to computing losses	
Borrowed labor losses	Human resources losses	Quality losses	
Order change losses	Malfunction losses	Lack of energy losses	
Loss of control	Project, new product commissioning losses	Setup/mold change losses	

These losses are found in the C matrix used in the WCM – CD (Cost Deployment) pillar. All losses are given in Table 4. The first three losses are NVAA, line density balance, and setup losses. The most significant proportion belongs to NVAA losses, and it was chosen as the line balancing problem to reduce and eliminate these losses.

**Table 5.** Current situation loss analysis

Loses	Number of Loses
NVAA	120
Line Fill Balance Losses	65
Setup / Mold Change Losses	43
Losses Due to Order Change	25
Loss of Control	15
Direct Material Shortage Losses	12
Malfunction Losses	8
Other	20

Afterward, the line with the highest NVAA losses was examined, and as a result of the analysis, it was observed that the highest loss was in the 4th line. In this way, the area to be improved and line balanced was determined as line 4. Line 5 was chosen as the dissemination area.

**Table 6.** NVAA-line balance losses by line

Lines	Number of loses
4th line	40
5th line	20
3rd line	17
2nd line	15
1st line	6

VAA-SVAA-NVAA analyses were performed on the selected lines. 4th and 5th line operations are;

- Back skeleton preparation
- Preparation of seat frame
- Seat back hooking
- Seat back dressing (1st operation)
- Seat back dressing (2nd operation)
- Seat and back joining
- Ironing – Bagging

Pareto shows the VAA-SVAA-NVAA distribution in Chart 3.

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY SCIENTIFIC STUDIES**

*April 09-16, 2024 / Lisbon, Portugal*

**Figure 1.** 4th line VA – SVA – NVA - Line Balance Paereto

The monthly labor requirement and line balance loss on the 4th and 5th lines are shown in the figure below.

4th line workforce and line balance loss distribution on a monthly basis

5th line workforce and line balance loss distribution on a monthly basis

blue bar: labor need, red bar: loss of line balance

**Figure 2.** The labor requirement and line balance loss on the 4th and 5th Lines

The NVAAs resulting from the analysis on the line are as follows (Table 6);

**Table 7.** Current status of NVAA percentage distributions

Loses	Percentage
Difficult Placement Loss	0 %
Loss of Walking	11 %
Loss of Reaching Pickup and Placement	3 %
Equipment/Material Preparation	22 %
Periodic Transactions	6 %
Loss of Sitting and Standing	0 %
Loss of Retrieving Handfuls from Mixed	0 %
Visual Control	0 %
Temporary Insertion Loss (part fixing)	25 %
Equipment Pickup/Dropoff	9 %
Bending Squatting Loss	0 %
Intermediate Transitions	13 %
Picking and Placing Heavy or Large Parts	11 %

The goal is to reduce NVAAs and line balance losses, thus reducing cycle time and the number of operators. Other goals are:

**Table 8.** MURI, MURA, MUDA targets and solutions

	CAUSE	SOLUTION	Target
<b>MURI</b>	Difficult and unusual work	Ergonomic works	To improve the points where the current ergonomics score is 15, and the vertical body movements are 3 points.
<b>MURA</b>	Irregular movements	Standard operation definitions	Improvement of irregular operations.
<b>MUDA</b>	Works that do not create added value	Analysis and reduction	Improvement in NVAAs.

According to these analyses, a working team was established with team members with various competencies.

### **3.2. Application**

During the application phase, Muri, Mura, and Muda analyses and improvements will be mentioned.

Every activity was examined, and human and machine movements were analyzed for a time study. It was videotaped using the camera technique in 3 shifts of 30 vehicles. The steps of the operation, whose video was recorded, were extracted, and the NVAA steps were examined by following the steps. As a result of the online analysis, NVAA/VAA distributions were determined. The list of VAA, SVAA, and NVAA is given in Table 9. The operation cycle time variation of each operator was determined. Duration changes were chosen based on analyzing the video footage taken for each shift.

**Table 9.** VAA, SVAA and NVAA list

Value Added Activities (VAA)	Semi Value Added Activities (SVAA)	Non-Value Added Activities (NVAA)		
Assembly	Getting Parts	Pull	Choose	Walk
Bending	Positioning	Press	Carry	Transport
Join	Getting Parts	Pick up	Separate	Standby
Assembly	Positioning	Download	Take	Inversion
Bending		Stacking	Open	Rotation
Join		Change	Dry	Trial for positioning
Assembly		Call	Organize	Trial for screwing
Bending		Count	Connect	Try to disassemble and open
Join		Organise	Look	Trying to place
Assembly		Measure	Delay	Try to wire
Bending		Weigh	Stop	Fix
Join		Transfer	Putting it in place	Peak
		Repackaging	Send	Leaving the pieces lying around
		Passing from hand to hand	Put in its place	Collect
		Re-stack	Push	

**Muri Analysis and Muri Improvements**

First of all, a Muri analysis of the 4th line was performed. Improvements have been made to create working environments with high added value and ergonomic comfort so that the operator can work in Golden Zone / Strike Zone areas (Golden Zone is a method used to pick up materials on the horizontal plane without difficulty). Maximum efficiency has been tried to be achieved with the least possible movement.

AA → All materials are accessible without leaving the assembly point.

A → Materials are within three times the distance of the installation point. The operator can reach at the elbows and use both arms to pick up the materials.

B → To reach the materials, raising the hands above shoulder level is necessary.

C → To reach the materials, arms must be extended, or auxiliary devices such as steps must be used.

D → The materials are outside the operator's reach and can only be accessed by special vehicles.

**Figure 3.** Golden zone schematic representation

A Strike Zone is a method used for the operator to pick up materials in the vertical plane without difficulty.

AA → All materials are at a height that can be reached without raising the hands.

A → Materials can only be reached by raising hands.

B → To reach the materials, raising the hands above shoulder level is necessary.

C → To reach the materials, arms must be extended, or auxiliary devices such as steps must be used.

D → Materials are out of the operator's reach.

**Figure 4.** Strike zone schematic representation

In Muri analysis, each operation is examined at three levels.

- Level 1: The ergonomic level the operator desires to work at.
- Level 2: Ergonomically acceptable but needs improvement.
- Level 3 represents the worst ergonomic situation, and improvement efforts should start here.

In Muri's analysis, operations were evaluated according to ergonomic movements in the literature.

After the current situation Muri analysis,

- There are 119 level 1 ergonomic movements (1 Point),
- There are 83 level 2 ergonomic movements (2 Points),
- It is seen that there are 40 level 3 ergonomic movements (3 points).

Muri analysis of the current situation of line 5 is as follows:

- There are 124 level 1 ergonomic movements (1 Point),
- There are 77 level 2 ergonomic movements (2 Points),
- It is seen that there are 41 level 3 ergonomic movements (3 points).

The first point that needs improvement: When the line operation is examined, the operator turns back and walks to get the assembly materials. Work has been carried out because these parts need to be improved.

### **Mura Analysis and Mura Improvements**

Mura: It is the improvement of irregular operations. Time analyses in 3 shifts were made. The results are shown in Table 10.

**Table 10.** Tread preparation operation time analysis

<b>Current Situation</b>	<b>Work I</b>	<b>Work II</b>	<b>Work III</b>	<b>Work IV</b>	<b>Average</b>
<b>Shift A</b>	103,6 sn	133,2 sn	135,32 sn	136,42 sn	127,135 sn
<b>Shift B</b>	106,6 sn	130,2 sn	135,32 sn	136,42 sn	127,135 sn
<b>Shift C</b>	121,7 sn	145,42 sn	115,28 sn	125,84 sn	127,060 sn

The second point that needs improvement: When the way operators work is examined, although there is not much difference in terms of time, the work needs to be standardized. For this reason, it is necessary to provide training and increase visuals to ensure the standard.

### **Muda Analysis and Muda Improvements**

Improving non-value-added activities is the reorganization and process integration of work and the application of low-cost automation.

3rd point that needs improvement: When the line operation is examined, the 5th and 4th line bagging operations are carried out separately. For this reason, there are separate operators. It is found that walking losses are high. The bagging operation should be shared, and walking losses should be reduced. The other losses are equipment and material preparation losses. For this reason, material preparation needs to be improved.

#### **4. Findings And Discussion**

The kitting method ensures that the components of each product made on the assembly line arrive at the same time and in the specified quantity as that product. The assembly materials are placed before the operator (golden zone), and body rotation and walking are eliminated. This way, while the correct products are fed to the line, the operator will not have time to search for parts, which will be eliminated in NVAA.

Muri analysis after the fourth line improvements is as follows:

- There are 135 level 1 ergonomic movements (1 Point),
- There are 76 level 2 ergonomic movements (2 Points),
- It is seen that there are 31 level 3 ergonomic movements (3 points).

Muri analysis after the fifth line improvements is as follows:

Muri analysis results after improvement;

- There are 142 level 1 ergonomic movements (1 Point),
- There are 67 level 2 ergonomic movements (2 Points),
- It is seen that there are 33 level 3 ergonomic movements (3 points).

The work distribution between shifts differed, and the 2nd operator slowed down the line during the backing operation. By regulating work distribution, the deviation between shifts was prevented.

**Table 12.** Tread preparation operation time analysis after improvement

<b>After Improvement</b>	<b>Work 1</b>	<b>Work 2</b>	<b>Work 3</b>	<b>Work 4</b>	<b>Average</b>
<b>Shift A</b>	103,6 sn	133,2 sn	135,32 sn	136,42 sn	127,135 sn
<b>Shift B</b>	106,6 sn	130,2 sn	135,32 sn	136,42 sn	127,135 sn
<b>Shift C</b>	103,6 sn	133,2 sn	135,32 sn	136,42 sn	127,135 sn

Since the fourth-line and fifth-line bagging operations were carried out in separate places, each line had an individual operator. By switching to the new line layout, the operations were combined by giving the fourth-line bagging and first-line bagging operations to the same operator. By preventing the operators from turning their backs and picking up materials, the materials were taken to the golden zone, resulting in a 5% improvement in NVAAAs.

### **5. Conclusion and Recommendations**

The automotive supplier company examined the production process, reduced cycle time, eliminated movements that do not create added value, and improved layout using a lean production system and WCM (World Class Manufacturing) tools as one of the lean production systems that were discussed. Thus, it is aimed to increase productivity. Balancing exercises have been proposed for assembly lines. As a result of the studies, line balance loss on the fourth line decreased from 29% to 9%; Line balance loss on the fifth line decreased from 36% to 9%. A 5% improvement was achieved in NVAAAs. The process detected irregularities by analyzing NVAA losses in the assembly lines, and time and operator savings were achieved by combining existing line flows. MURI applications have been made to improve the operator's ergonomic movements. With all these studies, the Lean production system was implemented with the WCM tool.

As a result, all employees within the company should be taught this systematically and expected to contribute through the suggestion system. As in this study, improvements can be made by performing loss analyses on assembly lines by applying a systematic approach to systems where balance losses may occur.

### **Thanks and Information Note**

We, the authors, would like to thank Industrial Engineer Berna Karasu for her contributions to this study.

**Özet**

Talep tahmini, çeşitli sektörlerde karar vermenin kritik bir yönüdür; envanter yönetimini, üretim planlamasını, genel operasyonel verimliliği ve kaynak tahsisini etkileyerek stratejik karar almayı kolaylaştırır. Doğru tahmin, kuruluşların operasyonlarını optimize etmelerine, maliyetleri azaltmalarına ve müşteri taleplerini verimli bir şekilde karşılamalarına olanak tanır. Zaman serisi analizi, ekonomi, finans ve çevre bilimi gibi çeşitli alanlarda temel kalıplara ve eğilimlere dair içgörüler sunarak önemli bir rol oynamaktadır. Talep tahmin yöntemlerinde zaman serilerine sıklıkla rastlanmaktadır. Karmaşık zamansal bağımlılıkları yakalamadaki esnekliği ve etkinliğiyle bilinen Otoresif Entegre Hareketli Ortalama (ARIMA) modelleri, zaman içinde gelişen olayların tahmin edilmesinde ve anlaşılmasında yaygın olarak kullanılmaktadır. Bu çalışma, cam endüstrisi için zaman serisi verilerinin analizinde ARIMA modellemesinin uygulanmasını araştırmayı ve ARIMA modellemesini uygulayarak talep tahmin doğruluğunu arttırmayı amaçlamaktadır. Bu çalışmada ARIMA modelinin zaman serisi verileri üzerindeki uygunluğunu ve performansını değerlendirmek amacıyla çeşitli analizler yapılmıştır. Sonuçlar, ARIMA modelinin etkinliğini değerlendirmeye ve zaman serisi verilerindeki eğilimler ve mevsimsellik gibi önemli özellikleri yakalamak için kullanılan bir dizi istatistiksel teste ve göstergelere dayanmaktadır. Bu çalışma, on dört farklı potansiyel model (iki farklı eğitim ve test dönemine dayanan yedi farklı yöntem) arasından en iyi sonuçlara sahip ARIMA modellerinin sonuçlarını incelemekte ve özellikle modeller arasında yer alan en iyi sonuçları sergileyen "Rastgele Aramalı En İyi ARIMA Modeli (son 2 yıllık eğitim verileri)" üzerine odaklanmaktadır. Durağanlık testleri, teşhis testleri, artık analizleri, hata analizleri ve istatistiksel değerlendirmeler, "Rastgele Aramalı En İyi ARIMA Modeli (son 2 yıllık eğitim verileri)"nin etkinliğini ve zaman serisi verilerindeki yapıları modelleme konusundaki başarılı yeteneğini göstermektedir. Bu yetenek, yüksek talep tahmini doğruluk oranıyla başarısını kanıtlamıştır.

**AN ANALYSIS OF TIME SERIES DATA AND ENHANCING DEMAND  
FORECASTING ACCURACY: A CASE STUDY USING ARIMA MODELING IN  
GLASS PRODUCTION INDUSTRY**

**Abstract**

Demand forecasting is a critical aspect of decision-making in various industries; it influences inventory management, production planning, overall operational efficiency, and resource allocation, facilitating strategic decision-making. Accurate forecasting enables organizations to optimize their operations, reduce costs, and efficiently meet customer demands. Time series analysis plays a significant role in various fields such as economics, finance, and environmental science by providing insights into fundamental patterns and trends. Time series are frequently encountered in demand forecasting methods. Known for their flexibility and effectiveness in capturing complex temporal dependencies, Autoregressive Integrated Moving Average (ARIMA) models are widely used in predicting and understanding evolving events over time. This study aims to investigate the application of ARIMA modeling in the analysis of time series data for the glass industry and to enhance demand forecasting accuracy by implementing ARIMA modeling. In this study, analyses were conducted to assess the suitability and performance of the ARIMA model on time series data. The results are based on a series of statistical tests and indicators used to evaluate the effectiveness of the ARIMA model and capture important features such as trends and seasonality in time series data. This study examines the best ARIMA results among fourteen different potential models (seven different methods based on two different training and testing periods), particularly focusing on the "Best ARIMA Model with Random Search (last 2 years of training data)" which exhibits the best fit among the models. Stationarity tests, diagnostic tests, residual analysis, error analysis, and statistical assessments demonstrate the effectiveness of the "Best ARIMA Model with Random Search (last 2 years of training data)" and its successful ability to model structures in time series data. This capability has proven its success with its high demand forecast accuracy rate.

**Keywords:** Autoregressive Integrated Moving Average (ARIMA), Time Series Analysis, Model Selection, Parameter Estimation, Glass Industry

## **Introduction**

With the increasing pace of consumption, many companies from different sectors are placing significant emphasis on supply chain management. Supply chain management encompasses various crucial aspects, from meeting demands and timely production to maintaining the right product in the right quantity in stock, effectively utilizing assets, and ensuring customer satisfaction, all contributing to the company's reputation. Decision-making in supply chain management often revolves around demand forecasting to balance inventory and service levels. A reliable demand forecasting system, which is the foundation of these principles, is the most important factor in enabling accurate production and inventory planning and making correct investment decisions for future periods. Precise demand forecasting is vital for maintaining optimal inventory levels and achieving service level objectives (Stephen et al., 2017). Inaccurate demand forecasting can lead to issues like stockouts or surplus inventory, which can diminish company profitability and customer satisfaction (Sodero & Rabinovich, 2017). In other words, demand forecasting is a critical aspect of supply chain management, impacting operational efficiency and strategic decision-making. In the complex landscape of forecasting, understanding its importance, benefits, and challenges becomes essential. Despite the critical nature of sales forecasts, they are considered intricate due to significant variations in consumer preferences (Allenby et al., 1996; Choi et al., 2014). Uncertainties in forecasts, stemming from model, parameter, and data uncertainties, present challenges within the process (Petropoulos et al., 2018). The uncertainties in demand significantly impact supply chain performance, influencing production planning, inventory management, and transportation logistics (Tosarkani & Amin, 2018). Effectively managing uncertainties within supply chains is vital, with demand forecasting emerging as a fundamental strategy (Boulaksil, 2016; Tang, 2006). Employing a robust demand forecasting system will naturally improve the accuracy of demand predictions and the efficacy of these processes. Accurate predictions facilitate efficient production scheduling, reduced downtime, optimal resource allocation, and overall improvements in supply chain efficiency. Demand forecasting holds particular importance in industries with extended production and research and development lead times, ensuring precise planning for production and sales (Arslankaya & Oz, 2018; Danese & Kalchschmidt, 2011). Timely and precise responses to customer needs, enabled by robust forecasting methods, enhance customer experiences, loyalty, and competitive advantage within the market. Accurate demand forecasting has the potential to boost the efficiency and resilience of production processes, including relevant supply chains. Aligning resources with actual requirements can

lead to reduced inventory levels and waste (Acar & Gardner, 2012; Ma S, 2016). Oliva and Watson (2009) underscore the favorable effects of a robust demand forecasting procedure, illustrating instances of inventory turnovers doubling and substantial drops in inventory quantities. Clarke (2006) underscores the financial impacts of successful demand forecasting, noting a 25% reduction in inventory days at Coca-Cola Inc. Conversely, an imprecise prediction may result in negative consequences like surplus inventory, inadequate production resources, elevated labor expenses, and harm to reputation (Gao et al., 2017). In the literature, there are studies on demand forecasting in nearly every sector from past to present, with efforts aimed at enhancing this capability. In summary, effective demand forecasting management is essential for efficiently organizing and overseeing processes (Merkuryeva et al., 2019). A reliable demand forecasting system will improve the accuracy of demand forecasts and enhance the performance of these processes. Temporal data frequently appears in demand forecasting. Typically, temporal data is divided into two main categories: the first, widely recognized one is time series data, and the second includes data associated with different time points (Minaei-Bidgoli & Lajevardi, 2008; Ricardo & Sheng, 2002). Time series data consists of a series of observations arranged in chronological order (Tak-chung, 2011). Time series analysis serves as a crucial tool across diverse domains, notably in finance, economics, and meteorology, facilitating the prediction of future values or examination of historical trends. In the realm of time series modeling and prediction, significant progress has been made with the Box-Jenkins ARIMA technique (Vishwajith, 2016). An important objective is to emphasize the consistency and alteration of values over time, along with pinpointing trends within these sequences. In contrast to conventional econometrics, the focus of time series analysis is not on establishing correlations between variables, but rather on exploring the "dynamics" of a variable. This entails employing linear models such as auto-regressive (AR) and moving average (MA) (often abbreviated as AR and MA) (Box-Jenkins, 1976), along with conditional heteroscedasticity models, specifically ARCH (Auto-Regressive Conditional Heteroskedasticity) (Engel, 1982), to model time series data. At present, ARIMA stands out as one of the most frequently utilized models in time series analysis. It's known for its simplicity, relying solely on endogenous variables without the need for external ones (Titus et al., 2021). In an ARIMA model, "p" represents the number of autoregressive terms, "d" signifies the degree of differencing the data, and "q" denotes the degree of the moving average process. In this framework, the future value of a variable is considered a linear function of previous observations and random errors (Huang et al., 2020). Autoregressive Integrated Moving Average (ARIMA) model, providing a robust

framework for modeling and forecasting time series data, offers advantages in capturing both short and long-term dependencies. Advanced time series analysis techniques like ARIMA modeling can combine complex mathematical models to capture the underlying structure of the data, addressing trends, seasonal variations, and random fluctuations to forecast future values. In the study by Uddin et al. (2020), ARIMA models have demonstrated their superiority not only in conventional sales data but also in trend analysis; moreover, Kurawarwala and Matsuo (1998) and Miller and Williams (2003) models have demonstrated the success of forecasting seasonality. Additionally, successful results in both trend and seasonality relationships have been expressed in the study by Hyndman (2004). Widely used in the analysis and modeling of such data, the ARIMA model is successfully applied across various domains such as sales forecasting, financial data analysis, industrial production forecasting, and demand forecasting. Also, in the manufacturing sector, the ARIMA model is commonly used in areas like sales forecasting, inventory management, demand forecasting, and production planning. For instance, in the energy domain, Ozturk and Ozturk (2018) employed the ARIMA model to forecast energy consumption in Turkey. In another study from the economics/finance sector, Godfred (2013) utilized ARIMA in the forecasting model for the relationship between per capita GDP growth and energy consumption. In the agricultural sector, which is vastly different from these topics, Sahu (2006) successfully used ARIMA modeling techniques to predict the production of potatoes, mustard, and wheat, Rahman et al. (2013) used ARIMA modeling techniques for lentil production, and Vishwajith et al. (2016) used ARIMA modeling techniques for sugarcane production. In a study conducted by Qin (2021) for the tourism sector, the results indicate that the model can accurately forecast the dynamic trend. Stationarity is an important criterion in ARIMA models. At this point, conducting stationarity tests and adjusting the model accordingly to fit this structure is crucial. In their study, Vishwajith et al. (2022), took first-order differences to make the dataset stationary and successfully used the ARIMA model in agricultural forecasting systems. Additionally, whether the errors in the ARIMA time series are correlated or not and normally distributed are also important criteria for model fit. In their study, Kumar and Anand (2014) demonstrated the absence of correlation among errors and normal distribution, thereby selecting an appropriate ARIMA model within certain confidence intervals. The performance of ARIMA models can be interpreted using information criteria. Dritsaki et al., (2021) attempted to find the most suitable model for forecasting petroleum consumption in Greece's energy sector using the Maximum Likelihood approach with the ARIMA method. AIC, SC, Sigma SQ, and AjR2 information criteria were used to evaluate and

find the most suitable model. In addition to information criteria, error metrics such as MSE and MAPE are also important for interpreting the adequacy and performance of the model. Ghosh (2020) used SBC, AIC, standard error, and maximum likelihood criteria to select the ARIMA model used for forecasting demand in food production. When real values compared to the selected model, it has shown feasible and successful results. Similarly, in a study led by Rahmanian et al. (2020), eleven different ARIMA models were analyzed for a disease within the healthcare sector. Eventually, the most suitable model, determined by the lowest Akaike Information Criterion (AIC) and Bayesian Information Criterion (BIC) values, was selected, and its predictive precision was evaluated through the mean absolute percentage error (MAPE). Similarly, Ariyo et al. (2014) tested the performance of the model based on the low standard error value BIC (Bayesian Information Criterion) and showed that the model can compete well. In short, ARIMA is widely applied in various sectors due to its ease of implementation and effectiveness. A brief literature review of ARIMA models applied in different sectors is shown in Table 1. The applicability and performance criteria of these models are important both in terms of literature review and interpreting the results of this study. In other words, studies have emphasized the importance of accurate demand forecasting in optimizing supply chain management and increasing operational efficiency and have highlighted the potential benefits of utilizing ARIMA modeling to improve forecast accuracy. Similarly, the effectiveness of ARIMA models has been demonstrated across various fields, including manufacturing, agriculture, finance, economics, and meteorology. It offers a flexible approach to modeling data by considering time series features such as stationarity, autocorrelation, and seasonality. Due to their flexibility, simplicity, and ability to adapt to complex temporal patterns, ARIMA models have been widely adopted.

As in other sectors, the demand forecasting system is important in the glass industry. In the literature, there are many studies applying various methods for mentioned reasons. It is desired to carry out a study similar to these studies in the glass industry in order to benefit from precise demand forecasting system. The aim is to apply statistical analyses to develop the demand forecasting method and test the performance impact of the new method used. Through statistical analyses, the proposed system's outputs will be interpreted, compared with real data, and the accuracy of demand forecasting will be calculated. Actual sales for the past years are used for these products for forecasting. The new system to be developed in this study will aim to analyze the presence/absence of seasonality and other influencing factors more effectively through statistical time series methods, leading to better predictions.

This study examines the suitability and results of ARIMA models generated from actual sales data for specific time series data pertaining to products 421 and 423 of a company operating in the glass manufacturing sector, aiming to capture the dynamics of the dataset. The data used in this study constitutes approximately 25 percent of all sales. This study evaluates the quality of the model and focuses on the top five models in terms of suitability and results among fourteen different models, as well as the best-performing model among those models.

### **Materials and Methods**

The methodology section summarizes the process of applying ARIMA modeling for demand forecasting on the monthly sales data of two different products, Product 421 and Product 423, which constitute the dataset used in the study. The study was carried out in Python by following the steps outlined in Figure 1 below. In this study, analysis was conducted on the time series data of two different products: Product 421 and Product 423. Additionally, detailed analyses were performed on the top five results that yielded the best ARIMA forecasts among fourteen models with two different training sets, where seven different approaches were applied. These analyses were based on parameter estimations, diagnostic statistics, and goodness-of-fit measures, focusing on the ability to accurately forecast future demand and capture underlying patterns in the data. Furthermore, a detailed analysis was conducted on the best-performing model, "Best ARIMA Model with Random Search (last 2 years of training data)". The analysis focuses on a specific dataset and encompasses various steps of the ARIMA modeling process, including model identification, parameter estimation, and diagnostic checking. To assess the adequacy of the model, various statistical tests were applied, including unit root tests (ADF (Augmented Dickey-Fuller) and KPSS (Kwiatkowski-Phillips-Schmidt-Shin)), normality tests (Shapiro-Wilk and Jarque-Bera), autocorrelation tests (Durbin-Watson and Ljung-Box), error term analysis, information criteria (AIC and BIC), and homoskedasticity tests. Model identification requires determining appropriate orders of autoregressive (AR) and moving average (MA) components as well as the degree of differencing required for stationarity. Parameter estimates of the model were obtained using the maximum likelihood method. Additionally, the predictive performance of the model was measured by statistically evaluating the differences between predicted and actual values. Model performance metrics (Mean Absolute Error, Mean Squared Error, Root Mean Squared Error) were computed. Diagnostic checking involves assessing the adequacy of the fitted model through various statistical tests (residual analysis, goodness-of-fit tests, and prediction evaluation metrics) and diagnostic plots.

**Figure 1:** Framework of Forecasting Model

### **Findings and Discussion**

This section presents the findings of the ARIMA modeling analysis, including selected model specifications, parameter estimates, diagnostic test results, and forecast accuracy measurements. In this study, the best ARIMA model was tested with fourteen different models, in other words, ARIMA model was tested with seven different approaches and two different training data sets of 2 years or 3 years. These seven approaches are as follows, respectively: "Best ARIMA Model with Exhaustive Search", "Best ARIMA Model with Stepwise Search", "Best ARIMA Model with BIC", "Best ARIMA Model with Grid Search", "Best ARIMA Model with Random Search", "Best ARIMA Model with Optuna function for Hyperparameter Optimization" and "Best ARIMA Model with Cross-Validation". These seven approaches offer different strategies for determining and optimizing ARIMA models. Exhaustive Search attempts to find the best ARIMA model by trying all possible parameter combinations, while Stepwise Search aims to achieve good results by searching parameters incrementally, reducing computational cost. Bayesian Information Criterion (BIC) balances model complexity and fit by using it for model selection. Grid Search conducts a systematic search by trying all

combinations on a parameter grid, while Random Search explores a wide range of possibilities by trying randomly selected parameter combinations. Effective parameter search is conducted using hyperparameter optimization tools like Optuna, and Cross-Validation evaluates the generalization ability of the model by dividing the dataset into different parts. These methods offer a broad range of approaches for addressing various aspects and complexities of ARIMA models. These approaches are often used to achieve the best results. Therefore, these seven approaches were preferred. They were evaluated according to diagnostic test results, stationarity results, information criteria and error metrics, as mentioned in the methodology section. These results are shared in Appendix 1 shared in the appendix. "Best ARIMA Model with BIC", "Best ARIMA Model with Grid Search" and "Best ARIMA Model with Optuna function for Hyperparameter Optimization" approaches were eliminated because they did not meet the normality assumption. In other results, they were excluded from the top five models because they had high error metrics. Normality and autocorrelation tests (Diagnostic tests) results of the five best-performing ARIMA models are given in Table 2. If the results of all five ARIMA models are compared and ranked, the model that provides the best results is "Best ARIMA Model with Random Search (last 2 years of training data)". The Shapiro-Wilk test is used to determine whether a dataset follows a normal distribution. The test result is considered to fit a normal distribution if the p-value is greater than 0.05 at a 95% confidence level. Similarly, the Jarque-Bera test calculates a test statistic using skewness and kurtosis coefficients to determine whether the dataset has a symmetric and normal distribution. The p-values of both the Shapiro-Wilk Test Statistic and Jarque-Bera Test Statistic are the highest. As the p-values are high for both Product 421 and Product 423, they are considered to exhibit a normal distribution. The Durbin-Watson test is used to determine whether there is autocorrelation (serial dependence) in the error terms of regression analysis. This statistic takes a value between 0 and 4. Values close to 2 indicate no autocorrelation, values approaching 0 indicate positive autocorrelation, and values approaching 4 indicate negative autocorrelation. The Durbin-Watson Statistic values are approximately 1.84 and 1.70, which are quite close to 2, indicating a strong independence indicator in the model. The absence of autocorrelation indicates that the errors in the model are random and there is no specific pattern among past values. The absence of autocorrelation means that the ARIMA model can make more reliable predictions because the model does not misinterpret structural features from past values or falsely indicate their presence where they do not exist. These tests were performed on residuals generated during the model's training.

**Table 2:** Diagnostic tests results of the five best-performing ARIMA models

Product	Test	Best ARIMA Model with Exhaustive Search (last 3 years of training data)	Best ARIMA Model with Stepwise Search (last 3 years of training data)	Best ARIMA with Random Search (last 2 years of training data)	Best ARIMA with Random Search (last 3 years of training data)	Best ARIMA Model with Cross-Validation (last 3 years of training data)
Product 421	Shapiro-Wilk Test Statistic	T.S. 0,955	T.S. 0,955	T.S. 0,972	T.S. 0,964	T.S. 0,966
		P.V. 0,149	P.V. 0,149	P.V. 0,720	P.V. 0,286	P.V. 0,324
Product 423	Shapiro-Wilk Test Statistic	T.S. 0,973	T.S. 0,973	T.S. 0,973	T.S. 0,973	T.S. 0,964
		P.V. 0,511	P.V. 0,511	P.V. 0,749	P.V. 0,506	P.V. 0,282
Product 421	Jarque-Bera Test Statistic	T.S. 1,573	T.S. 1,573	T.S. 1,014	T.S. 1,153	T.S. 0,217
		P.V. 0,456	P.V. 0,456	P.V. 0,602	P.V. 0,562	P.V. 0,897
Product 423	Jarque-Bera Test Statistic	T.S. 1,046	T.S. 1,046	T.S. 0,512	T.S. 0,745	T.S. 0,685
		P.V. 0,593	P.V. 0,593	P.V. 0,774	P.V. 0,689	P.V. 0,710
Product 421	Durbin-Watson Statistic	1,727	1,727	1,843	1,862	1,908
Product 423	Durbin-Watson Statistic	1,757	1,757	1,696	1,857	1,798

(T.S.=Test Statistic; P.V=P-Value)

During residual analysis, residuals close to a normal distribution are desired. A normal distribution indicates that the residuals are symmetrically distributed around the mean with few outliers in the tails. Residuals that do not follow a normal distribution can question the accuracy of the model and lead to incorrect results. Autocorrelation is a type of dependency observed among residuals. In other words, there is a relationship between residuals, which can affect the reliability of the regression model. The absence of autocorrelation indicates that the residuals are independent of each other, and the regression model is reliable. This indicates that the model's predictions are reliable and the errors in the model are randomly distributed. Confirmation of these results can be observed using the Q-Q plot of the residuals of the best model in Figure 2 below.

**Figure 2:** Q-Q Plot for Residuals of Products

In conclusion, it can be considered that this model has the most statistically reliable results. However, also in the other four results, both statistically in terms of normality and autocorrelation, they are suitable. Stationarity test results of the five best-performing ARIMA models are given in Table 3. Determining whether a time series is stationary is important for modeling and forecasting processes. The ADF Test (Augmented Dickey-Fuller Test) tests for the presence of a unit root in a time series, which determines whether the series is stationary. The KPSS Test (Kwiatkowski-Phillips-Schmidt-Shin Test) is a statistical test that evaluates the stationarity property of time series, like the ADF test. However, the KPSS test tests for the absence of a unit root. Generally, if the ADF test statistic is negative and the p-value is small, or if the KPSS test statistic is positive and the p-value is small, the time series is considered stationary. The Seasonal Decomposition test decomposes a time series into seasonal, trend, and irregular components. The results of Seasonal Decomposition help examine seasonality or trends in the time series. These tests are performed on the training data. In the results of the "Best ARIMA Model with Random Search (last 2 years of training data)", the ADF Test Statistic values are positive, and the p-values are above 0.05 significance level, indicating that the series is non-stationary. KPSS Test Statistic values are above the 0.05 significance level, and the p-values are high. Looking at the results of Seasonal Decomposition, it is observed that the residual series show low variability. In the 'Other models,' the ADF Test Statistic value is negative, and the p-value is small for Product 421 and Product 423, and the KPSS Test Statistic values are high. This indicates that both products are stationary. The ARIMA model can also handle non-stationary components. Techniques like differencing can be used to make the series stationary, and then the ARIMA model can be applied. In this case, the ARIMA model can successfully model the non-stationary components of the time series. In Table 3, despite the time series being stationary for other models, there appears to be more fluctuation between the predicted values and the actual values. In this scenario, the ability of the ARIMA model to make accurate forecasts may be limited. In conclusion, the results of the "Best ARIMA Model with Random Search (last 2 years of training data)" indicate signs for a more suitable ARIMA model. This is because in this table, it is observed that the time series is non-stationary, and the seasonal component shows lower variability. This provides a more suitable basis for implementing the ARIMA model.

Ljung-Box test results of the five best-performing ARIMA models are given in Appendix 2. The Ljung-Box test is a statistical test used to assess the autocorrelation of a time series. It is typically used to evaluate the adequacy of a model in time series analysis. The Ljung-Box test calculates an autocorrelation function for a series of observations and then tests whether there is autocorrelation at a specific point in this function (usually after several lagged time steps). If the test statistic is small and the p-value is high, the time series is considered good in terms of autocorrelation, meaning it fits the ARIMA model better. This test is calculated with the residuals of the model on the training set. The Ljung-Box Test Statistic values for the “Best ARIMA Model with Random Search (last 2 years of training data)” are generally lower compared to other models. Similarly, the p-values are generally higher compared to other models. This model indicates lower autocorrelation and better fit models. It shows that the “Best ARIMA Model with Random Search (last 3 years of training data)” generally exhibits the lowest performance. For Product421 and For Product423, the Ljung-Box test statistic generally increases, but since the p-values are greater than 0.05 significance level, it suggests that the autocorrelation is not statistically significant. Thus, it indicates a random relationship between observations in the time series.

The ARIMA parameters results for five different models are shared in Table 4 below.

**Table 4: ARIMA parameters of the five best-performing ARIMA models**

Product	Parameters	Best ARIMA Model with Exhaustive Search (last 3 years of training data)	Best ARIMA Model with Stepwise Search (last 3 years of training data)	Best ARIMA Model with Random Search (last 2 years of training data)	Best ARIMA Model with Random Search (last 3 years of training data)	Best ARIMA Model with Cross-Validation (last 3 years of training data)

ARIMA Parameters are the parameters that define the ARIMA model. These parameters allow the ARIMA model to be fitted to time series data and predict future values. Autoregressive (AR) terms predict the value at the current time step using a linear combination of past time steps. Moving Average (MA) terms predict the value at the current time step using a linear combination of past errors. These parameters have been calculated based on the 2022 Forecast Data. In the “Best ARIMA Model with Random Search (last 2 years of training data)” model, a more complex structure has been used for the ARIMA model. It may have achieved better fit with higher-order AR and MA terms. However, it's important to consider that this more complex model may also involve more overfitting. In the “Best ARIMA Model with Exhaustive Search (last 3 years of training data)” and “Best ARIMA Model with Stepwise Search (last 3 years of training data)” models, a simpler ARIMA structure has been used. They contain fewer parameters and may carry less risk of overfitting. However, due to their lower flexibility, they may not fit the data perfectly. This ranking may indicate that more complex models perform better according to ARIMA parameters, but it's important to consider the risk of overfitting. While more complex models can often fit more data, unnecessary complexity can reduce the reliability of predictions. Therefore, adopting a balanced approach is important when selecting the most appropriate model. The ARIMA parameters and statistical evaluation results for five different models are shared in Appendix 3. This table provides detailed information on the estimated coefficients of the AR (autoregressive) and MA (moving average) terms of the ARIMA model, their standard errors, and z-test values, probabilities of the true value at 95% confidence interval, measurements of autocorrelation at the first lag time step, skewness and kurtosis measurements of the time series, results of the heteroskedasticity test, and skewness measurement of the time series. These tables are used to assess the adequacy of an ARIMA model, the reliability of estimated coefficients, and the statistical properties of the time series. This information is obtained using the 2022 Forecast Data. It is necessary to interpret in detail

the parameters and fits of the ARIMA models presented in the tables. The parameters of the “Best ARIMA Model with Random Search (last 2 years of training data)” model are statistically significant ( $p < 0.05$ ). Box test results indicate no autocorrelation in the model, meaning the error terms of the model are independent. The Jarque-Bera test indicates that the error terms follow a normal distribution, which indicates that the error terms of the model meet the assumption of normal distribution. The high Prob(H) value suggests that the homoscedasticity assumption is acceptable. In other words, signs of heteroskedasticity are weak, meaning the error terms are homoscedastic. Therefore, this model is more robust and reliable compared to others. The first four autoregressive (AR) terms are statistically significant ( $p < 0.05$ ). These terms have positive and large coefficients, indicating that past values play an important role in predicting future values. The last four moving average (MA) terms are statistically significant ( $p < 0.05$ ). These terms have negative and large coefficients, indicating that past values of errors in the model need to be corrected with a predetermined weight. The error variance of the model ( $\sigma^2$ ) is quite small, indicating a good fit to the data. In conclusion, the parameters of the “Best ARIMA Model with Random Search (last 2 years of training data)” are the most significant and consistent, indicating that the model is more reliable compared to others. In other models, some parameters are statistically insignificant, and the overall performance of the model is weaker. In the “Best ARIMA Model with Cross-Validation (last 3 years of training data)” model, many coefficients are statistically insignificant, reducing the predictive power of the model. Ljung-Box and Jarque-Bera test results may indicate that the model is not appropriate. Signs of heteroskedasticity are observed. Therefore, this model exhibits the weakest performance compared to others. AIC (Akaike Information Criterion) and BIC (Bayesian Information Criterion) information criteria test results of the five best-performing ARIMA models are given in Table 5.

**Table 5:** Information criteria test results of the five best-performing ARIMA models

Product	Best ARIMA Model with Exhaustive Search (last 3 years of training data)	Best ARIMA Model with Stepwise Search (last 3 years of training data)	Best ARIMA Model with Random Search (last 2 years of training data)	Best ARIMA Model with Random Search (last 3 years of training data)	Best ARIMA Model with Cross-Validation (last 3 years of training data)
Product 421	AIC	AIC	AIC	AIC	AIC
	613,04	613,04	476,44	633,74	634,25
	BIC	BIC	BIC	BIC	BIC
	620,81	620,81	488,22	649,57	648,50
Product 423	AIC	AIC	AIC	AIC	AIC
	614,12	614,12	426,82	636,84	635,55
	BIC	BIC	BIC	BIC	BIC
	621,90	621,90	438,60	652,67	649,80

AIC (Akaike Information Criterion) and BIC (Bayesian Information Criterion) are information criteria used in statistical model selection and decision-making processes, aiding in comparing

different models and selecting the best model. Smaller values indicate better model fit and generalization ability. AIC penalizes model complexity less, whereas BIC penalizes greater model complexity. These information criteria have been calculated based on the 2022 Forecast Data. When evaluating AIC and BIC values, the model that provides the best results is the “Best ARIMA Model with Random Search (last 2 years of training data)”. Its values are lower compared to other models, indicating better fit than others. Although the values of other models are not significantly higher, they are close to each other.

The performance of the five best-performing ARIMA models according to error metrics is shown in Table 6 below.

**Table 6:** Error metrics of the five best-performing ARIMA models

Product	Metric	Best ARIMA Model with Exhaustive Search (last 3 years of training data)	Best ARIMA Model with Stepwise Search (last 3 years of training data)	Best ARIMA Model with Random Search (last 2 years of training data)	Best ARIMA Model with Random Search (last 3 years of training data)	Best ARIMA Model with Cross-Validation (last 3 years of training data)
Product 421	Mean Absolute Error	904	904	918	1.773	1.237
Product 423	Mean Absolute Error	991	991	1.129	1.302	1.386
Product 421	Mean Squared Error	1.120.071	1.120.071	1.021.159	4.646.444	2.343.719
Product 423	Mean Squared Error	1.537.188	1.537.188	1.900.309	2.414.567	2.672.109
Product 421	Root Mean Squared Error	1.058	1.058	1.011	2.156	1.531
Product 423	Root Mean Squared Error	1.240	1.240	1.379	1.554	1.635

Terms like Mean Absolute Error (MAE), Mean Squared Error (MSE), and Root Mean Squared Error (RMSE) are criteria used to evaluate the performance of prediction models such as regression analysis. These metrics determine how well the model matches the actual values or how much it deviates. Generally, all three metrics assess the prediction performance of a model but are structured differently. While MAE and RMSE measure the magnitude of errors, RMSE provides a value compatible with the original scale. MSE provides value by using the squares of errors, thus giving more weight to larger errors. Error metrics are used to evaluate how close a model's predictions are to the actual values. The lower these metrics, the better the model's performance. These error metrics have been calculated considering the 2022 Forecast Data and Actual Data. In terms of error metrics, it can be noted that the models “Best ARIMA Model with Exhaustive Search (last 3 years of training data)” demonstrate the best performance, with the “Best ARIMA Model with Random Search (last 2 years of training data)” model also showing very close values. Similarly, looking at the average error performances, it can be said that the best model is the “Best ARIMA Model with Random Search (last 2 years of training data)”. The above results indicate that the “Best ARIMA Model with Random Search (last 3 years of training data)” and “Best ARIMA Model with Cross-Validation (last 3 years of training data)” models exhibit lower performance. Additionally, considering the outputs of AIC (Akaike Information Criterion) and BIC (Bayesian Information Criterion), it can conclude that the most

appropriate and best-performing model is the “Best ARIMA Model with Random Search (last 2 years of training data)” model.

Overall, interpreting the results, the “Best ARIMA Model with Random Search (last 2 years of training data)” indicates:

- **Data Normality:** Both Shapiro-Wilk and Jarque-Bera tests indicate statistical proximity to normal distribution.
- **Absence of Autocorrelation:** Durbin-Watson statistics for both products close to 2 (indicating independence). Ljung-Box tests, indicating no significant difference in autocorrelation among these models.
- **Time Series Stationarity:** Unit root tests confirm the statistical significance of the model and stationarity of the series.
- **Low AIC and BIC Values:** Low AIC and BIC values indicate a better fit to the data.
- **ARIMA Parameters (4, 0, 4) (A more complex model):** The model parameters are statistically significant.
- **Heteroskedasticity Results:** There is no significant evidence indicating heteroskedasticity for both products.
- **Low Mean Absolute Error and Mean Squared Error:** Low error values imply better prediction capability.

These findings indicate that “Best ARIMA Model with Random Search (last 2 years of training data)” is an effective model and a reliable tool for forecasting future values. In line with the explanations mentioned above, visual analyzes were also examined as follows Figure 3.

**Figure 3:** Residuals Plot and Residuals Histogram

Supported by graphs and tables, the results demonstrate that the data are consistent with a normal distribution. The "Residual Histogram for Products" and "Residuals Plot" visuals were applied to the training dataset. The purpose of these visuals is to evaluate how well the ARIMA model fits the training dataset. Therefore, analyzing these visuals is important to determine how

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

*April 09-16, 2024 / Lisbon, Portugal*

well the ARIMA model fits the training dataset and how reliable the predictions are. This Histogram Plot helps visually assess how accurate the model predictions are and how homogeneously distributed the residuals are. The residuals are symmetrically distributed around a certain center, it indicates that the best model is well-calibrated, and the predictions are close to the actual values. In the Residuals Plot graph, the residual values represent the differences between the model predictions and the actual values. This indicates how successful the model is for each time point or observation unit. The residual values are close to zero and homogeneously distributed, it indicates that the best model is well-calibrated, and the predictions are close to the actual values. The residuals are symmetrically distributed around a certain center and show no significant pattern over time, it seems that the best model is successful. The convergence of residuals to a normal distribution in the training set can enhance the model's ability to make accurate and reliable predictions. These results can be considered when deciding which model to use. Overall, it has been noted that in the top five models, the data exhibited normal distribution and no autocorrelation. Prediction performance was evaluated using various metrics such as AIC and BIC criteria. Indicatively, the selected “Best ARIMA Model with Random Search (last 2 years of training data)” model has shown a fairly satisfactory level of accuracy. With 1-MAD (Mean Absolute Deviation) /MEAN(Sales), the demand forecast accuracy of the relevant item is calculated. In addition, annual demand forecast accuracy was calculated based on the weighted average by sales too. Demand forecast accuracy calculations are shared in detail in Table 7 below.

**Table 7: Forecast Accuracy Calculation Table**

Product	Country	Month	Accuracy	Weighted Accuracy by Sales
421	45	1.01.2022	97%	9%
421	45	1.02.2022	91%	7%
421	45	1.03.2022	92%	7%
421	45	1.04.2022	94%	8%
421	45	1.05.2022	83%	8%
421	45	1.06.2022	89%	9%
421	45	1.07.2022	80%	5%
421	45	1.08.2022	87%	7%
421	45	1.09.2022	85%	8%
421	45	1.10.2022	87%	8%
421	45	1.11.2022	87%	7%
421	45	1.12.2022	97%	7%
<b>TOTAL Product 421</b>			<b>89%</b>	<b>89%</b>
423	45	1.01.2022	82%	7%
423	45	1.02.2022	97%	9%
423	45	1.03.2022	85%	7%
423	45	1.04.2022	86%	7%
423	45	1.05.2022	95%	8%
423	45	1.06.2022	78%	8%
423	45	1.07.2022	41%	2%
423	45	1.08.2022	100%	7%
423	45	1.09.2022	87%	7%
423	45	1.10.2022	68%	7%
423	45	1.11.2022	75%	7%
423	45	1.12.2022	86%	5%
<b>TOTAL Product 423</b>			<b>82%</b>	<b>83%</b>
<b>TOTAL</b>			<b>85%</b>	<b>86%</b>

The results show an accuracy rate of 85% on a monthly average and 86% on a weighted average. While the accuracy rate of Product 421 appears to be 89%, the accuracy rate of Product 423 is 83%. In general, when look at the products month by month, almost all prediction rates are over 85%. All of the accuracy rates are classified as 85-100%, 80-85%, 75-80% and other by products and their percentages are shown in Figure 4 below.

**Figure 4:** Classification Percentages of Forecast Accuracy

Generally, when the biases are examined, it does not appear to be a biased distribution to one side. It shows normal distribution in terms of a positive and negative bias. In general, having a normal bias distribution and high demand forecasts indicates that the selected ARIMA model can be applied successfully. In conclusion, this study highlights the importance of ARIMA modeling in improving demand forecasting accuracy and optimizing supply chain management. The findings demonstrate that the ARIMA (4, 0, 4) model adequately represents the underlying structure of time series data. Significant autoregressive and moving average components imply the presence of both short-term and long-term dependencies in the data. The model's ability to capture these dependencies accurately makes it valuable for predicting future observations and understanding the underlying processes driving the data. It serves as a useful tool for future research and decision-making in relevant domains.

### **Conclusion and Recommendations**

As a result, this study underscores the importance of advanced time series analysis techniques such as ARIMA modeling in improving demand forecasting accuracy. The significance of demand forecasting accuracy in increasing operational efficiency and customer satisfaction emphasizes the importance of utilizing advanced modeling techniques like ARIMA. The results demonstrate the effectiveness of ARIMA models in capturing complex temporal dependencies and enhancing prediction performance in real-world applications. Companies can improve their decision-making processes, optimize resource allocation, and enhance overall operational efficiency by selecting the appropriate ARIMA model. Organizations can make more informed

decisions, streamline their operations, and gain a competitive advantage in today's dynamic business environment by leveraging ARIMA modeling. This study evaluates the forecasts made by a company operating in the glass manufacturing sector using an ARIMA model based on actual shipment data. Additionally, this study provides a comprehensive analysis to assess the suitability and prediction performance of ARIMA models. Based on the data presented above, "Best ARIMA Model with Random Search (last 2 years of training data)" is selected and the effectiveness of the model has been evaluated for products 421 and 423. Results from normality tests, autocorrelation tests, heteroskedasticity tests, and time series stationarity tests demonstrate that the ARIMA model is applied correctly and provides reliable forecasts. The results indicate that the model captures important features in the time series data, such as trend and seasonality, effectively. This study demonstrates the effectiveness of ARIMA models in forecasting time series data for specific products. In the future, this analysis can be expanded with a larger dataset and the use of different modeling techniques. Future research directions may include exploring the application of other advanced time series analysis techniques, such as exponential smoothing methods or machine learning algorithms, to further enhance demand forecasting accuracy. Additionally, research efforts could focus on integrating external factors.

**Özet**

Hafif, dayanıklı ve yüksek performanslı malzemeler, modern mühendislik uygulamalarında rekabetçilik açısından vazgeçilmezdir. Cam elyafı ile güçlendirilmiş polimer bazlı bir malzeme olan Cam Elyaf Takviyeli Plastikler (GFRP), havacılık, rüzgar enerjisi, savunma ve denizcilik endüstrileri gibi kritik sektörlerde hayati bir rol oynamaktadır. GFRP ile ilgili zorluklar, heterojen ve anizotropik doğasında yatmaktadır; bu da işlemede zorluklara ve delaminasyon, çıkıntılar, elyaf kırılmaları, matris yayılması ve yırtılma gibi potansiyel hasarlara yol açmaktadır. Bu çalışma, delme işlemi sırasında GFRP'de meydana gelen delaminasyon etkisinin araştırılmasına odaklanmakta ve en uygun parametreleri belirlemeyi amaçlamaktadır. Taguchi yöntemi kullanılarak delme sırasında giriş ve çıkış noktalarındaki delaminasyon faktörünü optimize edecek bir yaklaşım geliştirilmiştir. Taguchi yöntemi, birden fazla parametrenin etkilerini minimum sayıda deneyle değerlendirerek, zamandan tasarruf ederek ve en iyi sonuçları sağlayarak süreç tasarımı optimizasyonunu kolaylaştırır. Deneylerde 6 mm Yüksek Hız Çeliği (HSS) kullanılmış ve farklı seviyelerde kesme hızı ilerleme hızı gibi delme parametrelerini içermektedir. Performans değerlendirmesi için Taguchi yöntemiyle birlikte bir L9 tasarımı kullanan analiz, ilerleme hızının çıkış bölgesindeki delaminasyonun %81,86'sına hakim olduğunu ortaya koyuyor. Bu da delme işlemi sırasında delaminasyon oluşumunda ilerleme hızının ne kadar etkili olduğunu göstermektedir.

**MINIMIZING DELAMINATION FACTOR IN GLASS FIBER REINFORCED  
PLASTIC COMPOSITE DRILLING THROUGH TAGUCHI OPTIMIZATION**

**Abstract**

Lightweight, durable, and high-performance materials are essential in modern engineering applications for competitiveness. Glass Fiber Reinforced Plastics (GFRP), a polymer-based material reinforced with fiberglass, plays a vital role in critical sectors like aviation, wind power, defense, and maritime industries. The challenges with GFRP lie in their heterogeneous and anisotropic nature, leading to difficulties in processing and potential damages such as delamination, protrusions, fiber breakages, matrix spreading, and tearing. This study focuses on investigating delamination in GFRP during the drilling process and aims to determine optimal parameters. Using the Taguchi method, an approach is developed to optimize the delamination factor at entry and exit points during drilling. The Taguchi method streamlines process design optimization by assessing the effects of multiple parameters with a minimized number of experiments, saving time and providing optimal results. The experiments use 6mm High-Speed Steel (HSS) and include drilling parameters such as cutting speed feed rate at different levels. Using an L9 design in combination with the Taguchi method for performance evaluation, the analysis reveals that the feed rate dominates 81.86% of the delamination in the exit zone. This shows how effective the feed rate is in the formation of delamination during the drilling process.

## **Introduction**

In recent years, the use of GFRP composite materials in the industries (i.e., automobile, ship, chemistry, aerospace) has increased due to their significant advantage over other materials, i.e., high specific stiffness and strength, superior corrosion resistance, lightweight and low thermal conductivity (Davim et al., 2004, Palanikumar et al., 2007). As GFRP composite materials are becoming increasingly popular, there is a growing emphasis on producing and fabricating them better, cheaper, and faster. Composite materials are subjected to many processes for the production and final product. Due to the intensive use of GFRP materials in many areas, a secondary process such as turning, milling, and drilling is required (Geng et al., 2019). Various non-traditional machining processes such as laser cutting, water jet cutting, ultrasonic cutting, and electro-discharge machining have also been developed to process GFRP (Jenkins & Joppa, 2009). One of the most common of these is the traditional drilling process. The life of the drilling joint in composite materials is directly affected by the quality of the holes drilled. Compared to conventional metallic materials, drilling composites pose additional challenges due to their unique nature, microscopic inhomogeneity, anisotropy, and laminate structure (Guo & Bao, 2012, Bayraktar, 2018). Defects such as fiber shrinkage, microcrack formation at the hole entry and exit surfaces, and thermal damage to the matrix phase, as well as delamination, occur during the drilling of GFRP (Işık & Ekici, 2010, Lukacs, 2023). Delamination is a surface defect caused by the separation of layered materials. The formation of delamination reduces laminate stiffness and strength against loads on the material. Therefore, delamination significantly reduces the material's resistance to load and lowers its fatigue resistance, thus accelerating the occurrence of fatigue damage. These adverse effects of delamination on the material are a major cause of part rejection in assemblies, especially in the aerospace and defense industry (Geng et al., 2019, Tsao & Hocheng, 2016). These defects pose a significant problem in terms of hole surface quality and need to be minimized for precise assembly of these materials. In order to perform the minimization process, it is necessary to perform delamination experiments on GFRP material under appropriate conditions and determine the appropriate drilling parameters. Increasing the number of experiments helps us to find the appropriate drilling parameters, but has disadvantages in terms of time and cost. More practical methods are needed to avoid excessive cost and time loss due to experiments (Adda & Bouchak, 2021). For this reason, Taguchi's experimental design methods were used in our study. With this method, instead of trying all combinations of experiments, only some of them are performed

with the help of orthogonal series and the factor levels that give the best performance can be found (Özdemir, 2023).

### **Materials and Methods**

In the study, an HSS drill bit with a 6 mm diameter, a 30° helix angle, and a 118° point angle was used for drilling. The materials used were produced by Secant Technology Development Inc., following to ASTM standards through the Infusion Method, employing 600 gr/m<sup>2</sup> E-Glass Plain Weave and Vinyl ester Resin (Figure 1.). The GFRP plates, produced at a thickness of 10 mm, were precision-cut using a water jet to prepare for drilling. The drilling process was conducted without coolant, under dry air conditions. The experiment varied cutting speed and feed rate across three levels to determine their impact on the drilling process, as detailed in Table 1. This methodical approach allows for a comprehensive analysis of the drilling parameters and their effects on the material's integrity and the quality of the holes produced (Khashaba & Elhamid, 2007).

**Figure 1.** GFRP composite material plates

**Table 1.** Drilling factors and levels

Factors and levels of machining parameters					
Factors	Symbols	Units	Levels		
			1	2	3
Cutting Speed	Vc	m/min	62	422	945
Feed Rate	f	mm/min	0.10	0.18	0.24

The delamination factor, often denoted as  $F_d$ , quantifies the extent of this effect by comparing the maximum diameter of the delaminated area to the original hole diameter, as shown in Figure 2. This factor is crucial for both the inlet and outlet of the hole, as it can significantly influence the structural integrity and the assembly tolerance of the final product. The use of an optical digital microscope in examining the workpiece allows for precise observation of the delamination and any burrs that may form, providing valuable insights into the quality of the drilling process. The schematic diagram, typically shown in Figure 3, details the experimental setup, including the positioning of the optical microscope.

**Figure 2.** Demonstration of delamination on the workpiece(Shafiq, 2018)

**Figure 3.** Experimental setup

The Taguchi method is a robust design technique that is widely used in engineering to optimize process parameters and improve quality. The "smaller is better" objective function is particularly useful in minimizing undesirable traits, such as the delamination effect in drilling processes (Eq. 1.). By focusing on the signal-to-noise ratio (S/N), the Taguchi method helps in identifying the settings that minimize variability due to noise factors (Tsao & Hocheng, 2004, 2014). The use of orthogonal arrays further streamlines the experimental process, reducing the number of trials needed to obtain reliable data (Bayraktar & Turgut, 2020, Sudhakara & Prasanthi, 2017). The optimizations were performed using the Minitab Software.

$$\eta = -10 \log_{10} \left[ \frac{1}{n} \sum_{i=1}^n y_i^2 \right] \quad 1$$

### Results and Discussion

Taguchi's experimental design methods offer a streamlined approach to optimization in complex experiments. By utilizing an L9(3<sup>2</sup>) orthogonal array, we can efficiently explore the effects of multiple factors on a process while minimizing the number of experiments needed. Table 2. Shows experimental results and S/N ratios.

**Table 2.** Experimental results and S/N ratios

Cutting Speed (m/min)	Feed Rate (mm/min)	D(in)	D(out)	SNRA1	SNRA2

The observation of burr formation or delamination is a crucial aspect of machining processes. The graphical representation as shown in Figure 4., with a feed rate of 0.24 and a cutting speed of 62, illustrates the challenges in maintaining material integrity (Mohan & Ramachandra, 2007). The side view showing elongated material with significant delamination emphasizes the need for careful control of machining parameters. Meanwhile, the entrance and exit views of the hole provide valuable insights into the effectiveness of the cutting operation, with minimal surface damage at the entrance and significant burr formation at the exit.

**Figure 4.** Delamination for a) side, b) inlet, c) outlet for 0.24 Feed Rate and 62 Cutting Speed

Figure 5. depicts main effect plots for the signal-to-noise (S/N) ratio concerning delamination, specifically at both the entrance (D(in)) and exit (D(out)) of the hole. These plots are used to analyze the influence of cutting speed and feed rate on the S/N ratio. D(in) plot indicates that as the cutting speed increases, the mean S/N ratio initially decreases sharply, then slightly increases at higher speeds. Conversely, an increase in feed rate consistently reduces the mean S/N ratio. D(out) plot shows that both increasing cutting speed and feed rate lead to a reduction in the mean S/N ratio. The results suggest that a high cutting speed combined with a low feed rate is optimal at the hole entrance to reduce D(in), while at the hole exit, the impact of cutting speed is less pronounced, yet a low feed rate remains beneficial for controlling D(out) (Khashaba, 2003).

**Figure 5.** Delamination main effect plots for S/N ratio for the entrance D(in) and exit D(out) of the hole

The analysis of Figures 6 and 7, 3D surface plots, provides valuable insights into the machining process, particularly in understanding how delamination is influenced by varying cutting speeds and feed rates. It's clear from the first graph that optimal conditions for minimizing delamination involve a combination of high cutting speeds and low feed rates. This suggests that at higher speeds, the cutting tool can pass through the material with less resistance, thereby reducing the chances of delamination. Conversely, as the feed rate increases, even at high cutting speeds, there is a corresponding increase in delamination, indicating that the material removal rate is a critical factor in the quality of the cut. The second graph reinforces this observation, showing that delamination is not solely dependent on the cutting speed but is significantly affected by the feed rate across all levels of cutting speeds.

**Figure 6.** Surface Plot of D(in) vs Cutting Speed and Feed Rate

**Figure 7.** Surface Plot of D(out) vs Cutting Speed and Feed Rate

The Analysis of Variance (ANOVA) analysis for the response variable D(out) indicates that feed rate is a significant factor, accounting for a substantial 81.86% of the variability in D(out), with a P-value of 0.02, which is below the standard significance level of 0.05 (Table 3.) This suggests that adjustments in feed rate can lead to significant improvements in D(out). Conversely, cutting speed appears to have a minimal impact, contributing only 4.72% to the variability and possessing a P-value of 0.547, well above the significance threshold. Therefore, it is concluded that cutting speed does not significantly affect D(out). The remaining 13.41% of the variability is attributed to error, representing unexplained factors not included in the model.

**Table 3.** Analysis of Variance for D(out)

Source	DF	Seq SS	Contribution	Adj SS	Adj MS	F-Value	P-Value
Cutting Speed	2	0.002428	4.72%	0.002428	0.001214	0.7	0.547000
Feed Rate	2	0.042101	81.86%	0.042101	0.02105	12.21	0.02000
Error	4	0.006898	13.41%	0.006898	0.001724		
Total	8	0.051427	100.00%				

Regression analysis is a powerful statistical tool that allows to examine the relationship between variables as presented in Figure 8. In the case of D(out), the provided statistics indicate a strong model. Standard Error of the Estimate (S) of 0.0337857 is quite low, suggesting that the model's predictions are on average very close to the actual observed values. The Coefficient of Determination (R-Sq) value of 86.7% is particularly impressive, as it means that the majority of the variance in D(out) is captured by the model. The Adjusted R-Squared (R-Sq(adj)) value of 82.2% is also significant because it takes into account the number of predictors used, which helps to prevent overfitting the model to the data. These statistics suggest that the regression model fits the data well, with a high proportion of the variance in D(out) being explained by the model. The standard error indicates that the observed values are, on average, close to the predicted values from the model.

**Figure 8.** Regression Analysis for D(out)

**Conclusion and Recommendations**

The study of drilling parameters in GFRP materials is essential for industries that demand high precision and quality, such as aerospace and defence industry. The results highlight the significance of feed rate, which is identified as the most influential parameter affecting delamination. A lower feed rate minimizes delamination at both the entry and exit points of the drill hole, which is crucial for maintaining the integrity of the material. Additionally, an increase

in cutting speed correlates with reduced delamination, suggesting that faster cutting speeds could be beneficial. However, a higher feed rate is associated with more deformation, indicating a trade-off between speed and accuracy. Damage types such as delamination, uncut fibers, and fragmentation are more prevalent at the hole exit, which suggests that the exit phase of drilling requires particular attention to prevent material degradation. Ultimately, the study underscores the importance of optimizing drilling parameters to enhance the quality and performance of GFRP components, which is vital for the efficiency and reliability of the production process in sensitive industries. Determining the most suitable parameters is not just a matter of quality, but also of ensuring the longevity and safety of the components produced.

### **ÖZET**

İnsan ihtiyaçlarını karşılayacak üretimi devam ettirebilmek için gerekli olan sonlu iş gücü ve doğal kaynaklar gibi sınırlı değişkenlerin verimli kullanımı iktisadın genel konusudur. Bu kaynaklar içinde doğal kaynakların sürdürülebilir kullanımı bugünün ve geleceğin iktisadi kavrayışının temelinde yer alır. Sonlu doğal kaynaklar içerisinde sektör ayırt etmeksizin tüm üretim süreçlerinde değişmez bir girdi olarak yer aldığı için suyun önemi iktisadi açıdan da yaşamsaldır. Özellikle son yıllarda küresel ısınmayla gelen iklim değişikliğinin su kaynakları üzerindeki olumsuz etkisi ciddi anlamda arttığından suyun miktar ve kalite açısından kullanılabilirlik durumu büyük baskı altına girmiştir. Ayrıca su, her sektörde bir girdi olduğu için bütünleşik bir yapı ve bütünleşik bir sorun arz eder. Bu nedenle su kaynaklarının sürdürülebilir kullanımı üzerinde birçok bilim dalı araştırma yapmaktadır. Buna ek olarak kaynakların kullanımı üzerindeki yönetim yaklaşımı da değişip gelişmektedir. Türkiye su kaynakları bakımından kırılgan bir konumda olup kaynakların kullanılabilirliği üzerindeki iktisadi ve yönetişimsel çalışmalar devam etmektedir. Fakat Türkiye su kaynaklarının sürdürülebilir kullanımı açısından henüz istenen aşamaya ulaşamamıştır. Bu çalışmada Türkiye'nin su potansiyeline değinilerek bu potansiyelin kullanılabilir olan kısmı ele alınacaktır. Buna ek olarak Türkiye'nin kullanılabilir su varlığındaki değişimin sürdürülebilir olup olmadığına dair sayısal veriler üzerinden bir değerlendirilme yapılacaktır.

**Anahtar Sözcükler:** Döngüsel Ekonomi, Sürdürülebilirlik, Kullanılabilir Su Kaynakları, Su Yönetimi

**WATER RESOURCES AND AVAILABILITY STATUS IN TURKEY**

**ABSTRACT**

The general subject of economics is the efficient use of limited variables such as finite labor force and natural resources required to continue production to meet human needs. Among these resources, the sustainable use of natural resources is at the basis of today's and future's economic understanding. The importance of water is also vital from an economic perspective, as it is a constant input in all production processes, regardless of sector, among finite natural resources. Especially in recent years, the negative impact of climate change due to global warming on water resources has increased significantly, and the availability of water in terms of quantity and quality has come under great pressure. Moreover, since water is an input in every sector, it presents an integrated structure and an integrated problem. For this reason, many branches of science are conducting research on the sustainable use of water resources. In addition, the management approach on the use of resources is also changing and developing. Turkey is in a fragile position in terms of water resources and economic and governance studies on the availability of resources continue. However, Türkiye has not yet reached the desired stage in terms of sustainable use of water resources. In this study, Turkey's water potential will be touched upon and the usable part of this potential will be discussed. In addition, an evaluation will be made based on numerical data as to whether the change in Turkey's water availability is sustainable.

## **GİRİŞ**

Dünyada bilinen her yaşam türü için gerekli olan su, iktisadi faaliyetin devam edebilmesi için de gereklidir. Ekonomide sektör ayırt etmeksizin su bir girdi olarak kullanılmaktadır. Kullanılış amaçları ve kullanılan su türleri farklı olsa da suyun bir girdi olarak yer almadığı bir üretim süreci hemen hemen yok gibidir. Ekonominin bu ihtiyacı faaliyet gösteren birimlerin yapılarına göre farklılık gösterebilir. Bu nedenle ihtiyacın karşılanması için kullanılan kaynaklar da farklı olabilir. Fakat hangi kaynağa başvurulursa vurulsun mevcut olan suyun tamamı kullanılabilir değildir. Çevresel dengenin bozulmaması için doğada bulunan tüm su varlığının yalnızca belirli bir kısmı kullanılabilir durumdadır. Bu sınırlama fiziki ya da kalite bakımından iki farklı biçimde olabilir. Özellikle orta vadeli geçmişten günümüze kadar küresel ısınma nedeniyle süregelen iklim değişikliğinin sözü edilen sınırları daraltmaktadır. Su kaynakları artan nüfusun, bilinçsiz kullanımın ve iklim değişikliğinin yarattığı çoklu etkiyle daha ağır baskı altına girmektedir. Bu nedenle mevcut su varlığının kullanılabilir kısmı giderek azalmaktadır. Su varlığı ve diğer sonlu doğal kaynaklar üzerindeki giderek artan baskının azaltılması için ekonomi de dahil olmak üzere birçok disiplin sürdürülebilirlik kavramı üzerinde durmaktadır. Eğer gelecekte sürdürülebilir bir üretim yapısı tüm faaliyet kollarında yerleştirilemezse sonu doğal kaynakların doğal yaşamı ve insan faaliyetini destekleyemeyeceği açıktır. Bu noktada sürdürülebilirlik kavramının genel geçer bir tanımı olsa da her koşul için genel geçer bir sınırı yoktur. Farklı coğrafi yapılar ve teknolojilerdeki farklılaşmaya göre sürdürülebilirlik için yapılması gerekenler değişkenlik gösterebilir. Örneğin Almanya ve İran'ın su kaynakları rejimleri birbirinden farklıdır. Bu nedenle kaynakatan yapılan çekimin sürdürülebilir bir ölçü içinde kalması için farklı oranda çekimler söz konusu olacaktır. Üretim teknolojilerindeki farklılık da sürdürülebilirlik sınırını değiştirebilir. Bu bağlamda, çalışmada ilk önce topyekûn varlığı ve bunun kullanılabilir kısmının ne olduğu ile ilgili ayırım ortaya konulacaktır. Ardından Türkiye'nin toplam su potansiyeli ve kullanılabilirlik oranına değinilecektir. Ardından Türkiye'nin kullanılabilir su varlığı verisi elde edilecektir. Daha sonra Falkenmark ve Shiklomanov endekslerinin tanımlanması yapılarak Türkiye'nin kullanılabilir su varlığının bu endeksler üzerinden yıllara göre nasıl bir değişim izlediği gösterilecektir. Elde edilen sonuçlar üzerinden Türkiye'nin kullanılabilir su kaynaklarının sürdürülebilir bir kullanım rejimine tabi olup olmadığı değerlendirilecektir.

## **ARAŞTIRMA VE BULGULAR**

### **1. Su Varlığı ve Kullanılabilirlik Oranı**

Dünyadaki su varlığının %96,5'i okyanuslar bünyesinde yer almaktayken %0,9'unu diğer tuzlu su kaynakları oluşturur. Dünya su varlığının ancak %2,5'i tatlı sulardan meydana gelmektedir. Bunun tatlı suları oluşturan bölümü ise %68,7 buzullar, %30,1'i yeraltı ve %1,2'si yüzey suları olmak üzere üç farklı kaynak türünde yer alır (USGS, 2019). Tuzlu sular tuzdan arındırma işlemi ile kentsel olarak kullanılabilir hale getirilebilir ya da sanayi de doğrudan kaynaktan çekildiği haliyle soğutma suyu olarak kullanılabilir. Fakat tuzdan arındırma işlemi son derece yüksek maliyetli olup yüksek oranda tuz meydana çıkarır. Bu yöntem yalnızca küçük birimlerin tatlı su ihtiyacını gidermek için nadiren seçilir. Buna ek olarak yüksek bakım maliyetine neden olması nedeniyle soğutma suyu olarak kullanımı da maliyetlidir. Bu nedenle su kaynakları ve bunların kullanılabilirlik oranına değinilirken tatlı sular temel alınacaktır. Su kaynaklarının tamamı insan faaliyeti için kullanıma uygun değildir. Gerek yüzey suları gerek yeraltı suları olsun insan kullanımı için ancak belirli bir miktar su hacmi kaynaklardan çekilebilir. Kaynaklardan çekilebilecek su varlığına güvenli kullanım oranı ya da kullanılabilirlik oranı denir. Bu oran belirlenirken kaynaktan yapılacak çekimin su döngüsünü bozmayacak kadar suyun çekilmesi esasına dayanılır. Yani yüzey sularından yapılacak çekim sonrası buharlaşma ve yeraltına sızma sonrasında nihai kaynağa ulaşabilecek kadar su bırakılması anlamına gelir. Yeraltı sularında ise basınç dengesini bozmamak koşullardan biridir. Aksi durumda bozulan basınç dengesi nedeniyle toprakta göçükler ya da deniz suyu tecavüzü gerçekleşebilecek olumsuz sonuçlardır. Buna ek olarak her iki kaynak türü için de çekim yapılırken göz önünde bulundurulması gereken koşullardan biri de kaynağa bağlı yaşayan canlı türlerini olumsuz etkilememesidir. Azalan su varlığı ekosistem için yeterli olamayacak seviyeye inmemelidir. Kaynaktan yapılan su çekimi kaynaklar üzerindeki fiziksel baskıyı arttıracak türden bir eylemdir. Bunun yanı sıra kaynaklar kalite bakımından da baskı altına girebilir. Bu noktada kalite bakımından yoğun baskı altına girerek kirlenmiş bir su kaynağı da kullanılabilir olmaktan çıkmış olabilir. Örneğin "siyah sular" olarak sınıflandırılan insani tuvalet atığı içeren sular kalite bakımından aşırı kirlenmiş sayılır. Bu türdeki suların arıtılması bir noktaya kadar mümkün olduğu için kullanılabilirlik oranını ciddi biçimde düşürür. Siyah sular bugünün arıtma olanaklarıyla evsel kullanıma uygun hale getirilememektedir. Diğer türde kullanımlar içinse arıtma maliyetleri oldukça yüksektir.

## **2. Türkiye'nin Su Varlığı ve Kullanılabilirlik Oranı**

Türkiye'nin tatlı su kaynakları ele alınırken ilk önce brüt kaynak hesabı yapılacak olursa bunun yıllık yağışla gelen miktarı ortalama olarak  $501 \text{ km}^3$ 'tür. Yüzeysel buharlaşması sonucu atmosfere karışan su miktarının yıllık ortalaması  $274 \text{ km}^3$  olarak hesaplanmıştır. Bunun yıllık ortalama  $41 \text{ km}^3$ 'ü yeraltı sularına karışır. Geriye kalan  $186 \text{ km}^3$ 'lük su hacmi ise yüzeysel akışını oluşturur. Türkiye ayrıca sınır aşan sulardan gelen yaklaşık  $7 \text{ km}^3$ 'lük brüt su varlığına sahiptir.

**Tablo 1.** Türkiye'nin Brüt ve Kullanılabilir Su Varlığı (Kalkınma Bakanlığı, 2018)

	<b>Kaynak Türü</b>	<b>Hacim (<math>\text{km}^3</math>)</b>
	Yıllık Ortalama Toplam Yüzeysel Akışı	193
	-Yıllık ortalama yüzeysel akışı	186
<b>Brüt su varlığı</b>	-Sınır aşan sulardan gelen	7
	Yeraltına Sızan Su	41
	Brüt Kaynak Toplamı	234
	Yıllık Kullanılabilir Yüzeysel Suyu Toplamı	98
	-Yüzeysel akışından gelen	95
<b>Kullanılabilir su varlığı</b>	-Sınır aşan sulardan gelen	3
	Yıllık Kullanılabilir Yeraltı Su Hacmi	14
	Kullanılabilir Kaynak Toplamı	112

Yukarıda belirtildiği gibi brüt su potansiyelinin tamamı kullanılabilir durumda değildir. Buna göre Türkiye'nin sahip olduğu toplam yüzeysel akışının ancak  $95 \text{ km}^3$ 'ü kullanılabilir durumdadır. Bu da yüzeysel akışının güvenli kullanım oranını %51 yapar. Sınır aşan suların ise  $3 \text{ km}^3$ 'ü kullanılabilir durumdadır. Böylece yıllık toplam yüzeysel akışının kullanılabilir kısmı  $98 \text{ km}^3$  olarak karşımıza çıkar. Bunun da güvenli kullanım oranı %50,7'dir. Yeraltı suları için  $14 \text{ km}^3$  güvenli çekime uygun olup güvenli kullanım oranı ancak %34,1'dir. Bu tablo Türkiye'nin fiziksel olarak kullanılabilir su hacmini  $112 \text{ km}^3$  olarak göstermektedir. Bu da güvenli kullanım hacminin yaklaşık %47,8 olduğunu gösterir (T.C. Kalkınma Bakanlığı, 2018).

**Grafik 1** Türkiye'nin Kişi Başına Düşen Kullanılabilir Su Varlığının Yıllara Göre Değişimi (1960-2022) (Tablo 1'de yer alan veriler ve Dünya Bankası, (2022) nüfus verileri aracılığıyla üretilmiştir). Türkiye'nin kullanılabilir su varlığının yıllara göre değişimi Grafik 1'de gösterilmiştir. Buna göre 1960 yılında kişi başına düşen yıllık kullanılabilir su varlığı 4000 m<sup>3</sup>'ün üzerindeyken bu hacim yıllar geçtikçe doğrusal bir biçimde düşerek 2022 yılına gelindiğinde yaklaşık 1300 m<sup>3</sup>'e gerilemiştir. Bu durumun Türkiye'nin sürekli artan nüfusunun kullanılabilir su kaynakları üzerinde ciddi baskı oluşturduğunu göstermektedir. Günümüzde Türkiye'nin kişi başına düşen yıllık kullanılabilir su varlığını iki güvenilir gösterge olan Shiklomanov ve Falkenmark göstergeleri ışığında değerlendirmek anlamlı olacaktır. Shiklomanov'a göre 1000-2000 m<sup>3</sup> bandında kişi başına düşen kullanılabilir su varlığı, su varlığını "çok az" olarak değerlendirmiştir (Bilen, 2008). Bu ifade yedi basamaktan oluşan göstergede "olağanüstü az"dan sonra gelen en kötü durumu betimlemek için kullanılmaktadır. Falkenmark göstergesine göre ise Türkiye'nin durumu 1700-1000 m<sup>3</sup> aralığına düşer. Bu da Falkenmark'a göre "su baskısının başlaması" aşaması (Abraha, v.d., 2022) olarak nitelendirilmiştir.

## SONUÇ

Su kaynakları olarak Türkiye genel kanının aksine zengin bir varlığa sahip değildir. Yoğun olarak yüzey sularına bel bağlar ve yüzey suları kalite bakımından ne kadar baskı altında olduğuna dair esaslı bir veri derlemesinden yoksundur. Bu bağlamda suların kullanılabilirlik durumu üzerinde belirsizlik mevcuttur. Hacimsel su varlığında ise kullanılabilirlik durumu ölçülebilir durumdadır. Buna göre Türkiye'nin su hacminin kullanılabilir olan kısmı 112 km<sup>3</sup> olarak tespit edilmiştir. Fakat kullanılabilir su varlığı giderek artan nüfusla birlikte büyük baskı altına girmiştir. Mevcut kullanılabilir su hacmini geliştirilen en güvenilir göstergelerden sayılan Falkenmark ve Shiklomanov göstergeleri ışığında değerlendirdiğimizde ortaya ciddi bir tablo

çıkarmaktadır. Buna göre 1300 m<sup>3</sup>'e gerileyen Türkiye'nin kişi başına düşen kullanılabilir su varlığı su baskısı yaşayan bir ülke betimler. Mevcut hesaplamaların da Türkiye Cumhuriyeti'nin resmi nüfus kayıtları üzerinden yapıldığı hatırlanırsa bu hacmin aslında çok daha düşük bir değerde olacağını tahmin etmek güç değildir. Yoğun yasadışı göçe ve sığınmacı akınına maruz kalan Türkiye'nin hali hazırda içinde barındırdığı insan sayısı hakkında kesin verilere ulaşmak söz konusu olmadığından kesin bir çıkarım yapmak oldukça güçtür. Türkiye'nin artmakta olan doğal nüfus yapısı (TÜİK, 2013; ÇŞİDB, 2018; Dünya Bankası, 2018) ve çoğalan düzensiz nüfus yükü de hesaba katıldığında Türkiye'nin kullanılabilir su kaynakları bakımından gelecekte çok ciddi sıkıntı yaşayacağı neredeyse kesin gibidir. Buna ek olarak yıllık 112 km<sup>3</sup>'lük kullanılabilir su varlığında küresel ısınma nedeniyle bir düşüş yaşanabileceği de unutulmamalıdır.

**Özet**

Son yıllarda biyoteknolojik çalışmalar kullanım alanı ve başarı durumu ilerleme göstermiştir. Oldukça sık kullanılan uygulamalardan biri de kallus kültürleridir. Kallus kültürlerinin birçok kullanım alanı bulunmaktadır. Elde edilen kallus dokusu farklı amaçlara hizmet edebilmektedir. Farklı bitki materyallerinden kontrollü in vitro koşullarda kallus elde edilmektedir. Kalluslar bitki türüne, hormon içeriğine ve kullanılan besin ortamlarına bağlı olarak sert, yumuşak dokulu; farklı renklerde ve özelliklerde olabilmektedir. Kallusun yapısı kullanım özelliklerini de etkilemektedir. Kallus kültürleri bitki rejenerasyonu ve somatik embriyogenesis çalışmalarında yer almaktadır. Günümüzde insan sağlığında çok önemli yer tutan sekonder bitki metabolitleri kallus kültürleri sayesinde daha hızlı ve kontrollü koşullarda elde edilebilmektedir. Bitki büyüme modellerinin oluşturulmasında önem arz etmektedir. Kallus kültürleri ıslah çalışmalarında da değerlidir. Abiyotik stres koşullarına dayanıklılık çalışmalarında kısa sürelerde sonuç alınması olanaklı kılmaktadır. Kallus topluluklarından hücre süspansiyon kültürleri oluşturularak, ıslah çalışmalarında gen aktarımı sağlanabilmektedir. Burada sunulan çalışmada kallus kültürlerinin kullanım alanlarına yönelik çalışmalardan örnekler sunulmuştur.

**Anahtar Kelimeler:** Kallus, hücre süspansiyon kültürü, büyümeyi düzenleyici, sekonder metabolit

**THE IMPORTANCE OF CALLUS CULTURE IN FRUIT GROWING AND ITS  
AREAS OF USE**

**Abstract**

In recent years, the field of use and success of biotechnological studies have progressed. One of the most frequently used applications is callus cultures. Callus cultures have many uses. The resulting callus tissue can serve different purposes. Callus is obtained from different plant materials under controlled in vitro conditions. Calli have hard or soft textures depending on the plant type, hormone content and nutrient media used; It can be in distinct colors and features. The structure of the callus also affects its usage properties. Callus cultures participate in plant regeneration and somatic embryogenesis studies. Nowadays, secondary plant metabolites, which are important for human health, they obtained faster and under controlled conditions thanks to callus cultures. It is important in creating plant growth models. Callus cultures are also valuable in breeding studies. It makes it possible to obtain results in a brief time in studies of resistance to abiotic stress conditions. By creating cell suspension cultures from callus communities, gene transfer can be achieved in breeding studies. In the study presented here, examples of studies on the usage areas of callus cultures are summarized.

**Keywords:** Callus, cell suspension culture, growth regulator, secondary metabolite

## **GİRİŞ**

Günümüzde teknolojik gelişmelere paralel olarak bitki ıslahı ve yetiştiriciliği konularında da ilerlemeler kaydedilmiştir. Bitkilerde biyoteknoloji uygulamaları her geçen gün daha geniş yer tutmaya başlamıştır. Kallus kültürleri in vitro uygulamalar içinde önemli bir üretim tekniğidir. Gen kaynaklarının çoğaltımı ve muhafazası, sekonder metabolitlerin üretimi, bitki ıslahı konularında geniş olanaklar sunmaktadır.

## **2. KALLUS KÜLTÜRLERİNİN UYGULAMA ALANLARINDAN ÖRNEKLER**

### **2.1. Kallus Kültürlerinin Sekonder Metabolitlerin Üretiminde Kullanılması**

*Siraitia grosvenorii* (Luo Han Guo) meyvesi mogrositler olarak bilinen sıfır kalorili doğal tatlandırıcı bileşikler nedeniyle ticari olarak önemli bir meyvedir. Yürütülen bir çalışmada meyvelerin mezokarpından hücre kültürü oluşturularak, bu kültürlerden mogrosit üretimi için alternatif bir kaynak sağlanması amaçlanmıştır. Mezokarp kallusundan geliştirilmiş hücre biyokütlesi (FW; 184,58 g/L) ile geliştirilen hücre süspansiyonunda mogrosit V (1,76 mg/g DW) ve 11-okso-mogrosit V (0,68 mg/g DW) içeriği önemli miktarlarda ölçülmüştür. Sonuç olarak meyve mezokarpından elde edilen in vitro kültürün mogrosit üretimi için potansiyel bir kaynak olduğu gösterilmiştir (Partab et al. 2022). Diğer bir çalışmada Granny Smith elma çeşidinin meyvelerinden kallus elde edilmiş, kallus dokularından hücre süspansiyon kültürleri oluşturulmuştur. Hücre kültüründeki fenolik bileşiklerden anti-tirozinaz aktivitesini ölçerek cildin yaşlanmasına karşı etkisinin değerlendirilmesine çalışılmıştır. Hücre kültürü ekstraktlarında klorojenik asit, kafeik asit, kateşin ve kuersetinin HPLC bazlı miktar tayini yapılmıştır. Sonuç, metanolik ekstraktın 1,42 µg/mg klorojenik asit, 0,46 µg/mg kateşin, 0,12 µg/mg kafeik asit ve 0,95 µg/mg kuersetin içerdiği belirlenmiştir. Hücre kültürü ekstraktının anti-tirozinaz aktivitesi ölçülmüş ve en yüksek inhibitör aktivite 100 mg/mL ekstrakt (%55) ile ilişkilendirilmiştir (Menbari et al. 2021). Tropikal bir meyve olan Guavanın aroması birçok meyve ürününde kullanılmaktadır. Laboratuvar çalışmaları meyvedeki aromanın ikincil bir metabolit olarak in vitro doku kültürü yoluyla ekspresyonunun mümkün olduğunu göstermiştir. Guavanın kallus kültürü için bir protokol oluşturulmuş, farklı olgunluktaki meyveleri kullanılmıştır. Klimakterik döneme ulaşmadan önce alınan meyve dokularından elde edilen kallus kültürlerinde aromanın maksimum değere ulaştığı belirlenmiştir (Madhavi et al. 1992). Karaerik üzüm çeşidinin kallus kültürlerinde ultraviyole ışınlarının antosiyanin üretimine etkileri araştırılmıştır. In vitro bitkilerin yapraklarından kallus kültürleri üretilmiş, ikinci alt kültürden sonra steril kabindeki petri kaplarının kapakları açılarak 12 ve 15 günlük kallus dokuları kaynaktan 10 cm uzaklıkta 10 ve 15 dakika boyunca 254 nm UV-C ışığa maruz

bırakılmıştır. Uygulama sonrasında kallus dokuları karanlık ortamda inkübe edilmiştir. Dokularda antosiyanin üretiminin uyarılmasında UV radyasyonunun etkili olduğu belirlenmiştir. En yüksek antosiyanin (196,74  $\mu\text{mol g}^{-1}$  FW) 10 dakika UV radyasyona maruz bırakılan 72 saatlik inkübasyonda yetiştirilen 12 günlük kalluslardan elde edilmiştir (Oğuz et al. 2020).

## **2.2. Kallus Kültürlerinin Bitkilerdeki Yaşamsal Olayların İncelenmesindeki Kullanımı**

Çilek meyvesinin olgunlaşması sırasında renk gelişimi ve hücre duvarı yapısının gelişimini incelemek için meyve kallus kültürleri model sistem olarak kullanılmıştır. Olgunlaşmamış-yeşil, beyaz ve olgun-kırmızı çilek meyvelerinin yaprak ve kortikal dokularından elde edilen kalluslarda yüksek miktarda pektin tespit edilmiştir. Pektin miktarı meyvelerin yeşil renk aşamasından beyaz aşamasına geçişinde artmış, kırmızı meyvelerde ise parçalanmıştır. Kallus kültürlerinden alınan hücre duvarı fraksiyonları ekstensin bakımından zengin bulunmuş, ancak az miktarda pektin içerdiği ortaya konmuştur. Genel olarak elde edilen sonuçlar, meyve hücre hatlarının çilekte renk gelişiminin hormonal düzenlemesini analiz etmek için kullanılabileceğini ancak meyve yumuşamasıyla ilişkili hücre duvarı yeniden yapılanma sürecinin kallus kültürlerinde yüksek ekstensin varlığı nedeniyle maskelenebileceğini göstermiştir (Ric-Varas et al. 2020). Kırmızı renkli armutlar, bol miktardaki besinsel faydaları ve görsel olarak çarpıcı kırmızı renk tonu nedeniyle beğenilmekte ve önemli bir pazar talebi bulunmaktadır. Kallus içindeki antosiyaninler de dahil olmak üzere ikincil metabolitlerdeki değişiklikleri araştırmak için farklı şeker, MS konsantrasyonları, ışık nitelikleri ve sıcaklıklara maruz bırakılan meyve etinden kallus üretimi üzerine çalışılmıştır. Sükrozun daha fazla antosiyanini indükleyebildiği ve bununla ilgili metabolitlerin ve genlerin de sükroz ve MS konsantrasyonlarının artmasına paralel olarak arttığı bulunmuştur. Kırmızı-mavi ışık ve 15 °C sıcaklık koşulları altında, daha fazla antosiyanin ve ikincil metabolit üretiminin tetiklenebileceği, ayrıca antosiyaninle ilgili genlerin ekspresyonunu, fizyolojik aktivitesini artırarak düzenleyebileceği ortaya konmuştur. Çalışma ile kırmızı armutlarda antosiyanin birikimine katkı yapan faktörlerin açıklanması ve böylece renk değişiminin altında yatan mekanizmaların anlaşılması için teorik bir temel sağlanmıştır (Yao et al. 2023).

## **2.3. Kallus Kültürlerinin Gen Kaynaklarının Muhafazasındaki Önemi**

Kallus kültürleri genetik kaynakların muhafazası, ıslah çalışmalarında yer alması bakımından da avantajlar sunmaktadır. *Malus sieversii* (Ledeb.) Roem., Orta Asya Tianshan Dağları'ndaki yabani elma ormanlarının yaklaşık %78'ini oluşturan bir genetik kaynaktır. Somatik embriyogenesis için in vitro sürgünlerin yaprak ve gövde kısımları başlangıç materyali olarak

kullanılmış, kültürlerde kompakt yapıda kallus oluşmuştur. Hormon olarak TDZ, NAA, BA kullanılmış, kallus rengi hormon içeriğine göre değişmiştir. Sarımsı renkte embriyojenik kalluslar oluşmuş, ancak somatik embriyo indüksiyonu gerçekleşmemiştir (Zhang ve diğ., 2020). Turunçgil tohumlarının meyve etinden ayrıldıktan sonra özel koşullarda saklanması gereklidir. Embriyojenik kalluslar ve kalluslardan elde edilen somatik embriyolar turunçgil genetik kaynaklarının *in vitro* koşullarda saklanmasına olanaklar sunmaktadır (Ling ve Iwamasa, 1997).

#### **2.4. Kallus Kültürlerinden Islah Çalışmalarında ve Bitkisel Üretim Materyali Olarak Somatik Embriyogenesis Oluşturulması**

Kallus kültürlerinden somatik embriyogenesis gerek bitkisel materyalin çoğaltılması gerekse ıslah çalışmalarında değer taşımaktadır. Kuş kirazında olgun zigotik embriyolarının kotiledonlarından geliştirilen adventif köklerden alınan protoplastlarla oluşturulan hücre süspansiyon kültürlerinde embriyojenik kalluslardan somatik embriyolar gelişmiştir (David ve diğ. 1992). Çin kestanesinde (*Castanea mollissima* Blume) yürütülen bir çalışmada somatik embriyogenesisin mekanizmasının tanımlanması ve somatik embriyogenesis ile ilgili genlerin ekspresyonu üzerinde çalışılmıştır (Lu ve diğ., 2017). Ceviz gençlik kısırlığı uzun bir meyve türüdür ve ıslah çalışmaları zaman alıcıdır. *J. nigra* ve *J. Regia* melezleri genellikle anormal gelişim göstermekte, melez bitkilerde canlılık oranı düşmektedir. İki türün melezlerinin olgunlaşmamış embriyolarının kotiledonlarından somatik embriyolar çoğaltılmış, bunlardan sağlıklı bitkiler elde edilerek, melezleme çalışmalarından çeşit adaylarının elde edilmesi sağlanmıştır. Bu sayede gerek materyal canlılığı korunmuş gerekse zamandan kazanılmıştır (Cornu, 1988). Diğer bir çalışmada da olgunlaşmamış embriyoların kotiledonlarından üretilen primer somatik embriyolardan sekonder embriyolar oluşturularak gen transferi çalışmalarında başarı şansı artırılmıştır (Bosela ve diğ, 2004) Somatik embriyoların elde edilmesinde önemli bir araç olan kallus kültürleri gelecekte küçük alanda çok sayıda bitki materyalinin üretimine olanak sağlayabilmesi bakımından teknik geliştirilmelidir. Golden Delicious (*Malus X domestica* Borkh)'ın olgunlaşmamış zigotik embriyolarının kotiledonlarından somatik embriyogenez yoluyla rejenerasyon sağlanmıştır. Çalışmada kallus indüksiyonu 3.7 mg/L nikotik asit+ 1.7 mg/L tiamin klorhidrat + 10 mg/L adenin+ 20 mg/L glutamin + 20 mg/L glisin+ 6 mg/L NAA ilave edilen MS ortamında sağlanmıştır. Embriyoların gelişme aşamasında MS + 3.7 mg/L nikotik asit + 1.7 mg/L tiamin klorhidrat + 0.5 mg/L BAP+0.05 mg/L NAA ortamı kullanılmıştır. Emriyolar hormonsuz 1/2 MS ortamında bitkiye dönüşmüştür (Paul ve diğ., 1994)Çilekte somatik embriyogenesis ile elde edilen bitkilerin üretimde kullanılma

potansiyeli önemlidir. Yapılan bir çalışmada 1.0 mg/l 2,4-D+ 0.5 mg/l BAP+Prolin eklenen MS ortamında somatik embriyolar başarı ile üretilmiş ve bitki rejenerasyonu sağlanarak, %90-95'e varan oranlarda başarı ile sera ve dış ortam koşullarına transfer edilmiştir (Biswas 2007).

Liçinin yaşlı ağaçlarından yeniden üretimde sorunlar yaşanmaktadır. Bu tür bitkilerden yeni üretim materyalinin oluşturulması için somatik embriyogenesis önemli bir avantaj sağlamaktadır. Bitkide embriyojenik kültürler yaprak eksplantlarından oluşturulmuştur. Kallus indüksiyonu ve embriyojenik kallusların oluşturulmasından sonra, süspansiyon kültüründe somatik embriyolar geliştirilmiştir. Beyaz-opak somatik embriyolar bitki rejenerasyonu için alınmıştır (Raharjo ve Litz, 2007). Turunçgillerde embriyojenik kalluslar ve kalluslardan elde edilen somatik embriyolar ıslah çalışmalarında, somatik hibridizasyon, genetik transformasyon, protoplast füzyonu ve uzun süreli muhafaza gibi pek çok çalışmada kullanılarak yeni çeşitlerin geliştirilmesinde katkı sağlamaktadır. Bu sayede *Citrus* ve *Citrus* akrabaları arasında somatik hibridizasyon gelişme göstermektedir (Ling ve Iwamasa, 1997). Calixto ve ark (2004) *Citrus sinensis* (L.) Osbeck ve *Citrus grandis* (L.) Osbeck (Hamlin+Indian Red ve hamlin+Singapura) arasında somatik hibridizasyon ile Tristeza virüsü ve *Phytophthora* hastalığına toleranslı anaçlar elde etmişlerdir. Turunçgillerdeki diğer bir çalışmada Avenido ve diğ. (2005) Şadok'ta somatik embriyoları olgunlaşmamış tohumların albedo dokularından 1mg/l BAP + 1mg/l 2,4-D ilave edilen MS ve BP ortamlarında elde etmişlerdir. Somatik embriyolar aracılığı ile çoğaltmanın virüsten ari fidan üretimi için kullanılabileceği belirtilmiştir. Guavada kalluslardan geliştirilen somatik embriyolarla çekirdeksizlik, artan raf ömrü ve solgunluk hastalığına yönelik genetiği değiştirilmiş guava oluşturulması konusundaki çalışmalarda ilerleme sağlanmıştır (Bajpai ve diğ. 2016) Meyve türlerinde somatik embriyolar sentetik tohum üretimi için kullanılmaktadır. Kapsüllenmiş somatik embriyolar, bitki germplazmasının çoğaltılması, depolanması ve değişimi için geleneksel materyallere göre avantajlar sağlamaktadır. Kapsüllenmiş hurma somatik embriyolarının 5°C'de uzun süre saklanması mümkündür ve uluslararası materyal değişimi için umut verici olarak belirtilmiştir (Bekheet, 2017).

### **3. SONUÇ**

Kallus kültürleri tek başına veya somatik embriyo aşaması ile birlikte bitkisel materyallerin ıslahı, muhafazası alanında önemini artırmaktadır. Diyet programlarında daha sık yer almaya başlayan sekonder metabolitlerin üretiminde önemli bir kaynaktır. Somatik embriyogenesis veya doğrudan organogenesis aracılığı ile bitkisel materyalin çeşitlenmesinde, yenilenmesinde kullanımı her geçen gün artmaktadır. Kallus kültürlerinin gelecekte küçük alanda çok sayıda

**ABSTRACT**

Opioid use disorder (OUD) is a complex and neurobehavioral disorder. Environmental factors as well as genetic predisposition have an effect on the development of OUD. Addictive substances can cause substance use disorder by affecting neurotransmitters in the brain's reward system. Some studies have shown that the endocannabinoid system is one of the main neural signaling pathways in OUD. Termination of anandamide (arachidonoyl ethanolamide) signaling in the central nervous system and peripheral tissues is mediated by fatty acid amide hydrolase (*FAAH*). The fatty acid amide hydrolase (*FAAH*) gene, which is involved in endocannabinoid signaling, indirectly controls the effects of the dopamine receptor and dopamine release. The aim of the current study was to analyze whether the *FAAH* rs324420 polymorphism is associated with OUD. For this purpose, 75 individuals with OUD according to DMS-5 criteria in AMATEM Clinic of Training and Research Hospital and 75 healthy individuals without past or current opioid use were included in this study. PCR-RFLP method was used for to genotype *FAAH* rs324420 polymorphism. The allele frequencies of the *FAAH* rs324420 were found 79% for wild type (C) and 21% for variant (A) in individuals with OUD. On the other hand, wild type and variant allele frequencies were 82% and 18% in healthy controls, respectively. The genotype frequencies were in accordance with Hardy Weinberg Equilibrium (HWE) ( $p>0.05$ ). No significant association was found between *FAAH* rs324420 and the susceptibility to OUD ( $p>0.05$ ). This study indicated that *FAAH* rs324420 didn't have an effect on the development of OUD in Turkish population.

**Keywords:** opioid use disorder, fatty acid amide hydrolase (*FAAH*), polymorphism, PCR-RFLP.

## **INTRODUCTION**

Substance use disorder (SUD), which is considered as a threat affecting individuals and society (Özbay et al., 2018), occurs in two ways: physical and psychological. Physical addiction is the state in which the body gets used to a new substance, and when the substance is not taken, the person experiences withdrawal symptoms and tolerance to the substance develops. The desire to continue using substances is defined as psychological addiction (Karakuş et al. 2021). Examples of substances that cause addiction in the individual are alcohol, heroin, amphetamines, marijuana, cocaine and barbuturates. Some of the addictive substances have narcotic properties and some have stimulant properties (Kılıç, 2016). Heroin, a semi-synthetic narcotic that creates a strong addiction in the individual. Heroin tolerance develops very quickly (Işık, 2013) and it shows its euphoric effect by binding to  $\mu$  opioid receptors (MOR) in the brain (Liu et al., 2021, Sun et al., 2021). Opioid use disorder (OUD) is defined as a complex neurobehavioral disorder. Although environmental factors affect the development of OUD in an individual, the effect of genetic factors is approximately 40-60% (Sun et al., 2019). Neurotransmitters of the central nervous system take part in the emergence of addiction. Dopamine, in particular, has an undeniable effect on addiction (Akgür, 2021). Anandamide (arachidonoyl ethanolamide) is hydrolyzed by fatty acid amide hydrolase (FAAH). Therefore, FAAH provides termination of anandamide signaling in the central nervous system and peripheral tissues. Anandamide acts as a feedback mechanism controlling dopamine receptor activation and increased dopamine release (Chiang et al., 2004; Vinklerová et al., 2002; Deutsch et al., 2002). Any change in the *FAAH* gene can lead to mRNA instability, a change in transcription, or a decrease in the activity of the encoded protein (López-Moreno et al., 2012). It has been mentioned that *FAAH* plays a part in several biological processes such as the reward system and mood and emotional response of the individual (Zhang et al., 2020), pain perception, and appetite regulation. *rs324420* polymorphism is a variation in the exon 3 of *FAAH* gene (Deutsch and Chin, 1993). This polymorphism changes proline (Pro/C-allele) to treonin (Thr/A-allele) in the Fatty Acid Amide Hydrolase (FAAH) protein (Sipe et al. 2012). Genetic polymorphisms of *FAAH* have been shown in various studies to be linked with some conditions such as substance/alcohol use disorders, obesity and eating disorders. Therefore, *FAAH* is considered as a new candidate gene for the treatment of various metabolic disorders, diseases, and SUD (Santoso and De Ridder, 2023).

**STUDY FIELD:** Forensic Biology

## **METHOD**

### **Case Selection**

75 individuals diagnosed with OUD who applied for the treatment at Ankara Training and Research Hospital-Alcohol and Substance Addiction Treatment and Training Center (AMATEM) and 75 healthy individuals were included in this study. The inclusion criteria are as follows: i) Being between the ages of 18-65, ii) Being diagnosed as OUD according to DSM-5 criteria, iii) smokers. The exclusion criteria are as follows: i) Individuals who use alcohol, ii) Not having mental retardation or mental disability, iii) Individuals with major cognitive and psychotic disorders, iv) Individuals with neurological diseases involving the central nervous system. Additionally, a form containing information about the individuals such as people's height and weight, their age, education level, occupation, marital status and sex was filled out. This study was approved by the institutional ethics committee (decision no. İ03-109-22 dated March 10, 2022).

### **Collection of blood samples, DNA isolation and PCR-RFLP method**

Venous blood samples were taken from all individuals participating in the study in EDTA tubes. For genomic DNA isolation, the method specified by the manufacturer was applied by using QIAamp DNA Blood Mini Kit (Qiagen). The region with the single nucleotide polymorphism was amplified by the Polymerase chain reaction (PCR) method, using forward (5'TGTTGCTGGTTACCCCTCTC3') and reverse (5'CCCAAATGACCCAAGATGC3') primers (Anvar et al., 2023). The PCR program used in the study is as follows: initial denaturation 1 cycle at 94°C for 5 minutes, denaturation 35 cycles at 94°C for 30 seconds, binding 35 cycles at 60°C for 30 seconds, elongation 35 cycles at 72°C for 30 seconds and final extension 1 cycle at 72°C for 10 minutes. And PCR mixture (25 µl) was prepared as 10x buffer 2,5 µl; 1 pmol/µl forward and 1 pmol/µl reverse primers, 0,125 U/µl taq DNA polymerase, 0.4 µM dNTP, 1.25 mM MgCl<sub>2</sub>. PCR products were treated with EtBr for being visible under UV light and were run on 1% agarose gel electrophoresis. PCR products were photographed with the "Syngene Gel Imaging System" (Figure 1).

**Figure 1:** Agarose gel electrophoresis image of the 338 bp PCR product of the *FAAH* gene region (M: 10 bp ladder; 1-19: 338 bp PCR products).

Restriction Fragment Length Polymorphism (RFLP) technique using the *StyI* restriction enzyme (Anvar et al., 2023) was applied to cut the amplified products. Oligonucleotides cut with restriction enzyme were run on 2% agarose gel electrophoresis. The cutting areas were photographed with the “Syngene Gel Imaging System” (Figure 2).

**Figure 2:** Agarose gel electrophoresis image of PCR products of *rs324420* polymorphism in *FAAH* gene (M: 10bp Ladder; Lanes 1-4,7,8,10: CC 200bp and 138bp; Lanes 5,9: CA 338bp, 200bp and 138bp; Lane 6: AA 338bp.)

### Statistical analysis

Study results were analyzed statistically. Statistical Package for Social Sciences (SPSS, V.25, Chicago, USA) was used for statistical analyzes in this study. The priority in the analysis was to analyze whether the data were normally distributed using the Kolmogorov-Smirnov test. For quantitative variables with a statistically non-normally distributed, median ( $\tilde{x}$ ) and Interquartile

Range (IQR) values are given. The  $\chi^2$  (chi-square) test used to determine relationships or differences between groups in categorical variables. Hardy-Weinberg equilibrium was calculated according to the genotype and allele frequencies of the genes. When matched groups are compared with the non-parametric Mann-Whitney U test. p value of  $<0.05$  was considered statistically significant.

## **RESULTS**

As a result of the analysis made according to the socio-demographic characteristics of 75 individuals with OUD and 75 healthy individuals, the median age of individuals with OUD was 30 years, the median age of healthy individuals was 36 years. It was determined that the average height of individuals with OUD was 174.5 cm and the average height of healthy individuals was 177.0 cm. The average weight of individuals with OUD and healthy individuals was 70 kg and 83 kg, respectively (Table 1).

**Table 1.** Sociodemographic characteristics of individuals with OUD and healthy individuals.

<b>Parameters</b>	<b>Individuals with OUD (n=75)</b>		<b>Healthy Controls (n=75)</b>		<b>p-value</b>

<b>Sex</b>	n	% frequency	n	% frequency	
Male	64	85.3	74	98.7	0.003
Female	11	14.7	1	1.3	

$\tilde{X}$ :median, n: sample size, IQR: Interquartile range.

When the age, weight and height of individuals with opioid use disorder and healthy individuals were compared, a significant difference was obtained ( $p=0.004$ ;  $p=0.001$ ;  $p=0.004$ , respectively). Additionally, significant differences were observed between the two groups in respect to education, employment status, marital status and sex ( $p=0.01$ ,  $p=0.01$ ,  $p=0.001$  and  $p=0.003$ , respectively). It is found that the most of individuals with opioid use disorder were graduated from middle and high schools (44%, 26.7% respectively) whereas the most of healthy

individuals were graduated from high schools and universities (50.7%, 16% respectively). Regarding employment status, 69.3% of individuals with OUD were working and 30.7% were not working, while 90.7% of healthy individuals were working and 9.3% were not working. Regarding marital status, 69.3% of individuals with OUD were single, 21.3% were married and 9.3% were widow/divorced, while 36% of healthy individuals were single, 62.7% were married and 1.3% were widow/divorced.

Table 2 shows the allele frequencies of *FAAH rs324420* polymorphism in individuals with OUD and healthy individuals. The allele frequencies of *FAAH rs324420* polymorphism in individuals with OUD were found 79% for wild type (C) and 21% for variant (A). On the other hand, wild type and variant allele frequencies were 82% and 18% in healthy controls, respectively. Both Individuals with OUD and healthy individuals were found to be in Hardy-Weinberg equilibrium ( $p > 0.05$ ). No significant results and association were found between *FAAH rs324420* and the susceptibility to OUD ( $p > 0.05$ ).

**Table 2.** Genotypes and frequencies of opioid users and healthy individuals.

<i>FAAH</i> <i>rs324420</i> genotypes	Individuals with OUD (n=75)		Healthy Controls (n=75)

\*NA: Non-available due to sample size  $\leq 5$ .

## DISCUSSION

Studies conducted on cell lines have shown that the variant allele of *FAAH rs324420* causes an increase in anandamide levels in the brain by changing the stability of proteins (Chiang et al., 2004; Dincheva et al., 2015). It has been reported that *FAAH* gene polymorphisms cause physical addiction in the individual by changing the reward pathways in the brain and changing the levels of the stimulatory effects of central nervous system signaling lipids (Sipe et al., 2002; Zhang et al., 2020). It has been supported by various studies that the *FAAH rs324420*

polymorphism causes addiction to substances such as alcohol, marijuana, cocaine, heroin, and nicotine (Chiang et al., 2004; Sipe et al., 2002; López-Moreno et al., 2012). In a research conducted in Caucasian populations, it was stated that the possibility of heroin, marijuana, alcohol and methamphetamine addiction increased among substance addicts carrying the *FAAH rs324420* A allele (Filbey, 2010). In another study conducted with a Caucasian population, it was reported that participants carrying the A allele of the polymorphism exhibited increased ventral striatal activity and impulsivity in the reward-related region of the brain compared to carrying the homozygous C allele (Hariri et al., 2009). Proudnikov et al. (2010) reported that the *rs324420* polymorphism in the *FAAH* gene was not related with OUD in African-Americans, Caucasians and Hispanics (Proudnikov et al., 2010). Our study findings supported this study. As regards to the results of our study, no relationship was found between OUD and *FAAH rs324420* polymorphism in Turkish individuals. Research conducted by Evren et al., it was stated that 88.6% of heroin users were men (Evren et al. 2002). In our study, it was also seen that 85.3% of individuals with OUD were male. Studies show that the education levels of substance addicts are low, generally below 9 years (Bulut et al., 2006; Nebioğlu et al., 2013). The findings of our study are also compatible with these previous studies. In conclusion, this study indicated that *FAAH rs324420* didn't have an effect on the development of OUD in a Turkish population.

**Özet**

Biyokütle bazlı karbon malzemelerinin araştırılması ve geliştirilmesi, çevresel sürdürülebilirlik ve yenilenebilir enerji kaynaklarının keşfi açısından son derece önemlidir. Özellikle atık biyokütle kaynaklarının, ceviz kabuğu ve yer fıstığı kabuğu gibi doğal kaynaklardan karbon bazlı malzemelerin üretimi için potansiyeli oldukça büyüktür. Ceviz kabuğu ve yer fıstığı kabuğu gibi bitkisel atıklar, genellikle değerlendirilmeden önce çevresel sorunlara yol açabilirler. Ancak bu atık kaynakları, uygun işlemlerle karbon bazlı malzemelere dönüştürülerek çeşitli endüstriyel uygulamalarda ve çevresel iyileştirme projelerinde kullanılabilir. Karbon bazlı malzemeler, yüksek yüzey alanına sahip olmaları, mükemmel adsorpsiyon özellikleri ve termal iletkenlik gibi özelliklerinden dolayı birçok alanda potansiyel sunarlar. Bu çalışmada, ceviz kabuğu ve yer fıstığı kabuğu gibi sıkça atık olarak ortaya çıkan biyokütle kaynaklarından karbon bazlı malzemelerin üretim potansiyeli araştırılmıştır. Öncelikle kuru ceviz ve yer fıstığı kabuğu biyokütleri toplanıp, parçalanarak öğütme işlemi ardından 75 µm altı boyutlarında elendi. Boyutu küçültülüp elenen biyoküteller kül fırınında belirlenen sıcaklık ve sürede demir içerikli katalizör varlığında karbonizasyon işlemine tabi tutuldu. Karbonize edilen örnekler soğutuldu. Karbonizasyon işlemi sonunda elde edilen karbon bazlı malzemelerin karakterizasyonu X-ray difraksiyonu (XRD), Fourier dönüşümlü kızılötesi spektrofotometresi (FTIR) ve Raman analizleri ile gerçekleştirildi. XRD, FTIR ve Raman analizlerinin sonuçları, lignoselülozik biyokütlenin karbonlaşma sürecinin başarıyla gerçekleştiğini ortaya koymaktadır. Bu analizler, hammaddenin yapısal değişimlerini ve karbonizasyonun ilerleyişini ayrıntılı bir şekilde göstermektedir. Bu araştırma, ceviz kabuğu ve yer fıstığı kabuğu gibi atık biyokütle kaynaklarının yeniden değerlendirilerek karbon bazlı malzemelerin üretimindeki potansiyelini ortaya koymaktadır. Bu malzemelerin üretim süreci, çevresel olarak sürdürülebilir ve ekonomik açıdan etkin bir yaklaşımı temsil ederken, aynı

**PRODUCTION OF CARBON-BASED MATERIALS FROM WALNUT AND  
PEANUT BIOMASS**

**Abstract**

The research and development of biomass-based carbon materials is extremely important for environmental sustainability and the exploration of renewable energy sources. In particular, waste biomass sources have great potential for the production of carbon-based materials from natural resources such as walnut hulls and peanut shells. Crop wastes such as walnut hulls and peanut shells can often cause environmental problems before they are utilized. However, these waste sources can be converted into carbon-based materials through appropriate processes and used in various industrial applications and environmental remediation projects. Carbon-based materials offer potential in many fields due to their high surface area, excellent adsorption properties and thermal conductivity. In this study, the potential for the production of carbon-based materials from biomass sources such as walnut shells and peanut shells was investigated. First of all, dry walnut and peanut shell biomasses were collected, crushed and sieved to a size of less than 75  $\mu\text{m}$  after grinding. The reduced and sieved biomasses were subjected to carbonization process in the presence of iron-containing catalyst in a muffle furnace at the specified temperature and time. Carbonized samples were cooled and collected. The carbon-based materials obtained at the end of the carbonization process were characterized by X-ray diffraction (XRD), Fourier transform infrared spectrophotometry (FTIR) and Raman analysis. The results of XRD, FTIR and Raman analyses reveal that the carbonization process of the lignocellulosic biomass was successful. These analyses show in detail the structural changes of the feedstock and the progress of carbonization. This research demonstrates the potential of recycling waste biomass resources such as walnut shells and peanut shells for the production of carbon-based materials. The production process of these materials represents an environmentally sustainable and economically efficient approach, while at the same time responding to various industrial needs. Therefore, the research and development of biomass-based carbon materials is expected to make a significant contribution to the development of future green and sustainable technologies.

**Keywords:** Peanuts, walnut shells, biomass, carbon-based material

## **Introduction**

Biomass is a renewable, abundant and cheap resource and its conversion into fuel, chemical and material precursors is of great importance to alleviate the energy crisis by reducing over-reliance on fossil resources, reduce environmental pollution and promote sustainable development (Baweja & Jeet, 2019). Recently, there is a high proportion of agricultural waste generated globally that is inefficiently used and cannot be recycled. These wastes can be considered as a viable resource that can impact environmental management. Furthermore, the utilization of biomass resources is thought to enable the use of less toxic reagents during the production phase, as well as adding value to agricultural by-products and reducing global dependence on petroleum-based feedstocks (Çavuş at al., 2022). In this study, it was aimed to investigate the potential of producing carbon-based materials from walnut shell and peanut shell, which are waste biomass sources. The obtained carbon-based materials were characterized by XRD, FTIR and Raman analysis.

## **Materials and Methods**

Dried walnut shells were obtained from Çorum region and dried peanut shells were obtained from Osmaniye region. Dried walnut and peanut shell biomasses were collected, crushed, ground and sieved to a size of less than 75 µm. The sieved biomasses were subjected to carbonization in the presence of iron-containing catalyst in a muffle furnace at 350°C. Carbonized samples were cooled and collected. The carbonized products obtained from dry walnut and peanut shell biomasses were named CC1 and CF1, respectively.

## **Findings and Discussion**

The synthesized samples were characterized by XRD, FTIR and RAMAN analysis. The phases of the biomasses and carbonized samples were observed by XRD patterns (Figure 1). Compared to the biomasses, the characteristic peaks of the prepared CC1 and CF1 carbonized products become more pronounced, indicating that the carbonization process only consumes impurities, but does not destroy the “core” structure of the biomasses. XRD spectra obtained from the crystal phase models of biochar (Figure 1) showed the presence of a peak indicating the formation of the intact structure of carbonaceous materials (Assirey & Altamimi, 2021). As shown in Figure 1, the XRD pattern of the prepared CC1 and CF1 exhibited a diffraction peak ( $2\theta=14^\circ$ ), indicating that the prepared carbon-based material has an amorphous carbon composed of aromatic carbon layers. This result clearly shows that under the process condition of carbonization and activation, it gives a carbonaceous structure composed of aromatic carbon layers (Wang, at al., 2020). After the carbonization process, it is seen that the peak at  $2\theta= 16.3^\circ$

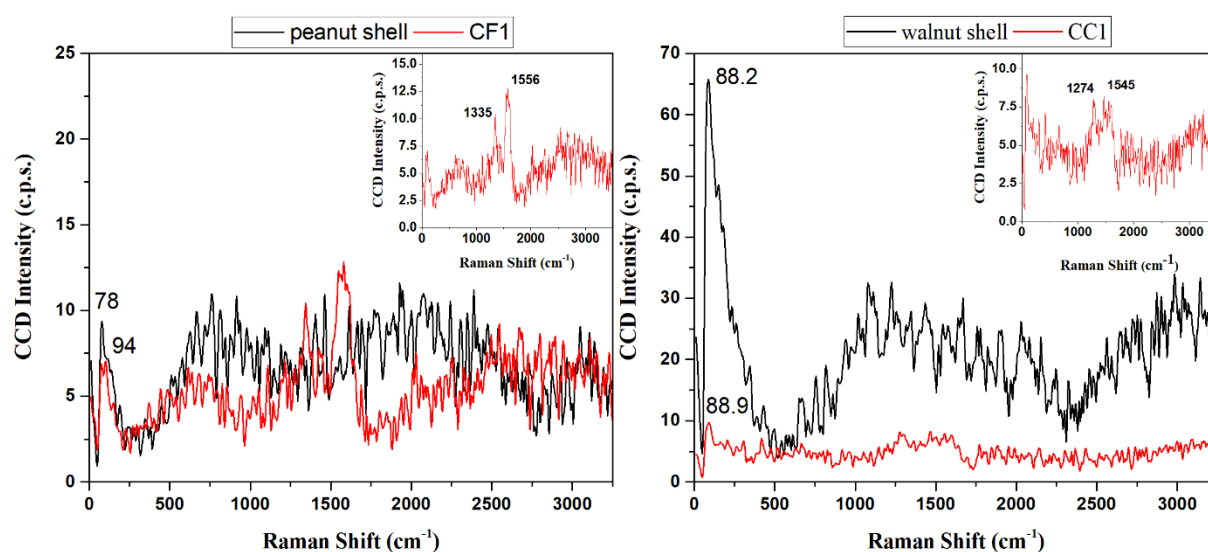

shifted to  $2\theta = 14^\circ$  and sharpened and also the peak between  $2\theta = 21.9-22^\circ$  broadened and a new peak was formed around  $2\theta = 25^\circ$ .

**Figure 1.** XRD diffractograms of biomass wastes and carbon-based materials obtained from these wastes FT-IR analysis of walnut and peanut wastes and carbon-based materials obtained from these biomasses is shown in Figure 2. It is seen that the broadband absorption peak is at  $3700-3000\text{ cm}^{-1}$ , indicating the presence of hydroxyl group (OH). This peak was found to be broadened in CC1 and CF1 samples while it was strong and narrow in biomasses. The absorption peak observed at  $2923\text{ cm}^{-1}$  in biomasses indicates the presence of aliphatic C-H vibration peaks originating from  $\text{sp}^3$ -hybridized carbon atoms. It is observed that the intensity of this peak completely disappears in CC1 and CF1 samples (Melese at al., 2020). The bands at  $1040\text{ cm}^{-1}$  attributed to aromatic C-O almost disappeared, while the C=C peak at  $1610\text{ cm}^{-1}$  and the C=O peak at  $1708\text{ cm}^{-1}$  appeared. All of these observations point to carbonization of lignocellulosic biomass (Wang at al., 2020).

**Figure 2.** FT-IR spectra of biomass wastes and carbon-based materials obtained from these wastes Figure 3 shows the Raman spectra of the respective G and D bands of carbon-based materials derived from various biomass wastes. One of the leading indicators of carbon-based material formation is the characteristic peaks seen in Raman spectroscopy. Raman spectra of carbon-based materials are regularly characterized by two characteristic bands, the D-band and the G-band. The D peak is usually located around  $\sim 1350\text{ cm}^{-1}$  and arises due to point defects in the planar structure. This band corresponds to  $\text{sp}^3$  carbon atoms of disordered or defective carbons. The G band corresponds to the in-plane stretching vibration of  $\text{sp}^2$  hybridized C atoms in a two-dimensional hexagonal lattice and appears around  $\sim 1580\text{ cm}^{-1}$  (Li et al., 2016). On the other hand, XRD diffractograms support the Raman analysis by showing the formation of partially turbostratic structures with assigned peaks. In our study, when all samples are evaluated within themselves, it is seen that only D and G bands belonging to carbon-based material-like structures appear.

**Figure 3.** Raman spectra of biomass wastes and carbon-based materials obtained from these wastes

### Conclusion and Recommendations

Carbon-based materials were successfully obtained from walnut shell and peanut shell biomasses. XRD diffractograms, Raman and FTIR spectra of the prepared biomasses and carbon-based materials were taken. It was determined that the carbon-based materials produced have a carbonaceous structure consisting of aromatic carbon layers. This research has demonstrated the potential of recycling waste biomass resources such as walnut shells and peanut shells for the production of carbon-based materials. The production process of these materials represents an environmentally sustainable and economically efficient approach, while at the same time responding to various industrial needs. As a result, the research and development of biomass-based carbon materials is expected to make a significant contribution to the development of future green and sustainable technologies.

**Abstract**

Optimism is one of the most important concepts in positive psychology. The benefits of being an optimist seem to outweigh the disadvantages by far. Most of the research supports this idea, and this is also how the general public thinks. By being an optimist, we expect good things to happen in the future, and we believe we can achieve our goals. On the contrary, if we are a pessimist, we tend to believe that things will not go our way. Consequently, we will have less motivation to act. In this article, we take a closer look at optimism in positive psychology, which is the kind of psychology that approaches the human psyche not from the aspect of psychopathology, but human thriving. Optimism is not as simple as it sometimes may sound. In this article, we examine its strong impact on well-being, life satisfaction, and even perceived pain management. But since optimism is not without any disadvantages, we also examined how some types of optimism, such as being too optimistic, can be not that good. Likewise, we talked about how some types of pessimism such as defensive pessimism can be beneficial in some cases. The most important point we find is that, the context is crucial when it comes to what kind of psychological attitude we should take, in terms of optimism or pessimism.

**Keywords:** optimism, positive psychology, pessimism, hope, life satisfaction

## **Introduction**

One of the most important concepts in positive psychology is optimism (Dunn, 2017). Optimism is usually defined as having a positive outlook on life and expecting positive events in one's future. The opposite of optimism is defined as pessimism, in which a person has a negative outlook on his or her life, and expects more negative events to happen in the future. Researchers, teachers, and people in general promote optimism for well-being, happiness, and life satisfaction. After all, being an optimist feels better, and we're more motivated to take productive action when we feel better, right? By contrast, being a pessimist feels bad, and it might stop us from taking productive action because we don't even believe something good will happen in the first place. But is it really that simple? If believing in something could make it happen, it would mean that there is a real power in positive thinking (Scheier & Carver, 1993). Looking closer at these terms, optimism, and pessimism, researchers see that there are various types of them. Cousins et al. (2016) talk about the power of optimism in pediatric pain. Windschitl and Stuart (2015) talk about various types of optimism and optimism biases. Youssef and Luthans (2007) examine the impact of optimism, hope, and resilience in the workplace. Shepperd et al. (2013) talk about unrealistic optimism, and also the sub-types of it. These are just a few examples within the vast sea of research in this area. Although it is easy to say that "optimism is good, and pessimism is bad," things get complicated when we talk about, for example, "being too optimistic," or "defensive pessimism". In this article, we take a closer look at these terms, examine some of their types, and also go into detail about the benefits and disadvantages of them (Norem & Chang, 2002). And although we are talking about optimism in terms of positive psychology, we didn't confine this article to research in that field.

## **History of Optimism: An Overview**

Peterson (2000) talks about two forms of optimism. The first one is the kind in which optimism is considered a part of human nature. The second one is optimism as an individual difference. When we look at the earlier approaches to optimism, we see that they were mostly negative. Writers from Sophocles to Nietzsche say that optimism contributes to one's suffering. They argue that it's better to face the hard facts of reality. Freud's influential writings also have this negative view of positive thinking as a main component of the subject. Around the 60s and 70s, the outlook on the subject started to change, when researchers started to find evidence that most people are not realists in a strict way, and they weren't so accurate in how they think. It was also documented by cognitive psychologists that people use many shortcuts when they process information. There were hundreds of studies that indicated people were selectively positive in

their thoughts, memory, and language (Peterson, 2000). As an example, most people use positive words more than negative words, both when speaking and writing. When they are trying to remember something freely, their positive memories come to mind sooner than the negative ones. The majority of people see themselves in a more positive light compared to others. It is accurate to say that in people's minds, all of them are "above average" (Peterson, 2000). Aaron Beck, who is mostly regarded as the father of Cognitive Behavioral Therapy (CBT), was influenced by these views at the time, and in the earlier times of his theory development, he strictly regarded people with depression as non-logical. This implied that people without depression were in fact logical. While it is true that people with depression can have a distorted view of reality, and think in ways that are not very logical, Beck didn't question the occasional positive view that the person with depression talks about in therapy. Later, Beck stopped assuming people who did not have depression were logical, and he started to consider people can have a positive bias toward their ongoing experiences and their future (Peterson, 2000). Greenwald's (1980) view on human nature was also a turning point for how optimism was regarded by psychologists. He likened human nature to a totalitarian regime. He says that the self can be viewed as an organized knowledge about one's identity and history. The self organizes the information in a biased way, by using information-control strategies just like a totalitarian regime in a country. People continuously create and revise their personal histories in their minds. And these stories are bound to be egocentric because all of us are the main characters in our stories. To some extent, all of us attribute good things to ourselves and attribute bad things to other things. We also resist changing the way we think (Peterson, 2000).

### **Recent Approaches to Optimism**

Being optimistic about life is one of the key elements in positive psychology. Optimism as a concept has been a research subject for over 30 years. It also has roots in expectancy-value models of motivation, and in folk psychology. According to the expectancy-value models, what underlies human behavior is goal pursuit, which in itself has two elements. The first element is the value of a goal. If a goal is more important, it's more likely to be pursued. The second element is about one's confidence regarding their ability to reach that goal. If someone has little or no confidence in their ability to reach a goal, they may never take action to reach it. They might also easily give up if they face challenges. As you might expect, people who have more confidence about reaching that goal will continue pursuing it even when they face challenges (Dunn, 2017).

Optimism has many forms and the research supports that most of those forms are related to better outcomes in coping, well-being satisfaction, etc., which are measured in various contexts. Looking at this, it is easy to assume that optimism should always be preferred over pessimism. Moreover, today it is promoted that parents, researchers, educators, policy consultants, and therapists should advocate for optimism as much as possible. Consequently, the popular culture in America also supports this. As such, it is important to approach the powerful zeitgeist of positivity in a more delicate and complex manner, and not simply say “Optimism is good” and “Pessimism is bad” (Norem & Chang, 2002). When it comes to forming expectancies, people do it in countless contexts. These contexts can be specific and narrow, or they can be in very broad areas in life. Optimism usually implies confidence in those broader areas in life, rather than specific or narrow contexts. So when we look at motivation from this expectancy-value point of view, it makes sense to anticipate that optimists are usually more confident and persistent, contrary to pessimists who are usually thought to be uncertain and hesitant (Dunn, 2017). Optimism research has two main ways of measuring it. The first approach is a straightforward one in which people are directly asked about their expectancies about the future. For example, they are asked if they expect the outcomes in their life to be generally bad, or good. It is this approach that the most widely used optimism measure uses. Two tests, namely the Life Orientation Test (LOT) and the LOT-Revised (LOT-R), people are presented with statements about the future, and they report their degree of disagreement or agreement with these statements. These statements can be like “In difficult times, I never lose hope” or “I usually don’t expect things to go the way I want”. As you can guess, if someone shows greater agreement with positive statements and disagreement with negative statements in the measure, they are considered more optimistic. Whereas if someone agrees more with the negative elements, and disagrees with the positive ones, they are considered more pessimistic (Dunn, 2017). The second approach to measuring optimism focuses more on the past. It involves asking people to make judgments and attributions about the causes of past happenings in their lives. The main idea behind this approach is that, interpretations of the past events affect the expectation of future events. Let’s say that someone believes that, in a specific area of their life, their failures are because of stable facts. If this is the case, they are likely to expect failure again in that area, in the future (Dunn, 2017).

### **Relationship Between Optimism and Pain**

There is a lot of existing research in chronic and experimental pain contexts, and most of the research is focused on adults. It is found that, among healthy adults, optimism is related to a

low amount of self-reported pain. It is also related to habituation to the pain of cold pressor (Cousins et al., 2016). Cold pressor test is a cardiovascular test that is done by immersing the hand in an ice water container (Wood et al., 1984). Even so, health-related cognitions seems to moderate the benefits of optimism. This means that optimism might be causing the person to disengage from the stressor and use active coping mechanisms. In the studies with adults, pain catastrophizing is found to be a mediator of the relationship between pain and optimism, and this suggests that, lower experimental pain might be related to decreased pain catastrophizing. Lastly, optimism seems to soften the effects of pain on executive functions after a cold pressor test (Cousins et al., 2016). Other than pain in experimental contexts, optimism research has also been conducted on adults with chronic pain. Again, optimism has been found to be associated with less severe perceived pain and lower pain catastrophizing. It was also found to be associated with well-being, higher functioning, internal locus of pain control, and active pain coping. In older adults, research shows that optimism mediates the relationship between life satisfaction and pain (Cousins et al., 2016).

### **Some Critical Views on Optimism**

According to Norem and Chang (2002), there are some complications to this general attitude toward optimism, as suggested by some researchers. We can look at the research on defensive pessimism, which clarifies some of these complications we would like to talk about. In summary, we can talk about these points: Since optimism and pessimism cover several concepts, it is important to keep the differences among them clear. There are several forms of optimism and pessimism, and the costs-benefits balance might differ among them. And even though there are potential costs and benefits to both pessimism and optimism, usually the merits of optimism are overemphasized, and its costs are underemphasized. Also, the context is highly important in this balance of costs and benefits and they can vastly differ if the context changes. As such, it is important to keep this in mind when conducting research and interpreting the results. It is also important to point out that optimism and positive psychology are not synonymous (Norem & Chang, 2002). When we look at the existing research, it is clear that there is an extremely lot of constructs for both optimism and pessimism. In other words, there are so many types of them. These include dispositional pessimism and optimism, pessimistic and optimistic explanatory or attributional styles, naïve optimism, optimistic illusions or biases, rational or neurotic pessimism, unrealistic optimism, realistic pessimism, strategic optimism, and defensive pessimism (Norem & Chang, 2002).

It is also worth noting that in highly individualistic cultures, most of the research on pessimism and optimism focuses on the outcomes in the individual's life, e.g. in their life satisfaction or positive affect (Norem & Chang, 2002). Defensive pessimism is a kind of pessimism in which an individual sets unrealistically low expectations for a situation, and reflects on all the possible outcomes of that situation. By contrast, strategic optimism refers to a strategy that is about having an optimistic view about a situation that is going to be experienced soon. It also involves avoiding extensive reflection prior to that situation and/or task (Norem & Chang, 2002). So what are the costs of optimism? One is that their optimistic attitude might get derailed. This can happen if someone in an optimist state of mind starts to calculate possible outcomes in their mind. This is said to impair their performance. But if the given situation requires a review of alternative outcomes, or getting a grasp of possible negative outcomes, a defensive pessimism might bear better outcomes (Norem & Chang, 2002). Aging is another context in which the outcomes of optimism and pessimism take an unexpected turn. It is found that the power of positive thinking does not predict well anxiety, depression, stress, and self-appraised health in older age groups. It is reported that a realistically pessimistic perspective among the elderly is associated with "positive negativity," and this makes them adapt to negative life events more easily (Norem & Chang, 2002).

### **Comparing the Terms Optimism, Hope, and Life Satisfaction**

When it comes to subjective well-being, one of the most important things is life satisfaction. Life satisfaction is usually defined as cognitive evaluations regarding one's own life, and this can be in general or specific areas. Life satisfaction motivates people to pursue goals, and it can be felt by an individual as a pleasant inner conscious experience. Also, a strong predictor of life satisfaction is having individual strivings, which helps integrate and organize one's goals (Bailey et al., 2007). The studies regarding hope were historically philosophical, examining the term from spiritual, emotional and existential aspects. Snyder et al. have a concept of hope with two components, which are called pathways and agency cognitions. Pathways thinking is about one's perceived capacity to create routes that lead to their goals. Agency thinking is about the perceived motivation to make use of these said pathways, so it is about initiating and sustaining action towards the goals (Bailey et al., 2007). Although they look similar, the concept of hope slightly differs from the concept of optimism. The usual definition of optimism is about believing good things, rather than bad things will happen. Consequently, optimists tend to expect future events to go their way, and this attitude of them is stable across different contexts and times. On the other hand, pessimists tend to expect future events to not turn out well for

them (Bailey et al., 2007). So in summary, researchers argue that optimism is a generally positive view on life in general, while hope is more about goal and path setting, and maybe self-efficacy. We believe that this difference is not that clear and sometimes the terms are used interchangeably.

### **Discussion and Conclusion**

It is clear that optimism is a well-established and evidence-based construct in positive psychology. It is evident that optimism can have a huge impact on one's life, their life satisfaction, and well-being. We especially find research regarding optimism and pain interesting and inspiring, because it shows how powerful optimism is, even having impact on both chronic pain and pain in experimental settings. But optimism is not without any downsides. We believe that even though optimism is a well-researched topic, it tends to have some blind spots, such as over emphasizing pros and discarding cons of it. It looks important to not make optimism a holy grail, as it is also evident in some other research that being too optimistic can be detrimental, and sometimes pessimism has its functions. It all depends on the context and the level of optimism and pessimism, and we also argue that it's about being flexible when we need to change our attitude towards something according to the changing contexts. Accordingly, we suggest that more research should be done to explore how this balance and possible dynamic nature of optimism, pessimism, their kinds and everything in between, can affect our well being, life satisfaction, and other important aspects about our happiness which positive psychology explores.

**Abstract**

The expansion of the tropical belt as a result of global climate change is predicted to lead to an increase in the usage of C<sub>4</sub> grasses in pastures. In particular, the tropical, subtropical, and warm temperate regions of the Americas are home to *Paspalum* species. Dallisgrass (*Paspalum dilatatum*) and bahiagrass (*Paspalum notatum*) are the most economically important and widely used *Paspalum* species for livestock production. Due to the global shortage of water for irrigated agriculture, deficit irrigation has gained popularity as a way to lower the amount of water needed for crops and fodder. Additionally, root herbivores influence plant-water relations in grasslands where they are the dominating taxon. Variations in the water content of the soil can affect phenology, rooting strategy, and plant growth.

**Keywords:** Drought, water stress, *Paspalum dilatatum*, anatomy

## **Introduction**

Drought restricts growth and productivity in the majority of the world's grasslands. The distribution and timing of water availability vary greatly, and this variation is correlated with the composition of plant communities. Plants adapt their morphology and physiology in response to such heterogeneity. These alterations show an ontogenic, plastic reaction to the surroundings. Stress, both biotic and abiotic, affects the performance of all plants, including genotypes that are resilient. But not every genotype reacts to extreme environments in the same way. Several researchers specify "structural" characteristics to evaluate grass productivity. The main variables are lamina length, number of live leaves per tiller and tiller/plant (number of tillers). These characteristics are influenced by a number of leaf-level 'morphogenetic' growth variables, primarily leaf longevity, leaf appearance rate, and leaf elongation rate. The morphogenetic and structural components are not only determined by genotype but also by growing circumstances. Specifically, these characteristics are associated to developmental changes in response to environmental factors. This is known as phenotypic plasticity (Couso ve Ark., 2010). Plants have been shown to exhibit plastic responses under drought. Leaf elongation rate was discovered to be one of the most drought-responsive characteristics, making it a sensitive indicator of drought-induced growth. Grasses growing under drought conditions have short stature, prostrate morphology, generally consistent tillering, and low tiller biomass. Palatable grasses exhibit similar overall morphological changes in response to grazing, both as a plastic and evolutionary response. Stress not only inhibits present leaf extension and growth, but it can also impede future regrowth potential. Recovery from defoliation is dependent not only on the plant's inherent capacity and type of defoliation, but also on the biotic and abiotic environment. Following a defoliation event, the plant experiences a transient period of rapidly altering carbon and nutrient allocation patterns. Defoliation and drought lower a plant's carbon input, yet carbon allocation priorities appear to be conflicting. Drought causes an increase in carbohydrates allotted to roots, whereas defoliation allocates carbohydrates to shoots (Gastal and Durand, 2000). Bud activation during defoliation would be more critical for tiller production than bud quantity or viability. Drought can inhibit tiller formation in both defoliated and undefoliated plants (Couso ve ark., 2010).

## **2. Drought tolerance in *Paspalum* spp.**

*Paspalum notatum*, *P. dilatatum*, *P. plicatulum*, and *P. guenoarum* are popular forage plants in south America (Acuña et al. 2011). *Paspalum* is a significant genus in the *Poaceae*, belonging to the subfamily *Panicoideae*, tribe *Paniceae*, and subtribe *Paspalinae*. It contains roughly 400

species (Eichemberg & Scatena, 2013). The majority of them are grown in tropical, subtropical, and temperate areas of America. Brazil is home to roughly 202 *Paspalum* species, which are scattered throughout the grasslands. *Paspalum* stands out for its presence and foraging potential in native Brazilian grasslands. *Paspalum* is the most abundant genus in Brazil's residual grasslands and has a high economic potential (Eichemberg & Scatena, 2013). *Paspalum* species are key components of South American grassland ecosystem biodiversity, and many are exploited as feed (Rua et al., 2010) but, some species, such as *Paspalum virgatum* are considered a pasture weed that causes significant damage to livestock (Nascimento Vasco et al., 2023). In a study, new *Paspalum atratum* accessions were discovered to be variably grazed by cattle, with no variations in herbage accumulation or nutritional value. Cattle preference of this species was inversely related to the fraction of lignified tissues, the number of primary vascular bundles, plant height, and leaf-blade length. Cattle preferences were influenced by the growth season and decreased by the presence of leaf structural tissue (Marcon et al., 2023). *Paspalum* species can be found in a variety of habitats, including savannas, forests, and forest margins, as well as dry, sandy, saline, or waterlogged soils (Mollard et al. 2008). Some species, such as *P. candidum* and *P. pygmaeum*, grow in mountainous locations as high as 4500 metres. Others grow in Patagonia's cold-temperate zones, such as *P. distichum* and *P. vaginatum*. The species *P. dilatatum*, *P. guenoarum*, *P. notatum*, and *P. urvillei* are all regarded excellent forage species. Because of the high number of species and morphological heterogeneity within the genus, *Paspalum* has been classified into subgenera, sections, or informal groups based mostly on inflorescence and spikelet morphological characteristics. Many scholars researched the foliar anatomy of *Paspalum*. The entire genus is classified as C<sub>4</sub> and "panicoid type" (Aliscioni & Denham, 2009). Many *Paspalum* species consist of sexual-diploid and apomictic-polyploid cytotypes, and others have arisen through hybridization (Rua et al., 2010). C<sub>4</sub> plants are believed to be less drought-sensitive than C<sub>3</sub> plants due to their CO<sub>2</sub> concentrating mechanism (Carmo-Silva et al., 2007). In warm, dry summer conditions, C<sub>4</sub> grasses produce higher yields than C<sub>3</sub> grasses (Gherbin et al., 2007), but better drought resistance in C<sub>4</sub> grasses is not always observed (Carmo-Silva et al., 2009). Water is one of the most critical constraints on plant development and agricultural productivity in many parts of the world. With the predicted increase in aridity, knowing plant responses to dry conditions, as well as identifying features relevant to climate change, are critical for improving water usage efficiency, plant production, and yields. C<sub>4</sub> grasses use water more efficiently than C<sub>3</sub> grasses as they have a stronger affinity for CO<sub>2</sub> and lower transpiration rates. The presence of a CO<sub>2</sub>-

concentrating mechanism makes C<sub>4</sub> photosynthesis more competitive in conditions that promote carbon loss through photorespiration, such as high temperatures, high light intensities, and decreased water availability, resulting in low intercellular CO<sub>2</sub> concentrations due to stomatal closure (Carmo-Silva et al., 2009). Some of *Paspalum* species has been reported to have a low water requirement, a moderate fertilization requirement, and resilience to mowing at various heights, in addition to superior salinity and drought resistance (Shahba 2010). *Paspalum* species, including *P. vaginatum* (Shahba et al. 2014) and *P. notatum* (Acuña et al. 2010), show potential for drought tolerance. Some species have high fodder value but the tolerance to water stress of these species, such as *P. atratum*, *P. conspersum*, *P. dilatatum*, *P. malacophyllum*, *P. quarinii*, and *P. regnellii*, has received less attention (Pezzopane et al., 2017). Drought resistance refers to a variety of processes utilised by plants to survive periods of drought. Drought escape, avoidance, and tolerance are all examples of strategic mechanisms. The significance of each of these techniques is connected to drought length and severity, as well as grass species. These mechanisms are linked to changes in anatomy, morphology, physiology, and biochemistry. Grasses frequently concentrate their roots in the top 30 cm. Grasses can withstand drought by establishing deeper root systems and having shoot morphological or physiological mechanisms that limit evapotranspiration losses. Grass quality and evapotranspiration rate have traditionally been employed to assess drought resistance in grasses. Deeper and larger root masses, as well as a more widespread dispersion of roots, allow for increased water extraction from the soil. Changes in leaves that assist drought tolerance include reduced leaf growth and area, greater pubescence, rolling or folding, and fewer stomates (Shahba et al, 2014). The use of water deficit and waterlogging-tolerant cultivars may help to mitigate climate risks and minimise the susceptibility of pasture-based animal production systems in the tropics. Pasture degradation is regarded as one of the most serious issues impacting tropical animal production systems, and it is frequently linked to abiotic stress. The persistence of grazing swards under water deficiency and waterlogging situations is determined by plant survival mechanisms and their ability to rebound after stress. Despite prior investigations on the response of tropical forages to water shortage stress, the recovery of plants following a period of water deficit has been poorly characterised (Beloni ve ark., 2017). *Paspalum paniculatum* is tolerant to dryness, water scarcity, and flooding. In a study, eleven days after the start of water restriction, variations in stomatal cell density and size, reduction in metaxylem diameter and root cortex, increase in bulliform cell size, and leaf concentrations of amino acid, and starch were identified (Melo et al., 2007). *Paspalum notatum*

(commonly known as Bahiagrass in Brazil) is regarded high-quality feed with good grazing resilience in Southern Brazil's native grasslands. The *P. notatum* has been found to have a broad and deep fibrous root system, which could be connected with the plant's ability to recover water from deep soil layers and hence display drought resistance (Beneragama & Kumara, 2018).

### **3. Drought tolerance in *Paspalum dilatatum***

Dallisgrass (*Paspalum dilatatum* Poir.) is a warm-season grass endemic to eastern Argentina, Uruguay, and southern Brazil. It is well-known for its feed quality and cattle preference. The introduction of this plant in temperate pastures enhances summer productivity and digestible dry matter production in heavy or clayey soils. It is more common in humid and extremely humid environments. This pattern can be explained by its endurance to flooding. Its low frequency in water-stressed areas could be attributed to issues with seedling establishment. Many years ago, various publications recognised the difficulty of establishing this species. They ascribed it to poor seed quality and slow germination. Several attempts to improve this species' establishment were unsuccessful, with the exception of using seed presowing treatments or residual cover. However, there were inconsistencies in the outcomes of those experiments. One probable explanation for the frequent failures in seedling establishment when presowing techniques were used is that seedlings died after emergence due to dehydration. Slow seed germination and seedling emergence prolong the period of vulnerability. As a result, effective establishment is less likely to occur in varying water conditions. The slow growth of seedlings following emergence is due to the root system's late development. Dallisgrass is more vulnerable to water stress during the seed-germination stage. As water stress rose, total germination reduced and emergence slowed. This species is highly susceptible to water stress during germination and initial growth, and rapid germination and early adventitious root growth can only occur when water is available continuously. The problem is more complicated because high temperatures are required to disrupt seed dormancy (Cornaglia et al., 2005). *Paspalum dilatatum* is a rhizomatous plant with smooth leaves and a robust root structure. Dallisgrass begins to grow in early spring, before most warm season grasses, and persists until late autumn. The pentaploid biotype is suitable as a forage grass because of its adaptation to varied soils, perennial growth, and high dry matter yield production during the summer (García et al., 2007). While *Paspalum dilatatum* has a higher forage quality than other C<sub>4</sub> forage grass species, generally digestibility of warm-season grasses is lower than temperate grasses. The presence of thick-walled parenchyma bundle-sheath cells around vascular bundles in C<sub>4</sub> forage grasses is linked to the deposition of lignin polymers in cell walls. High lignin content correlates

poorly with digestion. Lignin acts as a physical barrier to microbial enzymes that digest polysaccharides, decreasing the rate of cellulose and hemicellulose degradation and the digestible energy available to ruminants (Giordano et al., 2014a). Dallisgrass, valued for its vigour, produces yields of up to 15 tonnes of dry matter per hectare (Cook et al., 2005) and crude protein concentrations of up to 18.6% (Baréa et al. 2007). It can withstand heavy grazing (Giordano et al., 2014a). *P. dilatatum* provides better feed quality than other C<sub>4</sub> forage grasses and is resistant to frost and water stress. This species is mostly cultivated in an apomictic monoculture, which increases the chance that biotic and abiotic stressors may destroy productivity. *P. dilatatum* is expected to be more widely used in animal grazing systems under forecasted climate change scenarios due to its greater drought resistance and water use efficiency when compared to regularly used C<sub>3</sub> grasses. However, standard breeding strategies for improving *P. dilatatum* are frequently hampered by its asexual reproduction mechanism. Apomictic reproduction produces seeds without fertilisation, resulting in uniform progeny that are genetically similar to their parents, limiting the genetic variation accessible for conventional breeding programmes (Giordano et al., 2014b). *Paspalum dilatatum* can be found throughout Argentina's drought-flood gradient (Couso et al., 2010). Huang et al. (2019) selected *Paspalum dilatatum* germplasms with high drought resistance and provided a theoretical foundation for breeding and promoting drought-resistant germplasm. A comprehensive examination of drought resistance revealed that the drought resistance of *P. dilatatum* germplasm from the United States was the the strongest followed by one from China, and then other germplasms.

**Fig. 1.** *Paspalum dilatatum*: A) habit, B) sheath, ligule, and blade, C) spikelet (Ibrahim & Peterson, 2014).

*Paspalum dilatatum*, *Cynodon dactylon*, and *Zoysia japonica* are three grasses (*Poaceae*) from various C4 subtypes that grow in natural settings with varying annual rainfall. Their leaf features were investigated by Carmo-Silva et al., (2009) to determine traits associated with drought tolerance. The leaves of *Z. japonica* had the highest relative dry matter content, while *P. dilatatum* had the lowest. Plants had an average of 3 (*P. dilatatum*), 5 (*C. dactylon*), or 15 (*Z. japonica*) fully developed leaves at the start of the drought treatment. These numbers were increased over the period when water was withheld, so that by the end of the experiment, control and drought-stressed plants had around 10 and 9 (*P. dilatatum*), 23 and 19 (*C. dactylon*), or 32 and 29 (*Z. japonica*) completely extended leaves. The drought-stressed plants of *P. dilatatum* and *C. dactylon* had a lower specific leaf area than the control plants. In *Z. japonica*, the percentage of leaf dry matter was higher. The findings show that *C. dactylon* and, particularly, *Z. japonica* have evolved leaf characteristics that are better suited to arid environments. Couso et al. (2010) evaluated three *P. dilatatum* materials for drought tolerance. Drought tolerance qualities were unaffected by genetic differences across species. Despite predictions, the three studied *P. dilatatum* varieties had equal reaction norms (no interaction between drought and variety) for all response variables. Drought lowered the rate of leaf elongation (cm/leaf/d). Drought also reduced leaf length. Drought lowered both tiller production and living leaf count.

Drought-induced accelerated senescence would explain the decrease in the number of leaves per tiller. Under drought conditions, all three research materials produced shorter, fewer leaves. However, tiller biomass was comparable in droughted and control plants. Tall material from humid locations (Primo) had higher tiller biomass under all water-availability situations. Despite having features that appeared to be related with drought tolerance (e.g., many, small tillers, short stature), the Alonso and Relincho varieties did not perform better under stress. Henry et al. (2009) investigated the habitat specialisation and competitive differences between dallisgrass (*Paspalum dilatatum*) and bahiagrass (*Paspalum notatum*). Final biomass and survival of shoots and rhizomes were measured for plants cultivated in monoculture or competition with hybrid bermudagrass (*Cynodon transvaalensis* × *C. dactylon*) in sand or sandy loam soil. Dallisgrass shoot and rhizome growth was greatest at the highest soil moisture levels in each gradient tank, regardless of soil type or competition. When planted as a monoculture, dallisgrass survival rate dropped to 50%, and it reduced to 12.5% when grown in competition with hybrid bermudagrass. The survival rate of bahiagrass was 100% regardless of water table depth, soil type, or competition. When grown in sandy loam soil, bahiagrass shoot and rhizome growth increased with increasing depth to the water table. Growing in sandy soil resulted in the opposite pattern. According to the findings, dallisgrass may compete more with hybrid bermudagrass when volumetric soil moisture is high, but bahiagrass may compete when volumetric soil moisture is low.

#### **4. Conclusions**

Although *Paspalum dilatatum* is not the best performing C<sub>4</sub> species in arid conditions, its important feature is performing well in both drought and flooded conditions. At the same time, its high yielding and high quality grass production capacity has proven itself in its natural habitat, where the species is widely preferred by both farmers and feeding animals. Dallisgrass (*Paspalum dilatatum*) and bahiagrass (*Paspalum notatum*) may be used in mixture, as found in its native habitat in different locations in the world. More studies are needed on morphological traits of *Paspalum dilatatum* under low water supply on different soil types especially under warming Mediterranean conditions with inclusion of all biotypes of the species along with inclusion of selected competitive C<sub>4</sub> and C<sub>3</sub> forage crops to compare. Special attention is required for failures in seedling establishment.

### **Özet**

Kanser, AIDS ve diğer bulaşıcı hastalıklar gibi hastalıkların erken tanısı ve kanda bulunması gereken çeşitli moleküllerin seviyelerinin düzenli olarak izlenmesi tıbbi tedavide her zaman önemli bir adım olmuştur. Bu bağlamda, nano ölçekte doğru ve güvenilir ölçümler elde etmek için yüksek hassasiyete sahip nano-biyosensörlerin geliştirilmesi gerekmektedir. Nano-biyosensörler, nanomol/litre veya pikomol/litre seviyesinde tespit yapabildikleri için geleneksel biyosensörlerden milyonlarca kat daha hassastır. Ayrıca hayvan, gıda ve çevre sağlığı için spesifik moleküllerin çoklu tespitini sağlayan biyosensör cihazların geliştirilmesi önemlidir. Yüzey zenginleştirilmiş Raman saçılması (SERS), DNA, proteinler, bakteriler, kan örnekleri, vb. gibi spesifik moleküllerin hızlı bir şekilde tespiti için en umut verici yaklaşımlardan biridir. Bu olağanüstü teknik, hastalıkların erken tanısına katkıda bulunabilir. Bu derleme esas olarak biyosensör uygulamaları için nanomalzeme temelli SERS aktif alttaşı malzemelerindeki son gelişmelere odaklanmaktadır. İki boyutlu nanomalzemeler (2DN), karbon temelli nanomalzemeler (CBN) ve gümüş ve altın gibi asil nanoparçacıklar ve 2DN kombinasyonu ayrıntılı olarak sunulmaktadır. Ek olarak, elektromanyetik ve kimyasal geliştirme mekanizması teorileri ve yukarıda belirtilen SERS biyosensör platformlarının tasarımı tartışılmıştır.

**Anahtar Kelimeler:** Biyosensör, nanomalzemeler, nanoparçacıklar, SERS

**SERS ACTIVE NANOMATERIALS FOR BIOSENSOR APPLICATION**

**Abstract**

The early diagnosis of diseases such as cancer, AIDS and other infectious diseases and the regular monitoring of the levels of various molecules that need to be present in the blood have always been a crucial step in medical treatment. In this context, nano-biosensors with high sensitivity need to be developed to obtain accurate and reliable measurements at the nanoscale. Nano-biosensors are millions of times more sensitive than conventional biosensors as they can detect at the nanomole/liter or picomole/liter level. In addition, it is important to develop biosensing devices that enable the multiple detection of specific molecules for animal, food and environmental health. Surface-enhanced Raman scattering (SERS) is one of the most promising approaches for the rapid detection of trace amounts of specific molecules such as DNA, proteins, bacteria, blood samples, etc. This outstanding technique can contribute to the early diagnosis of diseases. This review mainly focuses on the recent advances in active SERS active substrate materials based on nanomaterials for biosensing applications. Two-dimensional nanomaterials (2DN), carbon-based nanomaterials (CBN), and the combination of 2DN and noble nanoparticles such as silver and gold were presented in detail. In addition, theories on electromagnetic and chemical enhancement mechanism theories and the design of the above-mentioned SERS biosensor platforms were discussed.

**Keywords:** Biosensor, nanomaterials, nanoparticles, SERS

## **Introduction**

The early diagnosis of life-threatening diseases such as cancer, AIDS, COVID-19-like infectious diseases, etc., the systematic monitoring of drug quantities that must be exist in the human body over a longer period of time, the immediate monitoring of substance quantities that are introduced into the tissue during serious operations, is one of the most important steps towards saving human life. Biosensors are crucial not only for human health, but also for the health of food, animals and the environment. Various electrochemical methods have been used to develop conventional biosensors. However, all of these methods have their own limitations, such as the costly production of samples, additional steps for sample preparation and analysis, the need for additional specialized personnel, and so on. With this in mind, it is important to develop next-generation biosensors that have multiple detection capabilities to accurately detect trace amounts of specific molecules in a very short time. SERS-based micro/nano biosensors can be a promising approach to overcome these limitations in the above-mentioned methods.

## **Surface-enhanced Raman spectroscopy (SERS)**

Raman spectroscopy is a kind of vibrational spectroscopy associated with the inelastic scattering of photons from a target analyte, causing changes in the photon frequency (Ferraro, 2003). This spectroscopic technique can provide various information, such as the composition and structure of the target material, crystallographic structure, electrical properties and so on. Raman spectroscopy is used in many fields, including physics, chemistry, biology, biochemistry, materials science, drug development and biotechnology. The interaction of the sample is ensured with a laser or other monochromatic light source. Most of the light scattered by the sample carries the same frequency as Rayleigh scattering. One in a million photons is scattered (Raman scattering) from the sample in an inelastic way and has a different energy than the incident one. This provides a specific Raman spectrum for each sample, which provides the final spectral fingerprint of the samples (Ferraro, 2003).

Raman spectroscopy has some limitations and shortcomings in detecting signals from samples. This is because one of the 10 photons shows inelastic Raman scattering and most photons show elastic Rayleigh scattering (Atkins et al., 2014). The SERS method is used to overcome these drawbacks and increase the density of inelastically scattered photons. The SERS technique was developed in 1974 and has become a sensitive and reliable method for qualitative and quantitative analysis of molecules even at very low concentrations (Fleischmann et al., 1974). Compared to other analytical techniques, SERS is easier to use for the detection of trace amounts. It is a technique that can save time and provide accurate and precise results. In

addition, it is attractive because no additional sample preparation is required prior to analysis. Thanks to its excellent performance, high precision, speed and non-destructive analysis method, it is widely used in biomedicine, food safety, environmental monitoring and so on. Electromagnetic enhancement mechanisms (EM) and chemical enhancement mechanism (CM) are two recognized SERS enhancement mechanism. EM is related to surface plasmon excitation in metal nanoparticles (MNPs) and CM is mainly related to electron charge transfer (Qian and Nie, 2008). To enhance EM, noble gold and silver nanoparticles are often used as SERS materials due to their excellent stability and sensitivity (Lu et al., 2011; Zhang et al., 2012; Çelik et al., 2023).

Above-mentioned metal surfaces can be MNPs, in particular gold and silver, or composite SERS-active substrates in hybrid structure. Free electrons on the surfaces of the substrates on which the analytes to be analyzed are located cause electromagnetic wave movements known as surface plasmons. When these plasmons interact with laser light, the electromagnetic field is enhanced in some regions where the analyte molecules interact with the surface plasmons and enhance Raman scattering. Surface plasmons on SERS-active substrate surfaces illuminate molecules close to the sample more intensely, resulting in a strong enhancement of the Raman signal. Therefore, SERS can detect even traces of certain molecules at much lower concentrations than conventional Raman spectroscopy. Another mechanism that provides surface enhancement and stronger Raman signals is the chemical enhancement mechanism. In this mechanism, a charge transfer with a strong electron pairing occurs between the analyte and the SERS substrate surface (Zou and Dong, 2006). In this process, the molecule is bound to the metal surface to perform the charge transfer. The laser interacts with the active SERS substrate to form electron-vacancy pairs and transfer energy to the molecular bonds. The energy is transferred back to the active SERS substrate so that scattering occurs, resulting in an amplified Raman signal.

### **Practical Applications of SERS-based Biosensors**

The rise of numerous biological menaces worldwide has significantly increased the need for the development of novel, effective and quick approaches for the early of viral pathogens. Techniques such as PCR and ELISA are frequently used to detect viruses. However, these techniques have disadvantages, such as requiring complex incubation and purification steps, requiring a complex pre-isolation procedure, being limited to the use of specific antibodies and requiring a long test time. As an alternative to PCR and ELISA techniques, SERS biosensors

based on metal nanoparticles therefore offer an efficient, reliable, sensitive and rapid detection method for diagnosing viral and bacterial disease infections at an early stage.

Some important medical applications of SERS, such as detection of tumor-like abnormalities during surgery, fiber optic monitoring techniques to detect unhealthy tissue, may be important in the near future. Karabeber et al. reported the ability of a portable Raman spectrometer to detect the microscopic tumor margins by gold-silica SERS-Nps in a genetically modified RCAS/tv-a glioblastoma rat model (Karabeber et al., 2014). In a virtual condition, they tested both a static Raman spectrometer and a mobile Raman spectrometer. They showed that SERS-assisted resection is much more precise than resection using white light imaging. Both techniques complemented each other, and parallel to histology, SERS-Nps was shown to precisely delineate the margins of the tumors. The mobile Raman spectrometer enabled near real-time scanning and identified additional microscopic cancer foci in the resection bed that could not be detected on static SERS images and thus would have remained unused.

Endoscopic monitoring is one of the most promising approaches to detect diseased tissue. Wang et al. have shown that silica-coated AuNps-based SERS materials can improve the detection of esophageal cancer in a rat model (Wang et al., 2015). They applied antibody-conjugated SERS-Nps locally on the luminal surface of rat esophagus to detect EGFR and HER2. A small spectral endoscope with a rotational scanner and axial retraction was used to monitor the SERS-Nps attached to the esophageal lumen.

Recently, various methods have been used to detect different types of cancer by plasmonic nanoparticle-driven SERS biosensors. Bai et al. reported a novel SERS biosensor for liver cancer using plasmonic AuNps (50 nm) to detect CEA, AFP, and proteins with a limit of detection (LOD) of 0.15, 20, and 4 pg/mL, respectively (Bai et al., 2019). Davis et al. developed an AuNps-based SERS platform for bladder cancer detection to identify the tumor proteins CD47 and CA9 (Davis et al., 2018). Li et al. used gold-NS hollow alloy nanocubes in a SERS biosensor for prostate cancer to detect miRNA-107 with an LOD of  $10^{-15}$  M (Li et al. 2019). Carmicheal et al. demonstrated a SERS biosensor for pancreatic cancer using a hybrid structure of AuNPs 10 nm on Ti/Au 40 nm/100 nm slide targeting CD18/HPAF, HPDE and MiaPaca exosomes (Carmicheal et al., 2019). Ag-encapsulated Au nanospheres were developed for the precise diagnosis of three types of breast cancer cell biomarkers, EpCAM, ErbB2 and CD44, with SERS-active substrates (Choi et al., 2020).

SERS-based immunoassays using different biomolecules have also been developed for the detection of hepatitis B virus (Song et al., 2009; Zengin et al., 2017; Lu et al., 2018). Recently,

a highly sensitive SERS immunoassay was demonstrated and a SERS material on a microfluidic chip was designed for the detection of hepatitis B (Kamińska et al., 2015). It was found that fuchsin provides efficient SERS enhancement and has an excellent ability to combine Au nanostructure and antibody. The developed SERS-active substrate proved to be crucial for increasing the effectiveness of SERS immunoassays owing to its perfect stability, reproducibility and strong enhancement ability.

Pandemics are another situation in which early detection measures should be taken. One of the most recent examples of this is the coronavirus (COVID-19), which first broke out in Wuhan, China, and then spread to other cities in China and around the world. Recent research has shown that the severe acute respiratory syndrome coronavirus (SARS-COV-2) has been detected in contaminated water. In order to detect the virus in contaminated water and effectively control the extent of the spread of SARS-COV-2, it is important to determine the true extent of the person infected with the coronavirus (Peng et al., 2020). Consequently, it is necessary to precisely identify SARS-COV-2 in infected body fluids or contaminated water in order to monitor the viruses in real time and diagnose them at an early stage. In this context, novel SERS-based approaches have been used for disease surveillance, early disease assessment and vaccine production (Zhang et al., 2021; Asif et al., 2020; Abid et al., 2021; Awada et al., 2021). SERS-based breath analyzers utilize the main oscillatory changes triggered by the contacts between breath substances and various receptors to advance a powerful PLS analysis model (Leong et al., 2022). Sanchez et al. developed a novel non-invasive diagnostic method using plasmonic and two-dimensional nanomaterials for the rapid detection of SARS-COV-2 virus spike proteins using the SERS technique (Sanchez et al., 2021). Recently, Zhang et al. developed a SERS-based assay for real-time identification of SARS-COV-2 that does not require additional processing when combined with multivariate analysis. In this study, they used Ag nanorods as the SERS-active surface that support the ACE2 receptors (Zhang et al., 2021). Awada et al. developed a novel method to detect the COVID-19 RBD protein using the SERS technique. They succeeded in preparing Au/Ag nanostructured SERS-active substrates that display the RBD protein with high efficiency and accuracy in only 3 seconds. They also achieved a limit of detection (LOD) of 1 pM using this approach (Awada et al., 2021).

Sepsis is defined as "life-threatening organ failure caused by an irregular host response to infection" (Singer et al., 2016). If sepsis is not diagnosed early, it may bring about septic shock, multiple organ failure and even death (Paoli et al., 2018). Procalcitonin (PCT) is a calcitonin precursor protein with 116 amino acids that accumulates in the Golgi. Although the plasma

concentration of PCT is initially low, its concentration increases during the course of sepsis (Prucha et al., 2015). High levels of PCT have also been reported to be directly related to the severity of COVID-19 and SARS-CoV-2 (Zhang et al., 2020; Lu et al., 2020; Huang et al., 2020; Guan et al., 2020; Lippi and Plebani, 2020). SERS could be a promising approach for the rapid detection of sepsis. Kundu et al. reported an AgNP-doped black phosphorus SERS substrate for the detection of PCT, taking into account the opportunity of discriminating between different biomarkers (Kundu et al., 2022). Zhou et al. developed an AgMNPs/IMs/CPs hybrid structure for the identification of inflammatory markers such as CRP, IL-6 and PCT (Zhou et al., 2022). Various nanoparticles such as MNPs, lipid-based nanoparticles, fluorescent silica and quantum dots (QDs) have been used for the diagnosis of sepsis-related infections (Kurdekar et al., 2016; Zhang et al., 2017; Mocan et al., 2016; Zhu et al., 2014).

In a recent study, we fabricated for the first time a SERS-active electrode with graphene-based AgNP/Gr@ ITO hybrid platform for the detection of PCT biomarkers (Selimoğlu and Ayhan, 2023). As a result, simple nanostructured SERS electrode materials based on AgNP-doped graphene were designed, allowing the quick detection of PCT. A perfect agreement of AgNPs and single-layer CVD graphene was achieved, resulting in efficient SERS performance. Thanks to the large surface area of graphene, numerous PCT antibody molecules could bind to the surface of the SERS substrates. A high EF of  $1.6 \times 10^9$  and a significant LOD of  $4 \text{ ngmL}^{-1}$  indicated that the fabricated SERS substrates exhibited excellent SERS activity.

### **Conclusion and Recommendations**

In the face of changing and evolving living conditions, expectations of science and technology are higher today than ever before. The development and production of reliable, rapid, sensitive, inexpensive, portable and wearable test materials is crucial for the early diagnosis and detection of trace amounts of specific molecules related to human, animal, food and environmental health. SERS-active substrates and the SERS technique developed by utilizing the perfect compatibility of NPs and other nanomaterials with superior properties are a promising approach. Parameters such as shape, size and distribution of all NPs, especially noble metals, can be modified, hybrid structures of NPs and 2D nanomaterials can be modified to produce SERS-active substrates with high EF and sensitivity, and specific molecules at very low concentrations can be reliably detected by mobile Raman devices within seconds.

**Özet**

Eğer bu çalışmanın amacı doğru bir şekilde incelenirse, günlük hayatta birçok paragrafın okunduğu ve bu paragrafların bazen önemli, bazen önemsiz olduğu fakat her bir paragrafın okunması için dakikaların harcadığı ortaya çıkarılabilir. Bu çalışma, tam olarak bu amaca yönelik olarak yapılmıştır. Uzun paragrafların okunması sırasında, zamanın tasarruflu kullanılması ve sadece önemli noktaların anlaşılabilmesi hedeflenmiştir. Metin özetleme üzerine yapılan çalışmalar, derin öğrenme tekniklerinin kullanımıyla büyük bir gelişme kaydetmiştir. Bu bildiride, epoch sayısının, loss değerinin ve metin özetlemesi için kullanılan modelin performansı üzerindeki etkisi incelenmiştir. Deneylerde, 10, 100 ve 1000 epoch ile eğitilen modellerin 5 cümlelik metin özetleri karşılaştırılmıştır. 10 epoch ile eğitilen modelin loss değerinin 2.41 olduğu ve %30'luk bir özetleme başarısı gösterdiği, ancak önemli noktalara yeterince odaklanamadığı gözlemlenmiştir. 100 epoch ile eğitilen modelin ise loss değerinin 1.07 olduğu ve %67'lik bir özetleme başarısı elde ettiği ve önemli noktaların çoğunu kapsadığı tespit edilmiştir. En uzun eğitim süresi olan 1000 epoch ile eğitilen modelin loss değerinin 0.81 olduğu ve %71 oranında metni özetleyebildiği ve önemli noktalara daha derinlemesine değindiği belirlenmiştir. Bu sonuçlar, metin özetleme alanında derin öğrenme yöntemlerinin etkinliğini ortaya koymaktadır. Ancak, optimal özetleme performansı için epoch sayısı gibi faktörlerin dikkate alınması önemlidir.

**TEXT SUMMARISATION WITH DEEP LEARNING: AN INVESTIGATION ON  
THE EFFECT OF EPOCH NUMBER**

**Abstract**

If the purpose of this study is examined correctly, it can be revealed that many paragraphs are read in daily life, and these paragraphs are sometimes important and sometimes unimportant, but minutes are spent reading each paragraph. This study has been specifically designed for this purpose. During the reading of long paragraphs, the aim is to use time efficiently and to understand only the important points. Studies on text summarization have shown significant progress with the use of deep learning techniques. In this paper, the effect of epoch number, loss value, and the model used for text summarization performance is examined. In experiments, models trained with 10, 100, and 1000 epochs are compared for 5-sentence text summaries. It was observed that the model trained with 10 epochs had a loss value of 2.41 and showed a summarization success rate of 30%, but it did not sufficiently focus on important points. The model trained with 100 epochs had a loss value of 1.07 and achieved a summarization success rate of 67%, covering most of the important points. The model trained with the longest training duration of 1000 epochs had a loss value of 0.81 and could summarize the text with a success rate of 71%, delving more deeply into the important points. These results demonstrate the effectiveness of deep learning methods in text summarization. However, it is important to consider factors such as the number of epochs for optimal summarization performance.

**Keywords:** Text summarization Deep Learning, Epoch Number, Machine Learning

## **Introduction**

In today's digital age, the sheer volume of information available to individuals has reached unprecedented levels, making it increasingly challenging to efficiently process and understand textual content. Whether it's news articles, academic papers, or online content, people are often required to sift through lengthy paragraphs to extract the essential information. While some of these texts contain critical details that readers need to grasp, others may be less significant but still consume valuable time during reading. With the exponential growth of textual content available on the Internet, as well as in various archives of news articles, scientific papers, legal documents, and more, the importance of Automatic Text Summarization (ATS) has become increasingly evident. Manual summarization methods are not only time-consuming and costly but also impractical given the sheer volume of textual data. Researchers have been striving to enhance ATS techniques since the 1950s, primarily focusing on extractive approaches where important sentences are selected and concatenated to form a summary. However, this focus on extractive methods has left the potential of abstractive and hybrid approaches relatively unexplored. The extractive approach, which selects and concatenates the most important sentences from the input document(s), has been the primary focus of most research efforts in ATS. In contrast, the abstractive approach represents the input document(s) in an intermediate representation and generates summaries with sentences that may differ from the original text. Hybrid approaches combine elements of both extractive and abstractive methods. Despite the plethora of proposed methods, the summaries generated by ATS still fall short of human-generated summaries in terms of quality and coherence. Recent research has emphasized the importance of exploring abstractive and hybrid approaches to overcome the limitations of traditional extractive methods (El-Kassas et al., 2021). Highlighted the significance of abstractive summarization of multi-documents in generating concentrated versions of documents while preserving the main information (Abualigah et al. 2020). Moreover, introduced a Fuzzy Inference System-based extraction approach and discussed the semantic approach using Latent Semantic Analysis, indicating the potential of alternative techniques in text summarization (Babar and Patil 2015). Given the massive amount of data available today, the importance of text summarization techniques that can efficiently extract relevant information from large documents cannot be overstated. This study aims to contribute to the existing body of knowledge by investigating the impact of epoch number, loss value, and model architecture on text summarization performance, while also considering the potential of abstractive and hybrid approaches.

## **Materials and Methods**

### **Data Collection:**

For this study, a diverse dataset of textual content was meticulously collected from multiple sources to represent the variety of paragraphs encountered in daily life. The sources included news articles, scientific papers, online content, and other text-based materials. To ensure the relevance and quality of the data, we focused on documents that cover a range of topics and styles, including both informative and less significant content.

The collected dataset was subjected to initial preprocessing steps to clean and refine the data. This preprocessing phase involved removing any noise such as HTML tags, special characters, and irrelevant content to create a clean and standardized dataset. Additionally, the data was tokenized into sentences and words to facilitate further analysis and model training.

The primary objective of this data collection process was to create a representative dataset that reflects the type of paragraphs encountered in daily reading, thereby enabling us to train and evaluate our text summarization models effectively.

### **Model Training and Configuration:**

In this study, deep learning techniques were employed to train text summarization models with a focus on exploring the impact of epoch number, loss value, and model architecture on summarization performance. Three different sets of models were trained with varying numbers of epochs, specifically 10, 100, and 1000 epochs, to understand their influence on the quality of generated summaries. The models were configured to use different loss functions to optimize the training process and improve the summarization performance. Additionally, we experimented with various model architectures, including both extractive and abstractive approaches, as well as hybrid models that combine elements of both approaches. Each model was trained on a subset of the preprocessed dataset obtained during the data collection phase. The training process involved feeding the data into the models iteratively, adjusting the model parameters based on the specified epoch number and loss value, and optimizing the model to generate accurate and coherent summaries. By varying the training parameters and model configurations, we aimed to explore the optimal conditions for achieving high-quality text summaries and understand the effectiveness of different approaches in capturing important points from the input paragraphs.

### **Analysis:**

The analysis of the text summarization models' performance was conducted using a multi-faceted approach, involving both automated metrics derived from the program and qualitative

insights from domain experts. This dual-analysis method was employed to provide a comprehensive evaluation of the models' capabilities and limitations. Automated metrics such as loss values and summarization success rates were calculated to quantitatively assess the performance of the trained models. These metrics provided valuable insights into the effectiveness of different training parameters and model configurations in generating accurate and coherent summaries. In addition to automated metrics, qualitative analysis was performed by presenting the generated summaries to text summarization experts. These experts evaluated the summaries based on their relevance, coherence, and overall quality, providing subjective assessments that complemented the quantitative metrics. By combining insights from both automated metrics and expert evaluations, we were able to gain a holistic understanding of the models' performance. The analysis revealed that increasing the number of epochs generally improved the summarization success rate, with models trained for longer durations achieving higher success rates. However, it also highlighted the importance of considering factors such as loss value and model architecture for optimal summarization performance. Overall, the dual-analysis approach enabled us to draw comprehensive conclusions about the effectiveness of deep learning methods in text summarization and identify areas for further improvement and exploration.

### **Conclusion and Discussion**

The aim of this study was to investigate the performance of text summarization models in efficiently capturing the essential points from paragraphs encountered in daily reading, thereby optimizing time utilization and comprehension. Leveraging deep learning techniques, we examined the impact of epoch number, loss value, and model architecture on summarization effectiveness. In our experiments, three sets of models were trained with varying numbers of epochs: 10, 100, and 1000. The quantitative results, as presented in Table 1, showed that the model trained with 10 epochs achieved a loss value of 2.41 and a summarization success rate of 30%, indicating a limited focus on important points. As the number of epochs increased to 100, the loss value decreased to 1.07, and the summarization success rate improved to 67%, covering most of the crucial information. The model trained with 1000 epochs further reduced the loss value to 0.81 and achieved a success rate of 71%, indicating a deeper understanding of the important points.

While these automated metrics provided valuable insights into the models' performance, we also sought qualitative evaluations from text summarization experts to validate the relevance and coherence of the generated summaries. The experts' assessments confirmed that as the

number of epochs increased, the models' ability to capture and summarize the essential points improved, aligning with the quantitative results. Comparing the program outputs with expert evaluations allowed us to draw comprehensive conclusions about the effectiveness of deep learning methods in text summarization. The combination of quantitative metrics and qualitative assessments provided a holistic perspective on the capabilities and limitations of the trained models. In conclusion, our findings demonstrate the effectiveness of deep learning techniques in generating text summaries that focus on the essential points of the input paragraphs. The results highlight the importance of optimizing training parameters, such as the number of epochs, to achieve optimal summarization performance. As the volume of textual content continues to grow, the development of efficient text summarization techniques remains crucial. Future research should further explore innovative approaches and optimization strategies to enhance the capabilities of text summarization models and address the evolving demands of information consumption in daily life.

**Abstract**

Pneumonia is defined as infection of lung tissue caused by various microorganisms. The most important mechanism in the formation of pneumonia is the aspiration of organisms in the oropharynx. In this case report, it is aimed to evaluate the nursing care of the patient diagnosed with pneumonia according to the Henderson Model, one of the nursing theories. In this case, a 74-year-old female patient diagnosed with pneumonia applied to the health institution with complaints of cough, sputum, difficulty breathing, constipation, nausea, and body pain and was hospitalized. Additionally, the patient has medical diagnoses of hypertension and heart failure. The problems identified regarding the patient were planned according to the basic requirements in the Henderson Nursing Model and classified with NANDA-I Nursing Diagnoses. It was applied between 06.02.24 and 10.02.24 in line with the Nursing Interventions Classification (NIC) to determine the interventions to be applied to the patient in line with the determined nursing diagnoses and the Nursing Care Outcomes Classification (NOC) to evaluate the results of the care provided. 5 nursing diagnoses from the areas of activity/rest sleep, rest, excretion and gas exchange, comfort, safety/protection in NANDA Taxonomy II are included. The nursing diagnoses determined for the patient are Disruption in Sleep Pattern, Ineffective Respiratory Pattern, Constipation, Oral Mucous Membrane Disruption and Nausea. With the nursing care and education provided to the patient using the Henderson Nursing Model, the patient's problems were tried to be solved and the aim was to reduce the patient's current complaints and increase his independence over his disease. The patient stated that he felt better since coming to the hospital and that he could eat hospital meals. She stated that during her hospitalization, her constipation complaint disappeared and her breathing became easier. The patient was given discharge training and was made aware of the issues he should pay attention to after discharge.

## **Introduction**

Nursing is a health discipline built on research, practice and theories based on philosophy. It guides the formation of knowledge in theories, determination of research methods, realization and implementation of the research process (Velioglu, 2012). For a profession to be professional, the information must also be scientific. This means we can use theories and models for systematic information. Theories, models and theories that form the conceptual framework of nursing are frequently used in nursing education, management, practice and nursing research (Kaya et al., 2010). The strengthening of the nursing profession will be achieved by understanding the theories, conducting theory-based research and developing new theories (Aydm & Kukulcu, 2020; Velioglu, 2012).

## **Theoretical Framework: Henderson Nursing Model**

Virginia Henderson, known as the best nurse of the 20th century, was born in America in 1897. She is a nursing theorist who advocates that health should be protected or regained by helping individuals with a holistic care approach (Ahtisham & Jacoline, 2015; Fernandes et al., 2019; Parker & Smith, 2010). Henderson defined the role of the nurse as "substituting for the patient, supportive (helping the patient), complementary (working with the patient), and aiming to help the individual be as independent as possible." The main purpose here is to help the patient and make him the most independent (Ahtisham & Jacoline, 2015; Kılıç et al., 2019; Velioglu, 2012). While making these definitions, he was influenced by basic human needs and Maslow's hierarchy. There are fourteen components in the Henderson nursing care model, which considers humans holistically with their biological, psychological, social and spiritual aspects. While the first nine components consist of physiological needs, the other components consist of love and belonging needs and self-esteem needs (Ahtisham & Jacoline, 2015; Soner, 2018). Henderson's care model and the stages of the nursing process are similar. During the data collection phase, information is obtained from the patient through observation, feeling and listening. Which needs the patient has difficulty meeting and the reasons for these should be investigated (Velioglu, 2012; Birol, 2016). The nurse should take into account factors such as the patient's age, gender, physiological and emotional state, culture and cultural background, and physical and mental intelligence level during the stages of defining, planning and implementing the patient's care needs. (Velioglu, 2012; Erol et al., 2016; Soner, 2018). With Henderson theory, the hierarchy of basic human needs is used to determine priorities in the planning phase of nursing care (Velioglu, 2012; Ahtisham & Jacoline, 2015; Erol et al., 2016). The aim of care planning is to meet the individual's basic needs and help him regain his

independence. The nurse should plan, implement and constantly evaluate the patient's care plan (Acun et al., 2022). In the evaluation phase of the nursing care plan, the results of the care provided by the patient with his/her capacity and power to meet his/her basic needs independently are revealed (Velioğlu, 2012; Erol et al., 2016; Birol, 2016; Soner, 2018).

### **Pneumonia**

Pneumonia is an infection of the lung tissue caused by various microorganisms (rickettsiae, fungi, parasites, viruses, bacteria) (Prina et al., 2015). The most important mechanism in the formation of pneumonia is the aspiration of organisms in the oropharynx. All respiratory tracts, from the nose to the bronchioles, are covered with a layer of mucus that covers the surface and keeps it moist. Mucus traps airborne particles with breathing and prevents them from entering the alveoli (Vaughn et al., 2019). In addition, cilia in the epithelium of the respiratory tract also retain foreign substances in the air. Mucus and cilia work in reverse to clean the respiratory tract. As body resistance decreases, this mucociliary activity is disrupted, pneumococci descend into the lower airways with oropharyngeal mucus and the disease occurs (Prina et al., 2015; Vaughn et al., 2019). Signs and symptoms of pneumonia; hypoxemia, tachypnea and dyspnea, fever, dehydration, pain, sputum cough, decreased lung expansion. The primary aim in nursing care of pneumonia is to reduce the symptoms and ensure the comfort of the patient (Demir et al., 2022; Prina et al., 2015; Vaughn et al., 2019). Hypoxemia is tried to be prevented by keeping oxygen saturation above 90%. To increase ventilation, the patient is seated in an upright position and diaphragm and muscle activities are regulated. The patient's pain level is determined and the appropriate treatment method is selected and applied to relieve the individual. Vital signs should be monitored at frequent intervals until the patient's condition stabilizes. The patient's fluid intake should be monitored. By establishing effective communication with the patient, anxiety is reduced and the person feels relaxed. (Prina et al., 2015).

### **CASE REPORT**

Seventy-four-year-old female patient A.Y is a housewife and has social security. She has two girls and four boys. A.Y. lost her two daughters and three sons for various reasons. Their surviving children married and established their own lives. A.Y. lives in the village with his wife. She lives close to her youngest son and brings her son to the hospital. The patient, diagnosed with pneumonia, was recently admitted to the internal medicine outpatient clinic of a state hospital on 06.02.2024 with complaints of cough, sputum, difficulty breathing, constipation, nausea and body pain. After the examination, it was decided that she would be

admitted to the Internal Medicine Service and she was admitted at 12:00. A.Y. is conscious, oriented and cooperative, has normal hearing and tactile senses, and uses glasses and dental prosthesis. The patient's medical medications are listed in Table 1.

**Table 1.** Medications that A.Y. has been using continuously and for the last year

Panto 40 mg	1x1 oral
Levotiron 100 mg	1x1 oral
Norvac 10 mg	1x1 oral
Coledan-D3 20.000 IU	1x1 oral
Zodinasıl 5 mg/100	1x1 intravenous
Meteospasmyl 60 mg	1x1 oral
Parafon 300 mg	1x1 oral
Elektra % 1.25	4x1 topical
Etol fort 400 mg	1x1 oral
Meresa 50 mg	1x1 oral
Cabral 400 mg	1x1 oral

A.Y's vital values on 06.02.2024: Respiration 18/min; pulse 100/min rhythmic full; TA 140/80 mm/Hg, body temperature 36.4 C<sup>0</sup>; SPO<sub>2</sub>: %86 (without oxygen). The patient was started on oxygen support via nasal cannula. The saturation value was measured as %91 with 3lt/min oxygen support. The patient's blood values are shown in Table 2.

**Table 2.** Laboratory Findings

Biochemistry findings	Creatinine value 0.57 (normal value range 0.70-1.20) ALT value 71 (normal value range 0-33) AST value 64 U/L (normal value range 0-32) Alkaline phosphatase value is 115 U/L (normal value range 35-105) CRP value 107 mg/L (normal value range 0-5) Calcium value 8.0 mg/L (normal value range 8.6-10.2)
Hemogram findings were normal. It was decided to monitor the patient's AST, ALT and CRP on a daily basis.	07.02.24 ALT value: 49 AST value: 27 CRP value: 84 08.02.24 ALT value: 41 AST value: 29 CRP value: 38 09.02.24 ALT value: 38 AST value: 21 CRP value: 21

The surgeries A.Y. has had in her CV include thyroidectomy, cesarean section and cataract. When family risk factors were examined, it was seen that his father had heart disease and her

mother had skin cancer. She has been receiving treatment for 10 years due to a diagnosis of asthma. Chronic diseases include hypertension and heart failure. She complies with drug treatment for these diseases and follows a salt-free diet. She has been diagnosed with osteoporosis for 20 years and has been using medication for it. There is no known food or drug allergy. She does not have any infectious diseases or a smoking habit. The patient, whose blood group is A Rh(+), has not received blood transfusion before. Nutrition is oral and independent. She is on a salt-free diet. She stated that his appetite has decreased recently due to feeling nauseated. The patient's vision, hearing and speech are normal, he has accepted his illness, her approach to the healthcare team is friendly and open to communication. A.Y is 1.55 tall and weighs 60 kg. Body mass index is within the normal range of 24.9. General appearance; It is tidy and clean. The patient can perform personal cleaning and hygiene independently. She does not use an assistive prosthesis for movement and can move independently. She can handle bathing and defecation on her own. The patient's defecation frequency is low. She stated that she had been suffering from constipation for a while A.Y. The lady has no sleep pattern lately and stated that she has difficulty sleeping. She stated that she experienced dry mouth in daily life, that she urinated frequently but could only urinate little, and that she had complaints of burning sensation under her feet and body pain. A.Y. stated that her eating increased after her hospitalization and that the treatment she received quickly helped. She said that he could not sleep on the first night of her stay because the bottoms of her feet were burning, and she was seen walking around the ward throughout the night. This situation was reported to her doctor the next day.

**Evaluation of the case and nursing diagnosis according to the Henderson Nursing Model**

In the case described above, the patient was interviewed at an appropriate time and interval and the problems were determined with the data collected (Table 3). The identified problems were planned according to the basic requirements in the Henderson Nursing Model and classified with NANDA-I Nursing Diagnoses. The determined nursing diagnoses were applied between 06.02.24 and 10.02.24 in line with the Nursing Interventions Classification (NIC) to determine the interventions to be applied to the patient and the Nursing Care Outcomes Classification (NOC) to evaluate the results of the care provided.

**Table 3.** Classification of Problems According to the Henderson Nursing Model Basic Needs Problems

Basic Needs	Problems
<b>1-Normal Breathing</b>	The patient's breathing rate is 18-24/min. The initial hospitalization oxygen saturation was 86.
<b>2-Adequate Eating and Drinking</b>	The female patient stated that her appetite decreased due to nausea at home and that she did not want to eat.
<b>3-Intestines and Bladder</b>	The patient experiences polyuria, urinating frequently and urinating small amounts. She has had defecation problems for two weeks.
<b>4-Moving and maintaining the desired position</b>	The patient can move independently in daily living activities without using an assistive prosthesis. There is no movement restriction.
<b>5-Sleep</b>	Before the disease, the patient had no sleep patterns and had difficulty falling asleep. It can wander around at night and sleep for 1-2 hours.
<b>6-Choosing appropriate clothing, dressing and undressing</b>	The individual can choose clothes and dress on her own.
<b>7-Keeping body temperature within normal limits by adjusting clothing and changing the environment</b>	It was observed that she walked around the ward without shoes at night, complaining of burning sensations on the bottom of her feet. The patient's body temperature is between 36.4-37.
<b>8-Keeping the body clean, caring for the skin and protecting its integrity</b>	There is no problem with skin care and integrity.
<b>9-Avoiding dangers in the environment and protecting from accidents and injuries</b>	The patient stated that she had not experienced any falls before. The risk of itachi fall score is calculated as 5 (normal). The bed borders are up and the head of the bed is arranged.
<b>10-Expressing feelings, needs, fears and thoughts by communicating with other individuals</b>	The patient is friendly to the healthcare team, believes in treatment, and is open to communication. She has no problem expressing herself.
<b>11-Worship in accordance with your beliefs</b>	She does not have any problems in fulfilling her religious belief.
<b>12-Achieving a sense of success while working</b>	The patient is a housewife. She used to care for cows, but no longer does so due to her aging.
<b>13-Participating in various entertainment activities or making use of time</b>	The patient lives close to his youngest son. She can also spend time with her grandchildren or relatives whenever she wants.
<b>14-Learning, exploring and satisfying one's curiosity, which will contribute to her normal development and health and benefit from existing health opportunities.</b>	The patient is knowledgeable about her treatment and disease.

### **Nursing Diagnoses**

**Nursing Diagnosis-1: Disturbance in Sleep Pattern** related to the pneumonia process, where the individual states that she cannot sleep well and it is observed that she cannot sleep on the first night of hospitalization.

#### **Area 4. Activity/rest Class 1. Sleep/Rest Code:00198**

##### **NOC-Classification of Nursing Outcomes**

- Facilitate regular sleep/wake cycle
- Staying awake at appropriate times
- Feeling refreshed after sleep

##### **NIC-Classification of Nursing Outcomes**

- Treatment hours were arranged to avoid interruption of sleep.
- Appropriate sleep time and treatment time were determined for the patient.
- Environmental noises have been reduced to a minimum.
- Care was taken to ensure uninterrupted sleep in the first period of sleep.
- Information was obtained about the patient's daily sleep habits and duration.
- A quiet and calm environment was provided for the patient to sleep.
- Attempts to ensure normal sleep patterns were planned (such as taking a warm shower, deep breathing exercises, drinking warm milk).

**Evaluation:** Interventions were implemented to increase sleep comfort by ensuring the patient's adaptation to the environment. She was taught how to maintain her sleep pattern at home after discharge. A decrease in the problem associated with this diagnosis was observed. The patient said that she was able to sleep at least 4 hours in the following nights.

**Nursing Diagnosis-2: Ineffective Respiratory Pattern** related to the Pneumonia process due to asthma and shortness of breath with complaints of cough and sputum in the individual.

#### **Domain 4. Activity/rest Class 1. Cardiovascular/Pulmonary responses Code:00032**

##### **NOC-Classification of Nursing Outcomes**

- Breath sounds will be normal
- Airway patency will be maintained
- Methods that will increase secretion excretion will be known and applied.
- The patient's SpO<sub>2</sub> value will be above 90%

##### **NIC-Classification of Nursing Outcomes**

- The patient was administered oxygen therapy via nasal cannula.
- Semi-fowler position was given to relieve breathing.

- The patient's back was supported with pillows.
- Respiratory sounds, wheezing, and presence of secretions were monitored.
- Bronchodilator and inhaler steroid drugs were administered as ordered.
- After inhaler treatment, the patient was told about the oral care he should do.

**Evaluation:** As a result of the interventions and care, A.Y.'s breathing problems decreased. The patient's saturation values were monitored throughout the day. The SpO<sub>2</sub> value rose above 90 without the need for a nasal cannula. The patient adapted to the treatment with the nebul mask.

**Nursing Diagnosis-3: Constipation** due to defecation problem lasting for two weeks

**Area 3. Excretion and Gas exchange Class 2. Gastrointestinal function Code: 00011**

**NOC-Classification of Nursing Outcomes**

- The patient's defecation is soft, shaped and without straining,
- Bowel sounds are 6-10/min
- Ensuring the patient defecates with normal frequency and consistency

**NIC-Classification of Nursing Outcomes**

- The patient's general defecation frequency, amount and solidity were evaluated.
- Daily fluid intake and fiber food consumption were evaluated.
- The patient's mobility was evaluated and daily physical activity was increased.
- The patient's privacy was taken into consideration.
- Oralac 670 mg syrup 1x1 oral treatment was ordered.
- It is recommended to walk in the corridor for at least 30 minutes during the day.

**Evaluation:** The patient used the ordered Oralac syrup until the constipation complaint disappeared. The patient's bowel movements were relieved with increased physical activity and an adjusted diet.

**Nursing Diagnosis-4: Risk of Deterioration in Oral Mucous Membrane** due to inhaler therapy

**Area 11.Safety/Protection Class 2. Physical injury Code.00247**

**NOC-Classification of Nursing Outcomes**

- Intact oral mucous membrane will be protected and precautions will be taken to prevent its deterioration.
- Ensuring the integrity and moisture of the oral-mucosal membrane

**NIC-Classification of Nursing Outcomes**

- Oral mucous membrane was evaluated regularly.
- The patient's nutrition and adequate fluid consumption were monitored.

- The patient was informed that foods that could harm the oral cavity should be avoided and liquids should be consumed warm.
- The patient was told to take care of his mouth by gargling after using inhaler medication.
- After discharge, the use of a soft toothbrush and oral care/brushing twice a day was explained to the patient.
- Adequate hydration of the patient with dry mouth was ensured.
- Lips were cared for with moisturizer.

**Evaluation:** The patient was given training to prevent oral injuries. Fluid intake was supported for complaints of dry mouth. The patient's problem in this regard was resolved.

**Nursing Diagnosis-5: Nausea** due to the patient stating that he cannot eat at home because he has nausea and that his appetite has decreased.

**Area 12. Comfort Class 1.Physical comfort Code.00134**

**NOC-Classification of Nursing Outcomes**

- Comfort state
- Hydration
- Nutritional status

**NIC-Classification of Nursing Outcomes**

- The causes of nausea were evaluated.
- The individual was encouraged to eat little and often.
- Oral care was given to ensure comfort.
- The patient was allowed to rest and sleep
- Unpleasant sights and smells in the patient room were eliminated.
- After the meal, the patient was instructed to rest in the semi-fowler position.
- Nausea reduction techniques were taught.
- Hot or cold liquids, caffeine, and spicy foods were avoided.

**Evaluation:** The patient, who complained of nausea due to the disease, stated that he could eat hospital food after IV treatments in the hospital and did not experience nausea.

**Discussion**

Pneumonia, which negatively affects the quality of life of patients, has physical, social and psychological effects on the patient. Symptoms of pneumonia include cough, fever, chills and shortness of breath, sputum, weakness, fatigue, nausea, vomiting, loss of appetite and muscle aches (Prina et al., 2015; Vaughn et al., 2019). In the study of Demir et al. (2022) with a pneumonia patient, it was determined that there was obstruction in the respiratory tract,

increased secretion and phlegm, pain, increased respiratory rate, sweating, feeling of restlessness, and weakness; In the study of Aksoy et al. (2014), it was found that the patient had complaints of dry cough, weight loss, night sweats and back pain. The anamnesis of the pneumonia patient in this case report was taken and it was determined that he had complaints of sputum, cough, difficulty in breathing and nausea. Additionally, other information obtained from the case was provided by A.Y. The woman cannot sleep at night, cannot breathe effectively and has a loss of appetite. In this case, NANDA Taxonomy II classification system was used in the nursing care of A.Y., who was diagnosed with pneumonia. Five nursing diagnoses in NANDA Taxonomy II are included in the areas of activity/rest sleep, rest, excretion and gas exchange, comfort, and safety/protection. In the A.Y. approach, holistic and humanistic care is provided with the Henderson nursing model, which excludes medication practices. The Henderson nursing model, which provides nursing care practices within the framework of supportive, complementary and sustaining nursing roles, aims to protect and restore health. In this case report, it was determined that the patient had been receiving asthma treatment for 10 years. Pneumonia usually presents with symptoms such as cough with phlegm, shortness of breath, nausea and vomiting, and fever (Aksoy et al., 2014; Prina et al., 2015). The patient was helped and helped to become most independent with the care and education provided using the Henderson Nursing Model. A.Y. said that he felt better since he came to the hospital and stated that he could eat hospital food. She stated that during her hospitalization, her constipation complaint disappeared and her breathing became easier. She learned what she could do about her sleep problems at home after being discharged. In addition, it can be said that nursing care provided using the Henderson Nursing Model provides a systematic approach to the detection and solution of multifaceted patient problems in care, makes nursing care visible, and plays a role in improving the nurse's decision-making and critical thinking skills.

### **Conclusion and Recommendations**

Henderson nursing model has enabled us to examine humans holistically with their biological, psychological, social and spiritual aspects. A.Y.'s complaints were listened to, effective communication was established, his problems were identified, and nursing care was provided accordingly to increase the patient's well-being. The care provided with a holistic approach increased the individual's independence in care and the training provided ensured the effectiveness of the healing process.

**Thanks and Information Note**

We would like to thank the patient diagnosed with Pneumonia who agreed to participate in the study.

**Ethical Approval**

Informed consent was obtained both verbally and in writing by explaining the purpose of the study and that the information would be used for scientific purposes. The patient's name was shortened considering ethical issues.

**Abstract**

Theories and models in nursing describe, predict and facilitate evaluation of events. In order for nursing care to have a scientific quality and to meet all the needs of the individual, it must be used together with a nursing model. Nursing theories and models give a systematic view to the nursing process and guide nurses. Ida Jean Orlando's Interaction Theory enables nurses to create an effective and comprehensive nursing care plan in adapting to the health problems that arise in the patient. At the same time, interaction theory is based on meeting the needs of the patient through communication between the patient and the nurse. In this case report, care was given to a mother in the postpartum period, during which she experienced motherhood for the first time, using Orlando's interaction model. Data were collected by interviewing the patient, from the patient file, and by researcher observation. In line with the data collected, a care plan was created taking into account the mother's verbal and non-verbal behaviors. The individual in the postpartum period was given education and care using the Interaction Model in Nursing regarding the postpartum process, newborn care and breastfeeding. Nursing care was planned, implemented and evaluated according to the Orlando Nursing Interaction Model. The NANDA-I diagnoses determined for this patient are mainly Anxiety, Acute Pain and Lack of Information. In this case, it was observed that the mother who went through the postpartum period and the puerperal period felt better psychologically and there were changes in communication and behavior. The ability to adapt and sustain this process has been provided. The mother gave positive feedback with both verbal and non-verbal behaviors. The patient was given discharge training and was made aware of the issues he should pay attention to after discharge.

**Keywords:** Nursing care, Interaction Model in Nursing, Postpartum, Case report

## **Introduction**

In the nursing profession, which is a professional health discipline, care is provided by using theories and models. Nurses plan care by using models and theories on the basis of the nursing process. The use of nursing models and theories guides the nurse in the care process and ensures that care is planned in a systematic manner. The postpartum period is defined as a process in which healthy attachment between mother, baby and family members is ensured, health is protected and improved, physiological and psychological processes are observed (Yurdal & Aksu, 2021). Postpartum period or puerperium period is a process in which nursing care is extremely important for mother and baby. In this process, both mother and newborn need a lot of nursing care. In this process, mothers may face many problems including newborn care, breastfeeding, breast care, sleep problems, constipation, communicating with the baby, motherhood role, mental problems such as depression. Therefore, the nursing care to be given in the postnatal period should be planned to meet the needs of both the mother, the baby and the family.

## **Ida Jean Orlando's Interaction Model**

Ida Jean Orlando, an American of Irish origin, was born in 1926. In 1947, she graduated from New York Medical College as a nurse and received her master's degree in 1954 (Yurdal & Aksu; 2021; Çakı & Güngörmüş, 2022). Orlando's interaction theory emphasises the communication and interaction between the patient and the nurse. According to Orlando, an individual is a person who completes his/her own independent processes and can act independently without being under stress. However, when any deviation from normal situations occurs and the individual cannot provide independence, nursing care is needed. According to Orlando, the nursing process consists of three basic components. These are; patient's behaviour, nurse's reaction and nursing actions. Patient's behaviour: It includes both verbal behaviours and non-verbal behaviours such as crying and skin discolouration that the nurse observes in the instant communication between the patient and the nurse. The nurse's reaction: while collecting data about the patient, the nurse becomes aware of the patient's behaviour and perceives the behaviour, thus forming thoughts and feelings about the subject. Nursing action: These are the nursing interventions that the nurse creates according to the nurse's reaction. In Orlando's Interaction Model, the centre is the individual and the aim is to establish an effective communication with the individual and to eliminate the existing distress. This model provides autonomy in nurses, but it also has weaknesses. One of the criticised aspects of the model is that it is difficult to apply to conscious patients. According to Orlando, nursing is a process and

there are four basic practices in this process: Observation, Oral report, Recording (written report), Activities with or for the patient (Özer Yurdal & Aksu, 2021).

### **Purpose of the Study**

In this study, it was aimed to evaluate the individual by applying the nursing process under the leadership of Orlando's Interaction Model to the mother who experienced first motherhood and in the postpartum process.

### **CASE REPORT**

She is 27 years old, a university graduate and a housewife, and this is her first experience of motherhood and her first child. M.Ö had a caesarean section due to breech presentation of the baby and her baby girl weighing 2960 g was born healthy. The puerperant was accompanied by her mother-in-law and relatives. The caesarean section was performed under general anaesthesia. After the operation, M.Ö was taken to her room and fed her newborn baby by expressing her first milk 4 hours later. The first vital signs of M.Ö were blood pressure 90/60 mm/Hg, pulse rate per minute 64, respiratory rate per minute 20 and oxygen saturation 96%. The vital signs of the newborn are within normal limits. The newborn's breast searches were active, skin colour, muscle tone and reactions were normal. After general anaesthesia, it was observed that the mother had difficulty in communicating, had pain, could not actively participate in breastfeeding education, did not ask questions and was constantly distracted. It was observed that the mother, who was constantly accompanied by family relatives, had tears in her eyes when her room was entered, family relatives asked more questions than the mother, and questions such as can we give the baby Zamzam water or dates were encountered. In this case, it was deemed necessary to provide detailed training to both the family and the mother. The content of the training includes topics such as the motherhood process, conditions that can be seen after caesarean section, the importance of breast milk and breastfeeding, breastfeeding positions, maternal psychology and postpartum depression. This training content was explained verbally to the mother and her relatives and given as a written brochure. The mother was discharged after 48 hours and it was stated that she should come for a follow-up visit after one week. One week later, M.Ö. was hospitalised and it was stated that the baby should receive phototherapy treatment at grade 4. It was requested by the physician to provide formula support when separate breast milk was not sufficient and to measure vital signs 6 times a day. Having an anxious and stressed appearance, M.Ö came to the hospital with her husband. She stated that she was given breastfeeding training but could not apply it effectively. She stated that her caesarean section and puerperium were very difficult, she could not breastfeed her baby

sufficiently, she could not burp her baby, her family relatives and mother-in-law constantly interfered with her in this process and she felt very inadequate. She stated that her husband did not support her by relying on the experience of her mother-in-law, that she did not feel psychologically well in this process and that they blamed her for the jaundice of the baby. She also stated that she herself was not sufficiently fed, had no appetite and therefore her milk was low.

## **RESULTS**

### **Observations**

#### **Direct Observations: The nurse's reaction to the patient's behaviour**

##### **\*Non-verbal observations**

- Not being open to communication in the first place
- Look tired
- Appearing tearful
- Distraction of the eye
- No questions asked

##### **\*Verbal observations**

- Stating that she feels guilty about not breastfeeding her baby properly
- Expressing that he/she thinks that there is a problem when his/her baby cries
- Otherwise, don't I have milk, nurse? Is my child going hungry?

#### **Indirect Observations Other Information Related to Patient's Behaviour**

-From the day the puerperium was admitted to the clinic and afterwards, the situation of the puerperium was discussed with the nurses and it was learned that the puerperium exhibited similar behaviours.

## **ACTIVITIES**

### **The Activity of the Nurse: Purposeful Nursing Process**

#### **\*Direct Assistance**

- Understanding the psychological concerns of the mother in the postpartum period, open communication was provided and support was provided for her to ask questions. The main cause of the problem was tried to be found and interventions were provided.
- Non-pharmacological (relaxation techniques and listening to music) as well as pharmacological methods were applied for the pain of the caesarean section mother.
- Breastfeeding techniques and positions, how to hold, how the baby is saturated or not saturated were explained to the mother.

- Gas removal techniques from the newborn and lying in the side position, warnings were given to prevent aspiration of the newborn.
- It was explained that myths about breastfeeding are wrong.
- The importance of breast milk was mentioned.
- Problems that may occur with the breast were mentioned.
- The importance of skin contact with the mother was also shown practically.
- The importance of water, nutrition, sleep and hygiene for the mother was mentioned.
- It was stated to the relatives of M.Ö that the newborn should only receive breast milk, that the increase in milk will increase with the sucking of the newborn, that stress factors should not be reflected to the mother, that we conveyed a lot of information, and that if you have questions, they should contact us, not the mother. It was stated that the mother should be given positive support.
- Support was also given during the neonatal phototherapy process to express her feelings. The mother's questions were repeated where they needed to be repeated in an understandable way.
- The room was ventilated, it was stated that her husband and family relatives should support her to walk in the room.
- In all interviews and interventions in this process, attention was paid to eye contact and communication was kept simple, short and clear.

**\*Indirect help**

- A milk pump was provided for expressing the mother's milk after general anaesthesia.

**REPORTING**

**Improvement in the patient's behaviour after his/her needs are met**

**\*Non-Verbal Behaviours**

- More open to communication
- Make eye contact
- Reduced distracted gaze

Approach their own baby in a more stress-free and self-confident way

- Facial expression shows that their fear has diminished

**\*Verbal Behaviour**

- Mother's statement that the pain has decreased
- The mother is willing to breastfeed and expresses her full belief that the newborn's milk will come and be sufficient with the correct breastfeeding techniques

- Expressing that she knows that these processes are natural due to maternity and that she should reduce stressors for the health of mother and baby
- Expression of increased desire to eat over time
- Stating that he expresses himself better
- Stating that these fears will decrease over time

### **Record Keeping**

Help needs of the mother in the postpartum period were met. Effective nursing care was provided. Positive developments were observed in verbal and non-verbal behaviours of the postpartum mother.

### **DISCUSSION**

Orlando's Interaction Nursing model makes a positive contribution to the nursing process by providing the nurse-patient relationship. Nurses plan and implement nursing interventions in line with the needs of healthy or sick individuals. Especially the individual in the postpartum period may face many problems such as newborn care, communicating with the baby, breast care and breastfeeding, motherhood role, communication problems, depression. It has been reported in the literature that nursing care provided by using a model/theory or classification system in these individuals yields effective results (Buldum & Yılmaz, 2020; Dündar & Gerçek, 2020; Yurdal & Aksu, 2021). In this case report, the health problems of a patient who gave birth by caesarean section were evaluated in line with Orlando's Interaction Model, nursing diagnoses were defined with NANDA-I and nursing care was applied in line with the nursing process. Three nursing diagnoses were determined according to NANDA-I Taxonomy II. These diagnoses are Anxiety, Pain and Lack of Information. As a result, it was observed that the individual followed in the postpartum process in this case had a decrease in her current complaints or some complaints were no longer present after both medical treatment and nursing care received in line with the Interaction Model. In this case, it was observed that the mother in the postpartum period felt better psychologically and there were changes in behaviour. It was also observed that she maintained mother-infant harmony more easily and got used to the motherhood process. The mother also made positive feedbacks and engaged in both verbal and non-verbal behaviours, and it was determined that the nurses providing care were satisfied. In this direction, it can be said that using Orlando's interaction model based on the verbal and non-verbal behaviours of the patients improves the quality of nursing care. In addition, it is thought that this study will serve as an example for nurses working in obstetrics and /newborn pediatric clinics or providing clinical care and will increase their awareness on this issue.

## **NURSING DIAGNOSES**

**Nursing Diagnosis-1: "ANXIETY"** related to the new postpartum processes, which was found when she stated that she felt guilty because she thought that she could not breastfeed her baby properly, that she was afraid of not being able to take care of her baby properly and that she was experiencing stress.

### **NOC-Classification of Nursing Outcomes**

- Use effective coping mechanisms
- Identify their own anxiety and coping patterns
- The individual expresses an increase in psychological and physiological comfort.

### **NIC- Nursing Interventions Classification**

#### **-Reducing anxiety**

#### **Initiatives**

Situations that would cause anxiety were determined by ensuring a healthy communication, empathic approach and self-expression.

-In order to reduce anxiety, the lack of information that would cause this anxiety was tried to be eliminated.

-Effective coping mechanisms were taught.

-It was determined that the relatives of the mother in the postpartum period created stress on M.Ö and the family was contacted. The reasons for the presence of M.Ö. with them were re-determined and it was stated how appropriate approaches should be.

M.Ö was encouraged to ask all questions about her baby and her fears about her baby were identified and a safe communication was established.

-A realistic hope approach was determined.

-M.Ö was told that the processes and emotions she experienced were normal things unless there was an abnormal situation and that she should be open to communication and that the process could be solved with a healthy communication.

#### **Evaluation**

It was observed that her anxiety decreased and the mother-baby process was carried out in a healthier way with the active participation of M.Ö.

**Nursing diagnosis-2: "PAIN"** related to caesarean section birth, found by expressing that she had pain.

### **NOC-Classification of Nursing Outcomes**

- Explaining the factors that increase pain by associating them

- Explaining the effective interventions by associating them
- The individual will express that he/she is relieved after an adequate, appropriate measure that gives satisfaction.

### **NIC- Nursing Interventions Classification**

- Pain reduction, pain management, management of drug therapy, emotional support, hot and cold application, massage

### **Initiatives**

- Conditions caused by pain explained

How long the pain will last and pharmacological and non-pharmacological methods for reducing it were mentioned.

- In addition to the normal pain of the individual, the reasons why the individual may experience a decrease or increase in pain were discussed.

- The family was told not to put pressure on M.Ö and effective communication techniques.

### **Evaluation**

It was observed that M.Ö's pain decreased day by day and he could cope with the current pain.

**Nursing Diagnosis-3: "LACK OF KNOWLEDGE"**, which was found when she stated that she did not know breastfeeding techniques, in line with the new mother-infant relationship

### **NOC-Classification of Nursing Outcomes**

The level of knowledge on the process of motherhood, the importance of breast milk and breastfeeding, breastfeeding positions, maternal psychology and postpartum depression will be increased.

### **Initiatives**

- Their perceptions, thoughts, experiences related to breast feeding were discussed and their expectations were learnt.

- The importance of self-efficacy perception in breastfeeding was mentioned.

- The importance of breast milk and its benefits for mother and baby were mentioned.

- The structure of the breast, hormones that provide milk production and secretion were mentioned.

- Breastfeeding technique and breastfeeding positions were explained to mother M.Ö.

- First breastfeeding, duration and frequency of breastfeeding, milking and storage of breast milk, breast and nipple problems were mentioned.

- By asking questions and explaining practically, it was ensured that she participated more effectively.

- Encouraged to ask effective questions during and after the teaching phase.
- It was ensured to express and determine what their feelings and thoughts and stress factors were.
- How to ensure mother-infant harmony, processes were mentioned.
- Emotional moods experienced by the postpartum mother were explained as normal and coping methods were explained in this process.
- The points to be considered in communication with the mother in the postpartum period were explained to the family relatives.

### **Evaluation**

-It was observed that mother M.Ö. participated more actively in the process and expressed her feelings and thoughts better with her baby receiving phototherapy and that mother-infant harmony was achieved when these interventions were applied and explained again.

Ineffective individual coping

Deterioration in self-esteem

Inadequate self-care

Deterioration in sleep habits

Change in family processes

Constipation

diagnoses.

Inadequate/unbalanced Nutrition

M.Ö can be diagnosed with these

### **Conclusion and Recommendations**

Nursing, which is a professional profession, bases the nursing process on models and theories. Orlando's interaction model can be used in ensuring the patient-nurse relationship. As seen in this case, it was seen that the mother who had her first baby experience and caesarean section experience contributed positively to the individual in the nursing care evaluated in psychological, physiological and biological aspects.

### **Thanks and Information Note**

We would like to thank the patient in the postpartum period who agreed to participate in the study.

### **Ethical Approval**

Informed consent was obtained both verbally and in writing by explaining the purpose of the study and that the information would be used for scientific purposes. The patient's name was shortened considering ethical issues.

**Abstract**

Chronic obstructive pulmonary disease is a progressive lung disease that manifests itself with shortness of breath, increased secretion and chronic cough due to exposure to harmful gases and particles or tobacco consumption. This study was conducted on a 63-year-old patient with Chronic Obstructive Pulmonary Disease, which negatively affects the quality of life synchronized with shortness of breath, increased secretion and chronic cough, under the leadership of Callista Roy's Adaptation Theory, to collect data, provide nursing care, evaluate the individual, patient-environment-health-care relationship. It was made as a case report in order to identify and support positive stimuli. The patient, who was diagnosed with COPD, applied to the hospital's chest diseases clinic on 25.01.2024 due to shortness of breath due to movement at home, cough, general body pain and change in sputum color, and was admitted to the chest diseases service. The NANDA-I diagnoses identified for this patient are Ineffective Respiratory Pattern, Chronic Pain, Sleep Pattern Disruption, Constipation, Fatigue, Fall Risk, and Lack of Information. The determined nursing diagnoses were used as the basis for determining the interventions to be applied to the patient. In this case, the patient's quality of life and independence were increased with the nursing care provided in line with the Roy Adaptation Model, and the patient's adaptation to the disease was ensured during his hospitalization. He stated that during his hospitalization, his constipation complaint disappeared, his breathing became easier, his cough and pain decreased, and his sleep patterns improved. The patient was given discharge training and was made aware of the issues he should pay attention to after discharge. In this regard, it can be said that this theory is effective in disease management and adaptation to chronic diseases.

**Keywords:** Nursing care, COPD, Case Report, Roy Adaptation Model

## **Introduction**

The basic use of theories and models is very important in terms of developing the nursing profession and creating a common field and language in nursing education (Callis, 2020; Pazarcıkcı & Uçak, 2021). Nursing education based on theories and models allows the individual to be evaluated holistically and to gain problem-solving skills (Callis, 2020; Koç et al., 2017). The use of theories in addition to pharmacological treatment in nursing allows focusing on the concept of 'Care', which is the main purpose of nursing (Baykara et al., 2019). Nursing theories help to achieve individual-oriented care and well-being by providing more effective, systematic and controlled application of treatment (Dağcı, 2019; Karaca & İster, 2016). In treatment management, patients' participation in treatment and compliance with the disease are important, and it is very important for nurses to work on the basis of patient-care relationship in disease management, especially with individuals with chronic diseases (Karaca & İster, 2016; Pazarcıkcı & Uçak, 2021). According to the research conducted by the World Health Organisation, chronic diseases, which are shown as the biggest health problem of the 21st century, include a large part of the death cases worldwide (Akın & Temiz, 2021; Gosak et al., 2022; Neşe, 2023; Zuhur & Özpancar, 2017). Patient adaptation plays an important role in managing symptoms, reducing repeated hospitalisations and improving quality of life with ongoing treatment and nursing care in chronic diseases (Criner & Han, 2018; Gosak et al., 2022; Karaca & İster, 2016; Zuhur & Özpancar, 2017). Chronic obstructive pulmonary disease is a chronic lung disease characterised by shortness of breath, increased secretion and chronic cough due to exposure to harmful gases and particles or tobacco consumption (Criner & Han, 2018; Neşe, 2023). In patients with COPD, shortness of breath and increased secretion are the most basic symptoms and are synchronised with anxiety and decreased quality of life (Akın & Temiz, 2021; Criner & Han, 2018; Karaca & İster, 2016; Turhal & Koç, 2019). In Callisto Roy's model, nursing care has a healing effect on the individual's adaptation to the disease and the environment not only in the hospital but also in home life, aiming to help patients respond positively to stimuli, and has a healing effect on the adaptation of patients to the disease and the development of awareness of living with the disease (Akın & Temiz, 2021; Dağcı, 2019; Karaca & İster, 2016; Vicdan & Karabacak, 2014; Turhal & Koç, 2019).

**Objective:** This study was conducted to evaluate the nursing care of an individual diagnosed with COPD according to the Roy Adaptation Model.

### **Roy Adaptation Model (RAM)**

In the model created by Callisto Roy based on adaptation; it is adopted that there is a state of continuous harmony between the patient, health, nursing and the environment (Callis, 2020; Vicdan & Karabacak, 2014; Karaca & İster, 2016; Pazarcıkcı & Uçak, 2021). In the Roy Adaptation model, the task of the nurse in the system is to increase the patient's positive adaptation to the internal and external environment by identifying patient stimuli and organising a nursing care plan according to the patient's four adaptation areas (Callis, 2020; Naga & AL-Khasib, 2014; Phillips & Harris, 2014). Stimuli are analysed in three areas: focal stimuli (reactions to sudden events), situational stimuli (stimuli that increase the effect of the situational stimulus) and possible stimuli (examination of past history, behaviours and environmental areas) (Naga & AL-Khasib, 2014). The areas taken as the basis for defining the patient in the Roy Adaptation model consist of four areas: physiological, self-concept, role function and interdependence adaptation area (Callis, 2020; Naga & AL-Khasib, 2014; Wang et al., 2020).

**Physiological Domain:** It includes physical responses such as oxygenation, nutrition, excretion and the aim is to ensure continuity in the physical domain (Callis, 2020; Naga & AL-Khasib, 2014; Phillips & Harris, 2014).

**Self-Concept Domain:** It includes the patient's own belief concept (coping with loss, etc.), moral values and goals in life, and combines with physical identity to address the self as a whole (Callis, 2020; Phillips & Harris, 2014; Wang et al., 2020).

**Role-Function Domain:** This domain defines the roles that the patient has in life and makes sense of his/her identity by sorting them within himself/herself. These roles are considered as primary (gender), secondary (parents-occupation, etc.), and tertiary (presidency of the school family union, etc.) (Callis, 2020; Phillips & Harris, 2014; Wang et al., 2020).

**Field of Mutual Commitment:** In the field of attachment, the concept of trust is provided by interpersonal attachment through respect, love and mutual valuing, and the ability to communicate is important (sufficient love, consistent love-respect, maturity-learning in relationships, relational trust, etc.) (Callis, 2020; Naga & AL-Khasib, 2014; Phillips & Harris, 2014; Wang et al., 2020).

### **CASE REPORT**

63-year-old A.K. is the mother of a son and a daughter. A.K. is a housewife and lives with her husband. She has been a regular smoker for 15 years and smokes half a packet of cigarettes daily. A.K. was first diagnosed in 2018 and has been receiving regular treatment for 6 years. In addition to COPD, she has diabetes and herniated disc diseases. A.K. has no known food or

antibiotic allergy. The patient diagnosed with COPD applied to the chest diseases outpatient clinic on 25.01.2024 due to shortness of breath, cough, general body pain and change in sputum colour due to movement at home. After being examined by the doctor, he was admitted to the chest ward on the same day. A.K.'s vital signs on 25.01.2024 were measured as respiratory rate 19, pulse 74, blood pressure 130/70 mm/Hg, body temperature 36.4°C, at blood glucose 380 and ECG was performed. The patient was started to be treated with 3 litres of oxygen per minute via nasal cannula. The treatment prescribed by the physician was started. A.K. is 162 cm and weighs 71 kg. A.K., who has diabetes, stated that she was compatible with the meals given in the hospital and that her appetite was open and that her daily water consumption was 1500 ml. A.K. has a good general appearance, her hair and nails are clean and short. A.K. stated that she had constant difficulty in defecation and verbally stated that she was constipated and could not defecate without using Bekunis A.K. stated that she could not sleep at night since her hospitalisation, her daytime naps were short, and she had headache because she felt a constant need for oxygen. She stated that she had shortness of breath while performing daily life activities and that she felt tired due to coughing. She complained that she did not have any companion during her hospitalisation and reproached her children who got married at a young age. She stated that she regretted her marriage with her husband, that he was addicted to alcohol and that there was incompatibility at home. She stated that he had been hospitalised eight times in the last 12 months and that some of these hospitalisations were due to the unrest in his home life. In the last laboratory tests of A.K., CRP was 19.67 mg/dl, haemoglobin 11.6 g/dl, urea 46.04 mg/dl, potassium 4.62 mEq/L and sodium 144.36 mEq/L.

### **NURSING PROCESS**

**Ethical approval:** Informed consent was obtained both verbally and in writing by explaining the purpose of the study and that the information would be used for scientific purposes (Date: 05.02.2024). The patient's name was shortened considering ethical issues.

### **Assessment and nursing diagnosis of the case according to the Roy Adaptation Model**

In the case described above, the patient was interviewed at the appropriate time and interval and the problems were determined with the data collected. The identified problems were classified with NANDA-I Nursing Diagnoses. The determined nursing diagnoses were taken as the basis for determining the interventions to be applied to the patient. The NANDA-I diagnoses determined for this patient are Ineffective Respiratory Pattern, Chronic Pain, Disturbance in Sleep Pattern, Constipation, Fatigue, Fall Risk and Lack of Information.

## **Nursing Care According to Adaptation Types According to Roy Adaptation Model**

### **A. Physiological Adaptation Form**

#### **Nursing Diagnosis: Ineffective Respiratory Pattern**

#### **Nursing Interventions**

- Data was collected about what the patient knew about his condition.
- Respiratory rate, respiratory rhythm, respiratory depth and respiratory effort were monitored (short, frequent and shallow audible breathing during movement).
- The individual was encouraged to share her concerns.
- The patient was asked to ask the questions in his mind and they were answered by checking whether the patient understood.
- Breathing and cough exercises were taught.
- In order to minimize respiratory distress, she was taught positions that would facilitate the appropriate ventilation/perfusion balance and enable him to use her breath correctly.
- Observed the patient's ability to cough actively and recorded the onset, characteristics and duration of the cough (short, deep cough at frequent intervals).

#### **Evaluation:**

- She stated that the patient's stress and anxiety decreased.
- It was determined that the patient's saturation and respiratory rate were within the normal range.
- The patient stated that she could breathe more easily.

#### **Nursing Diagnosis: Constipation**

#### **Nursing Initiatives**

- She was informed about the habit and importance of regular defecation.
- It is recommended to drink a glass of warm water 30 minutes before breakfast.
- She was informed not to delay when he needed to defecate.
- It is recommended to add fibrous foods to your meals.
- Daily periodic walking and exercise were recommended.

#### **Evaluation**

- The patient defecated daily while she was in the hospital.

#### **Nursing Diagnosis: Chronic Pain**

#### **Nursing Initiatives**

- The patient's pain was evaluated according to the scale.

-The location of the pain, its severity, time of onset, factors that increase and decrease it were evaluated.

-The patient's pain coping mechanisms and non-pharmacological methods were questioned.

-Requested analgesics were administered and their effectiveness was evaluated.

-The patient's pain, the amount and frequency of medication dose, and his/her response to pain treatment were observed and recorded.

-The patient was informed about non-pharmacological methods such as breathing exercises, heat application and position changes.

### **Evaluation**

-The patient stated that she experienced less pain during his stay in the hospital.

### **Nursing Diagnosis: Sleep Pattern Disturbance**

#### **Nursing Initiatives**

-Interventions were planned for pain, which is one of the causes of insomnia.

-Information was obtained about the patient's daily sleep habits and duration.

-A quiet and calm environment was provided for the patient to sleep.

-Interventions were planned to ensure normal sleep patterns (warm shower, deep, breathing, exercises, drinking warm milk).

### **Evaluation**

-It was observed that there was an increase in the time the patient spent sleeping at night.

### **B. Self-Concept Adaptation Style**

#### **Nursing Diagnosis: Lack of Information**

#### **Nursing Initiatives**

-The patient was listened to carefully and his movements and behaviors were monitored.

-She was made aware of herself by asking some questions.

### **Evaluation**

-Awareness was increased in areas where there was lack of information by providing information about the patient's medications and daily life activities.

### **C. Role Function Adaptation Type**

#### **Nursing Diagnosis: Fatigue**

#### **Nursing Initiatives**

-Perceptions of patients and their relatives regarding the causes of fatigue were determined.

-The patient was made aware of the improvements and developments observed in her condition.

-The patient was encouraged to manage the process herself.

-Disturbing environmental stimuli were reduced so that the patient could rest.

#### **Evaluation**

-The patient stated that she felt better.

#### **D. Interdependence Mode of Adaptation**

##### **Nursing Diagnosis: Fall Risk**

##### **Nursing Initiatives**

-The use of assistive devices while on the move is recommended.

-Necessary safety precautions were taken to prevent the risk of falling in the hospital environment.

-The purpose and use of the nurse call bell was taught.

-Information was given about the use of appropriate shoes and non-slip slippers.

#### **Evaluation**

-The patient has no history of falling during her hospital stay.

#### **DISCUSSION**

Individuals diagnosed with COPD may experience both psychological and physical problems. Symptoms frequently seen in COPD are dyspnea, anxiety, depression, cyanosis, fear, panic attack, cough, fatigue, wheezing, chest pain, increased secretion, inactivity and inability to tolerate activity (Akın & Temiz, 2021; Neşe, 2023). The COPD patient in this case, who was still on medication, had complaints such as shortness of breath, cough, phlegm, chronic pain, fatigue, inability to sleep at night, restlessness, anxiety, and lack of oxygen, similar to the literature. In their study by Köksal and Durgun (2022) with a patient diagnosed with COPD, the patient experienced complaints of difficulty breathing, cough, increase in the amount of secretion, and fatigue. In the study of Bilgehan et al. (2020), they found that the COPD patient experienced shortness of breath, cough, and an increase in the amount of sputum production. They determined that he had complaints of cyanosis. Symptoms and disorders that negatively affect the quality of life of COPD patients make it difficult for patients to comply with treatment. It is reported in the literature that nursing care provided to these patients using a model/theory or classification system produces effective results (Bilgehan et al., 2020; Dağcı, 2019; Karaca & Lider, 2016; Köksal & Durgun, 2022; Turhal & Koç, 2021). In this case report, the health problems of the patient who was admitted to the chest diseases service of a state hospital with the diagnosis of COPD were evaluated in line with the Roy Adaptation Model, nursing diagnoses were defined with NANDA-I, and nursing care was applied in line with the nursing process. Seven nursing diagnoses were determined according to NANDA-I Taxonomy

II. These diagnoses are Ineffective Respiratory Pattern, Chronic Pain, Disruption in Sleep Pattern, Constipation, Fatigue, Fall Risk and Lack of Information.

As a result, it was observed that the individual in this case, who was followed up with the diagnosis of COPD, had a decrease in his existing complaints or some of his complaints no longer existed after receiving both medical treatment and nursing care in line with the Roy Adaptation Model. In this case report of a patient diagnosed with COPD, as a result of the nursing care provided with the Roy Adaptation Model and NANDA-I classification systems, it can be said that the classification systems used facilitate decision-making in interventions for the patient, provide a systematic diagnosis and planning, and facilitate the evaluation of nursing care. It is thought that this study will serve as an example for nurses working or providing clinical care in chest diseases clinics and intensive care areas and will increase their awareness on this subject.

#### **Conclusion and Recommendations**

In this case, the patient's quality of life and independence were increased with the nursing care provided in line with the Roy Adaptation Model, and the patient's adaptation to the disease was ensured during his hospitalization. In this regard, it can be said that this theory is effective in disease management and adaptation to chronic diseases. In addition, it can be said that nursing care provided using a model or theory provides a systematic approach to the detection and solution of multifaceted patient problems in care, makes nursing care visible, and plays a role in improving the nurse's decision-making and critical thinking skills. It is recommended to increase the studies that can be done using nursing models and classification systems regarding the diagnosis of COPD.

#### **Thanks and Information Note**

We would like to thank the patient diagnosed with COPD who agreed to participate in the study.

**Abstract**

Effective improvement in the growth of tobacco (*Nicotiana tabacum*) seedlings by Indole Acetic Acid (IAA) hormone was the sole purpose of this study. Seedlings of *N. tabacum* treated with equal quantities of IAA hormone (0.7%) were grown in 1kgs of vermiculite, perlite, planting soil, sand, and equal mixture of all media. The set up were treated equally with water and organic manure. Control set up was made with a mixture of different rooting media without IAA. Data on shoot development were noted for 6 weeks and root length was measured on the day of harvest. The parameters measured were analysed statistically using ANOVA, and it was found out that root and shoot lengths were significant at  $p > 0.05$  in the entire rooting media and the highest percentage development (49 and 51%) respectively for root and stem respectively, was observed in the rooting media that has equal measure of each constituent (i.e. the mixed constituents). Germination rate among the media were 100, 70, 60, 50 and 40% for mixed, sand, planting soil and vermiculite, perlite and control respectively. Different sections of mature stem tested with IAA hormone were not significant in their root and stem development, although basal cutting stems tend to mature faster than apical. This therefore means that propagating *N. tabacum* by seedlings can be optimally achieved through mixture of 0.7% of IAA in a collection of different rooting media.

## **Introduction**

Tobacco is an important commercial and agricultural plants growth in several part of the globe because of its economic need. This is a plant with a common name of several plants in the genus *Nicotiana* of the family *Solanaceae*, and the general term for any product prepared from the cured leaves of these plants. More than 70 species of tobacco are known, but the chief commercial crop is *Nicotiana tabacum*. (Singh *et al.* 2009). Tobacco is a plant (*Nicotiana tabacum* and *Nicotiana rustica*) that contains nicotine, an addictive drug with both stimulant and depressant effects. Tobacco leaves are used to make products that can be consumed in different ways: smoked in cigarettes, cigars or pipes. smoked in loose form in hookahs. All forms of tobacco are harmful, and there is no safe level of exposure to tobacco. Cigarette smoking is the most common form of tobacco use and the reason is because it contains nicotine because of the highly addictive stimulant alkaloid nicotine as well as harmful alkaloids. Tobacco use is a cause or risk factor for many deadly diseases, hence is always advised that tobacco smoking is dangerous to health. Indole acetic acid (IAA) is the main auxin in plants, regulating growth and developmental processes such as cell division and elongation, tissue differentiation, apical dominance, and responses to light, gravity, and pathogens. IAA stimulates overproduction of root hairs and lateral roots in plants and release of saccharides from plant cell walls during the elongation (Sosnowski *et al.* 2023). Saccharides are a source of nutrients for microorganisms and can increase the colonization ability of plant-associated bacteria, this is because IAA production is a major property of rhizosphere bacteria that stimulate and facilitate plant growth. Indoleacetic acid (IAA) is a molecule that is synthesized by plants and a few microbes (Ansari *et al.* 2023). In plants, IAA plays a key role in both root and shoot development. The hormone moves from one part of the plant to another by a designated importer (AUX1) and efflux pumps (PIN1–7). IAA also regulates geotropism by accumulating on the underside of shoots and roots. In shoots, IAA causes cell elongation on the underside of the shoot, causing it to bend upwards, away from the force of gravity. In roots, IAA inhibits cell growth, causing roots to grow downwards, towards the force of gravity. The medicinal properties of plants lie in their phytochemical components like alkaloids, flavonoids, tannins in addition to other phenolics that co-opt as to producing definite physiological functions to the body of man and animals (Taiwo *et al.* 2000; Che Man 2010). However, analysis of extracts of *N. tabacum* were found to be rich in flavonoid and flavonones, triterpene, terpenic compounds, chalcone, steroids as well as peroxidase isoenzymes (Anup *et al.* 2011; Anyasi *et al.* 2019; Raymond Anyasi and Anyasi, 2020). It is also rich in

carbohydrates, high content of total proteins in addition to high percentage of nitrogen. All these contribute to the high phytochemical properties of the plant. *N. tabacum* is therefore grown as a medicinal plant for the treatment of skin wounds especially in Indonesia (Metwally and Ekejuba 1981; Phan et al. 1996). In South Africa for example, the leaf of *N. tabacum* is used for the production of tobacco by the tobacco companies. However, because everyone deserves a fair and just opportunity to be as healthy as possible, this is known as health equity. Therefore, achieving health equity means addressing system-wide problems, unfair practices, and unjust conditions that have a negative impact on the health of specific groups. To achieve health equity, it is important to eliminate health disparities which are differences in health outcomes that are closely linked with social, economic, and/or environmental factors, that affect the entire people of the globe (Taiwo et al, 2000). To improve health equity, we must consider the role of commercial tobacco (Phan et al. 1996; Akinmoladun et al., 2007; Anup et al., 2011). *N. tabacum* has also been implicated by its diuretic, hepatotropic and astringent properties (Weninger and Robenean 1988; Iwu 1993). *N. tabacum* can be propagated mainly by seeds, this is one of the significant agronomic properties of the plant (Tanhan et al., 2007; Anyasi et al. 2019). However, it has been reported that germination of seeds from weeds are most likely affected by soil compositions especially in the field study, therefore such propagation is aided by agronomic factors that enhances the growth and multiplication of such plant (Adebayo et al., 2005; Agbo and Obi 2007). Moreover, as some other types of propagation such as stem cuttings propagation prolongs hybridization of genome as segregation through recombinant gene is avoided, this may not be possible in some plants for example in the tobacco plant we are studying. The success of rooting has been attributed amongst other factors to the rooting medium as well as the presence of rooting hormone and its concentration (Al-Saqri and Alderson 1996; Hartmann et al. 1997). Influences of rooting media and hormone on rooting in different kinds of plant have been documented and its effects in structure propagations were elucidated (Akwatulira et al. 2011). These media combination used in the rooting of the seedlings provide physical support as well as oxygen and water to the plant seeds (Larsen and Guse 1997). However, IAA; an auxin containing product was reported to stimulate adventitious roots in of some plants (Araya et al. 2007). This was buttressed by the study by Rao et al. (2005) which reported that IAA was the leading plants hormone used to promote the formation of roots in Tomatoes. Hence with the quest for a systematic search for specific useful factors from plants like *N. tabacum*, even though most plants can root without hormone, there is need for an improved method of propagation and growth for such nutraceutical plants. This will therefore

form a rational approach towards drug and nutritional research. The aim of this study was to evaluate the effect of IAA hormone and rooting media for optimal rooting of propagated *N. tabacum*.

## **2.0 Materials and methods**

Seeds of *N. tobacco* plants was collected from the greenhouse at the University of South Africa in Pretoria (25°46'1"S, 28°12'2"E) and 1439m above sea level. The experiment took place in polyvinyl chloride (PVC) pots with dimensions 30x25x30 at a garden at the University of South Africa at Florida Campus. The pots contain 1kgs of different rooting medium that has been mixed with equal volume of organic manure collected at the animal farm of the University of Pretoria in Onderstepoort. Inside each pot was made holes designed to contain equal weight of IAA hormone (0.7%), for the plants. The set up was made in a complete randomized design containing a 3x4 factorial treatment model (Jeruto *et al.* 2008). The rooting media used here were planting soil and humus in the ration of 2:1 (w/w). About thirty-six plantlets were used in each set of rooting media and IAA hormone concentration by volume percentage. Then sets of water treated seedlings were sawn into holes containing the IAA hormone in the rooting media and were replicated by three. Random allocation of plant seedlings to the rooting media using random digit from a table was employed as to eliminate bias (Johnson and Bhattacharyya 2006).

### **2.1 Rooting media**

The rooting media was homogenized by hand, mixed with equal volume of organic manure and air dried on an impervious polythene sheet for 24 hours, there were pasteurized and fumigated, measured into the PVC pots with the hole containing about 0.7% of IAA hormone. This concentration was chosen because of its optimum performance from other unpublished trials.

### **2.2 Propagation of the seedlings**

The 10.0 cm Plantlets with lateral buds were about 360 collected at tale end of the afternoon when the weather was moist and were kept in a bow containing water (Agbo and Obi 2007). The bases were made squared using sharp sickle to spread the rooting. For each of the cuttings, about half of it was dipped into the IAA hormone that has been made into hole in each of the pots as to soak the powder. Excess of it was shaken off the base of the cuttings and the hormone was manually made to concentrate at the base. The plantlets were then inserted into the soil to about 6 cm, watered and maintained to about 70% humidity (Tanhan *et al.* 2007). Fungicides were sprayed onto the plants to control infections (Yeboah and Amoah 2009). The set up was allowed to grow for six weeks while monitoring in between days to remove any invading weeds.

Data on shoot development was taken at interval of weeks and root length was measured on the day of harvest after weeks.

### **2.3 Data collection**

Data collection which commenced on the first week after propagation continued till the sixth week and the parameters measured were survived seedlings, length of shootings/buds, and the root length, number, and weight of the plant on the day of harvest.

### **2.4 Data analysis**

The data collected was analysed using Microsoft excel to obtain the mean number and percentage of plants that were able to form developed root and sprouted shoots from the series of transplanted seedlings. The data was then imported into SPSS version 13.0 and was analysed using analysis of variance (ANOVA) and standard deviation for the length of shoot and roots. The significance effects were determined at 5% level of significance.

### **3.0 Results**

*N. tabacum* seedlings treated with concentration of 0.7% (w/w) IAA hormone propagated in different growth media recorded the highest mean number of the seedlings that developed roots and sprouted shoots in the set up with equal mixtures of the 4 growth media with organic manure. While the stem seedlings propagated in the perlite and control recorded the least mean rooted (2 each) and sprouted shoots (4 and 3) as recorded in Table 3.1. Amazingly, perlite and vermiculate maintained almost equal numbers of shoot developed (4 and 3 respectively) like in the root (2 each). However, significant difference existed among the different media with reference to their mean rate of development and formation of root and shoot. The efficacy of IAA hormone to the development of root and shoots was noticed by the difference between the treated samples and the controls without the hormone. There was significance difference between the two samples. Number and length of roots developed among different rooting medium and the concentration of hormone were not significant (Table 1.0) but shoot lengths and number per sprouted stem was significant. Increase in shoot length occurred in this order: mixture>vermiculate>perlite>planting soil>sand>control while increase in root length were in the order: mixture>vermiculate>perlite>planting soil>sand>control. But it made a turnaround in the number that rooted and shooted within the rooting media, i.e., sand and planting soil had the same mean number of roots (4) and a little difference in Shoots (6 and 12). The control media maintained equal numbers. In fresh weight of the plants (apical and basal), there were higher weight measurement in the basal sections than the apical ones, though not significant. Equally, set up containing the mixture of the rooting media still maintained the highest weight

followed by sand, perlite, planting soil, vermiculate and the control. The same sequence was also followed in their dry weights. In sand however, there were greater number of root numbers while in other rooting media had the same number of roots. Shoot and root length of mixture of rooting media and vermiculate were synonymous with each other and were almost significant with the rest of the medium. Root lengths were 34 and 33mm for mixture and vermiculate respectively, 39 and 37mm in sand and planting soil. The shoot length was 41mm in both sand and vermiculate, while 43mm all in planting soil and mixture respectively. The set up containing equal mixtures of all media had 100% germination rate compared to 70, 60 50 and 40% for sand; planting soil/vermiculate; perlite and control respectively. However, the rest of the media demonstrated improved significant effects in all the parameters measures compared to the control.

### **Discussion**

The rooting medium supplement that has mixtures of planting soil, perlite, sand and vermiculate at equal proportion enabled highest development of root and shoot in a cutting of *N. tabacum*. This improved effect could be attributed to the fact that the combined nutrient supplement of the entire rooting media acted optimally with the IAA hormone concentration added which created the enabling soil condition for example, optimum aeration and moisture level (Kalyoncu and Ozer 2000; Akwatulira *et al.* 2011). Meanwhile dose application of IAA hormone was shown to be an aid to improved moisture content in the soil for an optimal rooting and shooting development of cuttings (Milleton *et al.* 1980; Leakey *et al.*, 1982; Aminah *et al.* 2006; Akwatulira *et al.* 2011; Raymond Anyasi and Anyasi 2020). However, most of these past studies maintained their IBA hormone concentration to about 0.7-0.8% of the rooting media used while this study based its IAA measurement on the weight of the cuttings. Moreover, the control sample of rooting medium supported low development of root and shoot than the auxin treated samples in the entire experiment. This could perhaps be because soil resistant to root penetration is dependent on amongst other factors on water content, structure and strength of soil as well as bulk densities though these were not measured in the rooting media (Amri *et al.* 2009). Soils do not possess the required aeration porosity for optimal gas exchange required for rooting of the cuttings resulting in poor rooting in the control. Poor rooting numbers in control could also be attributed to the feel of anoxia which is an effect of low oxygen in the soil (Hartmann *et al.* 2002). Low incidence of rooting was found in the control samples. Nonetheless, there are instances where optimum concentration of IAA in the soil has resulted in the failure of the development of roots by stem cuttings as was reported by Griffin and Shroeder

(2004). That was an indication of the sensitivity of root formations to hormone formulations (Akwatulira *et al.* 2011; Anyasi 2023). It has also been reported that rooting hormone to a certain instance could be inhibitory to the development of roots in the cutting especially during the initiation stage (Akwatulira *et al.* 2011). This then means that different rooting media accommodates different concentration of auxin for optimal growth of plants.

### **Conclusions**

Mixture of various rooting media in the right proportion with 0.7% of IAA hormone has been proven to be effective in the root and shoot development of cuttings of tobacco irrespective of the position of the cuttings. Although the individual medium did not have high incidences in most of the parameters measured, but there were able to support root and shoot development as well. Therefore, there is need for a study of IAA concentration effects on the media as to be able to determine if concentration was not the factor responsible for the low root and shoot development. This will promote mass production of *N. tabacum* especially in areas that the plants do not occur naturally.

### **Acknowledgements**

Wish to express my appreciation to the University of South Africa and National Research Foundation for their assistance in this project.

### **Tables and Figures**

**Table 1.0** Number of rooted and shooted seedlings within rooting media. Values are mean of replicates (Numbers with same superscript within same row are not statistically significant at  $p=0.05$ )

Rooting media	Number of cuttings		IAA hormone concentration
	Rooted	Shooted	
Planting soil	4±0.75 <sup>a</sup>	12±2.55 <sup>b</sup>	0.7
Control	2±0.69 <sup>a</sup>	3±0.00 <sup>a</sup>	0.7

**Table 2.0** Rate of germination of shoots among rooting media with 0.7% concentration of IAA hormone. Values are mean of replicates (Numbers with same superscript within same row are not statistically significant at  $p=0.05$ )

Rooting media	IAA hormone concentration (%)	Rate of germination (%)
Planting soil	0.7 <sup>a</sup>	60 <sup>b</sup>
Control	0.7 <sup>a</sup>	40 <sup>a</sup>

**ABSTRACT**

Artificial intelligence (AI) technology integration is significantly boosting agricultural development in Nigeria, as it is in many other regions of the world. Because of the issues facing the country's agriculture industry and growing population, food security is a major concern in Nigeria. The increasing number of people means that food needs are increasing faster than farmers can supply them via traditional means. Thus, in order to meet the demand for food and sustainability, the agriculture sector has started to use artificial intelligence. Technologies like robotics, nanotechnology, synthetic proteins, cellular agriculture, gene editing, artificial intelligence, blockchain, machine learning, and others that are either already in use or in the process of development make up Agriculture 4.0. These technologies have the potential to significantly transform agriculture and food systems in the future and could have a widespread impact. AI increases farmer sustainability and production, and these technologies have the potential to drastically change food systems and agriculture in the future. Alongside opportunities like precision farming, climate-resilient techniques, and crop monitoring, issues including talent shortages and data accessibility in technology infrastructure are examined. In order to protect the environment and ensure the availability of food for everyone, agricultural production systems must increasingly adopt more sustainable practices. This study looks at artificial intelligence's revolutionary potential and the adoption of sustainable agriculture practices in the context of sustainable agricultural development throughout Nigerian regions.

Through financial inclusion and improved data gathering related to poverty through poverty maps, artificial intelligence is revolutionizing the fields of agriculture education and banking.

**Keywords:** Agriculture, Artificial Intelligence, poverty alleviation, Sustainability, Transformation and productivity

## **INTRODUCTION**

Background of the Study In Nigeria, a substantial portion of the population still makes their living mostly from agriculture. A nation's ability to prosper economically depends on its agriculture. Given the challenges posed by climate change and the world's expanding population, a creative strategy for transforming and maintaining agriculture is urgently needed. One intriguing avenue for this transformation is the application of artificial intelligence (AI) in agricultural processes. Artificial intelligence (AI)-based solutions have the potential to improve productivity in several industries, including agriculture. These include managing issues related to crop production, irrigation, soil content sensing, crop monitoring, weeding, and crop establishment (Kim et al., 2008). High-value AI applications in the aforementioned area are the aim of agricultural robots. The world's population is expanding at an accelerated rate, endangering the agriculture sector. However, artificial intelligence (AI) has the potential to offer much-needed help. Thanks to AI-based technological solutions, farmers can now produce larger yields with less input. These solutions have also improved the quality of the output and shortened the time it takes for harvested commodities to reach the market.

In addition, Nigeria's agriculture industry is currently battling major issues including resource depletion and climate change while attempting to feed the nation's growing population in an environmentally responsible way (Firstbank et al., 2018). Numerous other fields are also seeing significant technical improvements, such as energy production, robotics, nanotechnology, gene technology, artificial intelligence, and machine learning (De Clercq et al., 2018; NFU, 2019). In contrast, the latter was characterized by invention during the British Agricultural Revolution, leading to the creation of new equipment like Jethro Tull's seed drill. This movement was toward settled agriculture (Agriculture 1.0). What some have referred to as "Agriculture 4.0," or the "fourth agricultural revolution," (Rose and Chilvers, 2018), will be brought about by these new technologies and will include a wide variety of prospective "future agricultures" or "future food systems," each of which will be identified by cutting-edge, sophisticated, and even revolutionary technology. Hunter-gatherers naturally migrated during the first agricultural revolution (known as Agriculture 2.0), and production in developing countries changed during the third agricultural revolution (known as Agriculture 3.0). Chilvers and Rose (2018). At the moment, the term "Agriculture 4.0" is vague and undefined, linking ideas on the Fourth Industrial Revolution, or Industry 4.0, to a range of other ideas and technologies. (Zambon et al., 2019). Future food and agriculture systems under the new Agriculture 4.0 include ideas like

aquaponics, digital agriculture, bioeconomy, vertical farming, and aquaponics (Hermans, 2018; Junge et al., 2017; Pigford et al., 2018; Pinstруп-Andersen, 2018; Herrero Acosta et al., 2019). Furthermore, new automated systems technology using agricultural robots and drones has contributed to the agroindustry. Numerous advanced computer systems, including those for weed identification, yield detection, crop quality assessment, and numerous other applications, are engineered to identify various critical factors (Liakos et al., 2018). Artificial intelligence (AI)-based technologies support increased productivity across industries and address issues that the agricultural sector faces, including crop yield, irrigation, soil content identification, crop monitoring, weeding, crop establishment, and so forth (Kim et al., 2008). Panpatte (2018) asserts that artificial intelligence enables farmers to gather vast amounts of information from websites, offer answers to a variety of unclear issues, and use intelligent farming techniques that will boost agricultural productivity.

### **Objectives of Artificial Intelligence interventions in agriculture**

- Long-term farm profits can be increased via more interconnected farm-to-market supply chains.
- AI systems aim to learn from experience and improve their performance over time.
- Technology and financial accessibility for smallholder farmers
- Dependable and secure food systems and real-time environmental impact monitoring
- Mechanizing farms to increase productivity and efficiency
- Digitizing the infrastructure needed for logistics and storage to cut down on food loss
- Managing natural risk intelligently

### **2.1 Internet of Things (IoT) and Artificial Intelligence**

Artificial Intelligence in Agriculture Artificial intelligence (AI) and the Internet of Things (IoT) are two technical developments that have the potential to significantly change the agriculture industry. Despite certain similarities, the two have different purposes and benefits. The Internet of Things, or IoT, is a network of real, physical objects connected to the internet by connections, software, and sensors. IoT devices can track a wide range of agricultural characteristics, including temperature, humidity, crop growth, and soil moisture. Farms can use Internet of Things (IoT) sensors to gather data from their machinery, livestock, and crops in real time. IoT device data can be utilized for decision-making in areas including resource management, early insect or disease detection, irrigation schedule optimization, and crop health. Sensor-based technologies are the main tools used by IoT in agriculture to collect data, link, and automate processes. The artificial intelligence (AI) used in agriculture, on the other hand, refers to the machine's ability to simulate human intelligence and perform tasks like sensing, thinking, learning, and decision-making that would typically require human cognition. Artificial Intelligence (AI) has the potential to handle and analyze massive volumes of data from Internet of Things (IoT) sensors in agriculture, together with historical data, weather trends, and other pertinent information.

### **3.0 Artificial Intelligence in Improving Agriculture**

The population of several Nigerian countries has been growing steadily, which has increased demand for agricultural land. This growth has affected the principal industry in many countries: agriculture. More food needs to be produced to feed the growing population. This is pushing

farmers and other agro-related stakeholders to come up with creative ways to reduce waste and increase productivity. Artificial intelligence (AI), a technology that is becoming more generally recognized, is going to change agriculture. More uses of artificial intelligence (AI) can be found in agriculture, such as accurate disease and pest management, autonomous harvesting robots, crop and soil monitoring, yield prediction, price forecasting, and disease diagnostics. Some key concepts of artificial intelligence in improving agriculture are as follows:

### **3.1 Precision Agriculture**

Farmers may optimize their use of water, fertilizers, pesticides, and other resources by employing AI systems to continuously monitor their crops through real-time data analysis. Farmers, who usually have few resources at their disposal, can reduce waste and save money by doing this. Devices that use artificial intelligence to make decisions can also provide customized guidance for specific crops and regions. Taking into consideration elements like as weather, soil quality, crop history, market trends, and expert information stored in databases or models developed using machine learning techniques makes measurable gains conceivable. These advancements have the potential to significantly boost Nigeria's agricultural productivity while reducing the harmful environmental effects of excessive pesticide use.

### **3.2 Crop Monitoring and Management**

Using drone, satellite, and aerial photo analysis, AI-powered systems may identify infections, monitor crop health, and identify nutritional deficiencies. Machine learning algorithms have the capacity to process large datasets and then generate recommendations for farmers regarding timely interventions and early warnings. This helps to maximize input utilization and reduce production loss.

### **3.3 Agricultural Robots and Drones**

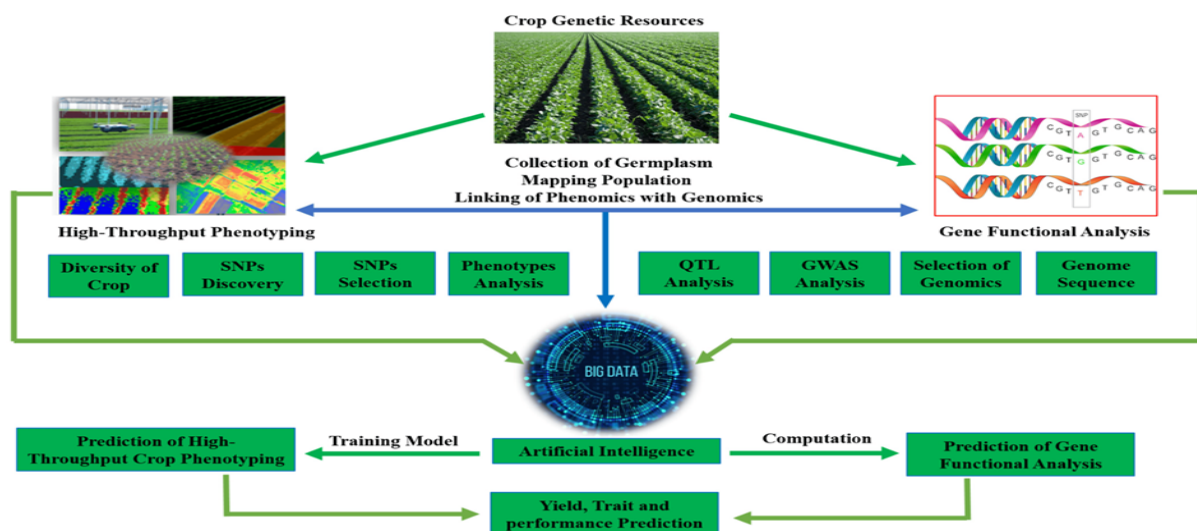

The creation of autonomous robots and drones that can carry out a variety of agricultural activities has been made possible by artificial intelligence (AI). Among the tasks that these robots can do out precisely and effectively are planting, weeding, spraying, and harvesting.

Artificial Intelligence (AI) algorithms have the potential to improve productivity by replacing human labor in tasks like navigation, object recognition, and decision-making.

### 3.4 Genetics and plant breeding

AI techniques aid in accelerating plant breeding efforts by identifying desirable traits and evaluating genomic data. Machine learning algorithms can process large amounts of genetic data to predict plant features and speed up the development of improved crop varieties. This facilitates the development of crops with high yields and adaptability to meet the demands of changing environmental

### 3.5 Early Pest and Disease Identification and Monitoring

It is now feasible to fully utilize technology to revolutionize agriculture in Africa. Thanks to the advancement of artificial intelligence (AI), farmers can now successfully detect and manage agricultural illnesses and pests in the current day. This groundbreaking invention has the power to drastically alter Nigeria's agricultural landscape by helping farmers overcome major

challenges and transition to a more sustainable future. This helps farmers identify the problem precisely and take the appropriate preventive measures.

### **3.6 Weed Detection**

AI-powered computer vision and image recognition systems can recognize and classify weeds in crops. By analyzing image data or sensor readings, AI may quickly detect weeds and alert farmers to their presence. This reduces the need for broad-spectrum herbicides and enables targeted weed management.

### **3.7 Agro Smart Monitoring**

Sensors with artificial intelligence (AI) capabilities can be positioned in the fields to monitor elements such as temperature, humidity, soil moisture, and nutrient levels. These sensors continuously collect data, which is subsequently analyzed by AI algorithms. By getting alerts when particular conditions deviate from ideal levels, farmers may make informed decisions about whether to apply fertilizer and when to plan irrigation.

### **3.8 Livestock Monitoring**

**4** Artificial intelligence (AI)-powered devices can monitor the health and behavior of animals by analyzing data from wearables, cameras, and sensors. Farmers can profit from this through early illness identification, animal welfare, and the optimization of feeding and breeding strategies.

### **4.1 Prospera**

Is an AI-based platform that monitors crop health and identifies irregularities using computer vision and machine learning. In order to give farmers real-time insights into crop conditions and enable the early diagnosis of illnesses, nutrient deficits, and other difficulties, it analyzes data from aerial photography, drones, and ground sensors.

### **4.1 CHALLENGES TO AI ADOPTION IN AGRICULTURE**

**1. Data Quality and Accessibility:** Reliable data is essential for AI applications to succeed. Significant barriers stand in the way of the successful implementation of AI in African agriculture, including data quality and accessibility issues.

**2. Infrastructure and Connectivity:** In many agricultural areas, dependable internet connectivity and infrastructure are lacking, making it difficult to transfer and retrieve real-time data needed for AI applications. The implementation of AI technology in remote or rural farming regions may encounter obstacles due to inadequate availability of electricity, network coverage, and consistent connectivity.

**3. Cost and Affordability:** The initial investment in AI technology is often high and comprises the acquisition of software, hardware, and skilled personnel for both maintenance and

installation. These technology could be too expensive for small-scale farmers and rural locations.

**4. Technical expertise and training:** AI implementation requires a certain set of skills and knowledge. Farming personnel and farmers must be trained in order to effectively understand and use AI technology and systems. Farmers will not successfully use AI technologies unless they receive adequate training and support.

**5. Legal and Ethical Issues:** As artificial intelligence is used to agriculture, questions about data ownership, privacy, and transparency come up. Concerns over the collection and use of farmer data, potential bias in algorithms, and the appropriate use of AI in decision-making must all be addressed with clear regulations and guidelines.

**6. Adaptation to Local Contexts:** Agricultural practices can differ greatly between nations and regions. For AI solutions to work with local crops, they need to be adaptable and customizable. Schemes, farming methods, and environmental circumstances

**7. Adoption:** A lack of knowledge or trust may make farmers reluctant to use AI technologies. For AI to be adopted and embraced more widely, it is imperative to establish credibility and provide evidence of its advantages in agriculture through case studies, pilot programs, and farmer involvement

## **5.1 CONCLUSION**

It's becoming more and more obvious that AI integration is essential to Nigeria's strategy for developing its agriculture sustainably this lead to mitigation of poverty. It will be necessary to overcome barriers, take advantage of possibilities, and establish legal and ethical frameworks in order to fully realize artificial intelligence's potential to enhance agriculture and guarantee food security for future generations through extended advice. Artificial intelligence (AI) the internet of things, and precision agriculture are just a few of the technology innovations that might empower smallholder farmers, boost output, and encourage sustainable farming methods. When combined, technologies can improve farming practices, increase output, and maximize crop yields.

### **Özet**

Nanomalzemeler morfolojilerine, boyutlarına, büyüklüklerine, aglomerasyon durumlarına ve bileşimlerine göre sınıflandırılabilir, bu da her bir özelliğe bağlı olarak onları çok çeşitli uygulamalar için uygun hale getirir. İki boyutlu (2D) nanomalzemeler atomik kalınlığa, geniş aktif yüzey alanlarına, geniş yüzey alanı-hacim oranına ve mükemmel mekanik özelliklere sahiptir; bu da onları enerji depolama, elektronik, sensörler, kataliz ve biyomedikal uygulamalar başta olmak üzere birçok uygulama için ideal hale getirmektedir. Dünya dijitalleşmeye doğru hızlanırken, verimli enerji depolama cihazlarına (ESD'ler) olan talep kısa sürede inanılmaz bir şekilde artmıştır. Tüm ESD'ler arasında bataryalar ve süperkapasitörler, uygun elektrokimyasal özellikleri nedeniyle verimli enerji depolama için önemli rakipler olarak tanımlanmıştır. Bataryalar süperkapasitörlere kıyasla yüksek enerji yoğunluğuna sahipken, süperkapasitörler bataryalara kıyasla yüksek güç yoğunluğuna sahiptir. Bataryaların enerji yoğunluğu boyuta bağlıdır, bu da mikro ölçekli ve giyilebilir cihazlarda kullanımlarını sınırlar. Süperkapasitörler, yüksek hız kapasiteleri ve uzun süreli çevrilebilirlikleri nedeniyle pulse gücünü depolamak için büyük ölçüde kullanılmaktadır. Ayrıca, çevre dostu olmaları ve elektrostatik etkileşimler açısından basit adsorpsiyon ve desorpsiyon mekanizmaları, süperkapasitörleri geleneksel pillerden daha iyi bir seçim haline getirmektedir. Son zamanlarda, MXen olarak adlandırılan bir grup yeni malzemeler, bilimsel araştırmaların her alanında yaratıcı fikirleri önemli ölçüde etkilemiştir. Karmaşık atomik düzenlemesi ve aşırı ayarlanabilir özelliklere sahip çok katmanlı yapısı, çok işlevli davranışlarını geliştirmektedir. Enerji depolama cihazları, katalizörler, sensörler, antenler ve RFID etiketleri, biyomedikal uygulamalar, elektromanyetik parazit kalkanı (EMI), nanokompozit-hibrit malzemeler, çevre ve su arıtma vb. alanlarda yapılan atılımlar buna örnek olarak verilebilir. Bu nedenle, MXenler yeni uygulamalara kapı açmakta ve mevcut uygulamaların performansını değiştirmekte/iyileştirmektedir. Bu çalışmada, MXenlerin enerji depolama uygulamaları üzerindeki potansiyel etkileri tartışılmıştır.

**Anahtar Kelimeler:** MXenes, Süperkapasitör, Enerji Depolama, Nanokompozit-hibrit malzemeler, Elektrokimyasal karakteristik.

## **MXENES FOR ENERGY STORAGE IN SUPERCAPACITORS**

### **Abstract**

Nanomaterials can be classified based on their morphology, dimensionality, size, agglomeration state, and composition, which, depending on each characteristic, makes them suitable for a wide variety of applications. Two-dimensional (2D) nanomaterials have an atomic thickness, sample active surface sites, a large surface area-to-volume ratio, and excellent mechanical properties, which make them ideal for multiple applications, most prominently in energy storage, electronics, sensors, catalysis, and biomedical applications. As the world accelerates toward digitalization, the demand for efficient energy storage devices (ESDs) has ramped up incredibly in a short period. Batteries and supercapacitors, among all ESDs, have been identified as important contenders for efficient energy storage due to their viable electrochemical characteristics. While batteries have a high energy density compared to supercapacitors, supercapacitors have a high power density compared to batteries. The energy density of batteries is size-dependent, which limits their use in microscale and wearable devices as well. Supercapacitors are massively employed to store pulse power because of their high-rate capability and long-term cyclability. Moreover, their environmental friendliness and simple adsorption and desorption mechanism in terms of electrostatic interactions make supercapacitors a better choice than traditional batteries. Recently, a group of new materials labeled MXenes has significantly influenced inventive ideas in each field of scientific research. Its complex atomic arrangement and multilayered structure with excessive tunable properties enhance its multifunctional behaviors. Examples are the breakthroughs made in energy storage devices, catalysts, sensors, antennas and RFID tags, biomedical applications, electromagnetic interference shielding (EMI), nanocomposite-hybrid materials, environmental and water purification, etc. Therefore, MXenes open the door to new applications and modify/improve the performance of current applications. In this work, we discussed potential impacts on energy storage applications of MXenes.

**Keywords:** Mxenes, Supercapacitor, Energy Storage, Nanocomposite-hybrid materials, Electrochemical characteristic.

## **Giriş**

Günümüzde, bilim ve nanoteknolojideki yenilikler nedeniyle, nanomalzemeler ve nanomalzeme bazlı kompozitlere ilişkin bilgi ve uygulamalar sürekli değişmektedir. Nanomalzemelerin benzersiz boyut ve bileşime özgü özellikleri, bilimdeki birçok zorluğun çözülmesine yardımcı olmaktadır. Nanomalzemeler morfolojilerine, boyutlarına, boyutlarına, aglomerasyon durumlarına ve bileşimlerine göre sınıflandırılabilir; bu da her bir özelliğe bağlı olarak onları çok çeşitli uygulamalar için uygun hale getirir. İki boyutlu (2D) nanomalzemeler atomik kalınlığa, geniş aktif yüzey alanlarına, geniş yüzey alanı-hacim oranına ve mükemmel mekanik özelliklere sahiptir, bu da onları enerji depolama, elektronik, sensörler ve kataliz ve biyomedikal uygulamalar başta olmak üzere birçok uygulama için ideal hale getirir (Glavin vd., 2020; Novoselov vd., 2004). Bu anlamda, 2D nanomalzemeler sınıfının şimdiye kadar en çok öne çıkan ve en çok kullanılan/çalışılan malzemelerden biri olduğu daha da doğrulanmaktadır. 2D nanomalzemenin ilk formu olan grafen, 2004 yılında Novoselov ve arkadaşları tarafından keşfedilmiştir (Novoselov vd., 2004). Daha sonra, örneğin altıgen bor nitrid, geçiş metali dikalkojenitleri ve fosforen dahil olmak üzere çok sayıda 2D nanomalzeme ortaya çıkmıştır. Bu liste arasında grafenin benzersiz bal peteği benzeri tek atomlu yapısı onu oldukça iletken ve daha güçlü kılmaktadır (Xu vd., 2019). Grafen bilim ve teknolojiye daha önemli ilerlemeler kaydetmiş olsa da diğer tüm 2D malzemelere kıyasla basit yapısı ve kimyası daha fazla ilerlemesini sınırlamaktadır. Son zamanlarda, MXen'ler olarak adlandırılan bir grup yeni malzeme, bilimsel araştırmaların her alanında yaratıcı fikirleri önemli ölçüde etkilemiştir. Karmaşık atomik düzenlemesi ve aşırı ayarlanabilir özelliklere sahip çok katmanlı yapısı, çok işlevli davranışlarını geliştirmektedir. Enerji depolama cihazları, katalizörler, sensörler, antenler ve RFID etiketleri, biyomedikal uygulamalar, elektromanyetik parazit kalkanı (EMI), nanokompozit-hibrit malzemeler, çevre ve su arıtma vb. alanlarda yapılan atılımlar buna örnek olarak verilebilir (Deysheer vd., 2019). MXen'in çeşitli alanlarda ortaya çıkan uygulamalarıyla birlikte, bilim camiasında "MXen'lerin nanoteknolojinin geleceği olduğu" fikri ortaya çıkmıştır. Yeni araştırmalarda, grafende olduğu gibi MXen'in yüzey fonksiyonel gruplarını uyarlayarak yüzey, elektrik ve elektrokimyasal özelliklerinin ayarlanabilmesi bu düşüncüyü daha da desteklemektedir. Çoğu MXen ve MXen bazlı malzeme yüksek hacimsel kapasitansa, antibakteriyel özelliklere, elektrokromik davranışa, yüksek elektronik iletkenliğe ve optik şeffaflığa sahiptir (Deysheer vd., 2019). Bu nedenle, MXen'ler yeni uygulamalara kapı açmakta ve mevcut uygulamaların performansını değiştirmekte/iyileştirmektedir.

2011'de ilk Mxen'in keşfinden başlayarak, birçok akademik araştırmacı Mxen'lerin çeşitli bileşimlerini ve yapılarını kullanarak deneyler yapmıştır. Literatüre göre, MXen ailesi  $M_{n+1}X_nT_x$  yapısına sahip karbürleri, nitrürleri ve karbonitrürleri içerir; burada M bir erken geçiş metali (Ti, V, Mo, Ta, vb.), X C ve/veya N,  $T_x$  yüzey gruplarını (tipik olarak =O, -OH, -F ve -Cl) ve  $n = 1-4$ 'ü temsil eder. MXen'ler, MAX fazları olarak bilinen katmanlı karbür/nitrür öncüllerinden belirli atomik düzlemlerin seçici kimyasal aşındırılmasıyla üretilir. Genel olarak, MAX fazı karbür/nitrür öncüleri  $M_{n+1}AX_n$  kimyasal formülünden oluşur, burada A Al veya Si'yi temsil eder (Firouzjaei vd., 2022; Wang vd., 2019; Perera vd., 2023).

Legend:

- M: M in MAX and MXene
- M: M only in MAX
- X: C, N
- T: Surface terminations
- A: A group element
- I: Intercalated ions

Legend:

- 1M: Single M
- 2M: Ordered double M
- SS: Solid solution double M
- 1A: Single A element
- SS: Solid solution in A layers

Şekil 1. MAX fazlarını, MXen'leri ve bunların interkalasyon iyonlarını oluşturmak için kullanılan elementler (Gogotsi & Anasori, 2019). Şekil 1'de gösterildiği gibi, MAX fazındaki geçiş elementlerinin bileşimine bağlı olarak, MXene'de geçiş metalinin 2-5 atomik katmanı bulunabilir. M atomlarının her n katmanı saf A katmanları ile iç içe geçmiştir; X atomları M atomları arasındaki oktahedral bölgeleri işgal eder (Firouzjaei vd., 2022; Wang vd., 2019).

Bugüne kadar dört farklı MXen bileşimi sentezlenmiştir:  $M_2XT_x$ ,  $M_3X_2T_x$ ,  $M_4X_3T_x$  ve  $M_5X_4T_x$  (Şekil 2). Yapılarına göre, mono geçiş metal (TM) MXen'ler, çift-TM katı çözelti MXen'ler, çift-TM sıralı MXen'ler ve yüksek entropili MXen'ler olarak tanımlanabilirler.

**Şekil 2.** MAX yapılarının  $n = 1$ 'den  $n = 4$ 'e kadar şematik gösterimi ve bunların geçiş metalleri, karbon/azot, A grubu elementlerin çoğunluğu ve yüzey sonlandırmaları ile kazınmış MXene yapıları (Wyatt vd., 2021).

## 2. Enerji Depolama Cihazları için MXene'ler

Dünya dijitalleşmeye doğru hızla ilerlerken, verimli enerji depolama cihazlarına (ESD'ler) olan talep kısa sürede inanılmaz bir şekilde arttı. Tüm ESD'ler arasında bataryalar ve süper kapasitörler, uygulanabilir elektrokimyasal özellikleri nedeniyle verimli enerji depolama için önemli rakipler olarak tanımlanmıştır. Bataryaların enerji yoğunluğu boyuta bağlıdır, bu da mikro ölçekli ve giyilebilir cihazlarda kullanımlarını sınırlamaktadır. Süperkapasitörler, yüksek hız kapasiteleri ve uzun süreli çevrilebilirlikleri nedeniyle pulse gücünü depolamak için büyük ölçüde kullanılmaktadır. Ayrıca, çevre dostu olmaları ve elektrostatik etkileşimler açısından basit adsorpsiyon ve desorpsiyon mekanizmaları, süperkapasitörleri geleneksel pillerden daha iyi bir seçim haline getirmektedir. Bu anlamda, her iki cihazın da zayıf yönleri vardır. Bu nedenle, yüksek performanslı piller ve süperkapasitörler üretmek için sürdürülebilir, düşük maliyetli, çevre dostu alternatif malzemeler için büyük bir arayış vardır (Simon & Gogotsi, 2020). MXen'ler, olağanüstü elektriksel ve elektronik özellikleri nedeniyle keşfedildiklerinden bu yana enerji depolama uygulamalarında büyük ölçüde araştırılmıştır. MXen'in atomik kalınlığı, kristal yapısı ve katmanlı yapısı, yüksek spesifik yüzey alanı, elektron taşınımı için düşük enerji bariyeri ve kısa iyon difüzyon yolunu kolaylaştırır. Buna ek olarak, hem teorik hem de deneysel olarak, MXen'lerin elektronik özelliklerinin yüzey sonlandırmaları değiştirilerek modifiye edilebileceği kanıtlanmıştır. Bu nedenle, son enerji depolama

çalışmaları, önümüzdeki kırk yıl içinde etkili ESD'lere ulaşmak için MXen ve MXen bazlı kaynakları kullanmanın yeni yollarını araştırmaktadır. MXen'ler ve MXen bazlı kompozitler, özellikle yeni taşınabilir ve esnek ESD'ler geliştiren birçok çalışmada elektrotlar, elektrolit ve bunların arayüz alanları dahil olmak üzere ESD'lerin çeşitli bileşenlerine dahil edilmiştir (Tripathi & Singh, 2019; Wang vd., 2020; VahidMohammadi vd., 2017).

### **3. Süperkapasitörler için MXene'ler**

Elektrokimyasal kapasitörler olarak da bilinen süperkapasitörler, yüksek güç yoğunluklarına, hızlı şarj/deşarj özelliklerine, yüksek döngüsel verimliliklere ve uzun ömürlere sahip enerji depolama cihazlarıdır. İlginç bir şekilde, iyi tasarlanmış 2D nano-MXene elektrotlar benzersiz özellikleri nedeniyle daha yüksek süperkapasitans göstermiştir. Örneğin, değişken oksidasyon sayılarına sahip geçiş metalleri, MXen'lerin benzersiz istiflenmiş yapıları ile birlikte onları içsel olarak iletken hale getirir. Ayrıca, MXen'lerdeki geniş spesifik yüzey alanları ve daha fazla mevcut redoks bölgesi, SC'lerde kullanılan aktif karbon, grafen, iletken polimerler ve geçiş metal oksitleri gibi diğer geleneksel malzemelere kıyasla elektrokimyasal özelliklerini geliştirir (Xu vd., 2022). MXen'lerin 2011 yılında keşfinden bu yana, enerji depolama amaçlı MXen tabanlı SC'ler hakkında çok sayıda araştırma yapılmıştır. Lukatskaya ve arkadaşları  $Ti_3C_2T_x$  elektrotların asidik ve bazik elektrolitlerdeki SC'lerdeki performanslarındaki değişikliklerin, bağlayıcı içermeyen  $Ti_3C_2T_x$  kağıdın KOH elektrolitinde 2 mV/s'de 442 F/cm<sup>3</sup> hacimsel kapasitans sergilediğini,  $Ti_3C_2T_x$  kil elektrotun ise H<sub>2</sub>SO<sub>4</sub> elektrolitinde aynı tarama hızında daha yüksek miktarda kapasitans (900 F/cm<sup>3</sup>) gösterdiğini bulmuşlardır (Lukatskaya vd., 2013; Lukatskaya vd., 2017). Bu sonuçlar motive edici yeniliklere yol açmıştır. MXene elektrotlarında, MXene nano tabakalarının boşluğunu artırmak için metal oksitler, karbon nanotüpler ve indirgenmiş grafen oksitler gibi ara katmanlar kullanılır. Bunlar her ne kadar tek tek katmanların bağlanmasını engellese de, diğer yandan SC'lerin performansının artmasına katkıda bulunurlar. Burada da MXene kompozitinin elektrokimyasal performansı, bozulmamış MXene elektrotlarından çok daha yüksektir. Geng ve arkadaşları,  $Ti_3C_2T_x/MnO_2$  ile kompozitin daha iyi bir performansa sahip oldukça esnek ve iletken bir kompozit olduğunu keşfetmiştir (Liu vd., 2017). Bir başka çalışmada, yüksek elektrot yoğunluğunu üst seviyede korurken hızlı elektron taşıma ve iyon difüzyon kinetiğini barındırmak için oldukça iletken bir MXene ağında bol miktarda kanal oluşturulmuştur. Üretilen süper kapasitör, Fe<sub>2</sub>O<sub>3</sub> nanoparçacıkları (Fe<sub>2</sub>O<sub>3</sub> NPs@MX) ile interkalifiye edilmiş esnek MXene hibrit kağıdı ile oldukça kompakttır.

Düzgün dağılmış Fe<sub>2</sub>O<sub>3</sub> NP'ler, MXene nano parçalarının katmanlar arası aralığını etkili bir şekilde genişletmiş, iyon difüzyon yollarını kısaltmış ve daha fazla aktif bölgeyi açığa çıkarmıştır. Aynı zamanda, iletken MXene iskeleti redoks reaksiyonları sırasında Fe<sub>2</sub>O<sub>3</sub> NP'lerin hacim genişlemesini uygun şekilde bastırmıştır. Böylece, MXene ve Fe<sub>2</sub>O<sub>3</sub> NP'lerin sinerjik etkisi 2607 F/cm<sup>3</sup> (584 F/g) gibi son derece yüksek bir hacimsel kapasitans ve mükemmel döngü performansı ile sonuçlanmıştır (Ma vd., 2020). Bu örnekler, metal oksitlerin MXen'ler ile kompozitlerinin SC'lerde üstün psödokapasitif performans sağladığını doğrulamıştır. Titanyum karbür MXen dışında, Wang ve arkadaşları tarafından ilk kez bir polianilin ve V<sub>2</sub>C MXen kompoziti bulunmuştur. Bu malzeme kombinasyonunu kullanarak, yüksek yoğunluklu ve yüksek hassasiyetli bir amonyak sensörüne sahip SC'ler sentezleyebilmişlerdir (Wang vd., 2021).

#### **4. Sonuçlar ve Tartışma**

İcat edilmelerinden on yıl sonra, özel elektrokimyasal etkilere sahip MXene bazlı NM'ler enerji depolama alanında inanılmaz bir ilerleme kaydetmiştir. Grafen üzerine yapılan önemli yeniliklerle genel bir perakende uygulamasına kıyasla, MXene tabanlı NM'ler yenidir ancak EED için mükemmel olanaklara sahiptir. Dikkat çekici bir şekilde, yönetilebilir film miktarı, katmanlar arası boşluk ve aktif kümelerin belirli bir tanımıyla sabit MXene'in dahil edilmesi, hızlı reaksiyon kinetiği için kolaylaştırıcıdır. Sulu ortamdaki MXene bazlı SC'ler, mükemmel iyonik iletkenlikleri, kolay sentez süreçleri ve düşük birleştirme masrafları sayesinde geniş bir uygulama yelpazesine sahiptir. Bununla birlikte, birkaç durumda, sulu elektrolitlerin dışarı akışı cihazın elektrokimyasal performansını olumsuz etkilemekte ve önemli bir güvenlik tehdidi oluşturmaktadır. Ayrıca, sulu ortamdaki sıvılaştırılmış oksijen, yüzey oksidasyonu yoluyla aktivitesini azaltır. Bu nedenle, sulu ortamın yerine katı ve sulu olmayan elektrolitler kullanan MXene bazlı NMs SC'lerin elektrokimyasal aktivitesini artırmak için daha fazla çalışma yapılmalıdır. MXene bazlı NMs SC'lerdeki EED aracı ve bunları etkileyen farklı özellikler (yüzey etkileşimi, ara katman ağı, film yeniden istifleme, vb.) hakkında daha derin bir bilgi, etkili SC'lerin üretilmesine olanak sağlayabilir. MXen'lerin endüstri ile ilgili olası entegrasyonunun geliştirilmesinde, koruma, kontrol edilebilirlik ve büyük ölçekli üretim potansiyelini kısıtlayan diğer sorunların değerlendirilmesi gerekecektir.

**Özet**

Yenilenemeyen enerji kaynaklarının hızla tükenmesi ve ciddi çevre sorunları, temiz ve yenilenebilir enerji kullanımını büyük ölçüde teşvik etmektedir. Enerji kullanımı sırasında aralıklı bir adım olan süperkapasitörler, ultra hızlı şarj-deşarj oranları, yüksek güç yoğunlukları, düşük bakım ve uzun çevrim ömürleri nedeniyle büyük ilgi görmüştür. Bir süperkapasitörün enerji depolama mekanizması ve spesifik kapasitesinin üst sınırı, seçilen elektrot tarafından önemli ölçüde baskın hale getirilir. Gözenekli karbon malzemeler, geniş spesifik yüzey alanları, yüksek iletkenlikleri, kararlı kimyasal özellikleri, ayarlanabilir gözenek boyutları ve düşük maliyetleri nedeniyle süperkapasitörler için elektrot malzemeleri olarak uygun bir seçimdir. Son yıllarda, gözenekli karbon bazlı süper kapasitörlerin elektrokimyasal performansı büyük ilgi görmüş ve morfoloji/gözenekli yapı ve yüzey özelliklerinin orantılı tasarımı ile büyük ölçüde geliştirilmiştir. Bununla birlikte, bu gözenekli karbon elektrotlar için, pratik iyon dinamikleri, yük depolama mekanizmaları ve bunların elektrokimyasal performans üzerindeki etkileri sınırlı bir şekilde anlaşılmaya devam etmektedir. Bu nedenle, yük depolama mekanizmalarının, elektronların/iyonların iletim yollarının ve elektrokimyasal olarak aktif bölgelerin derinlemesine anlaşılması, daha etkin süperkapasitörler oluşturmak için son derece önemlidir. Biz bu çalışmada özellikle süperkapasitörlerin gözenekli karbon elektrotlarında iyon/yük depolanmasını ve katkı türleri ile elektrokimyasal performanslar arasındaki yapı-aktivite ilişkilerini ve en son gelişmeleri özetliyor ve tartışıyoruz.

**Anahtar Kelimeler:** Süperkapasitör, yenilenebilir enerji, gözenekli karbon elektrot, yük depolama mekanizması.

**EFFECTS OF PORE STRUCTURE ON ELECTROCHEMICAL CHARGE  
STORAGE MECHANISM IN SUPERCAPACITORS**

**Abstract**

The rapid depletion of non-renewable energy sources and serious environmental issues largely stimulate the utilization of clean and renewable energy. Supercapacitors, as an intermittent step during energy usage, have attracted wide attention due to their ultrafast charge–discharge rate, high power density, low maintenance and long cycle life. The energy storage mechanism and the upper limit of specific capacity of a supercapacitor is significantly dominated by the selected electrode. Porous carbon materials are an attractive choice as electrode materials for supercapacitors due to their large specific surface area, high conductivity, stable chemical properties, adjustable pore size and low cost. In recent years, the electrochemical performance of porous carbon-based supercapacitors has gained considerable attention and has been greatly improved via the rational design of morphology/porous structure and surface properties. However, for these porous carbon electrodes, there remains a limited understanding of practical ion dynamics, charge storage mechanisms and their influence on the electrochemical performance. Therefore, an in-depth fundamental understanding of the charge storage mechanisms, transport pathways of electrons/ions and the electrochemically active sites is extremely important for further building efficient supercapacitors. We specifically summarize the state-of-the-art progress, understand the ion/charge storage in porous carbon electrodes of supercapacitors, and further discuss the structure–activity relationships between doping species and electrochemical performances.

**Keywords:** Supercapacitor, renewable energy, porous carbon electrode, charge storage mechanism.

## Giriş

Küresel ısınma, çevresel bozulma ve yenilenemeyen enerjiye bağımlılık nedeniyle alternatif yakıt, yüksek değerli kimyasallar ve enerji kaynakları bulmak daha önemli hale geldi (Rawat vd., 2022; Zheng vd., 2022; Fan vd., 2023). Yeni enerji teknolojisindeki gelişmeler geleneksel enerjiye olan talebi azaltabilir (Fu vd., 2019a, Fu vd., 2019b). Yenilenemeyen enerji kaynaklarının hızla tükenmesi ve ciddi çevre sorunları, temiz ve yenilenebilir enerjinin kullanımını büyük ölçüde teşvik etmektedir (Béguin vd., 2014; Li and Wang, 2019; Chen vd., 2020). Bu nedenle, alternatif enerji kaynaklarının ve güvenilir enerji depolama teknolojilerinin geliştirilmesi, mevcut sorunları çözenin anahtarı haline gelmiştir (Cao vd., 2021). Süperkapasitörler, enerji kullanımı sırasında aralıklı bir adım olarak, ultra hızlı şarj-deşarj hızı, yüksek güç yoğunluğu, az bakım gerektirmesi ve uzun çevrim ömrü nedeniyle büyük ilgi görmüştür (McCloskey, 2015; Liu vd., 2019; Wang vd., 2020; Xie vd., 2020) (Şekil 1).

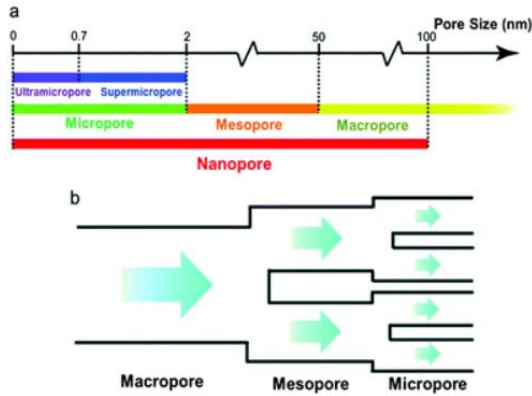

Şekil 1. Batarya ve süperkapasitörlerin Ragone eğrilerinin mukayesesi ( Kim vd., 2015).

Bu nedenle, gelişmiş bir süper kapasitör için önemli bir hedef, ideal bir elektrot malzemesi seçmektir. Çeşitli elektrot malzemeleri arasında gözenekli karbonlar, geniş yüzey alanları, ayarlanabilir gözenek boyutları, yüksek iletkenlikleri ve geniş kimyasal stabiliteyi nedeniyle süper kapasitörler için çekici bir elektrot adayı olarak kabul edilir. Bununla birlikte, mevcut süper kapasitörlerin sınırlı enerji yoğunluğu, yaygın uygulamalarını büyük ölçüde engellemektedir. Süper kapasitörlerin enerji yoğunluğu, gözenekli karbon elektrotun yapısına ve özelliklerine kritik olarak bağlıdır ve bu nedenle bunu optimize etmek, süper kapasitörlerin elektrokimyasal performanslarını arttırmanın anahtarıdır (Xie vd., 2020). Gözenekli malzeme yüksek bir özgül yüzey alanına sahiptir, şarj vedeşarj işlemi sırasında kimyasal reaksiyonlara girmez ve şarjı yüksek güvenilirlik ve döngü kararlılığı ile depolamak için elektrikli çift

katmanlı mekanizmaya dayanır (Wang vd., 2021; Han vd., 2020; Yang vd., 2021). Bu tür malzeme için, spesifik yüzey alanı ve gözenek yapısı, kapasitansı etkileyen temel faktörlerdir. Elektrikli çift katman teorisine göre, daha büyük bir özgül yüzey alanı, daha fazla şarj depolama alanı sağlar ve özgül kapasiteyi artırır. Karbon malzemenin özgül yüzey alanı küçük olduğunda, özgül kapasitans, özgül yüzey alanı ile pozitif korelasyon gösterir (Cao vd., 2021). Bu çalışmada ise elektrokimyasal yük depolamada gözeneklerin etkisi ele alınmıştır.

## **2.Süperkapasitör Elektrotlar İçin Gözenekli Yapılar**

Daha küçük ve büyük gözeneklerin biraraya getirilmesi, elektrot malzeme içindeki iyon transferi için güvenli ve oldukça önemlidir (Schwieger vd., 2016; Borchardt vd., 2018). Bu durumda, mikro (<2 nm), mezo (2~50 nm) ve makro gözeneklere (>50 nm) kadar farklı uzunluktaki gözeneklerden oluşan çok sayıda gözenekli karbon geliştirilmiştir (Trogadas vd., 2016; Liu vd., 2017; An vd., 2017; Gadipelli vd., 2020) ve gözenek tipleri Şekil 2a'da gösterilmektedir (Liu vd., 2017). Bu makro-mezo-mikro gözenekli karbonları kullanmaktaki temel amaç, belirli geometric sınırlamalar içerisinde küçük mikro gözeneklerin, zıt iyon yükünü filtrelemedeki etkinliği ve yüksek bir enerji yoğunluğu elde edebilmesidir. Makro- ve mezo-gözenekler ise hızlı ve etkin yük transferi için 'iyon yolu planlaması' sağlayabilir (Şekil 2b) (Zhou vd., 2018; Yu vd., 2015; Lee& Pyun, 2006).

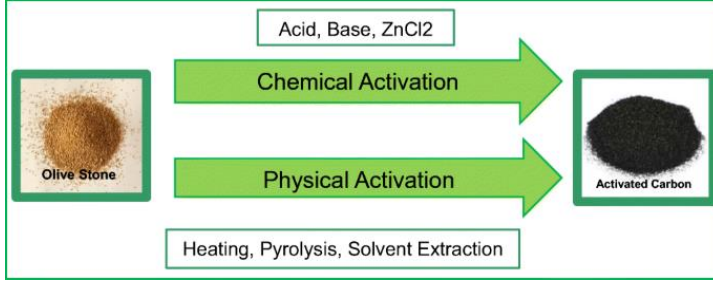

**Şekil 2. a)** Gözeneklerin genişliğine bağlı sınıflandırma, **b)** Gözenek yapısına bağlı iyon difüzyon yolunun şematik gösterimi (Xie vd., 2020).

### **2.1. Gözenekli Aktif Karbon Yapılar**

Aktif karbon (AC'lar), geniş yüzey alanı, iyi elektriksel özellikler ve düşük maliyet avantajlarına sahip, yaygın olarak kullanılan bir elektrot malzemesidir. AC'ler genellikle odun, kömür, fındık kabukları vb. gibi çeşitli karbonlu malzemelerin fiziksel (termal) ve/veya kimyasal aktivasyonu ile üretilir (Wang vd., 2021; Wang vd., 2020; Nguyen vd., 2021) (Şekil 3). Fiziksel aktivasyon genellikle buhar, karbondioksit ve hava gibi oksitleyici gazların

varlığında karbon öncüllerinin yüksek sıcaklıkta (700~1200 °C) işlenmesini ifade eder. Kimyasal aktivasyon genellikle potasyum hidroksit, sodyum hidroksit ve çinko klorür gibi aktivatörler kullanılarak daha düşük bir sıcaklıkta (400~700 °C) gerçekleştirilir (Lin vd., 2018; Jin vd., 2010). Aktif karbonun elektrik iletkenliği genellikle düşüktür, bu da gelişimini engellemektedir (Salunkhe vd., 2015). Yüksek iletkenlik ve elektrolitler için iyi gözenek afinitesi, AC tabanlı yüksek hızlı süper kapasitör elektrotlar için iki önemli özelliktir.

Şekil 3. Aktif karbon prosesi (Saleem vd., 2019).

## 2.2. Gözenekli Şablonlu Yapılar

Şablonlu karbonizasyon tekniği kullanılarak oluşturulan şablon gözenekli karbon (TC'ler), nanometre seviyesinde yapısal kontrol ile yapılabilir. Yumuşak şablon sentez yöntemi ve sert şablon sentez yöntemi olmak üzere iki farklı TC üretim yöntemi vardır (Şekil 4) (Xie vd., 2016).

Şekil 4. Sert ve yumuşak şablon sentezi (Lama, 2018).

Yumuşak şablon tekniği, düzenli mezo-gözenekli karbon üretmek için, karbonizasyonu takiben, bir karbon öncülü ve genellikle yüzey aktif maddenin kendiliğinden bir araya getirilmesi ile oluşur. Sert şablon yöntemi, benzersiz bir gözenek yapısına ve morfolojiye (zeolit veya metal oksit gibi) sahip bir şablonlama maddesinin seçilmesini, yüksek sıcaklıkta karbonizasyon için karbon öncülünün gözeneklerine sokulmasını ve daha sonra şablona benzer

morfolojili gözenekli karbon elde etmek için şablonlama maddesinin çıkarılmasını içerir. Şablon tekniğiyle üretilen düzenli gözenekli karbon, gözenekli şablonların birbirine bağlı mezogözenekli yapısıyla eşleşir (Nishihara& Kyotani, 2012). Şablonun gözenek yapısının seçilmesi veya değiştirilmesi, gözenekli karbonun gözenek yapısını doğrudan yönlendirebilir (Wang vd., 2021). Şablon gözenekli karbon, şablonun yardımıyla düzenli mezo-gözenekli bir yapı üretebilir, ancak sınırlı mikro gözenekleri nedeniyle, spesifik yüzey alanı nadiren  $1000 \text{ m}^2 \text{ g}^{-1}$ 'i aşabilir. Sonuç olarak, spesifik yüzey alanının artırılması, mikro gözenekler oluşturmak için aktivatörlerin kullanılmasını gerektirir ve bu da aynı zamanda şablon tekniğinin bir kısıtlamasıdır (Lu vd., 2017).

### **2.3. Grafen**

Grafen, sayısız özel özelliği nedeniyle süper kapasitörlerde daha sık kullanılmaktadır. Grafen, olağanüstü elektriksel iletkenlik, termal kararlılık, kimyasal kararlılık, esneklik ve spesifik yüzey alanı sergiler. Grafen, şu anda geliştirilen karbon malzemeler arasında en kapsamlı özellikleri göstermektedir. Xu ve çalışma arkadaşları, grafen oksidin hidrokinon ile tek aşamalı indirgenmesiyle işlevselleştirilmiş grafen jeller hazırlamıştır. Elde edilen işlevselleştirilmiş grafen jeller, süper kapasitörlerde yüksek elektrokimyasal performans sergiler ve ek katkı maddelerine ihtiyaç duymadan elektrot malzemeleri olarak kullanılabilir (Xu vd., 2013). Tek bir gözenekli karbonun bir elektrot malzemesi olarak oynayabileceği rolün hala sınırlı olduğunu ve üç ana eksiklik olduğunu bulmak zor değildir: Birincisi, gözenekli karbonun grafit yapısı zayıftır, grafitleşme derecesi düşüktür; İkincisi, gözenekli karbonun gözenek yapısı gelişmemiştir ve etkili yüzey alanı düşüktür; son olarak, heteroatom katkılamanın olmaması. Bu sorunları ele almak ve süper kapasitörlerin performansını zirveye çıkarmak için, gözenekli karbon, ikili ve hatta üçlü kompozit sistemler oluşturmak için diğer maddelerle birleştirilmelidir (Yang vd., 2023). Grafen tabakaları arasındaki  $\pi$ - $\pi$  etkileşimleri, grafenin kolayca topaklaşmasına ve istiflenmesine yol açar, bu da spesifik yüzey alanının, spesifik kapasitansın ve enerji yoğunluğunun azalmasına neden olur.

### **2.4. Karbid Türevli Gözenekli Yapılar**

Karbür türevi karbon (CDC), metal atomlarının karbür kafesinden aşındırılmasıyla üretilen yeni bir karbon malzemesi türüdür. CDC hazırlama yönteminin en avantajlı özelliği aşındırma işlemi sırasında karbürün şeklinin ve boyutunun değişmemesi ve karbon malzemenin atomik seviyede düzenlenebilmesidir. CDC'nin en basit ve yaygın olarak kullanılan hazırlama yöntemi ise halojen aşındırma yöntemidir, yani gözenekli karbon malzemeleri hazırlamak için karbürleri  $150\sim 1650 \text{ }^\circ\text{C}$ 'de aşındırmak için taze hazırlanmış halojen ( $\text{F}_2$ ,  $\text{Cl}_2$ ,  $\text{Br}_2$ ,  $\text{I}_2$ ) veya halojen

bileşikleri ( $\text{CCl}_4$ ,  $\text{CHCl}_3$ ,  $\text{Cl}_2\text{-HCl}$ ,  $\text{Cl}_2\text{-H}_2$ ,  $\text{HF}$ ) kullanılır. Şimdilerde ise  $\text{TiC}$ ,  $\text{SiC}$ ,  $\text{Mo}_2\text{C}$ ,  $\text{Al}_4\text{C}_3$ ,  $\text{Fe}_3\text{C}_4$ ,  $\text{Ti}_2\text{AlC}$  ve  $\text{ZrC}$  öncüller olarak bildirilmiştir (Jänes vd., 2007; Ding vd., 2016). CDC, ideal bir çift katmanlı elektrot malzemesinin bütün özelliklerine sahiptir: geniş spesifik yüzey alanı, hassas ve ayarlanabilir gözenek boyutu dağılımı, yüksek elektronik iletkenlik gibi (Lukatskaya vd., 2014). CDC'nin bu gözenek yapısı, çeşitli öncüller kullanılarak veya üretim boyunca aşındırma sıcaklığı değiştirilerek 0,6 ile 1,1 nm arasında hassas bir şekilde ayarlanabilir (Chmiola vd., 2006; Jänes vd., 2007; Ding vd., 2016; Cao vd., 2021).

### **2.5. Biyokütleden Üretilen Gözenekli Yapılar**

Biyokütleden üretilen karbon, karbon öncülü olarak karbon açısından zengin biyokütle kullanılarak yüksek sıcaklıkta karbonizasyon ve aktivasyon reaksiyonları ile oluşturulan gözenekli bir karbon malzemesidir. Şu anda, biyokütle gözenekli karbonun hazırlanması için iki yaygın hammadde bulunmaktadır: biri glikoz (Feng vd., 2020; Tooming vd., 2015) fruktoz (Cao&Yang, 2018) sakaroz (Vazquez-Samperio vd., 2020) ve nişasta gibi bir karbonhidrattır (Yadav vd., 2018), diğeri ise doğal bir bitki ve hayvan matrisidir. Polen (Cao vd., 2021), kitin (Zheng vd., 2021), üzüm (Wang vd., 2020), selüloz (Ewulonu vd., 2019), saç (Zhao vd., 2020) vb. gibi malzemeler. Biyokütle hammaddeleri çok sayıda doğal mikroskobik gözenek yapısına ve çeşitli heteroatomlara sahiptir, dolayısıyla biyokütle bazlı karbon malzemeleri de farklı mikroskobik morfolojiye sahiptir, yüzey kimyasal özellikleri ve çok sayıda gözenek yapısı gibi (Şekil 5).

**Şekil 5.** Süperkapasitörler için biyokütle türevli karbon malzemeler (Rawat vd., 2022).

Biyokütle, aktif karbon üretimi için sadece karbon kaynağı olmayıp aynı zamanda doğal bir yapıya da sahip olduğundan bu yapıların tam potansiyelleriyle kullanılması, biyokütle türevi gözenekli karbon ürünlerinde etkili gözenek yapılarının oluşmasını sağlar. Biyokütle bazlı gözenekli karbon malzemelerin avantajları, düşük maliyetleri, geniş kullanılabilirlikleri, çevre

dostu olmaları ve hazırlanma kolaylığıdır. Enerji depolama alanındaki uygulamaları, çevrenin uzun vadeli gelişimi ve korunması için kritik öneme sahiptir (Cao vd., 2021).

### **3. Sonuçlar ve Tartışma**

Aktif karbon, safsızlıklardan büyük ölçüde etkilenir. Şablon karbon, şablonların tanıtılması yoluyla karbon malzemelerin gözenek yapısını kontrol edebilir. Makro gözenekler-mezoporeler-mikro gözeneklere sahip gözenekli karbon, yalnızca iyon taşıma direncini azaltmakla kalmaz, aynı zamanda geniş spesifik yüzey alanı sağlar. Yumuşak şablon yönteminin şablonu çıkarması gerekmesede, mezoporların oranı mikro gözeneklerinkinden çok daha yüksektir, bu da düşük özgül yüzey alanına ve zayıf kapasitans performansına yol açar. Grafen çok yüksek bir iletkenliğe ve çok geniş bir özgül yüzey alanına sahiptir. Süper kapasitörlere uygulandığında, hızlı şarj-deşarj özellikleri ve iyi çevrim kararlılığı gösterir. Bununla birlikte, grafenin dezavantajı, katmanlar arasında yığılmasının kolay olması ve diğer gözenekli karbonlarla karşılaştırıldığında çok pahalı olmasıdır. Bu nedenle, süper kapasitörler için yüksek performanslı elektrot malzemeleri olarak gözenekli malzemelerin fonksiyonel özelliklerinin geliştirilmesi büyük önem taşımaktadır.

**Özet**

Hipertansiyon doğum sonu dönemde anne sağlığını etkileyebilecek önemli bir sağlık sorunudur. Bu dönemde hipertansiyon; kronik hipertansiyon geçmişi, gebelik hipertansiyonu, preeklampsi ve eklampsi olarak sınıflandırılmaktadır. Genellikle gebelikte seyreden yüksek kan basıncının doğum sonrası dönemde de aynı yükseklikte devam etmesi sonucu meydana gelmektedir. Hipertansiyon mutlaka tedavi edilmeli ve kan basıncı dikkatle takip edilerek normal seviyede tutulmalıdır. Başlangıç tedavisi hastalığın geçmişine, klinik bulgularına, ilgili semptomlara, laboratuvar bulguları olan idrarda protein, trombosit sayısı, karaciğer enzimleri, serum kreatinin, elektrolit düzeyine ve hipertansiyon tedavisine verilen cevaba bağlıdır. Çoğu anneye doğumdan önce başlanan antihipertansif ajanlara devam edilir, ancak doz artışı gerekli olabilir. Bu çalışma, güncel literatür incelenerek doğum sonu dönemde gelişen hipertansiyona ilişkin güncel yaklaşımlar konusunda sağlık profesyonellerini ve kadınları bilgilendirmeyi amaçlamaktadır.

**Anahtar kelimeler:** Doğum sonu dönem, hipertansiyon, ebelik, güncel yaklaşımlar

## **POSTPARTUM HYPERTENSION AND CURRENT APPROACHES**

### **Abstract**

Hypertension is an important health problem that may affect maternal health in the postnatal period. Hypertension in this period is classified as chronic hypertension history, pregnancy hypertension, preeclampsia and eclampsia. Generally, it occurs as a result of high blood pressure during pregnancy continuing at the same height in the postnatal period. Hypertension must be treated and blood pressure must be carefully monitored and kept at a normal level. Initial treatment depends on the history of the disease, clinical findings, related symptoms, laboratory findings such as protein in urine, platelet count, liver enzymes, serum creatinine, electrolyte levels and the response to hypertension treatment. Antihypertensive agents started before delivery are continued in most mothers, but dose increase may be necessary. This study aims to inform healthcare professionals and women about the current approaches to hypertension in the postpartum period by reviewing the current literature.

**Keywords:** Postnatal period, hypertension, midwifery, current approaches

## **GİRİŞ**

Hipertansif bozukluklar gestasyonel hipertansiyon, preeklampsi ve eklampsiyi içermektedir. Gebelikte gelişen hipertansiyon doğum sonrası devam etmekte veya gebelik boyunca kan basıncı normal aralıkta seyrederken doğum sonrası yükselebilmektedir. Bu nedenle doğum sonrası dönemde yeni başlayan hipertansiyonun da hipertansif bozukluklar içerisinde dahil edilmesi gerekmektedir. Doğum sonrası dönemde hipertansiyon, gebelikteki maternal komplikasyonları içermektedir (Katsi ve ark., 2020). Güncel çalışmalar göstermektedir ki gebeliğinde hipertansif hastalığı olan bir kadın yaşamının ilerleyen dönemlerinde Kardiyovasküler Hastalık gelişme açısından da risk altındadır (Sukmanee and Liabsuetrakul, 2022). Bir derleme ve meta analiz çalışması sonucunda; gebelikte hipertansif hastalık öyküsünün bulunması doğumdan sonraki 2 yıl içinde hipertansiyon gelişme riskini, normal kan basıncı olan gebelere kıyasla altı kat daha yüksek olduğu sonucuna ulaşılmıştır (Giorgione ve ark., 2021). Türkiye’de anne ölüm nedenleri içerisinde hipertansif durumlar ilk dörtte yer almaktadır (Sağlık Bakanlığı, 2021). Ayrıca Dünya Sağlık Örgütü verilerine göre anne ölümlerinin %75’inden sorumlu komplikasyonlar içinde hipertansif durumlar yer almaktadır (WHO, 2023). Gebelikte hipertansiyon sistolik kan basıncının 140/90 mmHg ve üzerinde olması veya 4 saat ara ile ölçülen diyastolik kan basıncını 90 mmHg ve üzerinde olmasıdır. Ayrıca 15-20 dakika aralıkla yapılan iki kan basıncı takibinde sistolik kan SKB  $\geq 160$  mmHg ve diyastolik kan basıncı  $\geq 110$  mmHg olması ciddi hipertansiyon olduğunu gösterir ve acil müdahale gerektirir (Katsi ve ark., 2020).

## **GENEL BİLGİLER**

Gebelikte kadın ile karşılaşılan ilk andan itibaren, preeklampsi oluşması için altta yatan bir risk faktörü var ise bunun belirlenip kontrol altına alınması gerekir. Kadın sağlıklı beslenme düzeni ve egzersiz yapması açısından desteklenmelidir (Karahana ve diğerleri, 2022). Aspirinin preeklampsinin önlenmesi ile ilgili yayınlanan raporlar 1980 yılından beri devam etmektedir. ASPRE denemesi, yüksek preeklampsi riski taşıyan kadınlarda 150 mg aspirin kullanımını plasebo grubu ile değerlendiren randomize bir çalışmadır. Çalışmanın sonucunda aspirin alan grupta preterm PE insidansı daha düşük bulunmuştur (Tousty ve ark., 2023). 2018 yılında yayınlanan preeklampsi (FACT) plasebo çalışmasında beş ülkede yürütülen uluslararası özellikle olup 8-16 gebelik haftasından doğuma kadar gebe kadınlara günde 1,1 mg folik asit takviyesi almaları sağlanmış ve yüksek doz folik asit takviyesinin preeklampsinin önüne geçemediği sonucuna ulaşılmıştır (Wen ve ark., 2018).

Günlük diyete kalsiyum takviyesi yapılmasının (500/600mg-2 gr) preeklampsinin gelişim riskini düşürebilir ancak etkililiği tam doğrulanmamıştır (Gunabalasingam ve ark., 2022). Doğum sonu dönemde kan basıncının kontrol altında tutulması için farklı antihipertansif ilaçlar kullanılmaktadır. En fazla nifedipin ve labetalol kullanılır. En sık kullanılan hızlı etkili hipertansif ajan nifedipin olmakla birlikte başka bölgede yapılan bir çalışmada en sık reçete edilen ilaç labetalol olmuştur. Bu durum farklı bölge, ilaca ulaşılma durumuna göre değişiklik gösterebilir (Ngene ve Moodley, 2020; Al-Duqhaishi ve ark., 2022). Şiddetli preeklampsi, eklampsi gibi durumlarda, konvülsiyon oluşumunu veya tekrar gelişmesini önlemek için Magnezyum Sülfat kullanımı genel olarak kabul edilmektedir (Hogg III ve ark., 2020). Doğum sonu dönemde belirli bir sıvı yönetimi protokolünü destekleyen önemli kanıtlar bulunmamaktadır ancak kılavuzlar kısıtlayıcı bir yaklaşım olmasını ve ek sıvı uygulamasını belirli durumlarda önermektedir. Genellikle, doğum için kabul edilen preeklamptik kadınlar, su ve elektrolit dengesinin korunması veya kaybedilen intravasküler hacmin yerine konması için sıvı tedavisine ihtiyaç duyabilir. Kristaloitlerin infüzyon hızı sabit 60 ila 80 mL.h<sup>-1</sup> olabilir. Aşırı sıvı yüklemesi durumu göz önünde bulundurulmalıdır (da Silva ve ark., 2021). Diüretikler ile ilgili bazı çalışmalar, postpartum annenin tansiyonunun daha çabuk kontrol altına alınmasını ve kan basıncı kontrolü için daha az tedaviye ihtiyaç duyulduğunu belirtse de kesin bir sonuç yoktur (Hogg III ve ark., 2020). Diüretikler gebe olmayan kadınlarda kan basıncını düşürür, ancak artık gestasyonel hipertansiyon için önerilmemektedir (Nimra ve ark., 2023). Şiddetli hipertansiyonu olan gebeler tromboemboli açısından daha fazla dikkat edilmesi gereken bir konumdadırlar. Sezaryen doğum olan kadınlarda pnömotik kompresyon cihazları kullanılması tavsiye edilmektedir (Hogg III ve ark., 2020). Yapılan bir çalışmada HELLP hastalarına kortikosteroid uygulanmasının, klinik belirtilerde azalma ve laboratuvar sonuçlarında olumlu gelişmeler saptanmıştır (Yang ve ark., 2016). Ancak literatürde doğum sonu dönemde kortikosteroid kullanımı ile ilgili kesinleşmiş bir bilgi bulunmamaktadır (Hogg III ve ark., 2020). Güncel veriler doğum sonu dönemde Nonsteroid antiinflamatuvar ilaç uygulamasının, kan basıncı kontrolünde ciddi bir negatif durum geliştirmedeği yönündedir. ACOG, ağrı yönetiminde NSAID kullanımını opioid ağrı kesici yerine tavsiye etmektedir (Hogg III ve diğerleri, 2020). Dünyada hipertansif durumların kontrolünde ve anne ölümlerinin azaltılmasında prepartum ve postpartum birçok izlem ve model bulunmaktadır. Bunlardan bazıları şunlardı: Safe@Home, evde kan basıncı ölçümü ve preeklampsi semptomlarının takibini gebenin kendisinin yapmasına olanak sağlayan dijital bir platformdur. Preeklampsi gelişme riski yüksek olan gebelerin 16. gebelik haftasından itibaren ve doğum öncesi ziyaret

sayısında azalma ile karakterize olarak deęerlendirmeyi amalar (van den Heuvel ve ark., 2020).Nurse-Family Partnership, gen, dşk gelirli, ilk kez anne olan kadınlar ve ailelerinin anne ve ocuk saęlıęının iyileştirilmesinde kanita dayalı bir programdır. Doęum ncesi dnemden doęum sonu bebeęin iki yaşına kadar olan srete hemşirenin ev ziyaretleri ile karakterizedir. Hipertansif durumlar aısından, saęlıklı doęum ncesi davranışların teşvik edilmesi ile doęum sonu dnemde olumlu gebelik sonuçları almak bu programın nemli hedeflerindedir (Jack ve ark., 2012). Teknolojinin yaygınlaşması saęlık alanında da yenilikler getirmiştir. Saęlıęın takibi mHealth gibi uygulamalar ile dijitale dklmüştür. Bu uygulama ile bireylerin vital bulgularının zamanında izlenmesi, saęlıkta bakımın saęlanması saęlık profesyonellerinin ortak alışmasını saęlar (Demir Yıldırım ve Hotun Şahin, 2022).

### **SONU VE NERİLER**

Hipertansif durumların kontrolnde saęlık profesyonelleri durumu btncl bakış aısı ile ele almalıdır. Postpartum dnemde kan basıncının kontrol esasen gebelik dnemine dayanmaktadır. Gebelikte hatta prekonsepsiyonel dnemde kadında hipertansif bir durum gelişmesi ynnden risk var ise tespit edilip nlem alınmalıdır. Hem gebelikte hem de doęum sonu dnemde medikal tedavi yntemleri ise her gn gelişmektedir. Saęlık profesyonellerinin anne lmlerinin nne geecek izlem ve modellerden yararlanması ile koruyucu saęlık hizmetleri, bakım ve postpartum dnemde hipertansif durumların kontrolnn saęlanması nem arz etmektedir.

**Abstract**

The purpose of this study is to inform policymakers, industry stakeholders, and the general public about the potential benefits and challenges of adopting EVs as a sustainable transportation solution, using literature review based approach. The findings of this study indicated that a transition process from conventional vehicles to EVs is rapidly taking effect already due to the numerous advantages offered by EVs. Firstly, EVs contribute to reducing greenhouse gas emissions, as they produce zero tailpipe emissions during operation. This reduction in emissions can help mitigate climate change and improve air quality, leading to better public health outcomes. Also, EVs have lower operating costs compared to conventional vehicles, primarily due to the lower cost of electricity compared to gasoline or diesel. Additionally, EVs require less maintenance, as they have fewer moving parts and do not require oil changes. The development and adoption of EVs can stimulate economic growth and job creation, as it requires investments in manufacturing, charging infrastructure, and research and development. However, several challenges need to be addressed to facilitate a successful transition to EVs. Firstly, the limited driving range of EVs compared to conventional vehicles remains a concern for potential buyers. Although the range of EVs has been improving, it is essential to continue investing in battery technology to increase their range and reduce charging times. Moreover, the availability and accessibility of charging infrastructure need to be expanded to alleviate range anxiety and ensure convenient charging options for EV owners. Furthermore, the upfront cost of EVs is currently higher than that of conventional vehicles, primarily due to the cost of batteries. However, as technology advances and economies of scale are achieved, the cost of EVs is expected to decrease, making them more affordable for consumers. Policymakers should prioritize investments in battery technology, charging infrastructure, and financial incentives to promote the widespread adoption of EVs. By doing so, a more sustainable and environmentally friendly transportation system can be achieved.

**Keywords:** Sustainable transportation, Electric vehicles, Reduced emissions, Automobiles.

## **Introduction**

The adoption of electric vehicles (EVs) as a sustainable transportation solution has gained significant attention in recent years due to the increasing concerns about climate change and air pollution. EVs are vehicles that are powered by electric motors and batteries, rather than internal combustion engines that run on gasoline or diesel. This shift towards EVs is seen as a crucial step towards reducing greenhouse gas emissions and promoting a cleaner and more sustainable transportation system (Alanazi, 2023; Muratori et al. 2021). The key operating principle of EVs lies in their use of electric motors to drive the vehicle. These motors are powered by rechargeable batteries, which store electricity that is used to propel the vehicle. The batteries can be charged using a variety of sources, including traditional electrical outlets, dedicated charging stations, or renewable energy sources such as solar panels. This reliance on electricity as a fuel source eliminates the need for gasoline or diesel, reducing the emissions of harmful pollutants such as carbon dioxide, nitrogen oxides, and particulate matter (Ortar & Ryghaug, 2019). One of the main driving forces behind the adoption of EVs has been the increasing awareness of the environmental impact of fossil fuel-powered vehicles. With concerns about climate change and air pollution on the rise, governments and consumers alike have been looking for cleaner and more sustainable transportation options. EVs, with their zero emissions and lower carbon footprint, have emerged as a promising solution to these pressing issues. Another factor that has contributed to the adoption of EVs is the advancement of technology. Over the years, significant improvements have been made in battery technology, allowing EVs to travel longer distances on a single charge and reducing the need for frequent recharging. Additionally, the development of charging infrastructure has made it easier for EV owners to recharge their vehicles, further increasing the appeal of EVs as a practical transportation option (Singh et al., 2023; Pinto et al., 2021; Yao et al. 2023; Tambunan; 2022). From a technical perspective, EVs offer several advantages over traditional gasoline-powered vehicles. EVs produce zero tailpipe emissions, which helps to improve air quality and reduce the harmful effects of pollution on human health and the environment. Additionally, EVs are more energy-efficient than gasoline-powered vehicles, as electric motors convert a higher percentage of energy from the grid into power to drive the vehicle. This efficiency can help to reduce overall energy consumption and dependence on fossil fuels. In terms of general introduction, the adoption of EVs is seen as a key strategy for achieving sustainability in the transportation sector. Governments, businesses, and individuals are increasingly recognizing the benefits of EVs in terms of reducing carbon emissions, improving air quality, and promoting energy

independence. (Hu et al., 2021; Li et al., 2020; Merfeld, 2019). As a result, there has been a growing investment in electric vehicle (EV) infrastructure, such as charging stations and incentives for EV purchases, to support the widespread adoption of EVs. EVs have gained significant attention in recent years as a sustainable transportation solution to combat climate change and reduce dependence on fossil fuels. From an industrial view, the adoption of EVs presents numerous opportunities for innovation and growth in the automotive sector. However, from a practical standpoint, there are still challenges that need to be addressed in order to fully realize the potential of EVs as a sustainable transportation solution (Kumar et al 2021; Srivastava et al, 2022; Hall & Lutsey, 2017). From an industrial perspective, the adoption of EVs offers a range of benefits for manufacturers, suppliers, and consumers. The shift towards electric vehicles has created new opportunities for innovation in battery technology, charging infrastructure, and vehicle design. Companies that invest in EV technology stand to benefit from increased market share and revenue as consumer demand for sustainable transportation options continues to grow. Additionally, the adoption of EVs can help reduce greenhouse gas emissions and improve air quality, leading to a healthier and more sustainable future for all. (Krishna, 2021; Singh et al., 2020; Jaiswal et al., 2022). There are several challenges that need to be addressed in order to accelerate the adoption of EVs. One of the main barriers to widespread adoption is the high upfront cost of EVs when compared to traditional gasoline-powered vehicles, and this can deter some consumers from making the switch. While the cost of EVs has been decreasing in recent years, it still remains a significant barrier for many consumers. In addition, the lack of charging infrastructure and range anxiety are also major concerns for potential EV buyers (Egbue et al., 2017; Broadbent et al, 2019). Without a robust network of charging stations, consumers may be hesitant to switch to electric vehicles due to concerns about running out of power while on the road. Additionally, the limited range of EVs and the availability of charging infrastructure can also be obstacles to widespread adoption. Despite these challenges, there are several strategies that can be implemented to promote the adoption of EVs as a sustainable transportation solution. Governments can offer incentives such as tax credits and rebates to encourage consumers to purchase EVs. Additionally, investing in charging infrastructure and public transportation options can help alleviate range anxiety and make EVs more convenient and accessible for consumers. Collaboration between government, industry, and consumers is essential to overcome the barriers to EV adoption and create a more sustainable transportation system for the future (LaMonaca & Ryan, 2022; Mastoi, et al., 2022; Mohammadi et al., 2023). However, advancements in battery technology, government

incentives, and increased public awareness are helping to address these challenges and drive the growth of the EV market. The adoption of electric vehicles as a sustainable transportation solution presents both opportunities and challenges from an industrial and practical standpoint. While the shift towards EVs offers numerous benefits for the automotive sector and the environment, there are barriers that need to be addressed in order to accelerate the adoption of EVs. By implementing strategies to reduce costs, improve infrastructure, and increase consumer awareness, we can create a more sustainable transportation system that benefits both current and future generations (Alanazi, 2023; Aijaz & Ahmad, 2022). Also, the adoption of electric vehicles as a sustainable transportation solution is a critical step towards reducing greenhouse gas emissions, improving air quality, and promoting energy efficiency. While there are challenges to overcome, the benefits of EVs in terms of sustainability and environmental protection make them a promising alternative to traditional gasoline-powered vehicles. By investing in EV infrastructure, incentivizing EV purchases, and raising awareness about the benefits of EVs, we can accelerate the transition to a cleaner and more sustainable transportation system. The present study argues that the adoption of EVs as a sustainable transportation solution can reshape the trends in conventional automobile applications, while it also explore the advancements in this field as well as demerits associated with EVs (Hossain et al.2022; Adnan et al .2018; Karduri & Ananth,2023).

## **2. Historical Development of Electric Vehicles**

EVs have been around for over a century, with the first known electric car dating back to the late 19th century. EVs have a long history dating back to the 19th century, when inventors such as Thomas Davenport and Robert Anderson first experimented with electric-powered vehicles. However, it was not until the late 20th century that EVs began to gain traction as a viable alternative to traditional gasoline-powered vehicles. In recent years, the development of EVs has been closely linked to the concept of sustainable transportation, as governments and consumers alike seek to reduce greenhouse gas emissions and combat climate change. One of the key drivers of the historical development of EVs has been the increasing awareness of the environmental impact of gasoline-powered vehicles. The transportation sector is a major contributor to greenhouse gas emissions, with cars and trucks accounting for a significant portion of these emissions. As a result, there has been a growing push for cleaner and more sustainable transportation options, with EVs emerging as a promising solution. The first EV was invented in the 1830s by Scottish inventor Robert Anderson, who created a crude electric carriage powered by non-rechargeable primary cells. However, it wasn't until the late 19th and

early 20th centuries that electric vehicles began to gain popularity. One of the earliest successful EVs was the Baker Electric, which was produced in the United States from 1899 to 1914 (Agamloh et al., 2020). These vehicles were popular among wealthy individuals, as they were quiet, easy to operate, and required minimal maintenance. In fact, EVs accounted for a significant portion of the automobile market in the early 20th century, with companies like Detroit Electric and Columbia Electric producing a wide range of models. However, the rise of the internal combustion engine and the availability of cheap gasoline led to a decline in the popularity of EVs. By the 1920s, most major automobile manufacturers had shifted their focus to gasoline-powered vehicles, and EVs were largely relegated to niche markets such as golf carts and delivery trucks. It wasn't until the late 20th century that EVs began to make a comeback. The oil crises of the 1970s and growing concerns about air pollution and climate change led to renewed interest in EVs as a cleaner and more sustainable alternative to gasoline-powered cars. In the 1990s, companies like General Motors and Toyota began producing EVs for the mass market, although these early models were limited by their range and performance. In recent years, advances in battery technology and the growing availability of charging infrastructure have made EVs more practical and affordable for consumers. The early days of EVs were marked by limited range and high costs, making them impractical for widespread adoption. However, advancements in battery technology and the push for sustainable transportation solutions have led to a resurgence in interest in EVs. (Hung & Lim 2020; Salmeron-Manzano & Manzano-Agugliaro, 2018). Today, EVs offer comparable performance to gasoline-powered vehicles, with the added benefit of zero emissions. Companies like Tesla have led the way in developing high-performance EVs with long ranges, while traditional automakers like Ford and Volkswagen have also begun to invest heavily in EV technology. Despite these advancements, electric vehicles still face challenges such as high upfront costs, limited charging infrastructure, and concerns about battery life and recycling. However, many experts believe that EVs are the future of transportation, as they offer a cleaner and more sustainable alternative to gasoline-powered cars. EVs have a long and complex history that stretches back to the 19th century. While they have faced challenges and setbacks over the years, recent advancements in technology and growing concerns about climate change have renewed interest in EVs as a viable alternative to conventional gasoline-powered cars. As the world continues to transition towards a more sustainable future, EVs are likely to play an increasingly important role in the transportation sector ((Singh et al., 2023; Pinto et al.,2021; Yao et al.2023; Tambunan;2022).

### **3. Advancements in EVs for Sustainable Transportation**

EVs have emerged as a promising solution to the environmental challenges posed by traditional gasoline-powered vehicles. With advancements in technology and innovation, EVs have become more efficient, affordable, and practical for everyday use. Electric vehicles (EVs) have witnessed significant technological advancements in recent years, making them a viable and sustainable alternative to traditional gasoline-powered vehicles. These advancements have been driven by a combination of factors, including government regulations, consumer demand for cleaner transportation options, and advancements in battery technology (Asghar et al., 2021; Sanguesa et al., 2021). One of the key innovations driving the adoption of EVs is the development of more efficient batteries. Lithium-ion batteries, which are commonly used in EVs, have witnessed significant improvements in energy density, charging speed, and lifespan. These advancements have led to longer driving ranges on a single charge, faster charging times, and reduced costs for consumers. As a result, EVs are now able to compete with traditional vehicles in terms of performance and convenience (Liu et al., 2022). Another important innovation in the EV industry is the development of smart charging infrastructure. With the increasing popularity of EVs, there is a growing need for reliable and efficient charging stations. Companies like Tesla and ChargePoint have been investing in fast-charging networks that can charge EVs in a matter of minutes, making long-distance travel more feasible. Additionally, smart charging technology allows EV owners to schedule charging times when electricity prices are lower, reducing the overall cost of ownership (Liu et al., 2022). Furthermore, advancements in electric motor technology have improved the efficiency and performance of EVs. High-efficiency motors and power electronics have made EVs more responsive and enjoyable to drive, while also reducing energy consumption. Furthermore, advancements in autonomous driving technology are also contributing to the sustainability of EVs, and also has the potential to further revolutionize the electric vehicle industry. Self-driving features such as lane-keeping assist, adaptive cruise control, and automatic parking can help reduce accidents and improve traffic flow, leading to lower emissions and fuel consumption, making EVs even more attractive to consumers. In the future, fully autonomous EVs could revolutionize the way we commute, making transportation more efficient and environmentally friendly (Nurliyana et al., 2023; Iranmanesh et al., 2023). Overall, the key technological advancements in electric vehicles have made them a more practical and sustainable transportation option. As battery technology continues to improve, charging infrastructure expands, and autonomous driving technology advances, the future of electric vehicles looks promising. With continued investment and

innovation, EVs have the potential to play a significant role in reducing greenhouse gas emissions and combating climate change. Despite these innovations, there are still challenges that need to be addressed in order to fully realize the potential of EVs as a sustainable transportation solution. One of the main barriers is the limited availability of charging infrastructure, especially in rural areas and developing countries. Governments and private companies need to invest in expanding the charging network to make EVs more accessible to a wider range of consumers. Innovations and technological advancements in EVs have made them a viable and sustainable transportation solution. With improvements in battery technology, charging infrastructure, and autonomous driving features, EVs are becoming more practical and convenient for everyday use. By transitioning to electric vehicles, we can reduce our carbon footprint, improve air quality, and decrease our dependence on fossil fuels. It is imperative that governments, businesses, and consumers work together to accelerate the adoption of EVs and create a more sustainable future for transportation. (Nurliyana et al., 2023; Sankeerthana, & Raghuram Kadali, 2022).

Figure 1: Classification of Electric Vehicles (EVs) according to engine technology and settings

#### **4. Why there must be Standards for Regulating (EVs)**

Yu et al. (2022) observed that with the increasing focus on sustainability and reducing greenhouse gas emissions, the adoption of EVs is seen as a crucial step towards achieving a more sustainable transportation system. However, in order to ensure the widespread adoption and success of EVs, it is essential to establish and adhere to standards that regulate their design, production, and operation.

- i. One of the key arguments in favour of implementing standards for EVs is to ensure safety and reliability. As EV technology continues to evolve, it is important to establish guidelines and regulations that govern the design and manufacturing of these vehicles. Standards related to battery safety, charging infrastructure, and vehicle performance can help to mitigate risks and ensure that EVs meet the necessary safety requirements.
- ii. Furthermore, standards can also play a crucial role in promoting interoperability and compatibility among different EV models and charging stations. By establishing

common standards for charging connectors, communication protocols, and battery technologies, it becomes easier for consumers to adopt EVs without having to worry about compatibility issues. This can help to accelerate the adoption of EVs and create a more seamless and user-friendly experience for consumers.

- iii. In addition, standards can also help to drive innovation and improve the overall performance of EVs. By setting benchmarks for energy efficiency, range, and charging times, standards can incentivize manufacturers to develop more advanced and efficient EV technologies. This can lead to the development of more reliable, affordable, and sustainable EVs that can compete with traditional gasoline-powered vehicles in terms of performance and convenience.

Standards regulating electric vehicles are essential for promoting sustainable transportation solutions. By establishing guidelines for safety, interoperability, and performance, standards can help to ensure the widespread adoption and success of EVs. Furthermore, standards can also drive innovation and improve the overall quality of EV technology. Therefore, it is imperative for policymakers, manufacturers, and stakeholders to work together to develop and implement robust standards that will help to accelerate the transition towards a more sustainable transportation system.

### **5. Key components in EVs**

Sharma et al. (2020).in their survey studies opined that electric vehicles (EVs) have shown promise as a solution for sustainable transportation, offering numerous environmental and economic benefits. In order to fully realize the potential of EVs in reducing greenhouse gas emissions and dependence on fossil fuels, it is essential to understand the following key components that make up these vehicles.

- i. One of the most important components of an EV is the battery. The battery is responsible for storing and providing the energy needed to power the vehicle. Advances in battery technology have led to increased energy density, longer driving ranges, and faster charging times, making EVs more practical and convenient for everyday use.
- ii. Another key component of EVs is the electric motor. Unlike traditional internal combustion engines, electric motors are more efficient and produce zero emissions. This not only reduces air pollution but also decreases noise pollution, creating a more pleasant driving experience for both the driver and surrounding communities.
- iii. Charging infrastructure is also a critical component of EV adoption. In order for EVs to become a mainstream transportation option, there needs to be a widespread network of

charging stations that are easily accessible to drivers. Governments and private companies are investing in expanding charging infrastructure to support the growing number of EVs on the road.

- iv. In addition to the physical components of EVs, software and connectivity play a crucial role in enhancing the driving experience. Features such as regenerative braking, energy management systems, and remote monitoring capabilities help optimize energy efficiency and performance, making EVs more attractive to consumers.

Overall, the key components of EVs work together to create a sustainable transportation solution that reduces greenhouse gas emissions, improves air quality, and decreases reliance on finite fossil fuels. As technology continues to advance and costs decrease, EVs have the potential to revolutionize the way we travel and contribute to a cleaner, greener future. EVs offer a viable solution for sustainable transportation, with key components such as batteries, electric motors, charging infrastructure, and software playing a crucial role in their success. By investing in EV technology and infrastructure, we can accelerate the transition to a more sustainable transportation system and reduce the environmental impact of our daily commutes.

### **6. Applications of EVs as Sustainable Transportation Solution**

Feng & Magee (2020) in their investigative study also observed that EVs have gained significant attention in recent years due to their potential to reduce greenhouse gas emissions and dependence on fossil fuels. While EVs are commonly associated with personal transportation, their applications extend beyond individual use to industrial, traffic, road, economic, and societal contexts highlighted as follows:

- i. In the industrial sector, EVs are increasingly being adopted for various purposes, such as material handling in warehouses and factories. Electric forklifts, pallet jacks, and other industrial vehicles offer lower operating costs, reduced emissions, and quieter operation compared to their diesel or gasoline counterparts. Additionally, EVs can be integrated into smart grid systems to provide grid stabilization and energy storage capabilities, contributing to a more sustainable industrial infrastructure.
- ii. In the realm of traffic and road applications, EVs play a crucial role in reducing air pollution and traffic congestion in urban areas. Electric buses, taxis, and delivery vehicles are becoming more prevalent in cities worldwide, offering cleaner and quieter transportation options for residents and visitors. Furthermore, the development of electric autonomous vehicles holds promise for improving road safety and efficiency, as well as reducing the environmental impact of transportation.

- iii. From an economic perspective, the widespread adoption of EVs has the potential to create new job opportunities in manufacturing, maintenance, and infrastructure development. The shift towards electric mobility also presents opportunities for innovation and investment in renewable energy sources, charging infrastructure, and energy storage technologies. Moreover, the reduced reliance on imported oil and the potential for cost savings on fuel and maintenance expenses can lead to economic benefits for individuals, businesses, and governments.
- iv. In terms of societal impact, the adoption of EVs can contribute to improved public health outcomes by reducing air pollution and noise pollution in urban areas. By transitioning to electric transportation, communities can mitigate the negative effects of vehicle emissions on respiratory health and overall well-being. Additionally, the promotion of EVs can help raise awareness about sustainable transportation practices and encourage individuals to make environmentally conscious choices in their daily lives.

EVs offer a wide range of applications beyond personal transportation, including industrial, traffic, road, economic, and societal contexts. By embracing the potential of EVs in various sectors, stakeholders can work towards a more sustainable and resilient future for both the environment and society as a whole.

### **7. Advantages of EVs as a Sustainable Transportation Solution**

(Hamurcu, & Eren, 2020; Kjellén & Tasala, 2020) opined that EVs have gained significant attention in recent years as a sustainable transportation solution. With the increasing concerns about climate change and air pollution, the adoption of EVs has been seen as a promising alternative to traditional gasoline-powered vehicles. The various advantages of adopting EVs as a sustainable transportation solution are as follows:

- i. One of the key advantages of EVs is their environmental benefits. EVs produce zero tailpipe emissions, which helps reduce air pollution and greenhouse gas emissions. Unlike conventional vehicles that run on gasoline or diesel, EVs are powered by electricity, which produces no emissions when driving. This not only helps to reduce air pollution in urban areas but also contributes to mitigating climate change by lowering greenhouse gas emissions. EVs produce significantly lower emissions compared to gasoline-powered vehicles, even when accounting for the emissions from electricity generation. This makes EVs a cleaner and more environmentally friendly option for transportation.

- ii. Another important characteristic of EVs is their energy efficiency. Electric motors are much more efficient than internal combustion engines, converting a higher percentage of the energy from the battery into motion. This means that EVs require less energy to travel the same distance as a conventional vehicle, resulting in lower energy consumption and operating costs. In addition, the regenerative braking system in EVs allows them to capture and store energy that would otherwise be lost as heat during braking, further improving their efficiency.
- iii. Furthermore, EVs offer the potential for renewable energy integration. By charging EVs with electricity generated from renewable sources such as solar or wind power, it is possible to further reduce the carbon footprint of transportation. This can help to accelerate the transition towards a low-carbon energy system and increase the overall sustainability of the transportation sector.
- iv. In addition to their environmental benefits, EVs also offer economic advantages. With the decreasing costs of battery technology and the availability of government incentives, the upfront cost of purchasing an EV has become more competitive with conventional vehicles. Moreover, the lower maintenance requirements of EVs, due to their simpler drivetrain and fewer moving parts, can result in long-term cost savings for consumers.
- v. Another advantage of EVs is their energy efficiency. EVs are more energy efficient than gasoline-powered vehicles, with electric motors converting over 60% of the electrical energy from the grid to power the wheels, compared to only about 20% for internal combustion engines. This higher efficiency means that EVs require less energy to operate, reducing overall energy consumption and dependence on fossil fuels.
- vi. In addition to their environmental and energy efficiency benefits, EVs also offer economic advantages. While the upfront cost of purchasing an EV may be higher than a traditional gasoline-powered vehicle, EVs have lower operating costs due to lower fuel and maintenance costs. The average annual fuel cost for an EV is about half that of a gasoline-powered vehicle. EVs have lower fuel and maintenance costs over their lifetime, making them a cost-effective option for consumers. Additionally, EVs have fewer moving parts than internal combustion engines, resulting in lower maintenance costs over the lifetime of the vehicle.
- vii. Furthermore, the adoption of EVs can also help reduce dependence on imported oil and improve energy security. By shifting to electric-powered vehicle transportation, countries can reduce their reliance on foreign oil imports and diversify their energy

sources. This can help reduce the vulnerability of transportation systems to oil price fluctuations and geopolitical tensions.

The adoption of EVs as a sustainable transportation solution offers numerous advantages, including environmental benefits, energy efficiency, lower operating costs, and improved energy security. Their zero emissions, energy efficiency, potential for renewable energy integration, and economic advantages all contribute to their appeal as a solution to reduce greenhouse gas emissions and improve air quality. As governments and industries around the world continue to promote the transition to electric transportation, it is clear that EVs have the potential to play a significant role in reducing emissions and creating a more sustainable future for transportation. As the technology continues to advance and become more widespread, EVs have the potential to play a significant role in achieving a more sustainable transportation system (Singh et al., 2023).

#### **8. Drawbacks of EVs as a Sustainable Transportation Solution**

(Balali & Stegen, 2021; Shah et al., 2021 & Sadeghian et al., 2022). EVs have been hailed as a sustainable transportation solution that can help reduce greenhouse gas emissions and combat climate change. However, the adoption of EVs also comes with its own set of disadvantages that need to be carefully considered. The key drawbacks of widespread adoption of EVs as a sustainable transportation solution are enumerated as follows:

- i. One of the main disadvantages of EVs is their high upfront cost. EVs are typically more expensive to purchase than traditional gasoline-powered vehicles, which can be a barrier for many consumers. Additionally, the cost of EV batteries, which are a key component of these vehicles, can be quite high and may need to be replaced after a certain number of years, further adding to the overall cost of ownership.
- ii. Another disadvantage of EVs is their limited range. While EV technology has improved in recent years, many EVs still have a limited driving range compared to traditional vehicles. This can be a major concern for consumers who need to travel long distances or who do not have access to charging infrastructure. Range anxiety, or the fear of running out of battery power while on the road, is a common issue for EV owners and can be a significant barrier to widespread adoption of these vehicles.
- iii. Charging infrastructure is another key disadvantage of EVs. While the number of charging stations is increasing, there are still not enough charging stations available to support widespread adoption of EVs. This can be a major inconvenience for EV owners, especially those who do not have access to a home charging station. Additionally,

charging times for EVs can be longer than refuelling times for traditional vehicles, which can be a major inconvenience for consumers.

- iv. Finally, the environmental impact of EVs is not as clear-cut as it may seem. While EVs produce zero tailpipe emissions, the production of electricity used to charge EVs can still generate greenhouse gas emissions, depending on the source of the electricity. This makes EVs a crucial tool in combating climate change and improving air quality in urban areas. Additionally, the production of EV batteries can have a significant environmental impact, as they require the extraction of rare earth metals and other resources.

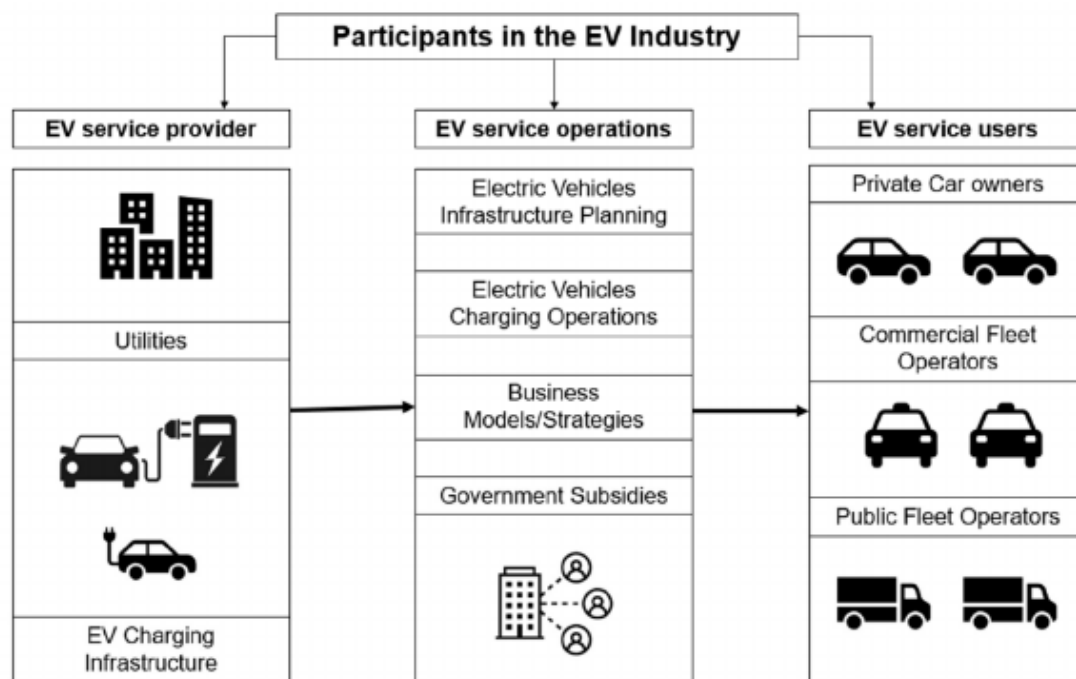

Figure 2: EV service operations/participants.

While EVs have the potential to be a sustainable transportation solution, they also come with a number of disadvantages that need to be carefully considered. High upfront costs, limited range, lack of charging infrastructure, and environmental impact are all key drawbacks of widespread adoption of EVs. It is important for policymakers, manufacturers, and consumers to carefully weigh these disadvantages against the potential benefits of EVs in order to make informed decisions about the future of transportation. However, the EV service industry's stakeholders and some of the key challenges that they deal with is illustrated in figure 2.

## **9. Conclusion and Recommendations**

The adoption of EVs) as a sustainable transportation solution is crucial in addressing the environmental challenges posed by traditional gasoline-powered vehicles. The transition to EVs offers numerous benefits, including reduced greenhouse gas emissions, improved air quality, and decreased dependence on fossil fuels. One of the key arguments in favour of EV adoption is the significant reduction in carbon emissions. EVs produce lower emissions over their lifetime compared to gasoline-powered vehicles, even when accounting for electricity generation from fossil fuels. This makes EVs a more environmentally friendly option for transportation. Furthermore, the adoption of EVs can also help improve air quality in urban areas. The emissions from gasoline-powered vehicles contribute to air pollution, which can have detrimental effects on public health. By switching to EVs, we can reduce harmful pollutants such as nitrogen oxides and particulate matter, leading to cleaner and healthier air for all. Additionally, the shift towards EVs can help reduce our dependence on fossil fuels, which are finite resources with negative environmental impacts. By utilizing electricity as a power source for transportation, we can take advantage of renewable energy sources such as solar and wind power, further reducing our carbon footprint. Despite the numerous benefits of EV adoption, there are still challenges that need to be addressed, such as the availability of charging infrastructure and the upfront cost of EVs. However, with advancements in technology and government incentives, these barriers can be overcome. The adoption of electric vehicles as a sustainable transportation solution is essential in combating climate change and promoting a cleaner, healthier environment. By making the switch to EVs, we can reduce emissions, improve air quality, and decrease our reliance on fossil fuels. It is imperative that we continue to support and promote the adoption of EVs to create a more sustainable future for generations to come. Based on the findings obtained from this study, the following recommendations are suggested for accelerated adoption and improved performance of EVs.

- i. Despite these benefits, the adoption of EVs still faces challenges. One of the main barriers to widespread adoption is the lack of charging infrastructure. To address this issue, policymakers and stakeholders should invest in expanding the charging network to make it more convenient for consumers to charge their EVs particularly in urban areas and along major highways. This could include installing charging stations in public places, workplaces, and residential areas, as well as offering incentives for businesses to install charging infrastructure. This will not only make it more convenient for EV

owners to charge their vehicles but also encourage more people to make the switch to electric transportation.

- ii. Another challenge is the upfront cost of EVs, which can be higher than traditional vehicles. While the cost of EVs has been decreasing in recent years, they are still more expensive than their gasoline-powered counterparts. To overcome this barrier, policymakers should consider implementing financial incentives such as tax credits, rebates, and subsidies to make EVs more affordable for consumers. In addition, promoting leasing and financing options for EVs can help make them more accessible to a wider range of consumers. Additionally, automakers should continue to innovate and find ways to reduce production costs without compromising on quality.
- iii. One of the main limitations of EVs is their limited driving range. Most EVs currently on the market have a range of around 200-300 miles on a single charge, which is significantly less than the range of traditional gasoline-powered vehicles. To address this limitation, it is important to continue investing in research and development to improve battery technology. This includes developing batteries with higher energy density, faster charging times, and longer lifespan. Additionally, expanding the infrastructure for charging stations is crucial to alleviate range anxiety and encourage more consumers to switch to EVs.

While there are still limitations that need to be addressed, the future of electric vehicles looks promising. By implementing the key recommendations discussed in this paper, such as improving battery technology, reducing upfront costs, and expanding charging infrastructure, we can overcome these limitations and accelerate the transition to a more sustainable transportation system. It is crucial for policymakers, automakers, and other stakeholders to work together to support the growth of the EV market and make electric transportation a viable option for all consumers (Alanazi, 2023; Asghar et al., 2021).

**ABSTRACT**

The purpose of the article is to improve the approach to software configuration of automated control systems. The subject of the study is experimental-static models used in this process. The work was carried out using the theory of relations, graphs and matrices. As a result, a universal method for machine synthesis of corresponding models was obtained. The algorithm implemented on its basis allows you to automate the process of configuring control systems for distributed technological objects. The development of modern metallurgical production is accompanied by the intensive introduction of automated process control systems (APCS) in all its areas. A special class of tasks is represented by the automation of centralized control of distributed technological objects (mainly on a territorial basis). Such facilities include both main production units (sinter plants, converter shops, mines, etc.) and industrial energy, telecommunications and transport systems and networks. The latter play an important role in the technological cycle of metallurgical, mining and coke-chemical enterprises [1 – 3]. The basis for the functioning of automated process control systems are mathematical models of production facilities and processes. Most modern automated process control systems are based on program logic, which determines the unity of the basic core software (software) of the systems themselves and experimental models for their research. However, complex distributed automation objects of a single series are characterized by different configurations of specific technical solutions. In this regard, it is necessary to adapt the software to a specific technical project, which is a separate stage in the design of the system itself [1, 4]. Traditionally, this task is solved using configuration files created in xml, txt, cfg, dll, ini, etc. format. Their direct compilation requires highly qualified designers, incl. certain knowledge and skills in the field of programming. To simplify and speed up this procedure, multiple tools and computer-aided design (CAD) systems have been developed for such files, which are based on experimental-static models (ESM) of the corresponding objects [1, 4 – 6]. However, a significant drawback of most of these CAD systems is the lack of their unification in relation to heterogeneous process control systems. Another disadvantage is the limitation of the dimensions of the designed objects due to the limited capabilities of the visualization tools for the user interface, the accumulation of analyzed information, etc. The goal of this work is to develop universal methods for synthesizing input ESMs for process control systems of large-dimensional objects on a computer.

**Keywords:** software configuration, automated control system, experimental-static model, machine synthesis, algorithm, distributed technological object.

## INTRODUCTION

A distributed technological object can be characterized by a set, where A, U and Z are, respectively, subsets of local management and control objects, their functional properties and logical connections between them. This set can be constructed in such a way that each element corresponds to a single element that connects it with the element, as well as a subset that specifies its properties that reproduce its functions. Based on this, each of the subsets of Y defines relations on its other subsets or external sets [7]:

$$\left\{ \begin{array}{l} (\forall a_i \in A) \rightarrow (\exists! z_{i,i+1} \in Z): a_i(z_{i,i+1})a_{i+1} \\ (\forall a_i \in A) \rightarrow (\exists \{u_{ij}\} \in U): a_i(u_{ij})\{f_{ij}\} \end{array} \right. \rightarrow \left\{ \begin{array}{l} A \subset Z \times Z \wedge U \times U \\ U \subset A \times F \\ Z \subset A \times A \end{array} \right.$$

where  $F = \{f_{ij}\}$  is the set of functions of the element  $a_i$ , specified by its properties  $\{u_{ij}\} \in U$ .

The set F is a characteristic of the dynamic component of the process control system or its test model and is uniquely determined by the set U onto which it is bijectively mapped ( $F \leftrightarrow U$ ). The relationship in formula (1), which must be embedded in the source code of the application software, connects the input ESM with the system itself. Therefore, the input model may not include the set F. Based on expression (1), the set Y can be uniquely displayed by a connected, mixed and weighted  $p \times q$  graph for which , where  $\Delta U$  is an additional subset of the proper properties of vertices  $v_i$  and edges  $e_j$  in the graph  $G_Y$  to identify its elements. The correspondence  $G_Y \leftrightarrow Y$  is reproduced in one of the following ways:

$$\left\{ \begin{array}{l} A \leftrightarrow V \\ Z \leftrightarrow E \\ U = U^G / \Delta U \end{array} \right. \vee \left\{ \begin{array}{l} A \leftrightarrow E \\ Z \leftrightarrow V \\ U = U^G / \Delta U \end{array} \right. \vee \left\{ \begin{array}{l} A \leftrightarrow G_Y^{T_h} \\ Z \subset V \times E \\ U = U^G / \Delta U \end{array} \right. \vee \left\{ \begin{array}{l} A_1 \leftrightarrow V_1 \wedge A_2 \leftrightarrow G_Y^{T_p} \\ Z \subset V \times E \\ U = U^G / \Delta U \end{array} \right.$$

where are the trees of the graph  $G_Y$ ;

- subsets reproduced by the vertices and trees of the graph  $G_Y$  ( , ), respectively.

The relation in formula (2) determines the incidence between the corresponding vertices and edges of the graph  $G_Y$ . Given that graph trees are always limited to vertices, matching is impossible [7]. Linking ESM with application software requires an analytical interpretation of the  $G_Y$  graph. An approach based on the direct use of topological matrices is not acceptable in this case for large-dimensional objects. The solution to this problem was found in the initial formation of ordinary blocks of a matrix of vector elements, which reproduces both topological and parametric (weight) properties of the graphical model.

Such a matrix is called a complex topological matrix (CTM). Blocks are created on the basis of components formed by cuts and adjacent to the reference vertices: . Each component must have structural completeness, which consists of maintaining the integrity of each element when it is reproduced by trees. The developed procedure for forming CFT blocks is as follows [7, 8]:

1. Determining the direction of analysis of the graph  $GY=(V, E)$  and numbering its elements in such a way that any of its components, obtained by an arbitrary cut, has a continuous (continuous) end-to-end numbering of vertices and edges.
2. Unification of the powers of sets specified by vectors  $(, )$ , by supplementing them with zero elements to the power of the most powerful vector:
3. Defining a set of ordered subsets of support vertices  $V'=\{V't\}$  for partitioning the graph into components as follows:- numbering of  $t$  sets is performed in the direction of graph analysis; - each subset must form, according to the principle of contiguity with respect to its elements (vertices), two simple cuts  $E't$  and  $E''t$ ;- provided or supporting vertices are selected in such a way that they enclose the corresponding trees.
4. Determination of cuts  $E'=\{e'i\}$  and  $E''=\{e''i\}$ , the corresponding elements  $e'i, e''i$  of which are adjacent relative to the vertices  $v'i$  according to the following principles:- for support vertices of sets with odd numbers, edges  $e''i$ , incident to the vertices, are assigned first in the direction of analyzing the graph relative to the support vertices, and edges  $e'i$  - second;- for support vertices of sets with even numbers - on the contrary, edges  $e'i$  are assigned first in the direction of graph analysis relative to the corresponding support vertices, and edges  $e''i$  are assigned second.

The above rules can be expressed by the following relations  $f^{\pm 1}, \varphi_{1,2}^{\pm 1}$ :

$$f^1(E'_t, E''_t) = f^{-1}(E'_t, E''_t) = [(e'_i \in E'_t) \wedge (e''_i \in E''_t)] \updownarrow [v'_i \in V'_t]$$

$$\varphi_1^1(V'_t) = \varphi_1^{-1}(E'_t) = \begin{cases} (e'_i \in E'_t) \downarrow (v'_i \in V'_t), \text{ если } t = x \\ (e'_i \in E'_t) \uparrow (v'_i \in V'_t), \text{ если } t = y \end{cases}$$

$$\varphi_2^1(V'_t) = \varphi_2^{-1}(E''_t) = \begin{cases} (e''_i \in E''_t) \uparrow (v'_i \in V'_t), \text{ если } t = x \\ (e''_i \in E''_t) \downarrow (v'_i \in V'_t), \text{ если } t = y \end{cases}$$

where  $x, y$  are, respectively, even and odd values of the number (index)  $t$ ;

“ $\updownarrow$ ” is a conventional symbol of contiguity;

“ $\downarrow$ ” is a conventional symbol of the incidence of an edge “to” the support vertex;

“ $\uparrow$ ” is a conventional symbol for the incidence of an edge “after” the support vertex.

5. Partitioning the graph into two ordered sets of components  $\{GE'k\}$  and  $\{GE''k\}$ , the elements of which have properties (3). The number  $k$  is assigned to them in the order in which the graph is analyzed, starting from one.

6. Compilation of CFT blocks for components  $GE^u$  and  $GE^w$ , where  $u$  and  $w$  are even and odd values of index  $k$ , respectively:

$$|M_{km_k}| = \begin{matrix} \begin{matrix} \overline{m_{11}^k} & \overline{m_{12}^k} & \dots & \overline{m_{1c}^k} \\ \overline{m_{21}^k} & \overline{m_{22}^k} & \dots & \overline{m_{2c}^k} \\ \dots & \dots & \dots & \dots \\ \overline{m_{d1}^k} & \overline{m_{d2}^k} & \dots & \overline{m_{dc}^k} \end{matrix} & \begin{matrix} i = \overline{1}, c, p \geq r \\ j = \overline{1}, d, d \geq r \\ m_{ij}^k = \langle n_e, n_v, u_\chi^e, u_\psi^v, \theta \rangle \end{matrix} \end{matrix}$$

where are topological-parametric vectors;

$i, j$  are the numbers, respectively, of the edges and vertices of the complete CFT, which correspond to the row and column in which the element is located;

$u_\chi^e, u_\psi^v$  – weight parameters for the corresponding element of the edge and vertex (indices  $\chi$  and  $\psi$  determine the numbers of these elements in the weight vectors);

$\theta$  is a topological property of the corresponding edge and vertex element.

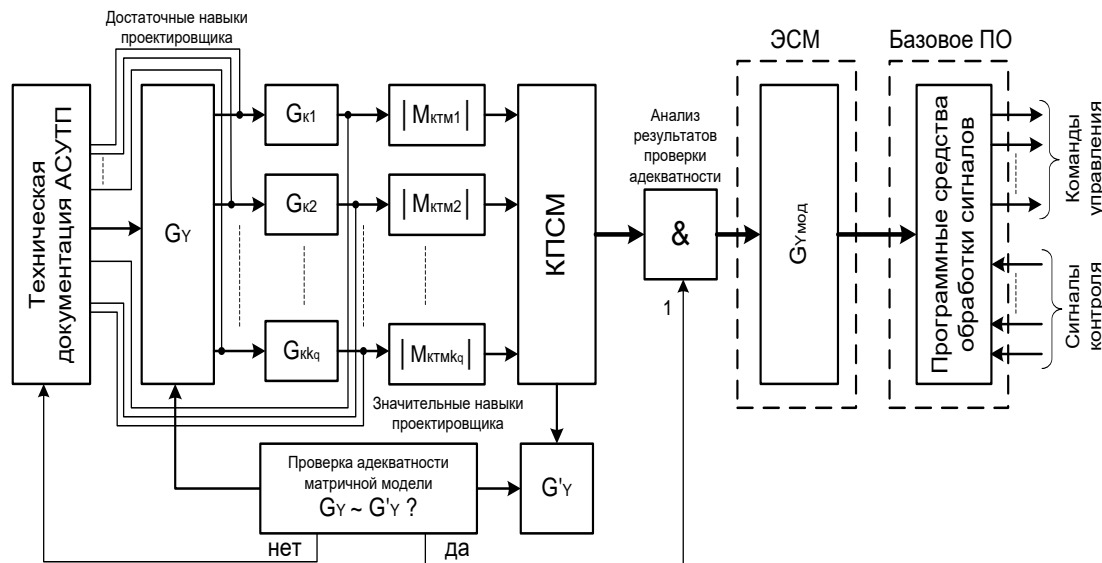

The values of the elements are assigned according to the following rule:

$$u_\chi^e = \begin{cases} u_1^e, \text{ если } j = 1 + rh \\ u_2^e, \text{ если } j = 2 + rh \\ \dots \\ u_r^e, \text{ если } j = r + rh \end{cases}, u_\psi^v = \begin{cases} u_1^v, \text{ если } i = 1 + rs & h = 0, 1, \dots, \left\lfloor \frac{c}{r} \right\rfloor, \\ u_2^v, \text{ если } i = 2 + rs \\ \dots \\ u_r^v, \text{ если } i = r + rs & s = 0, 1, \dots, \left\lfloor \frac{d}{r} \right\rfloor, \end{cases}$$

Based on formula (5), the minimum dimension of each matrix in formula (4), ensuring coverage of all vector elements for each vertex and edge of the graph, should be  $r \times r$ :  $c_{min}=r, d_{min}=r$ .

The topological property  $\theta = 0 \pm 1$  is determined by the type of matrices and corresponds to direct or indirect relationships between the elements of the graph. The most obvious way is to use the incidence property. Given the unity of the basic software of objects of the same type, machine synthesis of the ESM and its integration with the software is carried out according to

the following scheme (Fig.1)

Rice. 1. Functional diagram of machine synthesis of ESM

## CONCLUSION

The proposed method of ESM synthesis has the following advantages: universality of application for process control systems of any distributed objects, ease of implementation from the position of qualified designer (who has sufficient knowledge of the operating technology of the control object and its properties, encoded in the form of weight vectors), the ability to localize spatial areas of the object at different stages design, the ability to form test models only for a certain part of a large object. At the same time, the main disadvantage of the method should be considered the presence of a minimum threshold for the dimension of CFT blocks, which, in the presence of multiple properties in the elements of a technological object, can lead to an excessive size of individual local areas. This drawback can be eliminated by superposition of local and global objects, which can be interpreted by the nested and outer matrices, respectively. The implementation of this approach requires additional research in this direction.

**ABSTRACT**

This study proposes a hybrid optimization approach that integrates two distinct procedures, analytical and metaheuristic, aiming to estimate the five parameters of the single-diode model. The primary objective of this approach is to achieve increased accuracy, high stability, and a fast convergence rate for the proposed algorithm compared to conventional optimization algorithms. The methodology involves the analytical determination of three parameters based on the estimation of the other two provided by the JAYA metaheuristic optimization algorithm. By reducing the search space to two dimensions instead of five, the optimization becomes more flexible, simplifying the improvement process. The effectiveness of our approach is validated by applying it to an RTC France solar cell. The assessment of the quality of the obtained solutions is done by comparison with the results of classical optimization, significantly highlighting the remarkable performance of our approach.

## INTRODUCTION

Nowadays, the exploitation of photovoltaic (PV) energy in green electricity production is experiencing exponential growth globally [1], [2]. This development represents one solution among others to address concerns related to the risks of atmospheric pollution and the exhaustive consumption of non-renewable resources such as oil, coal, and natural gas [3], [4]. Solar energy is acknowledged for its numerous advantages, including cleanliness, sustainability, and universal availability. For these reasons, photovoltaic technology (PV), primarily based on PV cells, is the subject of extensive scientific research aimed at efficiently harnessing this energy resource to meet a portion of our energy needs. Photovoltaic cells (PV) are primarily composed of semiconductor materials with the property of absorbing photons to impart mobility to electrons through the photoelectric effect. This mobility, guided by forced polarization, generates electrical power dependent on the ambient temperature and illumination received by the PV cell [5]. This dependence poses a challenge in achieving a stable quantification of the produced energy and its suitability in terms of electrical power supply. Therefore, it is crucial to adopt electrical models capable of reproducing the electrical responses of these cells to estimate their energy productivity as a preventive step during assembly and installation. Models with a single diode (SD) [6], double diode (DD) [7] and three diodes (TD) [8] are widely used for this purpose. In practice, the (SD) model is preferred due to its simplicity and high precision. Fig. 1 illustrates its components, including a current generator with intensity  $I_{ph}$ , a diode  $D$  traversed by a current  $I_d$  where the reverse saturation current intensity is  $I_o$ , a series resistance  $R_s$  related to ohmic losses, and a shunt resistance  $R_{sh}$  associated with leakage current  $I_{sh}$ .

Fig.1. Equivalent electrical circuit for the SD.

By applying Kirchhoff's laws and using the Shockley equation expressing the diode current,  $I_d = I_o \cdot \left( \exp \left[ \frac{V + R_s \cdot I}{a \cdot V_t} \right] - 1 \right)$ , we can derive the characteristic equation (I-V) that relates the output current  $I$  and the output voltage  $V$  :

$$I = I_{ph} - I_o \cdot \left( \exp \left( \frac{V + R_s \cdot I}{a \cdot V_t} \right) - 1 \right) - \frac{V + R_s \cdot I}{R_{sh}} \quad (1)$$

where  $V_t = \frac{k \times T}{q}$  represents the thermal voltage,  $a$ : ideality factor of the diode,  $k$ : Boltzmann constant,  $q$ : electronic charge and  $T$ : cell temperature in Kelvin (K). To characterize this model, it is essential to determine its five optimal parameters, namely  $I_{ph}$ ,  $I_o$ ,  $R_s$ ,  $R_{sh}$  and  $a$ . The approaches used at this stage are mainly divided into three categories: analytical methods that employ mathematical simplifications and approximations to make the parameter expressions explicit [9], [10], iterative methods that use incrementation procedures and numerical calculation techniques [11], [12], and metaheuristics based on evolutionary optimization algorithms [13], [14]. In our work, we will adopt a combined approach that integrates both analytical techniques and metaheuristics. The specific steps of this approach will be detailed in the following section.

### 1. MATHEMATICAL PROBLEM FORMULATION

The five parameters of the single-diode model can be simultaneously determined conventionally using a metaheuristic optimization algorithm. It involves optimizing the objective function  $F$ , defined by Eq. (2), representing the root mean square error (RMSE).

$$F = \sqrt{\frac{\sum_{i=1}^N (I_{exp}(i) - I_{est}(i))^2}{N}} \quad (2)$$

where  $I_{exp}$  and  $I_{est}$  respectively denote the experimental current and the current estimated by the model, and  $N$  represents the number of data points in the (I-V) characteristic.

To obtain  $I_{est}$ , it is sufficient to solve Eq. (3) using the Newton-Raphson method:

$$I_{est}(i) = I_{ph} - I_o \cdot \left\{ \exp \left[ \frac{V_{exp}(i) + R_s \cdot I_{est}(i)}{a \cdot V_t} \right] - 1 \right\} - \frac{V_{exp}(i) + R_s \cdot I_{est}(i)}{R_{sh}} \quad (3)$$

By minimizing  $F$ , the optimal combination of parameters, denoted as  $\theta = (I_{ph}, I_o, R_s, R_{sh}, a)$ , can be derived. Fortunately, the (I-V) characteristic of a photovoltaic cell is always defined by three essential points:  $(I_{sc}, 0)$ ,  $(0, V_{oc})$  and  $(I_m, V_m)$ . These points are typically provided in the manufacturer's technical specifications. By evaluating Eq. (1) at these points, we can analytically develop the following system of equations [15]:

$$I_{ph} = \frac{I_{sc} \cdot \left(1 + \frac{R_s}{R_{sh}}\right) \cdot \left(\exp \left[ \frac{V_{oc}}{a \cdot V_t} \right] - 1\right) - \frac{V_{oc}}{R_{sh}} \cdot \left(\exp \left[ \frac{R_s \cdot I_{sc}}{a \cdot V_t} \right] - 1\right)}{\exp \left[ \frac{V_{oc}}{a \cdot V_t} \right] - \exp \left[ \frac{R_s \cdot I_{sc}}{a \cdot V_t} \right]} \quad (4)$$

$$R_{sh} = \frac{(V_m + R_s \cdot I_m) \cdot \left( \exp \left[ \frac{V_{oc}}{a \cdot V_t} \right] - 1 \right) - V_{oc} \cdot \left( \exp \left[ \frac{V_m + R_s \cdot I_m}{a \cdot V_t} \right] - 1 \right)}{I_{ph} \cdot \left( \exp \left[ \frac{V_{oc}}{a \cdot V_t} \right] - \exp \left[ \frac{V_m + R_s \cdot I_m}{a \cdot V_t} \right] \right) - I_m \cdot \left( \exp \left[ \frac{V_{oc}}{a \cdot V_t} \right] - 1 \right)} \quad (5)$$

$$I_o = \frac{I_{ph} - \frac{V_{oc}}{R_{sh}}}{\exp \left[ \frac{V_{oc}}{a \cdot V_t} \right] - 1} \quad (6)$$

where  $I_{sc}$  representing the short-circuit current,  $V_{oc}$  the open-circuit voltage, and  $I_m$ ,  $V_m$  denoting respectively the current and voltage corresponding to the maximum power point (*MPP*). The three parameters from Eqs. (4-6) can be easily calculated if  $a$  and  $R_s$  are known. Therefore, instead of searching for all five parameters simultaneously, we will narrow the search to  $a$  et  $R_s$  while incorporating the expressions for de  $I_{ph}$ ,  $R_{sh}$  and  $I_o$  into the objective function  $F$ . For the optimization algorithm, we chose JAYA due to its high capability for local search and simplicity, requiring no specific tuning of these intrinsic parameters [16]. This algorithm is based on the following equation :

$$x_{new\ i,j} = x_{i,j} + \alpha \cdot (x_{best\ j} - |x_{i,j}|) - \beta \cdot (x_{worst\ j} - |x_{i,j}|) \quad (7)$$

where  $x_{i,j}$  denotes the  $j^{th}$  component of the  $i^{th}$  candidate solution, with its absolute value noted as  $|x_{i,j}|$ ;  $x_{new\ i,j}$  represents the updated value of  $x_{i,j}$ ;  $x_{best\ j}$  and  $x_{worst\ j}$  denote, respectively, the values of the  $j^{th}$  component of the optimal solution and the worst solution.  $\alpha$  and  $\beta$  are two random numbers ranging between 0 and 1. The update of each solution's components is based on approximating the current best solution and measuring the distance from the least performing solution within the population. This strategy ensures the enhancement of solution quality throughout the evolution. The flowchart of JAYA, incorporating the analytical phase (\*), is depicted in Fig. 2

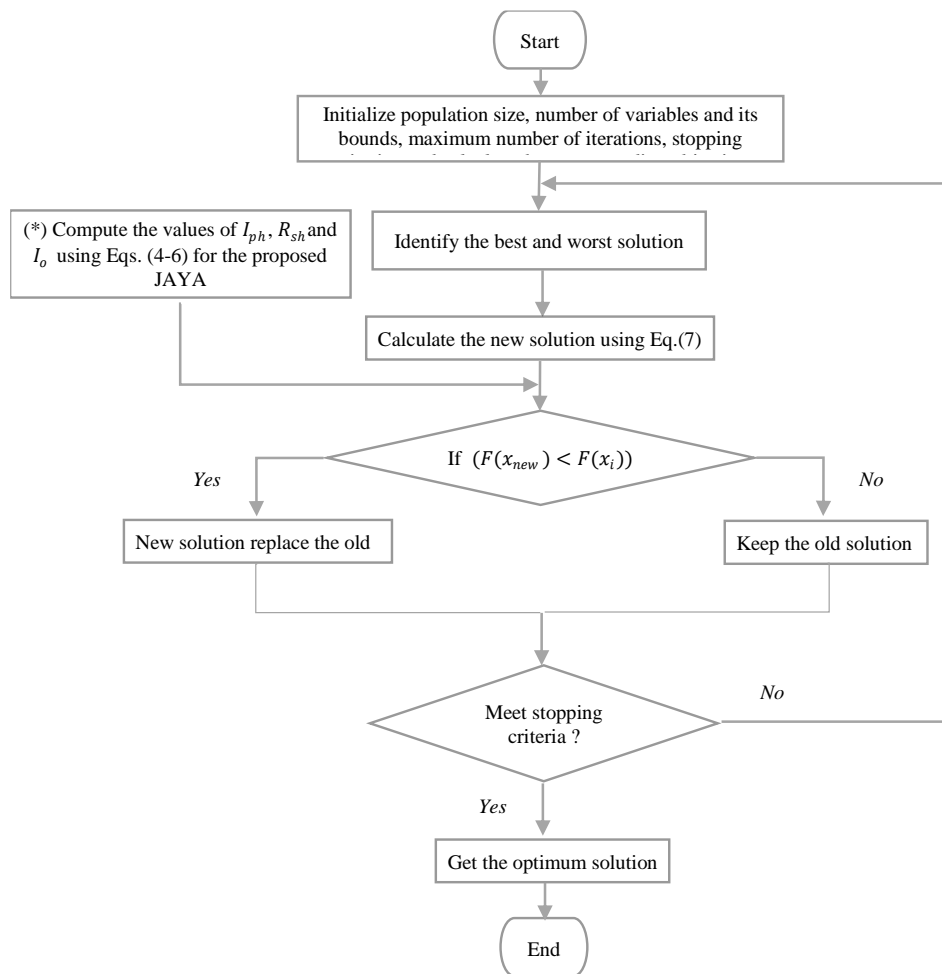

Fig.2. Flow chart of the JAYA proposed (\*)

## 2. RESULTS AND DISCUSSIONS

To validate the proposed method, we used an RTC France solar cell, and its characteristics are presented in Table 1. The experimental data for this cell are extracted from [17].

**Table 1**

RTC France solar cell electrical characteristics.

Electrical characteristics	Values
Current at MPP(A)	0.6894
Voltage at MPP(V)	0.4507
Short circuit current(A)	0.7603
Open circuit voltage(V)	0.5728
Test temperature (°C)	33
Test radiation (W. m <sup>-2</sup> )	1000

In this study, the proposed algorithm and the standard JAYA algorithm were executed separately for thirty iterations. The population size was set to thirty, with a maximum number of iterations fixed at one hundred. The lower and upper bounds of the search space are selected as follows:  $1 \leq a \leq 2$ ,  $0 \leq R_s \leq 1\Omega$ ,  $0 \leq R_{sh} \leq 100\Omega$ ,  $0 \leq I_{ph} \leq 1A$  and  $0 \leq I_o \leq 1\mu A$ . The statistical results, including the minimum (*Min*), maximum (*Max*), mean (*Mean*), and standard deviations (*Std*) of the objective functions *RMSE*, were consolidated in Table 2.

**Table 2**

The results of thirty tests performed.

Algorithm	Min	Max	Mean	Std
JAYA proposed	7.809288897E-04	7.809289125E-04	7.809288921E-04	5.956171839E-12
JAYA standard	8.558837315E-04	7.256816220E-03	2.950435049E-03	1.626164973E-03

The analysis of Table 2 highlights a remarkable consistency in the *RMSE* values obtained by the proposed JAYA, while the classical JAYA exhibits quite significant differences. These observations are supported by the standard deviation (*Std*) values recorded for the two compared algorithms. Indeed, the standard deviation obtained by our approach is significantly smaller than that of JAYA, indicating an increased stability of our algorithm compared to JAYA. Additionally, when examining the minimal *RMSE* values achieved, our algorithm shows a notably higher precision compared to the standard JAYA. These outstanding performances in terms of stability and precision undoubtedly confirm the effectiveness of reducing the search space through the integration of the analytical procedure within the metaheuristic algorithm. To illustrate this precision, we recorded the parameters associated with the best *RMSE* value obtained by our algorithm. These parameters are listed in Table 3 and are used to plot the (I-V) characteristic. Fig. 3 provides a comparison between experimental results and simulations

**Table 3** Best parameters obtained by the proposed algorithm.

Parameters	Values obtained
$a$	1.4777
$R_s(\Omega)$	0.036
$R_{sh}(\Omega)$	52.995
$I_{ph}(A)$	0.7608
$I_o(\mu A)$	0.3119

Fig.3. (a): The experimental and simulation I-V characteristics; (b): The relative error at each point.

According to Fig. 3, an excellent agreement between measurement and simulation data is observed. Regarding the relative error, it is also noted that, except for a few points, especially beyond the point corresponding to the open-circuit voltage, the error margins are minimal and do not exceed 0.9045%. Thus, the proposed method allows for a precise identification of the equivalent model parameters, enabling it to adequately describe the actual behavior of the studied cell. To highlight the impact of the analytical phase on the convergence rate, we plotted the convergence curves for the presented approach and the standard JAYA algorithm. The results are shown in Fig. 4. These graphical data reveal a significantly faster convergence of the proposed method compared to the standard JAYA algorithm. Specifically, our algorithm reached the best solution after fifty-five iterations, while the JAYA algorithm is still in the search phase at this point. This observation strengthens our positive assessment regarding the

beneficial impact of integrating the analytical phase on the convergence rate of the JAYA algorithm.

Fig.4. Convergence results for the tested algorithms.

## CONCLUSION

In this study, we have developed a hybrid approach for extracting parameters of the single-diode model. This method integrates an analytical phase into the JAYA algorithm during the search for optimal solutions. We assessed the effectiveness of this technique by applying it to an RTC solar cell. The results of the comparison clearly highlight the advantages of the proposed method over the conventional JAYA optimization algorithm. The integration of the analytical phase in tandem with JAYA has stabilized and accelerated the convergence of the algorithm, achieving remarkably high precision. These findings were corroborated by in-depth statistical analysis, convergence studies, and the calculation of precision indicators such as root mean square error (RMSE) and relative error. In summary, our hybrid approach has proven to be an effective and enhanced method for accurately estimating parameters of the single-diode model, paving the way for more reliable applications in the field of solar cell modeling.

**MSc. Ambra PURDE**

**Abstract**

**Introduction**

This study looks into artificial intelligence in the workplace and the challenges associated with utilizing this type of platform. Artificial Intelligence takes a multidisciplinary approach to understand how the dynamics of job growth. Investigating and analyzing the effects of artificial intelligence on employment and labor market dynamics is the goal of this study. However, there are a number of ways that the employment sector has been impacted by AI. The aim of this study is to analyze effects of artificial intelligence on the labor market. Methodology This study is based on a review of existing literature, academic journals, government reports, and various publications. This will show where the study stands in terms of the knowledge currently available and point out any gaps in the body of research. In addition to doing a literature analysis, the project will employ research surveys to collect data regarding the experiences and perspectives of artificial intelligence from a sample of employers and employees. We also detect the growing application of AI in labor market structure and employment dynamics by evaluating current labor market analyses. Results This study highlights the importance of adapting job seekers and organizations to these profound changes in technology, as well as the need for appropriate policy strategies to identify and take advantage of the opportunities AI brings to the labor market. An increase in the automation of routine tasks and a greater focus on data analysis and management skills are identified. Based on the studies conducted regarding the effect of artificial intelligence on the security of the labor market, it was found that it increased by 20%, no change by 60%, and decreased by 20%. Conclusion According to this study, we concluded that investing in artificial intelligence in the labor market is necessary for providing workers with the required abilities, as this kind of investment improves the efficient operation of work processes. Programs designed to assist staff members in keeping up with the rapid advancements in technology. Employers need to give improving training first priority.

**Keywords:** Artificial Intelligence, labor market, business, growth, routine tasks

## **Introduction**

In an era where technology is advancing quickly and reshaping how we work, artificial intelligence has emerged in the labor market as a driver of transformation and progress. Artificial Intelligence (AI) stands out as a groundbreaking technology, in today's world bringing about shifts, in the labor market dynamics and how tasks are carried out. This study looks into artificial intelligence in the workplace and the challenges associated with utilizing this type of platform. Artificial Intelligence takes a multidisciplinary approach to understand how the dynamics of job growth. Investigating and analyzing the effects of artificial intelligence on employment and labor market dynamics is the goal of this study. However, there are several ways that the employment sector has been impacted by AI. As such, it is essential to analyze the effects of AI on the labor market carefully. This study looks into how AI algorithms can be utilized to improve recruitment practices, performance management, and labor market data analysis. Various studies have shown different attitudes regarding the effects of new technologies on the labor market. While some researchers have expressed concerns about the potential replacement of jobs by AI, others have offered a more optimistic view, highlighting opportunities to create new tasks and enhance productivity. According to research findings, it has been shown that emerging technologies impact the labor market in ways leading to three outcomes; enhanced productivity, job displacement, and workforce relocation.<sup>1</sup> However, many of these studies have focused on the conditions, inside countries. In addition, according to recent analyses, there is a lack of specialized studies on the effects of artificial intelligence on the labor market in the context of Albania. However, these shortages are evident again; the rapid developments of artificial intelligence technology have also involved Albania. The aim of this study is to analyze and to investigate the effects of artificial intelligence on the labor market, focusing on the situation of the labor market, in Albania. The adoption of intelligent technologies has grown significantly over the past decade, presenting both opportunities and challenges in the professional sphere. This analysis purpose to provide a broad understanding of the impact of new technologies on employment at the global and local level, as well as to create a clear and detailed understanding of the effects of AI on the labor market, to face the challenges and benefits from the opportunities that this technology brings. The primary objective is to develop an understanding of the impact of intelligence, on employment and the

---

<sup>1</sup> Acemoglu, D., & Restrepo, P. (2019). "Automation and New Tasks: How Technology Displaces and Reinstates Labor". *Journal of Economic Perspectives*, 33(2), 3-30.

economy. This will be achieved by conducting research and data analysis. Additionally, the objective is to propose measures and regulations to adapt to these transformations and promote the integration of AI, in workplaces. Some of the objectives that we can mention in this study are:

1. The goal is to explore the benefits and obstacles associated with implementing AI in work environments.
2. We propose to understand how AI influences work dynamics reshaping employee roles and enhancing productivity.
3. Our objective is to suggest and evaluate strategies and policies that can address challenges and maximize the benefits of AI advancements, in the labor market.
4. We seek to comprehend how AI adoption affects recruitment methods and procedures across organizations.

In studies exploring the impact of Artificial Intelligence, on the labor market, researchers have distinguished between two perspectives, the view and the hopeful outlook. A major issue, in this field, is the threat, to service sector jobs posed by the progress of computerization and automation. Based on the model some researchers have determined that high degrees of jobs in the European Union are at high risk of automation.<sup>2</sup> Some researchers have shown that the labor market has undergone a split, over the decades favoring both low-skilled and high-skilled positions while positions requiring moderate skills have decreased due, to the advancement of computer technology. However, this polarization may change, given that some low- and medium-skill jobs may be relatively resistant to automation, while some high-skill but routine jobs may be vulnerable, potentially by technologies like AI.<sup>3</sup> In contrast, to the impact of computers and robots experts believe that the rise of intelligence will not necessarily lead to labor market polarization but will instead influence the evolution of jobs, across skill levels. Nonetheless, AI has indeed made its mark on the employment landscape in many ways. Albania, a nation changing at the end of the communist era, in the 1990s has seen shifts in its labor market due to factors like moving towards a market-based economy, labor migration, and advancements, in sectors.<sup>4</sup> Over the last ten years, we have seen a rise, in the tech and information industry leading to the emergence of IT firms and the generation of fresh

<sup>3</sup> Frey, C. B., & Osborne, M. A. (2013). "[The Future of Employment: How Susceptible Are Jobs to Computerisation? Technological Forecasting and Social Change](#)", 114, 254-280.

<sup>4</sup> Petropoulos, G and S Brekelmans (2020), "[Artificial intelligence's great impact on low and middle-skilled jobs](#)", Bruegel blog

employment opportunities. Investments in the field of artificial intelligence are of great importance for the development of the technology sector and international competition. The application of intelligence, in industries such, as finance, healthcare, transportation, and customer service could enhance productivity and lead to the development of fresh employment opportunities.<sup>5</sup> Startups and technology companies in Albania are focused on the development and implementation of artificial intelligence applications, contributing to the growth of the technology sector. The government and academic institutions offer programs and training in the field of artificial intelligence to accelerate the development of the competencies of employees in the country. The integration of intelligence, in the workforce presents both challenges and opportunities for employers, employees, and the economy overall. This includes adjusting the workforce to technologies and shifts, in skill requirements and talent demand. Through this extensive analysis, we aim to contribute to the development of employment policies and practices in Albania, ensuring that the country benefits from the advantages of artificial intelligence while minimizing potential social and economic challenges. In this context, a keyword for the future of the labor market is the adaptation of the workforce to new technologies, investing in training, and developing the skills needed to work with artificial intelligence. In addition, to help increase the awareness and use of artificial intelligence in the country, it is important to create a stimulating environment for innovation and technological progress, supporting start-ups and new firms in the technology sector.

### **Methodology**

This study is based on a review of existing literature, academic journals, government reports, and various publications. This will show where the study stands in terms of the knowledge currently available and point out any gaps in the body of research. In addition to doing a literature analysis, the project will employ research surveys to collect data regarding the experiences and perspectives of artificial intelligence from a sample of employers and employees. We also detect the growing application of AI in labor market structure and employment dynamics by evaluating current labor market analyses. The study proposes to use an appropriate methodology to examine the effects of artificial intelligence on the labor market in Albania. Initially, a review of existing literature, including academic journals, government reports, and various publications, will be conducted to identify and assess current knowledge

[https://akep.al/wp-content/uploads/2023/07/AKEP\\_RAPORTVJETOR-20223.pdf](https://akep.al/wp-content/uploads/2023/07/AKEP_RAPORTVJETOR-20223.pdf)

in the field. After reviewing the literature, a survey was developed via Google Forms to collect data on the experiences, opinions, and perceptions of employers and employees regarding artificial intelligence and the labor market globally and locally, including Albania. 100 employers and 100 job seekers responded to this survey. The survey questions were carefully designed to address the key themes of the study and to provide qualitative information for further analysis. After completing the data collection phase through the survey called "Effects of AI on the labor market", the data were analyzed with different methods appropriate to our study. Analysis is done using statistical tools to identify trends and different percentages in survey responses while evaluating individual responses to identify deep motives, experiences, and perceptions that cannot be captured through numbers. Finally, this study will examine the outcomes of research surveys. Evaluate the increasing integration of AI, in the structure of the labor market and employment dynamics in Albania. This will involve an evaluation of labor market patterns and the influence that AI technology has or could potentially have on these patterns. Furthermore, this study seeks to put forth suggestions and consequences for employment policies and practices in Albania based on the discoveries from the analysis. These suggestions encompass recommendations for employers, job seekers, government bodies, and educational institutions to enhance the utilization of intelligence in the labor market while also addressing the obstacles and opportunities stemming from this technology. This research also contributes to comprehending how artificial intelligence affects Albania's labor market and aids in formulating the policies and strategies to confront challenges and leverage the benefits of this technology, within employment scenarios.

### **Discussions**

The integration of methods offers an approach, to research. Analytics delve into individual's perspectives and experiences while also tracking trends and statistics. Assessing the impact of intelligence on Albania's labor market involves identifying sectors or professions most affected by automation and pinpointing areas with potential for increased employment through AI. Examining the economic implications of AI in Albania's workforce includes analyzing its effects on unemployment rates, productivity growth, and shifts in employment patterns. Drawing insights from this analysis allows for the formulation of recommendations and strategies to address challenges and leverage opportunities presented by AI in Albania's labor market. These recommendations may encompass initiatives such as training programs for AI skill development fostering innovation, in AI-related sectors, and implementing measures to mitigate disparities arising from technological advancements.

## Results

This study highlights the importance of adapting job seekers and organizations to these profound changes in technology, as well as the need for appropriate policy strategies to identify and take advantage of the opportunities AI brings to the labor market. An increase in the automation of routine tasks and a greater focus on data analysis and management skills are identified. Based on the studies conducted regarding the effect of artificial intelligence on the security of the labor market, it was found that it increased by 20%, no change by 60%, and decreased by 20%. After examining the gathered data, the findings of this research reveal viewpoints and encounters shared by employers and job seekers concerning the adoption of intelligence, within Albania's labor market.

Graph 1 shows indicates that a notable portion of employers (45%) perceive that artificial intelligence has influenced the setup of their workplaces indicating an impact this technology has, on their overall structure and functioning.

*Figure 1. The Effect of AI on Work Organization*

Graph 2 shows that 30% of employers have either utilized or intend to utilize intelligence in their employee hiring practices suggesting that there is potential, for further adoption of this technology, in the recruitment process.

*Figure 2. The Effect of AI on Work Organization*

Graph 3 shows that an important part of employees, in summary, 40%, see the use of artificial intelligence as something positive in the labor market in Albania. A smaller percentage, 20%, see it as something negative, while another equal percentage, also 40%, have a neutral attitude towards the use of artificial intelligence in employment.

*Figure 3. Personal Experiences with AI in Albania's Labor Market*

Most employers estimate that artificial intelligence has improved work efficiency and productivity in their organizations, pointing to the advantages this technology brings to business performance. The main challenges they reported are the lack of technical knowledge (25%) and data security (30%), which indicates the need for further investment and preparation to address these challenges. On the employee side, a significant percentage (35%) have noticed any change in the way work is organized or performed in their workplace after using artificial intelligence. This shows the real changes that the application of this technology brings to the work environment. Meanwhile, a higher percentage (50%) of employees see the use of artificial intelligence as an opportunity to develop their skills and careers, a feeling described as positive by many of them. Personal experiences with the use of artificial intelligence in the labor market in Albania are generally divided, with 30% of employees considering it positive and 15% considering it negative. This points to a wide spectrum of individual experiences and perceptions, which must be taken into account in the design of employment policies and strategies to face the challenges and take advantage of the advantages of artificial intelligence in the context of employment in Albania. On the side, many employees have observed shifts, in how work is structured or carried out following the incorporation of artificial intelligence in their workplace. This indicates that the adoption of this technology has resulted in alterations to routines and work procedures leading to a shift in organizational dynamics. Additionally, a

considerable number of employees view the integration of intelligence as a chance to enhance their skills and advance their careers. This showcases a sentiment, among employees regarding the advantages and prospects presented by intelligence technology for their career growth. Employee's opinions, on using artificial intelligence vary. Some find it beneficial, noting efficiency and work methods. However, others have faced challenges, like support or unclear procedures. This shows the range of experiences and viewpoints emphasizing the importance of considering these variations when shaping future employment guidelines and approaches.

### **Conclusions**

According to this study, we concluded that investing in artificial intelligence in the labor market is necessary for providing workers with the required abilities, as this kind of investment improves the efficient operation of work processes. Programs designed to assist staff members in keeping up with the rapid advancements in technology. Employers need to give improving training priority. In summary, the findings of this research reveal an overview of how artificial intelligence is utilized and perceived in the labor market, in Albania. While some organizations have embraced this technology to some extent there remains a portion that has yet to adopt it or harbors uncertainties about its implementation. This suggests the potential for increased adoption and utilization going forward. Generally, artificial intelligence has received assessments for enhancing work efficiency and productivity with challenges such as lack of expertise and concerns about data security being highlighted. This underscores the importance of training employees and implementing measures to safeguard data integrity and privacy. Additionally, employees view intelligence as a means to enhance their skills and careers but also recognize it as a threat to job security. This underscores the need for training initiatives. Raising awareness among employees about the possibilities and impacts of this technology. To maximize the benefits and utilization of intelligence in Albania's labor market organizations must address challenges while leveraging opportunities offered by this technology ensuring a sustainable adaptation, to technological advancements aligned with societal needs. Transitioning to a work environment that embraces intelligence would pave the way, for growth and sustainable development for everyone in the labor market, in Albania.

**Email:**pdthuan@ctu.edu.vn

**Abstract**

Vietnam and the United States are two countries with diplomatic relations many years ago. During the cold war, the Vietnam War (1961 - 1975) caused the relationship between Vietnam and the US to crack and the US had to withdraw from Vietnam in 1975. Since 1995, the two countries have resumed foreign relations and the United States has become an important country with Vietnam in economic development and has friendly diplomatic relations in all fields. The covid 19 pandemic has caused many health and life losses around the world, and vaccines are seen as the key to solving the difficulties caused by the covid 19 pandemic. Vietnam has to go through a lot of difficulties in dealing with the pandemic because of the scarcity of covid 19 vaccine resources. In that context, the help of a covid 19 vaccine from the United States is very important and necessary. As of March 2022, the United States is the largest vaccine donor to Vietnam. This affirms that the diplomatic relations between the two countries are in the best period, especially during the period when President Joe Biden focused on Southeast Asia, including Vietnam.

**Keywords:** Vietnam, The United States, diplomacy, COVID-19 vaccine, Asia

### **Overview of diplomatic relations between Vietnam and the US**

After the Vietnam War, the US and Vietnam restored diplomatic relations in 1995 and began to take diplomatic steps to serve the development strategy of both countries. The US has increased its economic support and aid to Vietnam. The impressive statistics increase year by year and the US has become a very important country in the economic development of Vietnam. In an effort to build Vietnam's self-reliance, the United States works to spur further growth and trade competitiveness, combat pandemic threats, promote renewable energy, address war legacy issues, and conserve Vietnam's forests and biodiversity. U.S. assistance in Vietnam focuses on consolidating gains to ensure sustainable economic development while promoting good governance and the rule of law. Assistance projects aim to deepen regulatory reforms, improve the capacity and independence of Vietnam's judicial and legislative bodies, and promote more effective public participation in the law and regulation-making processes. The United States also assists the Government of Vietnam to bring its laws and practices into compliance with international labor standards and effectively enforce labor laws and uphold workers' rights. U.S. assistance seeks to support Vietnam's response to climate change and other environmental challenges, including remediating Agent Orange/dioxin contamination, strengthening the country's health and education systems, and assisting vulnerable populations. The United States and Vietnam successfully concluded the first phase of dioxin remediation at Danang International Airport in 2017, and in December 2019 commenced a 10-year remediation project at Bien Hoa Air Base as well as a \$65 million initiative to provide assistance to persons with disabilities in conflict-affected provinces. Since entry into force of the U.S.-Vietnam bilateral trade agreement in 2001, trade between the two countries and U.S. investment in Vietnam have grown dramatically. The United States and Vietnam have concluded a trade and investment framework agreement; they also have signed textile, air transport, customs, and maritime agreements. U.S. exports to Vietnam include machinery, computers and electronics, yarn/fabric, agricultural products, and vehicles. U.S. imports from Vietnam include apparel, footwear, furniture and bedding, agricultural products, seafood, and electrical machinery. U.S.-Vietnam bilateral trade has grown from \$451 million in 1995 to over \$90 billion in 2020. U.S. goods exports to Vietnam were worth over \$10 billion in 2020, and U.S. goods imports in 2020 were worth \$79.6 billion. U.S. investment in Vietnam was \$2.6 billion in 2019 (U.S. Embassy and Consulate in Vietnam, 2021).

### **Situation of the Covid 19 Pandemic in Vietnam**

In 2020, Vietnam was cited by global media as having one of the best-organized epidemic control programs in the world. This success has been attributed to several factors, including a well-developed public health system, a decisive central government, and a proactive containment strategy based on comprehensive testing, tracing, and quarantining. From the end of April 2021, Vietnam experienced “a fast-spreading outbreak” of more than 350,000 cases. Clusters have been found in industrial parks in Bac Giang province and then in at least ten major hospitals in the country. As the epidemic has spread to many provinces in Vietnam, many outbreaks are occurring in many localities at the same time, making it “nearly impossible” to trace and cut the chain of infection. According to WHO, to prepare for the worsening situation, the country has built more than 30 field hospitals with a scale of 1,500 ICU beds and 30,000 non-ICU beds. When total cases reached a few thousands per day, the Central government decided to lock down the entire Southern Region with 35 million people, along with the capital, Hanoi, to contain the spread. On 26 July 2021, for the first time in the country's disease prevention history, Ho Chi Minh City imposed a daily night curfew beginning at 6:00 PM. As a result, no one is permitted to leave the city, and only emergency services are permitted to operate. On 28 July, the National Assembly gave the central government in Hanoi mandate to implement emergency measures for curbing the pandemic locally. The government also mobilized 10,000 troops to the city to enforce the lockdown and deliver food supplies. One of the main reasons for this outbreak is a four-day holiday for Reunification Day and International Workers' Day, which saw many vacation destinations packed with travellers. In addition, gene sequencing results show that the SARS-CoV-2 Delta variant is the dominant variant in this wave, especially among cases in central and southern localities of Vietnam. On 29 August, Vietnamese Prime Minister Pham Minh Chinh announced that Vietnam may face a protracted battle and cannot rely on indefinite closures and quarantines. He also acknowledged the possibility that Vietnam will have to live with the virus. This marks a major change in the country's approach to COVID-19.

In response to the covid 19 pandemic, Vietnam has stepped up its covid 19 vaccination campaign<sup>6</sup>. In an effort to find a supply of the covid 19 vaccine to fight the pandemic. Vietnam has activated a strategy of covid 19 vaccine diplomacy and achieved some desirable achievements. On 16 June 2021, Vietnam also received 966,320 doses of AstraZeneca COVID-19 vaccine donated by Japan. On 25 June, it is announced that Japan will donate another 1 million doses of AstraZeneca vaccine to Vietnam. The first batch of this donation (400,000 doses) arrived at Tân Sơn Nhất International Airport on 2 July, while the second batch arrived

<sup>6</sup> Following the approval of the Oxford–AstraZeneca COVID-19 vaccine on 30 January 2021, vaccinations commenced on 8 March 2021, and will continue throughout the year with the goal of vaccinating 80% of the population by June 2022. The Sputnik V was later approved for use on 23 March 2021. Sinopharm COVID-19 vaccine was approved for emergency use on 4 June 2021, while Pfizer–BioNTech COVID-19 vaccine, Moderna COVID-19 vaccine and Janssen COVID-19 vaccine were approved on 12 June 2021, 29 June 2021, and 15 July 2021, respectively. This is the country's largest-ever immunization campaign with over 150 million doses. Although Vietnam is a success story in disease prevention and has kept outbreaks under control, the country's COVID-19 vaccination program is considered to be slower than most countries in Asia. As of 27 August 2021, Vietnam has administered 19,151,122 vaccine doses across the country. It expected that a total of 124 million doses would be available by the end of 2021

on 9 July. On 16 July, Japan sent another 996,740 doses of AstraZeneca vaccine to Vietnam. On 3 August 2021, Vietnam received 415,000 doses of AstraZeneca vaccine donated by the UK Government. On late August, Vietnam also received 501,600 doses and 300,000 doses of AstraZeneca vaccine donated by Poland and Romania. On 26 August 2021, Vietnam received 404,000 doses of COVID-19 vaccine part of Australia's commitment to provide 1.5 million doses of AstraZeneca vaccine for Vietnam through UNICEF. In total, Vietnam has received 18.92782 million AstraZeneca COVID-19 vaccine doses. On July 10, Vietnam received 2,000,040 doses of Moderna COVID-19 vaccine donated to the COVAX Facility by the United States Government. On 7 July 2021, the first batch of Pfizer's vaccines, containing 97,110 doses, arrived at Nội Bài International Airport. It was later confirmed that Vietnam received 746,460 doses of Pfizer's vaccines that day. A day earlier, on 6 July, it is also confirmed that the United States would send Vietnam two million doses of Moderna COVID-19 vaccine via Covax mechanism. This batch of vaccines arrived in Vietnam on 10 July. Another batch containing 3,000,060 doses of Moderna vaccine donated to COVAX by the US Government arrived in Hanoi on 24 and 25 July. On 11 August 2021 and 26 August 2021, Vietnam received 217,620 and 770,000 doses of Pfizer's vaccines purchased by the government. On 25–27 August 2021, Vietnam received 1,065,870 doses of Pfizer vaccine donated by the US government. Vietnam received 250,800 doses of AstraZeneca and Moderna COVID-19 vaccine donated by the Czech Republic on 30 August.

Share of people vaccinated against COVID-19, Mar 9, 2022

Looking at the above statistics, it shows that vaccination against covid 19 in Vietnam is faster than many other countries in the world.

## 3. The US's COVID-19 vaccine aid policy for Vietnam

On August 3, the White House released a notice saying that so far, the US has donated and handed over 110 million doses of Covid-19 vaccine to more than 60 countries and territories around the world to affirm its position “Global leader in support of Covid-19 vaccines”.

According to the United Nations, the number of covid 19 vaccines that the US gives is higher than all the vaccines aided by all other countries combined and shows the generosity of the US. Based on the list attached to the notice by the White House, Vietnam ranks 7th in the list of countries receiving the most vaccines from the US with 5 million doses, after Indonesia (8 million), the Philippines (over 6.2 million doses), Colombia (6 million), South Africa (more than 5.6 million), Pakistan (5.5 million doses), Bangladesh (5.5 million).

According to the White House, the US vaccine aid is part of President Joe Biden's strategy to stop the pandemic from spreading globally. Mr. Biden has pledged that the US will become “the army of vaccines for the world”.

The visit of US Vice President Kamala Harris to Vietnam from August 24-26 can be considered a new milestone in the Vietnam - US relations when in the last two consecutive terms, leaders

at senior level The highest ranking officers in the new US administration all visited Vietnam within the first year after taking office. Vice President Kamala Harris announced that the US will continue to support Vietnam with 1 million doses of Pfizer vaccine, bringing the total number of US vaccines for Vietnam to 6 million doses; said it will continue to support Vietnam to access vaccines faster, including vaccines for children. At the same time, support in medical equipment, improve medical capacity to cope with other epidemic risks in the long run. Through the American Rescue Plan Act (ARPA) and other emergency resources, the United States Agency for International Development (USAID) and CDC provide an additional \$23 million in technical assistance to Vietnam to respond to the pandemic. COVID-19 pandemic, bringing the total support since the beginning of the pandemic to nearly \$44 million. This support will promote equitable access and safe and effective delivery of a Covid-19 vaccine, strengthen Vietnam's health system to respond to Covid-19 and build capacity to detect, monitor Covid-19 and future disease threats. USAID also donated \$1 million to the Vietnam Red Cross to reduce the impact and prevent the spread of Covid-19 in vulnerable communities. Vice President Kamala Harris and Vietnamese Prime Minister Pham Minh Chinh attended the opening ceremony of the Southeast Asia Regional Office of the US Centers for Disease Control and Prevention (CDC) in Hanoi. The U.S. CDC Office will promote global health security by maintaining a sustained presence in the region, enabling a rapid and effective response to health threats whenever they occur. and reinforces CDC's core mission of protecting the American people. Vietnam is very supportive and grateful to the United States for choosing Hanoi as the location for the Office, thereby demonstrating the good development as well as bright prospects of the diplomatic relations “Comprehensive Partnership United States- Vietnam” and affirmed that Vietnam will create favorable conditions for the Office to operate effectively.

Looking at the above statistics, it shows that the United States is the country with the most support for the covid 19 vaccine for Vietnam in dealing with the covid 19 pandemic. The US covid 19 vaccine aid for Vietnam has been helped Vietnam a lot in responding to the pandemic and this action of the United States has given great affection of the Vietnamese government and people to the United States.

#### **4. The causes of the support of the covid 19 vaccine that the US has for Vietnam and the prospects of diplomatic relations between Vietnam and the US**

##### **4.1.The competition between China and the US in “Vaccine diplomacy”**

According Hotez (2014) Vaccine diplomacy refers to almost any aspect of global health diplomacy that relies on the use or delivery of vaccines and encompasses the important work of the GAVI Alliance, as well as elements of the WHO, the Gates Foundation, and other important international organizations. Central to vaccine diplomacy is its potential as a humanitarian intervention and its proven role in mediating cessation of hostilities and even cease-fires during vaccination campaigns. Among the initiatives relevant to vaccine diplomacy in the 21st century are international efforts to ensure universal or equitable access for low- and

## ***VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY SCIENTIFIC STUDIES***

***April 09-16, 2024 / Lisbon, Portugal***

middle-income countries to urgently needed vaccines for diseases of pandemic potential (Hotez, 2014). Over a long period of time, vaccines and vaccine diplomacy have been increasingly developed, which is associated with the progress and development of medicine, and also contains political elements. The modern era of American vaccine diplomacy followed on the heels of the Marshall Plan when US technical and scientific resources were first engaged in foreign policy. In the 1950s, when polio epidemics occurred every summer in North America, Europe and the USSR, Albert Sabin began to work closely with Soviet virologists in order to develop, test and license the live polio vaccine. It is not widely known that the attenuated polio strains developed in Sabin's laboratory at the University of Cincinnati were transformed into a clinically useful oral vaccine with the help of Soviet virologists. Presumably it was the terror that polio inflicted into parents on both sides of the Atlantic that prompted both the Americans and Soviets to set aside their ideological differences in 1956 (Benison, 1982). At the height of the Cold War, leading Soviet virologists travelled to Cincinnati where they obtained a commitment from Dr Sabin to provide them with his vaccine strains. In a landmark reciprocal visit a few months later, Sabin received permission to visit the laboratories of Soviet scientists. Both exchanges proceeded with the tacit approval of a stridently anti-communist Republican Eisenhower administration. What followed was a remarkable example of Cold War diplomacy, in which Soviet children were among the first to receive test doses of the oral polio vaccine. By 1960, millions of Soviet children were vaccinated. Only after its safety had been established in the USSR and validated by Dorothy Horstmann from Yale, was the Sabin vaccine approved and licensed in the USA. Similar co-operation channelled through the WHO led to the introduction of essential smallpox freeze-drying technology (Hotez, 2001). During the covid 19 pandemic, countries such as the US, China, Russia, and Japan have used vaccine diplomacy as a tool to increase political and economic influence. It is like a series of "soft power" in the pandemic and post-pandemic era. According Nicholas (2020), As the Biden transition team plots out how best to rebuild the alliances and international cooperation mechanisms that were so badly eroded during the Trump presidency, one early proposal floated by some of Biden's key advisors seems likely to rise to the fore, and could even serve as the centerpiece of a new "Biden Doctrine" in the first 100 days. According to Jake Sullivan, a top Obama era official routinely mentioned as a possible National Security Advisor, Biden should, "put values and democracy back at the center of US foreign policy... Rally[ing] like-minded free democratic nations in common purpose to both push back against authoritarian competitors and also construct and build the kind of long-term durable solutions for the challenges that afflict us all."

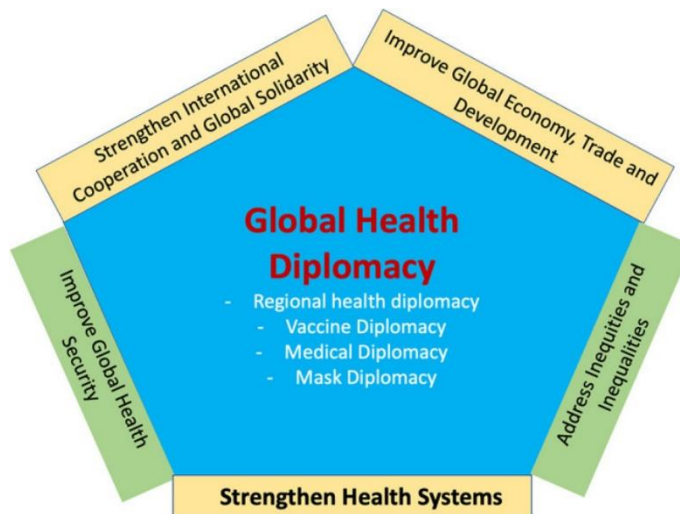

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

*April 09-16, 2024 / Lisbon, Portugal*

Concretely, this may manifest itself in a US-convened global “summit of democracies” possibly based on the D-10 model, the world’s 10 largest democracies, a concept the Atlantic Council has advanced through the work of its Scowcroft Center. For China, because it was an early producer of the covid 19 vaccine and quickly controlled the pandemic, it quickly implemented vaccine diplomacy as an effective tool of influence. According Soew Ting Lee (2021) Despite international efforts to address vaccine access, most notably through the creation of COVAX, low- and middle-income countries have struggled to procure vaccines for their populations. The UN, describing the vaccine inequity as a “catastrophic moral failure,” found that residents in 10 countries have received 80% of the world’s COVID-19 vaccine, as of February 2021—prompting it to launch a new global campaign, Only Together, to advance fair and equitable access to COVID-19 vaccines worldwide (UN launches Only Together 2021). Leveraging on the vaccine inequity, China has targeted the low- and middle-income countries largely left behind as rich nations scooped up most of the pricey vaccines produced by Pfizer and Moderna, and capitalized on slower-than-hoped-for deliveries by U.S. and European vaccine makers (Seow Ting Lee, 2021) Although India was severely impacted by the covid 19 pandemic, it quickly entered into vaccine production and aid abroad with the desire not to be left behind in the race to aid in the covid 19 vaccine. Being a leader in vaccine manufacturing, India’s ability to offer complimentary COVID-19 vaccines to low-income countries, especially the immediate neighbors, will not only help strengthen its ties with partner countries but also achieve equitable access to vaccines. Furthermore, India’s move to provide vaccine assistance to low- and middle-income countries will boost the efforts in achieving global vaccination coverage. India’s ability to develop and manufacture cost-effective COVID-19 vaccines on a large scale will help to meet the global vaccine requirements without causing an additional economic burden (Taghizade et al, 2021).

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

*April 09-16, 2024 / Lisbon, Portugal*

**Pic.2: Global health diplomacy and the five key areas of impact**

Source: Varshney, S. K., & Prasanna, N. K. (2021). *Vaccine diplomacy: Exploring the benefits of international collaboration*. *Current Trends in Biotechnology and Pharmacy*, 15(1), 110-114. Thus, it can be seen that, in addition to the humanitarian reasons, there is competition between powerful countries such as the US, China and India, through vaccine diplomacy through vaccine diplomacy... Bollyky, T. J., Murray, C. J., & Reiner (2021) said that Renewed state-to-state systemic competition between the two largest economies today will have an important effect on the overall ability of the world to combat COVID-19, as well as recover economically from the detrimental economic effects of lockdowns, which will in turn impact countries' future ability to manage a major health crises (Bollyky et al, 2021). World bank (2021) warns that In the first two months of 2021, the production of COVID-19 vaccines has suffered setbacks delaying the implementation of national inoculation strategies. These delays have revealed the concentration of vaccine manufacture in a small club of producer nations, which in turn has implications for the degree to which cross-border value chains can deter more aggressive forms of Vaccine Nationalism, such as export curbs. During 2017–19, vaccine producing nations sourced 88 percent of their key vaccine ingredients from other vaccine producing trading partners. Combined with the growing number of mutations of COVID-19 and the realization that this coronavirus is likely to become a permanent endemic global health threat, this finding calls for a rethink of the policy calculus towards ramping up the production and distribution of COVID-19 vaccines, its ingredients, and the various items needed to deliver them. The more approved vaccines that are safely produced, the smaller will be the temptation to succumb to zero-sum Vaccine Nationalism (Simon J et al, 2021). Vietnam is a country in the

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

*April 09-16, 2024 / Lisbon, Portugal*

Asia-Pacific region, bordering China and having traditional diplomatic relations with this country. Besides, at present, Vietnam has friendly diplomatic relations and cooperation in many fields with the US. Therefore, during the covid 19 pandemic, Vietnam implementing a vaccine diplomacy strategy should pay attention to its relationship with both these countries. China: In the context of Southeast Asian countries struggling to order vaccines from scarce supplies in the world, the covid 19 vaccine that China soon sponsored and provided to Southeast Asian countries has enhanced the position of China. China, it reinforces the image of a responsible "neighborhood". Sinovac's first batch of 200,000 doses of covid 19 vaccine has arrived in Bangkok, the vaccination campaign in Thailand will kick off this week. Similarly, the Philippines is also ready to deploy vaccination when a shipment of 600,000 vaccines is also from Sinovac. If all goes well, Thailand and the Philippines, along with Indonesia, Laos and Cambodia, will become 5 out of 10 ASEAN countries that launch a large-scale vaccination campaign, all of which use vaccines manufactured by China. . Previously, in January, Indonesia launched Sinovac's vaccination campaign, while Laos and Cambodia also deployed vaccination using Sinopharm's vaccine on January 27, 2021 and October 10, respectively. February 2021. Brunei also received a vaccine aid batch from Sinopharm in February 2021. China's covid 19 vaccine has somewhat worked in some countries, but with the pandemic spreading strongly in countries using the sinovac vaccine and the pandemic also returning in China, the Questions about the quality of the Chinese-made covid 19 vaccine are raised more than ever. In addition, there is concern that Beijing could use vaccine supply as leverage to achieve geopolitical goals in the region, or cut off supplies if disagreements arise. China also used the vaccine to ask the Brazilian and Dominican governments to withdraw their decision to exclude Huawei from their 5G network development plans. In Honduras, in order to have a vaccine against Covid-19, President Juan Orlando Hernandez had to commit to opening a commercial office in China. US: From the end of 2020 to the beginning of this year, when the US and Europe were focusing on dealing with the crisis of the pandemic, China took advantage of the opportunity to deploy "vaccine diplomacy", China provided more than 300 million domestically produced dose for over 80 countries. However, the situation changed when the US basically controlled the epidemic situation in the country. President Biden declared to the world "America is back" and ready to play the role of a responsible power. The core and cross-cutting foreign policy goal of the administration of President J. Biden over the next four years is to gradually re-establish America's global leadership position, and at the same time realize three strategic goals in the relationship with the US and China. China, it is to contain China militarily; maintain peace and

## **VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY SCIENTIFIC STUDIES**

*April 09-16, 2024 / Lisbon, Portugal*

stability in the South China Sea in accordance with international law and change China's perception of relations with the US (Thuy, 2021). On the eve of the G7 summit, President Biden announced the aid of 500 million doses of the US Pfizer vaccine to the poorest countries. He stressed that this donation does not come with any pressure to support or make concessions. This contrasts with China's use of a Covid-19 vaccine to promote its own political and economic interests. It is expected that the US vaccine donation will start from August. According to the plan, the US will donate a total of 200 million doses by the end of 2021 and continue to donate 300 million doses in the first half of next year. Previously, on May 17, 2021, President Biden announced that by the end of June 2021, he would donate about 80 million doses to countries, including 20 million doses produced by Pfizer, Moderna and Johnson & Johnson corporations and 60 million doses. million doses of AstraZeneca that the US has pledged to support countries. Following the US pioneering step, G7 leaders pledged to expand production, sharing at least 1 billion doses of vaccine with the world through existing mechanisms and bilateral aid. This will be the largest relief operation of the G7 after World War II. It has opened up a new area of competition between the US and China. Vietnam's vaccine diplomacy stands in the face of fierce competition from the US and China, but Vietnamese people have skepticism towards China's covid 19 vaccine, as evidenced by only 500,000 doses China's Covid-19 vaccine in Vietnam and this vaccine is only given to Chinese citizens in Vietnam and some people who do business at the Vietnam-China border. In July 2021, a company in Vietnam imported about 5 million doses of Sinopharm vaccine but not a single dose has been used yet due to the rejection reaction of the Vietnamese people. The US is the country that donates the most Covid-19 vaccine to Vietnam, which puts Vietnam in a diplomatic difficulty that is facing conflicts between the US and China. That requires Vietnam to have a smart diplomatic strategy to be able to ensure its interests when receiving COVID-19 vaccine aid.

### **US Foreign Policy under President Joe Biden towards Southeast Asia**

Based on the first steps of the US government after the election, it can be seen that the administration of President J. Biden will pursue a number of diplomatic measures as follows: Regarding bilateral cooperation: the administration of President J. Biden will continue to strengthen bilateral relations with countries in the Asia-Pacific region to promote the signing of FTAs with six countries, including: Japan, South Korea, Australia, Vietnam, New Zealand and Indonesia in the period of 2021 - 2022. At the same time, the administration of President J. Biden will also conduct bilateral diplomatic activities with allies and partners. cooperation on issues such as: trade wars, currency manipulation, and negotiations to extend the new Strategic

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

*April 09-16, 2024 / Lisbon, Portugal*

Arms Reduction Treaty (START) with Russia. Regarding multilateral cooperation, despite the commitment to abandon a number of foreign-defense initiatives under the D. Trump administration, such as the prosperous economic network, the Indo-Pacific Treaty organization ..., but the administration of President J. Biden will still maintain initiatives such as the Free and Open Indo-Pacific Strategy (FOIP), the Asian High Quality Infrastructure Initiative. In addition, the US will also make efforts to negotiate to join other multilateral organizations such as the Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP), and the Regional Comprehensive Economic Partnership (RCEP). Thus, in the coming time, the administration of President J. Biden will still inherit some of the policies of the previous Trump administration, but will basically make adjustments to suit the conditions and circumstances of the country. America today when the US commits to “reconciliation” instead of “confrontation”, “cooperation” instead of “antagonism” and “conflict”. However, whether this new foreign policy can be implemented or not depends a lot on the economic potential, the role of the United States and the policy-making ability of the administration of President J. Biden. With its geo-strategic location, Southeast Asia is in the midst of a spiral of strategic competition of major countries. In particular, the number one US adversary in the region, China, considers Southeast Asia a starting point to deploy the “Belt and Road Initiative” (BRI), in order to expand political influence, maintain the stabilize and affirm China's influence in the region. The US “Free and Open Indo-Pacific Strategy” (FOIP) is deployed to protect national interests, freedom and maritime security, maintain the balance of forces, promote diplomatic activities and socio-cultural exchanges in the region, and at the same time, challenge the strong rise of China. This is a global strategy that determines the prospect of Washington's position and strength in the world order and in the Asian region in the present and in the future. In particular, the US takes Southeast Asia as the focal point connecting the two oceans. Inheriting the vision of a free and open Indo-Pacific region under the Trump administration, President Biden's administration has taken steps to adjust and supplement its approach. in a more skillful and methodical way to achieve the collective goal and increase the collective strength in handling challenges.

For Southeast Asian countries, the Biden administration attaches great importance to the Strategic Partnership with ASEAN, supports the central role of ASEAN and ASEAN's View of the Indo-Pacific (AOIP), promotes promote the strengthening of US-ASEAN cooperation and

## ***VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY SCIENTIFIC STUDIES***

***April 09-16, 2024 / Lisbon, Portugal***

cooperation between ASEAN member countries and the countries of the “Quad”<sup>7</sup> group to solve the challenges posed. The US will closely coordinate to contribute to maintaining peace, security and stability in the region, including maritime security and safety in the East Sea. The United States continues to contribute to ASEAN's regional cooperation mechanisms such as the ASEAN Regional Forum (ARF), the ASEAN Defense Ministers' Meeting Plus (ADMM+) and the East Asia Summit (EAS). The US actively supports ASEAN's efforts to negotiate a Code of Conduct in the East Sea (COC) with China in accordance with international law, including the 1982 United Nations Convention on the Law of the Sea (UNCLOS). Over the years, the US-ASEAN has had many diverse cooperation activities in many fields such as science, health, education, and livelihoods. Existing cooperation programs and initiatives such as the ASEAN-US Trade and Investment Framework, the ASEAN-US Connectivity Initiative, the ASEAN-US Smart Cities Partnership, the Southeast Young Leaders Initiative Asia (YEASLI) and cooperation programs on trade-investment, human resource development, renewable energy, maritime cooperation, disaster response, climate change, support ASEAN response to Covid-19,... The US-ASEAN cooperation action plan for the period 2021-2025 has also been implemented. Therefore, the support of covid 19 vaccines for Vietnam and some Southeast Asian countries such as Vietnam, the Philippines, and Thailand represents a vision in a policy towards Southeast Asia under US President Biden.

### **Conclusion**

Vietnam is experiencing the outbreak of the covid 19 pandemic and the situation is very difficult right now. In that context, international support is very important, especially the source of the covid 19 vaccine. The covid 19 vaccine aid from the United States has made a very important contribution to the response to the covid-19 pandemic in Vietnam. The help from the US shows that the foreign policy under US President Joe Biden has had certain interests in Southeast Asia, considering it a very important area in expanding US influence in Asia. and worldwide. This is also an area where China is currently expanding its influence and now has huge covid 19 vaccine support for Indonesia, Cambodia and Malaysia. The US has given a huge aid to Vietnam, Thailand, and the Philippines to help fight the pandemic. It can be said that the

**Abstract**

The investigation is focused to clarify photocatalytic discoloration and purification of Orange II water solutions under UV irradiation with anatase/rutile composite powder catalysts samples. Comparative experiments with the commercial anatase, rutile and Degussa P 25 are provided. The variation of the pH values during the experiments is reported. The photocatalysts samples are characterized by SEM and XRD analysis. The photocatalytic destruction of Orange II was determined by spectroscopic and total organic carbon analysis. Faster and total discoloration of 20 ppm Orange II suspensions with Degussa P 25 is observed comparing the photocatalytic activity of the prepared anatase/rutile composites to the commercial catalysts. The apparent rate constants of the process generally increase with the anatase content in the composite samples. However, the total organic carbon measurements of the investigated solutions show better mineralization of the dye treated with the anatase 75 % catalyst sample.

**Keywords:** TiO<sub>2</sub> composites, heterogeneous photocatalysis, UV light, Orange II, dye mineralization

## **INTRODUCTION**

Textile colorants are common contaminants in the aquatic ecosystems, due to their large scale production, slow biodegradation and toxic effects on human and animals [1-3]. Nowadays at least 15 % of the manufactured worldwide dyes are lost in waste waters during their production and application [4]. The most common dyes present in the textile industry are azo-dyes. In general, as the traditional techniques used for dye removal are physical methods (adsorption on activated carbon, coagulation by chemical agents, filtration, reverse osmosis, ion exchange on synthetic adsorbents, etc.) [5-8], the majority of dyes is only adsorbed and not degraded [9,10]. UV induced heterogeneous photocatalysis of TiO<sub>2</sub> suspensions is an advanced oxidation technology applicable for waste waters complete remediation at low concentrations of organic pollutants [11-15]. The organic dye Orange II (O II) is common and very stable azo-dye [15]. In this investigation it is used as model pollutant in respect to its well known structure, suitable spectrophotometric properties and low sorption level onto glassware and TiO<sub>2</sub> particles. The aim of this work is to investigate the process of photocatalytic purification of water solutions from Orange II under UV irradiation with prepared by us anatase/rutile composites. It is a continuation of our previous research, focused on the optimal anatase/rutile ratio [16] and the influence of the temperature and gas atmosphere during the preparation procedure [17] on the photocatalytic activity of mixed anatase and rutile powders. As the great part of the studies on the photocatalytic degradation of azo dyes relies only on the monitoring of solution decolorization, in this investigation monitoring of the pH during photocatalysis and mineralization of degraded organics is also presented.

In our previous study on anatase/rutile based powder composites [16] better results have shown the samples, prepared in air atmosphere. Here we present their photocatalytic performance compared to these of the commercial TiO<sub>2</sub> brands.

## **MATERIALS AND METHODS**

The composite photocatalysts were prepared from commercial anatase and rutile supplied from KRONOS TITAN GmbH Leverkusen Germany. The initial mixture consists from precisely homogenized quantities of the both allotropic forms, calculated in correspondance to 25, 50 and 75 wt % of anatase content in the different powder samples. Small amounts of ethanol (a few droplets per g) were used as mixing media. All TiO<sub>2</sub> samples were treated thermally at 200°C in an oven for 2 h. Then the as prepared composite powders and commercial ones were characterized by Scanning Electron Microscope (SEM JEOL JSM-5510) and X-ray analysis (diffractometer Siemens D 500, CuK $\alpha$  source-radiation at a step of 0.05 deg for 2 $\Theta$  and counting

time 2s/step). The surface area of all powder samples was determined by BET analyses, using standard BET apparatus and volumetric technique. N<sub>2</sub> adsorption and desorption processes were performed at 77 K. Before the N<sub>2</sub> adsorption the analyzed samples were completely degassed at 150 °C for 4 h. The acid azo dye Orange II (C<sub>16</sub>H<sub>11</sub>N<sub>2</sub>NaO<sub>4</sub>S, dye content >85 %, λ<sub>max</sub> = 484 nm), used as modal contaminant in the photocatalytic experiments, was supplied from Fluka. The calibration curve of O II determined by UV-VIS Spectrophotometer Jenaway (300-1000 nm) and its structural formula are shown in Figure 1.

**Figure1.** Calibration curve and structural formula (inset) of the organic dye Orange II.

The photocatalytic tests were performed in cylindrical Pyrex glass reactor. The source of illumination was OSRAM DULUX DL18W/71 UV lamp, emitting mainly in the range of 350-400 nm. The lamp with a length of 22.5 cm and diameter of 3.8 cm, is placed in a Pyrex tube axially inside the reactor. The volume of the treated dye solutions was 250 ml. The selected initial O II dye concentration was 20 ppm. The catalyst concentration in the suspensions was 0.5 g L<sup>-1</sup>. The suspensions were at first stirred for 30 min in complete darkness (without any illumination) to achieve sorption-desorption equilibrium of the dye on the catalysts surface, before the photocatalytic experiments. Aliquot samples of 6 ml were taken from the treated suspensions at determined time intervals of UV irradiation. The aliquots were filtered through 0.22 μm membrane filters to remove the TiO<sub>2</sub> particles. The change in O II dye concentration with illumination time was monitored by UV-VIS Spectrophotometer Jenaway (300-1000 nm) at the maximum of absorbance of the dye. Comparative experiments with the commercial brands (Degussa P 25, and KRONOS anatase and rutile) were also performed.

Stirring of 350 rpm and air bubbling of 35 L h<sup>-1</sup> were kept constant along the experiments. The degradation was carried out at the natural pH of the solutions and at room temperature of 23±2°C. The change in pH of the dye solutions was observed by pH meter 211 Hanna instruments. The treated solutions were analyzed for total organic carbon (TOC) content by Shimadzu 5000A TOC analyzer.

## RESULTS AND DISCUSSION

The crystalline phase of the obtained TiO<sub>2</sub> powder composites is identified by X-ray diffraction analysis (Figure 2). The average crystallite sizes were calculated by Scherrer's equation:

$$d_{hkl} = k \cdot \lambda / \beta \cdot \cos(2\theta) \quad (1)$$

where  $d_{hkl}$  is the average crystallite size (nm),  $\lambda$  is the wavelength of CuK $\alpha$  radiation ( $\lambda = 0.154056$  nm),  $\theta$  is the Bragg's diffraction angle,  $\beta$  is the full-width at half maximum intensity of the main characteristic peak (at  $2\theta$  converted to radians) and  $k$  is a constant ~0.9.

**Figure 2.** Comparative XRD of the prepared composites of different anatase content and KRONOS commercial brands (anatase and rutile). The TiO<sub>2</sub> phases are denoted as “A” for anatase and “R” for rutile.

The average crystallite size, calculated from the most intensive peaks (101) for anatase is  $d_{hkl} = 40.7$  nm and from the main peak of (110) is  $d_{hkl} = 40.9$  nm for rutile phase in the prepared mixed samples. The characteristic peaks for anatase and rutile in Figure 2 manifest smooth transition in their intensity in accordance with the corresponding composition of the prepared samples. The average crystallite size of Degussa P25 sample, calculated also by the Scherrer equation is 42 nm for the anatase and 56 nm for the rutile phase. The morphology of prepared composite powder is illustrated in Figure 3. The SEM micrographs of the prepared titania composites at different magnifications represent general overview of catalysts surface. The obtained powders seem homogeneous, of uniform grain size of about 0.2  $\mu$ m, as the initial

commercial catalysts. The larger agglomerates (as seen in Fig. 3 d), are built up of pellete shaped smaller and uniform TiO<sub>2</sub> particles.

**Figure 3.** Scanning electron micrographs of TiO<sub>2</sub> composite of 50% anatase content at different magnifications: (a) 25000, (b) 10000, (c) 15000 and (d) 2000.

The determined specific surface area values according to BET analysis of mixed powder samples are found to be for anatase surface area of 35.67 m<sup>2</sup>.g<sup>-1</sup> and for rutile respectively - surface area of 37.56 m<sup>2</sup>.g<sup>-1</sup>. The surface area of Degussa P 25 catalysts is greater than that of pure titania modifications - 57.60 m<sup>2</sup>.g<sup>-1</sup>. The greater illuminated surface area plays a key role for more effective photocatalysis. The effect of this parameter will be confirmed in the photocatalytic experiments – the enlarged surface increases the total illuminated surface area, this way increasing the number of active surface sites and enhancing the photocatalytic activity of the sample Degussa P 25 (Figs. 4 and 5). Figure 4 represents the observed color change of the 20 ppm O II suspensions at the 30 minute contact with the catalysts particles without or under UV irradiation. The sorption values *D<sub>s</sub>* for the investigated catalyst after 30 minutes stirring of the slurry without any illumination, also given in Figure 4, are determined by the equation:

$$D_S\% = (A_0 - A_{EQ}) / A_0 \times 100 \quad (2)$$

where *A<sub>0</sub>* is the absorbance at 484 nm of the initial O II solution and *A<sub>EQ</sub>* is the absorbance at *λ<sub>max</sub>* of the dye suspension after 30 minutes contact (stirring) with the catalyst particles in complete darkness.

**Figure 4.** Sorption degree of O II onto the catalysts samples without illumination (a). Degree of photobleaching of 20 ppm O II water solution with the different titania catalysts after 30 minutes of UV irradiation (b). The best result in photodiscolorization (90%) of O II is achieved with Degussa P 25. The composite samples show regular tendency for better photobleaching of the dye solution with higher anatase content (Figs. 4 and 5). The pure anatase performance is relatively efficient and quite (80% dye degradation) comparable to that of Degussa P 25. Lowest photocatalytic efficiency is observed in case of rutile – only 3% contaminant photodegradation.

**Figure 5.** Kinetics of water photopurification from the pollutant OII with the different catalyst samples. The initial O II concentration is 20 ppm. The experimental data points are the average from two or three independent photocatalytic experiments in slurry. It is also seen from the data

in Figs. 4 and 5, that Degussa P 25 expresses quite different sorption ability and photocatalytic behavior, compared to the rest samples. In order to check the observed effect additional measurement and analysis were performed. The values  $k$  of the rate constants of O II photodegradation, shown in Figure 6, are calculated from the experimental data following the equation:

$$C = C_{in} \cdot e^{-kt} \quad (3)$$

where  $C$  is the concentration of the dye solution at the moment  $t$ ,  $C_{in}$  – the initial dye concentration and  $t$  is the UV irradiation time in minutes.

**Figure 6.** Rate constants of photodecolorization versus anatase content in the prepared composite powders.

As seen from the figure, the values of the rate constants for the composite powders increase with the rise of the anatase content in the sample. The rate constant of  $5.58 \times 10^{-2} \text{ min}^{-1}$ , calculated in case of Degussa P 25 is slightly higher, compared to that of pure anatase.

The pH values of the suspensions during the catalytical experiments are plotted in Figure 7. pH is measured first for the pure 20 ppm O II solutions (corresponding to point -30 min „negative“ time before the start of UV irradiation), after the end of the sorption-desorption period without illumination (zero time) and after 30 minutes photocatalysis. As seen from the experimental data in Figure 7, two controversial trends are presented – before and after the UV irradiation. Such effect has been also observed in our previous work on photocatalytic degradation of the organic dye Malachite green hydrochloride from  $\text{TiO}_2$  composite suspensions under UV irradiation [17]. It can be attributed to rise in pH of the initial acidic dye solution before illumination, due to the basic properties of the  $\text{TiO}_2$  added and next decrease of the pH values with the photodegradation of the organics. The exceptions of this tendency are rutile and the anatase

75% composite. Rutile inspires slight decrease of the suspensions pH and practically has no catalytic activity. The anatase 75% sample leads to slight decrease of the pH values with time and has the best catalytic behavior from the prepared composite catalysts.

**Figure 7.** Time dependence of pH changes in 20 ppm O II solutions during the photocatalytic experiments with the different catalysts: commercial brands and anatase/rutile composites. The time interval -15÷0 min represents the period without illumination.

In addition to the observed trends from the results of the photocatalytic experiments, we analyzed the suspensions, treated with Degussa P 25, anatase and anatase 75% composite (the samples with the most effective catalytic performance). The results of TOC analysis are shown in Table 1.

Catalyst	Total carbon (TC)	Inorganic carbon (IC)	Total organic carbon (TOC)
<b>Degussa P25</b>	16,85	0,185	16,67
<b>75% Anatase</b>	13,55	0,451	13,1
<b>Anatase</b>	10,89	0,258	10,63

**Table 1.** TOC analysis of 20 ppm O II solution after 30 minutes of photocatalysis with the different samples

The presented data show highest value for TOC/TC for the Degussa P 25 treated solution, followed by the anatase treated, respectively. That fact leads to the assumption that Figures 4 and 5 illustrate fast discoloration of O II in case of Degussa. Moreover, this observation is in accordance to the literature data [18] reporting TiO<sub>2</sub> photocatalytic discoloration of O II in 50

minutes and mineralization in 4 hours under UV light. The values for IC indicate also higher presence of  $\text{HCO}_3^-$  or  $\text{CO}_3^{2-}$  ions in the treated with the composite catalyst dye solution. Taking in account the later, one can conclude that slow but best mineralization is achieved with the anatase 75% sample. The reason for the observed effect can be different pathways of O II degradation resulting in fast discoloration and slow degradation in case of Degussa P 25 and relatively slow discoloration and higher demineralization in case of the anatase 75 % catalyst.

### **CONCLUSION**

The photocatalytic efficiency and the respective rate constants values of the process generally increase with the anatase content in the titania composite samples. Comparing the photocatalytic activity of prepared by us anatase/rutile composites we observed faster and total discoloration of 20 ppm Orange II suspensions with the rise of anatase content in the prepared photocatalysts – from 3% (rutile) to 80% dye degradation in case of anatase sample. Best performer is P 25 with 90% degradation of dye contaminant. However, the TOC measurements show better mineralization of the dye treated with our anatase 75 % catalyst in comparison to that in case of Degussa P 25.

**Abstract**

The application of heterogeneous photocatalytic water purification processes is very popular due to its effectiveness in mineralizing the organic compounds as well as the possibility of utilizing the UV and visible-light spectrum. The photocatalytic degradation of the organic pollutants with the ZnO as photocatalyst is widely studied in the world. In this paper, various morphologies of ZnO, ZnFe<sub>2</sub>O<sub>4</sub> and ZnO/ZnFe<sub>2</sub>O<sub>4</sub> composite films are prepared via a two-step route including precipitation process and sol-gel method. The films are deposited on glass substrates via dip coating technique and characterized by means of Scanning Electron Microscopy, X-ray diffraction and UV-vis spectroscopy. Nanostructured ZnO thin films with different concentrations of ZnFe<sub>2</sub>O<sub>4</sub> (0, 0.25, 0.5 and 1.0 wt%) are investigated and compared for photocatalytic degradation of Malachite Green (3, 5 and 10 ppm) under UV and visible illumination. The experimental results indicate that the combination of spinel structure with ZnO (hexagonal wurtzite) reduces the photocatalytic efficiencies (UV –  $D_{\text{ZnO}} = 98\%$ ,  $D_{\text{ZnO/ZnFe}_2\text{O}_4} = 68\%$  and Vis –  $D_{\text{ZnO}} = 86\%$ ,  $D_{\text{ZnO/ZnFe}_2\text{O}_4} = 56\%$ )

**Keywords:** ZnO/ZnFe<sub>2</sub>O<sub>4</sub>, thin films, photocatalytic efficiencies, sol-gel, Malachite Green

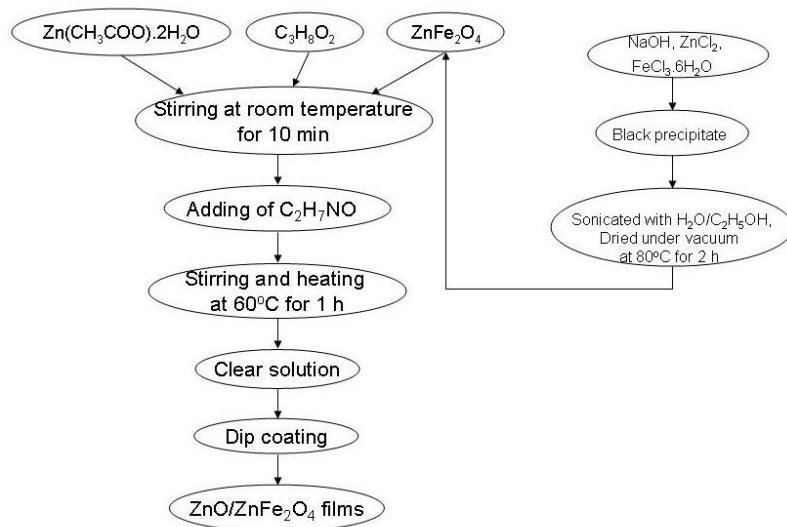

## **INTRODUCTION**

Advanced oxidation processes are particularly attractive as a method for removing organic pollutants from water because they can destroy hazardous contaminants, not simply transfer them to another phase as do air stripping and granular activated carbon adsorption. Photocatalytic oxidation processes providing an interesting route to the destruction of toxic and hazardous pollutants in the  $\mu\text{g/l}$  or few  $\text{mg/l}$  range alternative to well established oxidation technologies such as ozonolysis or oxidation with  $\text{H}_2\text{O}_2$  under UV irradiation [1,2]. Among them the ZnO/UV process is known to have many important advantages [3,4]. Ideally, the end products of these processes are carbon dioxide, water and inorganic mineral salts. Thus, the mineralization of organic compounds sensitized by semiconductor photocatalysts such as  $\text{TiO}_2$  [5,6] or ZnO [7-10] is an area of intensive research. Zinc oxide is the most widely accepted photocatalyst for pollutant destruction in water as it is considered a very efficient catalyst that, unlike other semiconductors (wide band gap 3.2 eV), non toxic, stable to photocorrosion, low cost and suitable to work using sunlight as energy source [11]. However, for higher photocatalytic efficiency and many practical applications, it is desirable that ZnO photocatalyst should absorb not only UV but also visible light. In order to absorb visible light, band gap of ZnO has to be narrowed or split into several subgaps, which can be achieved by implanting or doping with metal ions [12-15], the coupling of zinc and the other semiconductor with visible light absorption, e.g. CdS [16],  $\text{WO}_3$  [17], and  $\text{SnO}_2$  [18] systems by sol-gel process, coprecipitation or simply physical mixing. Spinel zinc ferrite is a semiconductor (band gap 1.9 eV) characterized by structure with a tetrahedral A site by  $\text{Zn}^{2+}$  ions and an octahedral B site by  $\text{Fe}^{3+}$  ions [19].  $\text{ZnFe}_2\text{O}_4$  is most prominently known for its magnetic and electrical properties, gas sensing and catalytic characteristics have also been studied. However, because of the lower valence band potential and poor property in photoelectric conversion, zinc ferrite cannot be used directly in the photocatalytic destruction of toxic organic compounds [20].  $\text{ZnFe}_2\text{O}_4$  does face its share of problems, including an energetically unfavorable conduction band and surface adsorption characteristics. In contrast to ZnO,  $\text{ZnFe}_2\text{O}_4$  is usually and perhaps most facilely prepared using chemical coprecipitation procedures performed under alkaline conditions followed by calcination temperatures ranging from 600-900°C [20,21], although several recent reports have suggested synthesis through sol-gel procedures [22,23] and mechanochemical methods by the mechanical alloying (MA) of ZnO and  $\text{Fe}_2\text{O}_3$  [24]. In the present work, we obtained spinel zinc ferrite by facile precipitation process without use of any templates or surfactants. The aim of this study is to make ZnO films modified with  $\text{ZnFe}_2\text{O}_4$  for

photocatalysis. ZnO and ZnO/ZnFe<sub>2</sub>O<sub>4</sub> films are deposited by sol-gel method via dip-coating technique. The photocatalytic performance for Malachite Green (MG) degradation over the ZnFe<sub>2</sub>O<sub>4</sub>, ZnO and ZnO/ZnFe<sub>2</sub>O<sub>4</sub> nanomaterials. The photocatalytic mechanism is systematically investigated with UV and visible illumination at different initial concentration of Malachite Green (3, 5 and 10 ppm).

## **MATERIALS AND METHODS**

Zinc acetate dehydrate ( $\geq 99.5\%$ ), 2-methoxyethanol ( $\geq 99.5\%$ ), monoethanolamine ( $\geq 99.0\%$ ) were supplied from Fluka. Malachite Green ( $\lambda_{\max} = 615$  nm, dye content ca. 55%) was from Sigma-Aldrich. Glass slides (76 x 26 mm), used as substrates for ZnO and ZnO/ZnFe<sub>2</sub>O<sub>4</sub> films, were from ISO-LAB (Germany). Distilled water was used in all experiments. Ferrous(III) chloride, FeCl<sub>3</sub>.6H<sub>2</sub>O, was from Stanlab (Poland), ZnCl<sub>2</sub>, NaOH and HCl were from Fluka ( $>99.0\%$ ). All reagents are analytically pure and used as-received without further purification. ZnFe<sub>2</sub>O<sub>4</sub> powders were synthesized by precipitation method as follows [25]: 300 ml NaOH was added slowly to 100 ml ZnCl<sub>2</sub> under continuous stirring. The obtained clear solution (Na[Zn(OH)<sub>3</sub>]) was transferred to Fe<sup>3+</sup> containing solution (FeCl<sub>3</sub>.6H<sub>2</sub>O, HCl were dissolved in 5000 ml water) and then heated at 60°C for 30 min. The precipitate (black, highly lustrous, brittle pieces) was collected by filtration and washed several times under sonication with water and ethanol and then dried under vacuum at 80°C for 2 h before characterization and application. Two spinel interferences of the as-prepared ZnFe<sub>2</sub>O<sub>4</sub> powder were detected by XRD spectra. After annealing for 1 hour at 500°C, the spinel pattern becomes completely expressed. ZnO/ZnFe<sub>2</sub>O<sub>4</sub> films were prepared by sol-gel method as follows: Zinc acetate dihydrate and zinc ferrite were dissolved in 2-methoxyethanol, followed by the addition of monoethanolamine (stabilizer) under continuous stirring to form a clear solution (Figure 1). The obtained sol was heated to 60°C for 1 hour and let to age overnight. The detailed procedure for the preparation of ZnO sol-gel films is described in our previous study [26]. Different weight percentages (0, 0.25, 0.5 and 1.0) of ZnFe<sub>2</sub>O<sub>4</sub> were incorporated into ZnO. The sol-gel films were prepared by dip coating technique. The films were deposited with 5 coatings and dried at 80°C for 30 min after each successive coating. The as-prepared gel films were annealed at 500°C for 1 hour. For comparison, pure zinc ferrite and zinc oxide films were also prepared with the same procedures described previously.

**Figure 1.** Schematic diagram for the preparation of ZnO, ZnO/ZnFe<sub>2</sub>O<sub>4</sub> films.

The morphology of ZnO, ZnFe<sub>2</sub>O<sub>4</sub> and ZnO/ZnFe<sub>2</sub>O<sub>4</sub> were examined by Scanning Electron Microscope (JSM-5510 (JEOL) operated at 10 kV of acceleration voltage). The crystallinity of the prepared samples was determined from XRD using a powder diffractometer (Siemens D500) with CuK $\alpha$  radiation within  $2\theta$  range of 10-80 deg and step 0.05 deg and counting time 2 s/step). The photocatalytic activities of the sol-gel films were evaluated by the decomposition of Malachite Green under ultraviolet and visible light irradiation in an aqueous solution. The initial concentration of MG was 3, 5 and 10 ppm.

The photocatalytic experiment was carried out in a 150 mL glass reactor supplied with magnetic stirred and covered with a UV-lamp (maximum emission at 370 nm) or visible lamp (TUNGSRAM lamp 500 W, maximum emission at about 700 nm). The lamp was fixed at 15 cm above the treated solution. The mineralization process of MG was monitored by UV-vis absorbance spectroscopy (Jenway 6400) in wavelength range from 400 to 800 nm. All photocatalytic tests were performed at a constant stirring rate of 500 rpm at room temperature (23 $\pm$ 2°C). The effect of initial concentration of MG (3, 5 and 10 ppm) was investigated with catalyst films. Photocatalytic efficiency of the catalysts was calculated by using following equation:

$$D = \left[ \frac{C_0 - C_i}{C_0} \right] \times 100$$

(1)

where  $C_0$  is the initial concentration of dye and  $C_i$  is the concentration of dye after irradiation at selected time interval,  $t$  (min).

## RESULTS

X-ray diffraction analysis is conducted for the determination of crystal structure and phase purity of the produced samples. The XRD pattern of ZnO, ZnFe<sub>2</sub>O<sub>4</sub> and ZnO/ZnFe<sub>2</sub>O<sub>4</sub> nanostructures are illustrated in Figure 2. All of the peaks of the pattern can be readily indexed to cubic ZnFe<sub>2</sub>O<sub>4</sub> (Figure 2. c) with spinel structure (JCPDS No. 22-1012), where the diffraction peaks at  $2\theta$  values of 30.1°, 35.3°, 42.6°, 52.9°, 56.7° and 62.2° can be ascribed to the reflection of (220), (311), (400), (422), (511) and (440) planes of the spinel ZnFe<sub>2</sub>O<sub>4</sub>, respectively. The crystal plane of pure ZnO (JCPDS No. 36-1452, Figure 2. a) showed three intense diffraction peaks at  $2\theta = 31.6^\circ, 34.2^\circ, 36.1^\circ, 47.3^\circ, 56.4^\circ$  and  $62.5^\circ$  which corresponds to the (100), (002), (101), (102), (110) and (103), which is responsible for the hexagonal wurtzite structure. The results indicate that the samples consist of pure phase and no characteristic peaks were observed for other impurities. The narrow width of the peaks confirms that both samples are of high purity and good crystallinity.

**Figure 2.** XRD patterns for films of **a.** pure zinc oxide, **b.** zinc oxide/zinc ferrite and **c.** zinc ferrite annealed at 500°C for 1 h. In case of ZnO/ZnFe<sub>2</sub>O<sub>4</sub> nanocomposites (Figure 2. b), all diffraction peaks correspond to hexagonal phase of zinc oxide and crystal plane of spinel zinc ferrite (peaks at  $2\theta = 35.3^\circ$  and  $62.2^\circ$  represented (311) and (440) planes). The presence of a diffraction peak (311) and the low intensity of the three characteristic peaks (100, 002 and 101) in the crystal lattice of ZnO/ZnFe<sub>2</sub>O<sub>4</sub> - confirms that ZnO is modified with zinc ferrite.

The morphology and structure of the obtained samples are determined by SEM (Figure 3). The surface of ZnFe<sub>2</sub>O<sub>4</sub> film consists of fine granules with particles of various size and shapes (Figure 3. a). The smooth surface is the reason for their lowest photocatalytic activity.

**Figure 3.** SEM images of thin films surface: pure **a.**  $\text{ZnFe}_2\text{O}_4$ , **b.**  $\text{ZnO}$  and **c.**  $\text{ZnO}/1 \text{ wt}\% \text{ ZnFe}_2\text{O}_4$ . Figure 3.b shows the surface of  $\text{ZnO}$  film, which is homogeneous and much more developed. There are different ganglia like hills with a typical width of about  $1 \mu\text{m}$ , length from  $5 \mu\text{m}$  to  $15 \mu\text{m}$  and a height of  $2\text{-}3 \mu\text{m}$ . A similar structure is observed on the surface of zinc ferrite, but this time it is not so pronounced (Figure 3 .c). Coating zinc ferrite over zinc oxide reduces the photocatalytic efficiency of the sample. The photocatalytic tests under UV and visible with such films showed lower photocatalytic activity in comparison with pure  $\text{ZnO}$ .

## DISCUSSION

The possible mechanism for the MG photodegradation over  $\text{ZnFe}_2\text{O}_4$ ,  $\text{ZnO}$  and  $\text{ZnO}/\text{ZnFe}_2\text{O}_4$  films can be proposed, as illustrated by Figure 4.

**Figure 4.** Suggested mechanism of the photocatalytic degradation of MG with  $\text{ZnFe}_2\text{O}_4$ ,  $\text{ZnO}$  and  $\text{ZnO}/\text{ZnFe}_2\text{O}_4$  films. When the energy of illuminate is greater than the photoabsorption threshold value of photocatalyst, the photogenerated electron–hole pairs will be produced in photocatalyst. Then electrons in the valence band (VB) can be excited to the conduction band (CB) and simultaneously the same amount of holes are generated in the VB. The photoinduced holes directly react with MG or interact with surface-bound  $\text{H}_2\text{O}$  or  $\text{OH}^-$  to produce the  $\text{OH}^\cdot$  radical species which is an extremely strong oxidant for the mineralization of MG. Meanwhile, the electrons formed can react with the adsorbed molecular oxygen to yield  $\text{O}_2^{\cdot-}$ . The generated

$O_2^{\bullet-}$  then further combine with  $H^+$  to produce  $HO_2^{\bullet}$ , which can react with the trapped electrons to generate  $OH^-$  radicals. All the reactive species can effectively decompose the organic dye of MG to final harmless degradation products. Based on the above analysis, the photocatalytic reaction can be expressed as follows:

Upon light illumination, the photogenerated electrons from CB of zinc ferrite are transferred to the CB of zinc oxide, oppositely, the photogenerated holes lefted in the VB of  $ZnFe_2O_4$ . The photogenerated electrons and holes can be effectively separated. The photogenerated electrons transferring into the CB of ZnO and holes left in the VB of  $ZnFe_2O_4$  can be captured by water-dissolved  $O_2$  and OH groups to form  $O_2^{\bullet-}$  and  $OH^{\bullet}$ , which can effectively decompose MG to final harmless small molecules. To evaluate the photocatalytic efficiencies of ZnO/ $ZnFe_2O_4$  photocatalyst under UV and visible light illumination, MG is employed as a model organic pollutant. As contrast, the activity of pure  $ZnFe_2O_4$  and ZnO photocatalysts are also carried out at the same conditions. Two effects in photocatalytic experiments are studied – initial dye concentration (3, 5 and 10 ppm) and irradiation conditions (UV and visible). Figure 5 shows the change in concentration ( $C/C_0$ ) of the dye as a function of reaction time in the presence of  $ZnFe_2O_4$  with different weight percentage in the starting ZnO material under UV and visible light irradiation. The pure ZnO films have the highest photocatalytic activity and quickly decomposed MG. The degradation of MG with  $ZnFe_2O_4$  modified ZnO catalysts exhibit higher photocatalytic activity, compared with that of zinc ferrite. Increasing the weight percentage of zinc ferrite in ZnO thus reduces the photocatalytic activity and the degradation rate of the dye. The photocatalytic efficiencies of the pure  $ZnFe_2O_4$  film is negligible.

The possible reason for the lower photocatalytic efficiency of ZnO/ZnFe<sub>2</sub>O<sub>4</sub> film is the difference in energy levels of the coupled semiconductor systems (ZnFe<sub>2</sub>O<sub>4</sub> with the narrow band gap – 1.92 eV and ZnO with the wide band gap – 3.2 eV). This difference plays an important role for achieving charge separation. In the modified ZnO film, the photogenerated electrons can be transferred from ZnFe<sub>2</sub>O<sub>4</sub> to the conduction band of ZnO, while holes occur in the valence band of zinc ferrite. Therefore, the primary charge separation in this electron transfer is efficient, thus improving the photocatalytic properties of zinc oxide to degrade MG in the presence of ultraviolet and visible light.

**Figure 5.** Degradation of Malachite Green with different photocatalysts under UV-light and visible. The initial dye concentration is **a.** 3 ppm, **b.** 5 ppm and **c.** 10 ppm.

These experimental results are confirmed by the rate constants and degree of degradation of the dye. The kinetic process of photocatalysis is described by pseudo-first order reaction equation:

$$\ln(C/C_0) = -kt \quad (10)$$

where  $C_0$  is the initial concentration of dye,  $C$  is the concentration of dye after irradiation in selected time interval,  $t$  and  $k$  is the rate constant, which has a positive correlation with the photocatalytic activity. The fitting results (rate constants,  $k$ ) and dye degradation rates ( $D\%$ ) of photocatalytic process and are shown in Table 1. Experimental results show that the ZnO has the highest rate constant ( $k_{UV} = 0.0171 \text{ min}^{-1}$ ,  $k_{vis} = 0.0098 \text{ min}^{-1}$ ) and fastest degradation the dye ( $D_{UV} = 97.76\%$ ,  $D_{vis} = 85.35\%$ ), which indicates that the pure ZnO films has the best photocatalytic activity.

Samples	Rate constants, $k$ ( $\text{min}^{-1}$ )		Degree of degradation, $D$ (%)	
	UV	Visible	UV	Visible
Pure $\text{ZnFe}_2\text{O}_4$	0.0016	0.001	29.98	20.02
$\text{ZnO}/\text{ZnFe}_2\text{O}_4(0.25\text{wt}\%)$	0.0049	0.0028	67.95	55.26
$\text{ZnO}/\text{ZnFe}_2\text{O}_4(0.50\text{wt}\%)$	0.0035	0.0016	54.37	38.45
$\text{ZnO}/\text{ZnFe}_2\text{O}_4(1.0\text{wt}\%)$	0.0021	0.0013	41.26	26.58
Pure $\text{ZnO}$	0.0171	0.0098	97.76	85.35

**Table 1.** The rate constants and degree of degradation of MG. The initial concentration of the dye is 10 ppm. The degradation rate of MG, catalyzed by  $\text{ZnO}/\text{ZnFe}_2\text{O}_4$  decreases with increasing  $\text{ZnFe}_2\text{O}_4$ , and  $\text{ZnO}$  films modified with 1.0 wt%  $\text{ZnFe}_2\text{O}_4$  content show the lowest degree of the degradation. While the  $\text{ZnFe}_2\text{O}_4$  content exceeds 0.25 wt%, the catalytic activity of the  $\text{ZnO}/\text{ZnFe}_2\text{O}_4$  samples decreases. The photocatalytic efficiency of these catalysts is ranked in an order from the highest to the lowest:  $\text{ZnO} > \text{ZnO}/\text{ZnFe}_2\text{O}_4$  (0.25wt%)  $>$   $\text{ZnO}/\text{ZnFe}_2\text{O}_4$ (0.50 wt%)  $>$   $\text{ZnO}/\text{ZnFe}_2\text{O}_4$ (1 wt%)  $>$   $\text{ZnFe}_2\text{O}_4$ .

### CONCLUSION

In this study, we investigated photocatalytic degradation of Malachite Green using synthesised  $\text{ZnFe}_2\text{O}_4$ ,  $\text{ZnO}$  and  $\text{ZnO}$  modified with different concentration of  $\text{ZnFe}_2\text{O}_4$  (0.25, 0.50 and 1.0 wt%) photocatalysts via chemical precipitation and sol-gel method. The X-Ray diffraction of the pure  $\text{ZnO}$  catalyst showed its well-crystalline hexagonal wurtzite structure and those of the pure  $\text{ZnFe}_2\text{O}_4$  – spinel structure. In addition, the scanning electron microscopy images revealed the surface morphology of the  $\text{ZnFe}_2\text{O}_4$ ,  $\text{ZnO}$  and  $\text{ZnO}/\text{Fe}_2\text{O}_4$  films. The photocatalytic results show that the pure  $\text{ZnO}$  films has highest photocatalytic efficiencies in comparison with those modified with zinc ferrite.

**Abstract**

The purpose of the present paper is to look at similarities in vision expressed by Virginia Woolf and Graham Swift with respect to the way they feel about walks, whether in nature or in London, in the center of the city or, in the case of Swift especially, in the suburban areas. Swift claims that after taking a walk in the park, he feels that his mind is refreshed and that he can write efficiently. Woolf also mentioned the refreshing effect of walks in the countryside, for her writing, as well as for her psychological well-being. Woolf has been diagnosed by research to have had bipolar disorder, as this would explain her moments of depression. We can find in the works of fiction of both authors moments when the characters feel very well in nature, whether in parks in the city or in the countryside, to the point where they experience moments of revelation, and where they feel that they are one with their surroundings. Additionally, the same refreshing and beneficial effect is noticed by both author with respect to walking in the city. Both of them live in London or, in Swift's case, in its suburban areas. The city is experienced as generating lots of energy and vitality, both for the authors personally and for their characters. As an example, Mrs Dalloway in the novel with the same title by Woolf feels extremely good and full of energy when she walks in the streets of London while going to buy flowers for the party she is preparing to host. We can connect fiction with reality, and claim that it makes reference to the intuitively noticed aspect of human psychology of feeling benefits from taking walks. Nowadays, popular psychology articles write about the beneficial effects of us taking walks and connecting with nature. This aspect is universal across cultures, as we can find the practice of meditation in nature in traditional Japanese culture, and also the practice of forest bathing, or shinrin-yoku, which refers to connecting with nature and meditating while walking in the forest. The European Union health policies raise awareness to the benefits of green spaces in big cities and of physical activity prompted by walking.

**Keywords:** environmental psychology, moments of revelation, popular psychology, health policies.

## **INTRODUCTION**

Walks in parks, in the countryside, in the suburbs of London, or in the centre of the city of London are common elements both in the personal lives and in the fictional works of writers Virginia Woolf and Graham Swift. For the authors, as well as for the characters, these walks feel beneficial, since they are enjoyed, and they experience the vitality of the surroundings, to the point where they can feel no separation from their environment. The feelings of merging with nature, of not feeling separate from it is a spiritual practice, which is transferred in the case of Woolf's and Swift's works to the setting of the city, where the characters feel so comfortable. The states of psychological and physical well-being which appear during and right after taking a walk go hand in hand. One influences the other. We can start from the evidence given by the way that Swift and Woolf claim that they feel so well and inspired for their works after taking walks and to continue asking ourselves the question: "Why?" Based on these observations, which reflect common experiences, we can find out, by looking at scientific research present in popular science articles, that taking walks increases our blood flow, as well as oxygen transpiration in our bodies to all organs, including our brain (Jabr, 2014). The result is that our thinking capacity increases, together with our potential for writing and creative activities. In turn, this influences our capacity for creativity in any type of work we have to do. In the examples dealt with in this paper, we have the confessions of two writers whose intent is to be able to create after these walks. Overall, taking walks can make us all feel good. Virginia Woolf and Graham Swift can describe experiences with taking walks which can be extremely relatable, yet, as writers, they have the gift to describe the experiences in words which maybe we cannot find at the moment. Once we have lived the experience of enjoying taking walks, we can easily relate to Woolf and Swift's writings, and find our own experience put into words by these two authors. What draws these two authors close for justifying the comparison is the way they enjoy taking walks both personally and the way they describe these walks in their fictional works, attributing, likely, what they have experienced themselves to their own characters. Readers may find, by connecting both autobiographical and fictional works, the experiences described as being completely authentic and honest, not just the work of make-believe and imagination. Readers may often wonder once they read very convincing experiences in fictional works if the authors have truly lived such experiences themselves, and then the experience is all the more convincing if the answer is yes. Another aspect which connects the two writers, Woolf and Swift, is their writing style, based on the stream of consciousness, on poetic style, and, overall, on the interior world of the characters. The action in their novels relies less on suspense, if at

all in some cases, and more on the way the various experiences are lived, at emotional and reflective level. The characters go through all the experiences and phases in life we all go, through issues regarding their relationships with the other characters as well as with themselves, as well as through various experiences of loss of dear ones, with the need for imagination and to feel loved, with isolation, with finding the joy in being able to feel connected again with the persons dear to them. Taking walks are natural parts of our everyday lives, yet for the characters in a fictional world these moments need not be present, just like any other activities we do on a daily basis, e.g. shopping, taking a bath, combing our hair, dressing up, and so on. The fact that taking walks is mentioned in Woolf's and Swift's fictional worlds shows that this practice is significant for some reason.

### **MATERIALS AND METHODS**

Environmental psychology (Steg & DeGroot, eds., 2019) deals with the way we react emotionally to our surroundings. We are never neutral to what surrounds us, even though, at some point, we feel that we are no longer paying attention to places that we know and where we go on our way of our daily routine. As an example, we may no longer pay attention to the road to and back from work. Even so, the changes in the seasons can draw our attention to our environment. Some cultures are portrayed through their practices as more concerned with nature than others. As an example, the Japanese culture includes, through the religions of Shintoism (Ashinova et al, 2019) and Buddhism (Nagatomo, 2006; Suzuki, 1991), the element of nature in the very practice of worship. Shintoism believes there are good spirits everywhere around us in nature, called kami. This belief definitely emphasizes the sense of well-being in nature for human beings. According to Zen Buddhist belief, the life cycle of nature can be understood in parallel with our own human lives. We grow old just as the seasons in nature succeed one another, starting from spring, symbolizing childhood, going on with summer, symbolizing adulthood, then with autumn, showing mature age and ending with winter, symbolizing old age. The changes nature goes through are occasions of us to reflect on the ephemeral nature of things in our lives. The cherry blossoms are symbols of Japanese culture members' understanding of the ephemerality of the beauty of the cherry blossoms which should be enjoyed while it lasts. Everything in our lives is going to be lost in a similar way. The Japanese culture members have their temples situated in the middle of nature, and they also meditate in a natural setting. Buddhist gardens are places where those willing to meditate but still continue with their usual everyday life routine and not retreating into solitude and into the lives of monks can take their time to reflect and afterwards return to their usual lives in the city.

Parks offer the opportunity for Japanese Zen Buddhist gardens. While the Japanese culture has precise habits and rituals, as well as various practices related to being in nature and which also imply walking, not all cultures in the world have them. Instead, the members of these cultures do take walks, without having formed ritualized practices around them. This state of affair proves, all the more, the universality of the well-being we all experience while walking in nature. In the meantime, walking has been extended, as a way of adapting it to our modern lives, to walking in the urban setting. While both nature and urban setting can be found together, as parks and gardens, together with green spaces can be found everywhere we live nowadays, we can also see how separate practices related only to nature can be found. The Japanese culture includes the practice of *shinrin-yoku*, which has been translated as forest bathing, and which includes walking in the forest, and focusing on the immediate sensations as we do breathing exercises, include the various smells of the forest and its fresh air. While breathing in the forest, we can also inhale those oils which are meant to draw away bacteria from the plants, and which have the effect of raising the immunity for human beings. We can find ourselves through the practice of *shinrin-yoku* experiencing relaxed states of mind, and feeling very well after such walks. The Japanese culture members have created a ritualized dimension around *shinrin-yoku* as well, yet walking in the forest can have the same benefits as a pass-time activity for other culture members as well and without practicing *shinrin-yoku* specifically. When there is vacation time, we generally feel the need to take a break from our usual environment, and change it, in order to experience new realities. We can go to the countryside, to the mountains, seaside, or to other cities. Walking, while on vacation, becomes our main pass-time activity since we are definitely going to explore our new environment. Sight-seeing is one of the main preoccupations while we go on vacation, yet it can also be practiced while in our own area. We may not practice walking to see new things in our city, yet there can be changes at some points in the way it looks, there can be events organized by the city hall, and, of course, the change of seasons can bring significant changes to the way the city, the parks and nature in general can look. Our state of mind can be further on improved by taking walks. Graham Swift confesses about enjoying taking walks anytime. He also mentions that, on the one hand, walking can allow him to reflect, or, on the contrary, to take a break from thinking: “Half a dozen times a year, at least – in all weathers. One of the great things about walking is that you can think while you walk or, of course, you can totally switch your mind off and just go along. I love being on my own two feet and steering myself” (Beckerman, 2014).

Swift would definitely gather his inspiration for his writing from walking, once he would go about his area. Woolf would believe that a walk through the city could bring her inspiration: “London itself perpetually attracts, stimulates, gives me a play and a story and a poem, without any trouble save that of moving my legs through the streets” (Bell, ed., 1982). We could claim that walking and thinking can be regarded comparatively. They both involve explorations of various kinds, external and internal. In the meantime, the works of both authors include characters walking in the city or in nature and, in the process, reflecting on their lives, both past and presents. Such examples include the novel *Mrs Dalloway* by Virginia Woolf, where the title characters is walking energetically through the city of London and thinking about various episodes in her youth. In the novel *The Light of Day* by Graham Swift, George Webb, the detective, think about his past and present life while walking through the suburbs of London. The characters are exploring their past while externally exploring the streets of the city and suburbs. Both novels also involve moments when Septimus Warren Smith in Woolf’s novel and the husband of Sarah, whom George tries to help, experience moments of feeling one with nature, to the point where there is no separation between them and their surroundings (Drobot, 2014). These can be called moments of being, as Woolf (1976) called them, or of enlightenment, or revelation, when we experience reality in a very intense way and we feel extremely aware of the present moment. In the essay *Street Haunting* by Virginia Woolf, the narrator imagines various stories based on what he or she sees around while on an evening walk through London (Bowlby, 2012). This essay can be seen in direct relationship with the way both Woolf and Swift find their inspiration for their writing while taking walks. While focusing on their concerns as writers when taking walks, as well as on combining walking with thinking and analysis various issues which preoccupy the characters with respect to their past, Woolf and Swift show how we can use walking as a means of refreshing. We can feel refreshed once we take a break from our work and from our thinking and, at the same time, we can feel more energetic and our mind can think more clearly once we have taken or are taking a walk. The moments of enlightenment characters have while taking their walks come from their clearer judgment while taking their walks. They become more connected with their present concerns. The process of reflecting while walking does not mean they are not enjoying their walks. They can feel connected here and now while walking, while they can take a clearer look at the past and at its relationship with the present. Mindfulness teaches us to be present here and now, and reflecting on the past, as characters do, as well as on the future, as the writers do, thinking about what they could write next when they get home can seem to contradict our presence here and

now. Still, reflecting on the past and future both have in common our present concerns and preoccupations. We can see walks, in the case of Woolf, Swift, and their fictional characters, as means of meditation about their present concerns.

## **RESULTS**

Taking walks can be seen as occasions for meditating on what we are preoccupied with at present, even if these preoccupations will extend to the past, as we can find in the past the root cause for our present-day crisis, and to the future, as we can use, as writers, the present material for our future works.

The present, past and future are definitely not separate from one another. At some point, they intersect and influence one another. We cannot just cut ties with the past and future and live completely in the present. What matters is to be aware of what is significant, and to select those important moments, as we do when we write fiction. Fiction writing involves a selection of interesting and relevant moments. Nothing that is presented or focused on in a work of fiction is random. It is not just a matter of not boring the audience, but also a matter of tying in a coherent story.

Self-analysis of the characters and the reflections of the writers while taking walks can be compared to the meditation practices present in Japanese culture. These practices have in common the element of increased awareness.

## **DISCUSSION**

We are constantly reminded nowadays through popular science articles about the physical and psychological well-being which comes from having a bit of physical activity. Outings and occasions for various activities created by city halls in big cities, such as moments when some portions of boulevards are available for pedestrians, and closed to cars, with various street shows, and activities for children and adults organized in parks can all be included under the health policies category promoted by various supranational organizations such as the European Union. The topic is, thus, one of actual concern. Reading fiction and writer's autobiographical writings, diary entries and essays can help promote this part of present-day ideology related to health. The concern raised for the environmental care goes hand in hand with citizens' health, since a polluted environment can be harmful to humans' health as well. Caring for natural spots, parks and green areas in large cities is currently a common practice all over the world. This practice ensures we have the right environment for taking walks beneficial to our health. Walking is a practice which can come in handy to anyone of us. We do not need to practice sports, to have expensive training, to go to a sports hall and pay for the training. We do not need

to learn how to ride a bicycle if we cannot. Walking is not even taking too much effort, as it can come naturally to us all. The benefits are clear, and it can even be a very pleasant activity. Virginia Woolf and Graham Swift's writings, both fictional and autobiographical, can help promote the healthy, beneficial practice of walking for anyone of us today. We tend to be inspired in the way we live our lifestyle through fiction and autobiographical writings. Writers of fiction such as Virginia Woolf and Graham Swift are personally convinced of the benefits they can get from taking walks in the city, as well as in nature. This is a practice accessible to us all. Life in the big city can mean long hours of waiting in the traffic, while driving our own car or while going by common means of transport, as well as an overall sedentary lifestyle since we spend, function of our jobs, a lot of time in the office, sitting, not moving frequently around, and the same can be said about working from home, in front of our laptops. Our possibilities for entertainment nowadays, with the Internet, and home cinema can also diminish our outings as we can have everything in our own homes, readily accessible. We can download a film, or watch it online, we can even have food delivered at our door and not even need to go shopping. Once the weather is not very good, we may not feel like going out at all, as it is well-known that the weather conditions can influence our mood. Once spring arrives and it is a beautiful day, we can notice how we can feel energized and willing to take walks. The same holds true for beautiful summer days. We can, nowadays, notice such practices in big cities. Activities in parks are organized, including workshops and activities for children, fairs with various products, ranging from healthy foods to handmade jewelry, bikes and electric scooters are available for rent, and so on. Additionally, in parks and in the city streets the cafes open up and provide the opportunity to sit in enclosed, backyard areas in old houses' gardens, in passageways, as well as in the streets to watch the busy city life or the beautiful architecture of the nearby buildings.

### **CONCLUSIONS**

The writings by Virginia Woolf and Graham Swift can be used to offer an example of emotional connection with readers feeling the same about taking walks, or simply willing to try out the experience more often than usual. While Woolf and Swift write about their own and their fictional characters' walks in the city of London and in the London suburbs and parks, such experiences can be relatable when applied to any other city in the world. Big cities can be, to some extent, alike in that they offer us so much variety of experiences. They can be busy streets, with shops and parks, they can offer us a sense of freedom and anonymity, as well as, at the same time, of emotional connection with the crowds. We tend to project our mood on our

surroundings, and we also have our mood influenced by the surroundings. The big city streets, with their fast pace of life, can suggest not only a sense of being busy and feeling stressed, but also a sense of fast pace rhythm, and plenty of energy. Once we start walking in the same rhythm as the others, we can feel that we start sharing the same fast pace rhythm to our thinking and capacity for taking care of many thing we need to do. We can become more efficient at everything we do. Our state of mind is influenced by the fast pace of others in the city streets the same way it is influenced by the fast pace of music. Once we are already in a good mood, we can further improve our mood by taking walks and feeling energized. Psychological and physiological well-being go hand in hand, as a better circulation of blood in our bodies can further on contribute to our feeling full of energy and increased efficiency in what we do afterwards. Woolf and Swift can be seen as communicating, through autobiographical writings and interviews, as well as through their fictional works, the experience of the benefits of taking walks. These descriptions of taking walks can be seen as sharing pleasant experiences, confessing, as well as advising us readers in a friendly way to take walks, or to recommend them to us, precisely since they can bring such states of well-being. Since the author experience these walks themselves, their recommendations are all the more believable and they can be seen as trustworthy, persuasive sources of information about walks. When we are recommended a certain activity, it seems that we need someone's example. Woolf's and Swift's works could be regarded as being able to teach us beneficial habits, to set up examples to follow, and they can be seen as role models for us all. We can imagine them giving to us readers a friendly advice regarding taking walks. Particular examples of real-life authors and fictional characters can have a larger impact through the better emotional connection than being told through various informative means, raising awareness campaigns and reading purely objective, scientific information about the benefits of taking walks. We can see how fiction and the personal experience of these two authors can resonate with us personally today, as well as with the values and lifestyle promoted for us through health policies of supranational organizations such as the European Union. Once we realize the universality of the experience, we can be all the more convinced that it is beneficial for us personally as well, and that it is not just a simple trend regarding the way we pass our free time. It is a practice that they do not just promote at ideological level, but one that they practice themselves. Ideology is nowadays present in the way our lifestyle is guided by supranational institutions such as the European Union through health policies and illustrated through popular science articles and other cultural products. Woolf's and Swift's writings show how they can overlap with our values today and with healthy

practices that we share with them. At the same time, for these two authors taking walks as a healthy practice overlaps with this practice being a hobby.

**Özet**

İki ve ikiden fazla dilin biçimbilgisel yapısında ve leksikolojik anlamında ortak özelliklerinin gözlemlenmesi söz konusu dillerin çoğunlukla jeneolojik açıdan akraba diller olduğunu ve kendilerinin bir ortak kaynaktan, “kök dil” adlandırabileceğimiz bir ortak dilden tüendiğini kanıtlar. Araştırmamızın konusu Hint-Avrupa dilleri ailesinin İran dilleri öbeğine ait olan Farsça ve Peştu dillerinin ünsüz sesleridir. Çok eski tarihe sahip Farsça Doğu’da oldukça büyük alanda yaygınlaşmış , klâsik eserlerin yazıldığı Hint-Avrupa dil ailesinin İran dilleri öbeğine aittir. Söz konusu dil İran İslam Cumhuriyetinin resmi devlet dilidir. Hint-Avrupa dillerinin İran dilleri öbeğine ait olan Peştu dili Peştunların ana dili olarak genellikle bütün Güney və Güneydoğu Afganistan`da, Kuzey Batı ve Batı Pakistan`da yaygınlaşmıştır. Darice ile beraber Afganistan`da resmi devlet dili olarak bilinir. Her iki dile yazıda Arap alfabesini kullanmakla Arap alfabesinin mevcut bulan harflerine, dillerine uygun çeşitli harfler, , diakritik işaretler eklenilmiştir. Farşlar Arap alfabesine 4 grafik örnek , Peştunlar ise 18 grafik örnek ekleyerek telâffuzlarına uygun olarak alfabelerini geliştirmişler. Peştu ve Farsça dilleri aynı dil grubuna ait olmalarına rağmen ünsüz ve ünlü seslerinin sayılarına göre birbirlerinden esaslı olarak farklıdırlar. Farsçada 23 ünsüz , 6 monoftong ünlü ve 1 diftong bulanmasına karşın Peştucada 30 ünsüz, 9 ünlü, 7 monoftong ünlü ses bulunmaktadır. Sonuçta Farsçada harf sayısının 30 şema örneği şeklinde belirlenmesine rağmen Peştucada harf sayısı toplam olarak 46`dır. Peştu dilinde harf sayısının çoğunluk oluşturması Peştunların telâffuzunda monoftong, diftongların sayıca yeğlik oluşturması ,aynı zamanda ünlü ve ünsüzlerin birçoğunun burun sesleri özelliklerini alabilmesi (*ing.: nasal vowel; nasal consonant*) ve söz konusu dildeki özel ünsüzlerin bulunmasının sonucudur.

**Anahtar Kelimeler:** Hint-Avrupa dilleri ailesi, İran dilleri, Peştu dili, ünlü sesler, ünsüz sesler.

**CONSONANTS IN TWO LANGUAGES OF THE SAME LANGUAGE  
FAMILY WITHIN COMPARATIVE STUDY**

**Abstract**

If two or more languages have common features in their grammatical structure and lexical composition, these languages are genetically related languages and they are descended from one common source, conventionally called the “root language”. The object of our research is the consonant sounds of the Persian and Pashto languages belonging to the Iranian group of the Indo-European language family. Widespread in the East with classical works written on it the Persian language which has an ancient history, belongs to the Iranian group of the Indo-European language family. This language is the official state language of the Islamic Republic of Iran. The Pashto language, which belongs to the Iranian group of Indo-European languages, as the mother tongue of the Pashtuns, is mainly spread throughout southern and southeastern Afghanistan, as well as in northwestern and western Pakistan. It is the official state language in Afghanistan along with Dari language. By using the Arabic alphabet in writing, both languages have added different letters and diacritical marks to the existing letters of the Arabic alphabet. The Persians added 4 graphic samples to the Arabic alphabet: the Pashtuns added 18 and improved their alphabet according to their pronunciation. Although Pashto and Persian belong to the same language group, they differ significantly in terms of the number of consonants and vowels. In Persian there are 23 consonants, 6 monophthong vowels and 1 diphthong; while Pashto has 30 consonants, 9 vowels and 7 monophthong vowel sounds. Thus, if the letters of the Persian language are identified in the form of only 30 graphic patterns, the total number of letters in the Pashto language is 46. This happens mainly due to the presence of many monophthongs and diphthongs in Pashtun pronunciation, as well as the nasalization of many vowels and consonants (nasal vowel; nasal consonant) and the presence of special consonants of this language.

**Keywords:** Indo-European language group, Iranian languages, Pashto language, vowel sounds, consonant sounds.

**Giriş:** Araşdırma obyektimiz Hind-Avropa dilləri ailəsinin İran qrupuna aid fars və puştu dillərinin samit səsləridir. Samitlər ingilis dilində - /consonants/; rus dilində -/согласные/; fars dilində -/həmxanha/; puştu dilində - /samet/adlanır. “Ümumi şəkildə danışq cihazında mərkəzləşməsi ilə səciyyəolənən, saitlə yanaşı gəldikdə heca nüvəsi əmələ gətirməyən səslərə deyilir”[4, s.183]Danışq aktının üzvlənməsi zamanı ciyərlərdən səs tellərinə daxil olan hava cərəyanı xaric olarkən öz yolunda müxtəlif maneələrə rast gəlir. Bu maneələr isə danışq cihazının müxtəlif üzvləri vasitəsilə yaradılır. Bunun nəticəsində ciyərlərdən gələn hava cərəyanı bu orqanlarda maneələrə təsadüf etdikcə və onları dəf etdikcə öz əvvəlki gücünü nəzərə çarpacaq dərəcədə azaldır. Bu zaman hava cərəyanı səs tellərindən başlayaraq, keçdiyi yolda ayrı-ayrı danışq üzvlərinin bir-birinə yaxınlaşması, dar keçidin yaradılması, sədd yaradılması, yaxud böyük bir maneənin olmaması nəticəsində müxtəlif dillərin müxtəlif samitlərini əmələ gətirir.

**Əsas araşdırma:** Hind-Avropa dillərinin İran dilləri qrupuna mənsub olan puştu dili puştunların ana dili kimi əsasən bütün cənub və cənub-şərqi Əfqanıstanda, şimal-qərbi və qərbi Pakistanda yayılmışdır. Dari dili ilə birlikdə Əfqanıstanda rəsmi dövlət dilidir. Leksik fonduna hind, fars, ərəb, türk, monqol, Avropa dillərindən külli miqdarda söz və tərkiblər daxil olmuşdur. “Çoxsaylı ləhcə və şivələri əsasən iki dialektə birləşir: şərqi və ya pişəvər-Cəlalabad və qərbi və ya Qəndəhar dialekti [ 2 ; 6]. Yazıda ərəb əlifbasından istifadə edilir. Ərəb əlifbasının mövcud hərflərinə dillərinə uyğun müxtəlif hərflər, diakritik işarələr artırmaqla əlifbalarının qrafik nümunələrini xeyli zənginləşdirmişlər. İlk yazılı abidə nümunələri XIII-XIV əsrlərə aiddir. Puştu və fars dilinin samit səsləri saylarına görə bir-birindən kəskin fərqlənirlər. Fars dilində 23 samit; 6 monofonq sait və 1 diftonq olduğu halda, puştu dilində 30 samit; 9 sait; 7 monofonq sait səs mövcuddur. Beləliklə, fars dilinin hərfləri cəmi 30 qrafik nümunə şəklində təsbit olunursa, puştu dilindəki hərflərin ümumi sayı 46-dır. Bu da əsasən puştunların tələffüzündə monofonq, diftonqların çox olması, eləcə də sait və samitlərin bir çoxunun burunlaşması (*ing.: nasal vowel; nasal consonant*) və bu dilin xüsusi samitlərinin mövcudluğunun nəticəsidir.Qeyd edək ki, həm fars, həm də puştu dilinin samitlərinin xüsusiyyətlərini müəyyənləşdirmək məqsədilə mütəxəssislər arasında aşağıda verilən prinsiplər ümumi qayda kimi qəbul edilir:

I prinsip. Səs tellərinin iştirakına görə,

II prinsip. Danışq üzvlərinin iştirakı və fəal üzvə görə ,

III prinsip. Maneənin növü və dəf edilməsi üsuluna görə .

Məqalənin həcmi nəzərə alaraq hər iki dilin samit səslərinin formalaşmasında yalnız səs tellərinin iştirakını araşdırmağı qarşımıza məqsəd qoyaraq davamını gələcək tədqiqatların öhdəsinə buraxdıq.

### **Səs tellərinin iştirakına görə hər iki dilin samitlərinin tədqiqi**

#### **I Samitlərin cingiltili səslənmə (*vakdar; voiced*) xüsusiyyəti**

Fars və puştu dili səslərinin çoxu əmələ gəldiyi anda səs tellərindən, qırtlaqdan keçən hava axını onları (hər iki orqanı) titrədir və bu zaman cingiltili səslər yaranır. Başqa bir qrup səslərin yaranmasında isə səs telləri titrəmir. Birinci qrup səsləri cingiltili, ikinci qrup səsləri isə kar səslər adlandırılır. Fars dilinin cingiltili samitləri : /b/, /m/, /v/, /d/, /z/, /l/, /n/, /ž/, /j/, /y/, /g/ /q/- sadaladığımız 12 fonemdən ibarətdir. Puştu dilinin cingiltili samitlərinin sayı 18 olmaqla aşağıdakı samit səsləri əhatə edir: /b/, /dz/, /dj/, /d/, /d./, /z/, /p/, /p./, /j/, /j. /, /q/, /q./, /l/, /m/, /n/, /n./, /v/, /y/. Avazlılıq hər iki dilin səsləri üçün fərqləndirici və qarşılaşdırıcı (*təmayoz-dəhənde; opposite or distinctive*) əhəmiyyət kəsb edir. Səslərin bu xüsusiyyəti əmələgəlmə yeri (*məhəll-e toulid; place of articulation*) və əmələgəlmə üsuluna (*nəhvə-ye toulid; manner of articulation*) görə bir-birinə oxşar olan səslər üçün xarakterikdir. Lakin qeyd edilməlidir ki, fars və puştu dillərinin bütün səslərini cingiltili və kar səslər kimi cüt-cüt qarşılaşdırmaq mümkün deyildir. Fars dilində /m, n, l, r, y/ samit fonemlərinin kar qarşılığı yoxdur. Fars dilinə müvafiq olaraq puştu dilindəki /m/, /n/, /n./, /l/, /r/, /r./ kimi sonor samitlərin də qarşılaşdırıla biləcək kar cütlüyü mövcud deyildir. Bundan əlavə hər iki dilin kar, nəfəsli /h/ samitinin də cingiltili qarşılığı mövcud deyildir. Danışq aktı zamanı cingiltili samitlər heç də həmişə öz cingiltililik xüsusiyyətlərini sona qədər qoruya bilmirlər. Bəzən cingiltili samitin söz daxilində yerləşdiyi fonetik şərait, pozisiya və qonşuluğundakı səslərin distributiv təsirləri nəticəsində bu səslər öz cingiltililik xarakterinin bir hissəsini, bəzi hallarda isə hamısını itirir və karlaşmış (devoiced) şəkllə düşürlər. Məsələn, (səbt) sözündəki /b/ cingiltili samiti hər iki dildə kar /t/ samitinin təsiri ilə cingiltilik xüsusiyyətinin bir hissəsini itirərək özünün kar variantı /p/-ya oxşar bir şəkildə tələffüz edilir. Lakin sonralar dəqiq tədqiqat nəticəsində görəcəyik ki, cingiltili samitlərin cingiltili olması onların yerindən, fonetik şəraitindən asılı olur. Samitlərin cingiltili və kar terminləri altında iki qrupa bölünməsi bütün fonetistlər tərəfindən qəbul edilsə də bunların özü də şərtidir. Çünki müxtəlif adamların tələffüzündən söz daxilindəki yerindən hansı səslərlə yanaşı gəlməsindən, distributiv xüsusiyyətindən asılı olaraq samitlərin cingiltililiyi özünü müxtəlif şəkildə nümayiş etdirir.

**Cingiltili samitlərdə küy və sonorluq xüsusiyyətləri:**

Hər iki dilin (fars və puştu) cingiltili samit səslərinin xarakterindəki küyün və tonun üstünlüyünə görə daha bir bölgü aparmaq mümkündür: Fars dili samitləri:

a) Küylü samitlər: /b/, /p/, /d/, /z/, /ʃ/, /j/ və s.

b) Sonor samitlər: /m/, /n/, /l/, /r/, /y/.

Puştu dilinin samitləri:

a) Küylü samitlər: /b/, /dz/, /dj/, /d/, /d./, /z/, /p/, /p./, /j/ və s.

b) Sonor samitlər: /m/, /n/, /n./, /l/, /r/, /r./, /y/.

Sonor samitlər də hansı rezonatorla əmələ gəlmələrinə görə ağız və burun sonorlarına bölünür. Nitq səslərinin formalaşmasında 2 əsas rezonator, ağız və burun boşluğunun mühüm rolu olduğu məlumdur. Damaq pərdəsi, dilçək aşağı düşərək ağız boşluğunun yolunu kəsədikdə bronxlardan gələn hava ağız boşluğuna deyil, burun boşluğuna gedir və buradan keçib, xaricə çıxır. Fars dilinin burun sonorları /m/, /n/ samitləridir.

Əgər damaq pərdəsi yuxarı qalxıb burun boşluğunun yolunu kəsərsə, nəticədə səs axını ağız rezonatoruna daxil olar. Bu zaman fars dili ağız səsləri olan sonorlardan /l/, /r/, /y/ və küylü samitlərinin hamısı formalaşar.

Fars dili ilə müqayisədə puştu dilinin sonor samitləri /r/ və /n/samitlərinin burunda tələffüz edilməsi nəticəsində bu dilin sonorları sayca daha çoxdur. Fars dilində beş, puştu dilində isə yeddi sonor samit mövcuddur.

**II Samitlərin kar səslənmə (*bivak; voiceless*) xüsusiyyəti**

İkinci qrupa, başqa sözlə kar samitlər qrupuna fars dilinin 11 samit fonemi : /t/, /p/, /f/, /s/, /ç/, /ş/, /k/, /q/, /h/, /x/, /ʔ/- aiddir.

Puştu dilinin 12 kar samit fonemi isə aşağıdakılardır: /p/, /t/, /t./, /s/, /ts/, /ç/, /ş/, /ş./, /f/, /k/, /x/, /h/ .

Hər iki dilin kar samitlərini nəfəslilik (*непридыхательные; aspirate; nəfəsli*) baxımından da özlərinə məxsus xarakter sərgiləyirlər. Qeyd edək ki, ümumiyyətlə, /p/, /t/, /k/ samitləri hər iki dildə adətən vurğulu saitdən əvvəl və mütləq sonluqda nəfəsli tələffüz olunurlar. Bu samitlərin bir hissəsi isə nəfəssiz samitlər adlanır. Əlbəttə, bu bir fonetik istilah olaraq dilçilik ədəbiyyatında qəbul olunmuşdur. Məlumdur ki, nəfəs olmasa heç bir səs tələffüz edilə bilməz. Birinci qrup samitlərinə nisbətən burada sadəcə nəfəsin rolu bir qədər az hiss olunur. Samitlərin bu qrupu bir çox dünya dillərində vardır və dilçilik termini kimi (*rus dilində: непридыхательные; ingilis dilində: unaspirated; azərbaycan dilində: nəfəssiz samit*) adlanır.

### **III Fars və puştu dilinin samitlərini nəfəsli və nəfəssizlik xüsusiyyətləri**

Hər iki dilin samit səslərini formalaşmasında nəfəsin nə dərəcədə iştirakı baxımından da iki qrupa bölmək olar:

a) Fars dilinin nəfəsli samitləri: /p/, /f/, /t/, /s/, /ç/, /ş/, /k/, /x/, /h/.

b) Fars dilinin nəfəssiz samitləri: /b/, /d/, /q/, /ğ/, /ʾ/, /v/ və s.

a) Puştu dilinin nəfəsli samitləri: /p/, /t/, /s/, /ts/, /ç/, /ş/, /ş./, /f/, /x/, /k/, /h/.

b) Puştu dilinin nəfəssiz samitləri: /b/, /d/, /q/, /j/, /ʾ/, /k/ və s.

Araşdırmalar göstərir ki, müəyyən şərait və fonetik pozisiyaya uyğun olaraq öz cingiltili xüsusiyyətini itirmiş samit bütün əlamətlərinə görə tam şəkildə qarşılıqlı ilə əvəzlənir. Burada səslərin cingiltili, kar, küylü, tonlu olması üçün onu bu əlamətlərə görə formalaşdıran başqa fiziki, fizioloji xüsusiyyətlər də əsasdır. Kar samitlərin formalaşmasında cingiltili samitlər və saitlərdən fərqli olaraq səsi əmələ gətirən hava cərəyanında küyün şiddətinin, davamlılığın, nəfəsliliyin də əhəmiyyəti böyükdür. Kar samitlərin tələffüzündə hava cərəyanı səs tellərini titrətmədən, başqa sözlə gücünü, qüvvəsini itirmədən ağız boşluğuna daxil olur. Sonra ağızda fəal və qeyri-fəal danışıq üzvləri tərəfindən yaranmış maneəni qüvvətlə dəf edərək müvafiq kar samiti formalaşdırır. Belə ki, novlu, kar /s/ samitinə sərf olunan enerji onun cingiltili qarşılıqlı /z/- ya sərf olunan enerjiden xeyli dərəcədə güclü olur. Bildiyimiz kimi, cingiltili /z/- nin tələffüzündə hava cərəyanının gücü bir qədər zəifləmiş olur (ona görə ki, bu təzyiqin bir hissəsi səs tellərini titrəyişə gətirməyə sərf olunur). Məhz buna görə də fars dilinin kar samitlərini sərt (*səxt; tense, fortis*), cingiltili samitlərini isə yumşaq (*nərm; lax, lenis*) adlandırırlar. Kar samitlər cingiltili samitlərlə müqayisədə özlərini daha davamlı və uzun kəmiyyətdə (*kəşəş; lenght*) nümayiş etdirirlər. Ossiloqraf lentlərində bizim təcrübəmizdə /sereşk/ və /zereh/ sözlərindəki /s/ və /z/ kar, cingiltili cütlüyünü davamlılıqlarına görə qarşılaşdırsaq, kar samiddə  $t_{zaman} = 120$  msan; cingiltili samiddə isə bu rəqəm cəmi 65 msan. təşkil etmişdir. Kar samitlərin formalaşmasının daha bir xüsusiyyəti isə onların cingiltili samitlərə və saitlərə nisbətən nəfəsli (*dəmeşi; aspiration*) olmalarıdır. Bu xüsusiyyət adətən kipləşən- partlayışlı (*enfecari; plosive*) samitlərə xasdır. Onların tələffüzü zamanı maneənin arxasında toplanmış hava cərəyanının səsə çevrildiyi anda sanki əsas səslə yanaşı tələffüzdə kiçik bir /h/səsi də eşidilir. Bu zaman kar samit nəfəsli (*dəmidə; aspirated*) olur. Fonetik transkripsiyada samitlərin bu xüsusiyyəti kar samitlərin sağ tərəfində yuxarıda qoyulmuş kiçik bir “h” səsi ilə işarə edilir: /p<sup>h</sup>/, /k<sup>h</sup>/ və s.

**Fars və puştu dili samitlərinin tədqiqinə araşdırmaçıların yanaşması.**

Qeyd etmək lazımdır ki, puştu dilinə nisbətən, fars dili daha çox tədqiqatçılar tərəfindən araşdırma obyektinə olmuşdur

Şərqsünaslardan N. H. Hatəmi [6], V. S. Rastorquyeva [15] fars dilində 22 samit fonem - /b/, /p/, /t/, /d/, /k/, /q/, /m/, /n/, /ç /, /j/, /f/, /v/, /s/, /z/, /y/, /x/, /ğ/, /ž/, /š/, /l/, /r/ olduğunu;

Y. A. Rubinçik [16] eləcə də fars dilçilərindən P.N. Xanləri [8], Ə. Həqşenas [7], Y. Səməreh [18], M. Müşkəddini [13] 23 samit fonem, L. Jirkov [9] və bir çox Avropa alimləri fars dilində 24 samit fonem olduğunu qeyd edirlər. Araşdırmalardan aydın olmuşdur ki, fars dilində 22 samit fonem olduğunu qəbul edənlər “ع” və “ء” – nin verdiyi /’/- ni nəzərə almamışlar. Bu dildə 24 samitin olduğunu iddia edənlər isə “ع” və “ق” samitlərinin verdiyi səsi müxtəlif fonem hesab etmişlər.

P. N. Xanləri fars dili samitlərini 3 prinsipə: a) maneənin dərəcəsinə ; b) səs tellərinin iştirakına; b) maneənin dəf edilməsinə görə bölmüşdür [8, s. 31]. Y.Səməreh fars dili samitlərinin ümumi xüsusiyyətlərindən danışaraq, onların bölgüsündə iki prinsipi: 1. maneənin əmələ gəlməsi və dəf edilməsi üsulunu; 2. samitlərin əmələ gəlməsində səs tellərinin iştirakını əsas götürmüşdür [18, s. 27]

Puştu dilinə gəldikcə bu dil bir növ fars dilinin yeni dövrü, Dəri ilə müəyyən yaxınlığı olsa da fonetik, morfoloji, sintaksisdə baş verən inversiya baxımından xeyli dərəcədə fərqli olması ilə hind dilinə yaxınlığı aydın şəkildə hiss edilir.

Puştu dilinin əsas tədqiqatçılarından olan [ N. B. Dvoryankov [5], K. A. Lebedev [10], İ. Y. Novqorodova [14], M. Mərhun [11] ], bu dilin səsləri haqqında demək olar ki bir-birindən cüzi və əsas məsələyə təsir edə bilməyəcək dərəcədə fikir bildirmişlər. Onların əsas fikir ayrılıqları qrafik nümunələrin transkripsiyası haqqındadır. Fikrimizcə bunu dəqiqləşdirmək üçün geniş eksperiment işləri aparılmalıdır.

Biz tədqiqatımızda puştu dilindəki mövcud səslərinin transkripsiyasını latın qrafikası ilə verdik. Xarici tədqiqatçılar da latın və Beynəlxalq transkripsiyadan istifadə edirlər. Lakin qeyd edilməlidir ki, puştu dili tədqiqatçıları arasında rus araşdırmaçılarına daha çox rast gəlindiyindən paralel olaraq kiril əlifbasına uyğunlaşdırılmış transkripsiyadan da istifadə olunur. Hətta bir çox səslərin rus dilinin səslərinə uyğun olduğuna əmin olan araşdırmaçıları da vardır. Onlardan biri K. A. Lebedevin aşağıdakı qeydi maraqlıdır: « В языке пушту тридцать согласных звуков. Половина из них, а именно: /б/, /п/, /т/, /с/, /з/, /ц/, /ч/, /г/, /л/, /р/, /м/, /н/, /ф/, /й/ по своим артикуляциям почти не отличаются от подобных им в русском языке.» [10, s.14 ]

Bu sadalanan məsələlərə aydınlıq gətirmək tədqiqatımızın əsas məqsədi olmuşdur. Fars dilinə aid araşdırmalar Sank-Peterburq Dövlət Universitetinin Rus dili kafedrasının Fonetika laboratoriyasında dörd iranlı tələbənin diktorluğu ilə, ən müasir aparatlardan istifadə etməklə yerinə yetirilmişdir. 3600 söz və tərkibdən tərtib olunmuş proqramlar oxunduqdan sonra 102 tipli 8 şleyfli ossilloqraf aparatında, SZÇ tipli spektrometrdə, “Görünən titq” nümunələri .... və s.-də analiz və təhlil edilmişdir. Aşağıda fars dili samit səslərinin fonetik xüsusiyyətlərini əks etdirən cədvəl sizinlə bölüşürük:

**Cədvəl Fars dili samitlərinin xarakteristikası**

Tədqiqatdan aydın olmuşdur ki: - fars dilinin fonetik quruluşunda 23 əsas samit fonem, samitlərin distribusiyasından asılı olaraq, hər birinin bir neçə allafonu da mövcuddur. Tədqiqat işində hər bir fonemin distributiv xüsusiyyəti, variativliyi, allafonları, omofon yaratma xüsusiyyəti, bir sözlə akustik və fonoloji təhlili aparılmışdır

**Sonuc:**

- Fars dili əsasən İran ərazisində farsların işlətdiyi dildir. Bu dil İran İslam Respublikasının rəsmi dövlət dilidir.
- Hind-Avropa dillərinin İran dilləri qrupuna mənsub olan puştu dili puştunların ana dili kimi əsasən bütün cənub və cənub-şərqi Əfqanıstanda, şimal-qərbi və qərbi Pakistanda yayılmışdır.
- Səs tellərinin iştirakına görə hər iki dilin samitləri ən ümdə, vaciv xüsusiyyətlərinə görə bölgüyə cəlb edilmişdir.
- Fars dilinin fonetik quruluşunun mühüm bir hissəni təşkil edən konsonantların /samitlərin/ tək-cə bölgüsü, növü, keyfiyyəti deyil, hətta sayı haqqında da mütəxəssislər arasında fikir ayrılığı mövcuddur.
- Fars dilində 23 samit, 1 diftonq və 6 monofonq sait olmaqla cəmi 30 qrafik nümunə və onların qarşılığı səs mövcuddur.
- Puştu dilində 30 samit, 7 diftonq və 9 monofonq sait olmaqla 46 qrafik nümunə və qarşılığı olan səs vardır.

**Xülasə**

Ölkə tarixində bəzi qara səhifələr mövcud olmuşdur. Buraya repressiyalar, qətləyər, sürgün və terror aktlarını misal göstərmək olar. Məhz bu cür müsibətlər Quba regionundan da yan keçməmişdir. Həmin tarix ərzində Azərbaycanın bir çox bölgələrində soydaşlarımıza və digər etnik azlıqlara qarşı soyqırımı hadisələri törədilmişdir. Buraya misal olaraq 1918-ci il mart soyqırımını qeyd edə bilərik. 1918-ci il martın əvvəllərində rus bolşevik Qızıl Ordusunun dəstəklədiyi erməni qüvvələri Azərbaycanın digər bölgələri də daxil olmaqla Quba qəzasına da hücumla keçdi. Quba qəzasında yerli əhali, ilk növbədə, azərbaycanlılar həmin amansız qətləyər atəşi altında qaldıqları üçün dəhşətli tarix ilə üzləşdilər. Ölənlərin sayı ilə bağlı proqnozlar müxtəlifdir, ancaq Quba hadisəsi zamanı çoxsaylı günahsız insanın terror nəticəsində həlak olduğu geniş yayılmışdır. Terrora qurban gedən təkcə azərbaycanlılar deyil, həmçinin bölgədə yaşamış müxtəlif etnik qrup nümayəndələridir. Araşdırmalar nəticəsində aşkar edilmişdir ki, qazıntı zamanı üzə çıxarılan kütləvi məzarlıqda azərbaycanlılar ilə yanaşı, Qubada etnik azlıqlar, yəni tat, yəhudi, ləzgi və başqaları da qeyri-insani əməllərlə terrora qurban edilmiş və cəsədləri vəhşicəsinə basdırılmışdır. Bu məqalədə 1918-ci ildə baş verən mart soyqırımını zamanı Quba qəzasında yaşamış etnik azlıqların rolları, hadisə zamanı onlara qarşı törədilən amansızlıqlar vurğulanmışdır.

**Açar sözlər:** Quba, etnik qrup, ləzgi, yəhudi, soyqırım

**Key words:** Guba, ethnic group, lezgi, jew, genocide

**QUBA QƏZASINDA YAŞAYAN ETNİK QRUPLAR**

**Abstract**

There have been some black pages in the country's history. Examples include repressions, massacres, exiles and acts of terrorism. Such calamities have not escaped the Guba region either. During that history, genocide was committed against our compatriots and other ethnic minorities in many regions of Azerbaijan. We can mention the March 1918 genocide as an example. At the beginning of March 1918, the Armenian forces supported by the Russian Bolshevik Red Army attacked Guba district, including other regions of Azerbaijan. In the Guba accident, the local population, first of all, the Azerbaijanis, faced a terrible history because they were under the fire of that merciless massacre. Estimates of the death toll vary, but it is widely believed that many innocent people died as a result of terrorism during the Guba incident. Victims of terrorism are not only Azerbaijanis, but also representatives of various ethnic groups who lived in the region. As a result of research, it was found that in addition to Azerbaijanis in the mass grave discovered during the excavation, ethnic minorities in Guba, such as Tats, Jews, Lezgi and others, were victims of terrorism with inhuman acts and their bodies were brutally buried. In this article, the roles of the ethnic minorities who lived in the Guba district during the March genocide in 1918, and the atrocities committed against them during the event, are highlighted.

**Key words:** Guba, ethnic group, lezgi, jew, genocide

1918-ci il martın əvvəllərində erməni nizamsız qüvvələri Azərbaycanın regionlarında dağıdıcı hücumu keçdi. Həmin regionlar arasında Quba qəzası da daxildir. Quba qəzasındakı azərbaycanlılar ilk növbədə olmaqla digər etnik qruplar da bu amansız terror atəşi altında amansızlıqla üzləşdilər. Qətlə yetirilənlərin sayı ilə bağlı təxminlər müxtəlifdir. Quba hadisəsi Azərbaycan xalqının yaddaşında yaşayır. Quba qəzasında baş verən hadisələr Azərbaycan Respublikasının tarixində faciəvi bir səhifə olaraq qalsa da, Azərbaycan xalqının milli kimliyinin formalaşmasında mühüm rol oynamışdır. Bu da həmin dəhşətləri unutmaq istəməyən bir cəmiyyətin davamlı ruhunun sübutu kimi dayanır. Hadisə tarixi ədalət ətrafında müzakirələrin əsas nöqtəsi olaraq qalmaqdadır. Hər il qurbanların unudulmaması və hadisənin tanınması üçün müxtəlif tədbirlər həyata keçirilməyə davam edir [5.s.8]. Quba qəzasında 1918-ci ilin qanlı mart kimi tanınan terror hadisələrindən sonra Şamaxı və Bakı qəzalarında bolşeviklər qurduqları Sovet hakimiyyətini daha da böyük çərçivədə genişləndirmək məqsədində idilər. Ancaq, Quba qəzasında olan real vəziyyət Şamaxı və Bakı qəzalarından nisbətən fərqli idi. Tarixi çərçivədən baxıldıqda Quba qəzasının və eyni adlı xanlığın iqtisadi və sosial-siyasi həyatında ermənilər heç də gözə çarpan bir rol oynamamışdı. Qeyd olunan ildə - 1918-ci ildə Quba qəzasında və onun 3 kiçik erməni kəndində məskunlaşan azsaylı erməni birliklərinin öz dini məktəbləri, kilsələri və s. olsa da yerli nüfuzlu elitası və zəngin təbəqəsi mövcud olmadığından onlardan təxminən heç biri qəzanın inzibati-idarəçilik strukturlarında təmsil olunmurdular. İnzibati-idarəçilik kimi strukturlarda başlıca vəzifələri azərbaycanlı, rus, ləzgi, yəhudi və tat kimi etnik xalqların nümayəndələri tuturdu [4]. Bu səbəblərdən 1918-ci ilin mart qırğınlarından bir qədər sonra Bakıda yaradılan bolşevik-daşnak hökuməti Qubanı sülh yolu bolşeviklərin qəza üzərində hakimiyyətini tam könüllü şəkildə razılaşdırmağa qərar verir. Qubanın yerli sakinləri ilə danışıqların aparılması D.A. Gelovaniyə verilir. Gelovaninin əsası ermənilərdən və tərkibində az sayda yəhudi və rusalardan ibarət dəstəsinin Quba qəzasına yaxınlaşdığı məlumatını alan qubanın sakinləri qəzanın yəhudi, rus və müsəlman nümayəndələrindən ibarət bir heyəti Xaçmaz stansiyasına - bolşeviklərin dayandığı nöqtəyə göndərirlər. Yerli sakinlər Şamaxı və Bakıda törədilmiş qanlı toqquşmalardan zorakılıqlardan xəbərdardılar. Hədə-qorxu nəticəsində düşünmələri üçün çox az bir vaxt verilən Qubada yaşayan azərbaycanlılar və digər etnik xalqlar Şamaxı və Bakıda baş verən hadisələrin vəhşiliklərini nəzərə alaraq öz doğma regionlarını qorumaq naminə məcburi olaraq ultimatumu qəbul etdilər və bu hadisə nəticəsində Quba səkkiz gün Sovet birliyinin

hakimiyyəti altında qaldılar. Ancaq, yaranmış bu yeni hakimiyyəti imtina edən və qətiyyətlə tanımayan yerli ləzgi əhalisi həmin hadisələrə ciddi şəkildə müdaxilələr edirdilər. Sovet hakimiyyətinin Qubada IX günü qəzanın yəhudi məhəlləsi hissəsindən çoxluq ləzgilərdən ibarət dəstənin silahlı qarşıdurmaları başlanır. Həmin münaqişə üç gün davam edir və bu müddət ərzində şiddətli baş verən münqaişə nəticəsində ləzgi qrupu dəstələri bolşeviklərin komandasını Quba qəzasından qovurlar. Bu mübarizədə hər bir tərəf tələflərlə nəticələnir, ləzgi dəstələrdən iki yüzə yaxın adam, dinc sakinlərdən təxminən 70 nəfər qətlə yetirilir, bolşeviklərin məğlubiyyətə uğrayır. Quba qəzasında Ləzgilərin bolşeviklərə qarşı xüsusi qarşıdurması burada Sovet hakimiyyətinin yaradılmasına son qoyur [5.s.30-91].1918-ci il Qubada mart hadisələrindən bəhs edərkən məskunlaşmış qeyri-müsəlman sakinlərinin də vəziyyətindən bəhs etmək mühümdür. Bolşevik-daşnak qüvvələrinin əsas hədəfinin heç bir etnik faktorlara baxmadan qəzanın hər bir müsəlman sakinin olduğu təkəcə azərbaycanlı-türk və digər müsəlmanlar deyil, tat və ləzgi kəndlərinin darmadağın edilməsi, yandırılması sübut edilirdi. Quba qəzasındakı yəhudi əhalisi ilə bağlı faktlar bir qədər daha mürəkkəb hal almışdır. Quba faciəsi zamanı yerli yəhudilərin müsəlman həmyerlilərinə kütləvi çıxış eləmədikləri və bununla yanaşı yəhudi birliklərinin bəzilərinin erməni talançılarına qatılaraq qəzanın müsəlman sakinlərinə qarşı terror aktlarında birbaşa iştirakı kimi faktlar yerli əhalinin şahid olduğu ifadələr ilə sübuta yetirilir. Qeyd etmək yerinə düşər ki, Quba qəzasında məskunlaşan yəhudilər Hamazaspın “ləzgilər və müsəlmanlar bir saat ərzində sizə hücum edib çoxsaylı bəlalər gətirəcək, sizi tikə-tikə doğrayıb qətlə yetirəcək” kimi yalanlarla aldanmış və minlərlə yəhudi erməni birliklərinə qatılaraq birlikdə çıxıb Qubanı tərk etmişdir. Bəzi yəhudilər isə təlaşa düşərək ayaq yalın, hazırlıqsız təşvişlə qaçmış, tezliklə hava şəraiti ilə əlaqədar xəstəliklərlə üzləşmiş və həlak olmuşdur [1.s.6],[6].Qubada mart terroru zamanı qəzada qalan yəhudi sakinləri itkilər vermişdi. İstər Gelovaninin dəstələri, istərsə də Hamazaspın dəstələri Qubanı top atəşinə tutaraq yəhudi sakinlərinin nümayəndələri qətlə yetirmişdi. Qubada qalan, təkəcə baş vermiş məlum hadisələr zamanı qətlə yetirilmiş yəhudilər deyil, kütləvi şəkildə qaçan yəhudilər acliqdan, müxtəlif əziyyətlərdən və xəstəliklərdən dünyasını dəyişmiş digər yəhudi qrupları da müsəlman həmyerliləri kimi ermənilərin törətdiyi təcavüzkar, ağılasığmaz millətçilik siyasətinin xüsusi qurbanları olaraq sayılırdılar [3.s.8].Bunu da qeyd etmək yerinə düşərdi ki, çoxsaylı araşdırmalar aparıldıqdan sonra məlum oldu ki, ermənilər Qubadakı sakinlərə zorakılıq tətbiq edərkən təkəcə odlu silahdan istifadə etməmişlər. Qurbanların sümüklərdə aparılan tədqiqatlarda güllə izi aşkar olunmamışdır. Məlum olub ki, qətlə yetirilmiş dinc əhalinin baş

nahiyəsindən balta və digər kəskin alətlərdən istifadə etməklə baş nahiyəsini bədənə ayırmış, digərlərinin baş nahiyəsinə isə küt alətlə, dəmir və mismar ilə vurmaqla ağlasığmaz işgəncələrlə qətlə yetirmiş, qırğından sonra kütləvi şəkildə hər bir cəsədi quyulara doldurulub və üzəri torpaqla örtülüb. Tədqiqatlar nəticəsində məlum olub ki, kütləvi məzarlıqda təkcə azərbaycanlılar deyil, Quba qəzasındakı digər milli azlıqlardan yəhudi, tat, ləzgi və digər etnik qruplar qeyri-insani əməllərlə qətlə yetirilərək basdırılmışdır [7]. Bir sıra mənbələrə əsaslansa qırğın zamanı beş minə yaxın tat və azərbaycanlı əhali, on minə qədər ləzgi terror qurbanı olmuşdur. Qubada Amazaspın olduğu günlər ərzində qəzanın kəndlərində təxminən iki minə yaxın azərbaycanlı, min beş yüzə yaxın ləzgini, beş yüz nəfərə yaxın tat əhalisi amansızlıqla qətlə yetirilmişdir. Bütün statistikanı göz qabağında saxlasaq Quba qəzasında qətlə yetirilən əhalinin mövcud əhalinin beşdə bir hissəsinə bərabər olduğunu qeyd edə bilərik [2.s.6]. Quba qəzasındakı mart soyqırımını Azərbaycan tarixində yaralı yazılmış səhifə olaraq qalmaqdadır. Burada törədilən həmin ağlasığmaz soyqırımın Azərbaycanın digər bölgələrdə həyata keçirilən terrordan başlıca fərqi bundan ibarətdir ki, başqa qırğınlar təkcə müsəlmanlara, azərbaycanlılara qarşı yönəldilmişdisə, Qubada etnik düşmənçilik təkcə azərbaycanlılara deyil, qızlara, ləzgilərə, buduqlara, tatlara və ceqlərə qarşı yönəlmişdi. Hər il soyqırım qurbanlarının xatirələri anılır və bu gündə həmin terror haqqında maarifçilik nəsildən nəsilə ötürülərək təbliğ edilir. Azərbaycan və burada yaşayan digər xalq nümunələri bu dəhşətli qırğın əsla unutmayacaqdır.

**ORGANIZATION OF INTERDISCIPLINARY RESEARCH AT THE  
AZERBAIJAN NATIONAL ACADEMY OF SCIENCES: A PHILOSOPHICAL  
APPROACH**

**Dr. Vusal ZULFUGAROV (ORCID: 0009-0004-7491-3520)**

Azerbaijan National Academy of Sciences, Baku-Azerbaijan

**Email:** vzulfugarov@gmail.com

**Abstract**

In recent years, great importance has been paid to the study of interdisciplinarity in philosophy and epistemology in terms of the organization and theoretical features of scientific creativity. At the same time, interdisciplinarity is examined philosophically in the context of a more perspectival organization of science-education interaction. Philosophers call the philosophical reflection of interdisciplinary studies "co-creativity" (A.Creech et al.), "strategy supporting collective creativity" (et al.). They also emphasize that interdisciplinarity accelerates the integration of knowledge in general. But "different contexts can produce different kinds of integrations" (O'Rourke). From these we can draw the following conclusion: the strategy of organizing interdisciplinary research has a significant impact on the mechanism and content of knowledge acquisition. Especially in large research institutions, the organization of this work comes to the fore. In this regard, the strategy of organizing interdisciplinary research at the Azerbaijan National Academy of Sciences is considered one of the important factors for the development of science as a whole in the country. In recent years, comprehensive programs in this direction have been prepared and implemented. We consider these philosophically at two levels. The first is the strategy of organizing interdisciplinary research in the internal environment of the Azerbaijan National Academy of Sciences. This includes conducting research in accordance with Azerbaijan's strategic development programs as the main direction. Secondly, organizing the exchange of experience between the Academy and scientific organizations outside this institution. In the first direction, the programs implemented at the Academy are designed to reorganize creative relations between different fields of socio-humanities. An example of this is the organization of joint creative events in recent years between History and Ethnology, Philosophy and Sociology, Linguistics, Oriental Studies and other institutes of the Academy. What results could research in the highlighted direction yield? At the Academy of Sciences, above all, interdisciplinary creative skills are developed and more comprehensive research opportunities are created. The potential for "collective creativity" is developing within the framework of certain projects. The cooperation of the Academy of Sciences with other research institutions seems more current in this respect. The development of cooperation in the field of creativity, especially with Turkey's TÜBİTAK institution, seems promising. Thanks to such collaborations, the Academy of Sciences and Azerbaijani scientists gain new and broad opportunities to publish their research in Turkey's indexed and respected journals. Thus, in the Academy of Sciences, more importance is given to the organization of interdisciplinary research in the internal environment, and the scope of interdisciplinary research is expanded mainly in the context of developing relations with the scientific organizations of the Turkic republics. The interactive development of these two lines will give serious impetus to the rise of interdisciplinary research in Azerbaijani science to a new level.

**Keywords:** Azerbaijan National Academy of Sciences, interdisciplinarity, collective creativity, research strategy, TÜBİTAK, indexed journals, interdisciplinary research organization, socio-humanities.

## **Introduction**

Philosophers consider interdisciplinary research to be the dominant direction of philosophical and scientific understanding. Interdisciplinary research is usually expressed with the term "interdisciplinarity". Here, the main focus is on conducting research in the common epistemological field of various disciplines. This entails considering the methodologies and methods of disciplines to be mutually related. This feature distinguishes interdisciplinarity from other integrative research approaches, such as multidisciplinary. Multidisciplinary involves various disciplines investigating a problem as separate research projects, each maintaining its own autonomy in methodology and methods. Transdisciplinarity, on the other hand, refers to transcending the epistemological and methodological boundaries of a single discipline.

Thus, when we refer to the organization of interdisciplinary research at the ANAS, we consider two levels of organizing interdisciplinary research. The first level is the formation of a common epistemological and methodological ground among research conducted in various profiled research institutes within the ANAS. The second level involves implementing interdisciplinary collaboration projects on various topics with external scientific structures outside the ANAS.

## **Methodology and Method**

The interdisciplinary approach applied in modern science for the philosophical reflection of the emphasized two directions is utilized through a unified methodological prism. Specifically, principles of non-linearity, openness, intersubjectivity, and synergistic formation are employed in methodology. Non-linearity is understood in this article as the expression of the principle "the whole is greater than the sum of its parts" during the mutual interaction of various disciplines on a unified topic. This implies the potential to form integrative knowledge through interdisciplinary understanding. Openness in interdisciplinary research denotes the perpetual openness of mutual interactions to new levels of understanding. We can metaphorically refer to this as "system openness." "System openness" reflects the constantly renewing character of interdisciplinary research. Intersubjectivity refers to the collective activity of subjects rather than the individual nature of research. From this perspective, it is accepted that interdisciplinary research is always intersubjective in nature. Finally, the principle of synergistic formation identifies the dynamic establishment of new knowledge with a unified structure and functional properties as a result of research. Methods of system synthesis and dynamic integration, which are consistent with the content and strategy of these principles, are applied. System synthesis involves approaching interdisciplinary research as a unified system, while integration reflects the expression of acquired information in a unified form of knowledge.

### **Interdisciplinary Research as a Strategic Approach**

In numerous philosophical studies conducted worldwide, it is emphasized that the influence of research conducted on the mutual relationship of various disciplines is increasing. For example, A.C.Edmondson and J.Harvey specifically highlight this point. They write that interdisciplinary research is now considered a leading approach and its "influence continues to grow" [Edmondson, Harvey, 2018, pp. 348-350]. Philosophers often associate the effective collaboration of representatives from various fields of knowledge as a unified team with interdisciplinary cooperation. According to some philosophers, "collective creativity" can be stimulated precisely through "interdisciplinary methods" [Parjanen, Hyypiä, pp. 27-32].

In recent years, the perspectives of applying interdisciplinary research in education are also being explored. E.R. Skayvark and colleagues have concluded that teaching doctoral students with interdisciplinary methods positively influences their development in the field of creativity [Skayvark et al., 2022, pp. 3-8]. These highlighted studies indicate that the strategy of organizing interdisciplinary research revitalizes the mechanism of knowledge acquisition. The unique characteristics of the mutual relationship between methodology and epistemology in the common understanding field of various disciplines actually create different situations. As a result, there is a close connection between the content of the new knowledge acquired and the formation of knowledge. In addition to other intellectual positions, the organizational problem of research in scientific institutions emerges with new urgency.

### **Strategy for Organizing Scientific Research at ANAS**

In recent years, the issue of organizing international research has become increasingly relevant. In this regard, research is organized in accordance with the provisions of the "Law on Science" ["Law on Science", 2016]. On August 9, 2023, President Ilham Aliyev issued a decree regarding amendments to the "Law on Science", which included the replacement of the phrase "various fields of science" with "its areas of activity" in amendment 5.2. of Article 11.3 [see: "Azerbaijan" newspaper, 2023, p.1]. This provided legal guarantees for broader inclusion of international research. Currently, the mechanisms for organizing and conducting international research at ANAS are determined by the organization's Charter [Charter of ANAS, 2024]. ANAS development of interdisciplinary research has set the goal of further expanding the development of international research within the context of new information and communication technologies and artificial intelligence. In this aspect, joint research projects among various institutions of the organization are increasingly prioritized to elevate creative connections to a new level.

### **ANAS's International Collaboration Strategy**

In this regard, there is a noticeable acceleration and expansion of activities. In this context, greater attention is paid to creative connections between ANAS and Turkey's TÜBİTAK institution. Both sides believe in the prospects of this collaboration. A representative of Turkey's TÜBİTAK organization participated in ANAS's General Assembly held in 2024. This is a very interesting and current event. It is the first occurrence of scientific collaboration between Azerbaijan and Turkey in the history of independent Azerbaijan. The Decision draft of that assembly states in clause 5.2.1.2: "In the framework of reforms aimed at the development of international relations, scientific cooperation between the scientific institutions of ANAS, the International Turkic Academy, the Turkish Academy of Sciences, the Atatürk Culture, Language and History High Institution, TÜBİTAK, and the Academies of Sciences of the Central Asian Republics should continue, with the expansion of joint research and implementation of other scientific and scientific-organizational events" [Decision, 2024, p. 11]. From the highlighted point, it is evident that ANAS has chosen to align its collaboration with Turkey in the direction of international research with the overall framework of scientific cooperation among Turkic states. This implies that in the near future, the elevation of collaboration in the new directions of science within the framework of the Turkic States Organization will be seen as an important task.

### **Conclusion**

The analysis conducted shows that there is an increasing emphasis on international research at ANAS. This process has its own specific internal dynamics. The alignment of ANAS's historical path with the requirements of the contemporary era is also gaining traction in determining its characteristics. From the conceptual documents prepared by ANAS in recent years, it is apparent that international research is being conducted at two levels in close connection with each other. The first level involves organizing interdisciplinary research within the internal environment of the organization. This includes the implementation of joint scientific projects by research institutes. The second direction is related to collaboration with other scientific research structures of ANAS. Currently, it is observed that ANAS prioritizes collaboration mainly with Turkey's TÜBİTAK institution in this direction. At the same time, ANAS also pays special attention to relations with other Turkic states.

**ÖZET**

Masallarda çocuklar için önemli olan kavramlar mecazi anlamda verildiği için daha iyi özümsebilir ve bilinçaltında kalır. Masal, çocuğu karşılaşılabileceği zor durumlara önceden hazırlar, gündelik sorunları çözebilenin yollarını sunar. Çocuk masallar aracılığıyla dünyadaki yerini öğrenir, iyi ve kötü, cesaret ve korkaklık, dostluk ve ihanet hakkındaki ilk fikirlerini edinir. Çocuğa neyin iyi neyin kötü olduğunu anlatan, ahlaki ve toplumsal değerleri aşıl原因an masalların etkisi daha güçlü olur. Masallar bir karakter oluşturur ve ruhu eğitir. Masallar çocuğun hayal gücünü ve fantezisini geliştirir. Bir milletin milli-manevi değerlerinin ilkin kodları masallarda saklıdır. Masallarla yetişen çocukların bilinç altında mensup oldukları milletin değerleri oluşur ve bu da onların birey olarak yetişmesinde mühim rol oynar.1974 yılından itibaren Anadolu ve Mezopotamya'dan, Kafkasya, Orta Asya ve Uzakdoğu'dan Avrupa içlerine kadar Türklerin yaşadığı bütün ülkelerden masallar derledi, çağdaş psikolojinin ihtiyaçlarını dikkate alarak onları yeniden yazarak "Kardeş Masallar" başlığı altında 32 kitaplık bir dizi oluşturdu. Bu bağlamda Yücel Feyzioğlu'nun bir araya getirip yayınlattığı masal kitapları çok önemlidir. Almanya'da Türk neslin oluşumunda ve onların milli-manevi değerlerine sarılarak, modern ruhta yetişmesinde bu eserlerin büyük önemi vardır. Bu masal kitapları okul çağındaki gençlerin ve gençlerin sanatsal beğenilerinin oluşmasına, Türkçe okuma ve yazma alışkanlıklarının oluşturulmasına, zihinsel yeteneklerin güçlenmesine hizmet etmektedir. Yücel Feyzioğlu farklı ülkelerin ve Türk topluluklarının masallarını bir araya getirerek Almanya'daki Türk gençlerinin milli-manevi bağlarını kaybetmemesine verdiği tarihi armağandır.Bu çalışmanın amacı, masalların eğitimsel işlevselliği ve Yücel Feyzioğlu'nun topladığı masalların çocukların eğitimindeki etkileri değerlendirilecektir.

**THE ROLE OF YÜCEL FEYZİOĞLU IN THE UPBRINGING OF TURKISH  
IMMIGRANT CHILDREN IN GERMANY IN LINE WITH NATIONAL-SPIRITUAL  
VALUES**

**SUMMARY**

Since concepts that are important to children in fairy tales are given in a figurative sense, they are better assimilated and remain in the subconscious. Fairy tales prepare the child for difficult situations he may encounter and offer ways to solve everyday problems. Through fairy tales, the child learns his place in the world, acquires his first ideas about good and evil, courage and cowardice, friendship and betrayal. The effect of fairy tales that tell the child what is good and what is bad and inculcate moral and social values is stronger. Fairy tales build character and educate the soul. Fairy tales develop the child's imagination and fantasy. The primary codes of a nation's national-spiritual values are hidden in fairy tales. Children who grow up with fairy tales subconsciously develop the values of the nation they belong to, and this plays an important role in their growth as individuals. Since 1974, he compiled fairy tales from all countries where Turks lived, from Anatolia and Mesopotamia, the Caucasus, Central Asia and the Far East to the interior of Europe, and rewrote them taking into account the needs of contemporary psychology, creating a series of 32 books under the title "Sister Tales". In this context, the fairy tale books that Yücel Feyzioğlu brought together and published are very important. These works are of great importance in the formation of the Turkish generation in Germany and their upbringing in the modern spirit by embracing their national-spiritual values. These fairy tale books serve to form the artistic tastes of school-aged youth and teenagers, to form Turkish reading and writing habits, and to strengthen mental abilities. By bringing together the tales of different countries and Turkish communities, Yücel Feyzioğlu is a historical gift to the Turkish youth in Germany in preserving their national and spiritual ties. The purpose of this study is to evaluate the educational functionality of fairy tales and the effects of fairy tales collected by Yücel Feyzioğlu on children's education.

## **Giriş**

Masallar toplumların, kültür aktarımının ve bireylerin geçmiş ile bağ kurmasının en temel öğelerindedir. Geçmişten günümüze kadar geçen süreçte, insanlar ve toplumlar birçok kere benzer olaylara tanık olmuş ve bu olaylardan çıkarımlarda bulunmuşlardır. Bu anlamda çocukların eğitiminde ve olaylar karşısında bilinçli davranmasında masalların önemi daha fazla ön plana çıkmaktadır. Masalların çocukların sosyalleşmesine, dinleme becerilerini geliştirmesine, kullandıkları dili geliştirmelerine ve yaşadıkları toplumun dil özellikleri ile tanışmalarına ve hayal gücünün gelişmesine katkı sağlar. Bunların yanında masallar, çocukların duygularını tanımalarını, farklı durumlara göre bakış açısı geliştirmelerini, olayların sonuçlarından ders çıkarmayı öğrenmelerini sağlar

Türk Dünyası masalları farklı lehçelerde, farklı yönlerde gelişmiş olsa bile dil, duygu ve kültür birliğini bir çatı altında tutuyor. Bu anlamda masallar toplumun tarihi kodlarını barındıran bellek görevindedir. Yetişen genç neslin milli ve manevi değerlerini öğrenip bunu davranış haline getirmesinde ilk okutulan ve ya dinletilen edebi metin olarak masalların rolü inkar edilemez. Bebekler gözlerini dünyaya açtıkları andan itibaren yaşamı anlamlandırmaya çalışır. Bu süreçte yaşamın anlamına dair zihninde beliren soruları kendi gelişimini sağlamak ve tamamlamak için yanıtlamak zorundadır. Çocuğun, zihinde beliren soru 2 ve sorunların çözümlerini doğrudan, hazır ve paketlenmiş olarak bir kaynaktan veya yetişkinlerden öğrenmesi neredeyse imkânsızdır. Değerlerin edinilmesi olarak da düşünebileceğimiz bu süreçte masallar vazgeçilmez araçlardır (Dilidüzgün, 1994: 169-173). Masallardaki alegorik kahramanlar çocuklarda insani değerlerin öğrenilmesinde ve hayal gücünün oluşmasında çok önemli rol oynar. Bu anlamda Yücel Feyzioğlu'nun masal kitapları çok değerlidir. Yücel Feyzioğlu hayatı boyu bir çok eser yazmış ve bu eserlere göre farklı ödüller almıştır. Yazdığı eserler içinde Türk dünyasını karış karış gezerek topladığı ve yeniden düzenleyerek yazdığı masal kitapları çok değerlidir. Nitekim Almanya'da Türk gençlerinin milli ve manevi değerler yönünden yetişmesinde önemli katkı sağlıyor. Bu masallar aynı zamanda Almanya'daki Türk çocuklarına Türkçenin saflığını, temizliğini aktarması bakımından da kıymetlidir. Yücel Feyzioğlu'nun 1979 yılından bu yana yurtdışında yaşayan Türk çocukları için ders kitapları yazan ilk yazarlardandır. Onun bu konudaki çalışmaları ortak Türk kültür mirasına önemli hizmettir. Bu çalışmalar bir de ona göre değerlidir ki, değişen, yenileşen dünyada genç neslin psikolojisini göz önünde bulundurarak yeniden düzenlemiştir. Özellikle Almanya'daki Türk çocuklarının entegrasyon sürecinde asimle olmasına engel olur, onların milli ve manevi değerlerinin, soy kökünün tanımalarına ve unutmamalarına yardımcı oluyor. Nitekim daha ilk

okul döneminde Batı kültürü ile tanışan, Batı masal kahramanlarıyla arkadaş olan Türk çocuklara milli masal kahramanlarını tanıstırarak sevdirmeye çalışmıştır. Yücel Feyzioğlu'nun yazdığı 35 masal kitabının tamamının değerlendirilmesi büyük bir araştırma konusudur.

### **Almanya'da çocuk edebiyatı**

Almanya'da çocuk ve gençlik edebiyatı, ağırlıklı olarak 12-15-21 yaş arası gençlere yönelik yazılmış eserler olarak kabul ediliyor. Almanya'daki Türk yazarlar başlangıçta bu yaş gruplarının yaşamının belirli bölümlerini konu alan eserler yazmış olsalar da bunlar tam olarak gençlik edebiyatı sayılmaz. Gençlik edebiyatı sadece gençlerin eserleri değil, onların iç dünyalarını ve duygularını yakalayan, onları ilgilendiren konulara değinen, bu sorunları çözenin yollarını öneren eserler olarak kabul edilir. 19. yüzyılın sonlarında Almanya'da Heinrich Wohlgast şöyle yazmıştı: “Was sollen unsere Jugendliche lesen?” (Gençler Ne Okumalı?) başlıklı makalesiyle, hangi kitapların gençlere ait olduğu araştırmasıyla Avrupa'da yeni bir tartışma konusu yarattı. (Wohlgast, 1899: 210 Ewers, 1993: 217)

Çocuk ve gençlik edebiyatı, genel edebiyat alanında olduğu gibi, tarihsel ve eleştirel konulara, çocuk ve gençlik edebiyatının kuramına ve kavramına dayalı, biraz spesifik bir yaklaşımla çocuk ve genç okur kitlesini hedef alan özel bir alandır. Türk edebiyatında bu konu günümüze kadar bazı tartışmalara neden olmuştur. Çoğu durumda çocuk ve gençlik eserleri çocuk ve gençlik edebiyatı başlığı altında toplanmaktadır. Ancak çocuk ve gençlik edebiyatı, “çocuk ve gençlere yönelik, kendileri tarafından veya bir kısmı tarafından kabul edilen bütün edebiyatlar” olarak bilinmektedir. (Dahrendorf, 1979 :159) Hatta pek çok Avrupalı yazar çocuk ve gençlik edebiyatını gruplara ayırıp her biri hakkında bir sınıflandırma yapmaktadır. Almanya'da yaratılan Türk çocuk ve gençlik edebiyatı bu anlamda Avrupa edebiyatının etkisinden uzak kalmamıştır. Özellikle Almanya'ya gelen Türk çalışan ailelerin çocuklarının karşılaştıkları sorunlar Türk yazarların dikkatinden kaçmamıştır. Türk yazarların ilk dönemlerinde çocuk ve gençlik edebiyatını formüle etmekten ziyade, Almanya'ya gelen ailelerin, okul çağındaki çocuklarının içinde buldukları yeni sosyal ve kültürel çevreye uyum sürecinin zorluklarını yansıtmayı amaçladılar. Bu nedenle Almanya'da yaşayan birinci ve ikinci dönem Türk yazarları çocuk ve gençleri merkeze almak yerine onların sorunlarını ele alan eserleri çocuk ve gençlik edebiyatı grubuna ayırmışlardır. Yukarıda da belirttiğimiz gibi Türkiye'de çocuk ve gençlik edebiyatının son yıllarda gelişmesi ve Türk yazar ve şairlerinin Avrupa edebiyatından etkilenmesi sonucu bu edebiyat alanına uygun eserler yazılmıştır. Çocuk ve gençlik edebiyatının Almanya'da erken şekillenmesi ve yaş gruplarına göre bölünmesi Türk yazarları da etkilemiştir. Dolayısıyla son dönemde Almanya'da gelişen Türk edebiyatında çocuk ve

gençlik edebiyatının sistemli bir şekilde geliştiğine tanık oluyoruz. Almanya'da çocuk ve gençlik edebiyatının gelişim sürecine baktığımızda, 60'lı yıllardan itibaren siyasi ve ekonomik nedenlerden dolayı, Türkiye'nin de aralarında bulunduğu yabancı ülkelerden gelen işçi ailelerin ve başta onların çocukları olmak üzere yaşam tarzları, Alman çocuk ve gençlik edebiyatı kapsamına alınmıştır. Sayıları az da olsa Türk çocukları bu eserlerde baş kahramanlardan biri olarak seçilmiş, amaç Türk ve Alman çocuklarını birbirleriyle kaynaştırmak olmuştur. Bu tür hikayeler farklı kültürlerin buluştuğu diğer toplumlar üzerinde de etkili olmuştur. Edebiyatın işlevlerinden biri kuşkusuz insanın içindeki iyiyi ortaya çıkarmaktır. Ama her edebî eserin bireyi iyiye yönlendirmediğini de göz ardı etmemek gerekir. Nitelikli olmayan bir eserle “iyi insan yetiştirme” amacına ulaşmak mümkün olmayacaktır. Bu yüzden edebî eserler bireylere değerleri aşılama da kullanılabilecek önemli araçlar olmalarına rağmen, bütün edebî eserlerin bu görevi yerine getirdiği söylenemez. Eserlerin yazarı, konusu, okurun gelişim düzeyine uygun olması, şiddet öğeleri içermemesi, yanlı yönlendirmelerde bulunmaması gibi birçok unsur edebî eserin niteliğini belirler. Bu yüzden özellikle çocuklara ve gençlere hitap eden kitaplar yazan yazarlara büyük sorumluluklar düşmektedir. Almanya'da Türk yazarlar ilk yıllarında çocuk ve gençlik edebiyatı adı altında bir çok eserler yazmışlar, ama çocukların iç dünyalarını, felsefelerini, dünya görüşlerini, tutkularını ve özlemlerini bir kenara bırakarak ağırlıklı olarak Türk işçi ailelerin sorunlarını kaleme almışlardır. Nitekim eserlerinde çocukların yaşadıkları sosyal çevreyi anlatırken bunu çocuk ve gençlik edebiyatı olarak nitelemişler. Ancak aynı dönemde Alman edebiyatında yazılan çocuk ve gençlere yönelik kitaplar birbirinden ayrılmış, çocukları eğlendiren, gençlerin sorunlarına odaklanan, onları her yönüyle yansıtan, sanatı, kültürü ve bilimi aşılaman eserler yazılmıştır. Elbette zaman içinde bu durum tamamen değişmiş ve Almanya'daki Türk yazarlar çocuk ve gençler için bir-birinden farklı ve yaş grubuna ve çocukların ilgi alanına uygun, gençlerin sosyal yaşamını ve gelecek planlarını belirlemeye, onlara bu konularda yol gösterici nitelikte bir edebiyat türü geliştirmeye başlamıştır. Çocukların ve gençlerin kendi kültürünü öğrenmekle birlikte diğer medeniyetleri de tanımalarına ve kaynayıp karışması için çocuk ve gençlik edebiyatının müstesna rolü vardır. Aynı zamanda bu çocukların daha küçük yaşta okuma becerisini ve alışkanlığını oluşturur. “Okuma pek çok kapının anahtarıdır. Bunun için ilköğretimde çocuklara okumayı sevdirmek ve onları okumaya yönlendirmek son derece önemlidir. Zira ilköğretimde pek çok öğrenci hiç kitap okumaz ya da çok az okur. Bu nedenle edebiyatın derslerde etkin bir biçimde kullanılması yönteminin amacı, çocukları kitapla buluşturmak ve onlara edebî metinlerle nasıl çalışacaklarını kendi deneyimleriyle öğretmektir” (Arkılıç-Songören, 2011: 85)

Almanya’da 70-li yıllardan itibaren göçmen ailelerin çocuklarını eserlerine konu eden yazarlar daha sonra 80-90-lı yıllarda Alman araştırmacıların da dikkatini çekmiştir. Başta problemleri anlatmak ve ya Alman dilini öğrenme kolaylığı sağlamak amacıyla yazılan çocuk eserleri sonraki dönemlerde daha da olgunlaşarak onlara kendi kültürünü öğretmekle birlikte buldukları topluma kaynayıp karışmayı öğretir. Yüksel Pazarkaya, Alev Tekinay, Neşet Erol, Özdemir Başargan, Nazif Telek ve Aygen Sibel Çelik arasında “Çağımızın masalcı dedesi” olarak anılan Yücel Feyzioğlu'nun müstesna bir rolü var. Yücel Feyzioğlu'nun yazdığı masallar Almanya’da Türk ve Alman çocukları arasında bir köprü oluşturdu. Yücel Feyzioğlu 2020 yılından yayınlanan “Masallar Bize Ne Anlatır?” adlı eserinde masalların kırktan fazla işlevini anlatırken, kitabın sonunda masalları yaş gruplarına göre tasniflendirmiştir. Bu tasniflendirmenin dışında yazar çocukların kendi iç dünyasına ve zihinsel olgunluğuna göre masallar seçebileceğini belirtir. Bu anlamda Almanya’da Türk yazarlar tarafından oluşturulan çocuk edebiyatı yeni bir biçim kazanmaya başlamıştır.

### **Yücel Feyzioğlu Ve Masallar Alemine Yolculuk**

Evliya Çelebi gibi diyar diyar dolaşıp Türklerin yaşadıkları coğrafyalarda bulunan masalları toplayarak yurtdışında Türk çocuklarına masal kültürünü anlattığı gibi , diğer kültürlerin çocuklarına da Türk insanını ve masallarını tanıtan Yücel Feyzioğlu 1946 yılında Kars’ta doğdu. Ailenin ilk çocuğu olan Yücel eğitimini Öğretmen okulunda aldı. Kendi söylediklerine göre Yücel Feyzioğlu edebi ortamda yetişti. Babasını soğuk kış akşamlarında onların evinde arkadaşları ile kitap okumaları, dede ve ninesinin daha çok küçük yaşlarından ona masallar anlatması gelecek hayatının yolunu çizmiştir. Daha küçük yaşlarından edebiyata olan hevesi ona küçük şeyler yazdırırdı. 1957 yılında sakladığı yazılarından birini yakalayan Faya öğretmeni Yücelin yazdığı küçük hikayeyi okur. “Bunu sen mi yazdın?” diye sorar. Çekingen bir sesle “evet” cevabını alan öğretmeni “sen çok güzel bir yazar olacaksın” sözleri Yücel’in gelecek hayatını şekillendirir. Yazar, 1965 yılında Kars Kazım Karabekir İlköğretmen Okulundan mezun olup Yozgat’ın Sorgun ilçesine bağlı Külhöyük İlkokuluna öğretmen olarak atanır. İki yıl bu okulda görev yaptıktan sonra askerlik görevini yerine getirmek üzere askere alınır. Acemi eğitimini Sivas’ta alan Feyzioğlu Ankara Etimesgut 28. Mekanize Tümeninde okuma yazma bilmeyenlere okuma öğretir, askerlik görevini Ardahan’da tamamlar. İlk olarak yerel 23 Şubat Gazetesi’nde makaleleri yayınlanan yazarın ulusal düzeyde Ulus, Akşam, Cumhuriyet gazetelerinde makaleleri ve sanat eklerinde öyküleri yayınlanır. 1971 yılına kadar Türkiye’de öğretmenlik yapabilen yazar, 1968 yılında yayımladığı “Sahipsizler” adlı hikâye kitabından dolayı Sıkıyönetim Mahkemesinde yargılanır, ceza alacağı anlaşılınca 1972 yılında

çok sevdiği vatanını terk ederek Almanya'ya yerleşir. Kendi ülkesinde kitaplar yazan, toplantılar yöneten yazar, Almanca bilmediği için kendi ifadesiyle birden sıfır yaşında bir bebeğe dönüşür. “1965 yılında Kars-Susuz-Kazım Karabekir İlköğretmen Okulunu bitirdim. Ancak 1971 yılına kadar öğretmenlik yapabildim. Yayımladığım ilk hikaye kitabımdan ve Arpaçay'da Türkiye Öğretmenler Sendikası kuruculuğu yapmamdan ötürü askeri yönetim beni görevden alıp sıkıyönetim mahkemesinde cezalandırdı. Ben de 1972 yılında bu yurdu terk edip Almanya'ya gitmek zorunda kaldım. Her melanette bir hayır olduğuna inanırım. İyi ki, ceza vermişler, diller öğrendim, masallara yönelme zorunluluğunu orada kavradım” (Feyzioğlu, 2013: 14)1973 yılında Adler firmasına ait bir fabrikada işçi olarak çalışan yazar, bu saırada Almanca Goethe Enstitüsünde dil eğitimi tamamlar ve 1974 yılında Almanya'da öğretmenliğe başlar. Yazar aynı zamanda Andersson Yazarlık Akademisini de bitirir. Bu akademinin onun yazarlık hayatında önemli etkisi olur. 1979 yılında Türk öğrencilere yönelik Türkçe ders kitapları hazırlamada görev alır. 1985 yılına kadar Almanya Eğitim Bakanlığına bağlı olarak öğretmenlik mesleğini icra eden Yücel Feyzioğlu yayınladığı kitaplar ve yazarlık mesleği ile ilgili verdiği konferanslar ve görüşlerin sıklığı nedeniyle kendi isteğiyle öğretmenlikten ayrılır. Halan faal olarak çocuk edebiyatı alanınında güzel eserler yazan yazar faaliyetini Almanya'nın Köln şehrinde devam ettiriyor.1974 yılından başlayarak tam kırk yıl boyunca masallar alemini, dünyanın neredeyse dört bir yanını seyahat ederek binlerce masal toplayan, onları tekrar değerlendirerek yeniden yazan Yücel Feyzioğlu masalların çocuk eğitimine ve güzel bir gençliğin yetişmesine önemli katkı sağladığını ve çokyönlü işlevini kısaca şöyle ifade eder: “İstiyorum ki, masalların neden gerekli olduğu anlaşılır olsun. Öğretmen ve anne babaların çalışmasını kolaylaştırın, onların motivasyonunu artırsın, onların başarısına ufacık da olsa bir katkı sağlasın...” (Feyzioğlu, 2020: 15)Masalların her birinin farklı işlevinin olduğunu ileri süren Y.Feyzioğlu, bunun çocuğa sağlam bir kişilik ve kültürel kimlik kazandıracağını düşünür. Yazar yazdığı masallara göre Türkiye ve Avrupa'da bir çok ödüle layık görülmüştür. Yücel Feyzioğlu, eserleriyle birçok ödüle layık görülür. Bunlardan bazıları: 1979 yılında “Uğultu” ile Sanat Emegi roman ödülü, 1986-87 Gençlik çalışmasıyla “Yunus Nadi Röportaj Ödülü” ikinciliği, 1992 yılında “Kırmızı fare” öykü ödülü, 1997 yılında ”Ömer Seyfettin” öykü özel ödülü, 2001 yılında “Göçün 40. Yılı” nedeniyle açılan yarışmada “Anadili Gerekli mi?” denemesiyle “Cumhuriyet Gazetesi” birincilik ödülü, 2003 yılında TRT İNT'in açtığı “AB/Türkiye ilişkileri” konulu yarışmada “Danışman” adlı öyküsü ile birincilik, TÜRKSAV tarafından “2011 yılı Türk Dünyasına Hizmet Ödülü”, Elginkan Vakfı tarafından “2011 yılı Türk Kültürünü Araştırma Ödülü” ve 2012 yılında da “Halk Kültürü Araştırma Vakfı

Ödülü"dür. Eserleri 1987 Gladbeck Gülmece Ödülü seçkisine girer, 2002 yılında "Sihirli Limon" adlı kitabı NRW Eğitim ve Bilim Bakanlığının 20 kitaplık seçkisine alınarak bütün çocuklara, okullara ve ailelere tavsiye edilir. Son olarak Türkiye'de "Anarbay" adlı romanı ile "Tarih Boyunca Dünyayı Sarsan Doğal Felaketler" adlı iki kitabı; Bonn'da ise Free Pen Verlag tarafından "Sihirli Limon" adlı masalı iki dile çevrilerek yayımlanır (Karaman, 2018: 35).

### **Kültürel Değerler bağlamında masalların önemi**

Yücel Feyzioğlu Almanya'daki çocukların Türkçe ve Almanca okuması, farklı kültürlerle bağ kurması amacıyla yazdığı kitaplar kısa sürede dikkat çekerek çeşitli dillere tercüme edilerek dünyanın bir çok yerinde yayınlandı. "Keloğlan" masal dizisi yine dünyanın bir çok yerinde büyük ilgiyle karşılandı. Radyo ve televizyon yayınlarında yer aldı. Farklı işlevlere sahip olan masallar çocuğun eğitiminde ve gelişiminde önemli yere sahiptir. Hayal ürünü olan masallar çocukları gerçek hayata hazırlar, yüksek ahlak değerleri, kültürel kimlik açısından olduğu gibi, çocuğun interkültürel bağlamda yetişmesinde de mühim rol oynar. Yücel Feyzioğlunun masalları bu bağlamda da önemlidir. Evliya Çelebi gibi diyar diyar gezip Türk kültürünün farklı boylarından aldığı renkli ilmeklerle sihirli bir masal halısı dokuyarak farklı kültürleri kaynaştırmaya çalışır. Bu farklılıkları bir araya getirirken çocukları bir birine tanıtarak yaşadıkları coğrafyayı, buldukları toplumun tarihini ve kültürünü de aktarıyor. Masallarla çocukların hayal gücünü geliştiriyor, onları bir birine tanıtır, masallarla Türk dünyası çocuklarını buluştururken, farklı kültürleri tanımalarına ve saygı duymasına olanak sağlıyor. "Uygurların yaşadığı topraklar nere, Kars nere, Almanya nere? Ama bu iki masal birbirine o kadar benzer ki, iki halk arasında köprü oluşturur. Dört kafadan mı gitti Bremen Mızıkacıları'nı etkiledi, yoksa tersi mi oldu? Veya iki masal da birbirinden bağımsız mı yaratıldı, bilmiyoruz. Ama bu benzerlik iki ülke arasında bir köprü kuruyor. Bu köprü aracılığı ile iki halk birbirine yakınlık duyabiliyor, birbirine dost olması daha da kolaylaşıyor. Yeter ki bu kültürleri bilelim, kültüresiz köprü kurmak kolay değil." (Y.Feyzioğlu, 2020: 115)

Yücel Feyzioğlu'nun masalları Almanya'daki Türk çocuklarının kültürel kimliklerini tanıması ve buldukları ülkelerde kültürel uyum sağlamaları açısından çok önemli. Nitekim masallar toplum bireylerin kültürel kimlik hakkında önemli bilgiler içerdiği için özellikle kimlik arayışı dönemlerinde çok önemlidir. Bunun yanında çocuklarda özgüven oluşmasına olanak sağlıyor. Çünkü bir toplumda var olan değerler anlatılır ve tebliğ edilirse, diğer toplum bireyleri kültürel köklerini derinden tanımyorsa büyük bir eksiklik yaşarlar. Fakat çocuklar masallarla kültürel bağlarını öğrenirse, yazarın deyimiyle "Onda varsa, bende de var" psikolojisiyle karşı tarafı da çok rahat anlar ve saygı duyar. Masallar derinden araştırılmasının bir toplumun estetik düşünce

tarzını, dünya görüşünü, kültürel kimliyini sahiplenmesi ve bir çok değerler bakımından ne kadar önemli ve etkili olduğunu görüyoruz. Masallar kültürel bağlamda değişir ve evrilir, bu da onların canlı ve esnek anlatılar olduğunu gösterir. Bu esneklik yazar tarafından mükemmel bir şekilde değerlendirilerek dönemin sosyal-kültürel ihtiyaçlarına ve topluma göre uygun bir hale getirilerek zaman içinde yeniden yazmıştır. Y.Feyzioğlu Almanya’da yaşayan çocukların anadilini öğrenmesine, zenginleştirmesinde masalların bir eğitim aracı olarak kullanılmasını bizzat kendisi pedagoji faaliyetinde tecrübe ederek faydalarını gözlemlemiştir. Çocukların masal kişileriyle kendilerini özedeştirerek; güzel davranışlar öğrenerek toplumsallaşma, sosyalleşme, kültürel bağlamda ulusal ve evrensel değerleri tanıma olanağı bulabilirler. Masalların çocukların çokyönlü eğitiminde en kolay, en hızlı ve en etkili yoldur.

Teknolojinin hızla geliştiği bir dönemde çocukların ve gençlerin zihni ve ruh gelişimi, dünyayı ve gerçekleri doğru yorumlaması yeniden yazılan masallarla mümkün olduğu pedagoglar ve araştırmacılar tarafından belirlenmiştir. Bu anlamda Yücel Feyzioğlu’nun yazdığı masal kitapları çok değerlidir.

### **Y.Feyzioğlu’nun yeni yaklaşımla yazdığı masalların eğitimsel işlevselliği**

Yukarıda da belirttiğimiz üzere Masalların çocuk eğitiminde müstesna yere sahiptir. Yücel Feyzioğlu’nun masal kitaplarında yer alan etik, psikolojik etkiler belirgin şekilde dile getirilmiştir. Örneğin yalan söylemenin insanı nasıl kötü duruma düşürdüğünü, güvensizliğe sebep olduğunu “Kırk koyun”adlı masalında mükemmel bir şekilde vurgulamıştır. Masalda düştüğü durumdan kurtulmak isteyen kahramanın yalana el atmasıyla daha kötü duruma düşmesine sebep olmuştur. Kurnazlık yapıp yalan söyleyerek, insanları aldatmak güveni sarsar ve ilişkiler arasında samimiyetsizliğe yol açar. “Aldar Köse-Kazak Masalları”nda Aldar Köse’nin kurnazlıkla nasıl aldatıldığını, güveninin sarsılmasını açık bir dille anlatmıştır. Aynı konu “Yartı Kulak-Türkmen Masalları”nda da söz edilir.Dürüst olmak, yalan söylememek, güven vermek ve güvenmek gibi konular Y.Feyzioğlu’nun “Cırttan ile Çilbik-Azerbaycan ve Dağıstan Masalları” kitabında da vurgulandığı saptır. Bu masallarda aynı zamanda haksızlık, özgüven ve cesaretli olma, zorluklar karşısında sabırla, yılmadan mücadele etmek çocuklarımıza örnek olabilecek niteliktedir.“Murkumomo ile Çomotay-Özbek Masalları”nda doğruyu söyleyen kardeşlerin Hakan tarafından mükafatlandırıldığı anlatılır. Bu masallarla da Y.Feyzioğlu çocuklara “dürüst olan her zaman kazanır” mesajını verir. Dürüstük, yalan söylememe, cesur olma durumu toplumda adaletin de sağlanmasına yardım eder. Haksızlık karşısında durarak adaletin sağlanması bu masallarda ortaya konulur. “Dimirtaş ile Pıtraş-Gagavuz Masalları”nda emanete sahip çıkan çoban adaletli davranan keşiş tarafından

ödüllendirilir. Bununla birlikte bu masalarda yardımseverliğe de vurgu yapılmıştır. Bu masalarda çocuklar insan psikolojisi ile tanıştırılır. Nitekim yardımseverlikten bahseden bu kitaplarda her kese kendi değerini vermenin, gereksiz yere iyilik yapmanın da doğru olmadığını iletir. Y.Feyzioğlu yeniden yazdığı masalarda çalışkanlığı, alçakgönüllülüğü, cesareti, fedakarlığı, sabırlı ve azimli olmayı, insanlara karşı iyi niyetli olmanı, merhametli ve sorumluluk sahibi olmayı ve bu gibi bir çok insani değerleri çocuklara öğretiyor. Bu masalarda çocukların yaş grubuna göre daha iyi anlayabilmeleri için dil ve üslupla birlikte masal mitoloji terminlerini de başarıyla kullanmıştır. Y.Feyzioğlu'nun yeniden yazdığı masalarında kültürel bağlamda her kesi olduğu gibi kabul etmek, insanların mensubiyetine saygı duymak, merhametli ve tatlı dilli olmakla, çalışkan, mesuliyetli bir birey olarak dünya ile ilgili bilgi almak ve olaylardan ders çıkarmak gerektiğini ileti olarak vermiştir. Y.Feyzioğlu'nun masaları esas olarak sosyal ve kültürel değerler bakımından zengindir ve çocukların eğitiminde çok faydalıdır. Yücel Feyzioğlu'nun masaları değerler eğitimi açısından incelenirken başlıca değer olarak bilinen (adalet, dostluk, dürüstlük, öz denetim, sabır, saygı, sevgi, sorumluluk, vatanseverlik, yardımseverlik) sıklıkla ifade edildiği belirlenmiştir. Çocukların eğitiminde onlar yüksek değerlerin kazandırılmasında Yücel Feyzioğlu'nun masallarından faydalanılabilir.

**Özet**

İklim değışikliği, sıcaklık artışları, değışen yağış rejimleri ve aşırı hava olaylarının sıklığında artış gibi faktörlerle tarım sektörü üzerindeki baskıları artırmaktadır. Bu durum, tarım ürünlerinin verimliliğini düşürmekte ve küresel gıda güvenliğini riske atmaktadır. Bu zorluklarla mücadele etmek amacıyla, iklim akıllı tarım sigortaları, sektörün iklim değışikliğine uyumunu destekleyen stratejik çözümler arasında önemli bir yer tutmaktadır. Bu sigortaların uygulanmasında, akıllı sözleşmeler ve dağıtılmış defter teknolojisi (DLT), merkezi olmayan, şeffaf ve otomatize edilmiş bir çözüm sunarak dikkat çekmektedir. Akıllı sözleşmeler, sigorta poliçelerinin yönetimini otomatikleştirerek hızlı ve şeffaf tazminat süreçleri sağlarken, DLT tüm işlem geçmişini kaydederek veri bütünlüğü ve güvenilirliğini artırır. DLT, blockchain ve akıllı sözleşmeler, modern dijital işlemler ve otomasyonlar için hayati öneme sahip birbirleriyle bağlantılı teknolojilerdir. DLT, merkezi bir otorite gerektirmeksizin işlemlerin birden fazla konumda kaydedilmesi için bir yapı olarak temel oluştururken, blockchain ise işlemleri güvenli ve merkezi olmayan bir şekilde kaydeden bir DLT türüdür. Akıllı sözleşmeler ise, önceden belirlenmiş koşulların gerçekleşmesi halinde otomatik olarak yürütülen ve taraflar arasındaki anlaşmaları dijital olarak kodlayan sözleşmelerdir. Bu teknolojiler çeşitli sektörlerde şeffaflığı artırmakta, maliyetleri azaltmakta ve operasyonların verimliliğini iyileştirmektedir. Bununla beraber bu teknolojilerin uygulanması yanlış veya eksik veri girişinden kaynaklanan veri bütünlüğü sorunları, blockchain işlemlerinin yüksek enerji tüketimi ve sonuç olarak çevresel etki, mevzuattaki hızlı değışikliklere uyum sağlama zorlukları gibi riskleri beraberinde getirmektedir. Bu araştırma, iklim değışikliğine uyumda iklim akıllı tarım sigortalarının önemini vurgulamakta ve akıllı sözleşmeler ile DLT'nin bu alandaki rolünü detaylı bir şekilde incelemektedir.

**Anahtar Kelimeler:** İklim akıllı tarım sigortası, dağıtılmış defter teknolojisi (DLT), akıllı sözleşmeler, blockchain

**ADAPTING TO CLIMATE CHANGE THROUGH CLIMATE-SMART  
AGRICULTURAL INSURANCE: THE ROLE OF SMART CONTRACTS AND  
DISTRIBUTED LEDGER TECHNOLOGY (DLT)**

**Abstract**

Climate change, characterized by increasing temperatures, shifting precipitation patterns, and a rise in the frequency of extreme weather events, is exerting significant pressure on the agricultural sector. This challenge reduces agricultural productivity and jeopardizes global food security. To address these issues, climate-smart agricultural insurance emerges as a strategic solution, facilitating the sector's adaptation to climate change. The implementation of these insurances highlights the use of smart contracts and Distributed Ledger Technology (DLT), which provide decentralized, transparent, and automated solutions. Smart contracts automate the management of insurance policies, enabling swift and transparent compensation processes, while DLT enhances data integrity and reliability by documenting all transaction histories comprehensively. DLT, blockchain, and smart contracts are interconnected technologies crucial for modern digital transactions and automation. DLT provides a framework for recording transactions across multiple locations without requiring a central authority, blockchain records transactions in a secure and decentralized manner as a form of DLT, and smart contracts are self-executing contracts that activate automatically when predefined conditions are met, digitally encoding agreements between parties. These technologies enhance transparency, reduce costs, and improve operational efficiency across various sectors. However, their implementation also brings challenges, such as risks associated with data integrity issues due to incorrect or incomplete data entries, the high energy consumption of blockchain transactions contributing to environmental impacts, and difficulties in keeping pace with rapid legislative changes. This research emphasizes the significance of climate-smart agricultural insurance in climate change adaptation and provides a detailed examination of the roles of smart contracts and DLT in this context.

**Keywords:** Climate-smart agricultural insurance, Distributed Ledger Technology (DLT), smart contracts, blockchain

## **Giriş**

İklim değişikliği, dünya genelinde tarımsal üretim sistemlerini ve gıda güvenliğini etkileyen en önemli çevresel sorunlardan biridir (Akalin, 2014). Artan sıcaklıklar, değişen yağış desenleri ve daha sık ve şiddetli hale gelen aşırı hava olayları tarım üzerindeki baskıyı artırmakta, ürün verimliliğini ve kalitesini olumsuz yönde etkilemektedir (Demirbaş, 2022). Bu durum, küresel gıda arzının sürdürülebilirliği konusunda ciddi endişelere yol açmakta ve tarım sektörünü iklim değişikliğine adaptasyon konusunda yenilikçi çözümler aramaya itmektedir. İklim değişikliğinin tarımsal üretim üzerindeki etkileri, küresel ölçekte farklılık göstermekle birlikte, özellikle gelişmekte olan ekonomilerdeki küçük ölçekli çiftçiler için önemli riskler oluşturmaktadır (Omar et al., 2023). Ekstrem hava olayları, çiftçilerin tarımsal üretimini doğrudan etkileyerek tarım tedarik zincirlerinin kırılganlığını artırmaktadır. İklimsel öngörülemezlik, hayvan ve bitki kayıplarına, açlığa ve göçe neden olmaktadır. Diğer taraftan tarımsal üretimdeki belirsizlikler, gıda fiyatlarında dalgalanmalara ve nihayetinde gıda güvenliğinin bozulmasına yol açabilmektedir. Bu bağlamda, küçük ölçekli çiftçiler, iklim değişikliğine karşı dirençlerini artırmak amacıyla çeşitli stratejilere başvurabilmekteler. Hükümetler arası İklim Değişikliği Paneli (IPCC), iklim değişkenliği ve değişikliğine karşı direnci, "bir sosyal veya ekolojik sistemin, temel yapısını ve işleyiş mekanizmalarını muhafaza ederken bozulmalara karşı direnç gösterebilme, kendini organize edebilme ve stresle veya değişimle başa çıkabilme kapasitesi" şeklinde tanımlamaktadır. Bu tanımdan yola çıkılarak, direncin esas niteliğinin, şok ve stres faktörlerine karşı dayanıklılık sergileme ve adaptasyon sürecinde gerekli dönüşümleri gerçekleştirme kapasitesi olduğu vurgulanmaktadır (Awazi et al., 2019). Literatürde, direnç oluşturma stratejileri maruziyeti azaltma, hassasiyeti azaltma ve uyum kapasitesini artırma olmak üzere üç ana başlık altında incelemiştir (Kangogo et al., 2020). Maruziyeti azaltma stratejisi, belirli bir riskin oluşma olasılığının ve şiddetinin azaltılması amacıyla yöneliktir. Bu stratejide, iklimsel ve iklimsel olmayan şoklar arasında bir ayrım yapılmaktadır; iklimsel olmayan şoklar için çiftlik düzeyinde olasılık ve şiddetin azaltılması mümkün olabilirken, iklimsel şoklar söz konusu olduğunda bu daha zor hale gelmektedir. Hassasiyeti azaltma stratejisi, çiftliklerin çeşitli şoklara karşı hassasiyetlerinin azaltılmasını hedeflemektedir. Bu süreçte, potansiyel risklerin tanımlanması ve bu risklerin etkilerini azaltacak yanıt mekanizmalarının geliştirilmesi gerekmektedir. Örneğin, kuraklığa daha dayanıklı tohum çeşitlerinin kullanımı, kuraklık gibi şoklara karşı hassasiyetin azaltılmasına katkıda bulunabilmektedir. Uyum kapasitesini artırma stratejisi ise, çiftçilerin iklim değişikliğinin etkilerine karşı hızlı ve etkili bir şekilde yanıt verebilme kapasitelerinin

geliştirilmesini ifade etmektedir. Bu bağlamda, yenilikçi yönetim uygulamalarının ve inovatif teknolojilerin benimsenmesi öne çıkmaktadır. Çiftçilerin uyum kapasitesinin artırılması, iklim değişikliğiyle başa çıkma stratejilerinin çeşitlendirilmesi ve belirsizlik altında karar alma süreçlerinin iyileştirilmesi ile ilişkilendirilmektedir. Bu bağlamda, değer zinciri iş birliği; hem diğer çiftçilerle yatay (çiftçi organizasyonları aracılığıyla) hem de ürün alıcılarıyla dikey (çiftçi-alıcı ilişkileri aracılığıyla) iş birlikleri yaparak, çiftçilerin uyum kapasitesini arttıran temel bir strateji olarak ön plana çıkmaktadır. Bu stratejiler arasında, tarımsal krediler ve genişletilmiş kredi erişimi aracılığıyla gelişmiş tarımsal üretim teknolojilerine yatırım yapmak da bulunmaktadır; bu yöntem, çiftçilerin iklim değişikliğine adaptasyon kapasitelerini önemli ölçüde güçlendiren bir yaklaşım olarak kabul edilmektedir (Kadanalı ve Kaya, 2021). Risk transfer aracı olarak tarım sigortası ise, iklim değişikliklerinin yol açtığı etkilerle mücadelede finansal direncin güçlendirilmesine önemli ölçüde katkıda bulunmaktadır. Bu katkı, kırılganlığın minimize edilmesi, risk ve belirsizliğin azaltılması ve üretken faaliyetlere yönelik yatırımların özendirilmesi şeklinde çok yönlü bir etki yaratmaktadır. Tarım sigortası, çiftçilere gelir güvencesi sağlamakta, ekipman yatırımlarını teşvik etmekte ve afet anında topluluklar ile hükümetler üzerindeki yükü hafifletmektedir (UNDP, 2023). Bu özellikleri ile tarım sigortası, çiftçilerin hem hassasiyetlerini azaltma hem de uyum kapasitelerini artırma yönünde önemli bir rol oynamaktadır. Sigorta, olumsuz hava koşulları gibi beklenmedik olaylardan kaynaklanan potansiyel zararları telafi ederek çiftçilerin zararlarını minimize etmektedir. Bu şekilde, çiftçilerin bu tür olaylara karşı daha az hassas hale gelmesini sağlamaktadır. Diğer taraftan sigorta, çiftçilere finansal güvence sağlayarak, onların iklim değişikliği ve diğer beklenmedik olaylar karşısında daha dirençli ve esnek olmalarını sağlamaktadır. Bu finansal güvence, çiftçilerin uzun vadeli planlama yapabilmelerine, yenilikçi tarım tekniklerine yatırım yapabilmelerine ve olası bir zarar durumunda toparlanabilmelerine olanak tanımaktadır. Dünya genelinde çeşitli tarımsal sigorta ürünleri mevcuttur (Ghimire et al., 2016). Bu sigorta ürünleri, tazminat miktarlarının hesaplanma yöntemlerine göre üç ana kategoriye ayrılmaktadır (Çizelge 1).

**Çizelge 1. Tarımsal Sigorta Ürünlerinin Sınıflandırılması**

<b>Tarımsal Sigorta Ürünü Türü</b>	<b>Ödemeler</b>
<b>a) Tazminat Temelli Tarımsal Sigorta (sigortalı birim seviyesindeki gerçek kayba dayalı tazminat ödemeleri)</b>	
1. Belirli Riskler	Hasar Yüzdesi
2. Çoklu Riskler	Verim Kaybı
<b>b) Endeks Bazlı Tarımsal Sigorta (sigorta ödemeleri bir endeks ölçümüne dayalı)</b>	
3. Alan-Verim Endeksi	Alan-verim Kaybı
4. Tarımsal Hava Durumu Endeksi Sigortası	Hava Durumu Endeksi tazminat ölçüğü
5. Normalleştirilmiş Fark Bitki Örtüsü Endeksi (NDVI) Sigortası	NDVI Endeksi Tazminat Ölçeği
6. Hayvan Ölüm Oranı Endeksi Sigortası	Hayvan Ölüm Oranı Endeksi Tazminat Ölçeği
7. Orman Yangını Endeksi Sigortası	Yangın Kaynağı ve Etkilenen Alan Tazminat Ölçeği
<b>c) Ürün Geliri Sigortası (Verim ölçümü ve ürün fiyatlarına dayalı sigorta ödemeleri)</b>	
8. Ürün Geliri Sigortası (CRI)	Verim ve Fiyat Kaybı

Kaynak: Ghimire et al., 2016

Tazminat temelli tarım sigortası ürünleri, hasar tazmin tutarını, sigortalı tarafından karşılaşılan gerçek zarara göre belirlenmektedir. Sigorta olayı gerçekleştiğinde, sigorta poliçesinde belirtilen teminatlar çerçevesinde hasar tespiti yapılmakta ve tazminat miktarı sigortalı düzeyinde saptanmaktadır. Endeks bazlı tarım sigortası ürünleri, hasar tespiti yerine, kayıplarla yüksek korelasyona sahip ve sigortalı tarafından etkilenmesi mümkün olmayan bir “endeks” değerine göre tazminat ödemektedir. Bu endeksler, yağış miktarı, sıcaklık, bölgesel verim gibi çeşitli faktörleri içermektedir. Ürün geliri sigortası, poliçe sahibine belirli bir gelir düzeyini garanti ederek hem verim düşüşlerine hem de olumsuz fiyat hareketlenmelerine karşı koruma sağlayan bir tarımsal sigorta türüdür. Bu sigortada, garanti edilen verim, üreticinin geçmiş dönem üretim verisinin bir yüzdesi olarak belirlenmektedir. Garanti edilen fiyat ise, hasat ayındaki ürünün gelecek vadeli piyasa fiyatı şeklinde belirlenebilmektedir. Hasat zamanında üreticinin elde ettiği gerçek gelir, gerçek verim ile hasat anındaki spot piyasa fiyatının çarpımı ile hesaplanmaktadır. Bu gerçek gelir, garanti edilen miktardan daha düşük ise, sigorta şirketi aradaki farkı tazmin olarak ödemektedir (Iturrioz, 2009).

Geleneksel tazminat temelli sigorta yöntemlerinin, iklim değişikliği kaynaklı olaylar sonucunda ortaya çıkan tarımsal zararların telafisinde önemli sınırlılıklar sergilediği gözlemlenmektedir. Bu yöntemlerin başlıca zaafaları; hasar tespit ve tazminat süreçlerinin uzun sürmesi, dolandırıcılık riskinin bulunması ve risk modelleme zorluklarıdır (Sushchenko and Schwarze,

2021). Öncelikle, iklim kaynaklı felaketlerin neden olduğu hasarların kapsamını kesin olarak tahmin etmek güç olup, bu belirsizlik, zararların belirlenmesi ve tazminatların ödenmesi süreçlerinin aylar sürebilmesine ve bu süre zarfında hasarların daha da artmasına neden olabilmektedir. İkincil olarak, tarım sektöründe faaliyet gösteren firmalar ve çiftçiler, gerçekleşen zararları abartma eğiliminde olabilmekte, bu durum sigorta şirketlerinin tazminat yönetimi süreçlerini karmaşıklaştırmakta ve zararın doğrulanması ile uygun tazminat miktarının belirlenmesi için ek maliyet ve zaman gerektirmektedir. Nihayetinde, küresel ortalama sıcaklıkların beklenenden daha hızlı bir şekilde artması, risk modellemesini önemli ölçüde güçleştirmekte ve dolayısıyla geleneksel sigorta modellerinin bu yeni ve öngörülemez koşullara adapte olmasını engellemektedir. Bu bağlamda, geleneksel tazminat temelli sigorta tekniklerinin, iklim değişikliğinin yol açtığı zorluklar karşısında yetersiz kaldığı ve tarımsal risk yönetimi alanında yenilikçi yaklaşımların gerekliliği açıkça ortaya çıkmaktadır. Endeks bazlı sigorta kavramı ise, tazminat temelli sigortanın karşılaştığı eksikliklerin bir sonucu olarak geliştirilmiştir. Objektif ve bağımsız fiziksel bir göstergeye dayanarak, endeks bazlı sigorta, tarımsal sigortanın mevcut sorunlarının üstesinden gelmekte ve maliyetlerde tasarruf sağlamaktadır (Omar et al., 2023). Ancak bu avantajlar yanında dikkate alınması gereken bir dizi dezavantajı da beraberinde getirmektedir. Bu dezavantajlardan ilki, endeks ve bireysel tarla bazlı kayıplar arasında yaşanabilecek potansiyel uyumsuzluk olan "baz riski"dir. Bölgesel ortalama verim veya yağış gibi genel göstergeleri temsil eden endeksler, her bir poliçe sahibinin bireysel kayıplarını tam olarak yansıtamayabilir, bu durum bazı sigortalılar için ya tazminat eksikliğine ya da gereğinden fazla tazminat ödenmesine neden olabilmektedir (Lichtenberg and Martínez, 2022). Endeks bazlı tarım sigortasının başarısı, doğru ve güncel endeks verilerine olan erişimine bağlıdır; bu verilerin eksikliği veya düşük kalitesi, baz riskini artırabilmekte ve sigorta primlerinin yanlış fiyatlandırılmasına yol açabilmektedir (Steinmetz, 2024). Özellikle gelişmekte olan ülkelerde, veri altyapısının yetersizliği, önemli bir engel teşkil edebilmektedir. Endeks bazlı tarım sigortası sisteminin suistimal edilme riski de bulunmaktadır; sigortalıların, kasıtlı olarak ekim alanlarını azaltması veya düşük verim elde etmesi, tazminat talebinde bulunmalarına neden olabilmekte, bu da sigorta primlerinin artışına ve sigorta havuzunun dengesizliğine yol açabilmektedir (Omar et al., 2023). Endeks bazlı tarım sigortası, geleneksel sigorta modellerine kıyasla daha karmaşık bir yapıya sahip olduğundan, poliçe sahipleri ve diğer ilgili tarafların sistemi tam olarak kavraması zor olabilmekte; bu durum, sigortaya erişim ve katılımı engelleyebilmektedir. Ayrıca, endeks bazlı tarım sigortasının yaygınlaşması, sigortacılık sektörünün teknik ve finansal kapasitesine ek yükler getirebilmekte, sigorta

şirketlerinin karmaşık risk modelleme ve veri analizi gibi alanlarda yetkinliklerini geliştirmeleri gerekmektedir (Maize Index, 2011). Endeks bazlı tarım sigortasının etkin bir şekilde uygulanabilmesi için, endekslerin seçimi ve hesaplanması, sigorta sözleşmelerinin şartları ve sigortacılık sektörünün gözetimi ve denetimi gibi konuları kapsayan, uygun bir yasal ve düzenleyici çerçeveye ihtiyaç bulunmaktadır. Bu bağlamda, endeks bazlı tarım sigortası tarımsal üretimde risk yönetimi için önemli bir araç olarak kabul edilse de bu dezavantajların ele alınması ve sistemin etkin bir şekilde uygulanabilmesi için kamu ve özel sektör paydaşlarının ortak çabaları gerekmektedir. Tazminat ve endeks bazlı tarım sigortası sistemlerinin mevcut dezavantajlarını aşma gereksinimi, yeni nesil sigorta ürünlerinin geliştirilmesini zorunlu kılmaktadır. İklim akıllı tarım sigortaları, bu yeni nesil ürünler arasında yer almakta ve akıllı sözleşmeler ile DLT gibi yenilikçi teknolojileri kullanarak tarımsal üretimde karşılaşılan riskleri daha etkili bir biçimde yönetme imkanı sunmaktadır. Akıllı sözleşmeler, önceden belirlenmiş koşulların gerçekleşmesi halinde otomatik olarak yürütülen ve taraflar arasındaki anlaşmaları dijital olarak kodlayan sözleşmelerdir (Knezevic, 2018). DLT ise, işlemlerin güvenli, şeffaf ve değiştirilemez bir şekilde kaydedilmesini sağlayan bir veri yapısıdır. İklim akıllı tarım sigortalarında kullanıldığında, bu teknolojiler, hasar tespit ve tazminat ödeme süreçlerini otomatikleştirebilmekte, dolandırıcılığı azaltabilmekte ve sigorta hizmetlerinin şeffaflığını ve güvenilirliğini artırabilmektedir. Bu bağlamda çalışmanın amacı, iklim değişikliğinin giderek artan etkilerine karşı tarımsal faaliyetlerin korunması için geliştirilen iklim akıllı tarım sigortalarının önemini vurgulamak ve bu alandaki yenilikçi teknolojilerin, özellikle akıllı sözleşmeler ve DLT, uygulamalarını detaylı bir şekilde incelemektir. Araştırma, tarımsal risk yönetiminde bu teknolojilerin nasıl bir potansiyel taşıdığını ve iklim akıllı tarım sigortası ürünlerinin, tarım sektöründeki mevcut zorluklara yenilikçi çözümler sunma kapasitesini ortaya koymayı hedeflemektedir.

## **2. DLT ve Akıllı Sözleşmelerin İklim Akıllı Tarım Sigortalarındaki Rolü**

İklim akıllı tarım, iklim değişikliği bağlamında tarımsal faaliyetlerin yönetilmesine yönelik bir strateji olarak öne çıkmaktadır. Bu yaklaşım hem ulusal hem de uluslararası düzeylerde, tarımsal planlamada karşılaşılan zorlukların üstesinden gelmeyi amaçlamakta ve bu bağlamda giderek daha fazla önem kazanmaktadır (Lipper and Zilberman, 2018). İklim akıllı tarım, üç ana hedef doğrultusunda tanımlanmaktadır: tarımsal verimliliği sürdürülebilir bir şekilde artırarak gelirleri, gıda güvenliğini ve kalkınmayı desteklemek; çeşitli seviyelerde uyum kapasitesini geliştirmek ve sera gazı emisyonlarını azaltarak karbon yutaklarını çoğaltmak (Adegoke et al., 2024). İklim akıllı tarım kapsamında, gelişmiş su yönetimi teknolojileri, bitki

ıslahı, koruyucu tarım, üretim çeşitlendirilmesi, hava durumu endeksine dayalı sigorta, toprak verimliliği yönetiminin entegre uygulamaları gibi yenilikçi teknolojiler yer almaktadır (Zhao et al., 2023). Bu yaklaşımın bir bileşeni olarak tarım sigortası, iklim risklerine karşı stratejik bir tepki olarak işlev görmektedir. Çiftçilerin risk maruziyetini azaltarak, normalde aşırı riskli kabul edilebilecek yenilikçi tarımsal uygulamaların benimsenmesini teşvik etmektedir. Tarım Sigortası, iklim risklerini yönetmek ve iklim akıllı uygulamalarının daha geniş ölçekte benimsenmesini desteklemek için etkili bir araç olup; böylelikle iklim değişkenliği karşısında gıda üretimini güvence altına almaktadır (Falco et al., 2014). Diğer tarafta iklim değişikliği, küresel bir sorun olarak tanınmakta olup, çözümü için merkezi olmayan, çoklu paydaşlara dayalı ve alttan yukarıya yönelik bir yaklaşımın benimsenmesi gerekmektedir. Bu süreç, mevcut ve gelişmekte olan iklim eylem araçları için açık ve uluslararası bir platformun varlığını zorunlu kılmaktadır. Bunun yanı sıra, bu yaklaşımın yüksek seviyede ölçüm, raporlama ve doğrulama yeteneğine izin vermesi ve yüksek düzeyde güven ve şeffaflık gerektirmesi esastır. DLT, bu özelliklerle optimal bir uyum sağlayan teknolojidir (Born, 2018). DLT, blockchain ve akıllı sözleşmeler, modern dijital işlemler ve otomasyonlar için hayati öneme sahip birbirleriyle bağlantılı teknolojilerdir. DLT, merkezi bir otorite gerektirmeksizin işlemlerin birden fazla konumda kaydedilmesi için bir yapı olarak temel oluştururken, blockchain ise işlemleri güvenli ve merkezi olmayan bir şekilde kaydeden bir DLT türüdür (Connolly et al., 2017; Goodson, 2022). Blockchain platformlarında işleyen akıllı sözleşmeler ise, tüm katılımcıların aracı bir kurumun müdahalesi olmaksızın sonucundan hemen emin olabilmeleri için bir anlaşmanın yürütülmesini otomatikleştirmek amacıyla tasarlanmış protokollerdir (Omar et al., 2023). Bu teknolojiler birlikte, çeşitli sektörlerde şeffaflığı artırır, maliyetleri azaltır ve operasyonların verimliliğini iyileştirir. FAO, DLT'lerin ve akıllı sözleşmelerin tarım sektöründe değer ve bilgi alışverişini daha verimli, şeffaf ve izlenebilir hale getirme konusunda benzersiz fırsatlar sunduğunu belirtmektedir (Goodson, 2022). DLT ve akıllı sözleşmelerin entegrasyonu, işlemleri basitleştirmesi ve yenilikleri teşvik etmesi açısından iklim akıllı tarım sigortası için dönüştürücü bir potansiyele sahiptir. DLT, eski muhasebe sistemlerine kıyasla daha ucuz ve esnek olup, işlem parametrelerinin bağımsız doğrulanmasını sağlamaktadır (Connolly et al., 2017). Araştırmalar, DLT'nin indeks tabanlı sigorta ile birleştirilmesinin, AB'nin Ortak Tarım Politikası içindeki sorunları hafifletebileceğini ve iklim felaketlerinden etkilenen çiftçilere yapılan tazminat ödemelerindeki gecikmeleri azaltabileceğini göstermektedir (Schwarze and Sushchenko, 2022). Ayrıca, akıllı sözleşmeler, talep işleme ve ödemeler gibi sigorta süreçlerini basitleştirerek, tarım sigortasının verimliliğini artırmaktadır (Mainelli and Manson, 2017).

Günümüzdeki parametrik sigorta uygulamaları, teknolojik kısıtlar nedeniyle yeterli güvenilirlik ve verimliliğe sahip değildir. Blockchain teknolojisi, akıllı sözleşmeler ve IoT sensörleri kullanarak, şeffaflığı ve operasyonel verimliliği artırarak çiftçiler için daha etkili bir parametrik sigorta modeli oluşturma imkânı sunmaktadır. Bu teknoloji, çiftçi risk verileri ile iklim endekslerini bütünleştirerek tarımsal ürünlerin dalgalanmalarına ilişkin anlık bilgiler sunmakta ve böylece yağış miktarı gibi belirli parametrelere dayalı olarak akıllı sözleşmeler aracılığıyla tazminat işlemlerinin otomasyonunu sağlamaktadır (Mavilia and Pisani, 2019; UN, 2023).

Blockchain teknolojisi, belirli bir ağ üzerinde gerçekleşen tüm işlemleri değiştirilemez dijital defterlerde güvenli bir şekilde kaydetme kapasitesine sahiptir. Özellikle tarım sektöründe çiftliklerin durumu ve sözleşmelerle ilgili bilgilerin toplanması genellikle yüksek maliyetli bir süreçtir; bu bağlamda, blockchain güvenilir bir bilgi kaynağı olarak ön plana çıkmaktadır (Goodson, 2022). İlk büyük uygulama alanı Bitcoin adlı kripto para birimi olmakla birlikte, Bitcoin'in işlem sistemini destekleyen blockchain teknolojisi, bu kripto para biriminden çok daha geniş bir alana yayılmaktadır. Blockchain, aracılar olmaksızın işlem yapılmasını mümkün kılan, düşük maliyetli ve şeffaf bir mekanizma sunmaktadır; aynı zamanda karmaşık ağların üyeleri arasındaki işlemlerin doğruluğunu izlemeyi, raporlamayı ve doğrulamayı da sağlamaktadır. Bu özellik, veri kanallarında şeffaflık ve tutarlılık sağlar ki bu, afet yardımlarının ve tazminat ödemelerinin şeffaf bir şekilde raporlanmasında temel bir öneme sahiptir. (Nellore et al., 2022). Blockchainde her katılımcı bu veritabanının tam bir kopyasını bilgisayarında tutmakta, böylece merkezi bir kontrol mekanizması bulunmamaktadır. Blockchain, zaman damgalı ve geçerli girişler içeren bloklar şeklinde yapılandırılmış bir işlem defteridir. Her blok, önceki bloğun hash değerini içererek zincirleme bir bağlantı oluşturmaktadır ve bu, yapılan herhangi bir değişikliği tüm katılımcılara açık hale getirmektedir. Sonuç olarak, blockchain, değiştirilemez ve dağıtılmış bir kayıt sistemi olarak işlev görmektedir (Dattoo, 2018)Blockchainde güven, aracı kurumlar olmaksızın işlemlerin geçerliliğinin kontrol edilmesi için dağıtılmış bir konsensus mekanizması kullanılarak sağlanmaktadır. Örneğin, Ethereum blockchain'inde İş Kanıtı (Proof of Work) kullanılmaktadır. Blockchain teknolojisi ile sigorta verileri, poliçeler, ödemeler, müşterini tanıma gibi bilgiler, düğümlerin dağılmış bir ağı üzerinde güvenli, bozulmaz dijital defterlere dijital olarak kaydedilebilmektedir. Ayrıca, veri transferi bağımsız ve otomatik olarak blok zinciri üzerinde gerçekleşmekte, böylece manuel, rutin ve kağıt temelli işlemleri ortadan kalkmaktadır (Nellore et al., 2022).Son zamanlarda, sigortacılar, çeşitli blockchainler kullanarak politika modelleri geliştirme ve deneme süreçleri yürütmektedirler. Akıllı sözleşme çözümleri sunan en yaygın blockchain platformu Ethereum

olup, NEO, NEM, EOS, Cardano, R3Corda ve Hyperledger gibi diğer platformlar da bulunmaktadır (Nguyen et al., 2019). Sigorta sektöründeki en dikkate değer blockchain konsorsiyumu ise, izinli-özel bir blockchain olan R3 Corda'yı işleten Blockchain Endüstri Sigorta Girişimi (B3i)'dir. Öte yandan, AXA, izinsiz ve açık kaynaklı bir blockchain teknolojisi olan Hyperledger Fabric ile denemeler yapmaktadır. Farklı blockchainlerin kullanımı, InsurTech sektörünün henüz olgunlaşma aşamasında olduğunu ve pazarın konsolidasyon sürecinde olduğunu göstermektedir (Nellore et al., 2022). Şekil 1, blok zincir teknolojisinin küçük ölçekli çiftçilere yönelik ürün sigortası sağlama sürecinde nasıl işlev görebileceğini göstermektedir (Omar et al., 2023). Bu süreç içerisinde, çiftçiler, meteorolojik veri sağlayıcılar ve sigorta şirketleri gibi tüm ilgili taraflar, akıllı sözleşmelerle yönetilen bir blok zinciri ağı aracılığıyla entegre bir şekilde birbirine bağlıdır. Bu akıllı sözleşmeler, belirli ekstrem olaylar meydana geldiğinde otomatik olarak aktive olmakta ve çiftçilere yönelik tazminat ödemelerinin hızlanmasını sağlamaktadır. Söz konusu teknoloji, otomatik ödeme mekanizmaları içeren, işlem maliyetlerini azaltmayı ve talep süreçlerini kısaltmayı mümkün kılan kişiye özel sigorta ürünleri geliştirme olanağını sunmaktadır. Bu çerçevede, tazminat talebinde bulunan bireyler, sigorta şirketinin talepleri elle işlemlerini beklemek zorunda kalmaz ve sözleşme şartları gerçekleştiğinde hemen ödeme alacaklarından emin olabilmekte. Aynı zamanda, bu sistem sigorta şirketlerinin, bireysel çiftçilerin davranışlarında olası değişiklikleri doğru ve şeffaf bir şekilde belirten risk bilgilerine erişimini mümkün kılmaktadır. Sigorta şirketleri, çoğu çiftçinin kabul edeceği tutarların üzerinde prim yükü getirmeksizin risk temelli fiyatlandırmaya dayanarak prim belirleyebilmektedir (UN, 2023)

Şekil 1. Akıllı sözleşmeler kullanılarak entegre edilen blok zinciri tabanlı tarımsal endeks çözümü (Kaynak: Omar et al., 2023)

Çizelge 2’de, blockchain teknolojisinin tarım sigortası sistemlerine katkıları ve sağladığı avantajlar özetlenmiştir. Bu teknoloji, bilgi erişimini artırma, işlem güvenliğini sağlama ve sigorta işlemlerini otomatize etme gibi çeşitli yollarla tarım sigortası alanında önemli iyileştirmeler sunmaktadır.

Çizelge 2. Blockchain teknolojisinin tarım sigortası sistemine sağladığı avantajları

Yön	Fayda
Şeffaflık	- Bilgiye erişimi artırır ve şeffaflığı sağlar. - Sigorta sözleşmelerinin yönetiminde güvenlik, inanılabilirlik ve güveni artırır. - Bilgiye eşit erişim sağlayarak olumsuz seçim ve ahlaki tehlike gibi sorunları hafifletir (bilgi asimetrisini azaltır)
Verimlilik	Akıllı sözleşmeler, risk değerlendirmesi, prim hesaplamaları, izleme ve tazminat ödemeleri dahil olmak üzere pek çok sigorta sürecini otomatize eder. Bu, maliyetleri ve gecikmeleri azaltır.
Parametrik Sigorta	Blockchain, bireysel hasar değerlendirmeleri yerine parametrelere (örn., hava verileri) bağlı olarak otomatik olarak tetiklenen ödemeleri sağlayan güvenli, veriye dayalı endeks bazlı sigortayı mümkün kılar.
Kripto Para Potansiyeli	Dijital para birimleri kullanarak prim ve tazminat ödemeleri gibi işlemleri daha hızlı ve ucuz hale getirir.

Blockchain teknolojisi, sigorta süreçlerinde çeşitli avantajlar sağlamakla birlikte, bu teknolojinin kullanımı belirli riskler ve zorluklar da içermektedir (Çizelge 3). Bu riskler, veri bütünlüğü, çevresel etkiler, mevzuattaki belirsizlikler, veri yönetimi, sosyo-ekonomik engeller ve iş modelindeki bozulmalar gibi kategoriler altında incelenmiştir. Bu risklerin detaylı bir şekilde değerlendirilmesi, Blockchain teknolojisinin tarım sigortası sistemlerinde etkin bir şekilde kullanılabilmesi için önem taşımaktadır.

Çizelge 3. Tarım sigortası sisteminde Blockchain teknolojisinin kullanımıyla ilişkili ana riskler

Kategori	Risk Açıklaması
Veri Bütünlüğü	Blockchain kaydedilen verilerin doğruluğunu garanti edemez. Yanlış veya düşük kaliteli veri girişi, kaydedildikten sonra verilerin değiştirilememesi nedeniyle sistemin güvenilirliğini tehlikeye atabilir.
Çevresel Etki	Özellikle kamu ağlarındaki blockchain, işlem doğrulaması için önemli güç gerektirir ve yenilenebilir olmayan enerji kullanımı nedeniyle CO2 emisyonlarının artmasına katkıda bulunur.
Mevzuatta Belirsizlik	Hızlı teknolojik gelişmeler, düzenlemelerin bu hıza ayak uydurmasını zorlaştırarak belirsizlik yaratır.
Veri Yönetimi	Blockchain’in değiştirilemez doğası, veri gizliliği düzenlemelerine uyum sağlamada zorluklar yaratır ve potansiyel hukuki çatışmalar oluşturabilir.
Sosyo-Ekonomik Engeller	Çiftçiler arasında düşük dijital okuryazarlık ve teknolojik değişime karşı direnç, Blockchain tabanlı dijital ürün ve hizmetlerin benimsenmesini ve ölçeklendirilmesini sınırlayabilir.
İş Modeli Bozulması	Akıllı sözleşmelerin ve Yapay Zekânın yaygın kullanımı, sigorta sektöründe iş modellerinde ve iş akışlarında değişiklikler gerektirebilir.

### **3. Dünya’da Uygulama Örnekleri**

Tarım sektöründe risk yönetimi, teknolojinin ilerlemesi ile birlikte yeni bir boyut kazanmıştır. InsurTech alanında, özellikle blockchain teknolojisinin entegrasyonu, dijital tarım sigortası uygulamalarını radikal bir şekilde dönüştürmekte ve geliştirmektedir. Bu teknolojiyi benimseyen şirketler, sigorta süreçlerini daha şeffaf, erişilebilir ve verimli hale getirmek için yenilikçi yollar aramaktadır. Bu bağlamda, özellikle Arbol platformu (ABD), Qoldau platformu (Kazakistan) ve Avrupa’da geliştirilen Beacon platformu gibi öncü girişimler, tarım sigortası alanında blockchain kullanımının öncü örnekleri olarak dikkat çekmektedir (Kosior, 2021).

*Arbolmarket platformu (ABD):* 2018 yılında Amerika Birleşik Devletleri’nde kurulan Arbol adlı start-up, tarım-gıda sektöründe faaliyet gösteren işletmeler başta olmak üzere çeşitli kuruluşlara yönelik hava durumu risklerine karşı sigorta erişimini geliştirmeyi amaçlamıştır. Arbol tarafından geliştirilen ArbolMarket platformu, hava koşullarından etkilenen tarımsal üreticiler ile sermaye sağlayıcıları—sigortacılar ve varlık yöneticileri (bankalar, hedge fonları, yatırımcılar ve hava türevlerinden kazanç sağlamak isteyen diğer taraflar) arasındaki işlemleri ve sözleşmeleri kolaylaştıran ve destekleyen çeşitli araçlara ve çözümlere erişim sunmaktadır. Bu platform, çiftçiler ve sigortacılar için bilgi asimetrisini azaltmayı ve sonuç olarak hava riski sigortası primlerini düşürmeyi hedeflemektedir. ArbolMarket platformunda sunulan ana ürün ve hizmet, tazminat ödemelerinin üretimdeki hasar ve kayıpların hesaplanmasına değil, belirli hava ve doğa olayları ile ilişkili kesin olarak tanımlanmış endekslere bağlı kılınan parametrik sigortadır. Arbol’un sağladığı sigorta, belirlenen endekslerin gerçekleşmesi durumunda otomatik tazminat ödemeleri yapılmasını sağlayan akıllı sözleşmeler şeklinde sunulmaktadır. Bu sözleşmeler, Ethereum ağı gibi, her bilgisayarın (düğüm) tüm sözleşmelerin bir kopyasını sakladığı ve tazminat ödemeleriyle ilgili işlemleri doğruladığı blockchain üzerinde doğrudan çalışan merkezi olmayan uygulamalar olarak işlev görmektedir. Şu anda, ArbolMarket platformu, çiftçilere ve sigorta piyasasına yatırım yapmak isteyen kuruluşlara, aşırı yağışlar, kar eksikliği, aşırı yüksek sıcaklıklar ve gübreleme işlemlerini engelleyen diğer hava olayları gibi çeşitli risklere karşı bir dizi parametrik sigorta ürünü sunmaktadır. Platform kurallarına göre, bir çiftçi sisteme giriş yaptıktan sonra, sigortalanacak risk türünü, koruma süresini, koruma altına alınacak alanları ve prim miktarını belirleyerek bir akıllı sözleşme oluşturma talebinde bulunabilir. Bu talep, sözleşmeyi kabul etme veya reddetme hakkına sahip yatırımcı sigortacılara raporlar aracılığıyla sunulur. İlgili bir yatırımcı ve çiftçi, akıllı sözleşmeye belirli bir miktar Ether kripto para birimi ödeyerek karşılığında sözleşme sertifikaları (imzalanmış sözleşmenin belgeleri) alırlar. Bu sertifikalar, çiftçiye tazminat talep etme hakkı ve yatırımcıya

kar elde etme hakkı verir. Eğer sigorta olayı gerçekleşirse (kesin olarak tanımlanan bir parametrede açıklanmışsa), çiftçi akıllı sözleşmeye atanan tüm fonları otomatik olarak alır. Sözleşmede belirtilen parametrenin gerçekleşmediği durumda ise, veri analizleri bunu gösterir ve akıllı sözleşme yatırılan tüm Ether miktarı sigortacıya (yatırımcıya) tahsis edilir. Platformda, hava ile ilişkili olmayan parametrik ürünler de yer almaktadır. Bunlardan biri olan SmartYield Programı, tarım ekipmanlarındaki sensörlerden elde edilen verilere dayanan bir verim endeksini kullanmaktadır. Belirlenen bir sınırın altına düşmesi halinde, çiftçiler otomatik olarak tazminat almaktadırlar. Bu ürün için, hava sigortasında olduğu gibi, çiftçilerin tazminat talebinde bulunmaları gerekmemektedir. Ayrıca, tazminat miktarını önceden bilmektedirler. *AgriLedger*: Blockchain teknolojisini kullanarak sürdürülebilir tarım ve yerel ekonomi kooperatiflerinin kurulmasına odaklanmaktadır. Bu platform, vadeli işlem ödemelerinin şeffaf ve verimli bir şekilde yapılmasını kolaylaştırırken, tarım felaketlerine karşı akıllı sözleşme sigortaları sunmakta ve ayrıca hizmetlerden yeterince yararlanamayan topluluklar için mikro finansman fırsatları sağlamaktadır. *AgriLedger*, Kenya, Myanmar ve Papua Yeni Gine gibi yerlerde pilot programlar yürüterek ekonomik faaliyetleri artırmakta ve bölgesel olarak daha fazla değer elde edilmesini sağlamaktadır (Kim and Laskowski, 2017). *AgriOnBlock*: Tarım sektöründeki çeşitli sorunları ele almak için çiftçiler, perakendeciler ve sigorta şirketleri gibi paydaşları IoT cihazları ve Ethereum üzerindeki akıllı sözleşmeler aracılığıyla bir araya getirmektedir. Ürün sigortası da dahil olmak üzere, platform, şeffaflık, güvenlik ve değiştirilemezlik özelliklerini güçlendirerek finansal kayıp, ürün kontaminasyonu ve bozulması gibi problemleri çözmeyi amaçlamaktadır (Patel and Shrimali, 2021).

#### **4. Sonuç ve Öneriler:**

Bu çalışmada, iklim değişikliğine adaptasyon sürecinde iklim akıllı tarım sigortaları potansiyelini, bu süreçlerde akıllı sözleşmelerin ve DLT'nin rollerini incelemiştir. Bulgular, iklim akıllı tarım sigortaları, akıllı sözleşmeler ve DLT ile entegrasyonunun, geleneksel tarım sigortası modellerine kıyasla önemli avantajlar sunduğunu göstermektedir. Akıllı sözleşmeler, DLT destekli sensörlerden toplanan önceden belirlenmiş parametreler temelinde tazminat değerlendirmesi ve ödeme işlemlerini otomatize ederek, manuel süreçlerle ilişkili gecikmeleri ve olası anlaşmazlıkları ortadan kaldırmaktadır. Bu durum, çiftçilerin iklimle ilgili kayıplar sonrasında daha hızlı mali toparlanma imkânı sunmakta ve taraflar arasındaki güveni artırmaktadır. Ayrıca, DLT'nin sağladığı güvenli ve şeffaf veri toplama kapasitesi, hava durumu istasyonları ve uydu görüntüleri gibi çeşitli kaynaklardan elde edilen verileri kullanarak daha kesin ve yerelleştirilmiş risk modelleri geliştirmeyi mümkün kılmaktadır. Bu da daha adil

primlerle ve iklim hassasiyetlerine özel olarak tasarlanmış etkili sigorta ürünlerinin sunulmasına olanak tanımaktadır. DLT ayrıca, özellikle uzak bölgelerdeki küçük çiftçiler için geleneksel sigorta erişimindeki sınırlamaları aşarak sigortayı daha kapsayıcı ve finansal olarak uygulanabilir hale getirmektedir. Ancak, bu teknolojilerin uygulanmasının bazı zorlukları ve riskleri de bulunmaktadır. Özellikle, yanlış veya eksik veri girişi, yüksek enerji tüketimi ve mevzuatla uyum sağlama konularında karşılaşılan zorluklar dikkate alınmalıdır. Çiftçiler ve sigorta sağlayıcıları arasında yeni teknolojilere olan güveni artırmak için sürekli eğitim ve kapasite geliştirme çabaları gerekmektedir. Gelecek araştırmalar, iklim akıllı tarım sigortalarının DLT ile ölçeklendirilmesinin ekonomik uygulanabilirliğini ve bu yenilikçi yaklaşımı destekleyecek düzenleyici çerçeveler üzerine tasarlanabilmektedir.

**ABSTRACT**

Integrated Pest Management (IPM) is a practical and eco-friendly method of controlling pests (including weeds, illnesses, and insects) that combines several useful strategies. Comprehensive, current data regarding pest life cycles and their interactions with the environment is used in IPM programs. To manage pest damage as cheaply and environmentally as possible, this information is used in conjunction with currently available pest management techniques. The IPM method can be used in non-agricultural settings like homes and offices, as well as agricultural ones like fields and gardens. IPM employs all suitable methods of controlling pests, which may involve the prudent application of pesticides (e.g., herbicides, fungicides, and insecticides). On the other hand, many of the same principles as IPM are used in organic food production; however, insecticides derived from natural sources rather than synthetic chemicals are used.

**Keywords:** Integrated Pest Management (IPM)

## **INRODUCTION**

IPM is the application of a variety of techniques for pest management rather than a single approach to pest control. Based on the IPM, an action threshold is established. Not often does the presence of a single pest indicate the need for control (Deguine et al., 2021). Future pest control decisions must be based on how much of an economic danger pests pose (Dara, 2019). The classic Integrated Pest Management (IPM) model gives some consideration to the economics of pest management in relation to yield losses, but its primary goal is to maintain ecological balance in the cropping system. The new model, which covers the management, business, and sustainability elements of pest management and explains its many components (Figure 1). It is more thorough than the previous model (Dara, 2019). The new model defines IPM as a method for controlling pests in a way that is safe for the environment, socially and economically acceptable, and all three.

Figure 4. Modern IPM (Dara, 2019)

Not every insect, weed, and microbe needs to be controlled. Numerous creatures are benign; a few even have positive properties. To determine the best course of action and action thresholds, IPM systems seek to monitor pests and precisely identify them. Pesticides cannot be used improperly or when they are not truly needed because of this identification and monitoring (Singh et al., 2020). IPM programs aim to manage the crop, lawn, or enclosure as the initial stage in pest control to keep pests from posing a hazard. When it comes to an agricultural crop, this could entail applying cultural techniques like crop rotation, choosing pest-resistant cultivars, and planting pest-free rootstocks. These control techniques can be very efficient and cause little to no harm to the environment or people. IPM programs assess the best control strategy for both efficacy and risk when monitoring, identification, and action thresholds show that pest management is required, and preventative measures are either ineffective or unavailable (Flint & Van den Bosch, 2012). The least dangerous pest management methods are selected first, including weeding or pheromones that prevent pests from breeding. Additional pest control techniques, such as targeted pesticide spraying, will be employed if additional monitoring, identification, and action thresholds show that less risky measures are ineffective. Spraying non-specific pesticides widely is a last resort. The foundational idea of IPM is the link between economic damage and loss. In other words, no injury level below the damage cap justifies suppression, but injuries that are expected to cause financial harm certainly do.

### **PRINCIPLES OF IPM**

One technique for managing pest issues while lowering hazards to people and the environment is IPM. All pests in urban, agricultural, wildland, and natural settings can be controlled with IPM. With a combination of tactics like biological control, habitat alteration, cultural practice modification, and the use of resistant cultivars, IPM is an ecosystem-based strategy that focuses on the long-term prevention of pests or their damage. In compliance with established guidelines, pesticides are only used when deemed essential, and treatments are only conducted to eradicate the intended organism. In order to reduce threats to the environment, beneficial and non-target creatures, and human health, pest control agents are carefully chosen and administered. Species classified as pests harm or impede the growth of plants that we find attractive in our landscapes, fields, orchards, or cause structural damage to houses or other buildings. Animal or human health-related organisms are also considered pests. In addition to causing pain, pests can spread illness. An invertebrate (an insect, tick, mite, or snail), a plant (weed), a disease-causing infection (a bacteria, virus, or fungus), or another type of animal or insect could be the pest.

These creatures are undesired and have the potential to damage the ecology, animal life, and water quality.

By controlling the ecosystem, IPM aims to prevent pests or the long-term harm they cause. By employing disease-resistant plants, applying sealant to cracks to keep mice and insects out of buildings, or cultivating a robust crop resistant to pest attacks, you can prevent pests from becoming a problem before they become one. By applying IPM, you will examine the environmental elements that impact the pest and its capacity to thrive, as opposed to just eliminating the pests you now observe. Now that you know this, you can make things difficult for the pest. Determining if management is required in IPM is facilitated by accurate pest identification and monitoring. In order to identify what pests are there, how many there are, and what kind of damage they are producing, you must monitor your field, landscape, forest, building, or other location. Gaining an accurate identification of the pest is essential to assessing its potential to cause issues and choosing the most effective control method. You can determine whether a pest can be tolerated or if it is a problem that needs to be controlled after keeping an eye on it and assessing its biology, surroundings, and other relevant elements. Should control be necessary, this data also aids in selecting the ideal time and most efficient management techniques. To be more effective, IPM programs integrate management techniques. Combining measures that complement each other rather than working alone is the most efficient, long-term approach to pest management. These are the broad categories into which pest management approaches fall. Utilizing viruses, competitors, parasites, and predators as natural enemies to manage pests and their damage is known as biological control. Many naturally occurring adversaries exist for vertebrates, nematodes, plant pathogens, weeds, and invertebrates. The establishment, growth, dispersal, and survival of pests are all decreased via cultural controls. By altering irrigation techniques, for instance, pest issues might be decreased while root illnesses and weed growth can be increased by excessive watering. In addition to preventing pests from existing, mechanical and physical controls can also alter the environment to make it less conducive to their presence. Mechanical controls include things like rodent traps. Physical controls include barriers like curtains to keep out birds and insects or mulches to control weeds and diseases. They can also involve steam sterilizing the soil. Pesticides are used for chemical control. To achieve more effective, long-term control, IPM uses pesticides sparingly and in concert with other methods. To reduce the risk of harm to people, non-target species, and the environment, pesticides are carefully chosen and used. The main goals of IPM are preventing pests, combining workable and practical methods, and using pesticides sparingly. Therefore,

compared to the traditional usage of soil pesticides, the IPM technique offers a more environmentally friendly and effective solution. All suitable pest management techniques, including the sparing application of pesticides, are employed in IPM programs. The risk of pesticide exposure may outweigh the advantages of control, particularly when nonchemical approaches yield equivalent results, therefore preventive pesticide application is restricted. IPM is an approach to pest management that integrates several strategies based on data gathered via inspection, monitoring, and reporting in the field (Bueno et al., 2021). Targets for preventing pests and requirements for condition removal inform the design of the IPM program (Karlsson Green et al., 2020). Identification and determination of harm thresholds of pest species is the first step for a successful IPM program. There are five strategic steps involved in all pest management decision-making. Each step provides an opportunity to thoroughly think through the pest control process and to reduce pesticide use (Figure 2).

Figure 2. Five Steps of IPM (Stein, 2006)

Pest identification and observation are critical (Baker et al., 2020). Therefore, precautionary actions are done. Less insecticide is used needlessly. Correct identification also keeps beneficial organisms from being eliminated. When keeping an eye out for pests, documentation must be retained, and mapping must be completed if required. Records of monitoring outcomes and audit conclusions, along with recommendations, are required. There are numerous monitoring methods that can differ based on the type of pest. Pest populations must be regularly monitored, pest-prone areas must be identified, and effective prevention and control measures must then be put into place for IPM programs to be successful. The outcomes of monitoring should be

used to revise IPM plans. The pest population level at which its existence poses a risk to human health, the environment, and the economy is known as an action threshold. To help direct decisions about pest treatment, an action threshold must be set. An IPM plan's size, breadth, and intensity will be the main topics of a specified threshold. IPM concentrates on prevention by getting rid of things like food, water, and shelter that draw pests. One way to prevent pests from entering a space is to reduce clutter, close off areas where they might enter, remove trash and overgrown vegetation, maintain clean eating and food storage spaces, construct pest barriers, remove standing water, and educate people about IPM. In the event that action thresholds are crossed, pest management is needed (Hendrichs et al., 2021). Taking into consideration hazards to the practitioner, others, and the environment, IPM programs employ the most efficient, low-risk choices. Pests can be controlled by trapping them, applying heat or cold, physically removing them, and using pesticides. When assessing a pest management program's effectiveness, documentation is essential (Lesley, 2020). Every pest management treatment, including the use of pesticides, should be documented on the spot and kept in an accessible, well-organized system. Evidence of the consideration and application of non-chemical control techniques ought to be present. It is important to identify recommendations for averting future pest issues. The use of IPM—a clever, considerate, and environmentally friendly method of pest control—needs to be increased. IPM controls pests and lowers the amount of pests and pesticides that are exposed to the environment and humans, resulting in a safer, healthier ecosystem (Barzman et al., 2015). It makes sense because school buildings and gardens employ realistic measures to decrease supplies of food, water, and insect habitat. Because it is economically favorable and concentrates on pest prevention, it is sustainable (Luna & House, 2020). IPM offers a variety of techniques to decrease pest contact and pesticide exposure in an efficient and environmentally friendly manner. IPM is crucial because it stops or drastically lowers pollution brought on by the overuse of pesticides.

## **CONCLUSION**

Integrated pest management (IPM), is not a novel idea; agricultural crops and orchards all over the world employ it. Special issues arise when applying it in both urban and rural settings, such as homes, buildings, workplaces, home gardens, landscapes, golf courses, meadow pasture areas, and woods. IPM is a field that is quickly growing in non-agricultural rural and urban locations. IPM, is a long-term approach to pest control that use a variety of techniques to bring insect populations down to manageable levels with the least amount of negative environmental effects and possible financial savings for the pest manager. IPM is another successful strategy

for maintaining public health. Prior to taking action, it is vital to identify pests and their hosts as well as beneficial organisms. For every sort of pest, there should be specific recommendations for monitoring. For the pest, an action threshold needs to be established. It is important to assess control strategies and put effective ones into practice. Outcomes must be tracked, assessed, and recorded. IPM is a tool that can be used to manage any kind of pest, including diseases, weeds, insects, and vertebrate pests. To prevent and reduce pests, prevention combines biological, chemical, mechanical, and/or physical pest control methods with cultural practices. IPM aims to successfully manage pests while minimizing the negative consequences of pest control on non-target organisms, the environment, and human health. As a result, IPM programs are made up of the integration of IPM methods and principles. While each circumstance is unique, all IPM programs share six essential elements. Dangerous is noted. It is done to keep an eye on the quantity and quality of pests. When management action is necessary, guidelines are prepared. It is regulated to prevent insect issues. Tools for managing biological, cultural, physical/mechanical, and chemical aspects are combined. After taking action, the results of pest management are assessed.

**ABSTRACT**

Weed management for improving ecology emphasizes restoring or improving degraded ecosystem health. Ecological areas or agricultural areas may be destroyed because of natural disasters or human activities. It may even be necessary to transform some agricultural areas back to nature. Weeds can be used to improve ecologically appropriate natural or agricultural areas. In selecting the weed species to be used for this purpose, issues such as soil type, moisture levels, plant community structure and disturbance history are considered. Another issue to consider when choosing appropriate weed species is to prevent the spread of invasive species. Chemicals should not be used unless it is necessary to prioritize non-chemical methods such as cover crops, crop rotation and conservation tillage as components of the weed management program in reclaimed areas. The use of weeds in regulating ecology positively affects the environment and public health.

**Keywords:** Weed management, Chemicals, crop

## **INRODUCTION**

Preventing, stopping, and undoing ecosystem degradation is the goal of ecological restoration (Gann et al., 2019). Restoration of the plant community is challenging when natural or human-caused disturbances occur (Young & Hamerlynck, 2023). The biggest dangers to plant communities are the introduction of new invasive species or the rise of quickly spreading weeds that generate large amounts of biomass and seeds. Utilizing desirable weeds in ecological restoration can lead to improvements (Reid et al., 2009). It is possible to stop unwanted species from spreading and the soil from staying barren by regularly adding seeds or breeding materials derived from native plants that have weed-like traits (Pedrini et al., 2020; Uroy et al., 2022). It is possible to build desirable plant communities and enhance ecology by using weeds. Weeds take over the following essential ecological activities for improving the soil, swiftly covering the bare soil (Humphries et al., 2021). Natural or enhanced ecosystems benefit from the usage of weeds because they replenish organic matter, prevent soil erosion from wind and rain, aid in bioremediation, and foster the growth of soil microorganisms. Additionally, the allelopathic properties of weeds can be used to suppress undesirable species (Cummings et al., 2012). Humans and natural disasters have the power to ruin ecology (Radicetti & Mancinelli, 2021). Perennials, biennials, or summer or winter annual weeds can all be employed to repair the damaged environment. Certain weeds use their tap roots to hold the soil in place, while others use their hair roots (Figure 1). Because legume weeds increase the amount of organic matter in the soil and bind free nitrogen from the air to the soil, they are beneficial. By using the components of jade for photosynthesis, weeds purify the air. Through their roots, certain weeds provide a home for microbes that aid in the decomposition of harmful heavy metals in the soil. It keeps species that cover the soil surface from disappearing from the soil. Colorful flowering plants produce an eye-catching, lovely scene in the natural world. These explanations highlight the benefits that might arise from capacity of weeds to preserve and enhance ecology.

Figure 1. Weeds for ecosystem (Woolington, 2024)

### **ECOLOGICAL RESTORATION AND WEEDS**

Successful weed control is essential to the preservation and restoration of natural plant populations, agricultural areas, and ecological restoration initiatives. It is important mapping and detecting troublesome species, such as noxious weeds that are designated by the state, and then offering suggestions for managing or eliminating those species (Khan et al., 2021). The

strategy is to reduce the long-term dependency on chemical herbicides by utilizing Integrated Weed Management approaches, which include mechanical, biological, cultural, and chemical control methods. Our ecological emphasis enables us to offer the most effective control strategy based on the distinctive qualities of each species. Creating an Integrated Weed Management Plan begins with mapping and inventorying noxious weeds. To identify and record the location and abundance of weed species of concern, we carry out thorough field survey. Locations are marked in the field using GPS units, and the data is subsequently entered into a GIS. The produced maps are used to support long-term monitoring programs and to identify and rank treatment locations for the management of noxious weeds. It is necessary to create weed management plans that include thorough implementation recommendations tailored to each project site, as well as maps and descriptions of the targeted species and regions of concern. Plans should concentrate on integrated weed management strategies, which combine mechanical, chemical, biological, and cultural control measures according to the distinct ecology of each weed, with the ultimate objective of lowering the long-term requirement for chemical herbicides. The dynamic process of managing weeds calls for close observation, advice, and supervision. Collaborating with various governmental or private organizations is crucial for executing Integrated Weed Management Plans. It is important to keep an eye on the applications' performance and to take appropriate action when needed. Long-term monitoring will be possible with the use of remote sensing or geographic information system-based weed mapping in conjunction with the establishment of quantitative vegetation monitoring transects to gather weed data from the weed management plan.

## **CONCLUSION**

Numerous weeds play crucial roles in the restoration of ecosystems. The carbon cycle and the hydrological cycle are the two main ways that plants, including weeds, contribute to or mitigate climate change. Many studies on "invasive" weeds are notable for failing to take disturbance kind and frequency into account. People usually assume that the plant is the issue! This room contains an elephant. Weeds are known to play a part in soil regeneration. In general, annuals help to enhance the status of nutrients; tap-rooted weeds, such as dock and dandelions, also draw nutrients up from the soil's depths and allow water to reach the subsoil. They eventually die off, causing the soil to become more humus-rich and favorable to other plants. Nitrogen is added to the soil by legume plants like clover. Numerous aquatic weeds contribute significantly to the natural ecosystem by purifying water and removing excess nutrients from contaminated streams and wetlands, hence enhancing aquatic habitat in wetlands and streams. Similar to this,

native wetland species—such as *Typha* spp. and *Phragmites*—may be weeds even though they have been utilized to cure pollution and serve as markers of it. Therefore, it's critical to consider if these species are "invading" more nutrient-dense populations while developing rehabilitation measures. Microorganisms and other animals find refuge in weeds. Animals are adapting to coexist with weeds, and numerous endangered and unusual species now rely on them for nesting, food, and shelter. Surprisingly, non-native plants have several uses in restoration. The contribution of salt cedar to precipitation in a desert climate is described by Tao Orion. Plants also emit cloud-seeding microorganisms during transpiration. In comparison to its native neighbors that do not accumulate salt, salt cedar appears to harbor a greater variety and quantity of bacteria. When soil is exposed to disturbances such as fire, flood, landslide, cutting, clear tillage, or the application of herbicides, weeds naturally cover and improve the exposed soil. Species that can quickly cover bare soil and start to carry out one or more of the following essential ecological tasks for soil improvement are known as pioneer plants, or weeds.

It keeps the soil from being eroded by wind and rain, replenishes organic matter that supports the growth of soil microorganisms, collects, stores, and recycles soluble nutrients that seep into the soil, and strengthens the structure of the soil.

**Özet**

Günümüz dünyasında biyolojik çeşitliliğin azalması, ekonomik, ekolojik ve kültürel değerleri tehdit etmektedir. Ekonomik ve ekolojik kazançların tehlikeye altında olması ülkeler arasındaki çatışmaları tetiklemektedir. Bununla birlikte biyolojik unsurların kullanım alanlarının genişlemesi de biyolojik çeşitliliği önemli bir zorunluluk haline getirmiştir. İnsanlığın başına gelmekte olan doğal felaketlerde kaybolan bitki türlerinin devamlılığı için tohum bankaları büyük bir öneme sahip olacaktır. Bu bağlamda milli gen bankalarının oluşturulması ve sürekliliğinin sağlanması gerekmektedir. Bitki türleri bakımından yüksek endemizm oranına sahip olan ülkemizde biyolojik çeşitliliğin korunması ayrıcalıklı bir önem taşımaktadır. Ayrıca birçok bitkinin anavatan olması bakımından da Türkiye'de bulunan bitki türlerinin korunması oldukça önemlidir. Diğer taraftan kaçakçılık, bilgisizlik, biyoistila gibi nedenlerle bitki çeşitliliğinin yok olmasına yol açacak durumların önüne geçmek için gerekli politikaların oluşturulması ve uygulamalarda kararlılığın sağlanması, biyolojik güvenliğimiz açısından elzemdir. Çeşitliliğin devamlılığının sağlanması açısından yerli tohumlarla üretimin sürdürülebilirliğinin sağlanması da gerekmektedir. Bu derlemede tohum bankalarının önemi ve tohum bankalarının Dünya'da ve Türkiye'deki durumuna değinilmiştir.

**Anahtar Kelimeler:** Yerli tohum, Sürdürülebilirlik, Tohum bankaları

**A GENERAL ASSESSMENT OF SEED BANKS**

**Abstract**

In today's world, the decrease in biological diversity threatens economic, ecological and cultural values. The fact that economic and ecological gains are at risk triggers conflicts between countries. However, the expansion of the usage areas of biological elements has made biodiversity an important necessity. Seed banks will be of great importance for the continuity of plant species lost in the natural disasters that occur to humanity. In this context, it is necessary to establish and maintain national gene banks. In our country, which has a high rate of endemism in terms of plant species, the protection of biological diversity is of special importance. In addition, it is very important to protect the plant species found in Turkey, as it is the homeland of many plants. On the other hand, it is essential for our biological security to establish the necessary policies and ensure consistency in practices in order to prevent situations that will lead to the extinction of plant diversity due to reasons such as smuggling, ignorance and bioinvasion. In order to ensure the continuity of diversity, it is also necessary to ensure the sustainability of production with local seeds. In this review, the importance of seed banks and the situation of seed banks in the world and in Türkiye are mentioned.

**Keywords:** Local seeds, Sustainability, Seed banks

## **Giriş**

Kullanım alanı genişleyen biyolojik çeşitlilik unsurları, ilerleyen teknoloji ve bilim sayesinde geçmiş dönemlere kıyasla daha önemli hale gelmiştir. Türlerin azalması veya yok olması çevresel, sosyal ve ekonomik açıdan birçok sorunu da beraberinde getirmektedir. Bu bağlamda biyolojik çeşitlilikteki kayıplar önemli bir milli güvenlik sorunu olarak ortaya çıkmaktadır (Sümer, 2016). Bir ülkede var olan gen kaynaklarının muhafazası için bitkisel çeşitliliğin korunması gerekmektedir. Muhafazada temel amaç bitkilerin oluşturdukları genetik çeşitliliğin korunmasıdır. Bitkilerin sahip oldukları genetik çeşitlilik, bitkinin bir parçasının veya tüm bitkinin sağlıklı tutulması ile muhafaza edilebilir (Balkaya ve Yanmaz, 2001). Bitki çeşitliliğinin aşınmasının insanlığın ve gezegenimizin refahı üzerinde ciddi etkileri vardır. Bitkilerin *ex situ* korunması, hızla ilerleyen ve kolayca erişilebilen teknolojiler gerektirmektedir. Bitki habitatlarının endişe verici kaybı, tohum adaptasyonlarından faydalanarak kurutmayı sürdüren geleneksel dondurucu depolamaya veya geleneksel yöntemlere uygun olmayan genetik materyalin uzun süre hayatta kalmasını sağlayan kriyojenik platformlara odaklanan teknolojilere küresel yatırım yapılmasına yol açmıştır (Walters ve Pence, 2021).

## **Tohum Bankalarının Önemi**

Biy çeşitliliğin önem kazanması hem teknoloji ve bilim sayesinde hem de insanın doğaya bakışının değişim göstermesi sayesinde canlılar hakkında daha fazla bilgi elde edilmesi ile yakından ilgilidir. Teknoloji ve bilim ile canlılara verilen zararlar artarken, canlıların ekonomik değerleri ön plana çıkmaktadır. Bir taraftan çevresel kirlenmelerle canlı türleri yok olma sürecine girerken, diğer taraftan ekonomik değeri olan türlerin yok olma süreci hızlanmaktadır. Önümüzdeki süreçte küresel çevre güvenliğinin en ayırt edilen özelliği kaynak savaşları olacaktır. Gelecekteki kaynak savaşları ulus devletin yozlaşmış ya da zayıf olduğu, dış ve yerli aktörlerin iktidar olmak için yarışa girdiği ülkeler başta olmak üzere gelişmekte olan ülkeler içerisinde ortaya çıkacaktır. Tüm diğer işlevlerin yanı sıra türlerin ekonomik işlevlerinin olması bile sadece bir kaynak üzerinde çatışmalara sebep olabilecektir (Sümer, 2016). Gelecekteki sürdürülebilir bir dünya, bitki biyoçeşitliliğini korumaya yönelik ortak çabalar gerektirmektedir. Botanik bahçeleri, üniversiteler, devlet kurumları ve sivil toplum kuruluşları bütünlük bir yaklaşım oluşturarak bu zorluğun üstesinden gelmeye çalışmaktadır. Bu bağlamda tohum bankacılığı güçlü ve etkili bir araç olmaya devam etmektedir. Aşırı kurumayı ve düşük sıcaklığı tolere edebilen tohumlar, ortak bir dondurucunun geleneksel koşulları kullanıldığında muhtemelen en az 100 yıl hayatta kalacaktır. Çeşitli taksonlar arasında

tohumların aşırı toleransı, küresel çapta tohum bankalarının sayısının şu anda 1.750'nin üzerine çıkmasına ve 50.000'den fazla türün korunmasına yol açmıştır (Walters ve Pence, 2021). Tohum bankaları metabolik olarak aktif olmayan bireylerin rezervuarlarıdır. Bu hareketsiz bireylerin genetik, fenotipik ve fonksiyonel çeşitliliği toplu olarak biyolojik sistemlerin davranışını önemli ve geniş kapsamlı şekillerde etkileyebilir. Hemen hemen tüm biyolojik varlıklar bir tohum bankası oluşturabilir, ancak belki de en ikonik ve iyi çalışılmış örnekler bitkilerden gelmektedir (Lennon ve ark., 2021). Binlerce yıl önce, insanların bitki tohumlarının çeşitliliğinden ve uzun ömürlülüğünden yararlanmaya başlamasıyla farklı kültür ve toplumlarda büyük dönüşümler ortaya çıkmıştır (Smith, 2001). O zamandan bu yana, zengin teorik, karşılaştırmalı ve deneysel çalışmalar, bitki popülasyonlarının ve topluluklarının çeşitliliği ve eko-evrimsel dinamikleri için tohum bankalarının dengeleyici rolüne ilişkin kritik bir anlayış sağlamıştır (Venable ve Lawlor, 1980; Ellner, 1985; Levin, 1990; Evans ve ark., 2007; Kortessis ve Chesson, 2019). Doğal sistemlerdeki gözlemlerden ilham alan tohum bankacılığı depoları, biyolojik çeşitliliğin korunmasına yardımcı olmak ve artan sıcaklıklar, hastalık salgınları, küresel ısınma ve diğer doğal afetler nedeniyle nesli tükenme tehlikesiyle karşı karşıya olan nadir bitki çeşitlerinin uzun süreli depolanması yoluyla gıda güvenliğini sağlamak amacıyla dünya çapında tasarlanmıştır (Peres, 2016; Lennon ve ark., 2021) Tohum bankaları biyolojik sistemlere dayanıklılık kazandıran önemli tamponlardır. Uyuşukluk, aksi takdirde bireyin kondisyonunu azaltacak uygun olmayan koşullardan koruma sağlar. Şanslıysanız, bu bireylerin en azından bir kısmı gelecekte çevrenin büyüme ve üreme için daha elverişli olduğu bir zamanda uyanacaktır. Evrim ve ekoloji üzerindeki sonuçları göz önüne alındığında, tohum bankası dinamiklerini kontrol eden mekanizmaların tanımlanmasına yönelik önemli çabalar sarf edilmiştir (Lennon ve ark., 2021).

### **Dünya'da ve Türkiye'de Tohum Bankalarının Durumu**

İnsanlar tarıma başladığı ilk zamanlardan beridir doğadaki bitkisel kaynakları tüketme amaçlarına göre kültüre almış ve bugün itibariyle kullanılmakta olan türlere ait çeşitleri geliştirmiştir. Bitki türlerindeki genetik çeşitliliğin yoğun olduğu yöreler Bitki Gen Merkezi (Vavilov, 1926), gen merkezleri içinde çeşit zenginliğini gösteren küçük alanlar da Mikro Gen Merkezi olarak tanımlanmıştır (Harlan, 1926). Bazı araştırmacılar yaptıkları çalışmalarda, dünya üzerinde 12 farklı gen merkezi bulunduğunu belirtmişlerdir (Zhukovsky, 1975; Krusteva ve ark., 1995). Bitki biyoçeşitliliğinin tarımsal kullanımına ve tohum bankalarının malzeme sağladığı rolüne ilişkin vaka çalışmaları, mahsulleri ortaya çıkan hastalıklardan, değişen manzaralardan ve değişen hava koşullarından koruma ihtiyacı arttıkça her geçen gün

artmaktadır (Byrne ve ark., 2018; Greene ve ark., 2019; Khoury ve ark., 2019). Örneğin, USDA Ulusal Bitki Gen Plazma Sistemi her yıl dünyanın dört bir yanından yüz binlerce bilgi ve gen plazması talebi almakta ve çeşitli kullanımlar için yılda yaklaşık 250.000 katılım dağıtmaktadır. Geleneksel veya kriyojenik platformlar altında bitki gen plazması bankacılığına izin veren hızla gelişen teknolojiler, olasılıkları genişletmekte ve insanların Dünya'nın bitki çeşitliliği hazinesini koruyabileceği sözünü vermektedir. Ancak bu paha biçilmez kaynakları dondurucularda ve kriyovatlarda saklamak yeterli değildir. Unutulan veya ihmal edilen depolanan genetik materyal eninde sonunda ölecek ve koruma amacına hizmet etmeyecektir. Bu nedenle, koruma teknolojilerini botanik uzmanlığı ve restorasyon ekolojisinin yanı sıra kamu ve özel sektör kuruluşlarıyla birleştiren entegre yaklaşımlar, bitkileri korumak ve onların kendi varlığı için bitkilere dayanan bir dünyada bir yuva sahibi olmalarını sağlamak için esastır (Walters ve Pence, 2021). Genetik çeşitlilik erozyonuna yanıt olarak gelecekte küresel gıda güvenliğini tehdit edebilecek potansiyel durumlara karşı önlem almak için Kuzey Kutbu'nun Svalbard takımadasında dünyanın tüm tohum türlerini bir araya getirmeyi amaçlayan Svalbard Küresel Tohum Deposu bulunmaktadır. Kıyamet Ambarı (Doomsday Vault) adıyla da bilinen 2001'de Birleşmiş Milletler tarafından müzakere edilen "Uluslararası Tohum Anlaşması'nın" imzalanmasından sonra resmi olarak 2008 yılında açılan ve 4,5 milyon tohum kapasitesine sahip olan depoda 1,2 milyonun üzerinde tohum türü bulunmaktadır. Tohum deposu, -18°C'de sakladığı tohumlarla iklim değişikliği gibi küresel gıda güvenliğine yönelik tehditlere karşı geleceğin gıda tedarikçisi olarak görülmektedir. Svalbard Tohum Deposu'nda Afrika ve Asya'dan mısır, pirinç ve buğday gibi birçok temel besinin ender bulunan türlerinin yanı sıra Avrupa ve Güney Amerika'dan patlıcan, marul, patates gibi besinlerin tohumları da bulunmaktadır. Ülkemiz bitki genetik çeşitliliği olarak eşsiz bir konumda bulunmaktadır. Üç önemli floristik bölgenin kesişim noktasında bulunan ülkemiz topografik, jeomorfolojik ve iklimsel özellikleri ile oldukça farklı habitatlara ve buna bağlı olarak da zengin endemizm oranı ve bitki türlerine sahiptir. Ülkemizin tohumuz ve tohumlu bitki taksonu sayısı 12.000 civarında olup bu sayının yaklaşık 4.000'i endemiktir. Özellikle tarımı yapılan türlere ait genetik kaynakların devamlılığının sağlanması, bitkisel üretimimizin sürdürülebilirliği açısından son derece önemlidir (Sarı ve ark., 2016). Bugün itibarıyla ülkemizde 18 arazi gen bankası ve 2 tohum gen bankası bulunmaktadır. Tohum gen bankalarından birisi İzmir'de faaliyet vermektedir. Ege Tarımsal Araştırma Enstitüsü'nde hizmet veren bu banka 1964'ten bu yana hizmet vermekte olup 1974'ten beridir "Ulusal Gen Bankası" adıyla çalışmalarını sürdürmektedir. Ulusal Gen Bankası dünyadaki gen bankalarının ilk örnekleri arasında

sayılmaktadır. Bu bankada gelecek nesillere aktarılmak için yaklaşık 3 bin 500 endemik bitki türü ve 60 bin tohum örneği koruma altında tutulmaktadır.

Ülkemizdeki diğer tohum gen bankası ise Ankara'da bulunmaktadır. 1988'de tohum örneklerinin güvenlik yedeklemelerini yapmak amacıyla faaliyete geçirilen bu gen bankası Ankara Tarla Bitkileri Merkez Araştırma Enstitüsü bünyesinde çalışmalarına başlamıştır. "Türkiye Tohum Gen Bankası" adıyla bilinen bu banka 250 bin tohum saklama kapasitesine sahiptir. Dünyadaki en önemli 10 gen bankası arasında gösterilen Türkiye Tohum Gen Bankası'nda ağırlıklı olarak kültürü yapılan bitkiler ve yabani akrabaları olmak üzere birçok farklı bitki grubunda çalışmalar yürütülmektedir. Bölümün görev alanı ekonomik öneme sahip yabani bitkiler, ıslah edilmiş çeşitler, yerel çeşitler, bunların yabani akrabaları ve doğal florada mevcut diğer bitki türlerinin (özellikle endemik türler) kaybolma tehlikelerine karşı toplanması, uzun süreli muhafazası, toplanan materyalde karakterizasyon, yenileme/üretim çalışmaları ve bilgilerin dokümantasyonudur (Sarı ve ark., 2016).

### **Sonuç**

Biyçeşitlilik hem de sosyal ve ekonomik istikrar için hem de sağlıklı bir ekolojik işleyiş için ulusal düzeyde olduğu kadar uluslararası alanda da büyük önem taşımaktadır. Özellikle gelişmiş ülkelerde tohum bankalarının sürekli ve düzenli bir şekilde oluşturuluyor olması, biyçeşitliliğin gelecekte çok daha önemli bir unsur olacağını işaret etmektedir. Bu bağlamda halkın ve bilhassa ilgili alanda uzmanlaşma yöneliminde olarak öğrenci ve araştırmacıların koruma bilincinin gelişmesine yönelik farkındalık ve eğitim çalışmaları yapılmalıdır. Ülkemizin genetik kaynaklarının gelecek nesiller için sürdürülebilir olmasını sağlamak adına yapılacak tüm çalışma içerikleri desteklenmelidir.

**Özet**

Bu çalışmada, *Fusarium oxysporum* kutinazın kristal yapısı (5AJH) ile monoterpen bileşikleri olan alpha-pinene, beta-pinene ve beta-phellandrene'nin etkileşimini araştırmak için moleküler yerleştirme yöntemi kullanılmıştır. Bu amaçla, biyoaktif bileşiklerin kutinazın kristal yapısı ile etkileşimleri silikomoleküler bağlanma simülasyonları kullanılarak incelenmiştir. Yerleştirme işlemleri için Chimera programı kullanılmış ve hedef protein yapıları üretilmiştir. Çalışma sonucunda, alpha-pinene, beta-pinene ve beta-phellandrene için hesaplanan RMSD değerlerinin 2'nin altında olduğu tespit edilmiştir. Alpha-pinene'nin en yüksek kenetlenme puanına sahip olduğu ve -6.0'lık bir bağlanma puanı elde edildiği görülmüştür. Daha sonra beta-pinene (-5.8) ve beta-phellandrene (-5.4) sırasıyla izlemiştir. Bu sonuçlar, alpha-pinene molekülünün enzimün spesifik bağlanma ceplerine en sıkı şekilde bağlandığını göstermektedir. Bu bulgular, yeni antifungal bileşiklerin geliştirilmesi için potansiyel bir temel sağlamaktadır, ancak bu mekanizmanın daha derinlemesine anlaşılması için in vitro çalışmaların yapılması önerilmektedir.

*Fusarium oxysporum***

**Abstract**

In this study, molecular docking was employed to investigate the interaction between *Fusarium oxysporum* cutinase's crystal structure (5AJH) and monoterpen compounds, specifically alpha-pinene, beta-pinene, and beta-phellandrene. Bioactive compound interactions with the cutinase crystal structure were examined using silico-molecular binding simulations. Chimera software was utilized for the docking procedures and to generate target protein structures. The study found that the calculated RMSD values for alpha-pinene, beta-pinene, and beta-phellandrene were below 2. Alpha-pinene exhibited the highest binding affinity, with a binding score of -6.0. Subsequently, beta-pinene (-5.8) and beta-phellandrene (-5.4) followed in affinity ranking. These results indicate that alpha-pinene binds most tightly to the enzyme's specific binding pockets. These findings provide a potential basis for developing new antifungal compounds, although further in vitro studies are recommended for a deeper understanding of this mechanism.

## **Giriş**

*Fusarium oxysporum* olarak bilinen mantar toprak yoluyla bitkilere bulaşmaktadır (Gordon ve Martyn, 1997). Ayrıca *Fusarium oxysporum* bitki enfeksiyonlarını da içeren devasa bir tür kompleksidir. Bu patojenler, saldırılarını çok çeşitli türlere, konakçıya özgü bir şekilde hedeflemektedir (Fourie ve ark., 2011). Çok sayıda bitki türünde solgunluk veya çürümeye neden olabilen çok çeşitli suşları bulunabilmektedir (Dean ve ark., 2012). Ayrıca pamuk, patates ve süs bitkileri de dahil olmak üzere çok çeşitli bitkileri etkileyen hastalıktan *Fusarium oxysporum*'un sorumlu olduğuna dair kanıtlar vardır (Peters ve ark., 2008; Lecomte ve ark., 2016; Halpern ve ark., 2018). Araştırmacılar bitkilerden elde edilen uçucu yağların *Fusarium oxysporum* mantarına karşı etkilerini raporlamışlardır (Barrera-Necha ve ark., 2009; Sharma ve ark., 2017). Esansiyel yağların birincil bileşenlerinin hücre zarını kırabilmesi ve hücrenin geçirgenliğinde önemli bir değişiklik yaratabilmesi sayesinde, uçucu yağların *Fusarium* solgunluğu hastalığına karşı hem önleyici hem de tedavi edici kapasitede etkili olduğu gösterilmiştir (Gill ve Holley, 2006; Sharma ve ark., 2017). Alpha-pinene, beta-pinene, ve beta-phellandrene birçok bitkide doğal olarak bulunabilmektedir (Murakami ve ark., 2009; Singh Bisht ve ark., 2019; Herrera-Calderon ve ark., 2022). Bu bileşiklere sahip bitkilerin uçucu yağları *Fusarium oxysporum*'un etkilerini kontrol etmek için kullanılabilceği bildirilmiştir (Al-Naser ve Al-Abrass, 2014). Bu çalışmada alpha-pinene, beta-pinene, ve beta-phellandrene bileşiklerin moleküler yapılarıyla *Fusarium oxysporum* kutinazın kristal yapısının (5AJH) in silico modelleme ile bağlanma simülasyonunun incelenmesi amaçlanmıştır.

## **Materyal ve Yöntem**

Monoterpen bileşikler olan alpha-pinene, beta-pinene, ve beta-phellandrene yapılarıyla *Fusarium oxysporum* kutinazın kristal yapısının (5AJH) etkileşime girip girmediğini araştırmak için moleküler yerleştirme yapılmıştır. Moleküler yerleştirme için biyoaktif bileşiklerin *Fusarium oxysporum* kutinazın kristal yapısı (<https://www.rcsb.org/structure/5AJH>) ile etkileşimi silikomoleküler bağlanma simülasyonları ile gerçekleştirilmiştir. Yerleştirme hedefleri olarak kullanıma hazır protein yapıları üretmek için Chimera (versiyon 1.16) programı kullanılmıştır.

## **Bulgular ve Tartışma**

Monoterpenler gibi bileşiklerin bakteri ve mantarlarla etkileşimini tahmin etmek amacıyla son yıllarda *in silico* araştırmalarının kullanımında önemli bir artış olmuştur (Jianu ve ark., 2021; Kundu ve ark., 2021; Santana de Oliveira ve ark., 2021). Bu çalışmada, bitkilerin uçucu yağlarında da doğal olarak bulunabilen alpha-pinene, beta-pinene, ve beta-phellandrene

bileşenleri ile *Fusarium oxysporum* kutinazın yapısı arasındaki bağlantıyı araştırmak için *in silico* yöntemler kullanılmıştır. Bu önemli bileşiklerin, mantar zarlarını parçalamanın yanı sıra hücre zarlarının geçirgenliğinde önemli bir değişikliğe neden olabildikleri gösterilmiştir (Gill ve Holley, 2006; Sharma ve ark., 2017). *In silico* tahmini için Chimera yazılımı kullanılmıştır. Her bir yeniden kenetlenme duruşunun kalitesini değerlendirmek için hem kök ortalama kare sapma (RMSD) değerleri hem de kenetlenme puanları dikkate alınmıştır. Redocked protein ile kristalografik ligand arasındaki kök ortalama kare sapma (RMSD) değerlerinin 2 Å'den (angström) daha az olması gerektiği bildirilmiştir (Silva ve ark., 2019). Bu çalışma sonucunda alpha-pinene, beta-pinene, ve beta-phellandrene için hesaplanan RMSD'nin 2'den düşük olduğu belirlenmiştir. Alpha-pinene'nin en yüksek kenetlenme puanına sahip olduğu bulunmuştur ve bu sonuç diğer üç bileşiğin öngörülen bağlanma puanıyla karşılaştırılmıştır. Alpha-pinene için -6.0'lık değer ile en yüksek değerde bağlanma puanı elde edilmiştir. Daha sonra sırasıyla beta-pinene (-5.8) ve beta-phellandrene (-5.4) bileşikleri izlemiştir. Stabil protein-ligand komplekslerinin oluşumu düşük yerleştirme puanlarıyla ölçülmektedir (Kundu ve ark., 2021). Bunun bir sonucu olarak, moleküler kenetlenmeyi içeren araştırmalar, alpha-pinene kenetlenme puanları açısından en üst konuma yerleştirmiştir. Şekil 1, alpha-pinene molekülünü, amino asit (Serin: SER) kalıntılarının enzimin spesifik bağlanma ceplerine yerleştirilmesini içeren optimal bağlanma pozisyonunda göstermektedir. Ayrıca beta-pinene, SER amino asidine bağlanırken beta-phellandrene, bilinmeyen amino aside bağlanmıştır.

Şekil 1. Alpha-pinene ve 5AJH'nin yerleştirme yapısı

Şekil 2. Beta-pinene ve 5AJH'nin yerleştirme yapısı

Şekil 3. Beta-phellandrene ve 5AJH'nin yerleştirme yapısı

### Sonuç

Bu çalışmanın sonucunda, alpha-pinene, beta-pinene, ve beta-phellandrene ligandlarının ve hedef protein (5AJH) arasındaki ilişkilere ilişkin ayrıntılı bilgi tespit edilmiştir; spesifik olarak, üç bileşenin *Fusarium oxysporum* kutinaz sentazının enzimatik cebinin kalıntılarına sıkı bir şekilde bağlandığı keşfedilmiştir. Bu bileşiklerin etkilerinin ardındaki mekanizmanın daha iyi anlaşılması için *in vitro* çalışmalar yapılması önerilmektedir. Bu araştırmanın bulgularına dayanarak yeni antifungal bileşiklerin geliştirilmesine yönelik yeni yollar açılabilir.

**Özet**

Artan nüfusun ihtiyaçlarını karşılamaya yetecek kadar gıda üretmek, dünya çapında gıda politikası uygulamalarının her zaman en büyük çabası olmuştur. Organik tarımın çevresel faydaları arasında biyolojik çeşitliliğin korunması, daha iyi toprak kalitesi, buharlaşmanın ve su kullanımının azaltılması, adaptasyon stratejilerinin güçlendirilmesi ve sera gazı emisyonlarının azaltılmasının yanı sıra enerji verimliliği de yer almaktadır. Karada bulunan bitkiler gibi deniz yosunu da fotosentetik pigmentler içermektedir. Deniz yosunları güneş ışığının ve deniz suyunda bulunan besinlerin yardımıyla fotosentez yapmaktadır. Deniz yosunu gübresinin farklı kültür bitkileri için uygulanması, ticari kimyasal gübrelerin yerini alması ve üretim maliyetini düşürmesi açısından büyük önem taşımaktadır. Deniz yosunlarından elde edilen gübrelerin, yüksek orandaki organik madde, mikro ve makro elementler, vitaminler ve yağ asitleri ile büyüme düzenleyiciler açısından da zengin olması nedeniyle bazı araştırmalarda kimyasal gübrelerle göre daha üstün olduğu tespit edilmiştir. Organik tarıma artan ilgi göz önüne alındığında, bu derlemenin üreticilere yosun gübresinin faydalarını anlayabilmeleri açısından önemli bir kaynak oluşturacağı düşünülmektedir. Bu derlemede deniz yosununun organik tarımda değerlendirilmesi ile birlikte çevrenin korunması, çevresel değişikliklere karşı yüksek dayanıklılık, çiftçi gelirlerinin artırılması, girdi maliyetlerinin azaltılması, toprak sağlığının korunması ve sağlıklı gıda ürünlerinin üretilmesine değinilmiştir.

**Anahtar Kelimeler:** Organik tarım, Yosun, Gübre, Yosun gübresi, Organik gübre

## **USE OF SEAWEED FERTILIZERS IN ORGANIC FARMING**

### **Abstract**

Producing enough food to meet the needs of a growing population has always been the greatest effort of food policy practices around the world. The environmental benefits of organic farming include preserving biodiversity, better soil quality, reducing evaporation and water use, strengthening adaptation strategies and reducing greenhouse gas emissions, as well as energy efficiency. Like land-based plants, seaweed contains photosynthetic pigments. Sea algae carry out photosynthesis with the help of sunlight and nutrients found in seawater. The application of seaweed fertilizer for different cultivated plants is of great importance in terms of replacing commercial chemical fertilizers and reducing the cost of production. Fertilizers obtained from seaweed have been found to be superior to chemical fertilizers in some studies, as they are rich in high amounts of organic matter, micro and macro elements, vitamins and fatty acids, and growth regulators. Considering the increasing interest in organic agriculture, it is thought that this review will be an important resource for producers to understand the benefits of seaweed fertilizer. In this review, the use of seaweed in organic agriculture and the protection of the environment, high resistance to environmental changes, increasing farmer incomes, reducing input costs, protecting soil health and producing healthy food products are discussed.

**Keywords:** Organic agriculture, Seaweed, Fertilizer, Seaweed fertilizer, Organic fertilizer

## **Giriş**

Dünya çapında nüfus ve buna bağlı olarak tüketim artarken, gelecekte gıda, yem ve yakıtta olan talepte artış olacaktır. Gelişmekte olan dünyada beslenme biçimleri değişmekte ve insanlar daha fazla gıda tükettikçe doğal kaynaklar üzerinde ekstra baskı oluşmaktadır (Godfray ve ark., 2010; Seufert ve ark., 2012). 2050 yılına gelindiğinde dünya nüfusunun 9 milyara ulaşması ve buna bağlı olarak tarım ürünlerine olan talebin yıllık %1,1 oranında artacağı tahmin edilmektedir (Alexandratos ve Bruinsma, 2012). Kimyasal gübrelerin aşırı bir şekilde kullanılması; toprağın tuzlanmasına, bitki besin maddelerinin dengesiz dağılmasına, ağır metal birikiminden dolayı toprak kirliliğine, mikroorganizma etkinliğinin azalmasına ve diğer çevre problemlerine sebep olmaktadır (Sönmez ve ark., 2008). Bununla birlikte kimyasal gübrelerdeki hızlı fiyat artışından dolayı üreticilerin organik gübrelere ilgisi daha da artmaktadır (Kara ve ark., 2013). Organik tarım, geleneksel tarım yöntemlerinden farklı olarak sentetik gübreler, pestisitler, genetik modifikasyonlar ve hormonlar gibi kimyasal girdilerin kullanılmadığı bir tarım uygulamasıdır. Bu yöntemde doğal ve organik kaynaklar kullanılarak ürünlerin yetiştirilmesi, böceklerle mücadele için zararsız yolların tercih edilmesi ve toprak verimliliğinin korunması hedeflenmektedir. Yosunlar, temel gıdanın bir bölümünü oluşturdukları Çin ve Japonya başta olmak üzere yüzyıllardır insan tarafından toplanmaktadır. Deniz yosunları; sığır yemi, insan tüketimine yönelik gıda olarak ve agar, alginik asit ve karragenan gibi fikokolloidlerin kaynağı olarak kullanılmaktadır (Chapman, 1970). Deniz yosunları sığ ve derin deniz alanlarında 180 m derinliğe kadar yetişmektedir. Deniz yosunları, normal bitkilerden tamamen farklıdır. Çünkü gerçek yaprakları, gövdeleri, kökleri ve özel organlara sahip damar sistemleri yoktur. Deniz yosunları, klorofil, karotenoidler ve fikobilinler gibi pigmentlerine göre yeşil (Chlorophyceae), kahverengi (Phaeophyceae), kırmızı (Rhodophyceae) olmak üzere üç gruba ayrılmaktadır. Granül ve toz gibi farklı formülasyonları piyasada mevcuttur. Dünyanın en önemli deniz kaynaklarından biri olup, insan gıdası, hayvan yemi ve birçok endüstrinin hammaddesi olarak kullanılmaktadır. Deniz yosunu ekstraktları, sitokininler (Durand ve ark. 2003), oksinler (Sahoo, 2000), gibberellinler (Strik ve Staden, 1997) gibi çoklu büyüme düzenleyicileri ve büyüme için gerekli çeşitli makro ve mikro besin maddelerini içerdikleri için sıvı gübre ve biyo-uyarıcı olarak pazarlanmaktadır. Yosun gübresi verimi, kaliteyi, tohum çimlenme hızını arttırmakla birlikte ve soğuğa (dona) dayanıklılığı, tuzluluk stresinin zararlarını azaltmayı, meyvenin daha uzun raf ömrüne sahip olmasını, mantar ve böcek saldırılarına karşı direnci artırmaktadır. (Erulan ve ark., 2009). Günümüzde yosun gübreleri birçok ülkede; gerek sıvı ekstrakt gerekse direk olarak toprağa karıştırılarak

uygulanmaktadır. Deniz yosunu gübresi uygulamadan birkaç saat sonra bitkiler tarafından absorbe edilebilmekte olup insan, hayvan ve çevre için güvenlidir (Sathya ve ark., 2010). Toprağa direk olarak uygulandıklarında; toprak yapısının düzeltilerek, toprak verimliliğinin uzun süre korunması amaçlanmaktadır. Deniz yosunu gübresi toprağın verimliliğini artırmanın yanı sıra nem tutma kapasitesini de arttırmaktadır (Dhargalkar ve Neelam Pereira, 2005). Uzun yıllardır denizlerde doğal olarak kıyıda bulunan bazı deniz yosunları tarlalarda gübre olarak kullanılmıştır (Güner ve Aysel, 1996). Yeni nesil doğal organik gübre olarak adlandırılan yosun gübreleri; tohum çimlenmesini, ürün verimini, topraktan inorganik besin maddelerinin alınımını ve stres koşullarına direncin artması gibi alanlarda özellikle gelişmiş ülkelerde daha fazla değerlendirilmektedir (Blunden, 1991). Deniz yosunları kuvvetli kök gelişmesini sağlayarak, bitkilerin topraktan daha fazla bitki su ve besin maddesi almalarını, bitkilerin hastalık ve zararlılara ve çevresel streslere dayanımını, bitkilerde klorofil oluşumunu hızlandırarak yeşil aksamın artmasını sağlamaktadırlar. Makro ve mikro besin elementlerinin topraktan uzun süreli ve dengeli olarak alınmasını sağlayarak kalite ile birlikte ihracat ve pazar değerini artırma ve genel verim kapasitelerini yükseltmektedirler (Blunden ve ark., 1992; Hong ve ark., 1995). Hem stresli hem de tuzlu koşullara dayanıklı olan Deniz yosunları Türkiye’de Karadeniz sahillerinde özellikle sığ ve kayalık alanlarda azot ve fosfor gibi elementlerin olduğu yerlerde yayılım göstermektedir (Pek, 2023). Son yıllarda organik gübreye artan ilgiyle beraber deniz yosunlarından elde edilen sıvı ekstrakt tarımsal amaçla çokça kullanılmaya başlanmıştır (Akyurt ve ark., 2011). Günümüzde geleneksel inorganik gübrelerin yerine doğal deniz yosunu ürünlerinin kullanılması önem kazanmıştır.

### **Deniz Yosunu Gübresi ile İlgili Yapılan Çalışmalar**

Deniz yosunu gübrelerinin kırmızı pancar (Wilczek ve Ng, 1982), marul (Moller ve Smith, 1998) ve bakla (El-Sheekh ve El-Saled, 2000) gibi çeşitli türlerde olan bitki tohumlarının çimlenmesini iyileştirdiği rapor edilmişlerdir. Ek olarak başka araştırmacılar da düşük konsantrasyonda deniz yosunu ekstraktı kullanıldığında daha yüksek çimlenme yüzdesi olduğunu bildirmişlerdir. Layek ve ark. (2018), çeltik tohumlarının daha düşük konsantrasyonlarda deniz yosunu özütlerine batırıldığında çimlenme yüzdesinin, sürgün ve kök uzunluğunun yanı sıra fide canlılık endeksinin daha yüksek olduğu sonucuna varmışlardır.

Deniz yosunlarında yüksek düzeyde organik maddenin varlığı, köklerin kullanabileceği rizosferdeki nem ve minerallerin korunmasına yardımcı olmaktadır (Sivasankari ve ark. 2006). Zodape ve ark. (2008) Deniz yosunu ekstraktlarının yaprağa uygulanması nedeniyle farklı mahsullerin veriminde önemli bir artış gösterdiğini, Rathore ve ark. (2009) ise yosun gübresinin

yapraktan uygulanması ile soya fasulyesinin verimini arttırmada umut verici olduğu sonucuna varmışlardır.

Hannan ve Salem (2011), Deniz yosunu uygulaması ile ayçiçeği tohumunun yağ içeriğini, yağ verimini, K, Na ve ham proteinini önemli ölçüde arttırdığını, *Gracilaria dendroides* ve *Ulva lactuca* yosun gübrelerinin %0,6 konsantrasyonunun uygulanmasının ayçiçeğinde sırasıyla %34,05 ve %30,55 daha yüksek yağ içeriği kaydettiği rapor etmişlerdir. Kavipriya ve ark., (2011) Hindistanın Tamil Nadu eyaletinin Mandapam sahilinden toplanan *Ulva lactuca*, *Caulerpa scalpelliformis*, *Sargassum plagiophyllum*, *Turbinaria conoides*, *Padina tetrastromatica*, *Dictyota dichotama* deniz yosunlarının Maş Fasulyesinde tohumların çimlenmesini, sürgün ve köklerin yaş ağırlığını ve kuru ağırlığını arttırdığı sonucuna varmışlardır. Bir başka çalışmada ise Thevanathan ve ark. (2005) ve Lingakumar ve ark., (2002) siyah mercimek ve börülcede aynı sonuçları elde ettiklerini bildirmişlerdir. Raverkar ve ark., (2016) Deniz yosunu (*Kappaphycus* ve *Gracilaria*) ekstraktlarının Maş Fasulyesi (*Vigna radiata*)'nin gelişme, verimi ve beslenmesi üzerindeki etkinliğini değerlendirmek için tarla koşullarında çalışma yapmışlardır. Elde edilen sonuçlara göre *Kappaphycus* uygulamasında ürün verimi kontrole göre %29.32 ile 33.81, *Gracilaria* uygulamasında ise %25.74 ile 26.15 arasında artış göstermiştir. *Kappaphycus*'un yaprağa uygulanmasının çiçeklenme sırasındaki kök nodüllerinin sayısı ve kuru ağırlığı artmıştır. Ayrıca her iki deniz yosunu ekstraktının uygulanması bitkide protein, P ve K içeriği açısından ürünlerin kalitesini de arttırmıştır. Zodape ve ark., (2009) Deniz yosunu ekstraktının yapraktan uygulanmasının buğdayın verimini önemli ölçüde arttırdığı rapor etmiştir. Jebasingh ve ark. (2015) siyah mercimekte, 3 farklı (*Laurencia pinnatifida*, *Sargassum duplicatum* ve *Caulerpa scalpelliformis*) sıvı deniz yosunu ekstraktlarını 5 dozda (%5, 10, 20, 40, 60, 80 ve 100; v/v) uygulamış ve tohum çimlenmesi ile bitki büyüme parametrelerine etkisini incelemişlerdir. Uygulama toprağa ve yaprağa sprej şeklinde yapılmıştır. Tüm büyüme parametrelerinin %10 konsantrasyonlu sıvı deniz yosunu uygulamasında en yüksek olduğu sonucuna varmışlardır. Düşük seviyede sıvı deniz yosunu uygulamasının bitkide kontrole göre çimlenme yüzdesini ve etkili fide büyümesini, kök uzunluğunu, sürgün uzunluğunu ve yaprak sayısını da arttırmıştır. Rawhey ve ark. (2008), Deniz yosunu ekstraktlarının sıvı gübre olarak kullandıkları çalışmada bakla bitkisinin büyümesi, verimi ve biyokimyasal bileşenleri üzerindeki etkisi araştırmışlardır. Deniz yosunu gübresinin sprej olarak yaprağa uygulanması ile kök parametreleri (kuru kök ağırlığı, yaş kök ağırlığı, kök uzunluğu, nodül sayısı, kökün nitrojen enzim aktivitesi), sürgün parametreleri (sürgün yaş ağırlığı, sürgün kuru ağırlığı, sürgün uzunluğu), pigment içeriği, kardeş sayısı, bakla/bitki

sayısı, tane verimi, saman verimi ve tohum indeksi artmıştır. Ayrıca tohumların bazı biyokimyasal metabolitleri de (toplam karbonhidrat, toplam protein, N, P ve K yüzdesi) artmıştır. Shah ve ark. (2013) Deniz yosunu ekstraktının buğdayın (*Triticum aestivum* L.) büyümesi ve verimi üzerindeki faydalı etkilerini rapor etmişlerdir. *K. alvarezii* ve *G. edulis* özsuyunun %7,5 ve %5,0 konsantrasyonlarında uygulanmasıyla buğday veriminin kontrole göre sırasıyla %19,74 ve %13,16 oranında önemli oranda artış gösterdi sonucuna varmışlardır.

### **Sonuç**

Günümüzde inorganik gübrelemenin çevreye, doğaya, toprağa ve yetiştirilen ürün kalitesine verilen zararları gün geçtikçe daha çok artmaktadır. Son yıllarda karşılaşılan bu sorunlara çözüm önerisi olarak alternatif yöntemlerin birisi de organik gübreleme kapsamında kullanılan yosun gübreleridir. Yosun gübreleri yapılarında içerdikleri sitokininler, oksinler, giberellinler, bitki büyüme düzenleyiciler ve makro-mikro besin maddeleri ile birlikte kültür bitkilerinin verimini, tohum çimlenme hızını, stres koşullarına karşı direncini arttırdığı için organik gübreler arasında önemli bir konuma sahiptir. Ayrıca insan gıdası, hayvan yemi ve birçok endüstrinin hammaddesi olarak kullanıldığından dolayı gelişmiş ülkeler yosun gübresinin önemini gün geçtikçe daha çok irdelemektedir. Dünyada çapında organik tarıma verilen önemin arttırılarak yosun gübreleri hakkında daha fazla araştırılma yapılması ve üreticiler ile etkileşim halinde olup bilinçlendirilmesi gerekmektedir.

**Özet**

Dormansi, tohumun yaşamsal olaylarının minimum düzeye indiği veya tamamen durduğu bir dinlenme hali olarak tanımlanmaktadır. Bu çalışmada, dormansiyi daha iyi anlayabilmek ve dormansinin nasıl kırılacağına dair genel bir bilgi edinebilmek için dormansi olayı ve kırma yöntemleri tanımlanmıştır. Bazı bitkiler üzerinde yapılan çalışmalar ve sonuçları belirtilmiştir. Yapılan araştırmalar sonucu tespit edilen dormansiye etkili hormonlar, bu çalışmada yer yer gösterilmiştir. Genel olarak bu derlemede tohumda dormansi ve dormansi kırma yöntemleri hakkında değerlendirmelere yer verilmiştir.

**Anahtar Kelimeler:** Dormansi, Tohum, Dormansi kırma

**DORMANCY IN SEEDS AND METHODS OF BREAKING DORMANCY**

**Abstract**

Dormancy is defined as a state of rest in which the vital events of the seed are reduced to a minimum or completely stopped. In this study, dormancy and breaking methods are defined in order to better understand dormancy and gain general information on how dormancy can be broken. Studies conducted on some plants and their results are stated. Hormones effective on dormancy, identified as a result of research, are shown here and there in this study. In general, this review includes evaluations about seed dormancy and dormancy breaking methods.

**Keywords:** Dormancy, Seed, Dormancy breaking

## **Giriş**

Tohumda dormansi ve dormansi kırma yöntemlerini tam anlamıyla kavrayabilmek için öncelikle çimlenme fizyolojisi ve biyolojisi konusunun bilinmesi gerekmektedir. Tohum bitkinin dölllenme sonucu oluşmuş olan embriyo ve embriyo yedek besin maddesi taşıyan generatif üreme organı olarak tanımlanmaktadır (Çiftçi 2017). Çimlenme olayı bitki embriyosunda bulunan ve kökü meydana getiren radikula dediğimiz yapının, tohum kabuğu yani testadan ilk çıkış anıdır (Finkelstein ve ark. 2008). Dormansi olayı tohum ve belli bitki bölümlerinde büyüme, gelişme ve çimlenme gibi benzeri faaliyetlerin durup, gerileyerek istirahat dönemine geçilmesi olayı olarak tanımlanmaktadır. Çimlenme olayının gerçekleşmesi için mevcut ortamda yeterli düzeylerde ısı, su ve oksijen bulunması zorunlu olup, bazı durumlarda ortamda ışığın da mevcut bulunması gerekmektedir. Bunlara ek olarak engelleyici veya zararlı kimyasal varlığının olmaması gerekmektedir. Bu koşulların tümü mevcut olsa dahi tohumun çimlenme göstermeyebileceği savunulmaktadır (İskenderoğlu, 1993). Bu hadise bitkinin büyüme organlarında gerçekleşmektedir (Kocaçalışkan, 2002). Vandelook ve ark. (2007), 30 gün süresince çimlenme göstermeyen tohumu dormant olarak nitelendirmiştir. Viémont ve Crabbé, (2000) tarafından dormansinin bir düzenleme olduğu savunulmuştur. İç ve dış koşulların optimum düzeye gelmesi ve dışarıdan bir müdahale söz konusu olması durumunda dormansi olayının son bulması, dormansi kırılması veyahut kalkması olarak nitelendirilmiştir. Gerçekleşen dormansi evresi süresince bitkinin metabolik olayları ya durmuş ya da oldukça düşük düzeyde gerçekleşmektedir (Kocaçalışkan, 2002). Dormansi olarak tanımlanan bu olay uyku hali şeklinde de nitelendirebilmektedir. Dormansi devresince bitkinin yaşamsal olayları adeta saklı halde gerçekleşmektedir (Kadıoğlu, 1998). İki tür dormansi mevcut bulunduğu yapılan çalışmalar sonucunda belirtilmektedir (Kocaçalışkan, 2003):

1. Gerçek dormansi (uyku hali)
2. Yalancı dormansi (istirahat hali)

Gerçek dormansi, genlerin baskı altında bulunup enzim sentezinin engellenme hali olarak tanımlanmaktadır. Büyümeye uygun hale getirilen dış ortam şartlarına rağmen büyüme olayı görülmemektedir. Yalancı dormansi olayında gerçek dormansinin aksine genlerin baskı altında bulunmayıp, yalnızca dış ortam şartlarından dolayı dormansi olduğu savunulmaktadır (Kocaçalışkan, 2003). Dış ortamın elverişsizliğinden dolayı enzim aktivitesi ve büyüme olayı engellenmektedir. Dormant halde bulunan tohumun, durağan olmayan aynı zamanda çimlenme olayını tetikleyen özel bir çevresel etkiye ihtiyaç duyduğu belirtilmektedir. Bu haldeki tohumlar ekstrem etkilere tabii tutulmadıkça çimlenme potansiyeli göstermemektedirler (İskenderoğlu,

1993). Dormansi birbirinden farklı birçok uygulamayla kaldırılabilir. Yaygın bir yöntem olarak soğuk uygulamasının gösterilebileceği araştırmacılar tarafından belirtilmiştir. Bunun dışında eter buharı, dikloretan, oksijenli su, sıcak su banyosu vs. uygulanabilmektedir (Akman, 1998). Bunlardan farklı olarak hormonal uygulamalar, stratifikasyon, tekrar eden değişik sıcaklık seviyeleri, mekanik parçalamalar, ışık ve gaz konsantrasyonlarının da dormansi kırma olayında nitelikli uygulamalar olduğu belirtilmektedir. Çimlenme ile fide oluşmasının sonraki evrelerinde ihtiyaç duyulan çevresel isteklerin, çimlenmenin başlaması için gerekli isteklerden farklı olduğu ve dormant halde bulunan tohumlarda bu çevresel ihtiyaçların oldukça özel oldukları belirtilmektedir (Jann, 1998). Tohumların dormansi halleri tür ve çeşitlere göre değişken olup 100 gün ya da daha çok sürebilmektedir (Onur, 1996).

### **Dormansi Kırma Yöntemleri**

Dormansiyi kırmak için mevcut bulunan birçok değişik yöntem olduğu çeşitli çalışmalarla ortaya konulmuştur. Bunlar; testanın çizilmesi, değişik kimyasalların uygulanması, soğuk uygulaması (stratifikasyon), sıcak uygulaması, dalgalı sıcaklık muamelesi, ışık muamelesi ve elektrik akım muamelesi şeklinde nitelendirilmektedir (Güncan, 2002).

Doğada testa aşınmasının birtakım yolları olduğu çeşitli araştırmacılar tarafından belirtilmiştir (Güncan, 2002);

- Toprak içerisinde kimyasal tepkimelerle
- Mekanik yollarla
- Mikrobiyal parçalanma ile
- Hayvan sindirim sisteminden kaynaklı aşınma ile
- Ekstrem sıcaklık faktörleri ile

Testada mevcut geçirimsizlik olaylarını yok etmek ve çimlendirmeyi gerçekleştirebilmek adına;

- Mumsu tabakanın alkol vb. çözeltiler yardımıyla eritilmesinin sağlanması,
- Testada konsantre asit, alkol yardımıyla ya da sıcak su kullanılarak yıkanmayla geçirgenlik kazandırılması, (Alkol ile mumsu tabakanın eritilmesi mümkün olup, sıcak su ile testa yumuşatılması sağlanmaktadır. Alkol-asit tohumun sıcaklığa verdiği tepkileri değiştirip, çimlenme inhibitörlerinin parçalanmasına veyahut yıkanmasına olanak sağlamaktadır.)
- Testa embriyonun tam olarak karşı kısmından çizilmek veya kesilmek suretiyle geçirimsizliği sağlanması,

- İç kısmı zımparayla örtülü kaplar içerisinde tohumlar döndürülmek suretiyle testanın aşındırılması (Günçan, 2002)
- Tohumların sıcak su da bekletilmesi (Pieterse, 2001), şeklinde sıralanabilmektedir.

**Değişik kimyasal uygulamalar:** Etilen, birtakım türlerde dormansi kırmada tesir edebilmektedir (Benech-Arnold, 2000). Söz konusu düzenleyicinin dormansi olayında oldukça önemli olduğu fakat ispatların tatmin edici düzeyde olmadığı belirtilmektedir. Etilenin depo halindeki yumrulara filizlenme sağlamasına karşılık yumrulara sentezlenen etilende filizlenmeye ihtiyaç ile kıyaslandığında oran oldukça alt seviyelerdedir ve bir başına etilenin patatesten tomurcuk dormansisini ayarlama tesirli olduğu savunulmaktadır (Tumbull, 1985). Dormanside devamlılığı sağlama açısından en tesirli hormonlardan birinin absisik asit olduğu belirtilmektedir. Dormant halde bulunan bitki dokularının içerisinde oldukça yüksek seviyelerde seyrettiği savunulmaktadır. Söz konusu hormonun salgısının durması halinde metabolik faaliyetler tekrar devam etmektedir. Absisik aside antagonist olarak giberellik asit hormonu bulunmaktadır. Yapılan araştırmalarda absisik asit salgılanması halinde çimlenme önlenerek dormansinin devam hali, giberellik asit uygulamasının ise çimlenmeye pozitif etki yaparak dormansiyi ortadan kaldırdığı kaydedilmiştir (Bidwell, 1979).

**Soğuk uygulaması (stratifikasyon):** Dormansiyi belirli olarak düzenleyen mühim dış etkenler olduğu ve bunların oksijen, sıcaklık, ışık ve rutubet etkenleri olduğu belirtilmektedir. Bu etkenlerin tümünün ayrı ayrı dormansi olayını oluşturan faktörlerle direkt olarak ilgi içinde olduğu belirtilmektedir. Soğuk muamelesi ardından tohumları kurutma olayı yapılırsa tohumun dormansiye döndüğü çeşitli araştırmacılar tarafından belirtilmiştir. Kurutulmadan direkt halde ekimi ise çimlenmeyi %80 oranından daha fazla artırmaktadır. Bu uygulama yönteminde kurutma olayına dikkat edilmelidir (Shen, 2001).

**Sıcak uygulaması:** Yüksek sıcaklık düzeyi bilindiği üzere kimi tohumlarda çimlenmeye hız verip artırmaktadır. Fakat bu dormansi kaldırma işlevi için, bilgilerin yeterli olmadığı belirtilmektedir. Yüksek sıcaklıkta bekletilen tohumlarda bir takım yapısal olaylar neticesi olarak kabuk geçirgenliği yükselmektedir (Günçan, 2002). Çimlenmeye engel oluşturan nedenler ortadan kalkmaktadır. Tohumun tabii tutulduğu sıcaklığın şiddeti ve tabii tutulma aralığının da çimlenmede tesirli olduğu savunulmaktadır. Çimlenmede sıcaklık tesiri kadar süresinin de önem teşkil ettiği belirtilmektedir (Susko, 2001).

**Dalgali sıcaklık muamelesi:** Çoğu yabancı otta çimlenmenin gün bazlı ya da mevsimsel sıcaklık değişimlerinde pozitif yönde etkilendiği belirtilmektedir. Kimi çeşitlerde dormansi

sonlanması tohumların ancak dalgalı sıcaklık muamelesine tabii tutulmasıyla sağlanmaktadır (Benech, 2000).

**Işık muamelesi:** Çoğu çeşitte bulunan dormansi üzerinde ışık önemli miktarda uyarıcı olmaktadır (Benech, 2000). Bunun yanı sıra kimi yabancı otların türüne bağlı olarak inhibitör etki oluşturabilmektedir. Çünkü daha çok kırmızı ışınlar olmak üzere ışık faktörü türe bağlı olarak yabancı otlarda çimlenme engelleyicilerini parçalayıp, çimlenmeyi artırabilmektedir. Işık etkisiyle çimlenme gösteren kimi yabancı ot tohumunda testa tohum içerisine ışık girişini engellemekte, dolayısıyla çimlenmeye imkan vermemektedir. Ancak testa saf dışı bırakılarak tohum içerisine ışık girmesi mümkün kılınıp çimlenme oluşturulmaktadır. Bu şekilde ışık faktörünün çimlenmedeki olumlu veya olumsuz etkileri hem dalga boyu hem de ışığa maruz kalınan süre akabinde değişkenlik göstermektedir (Günca, 2002).

**Elektrik akım muamelesi:** Kendince diğer yöntemlerden ayrı olan bu uygulama da dormansi sonlanması için uygulanan bir metot olarak belirtilmektedir. Örnek olarak patates bitkisinin yumrularındaki dormansi olayının bu muamele ile son bulduğu kaydedilmiştir. Yumrulardaki dormansi olayının giderilmesi hasat sonrası hastalık tayininin yapılması, sera-tarla alanlarından erkenci patates eldesi için elzem olduğu savunulmaktadır. Sebep olarak yumru yoluyla üretimin öne sürülebileceği belirtilmiştir. Yapılan araştırmalarda bu metodun öteki metotlardan çok bariz bir değişkenlik ortaya koymadığı diğer metotlara nazaran insan-çevre sağlığı açısından bir zarar göstermediği, pazarda hafif bir metot olması itibarıyla başvurulabileceği sonucu ortaya konulmuştur (Kocaçalışkan, 1989).

### **Yürütülen Bazı Çalışmalar**

Liu ve ark. (2005), çalışmasında *Garciniacowa* Roxb. 'te dormansi kaldırılması ve germplasm muhafazasının mümkün olması için gerekli depolama şartları çalışmıştır. Dormansi sonlanması için yapılacak en etkili metot olarak testanın tamamıyla uzaklaştırılıp kimyasal testayı yok etmesi saptanmıştır. Çetinbaş ve Koyuncu (2005), kuş kirazı (*Prunus avium* L.)'nda dormansi kırması sonrasında soğuk etkisiyle katlama ve testanın tesirlerini çalışmışlardır. 3 farklı zamanda katlama işlemi gören tohumlar kabukla ve kabuksuz şekilde çimlendirmeye alınmıştır. Her iki şekilde çimlenen tohumlarda katlama zamanları ve çimlenme oranında orantılı bir münasebet saptanmıştır. Kabuk bulunmayan tohumların çimlenmeleri kabuk bulunan tohuma göre hem daha hızlı hem de daha önce başladığı gözlenmiştir.

Tsuyuzaki (2006), *Rumex obtusifolius* L., *Polygonum longisetum* Brujin ve *Oenothera biennis* Walter bitkilerinde tohumların farklı derinliklerine ekimine bağlı olarak yaşanacak değişimleri çalışmışlardır. Değişik sıcaklık seviyelerinde çimlenme deneylerinin yapılmasıyla mevsime

baęlı deęişikliklerin imlenmedeki tesirleri alıřılmıştır. Walck ve ark. (2008), *Cyclosporum (Apium) leptophyllum* (Pers.) Sprague'de tohum dormansi kırma uygulaması ile imlenme üzerine arařtırma yapmışlardır. Taze tohumlar geniř olmayan sıcaklık düzeylerinde yüksekçe seviyelerde imlenme gerekleřtirmişlerdir. Gerekleşen olay řartlara endeksli fizyolojik dormansi halini açıka ispatlamaktadır.

Nyachiro ve ark. (2002), 10 eřit yaz buędayı üzerinde imlenmeye dair eřitlilik ile tohumda meydana gelen dormansiyi açıklama adına alıřma yürütmek için deęişik sıcaklıklar altında imlenme denemeleri yürütmüşlerdir. Tohumda görölmekte olan dormansinin bitkide genetik ve imlenme sıcaklığına endeksli bulunduęunu tespit etmişlerdir. Masaka ve Yamada (2009), *Robinia pseudoacacia* L. (Leguminosae) türünde bir başına aęaç düzeyinde karakter yönünden imlenme deęişiklięini arařtırmışlardır. Tohum üzerinde testayı kaldırma, soęukta katlama, günlük termal rejim, ısı, etin kış mevsimi kořullarında arındırma tipi yöntemler uygulamışlardır. Netice olarak 3 ayrı aęaç türünün tohumlarıyla alıřmış olan arařtırmacılar tüm bireylerde ayrı ayrı dormansi düzeyleri saptamışlardır.

### **Sonuç**

Daha önce yapılan alıřmalar ışığında dormansi kırma yöntemleri olarak; testanın izilmesi, deęişik kimyasalların uygulanması, soęuk uygulaması (stratifikasyon), sıcak uygulaması, dalgalı sıcaklık muamelesi, ışık muamelesi ve elektrik akım muamelesi gibi yöntemler tanımlanmaktadır. Dormant tohumlar üzerinde bu yöntemlerden biri veya birkaçının kombinasyon halinde uygulanması ile dormansi olayının kırılabilereęi yapılan pek ok alıřma ile ispatlanmıştır.

**Özet**

Küresel ısınmayla birlikte yağış rejiminde meydana gelen değişiklikler dayanıklı çeşit geliştirme çalışmalarını zorunlu kılmaktadır. Tarımsal üretimde verimliliğin düşmesine, ürün çeşitliliğin sınırlandırılmasına neden olan ve gelecekte gıda güvenliğinin sağlanmasını tehlikeye sokacak kuraklık stresi, abiyotik streslerin en yıkıcı olanıdır. Bu nedenlerle araştırmacılar çalışmalarında bitkilerin kuraklık stresinin üstesinden gelmek için geliştirdikleri stratejiler üzerine odaklanmıştır. Bu süreçte geleneksel ıslah yöntemlerinin uzun zaman alması, yoğun iş gücü ve büyük alanlara ihtiyaç duyulması nedeniyle ıslah sürecini hızlandıran moleküler yaklaşımlar umut vadeci olmuştur. Ayrıca son yıllarda biyoteknoloji alanında yeni nesil teknolojilerin kullanılmaya başlanması araştırmacıları genom boyutunda çalışmaya yöneltmiştir. Kuraklık stresi koşullarında bitkilerdeki dayanıklılığı arttırmak için tolerans mekanizmasında görev yapan genleri ve bu genlerin işlevlerinin tanımlanması kritiktir. Kuraklığa dayanıklı çeşit ıslahında önemli olan ve geniş bir transkripsiyon faktörleri (TF'ler) ailesine sahip olan WRKY genleri, bitkilerin fizyolojik süreçlerinde ve çevreye uyumunda hayati rollere sahiptir. WRKY proteini, çeşitli streslere (örneğin soğuk, sıcak, tuz, kuraklık, iyonlar, patojenler ve böcekler) karşı hücrelerde yanıt olarak üretilmektedir. Birçok WRKY geni, farklı biyotik ve abiyotik streslere karşı bitki tepkilerinde pozitif veya negatif düzenleyici rol oynamadığı tespit edilmiştir. İlk olarak tatlı patatesten klonlanan WRKY geninin, bitki türlerine göre gen aile üye sayıları değişim göstermektedir. WRKY proteinleri korunmuş WRKY bölgelerine ve çinko-parmak yapısına göre üç gruba ayrıldığı belirlenmiştir. Çoğu bitki türlerinde henüz WRKY genleri tanımlanmamıştır. Kuraklık stresine karşı dayanıklı çeşitlerin elde edilmesi için WRKY genlerinin dayanıklılık ıslahına entegre edilmesi ıslah başarısını arttıracaktır.

**Anahtar Kelimeler:** Genom çapında ilişkilendirme, WRKY gen ailesi, Kuraklık stresi, Gen İfadesi

**THE ROLE OF WRKY TRANSCRIPTION FACTORS IN DROUGHT STRESS  
TOLERANCE OF PLANTS**

**Abstract**

Changes in the precipitation regime with global warming necessitate the development of resistant varieties. Drought stress is the most destructive of abiotic stresses, causing a decrease in productivity in agricultural production, limiting product diversity and endangering food security in the future. For these reasons, researchers focused their studies on the strategies developed by plants to overcome drought stress. In this process, molecular approaches that accelerate the breeding process have been promising because traditional breeding methods take a long time, require intensive labor and large areas. In addition, the use of new generation technologies in the field of biotechnology in recent years has led researchers to work on the genome dimension. In order to increase the resilience of plants under drought stress conditions, it is critical to identify the genes that function in the tolerance mechanism and the functions of these genes. WRKY genes, which are important in breeding drought-resistant varieties and have a large family of transcription factors (TFs), have vital roles in the physiological processes and adaptation of plants to the environment. WRKY protein is produced in cells in response to various stresses (e.g. cold, heat, salt, drought, ions, pathogens and insects). Many WRKY genes have been found to play no positive or negative regulatory role in plant responses to different biotic and abiotic stresses. The number of gene family members of the WRKY gene, which was first cloned from sweet potato, varies depending on plant species. It has been determined that WRKY proteins are divided into three groups according to their conserved WRKY regions and zinc-finger structure. WRKY genes have not yet been identified in most plant species. Integrating WRKY genes into resistance breeding to obtain varieties resistant to drought stress will increase breeding success.

**Keywords:** Genom-wide identification, Wrky gen family, Drought stress, Gene Expression

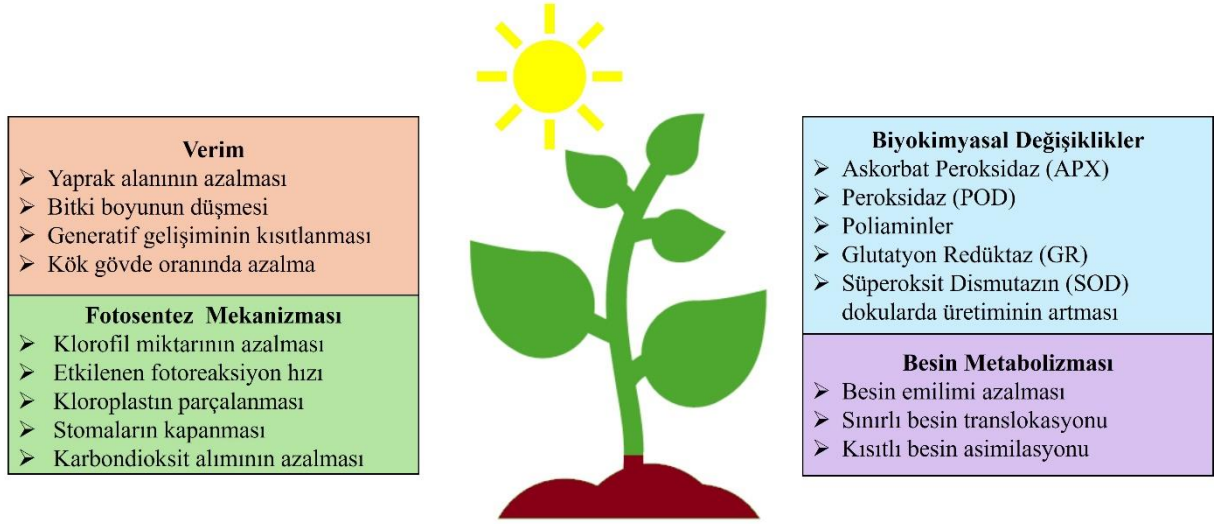

## **Giriş**

Dünya çapında iklim koşullarındaki aşırı ve hızlı değişiklikler nedeniyle ortaya çıkan kuraklık, bitkilerin büyüme ve gelişme dönemlerinde karşılaştıkları abiyotik streslerden en yıkıcı olanıdır. Tarımsal üretimi ve ürün verimliliğini sınırlandıran bu çevresel stres faktörü gıda güvenliğini dünya çapında tehdit etmektedir (Iqbal ve ark., 2020). Özellikle kuraklık stresinin bitkinin hassas gelişme dönemlerine denk gelmesi, sıklığı, şiddeti ve süresi zararın boyutunu arttırmaktadır (Farooq ve ark., 2009). Kuraklık stresinin 2050 yılına kadar ekilebilir arazilerin %50'sinden fazlasında ciddi bitki büyüme sorunlarına neden olacağı tahmin edilmektedir (Gu ve ark., 2024). Kuraklık stresine maruz kalan bitkilerin %48'lik verim düşüşü yaşadığı ve bu kaybın diğer tüm abiyotik streslerin toplamından fazla olduğu tespit edilmiştir (Cohen ve ark., 2021). Üründe verim kayıpları bitkinin kuraklığa karşı verdiği tepkiye göre değişmektedir. Bitkilerin kuraklığa duyarlılığı karmaşık bir olgudur ve bitkinin büyüme aşaması, genetik potansiyeli, stresin süresi ve şiddeti gibi çok sayıda faktöre bağlıdır (Zu, 2002). Kuraklık, karbon asimilasyon hızı, turgorun azalması, oksidatif hasarın artması ve yaprak gazı değişimindeki değişiklikler gibi çeşitli bitki aktivitelerini bozarak bitkiler üzerinde birçok yıkıcı etkiye sahiptir ve bitkide verimin azalmasına neden olmaktadır (Nadeem ve ark., 2019). Bitkide meydana gelen morfolojik, fizyolojik ve biyokimyasal bu değişikliklerin ve kuraklık stresine karşı bitki reaksiyonlarının bilinmesi kuraklık stresine karşı dayanıklılığını arttırmak için önemlidir.

## **Kuraklık Stresinin Mahsul Büyümesi Üzerindeki Olumsuz Etkileri**

Yaşamın en önemli bileşeni olan su, yokluğunda dünya çapında tarımsal ürün üretimini olumsuz yönde etkileyen başlıca abiyotik stres faktörlerinden biridir (Waraich ve ark., 2011). Su stresi koşulları altında, bitkilerde yaprak alanı azalmakta, büyüme ve gelişme sınırlanmakta, kök oranı artarken gövde oranı azalmakta ve yaşlanma hızlanmaktadır (Gu ve ark., 2024). Uzun süreli kuraklık, besin alımı ve asimilasyonu, fotosentez, protein sentezi ve reaktif oksijen türlerinin (ROS) birikimi dahil olmak üzere çok sayıda bitki hücrel fonksiyonunu olumsuz yönde etkilemektedir (Şekil 1). Kuraklık stresi, süperoksit anyonları ( $O_2^-$ ), hidrojen peroksit ( $H_2O_2$ ) ve hidroksil radikalleri (OH) dahil olmak üzere aşırı reaktif oksijen türlerinin (ROS) oluşumunu arttırmaktadır. Aşırı miktarda ROS birikimi ise DNA veya RNA hasarına, enzim inaktivasyonuna, iyonik dengesizliklere ve protein denatürasyonuna neden olmaktadır (Hussain ve ark., 2018; Kang ve ark., 2022). Bitkiler genellikle kuraklık stresinin üstesinden gelmek için üç strateji benimser (Gupta ve ark., 2020; Fang ve Xiong, 2015);

1. Kaçış stratejisi (Vejetatif dönemden generatif döneme geçişi hızlandırmak veya yavaşlatmak)
2. Kök Sistemini Düzenleme Stratejisi (Kök uzamasının artması, absisik asit üretimi yaprakтан K<sup>+</sup> iyonlarının akışının artması, yaprak stomalarını daraltarak fotosentez aktivitesini düşmesiyle fotosentezin değiştirilmesi yoluyla stresin zararlı etkilerinden kaçınma)
3. Ozmotik ayarlamayı, Antioksidan savunma sistemlerinin aktivasyonunu ve fitohormonlara ve klorofil içeriğine verilen yanıtları içeren tolerans stratejisidir.

**Şekil 1.** Kuraklık stresinin bitki gelişimine etkileri

Günümüzde araştırmacılar bitkilerin kuraklık toleransını anlamak ve kuraklığa dayanıklılığı arttırmak için su eksikliği koşullarına yanıt olarak belirli genleri ve işlevlerini tanımlamaya odaklanmaktadır. Kuraklığa dayanıklı bitkilerdeki moleküler mekanizmaların bazıları;

- ❖ Transkripsiyonel aktivasyon ve düzenlemenin takip ettiği bir sinyal iletim sistemi,
- ❖ Geç embriyogenezde bol miktarda bulunan dehidrinler veya ısı şoku proteinleri, şaperonlar gibi birçok proteinin yardımıyla proteinlerin korunması,
- ❖ Mannitol, betain, prolin, trehaloz, miyo-inositol ve glisin dahil olmak üzere ozmolitlerin hücre içerisinde birikmesi,
- ❖ Glutasyon ve askorbik asit gibi kimyasal antioksidanların indüksiyonu,
- ❖ Süperoksit dismutaz ve glutasyon S-transferaz yoluyla reaktif oksijen türleri (ROS) toksisitesinin azaltılması sayılabilir (Sahabi et al. 2018).

Yapılan arařtırmalar incelendiğinde *Dactylis glomerata* L. bitkisinde ARF, DREB, WRKY, NAC, TCP, MYB, GRAS gen aileleri, absisik asit, dehidrin genlerinin (Ji et al. 2018), *Glycine max* L.'da ge embriyogenez bol proteinlerinin (Kim et al. 2020), *Gossypium hirsutum*'da kuraklık stresine karřı toleransta TLP5, NSP2, DRE1D, NAC29 genleri tekrarlayan kuraklık kořulları altında yksek transkript seviyelerinin tespit edildiđi (Bano et al. 2022), *Medicago sativa*'da ise ROS temizleyici gen ailelerinin kuraklıđa tepki olarak korunmuř dokuya zg gen ekspresyonu modelleri oluřturduđu bildirilmiřtir (Kang and Udvardi, 2012). alıřmalar genlerin, transkripsiyon sonrası gen dzenlemesi, abiyotik streslere karřı tolerans ve reaktif oksijen trlerinin temizlenmesi yoluyla kuraklık toleransına nasıl katkıda bulunduđuna dair kapsamlı bir genel bakıř sunmaktadır (řimřek et al. 2024).

### **WRKY Transkripsiyon Faktrleri**

Bitkilerdeki en byk ailelerden biri olan WRKY transkripsiyon faktrleri ailesi, bitki geliřimi ve stres srelerinde nemli rol oynamaktadır (Nan et al. 2020). Bu gen ailesi temel olarak spesifik olarak ve evresel faktrlere, biyolojik strese (bakteri, mantar, virs ve diđer patojenler gibi) veya abiyotik strese (ekzojen hormonlar, yksek sıcaklık, dřk sıcaklık, yksek sıcaklık, tuz, mekanik yaralanma gibi) karřı hedef genlerin ekspresyonunu dzenlemektedir (Wu et al. 2024). rneđin; Arabidopsis'in tohum kabuđu ve trichome geliřiminde (Johnson ve ark. 2002), eltikte (*Oryza sativa*) alron hcrelerindeki gibberellin sinyal yolu gibi eřitli fizyolojik srelerde (Zhang ve ark. 2004) ve Arabidopsis'te yaprak yařlanmasında grev almaktadır. (Miao ve ark. 2004). Ayrıca, ROS (reaktif oksijen trleri) ve hormon sinyal yolları gibi eřitli biyolojik yollara katılarak, bitki enzim sistemlerini, stoma kapanmasını ve yaprak bzlmesinin fizyolojik tepkilerini daha da dzenleyerek bitkinin eřitli ortamlara adaptasyonuna aracılık etmektedir (Wu et al. 2024). İlk WRKY geni tatlı patatesten klonlanmıř ve daha sonra yabani yulaf (*Avena fatua* L.), maydanoz (*Petroselinum crispum* L.) ve Arabidopsis thaliana gibi diđer trlerden srekli olarak klonlanma yapılmıřtır (Javed and Gao, 2023; Goyal et al. 2023; Khoso et al. 2022). Bitkilerdeki WRKY genlerinin sayısı trler arasında deđiřim gstermektedir. rneđin; *Gossypium hirsutum* bitkisinde 238 gen, *Cirus trifoliata* bitkisinde 55 gen, *Zea mays*'da 137 gen, *Oryza sativa* L. ssp indica ve L. ssp. japonica bitkisinde sırasıyla 102 ve 98, soyada (*Glycine max*) 296 ve fasulyede (*Phaseolus vulgaris* L.) ise 88 adet WRKY geni tanımlanmıřtır (Wu et al. 2024; Ross et al. 2007; Wu et al. 2017). WRKY proteinleri  gruba ayrılabilir. Grup I iki WRKY alanı ve iki inko parmak motifi, grup II bir WRKY alanına ve bir inko parmak motifine ve beř alt gruba ayrılır, grup III ise bir WRKY'ye sahiptir bir inko parmak motifi ieren alanı bulunmaktadır (Wu et al. 2017). WRKY transkripsiyon

faktörü kuraklık stresinde önemli bir rol oynamakta ancak çoğu bitkide WRKY gen ailesinin özellikleri bilinmemektedir. Birçok çalışma WRKY genlerinin kuraklığa yanıt verdiğini göstermiştir. Örneğin, Arabidopsis'te AtWRKY25, AtWRKY33, AtWRKY46, AtWRKY57 ve AtWRKY63 kuraklık stresine verilen yanıtlarda anahtar rol oynamaktadır (Fu et al. 2010; Qiao et al. 2016; Wu et al. 2017).

### **Sonuç**

Küresel iklim değişikliği ve su kıtlığı gibi sorunlar, tarımsal üretimde sürdürülebilirliğin önüne geçmektedir. Artan dünya nüfusuna karşı gıda arzını sağlamak için kuraklığa karşı dayanıklı çeşit sayısının artırılması hayati önem taşımaktadır. Kuraklığa dayanıklı çeşitlerin geliştirilmesi ve ülke çapında dağıtılması uzun bir süreçtir. Bu sürecin kısalması için geleneksel ıslah metotlarının yanında, genetik ve moleküler tekniklerin (modern ıslah yöntemlerinin) multidisipliner yaklaşımla birleştirilmesi gerekmektedir. Genom düzenleme araçlarının dayanıklılık ıslahına entegre edilmesi tarımsal dayanıklılığın artırılması açısından kritik öneme sahiptir.

**Özet**

Ribozomu inaktive eden proteinler (RIP'ler), ökaryotik ve prokaryotik rRNA'ları depürine ederek protein translasyonu esnasında protein sentezini geri dönüşümsüz olarak durduran toksik N-glikosidazlardır. Araştırmalar RIP'lerin çoğunlukla bitkilerde fazlaca olmasının yanında farklı organizmalarda bulunduğunu göstermiştir. Ricin, abrin gibi RIP'lerin yüksek toksiteye sahip olmaları RIP'lerin tıp alanında kullanımı ile ilgili çalışmaların sayısında artış sağlamış olsada, tarım alanındaki potansiyel uygulamaları son yıllarda araştırmacıların ilgisini çekmiştir. Bu çalışma derleme niteliğinde olup RIP'lerin fitopatojenlere karşı anti-viral, anti-fungal, anti-bakteriyel ve böcek öldürücü aktiviteleri ele alınarak RIP'lerin tarımda potansiyel kullanımını değerlendirilmiştir.

**Anahtar kelimeler:** Ribozom inaktive eden protein, Fitopatojen, Bitki savunması

**USE OF RIBOSOME-INACTIVATING PROTEINS (RIPs) IN AGRICULTURE**

**Abstract**

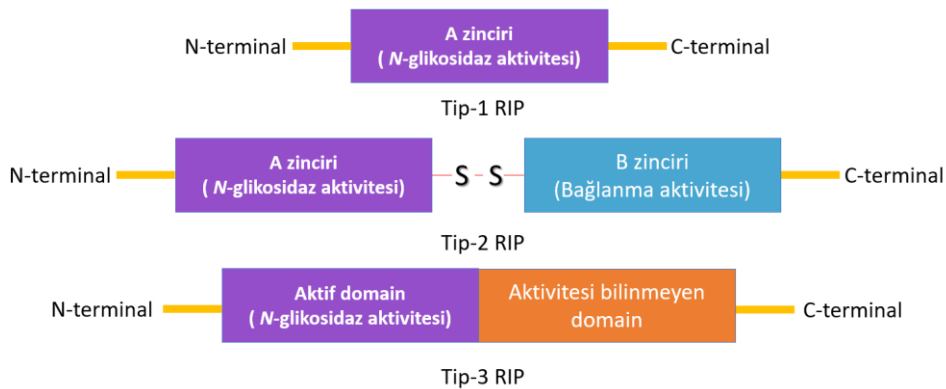

Ribosome-inactivating proteins (RIPs) are extremely dangerous proteins that permanently stop protein synthesis by removing purine bases from eukaryotic and prokaryotic ribosomal RNAs (rRNAs) during translation. Studies have shown that ribosome-inactivating proteins (RIPs) are plentiful in plants and are also present in many species. The increased number of studies on the usage of highly toxic ribosome-inactivating proteins (RIPs) like ricin and abrin in medicine has caused interest among researchers in their possible uses in agriculture. This paper is an overview that evaluates the prospective application of RIPs in agriculture by examining their anti-viral, anti-fungal, anti-bacterial, and insecticidal actions against phytopathogens.

**Keywords:** Ribosome inactivating protein, Phytopathogen, Plant defense

## Giriş

Ribozomu inaktive eden proteinler (RIP'ler), ribozomları etkisiz hale getiren ve protein sentezinin geri döndürülemez inhibisyonuna yol açan bir protein grubudur (Bolognesi ve diğerleri, 2016). Bu proteinlerin ribozom üzerindeki etkisi büyük ribozomal alt biriminin sarcin/ricin loop bölgesinde çoğunlukla korunmuş olan özel adenin kalıntılarının geri dönüşümsüz bir şekilde depürasyonunu katalizleyerek ribozomu etkisiz hale getirmesidir. Dolayısıyla RIP'ler N-glikosidazlar olarak işlev görürler. Bu N-glikozidaz aktivitesi *E. coli* 23S rRNA'sında A2660 ve ökaryotik 28S rRNA'da A4324 üzerinden gerçekleşmektedir. Ribozomun bu şekilde inaktivasyonu uzama faktörü 2 (eF-2)'nin bağlanmasını engelleyerek protein sentezi inhibe olur ve sonuç olarak hücre ölümü gerçekleşir (Endo ve diğerleri, 1987). Ribozom inaktive eden proteinler yapılarına göre 3 farklı sınıfa ayrılmıştır (Şekil 1). RIP'ler, yapılarına göre, enzimatik aktiviteye sahip bir polipeptit zincirinden oluşan tip 1 RIP'ler ve iki polipeptit zincirinden, enzimatik aktiviteye sahip bir A zinciri ve bağlanabilen lektin aktivitesine sahip bir B zincirinden oluşan tip 2 RIP'ler olarak sınıflandırılmıştır (Stripe 2013). Ayrıca, proteoliz ile aktive edilen jasmonatla indüklenen protein 60 (JIP60) ve mısır b-32 proteini gibi birkaç üyeyi içeren, tip 3 RIP'ler olarak adlandırılan üçüncü bir RIP sınıfı da tanımlanmıştır (Peumans ve diğerleri, 2001). Risin ve abrin gibi bazı tip 2 RIP'ler son derece toksik iken, diğer RIP sınıfı üyeleri ise düşük toksisiteye sahiptir (Stripe ve Battelli, 2006). Tip 1 RIP'lerin toksisitesi daha düşüktür, çünkü bunlar lektin kısmından yoksun olup, tip 2 RIP'lerin yaptığı gibi hücrelere bağlanamazlar.

Şekil 1. Ribozom inaktive eden proteinlerin yapısı (Demirel et al., 2022)

RIP genleri bakterilerde, mantarlarda ve hatta bazı böceklerde bulunsa da bu genlerin bitkilerde daha yaygın olduğu görülmektedir (Peumans ve Van Damme, 2010). RIP'ler ayrıca 17 farklı

bitki familyasında da bulunmaktadır (Girbes ve diğerleri, 2004, Stripe, 2004). RIP'lerin çoğu *Cucurbitaceae*, *Poaceae*, *Caryophyllaceae*, *Euphorbiaceae*, *Sambucaceae* ve *Phytolaccaceae* gibi familyalarda daha yaygındır (Girbes ve diğerleri, 2004; Domashevskiy ve Goss, 2015; Shang ve diğerleri, 2016). Bazı araştırmacılar, RIP'lerin *Hypsizigus marmoreus*, *Lyophyllum shimeji* ve *Volvariella volvacea* gibi mantar türlerinde de yaygın olarak bulunduğunu ortaya çıkarmıştır (Yao ve diğerleri, 1998; Lam ve Ng, 2001a; Lam ve Ng, 2001b). Liu ve diğerleri, (2002), *Laminaria japonica* A alglerinde RIP proteinlerinin varlığını ortaya koyarken, Lapadula ve Ayub (2017) ve Lapadula ve diğerleri, (2013), iki sivrisineğin genomunda farklı RIP genlerinin mevcut olduğunu göstermiştir. Ayrıca RIP'ler bitkilerde yaprak, çiçek, meyve, tohum kök, rizom, ağaç kabuğu ve lateks gibi farklı bitki kısımlarında bulunmaktadır (Schrot ve diğerleri, 2015; Kumar ve diğerleri, 2022)RIP'ler uzun yıllardan tıp başta olmak üzere farklı alanlarda pratik uygulamalar bulmuştur. RIP'lerin, özellikle PAP ve TC'ye ilişkin hayvan virüslerine karşı anti-viral aktivite, HIV ile enfekte hücrelerde etkisi ve bunların AIDS tedavisinde bir adjuvan olarak olası kullanımları umuduyla çok sayıda çalışma gerçekleştirilmiştir (McGrath ve diğerleri, 1989). RIP'lerin tümör hücrelerinde normal hücrelere göre daha toksik olmalarının bulunmasından sonra bunların immünotoksin potansiyeli, anti-viral ve anti-tümör özelliklerini değerlendiren çalışmalar mevcuttur (Sha ve diğerleri, 2013; Gilabert-Oriol ve diğerleri, 2014; Ajji ve diğerleri, 2016). RIP'lerin çoğu bitkilerde yapısal olarak sentezlenir ancak patojenlerin ve zararlıların saldırısı üzerine salınacak ve daha sonra aktif hale gelecek şekilde tecrit edilmiş bir formda tutulur (De Zaeytjij ve ark. 2019). RIP'ler, patojenin konakçı hücreye zarar vermesi üzerine salınması bilgisi araştırmacıları bitkilerde savunma sisteminde RIP'lerin rolünü araştırmaya sevk etmiştir. RIP'ların biyolojik rolleri tam olarak bilinmese de ve her geçen gün çalışmalar RIP'ların farklı rolleri olduğunu göstermektedir. Birçok çalışma RIP'ların anti-viral özelliklerine odaklansa da, tarımda RIP'ların anti-bakteriyel, anti-fungal ve insektisit aktivitelerinden yararlanmaya yönelik birçok girişim bulunmaktadır (Vargas ve Carlini, 2014). Bu çalışmada RIP'lerin tarımda kullanımları ile ilgili yönleri literatür taraması ile ele alınarak son yıllardaki gelişmeler araştırılarak elde edilen bilgiler derleme olarak sunulmuştur.

### **Ribozom İnaktive Eden Proteinler ile Yapılan Çalışmalar**

Pokeweed ekstraktlarının ilk kez bitkilerde viral enfeksiyonlara karşı inhibitör aktiviteye sahip olduğu gösterildiğinde RIP'ların bitki savunmasında yer aldığı düşünülmüştür. Bundan sonra RIP'ların anti-mikrobiyal aktivitesinden yararlanmak için çeşitli çalışmalar gerçekleştirilmiş ve anti-mikrobiyal ajanlar olarak etki gösterebildiği ortaya konmuştur (Girbes ve diğerleri, 2004).

İlk kez *Mirabilis expansa* köklerinden izole edilen ME1 ve ME2 isimli RIP'lerin bakterilere karşı anti-bakteriyel aktivite sergilediğini gösterilmiş ve o günden sonra bitkilerde patojen olan çeşitli bakteri türlerine karşı farklı RIP'lerin anti-bakteriyel etkileri ortaya konmuştur (Tablo 1).

Bazı peptit ve proteinler bitkilerin fungus istilasına ve hastalıklarla savaşmak için savunma mekanizmalarında kullandıkları anti-fungal özellikli önemli silahlardandır (Becker-Ritt ve Carlini, 2012). RIP'lerin funguslar da spor oluşumunu, hif oluşumunu azalttığı ve fungus büyümesini inhibe ettiğini gösteren birçok çalışma mevcuttur (Tablo 2).

Tip-1 RIP pokeweed antiviral proteininin (PAP) tobacco mosaic virüs enfeksiyonunu engellediğinin bilinmesinden beri, RIP'ler birçok hayvan, bitki ve insan virüsüne karşı güçlü anti-viral ajanlar olarak dikkat çekmişlerdir. Araştırmaların çoğunluğu insan ve hayvan virüslerine karşı RIP'lerin anti-viral aktivitesini değerlendirirse de, ancak son zamanlarda tarımda dünya genelinde önemli kayıplara neden olan bitki virüslerine karşı anti-viral ajan olma potansiyellerini değerlendiren birçok çalışma mevcuttur ve bu çalışmaların sayısı giderek artmaktadır (Tablo 3).

Birçok çalışma, RIP'lerin Lepidoptera, Coleoptera ve Diptera gibi farklı böcekler üzerinde insektisidal aktiviteye sahip olduğunu ileri sürmektedir. Yapay diyet deneyleri çoğunlukla RIP'lerin böcek öldürücü aktivitesini incelemek için kullanılmıştır. Örneğin, *Sambucus nigra*'dan elde edilen tip II RIP'nin farklı konsantrasyonlarıyla desteklenen yapay bir diyet, *Acyrtosiphon pisum*'un doğurganlığını ve hayatta kalma oranını azaltmıştır. (Shahidi-Noghabi ve diğerleri, 2008). Tablo 4 RIP'lerin bitkilerde zararlı böcek türlerine karşı insektisidal etkisini ortaya koyan çalışmaları özetlemektedir.

### **Sonuç**

Günümüze kadar gerçekleştirilen çalışmalar RIP'lerin patojenlere karşı savunmada önemli rolü olduğunu ve çeşitli RIP'lerin anti-bakteriyel, anti-fungal, anti-viral ve böcek öldürücü aktivite dâhil olmak üzere benzersiz biyoaktif özellikler gösterdiğini ortaya koymuştur. Gelişen teknoloji ve özellikle CRISPR-Cas teknolojisi gibi biyoteknolojik yöntemler, RIP'lerin patojenlere karşı spesifik kullanımına yol açabileceği gibi endojen RIP aktivitesi olmayan bitkilerde RIP geninin ekspresyonuyla patojenlere ve zararlılara karşı koruma sağlamanın ve kimyasal pestisit uygulama ihtiyacını en aza indirmek adına ümit vadetmektedir.

**Özet**

Kloroplastlar yeryüzündeki yaşamın sürdürülmesinde çok önemli bir rol oynamaktadır. Çeşitli kara bitkilerinden 800'den fazla dizilenmiş kloroplast genomunun mevcudiyeti, kloroplast biyolojisi, hücre içi gen aktarımı, koruma, çeşitlilik ve kloroplast transgenlerinin bitki agronomik özelliklerini geliştirmek veya yüksek değerli tarımsal veya biyomedikal ürünler üretmek için tasarlanabileceği genetik temel hakkındaki anlayışımızı geliştirmiştir. Kloroplast genomu bitki ıslahında gen ekleme bölgesinin kontrolü, yüksek transgen ifadesi ve protein birikimi oranları, plastid genlerinin maternal olarak kalıtılması nedeniyle transgenin polen yoluyla aktarılmaması ve epigenetik etkilerin olmaması gibi avantajlar sağlar. Herbisit ve patojen direnci, kuraklığa karşı direnç, tuz toleransı ve fitoremediasyon potansiyeli gibi tarımsal özelliklerin iyileştirilmesi umut verici uygulamalardır. Kloroplast genomu uygulamaları mısır, domates, pamuk, patates, pirinç, tütün ve şeker pancarı gibi ürünlerde de başarılı bir şekilde gerçekleştirilmektedir. Moleküler ilaçlama, kloroplast mühendisliğinin yüksek potansiyele sahip bir başka alanıdır; aşı antijenleri, farmasötik proteinler (insan somatotropini, insan serum albümini, insan interferonu, monoklonal antikorlar) ve endüstriyel proteinler (avidin, beta kazein, sıvı kristal polimerler, ksilanaz, antranilat sentaz) gibi çok çeşitli ürünlerin üretimi, bakteri yetiştiriciliği veya hayvan hücre kültürlerine kıyasla ekonomik açıdan faydalıdır. Bu bildiride, kloroplast genom dizilerinin ekonomik açıdan önemli kültür türlerinin kökenlerinin ve domestikasyonu sırasında meydana gelen değişikliklerden bahsedilmiştir. Ayrıca kloroplast genomlarının potansiyel biyoteknolojik uygulamalarına da yer verilmiştir.

**Anahtar Kelimeler:** Kloroplast genomu, Bitki Islahı, Evcilleşme

**USE OF CHLOROPLAST GENOMES IN PLANT BREEDING**

**Abstract**

Chloroplasts play a very important role in sustaining life on earth. The availability of more than 800 sequenced chloroplast genomes from diverse land plants has improved our understanding of chloroplast biology, intracellular gene transfer, conservation, diversity, and the genetic basis on which chloroplast transgenes can be engineered to improve plant agronomic traits or produce high-value agricultural or biomedical products. The chloroplast genome provides advantages in plant breeding, such as control of the gene insertion site, high transgene expression and protein accumulation rates, lack of transgene transfer through pollen due to maternal inheritance of plastid genes, and absence of epigenetic effects. Improving agricultural traits such as herbicide and pathogen resistance, drought resistance, salt tolerance, and phytoremediation potential are promising applications. Chloroplast genome applications are also successfully carried out in products such as corn, tomato, cotton, potato, rice, tobacco and sugar beet. Molecular pesticides are another high-potential area of chloroplast engineering. The production of a wide variety of products such as vaccine antigens, pharmaceutical proteins (human somatotropin, human serum albumin, human interferon, monoclonal antibodies), and industrial proteins (avidin, beta-casein, liquid crystal polymers, xylanase, anthranilate synthase) is comparable to bacterial cultivation or animal cell cultures. It is economically beneficial. This paper mentions the origins of chloroplast genome sequences of economically important cultivars and the changes that occurred during domestication. Potential biotechnological applications of chloroplast genomes are also included.

**Keywords:** Chloroplast genome, Plant Breeding, Domestication

## **Giriş**

Kloroplastlar, fotosentez ve oksijen salınımı yoluyla güneş enerjisini karbohidratlara dönüştürerek yeryüzündeki yaşamı sürdüren aktif metabolik merkezlerdir. Fotosentez genellikle plastidlerin temel işlevi olarak kabul edilse de, amino asitlerin, nükleotidlerin, yağ asitlerinin, fitohormonların, vitaminlerin ve çok sayıda metabolitin sentezi ve kükürt ve azotun asimilasyonu dahil olmak üzere bitki fizyolojisi ve gelişiminin diğer yönlerinde de hayati roller oynarlar. Kloroplastlarda sentezlenen metabolitler, bitkilerin çevreleriyle etkileşimleri (ısı, kuraklık, tuz, ışık vb. tepkiler) ve istilacı patojenlere karşı savunmaları için önemlidir. Dolayısıyla, kloroplastlar sinyallere karşı hücrel reaksiyonlarda metabolik merkezler olarak görev yapar ve retrograd sinyalizasyon yoluyla yanıt verirler (Bobik ve ark. 2015; Daniell ve ark.2016). Kloroplast genomu, fotosentez ve diğer metabolik süreçlerde yer alan birçok anahtar proteini kodlamıştır. Yüksek verimli dizileme teknolojilerinin ortaya çıkışı, kloroplast genetiği ve genomik alanında hızlı ilerlemeyi kolaylaştırmıştır. Tütünden (*Nicotiana tabacum*) elde edilen ilk kloroplast genomunun 1986 yılında dizilenmesinden bu yana (Shinozaki ve ark.1986), National Center for Biotechnology Information (NCBI) organel genom veritabanında 300'ü bitki ve ağaç genomlarından olmak üzere 800'den fazla tam kloroplast genom dizisi kullanıma sunulmuştur. Tam kloroplast genom dizilerinden elde edilen bilgiler, bitki biyolojisi ve çeşitliliği anlayışımızı geliştirmiştir. Kloroplast genomları, çeşitli bitki ailelerinin filogenetik çalışmalarına ve filogenetik kümeler içindeki evrimsel ilişkilerin çözümlenmesine önemli katkılarda bulunmuştur. Buna ek olarak, kloroplast genom dizileri, hem dizi hem de yapısal varyasyon açısından bitki türleri içinde ve arasında önemli farklılıklar olduğunu ortaya koymuştur. Bu bilgiler, ekonomik açıdan önemli ürünlerin iklimsel adaptasyonunu anlamamız açısından özellikle değerli olmuş, yakın akraba türlerin ıslahını ve değerli özelliklerin tanımlanmasını ve korunmasını kolaylaştırmıştır (Wambugu ve ark.2015). Kloroplast genomik araştırmaları, bitki biyolojisi ve evrimi anlayışımızı geliştirmenin yanı sıra biyotik veya abiyotik strese karşı koruma sağlamak ve yenilebilir mahsul bitkilerinde aşı ve biyofarmasötiklerin geliştirilmesi gibi önemli uygulamalara da sahiptir. Yakın akraba bitki türlerinin kloroplast genomları arasında bile intergenik spacer bölgelerinin korunmaması ve düzenleyici dizilerin türe özgü olması, yabancı genlerin kloroplastlara entegrasyonu ve ifadesi için yüksek verimli transformasyon vektörlerinin geliştirilmesini kolaylaştırmıştır. Kloroplast genomu 120 ila 160 kb'lik bir moleküldür (Sugiura ve Takeda 2000). Hücre başına kopya sayısı hücre yaşına bağlı olarak 1000 ila 10 000 arasında değişir: tipik bir fotosentetik olarak aktif bitki hücresi yaklaşık 100 kloroplast içerir ve her kloroplast 100 kadar DNA kopyası içerir.

Bitki mitokondriyal genomları daha deęişken büyüklüktedir ve yaklaşık 200 kb ila 2600 kb arasında deęişir (Sugiura ve Takeda 2000). Bu genomlar çoklu alt genomik halkalar halinde bulunur; küçük halkalar çaprazlama yoluyla daha büyük olanlardan türetilir. Yirmi yıl önce kloroplastların başarılı bir şekilde transformasyonu (Svab ve ark. 1990), birçok açıdan sağladığı avantajlar nedeniyle nükleer gen transformasyonuna cazip bir alternatif sunmuştur. Tek bir plastid geni fotosentetik olarak aktif bir hücrede 10 000 kez temsil edilir; yüksek bitkilerin iki ters tekrar bölgesi dikkate alındığında, kopya sayısı 20 000'e kadar ulaşabilir. Bu da yüksek düzeyde transgen ekspresyonu ile sonuçlanır. Yabancı proteinlerin toplam yaprak çözünür proteininin (tsp) %46'sı kadar yüksek bir seviyede biriktiği gösterilmiştir (De Cosa ve ark. 2001) ve transkriptlerin birikimi kloroplastlarda nükleer transformasyondan sonraki bitkilerden 169 kat daha yüksektir (Lee ve ark. 2003). Kloroplastlar, kolera toksini B alt birimi, trehaloz veya ksilanaz gibi sitoplazmada zararlı olabilecek proteinleri veya bunların biyosentetik ürünlerini biriktirmek için ideal bir yerdir (Bogorad 2000). Bu trans-plastomik ifade, kloroplast biyoreaktörü kullanılarak rekombinant proteinlerin üretimi için en yaygın ve başarılı yöntemdir. Bu bildiri kloroplast biyolojisini daha iyi anlamamıza ek olarak, kloroplast genom dizilerinin hücre içi gen transferi, koruma, çeşitlilik ve kloroplast transgenlerinin bitki tarımsal özelliklerini geliştirmek veya yüksek değerli tarımsal veya biyomedikal ürünler üretmek için tasarlandığı genetik temel hakkındaki anlayışında gelişmesine yardımcı olacaktır.

### **Kloroplast Genom Yapısı**

Kara bitkilerinin kloroplast genomları oldukça korunmuş yapılara ve içerik organizasyonuna sahiptir; büyük ve küçük tek kopya (LSC ve SSC) bölgelerini ayıran bir IR bölgesinin iki kopyasını içeren dörtlü bir yapıya sahip tek bir dairesel molekülden oluşurlar. Kloroplast genomu, öncelikle fotosentez, transkripsiyon ve translasyona katılan 120-130 gen içerir. Son zamanlarda yapılan çalışmalar, genellikle önemli düzenleyici dizileri içeren kodlamayan intergenik spacer bölgelerinde önemli çeşitlilik tespit etmiştir. Yapıdaki genel korunuma rağmen, kloroplast genom büyüklüğü 107 kb (*Cathaya argyrophylla*) ile 218 kb (*Pelargonium*) arasında deęişen türler arasında farklılık gösterir ve nükleer genom büyüklüğünden bağımsızdır. Kara bitkisi kloroplast genomlarının belirli soyları da IR bölgelerinin veya tüm gen ailelerinin kaybına dair kanıtlarla birlikte önemli yapısal yeniden düzenlemeler göstermektedir (Daniell ve ark. 2006; Oldenburg ve ark. 2015).

Şekil.1. *Prunus armeniaca* kloroplast genomunun genom haritası (Turan et al.,2019)

Genler gibi, kara bitkileri kloroplast genomlarındaki intronlar da genellikle korunur, ancak protein kodlayan genler içindeki intronların kaybı arpa (*Hordeum vulgare*) (Saski ve ark.2007), bambu (*Bambusa sp.*) (Wu ve ark. 2009), manyok (*Manihot esculenta*) ve nohut (*Cicer arietinum*) (Jansen ve ark.2008) dahil olmak üzere birçok bitki türünde bildirilmiştir. İtron kaybının meydana geldiği bilinen genler tarafından kodlanan proteinlerin çeşitli işlevleri vardır; bunlar arasında bir ATP sentaz (atpF), bir Clp proteaz (clpP), bir RNA polimeraz (rpoC2) ve ribozomal proteinler (rpl2, rps12 ve rps16) bulunur (Jansen ark. 2007). Rapor edilen intron kayıplarının çoğu belirli bitki gruplarında veya türlerinde gözlemlenmiştir, ancak bazı intron kaybı örnekleri (clpP'de olduğu gibi) tek çenekliler (Poaceae), ödikotlar (Onagraceae ve Oleaceae) ve açık tohumlular (Pinus) dahil olmak üzere çeşitli bitki türlerinde görülmüştür.

### Kloroplast Genom Dizileme Teknolojisindeki Gelişmeler

Kloroplast genomik alanının hızla ilerlemesindeki önemli faktörlerden biri de dizileme teknolojilerindeki gelişmedir. Yüksek verimli yöntemlerin bulunmasından önce yapılan çalışmalarda, izole edilmiş kloroplastlar tüm kloroplast genomunun amplifikasyonu için kullanılmıştır (Jansen ve ark. 2008; Bausher ve ark. 2006). Alternatif bir strateji, prob olarak kloroplast genom dizilerini kullanarak bakteriyel yapay kromozom (BAC) veya fosmid

kütüphanelerini taramaktır (Daniell ve ark.2006). Ancak bu yöntemlerle, iyi kalitede BAC veya fosmid kütüphaneleri oluşturmak çok sayıda PCR reaksiyonu ve diğer organellar DNA'dan kontaminasyon olasılığı gibi birçok zorluğa tabidir (Wu ve ark. 2012; Lin ve ark 2015). PCR yaklaşımının, kloroplast genomları dizilenmiş akrabaları olmayan veya yüksek oranda yeniden düzenlenmiş kloroplast genomlarına sahip türlere uygulanması da zordur. Yeni nesil dizileme (NGS) yöntemlerinin geliştirilmesi, bilim insanlarına kloroplast genomlarını dizilemek için daha hızlı ve daha ucuz yöntemler sağlamıştır. Kloroplast genom dizilimi için birden fazla NGS platformu mevcut olmasına rağmen (Wang ve Messing 2011), Illumina şu anda kloroplast genomları için kullanılan başlıca NGS platformudur çünkü rolling circle amplifikasyon ürünlerinin kullanımına izin vermektedir. Araştırmacılar daha sonra referans genom dizilerine ihtiyaç duymadan de novo birleştirme yapmak için biyoinformatik platformlarını kullanabilir; bu birleştirmelerden konsensüs kloroplast genom dizilerini tanımlamak mümkündür. Tek molekülli gerçek zamanlı (SMRT) dizileme kullanan üçüncü nesil bir dizileme cihazı olan PacBio sistemi artık kloroplast genom dizilemesinde yaygın olarak kullanılmaktadır. PacBio platformu (English ve ark. 2012) tarafından üretilen uzun okumaların düşük doğruluğu (ham verilerin ~%85'i), en son kimya ile hiyerarşik bir genom birleştirme işlemi algoritması birleştirilerek düzeltilebilir; bu tür hata sonrası düzeltmelerden sonra %99,999'a kadar yüksek doğruluk oranları elde edilebilir (Chin ve ark. 2013).

### **Kloroplast Genomunun Islahta Yeri**

Daha yüksek taksonomik seviyelerde (familya seviyesi), protein kodlama bölgeleri ve kloroplast genomunun korunmuş dizileri filogenetik analiz ve domestikasyon çalışmaları için kullanılabilir. Daha önceki filogenetik analizlerde kısmi kloroplast DNA dizileri kullanılmıştır. Değişken bölgelerin veya çoklu DNA parçalarının kullanımı bu analizlerin faydasını önemli ölçüde artırmıştır, ancak bu dizilerde, özellikle taksonomik ilişkileri belirsiz olan bazı tür içi taksonlar olmak üzere, yakın ilişkili taksonları ayırt etmek için gerekli yüksek çözünürlüğü sağlamak için yeterli bilgi yoktur. Tam kloroplast genom dizileri, yakın akraba taksonlar arasındaki filogenetik ilişkilerin deşifre edilmesi ve bitki türlerinin evrimine dair anlayışımızın geliştirilmesi açısından değerlidir. Kloroplast genomunun tarımdaki önemli bir uygulaması, ticari çeşitlerin tanımlanması ve saflıklarının belirlenmesidir. Kloroplast genomundan türetilen DNA barkodları, çeşitlerin tanımlanmasında ve ıslah kaynaklarının korunmasında kullanılabilir. Islahta başarı genetik uyumlulukla belirlenir ve kloroplast genomları, yakın akraba olması muhtemel ve dolayısıyla genetik olarak uyumlu bitkileri tanımlamak için değerli bir araç görevi görür. Kültür bitkileri ve yabani akrabaları arasındaki genetik ilişkilerin

anlaşılması, kültür bitkilerine belirli avantajlı özelliklerin kazandırılmasına yönelik çabalar hakkında bilgi verir. Orchidaceae, tüm angiospermelerin yaklaşık %6-11'ini kapsayan büyük bir familyadır ve çiçek yetiştiriciliğinde önemlidir (Pillon ve Chase 2007). Ticari açıdan önemli birçok orkide türü Epidendroideae alt familyasına aittir ve bu alt familyadan birkaç türün kloroplast genomları dizilenmiştir (Chang ve ark. 2006; Perini ve ark. 2015). Orkidelerde türler arası çaprazlama yapmak kolay olduğundan ve ıslah kayıtları bazen eksik olduğundan, ticari açıdan önemli çeşitlerin ebeveyn kökenini doğrulamak genellikle zordur. Düzeltilmiş ebeveyn bilgileri ıslah ve çeşit tanımlama için önemlidir. Epidendroideae içinde bir alt kabile olan Oncidiinae ile ilgili bir araştırmada, 15 ticari çeşitte sekiz korunmuş bölgeden elde edilen PCR ürünleri, tür düzeyinde filogenetik ilişkilerini çözmüş (Wu ve ark. 2010) ve ebeveyn kökenindeki varsayılan hataları çözmeye yardımcı olmuştur. Kloroplast DNA temelli filogenetik ağaç ile ebeveyn kayıtları arasındaki tutarsızlıkların olası bir nedeni kloroplast yakalamadır. Kloroplast yakalama, tür içi ve türler arası hibridizasyondan sonra kloroplastların bir türden diğerine geçmesidir (Tsitrone ve ark. 2003). Kloroplast genomları, yakın akraba taksonları içeren filogenetik analizler için yararlı bilgiler sağlasa da, hibridizasyon yoluyla kloroplast yakalama, yakalanan kloroplast genomları veya bunların içerdiği genler kullanılırsa filogenetik ilişkileri bozabildiği gözlemlenmiştir. Hem nükleer hem de kloroplast genomlarının kullanılması daha eksiksiz filogeniler sağlayabilir (Wambugu ve ark. 2015). Kloroplast genomları hakkındaki bilgiler, özellikle baklagiller olmak üzere çeşitli ürünlerin domestikasyonunu anlamak için yararlıdır. Baklagillerin kloroplast genom yapısı çok ilginçtir; büyük ters çevrilmiş segmentler ve ters çevrilmiş tekrarların kaybı dahil olmak üzere çok sayıda yeniden düzenleme içerir. Buna bir örnek, Papilionoideae alt familyasının çoğu üyesinde rapor edilmeden önce ilk olarak soya fasulyesi (*Glycine max*) kloroplast genom dizisinde (Saski ve ark. 2005) tanımlanan 51 kb'lık bir inversiyondur. Daha sonra *Phaseolus* ve *Vigna* kloroplast genomlarında 78 kb'lık bir tersinme doğrulanmıştır (Guo ve ark. 2007; Tangphatsornruang ve ark. 2010). Daha yakın zamanda, 51-kb inversiyonun içinde 36-kb (Martin ve ark. 2014) ve 5.6-kb (Kazakoff ve ark. 2012) inversiyonlar tanımlanmıştır. Bu ters bölgeler içinde birçok önemli gen vardır ancak hiçbir gen bozulmamış ve bitkinin hayatta kalması ve performansı etkilenmemiştir. Bu benzersiz özellikler sadece filogenetik çalışmalarda çok yararlı olmakla kalmaz (Schwarz ve ark. 2015), aynı zamanda baklagillerde kloroplast dönüşümü için de önemli bilgiler sağlar. Kloroplast yapısı, daha fazla domestikasyon ve filogenetik analiz için dizilerin amplifikasyonunda ihtiyaç duyulan primerlerin tasarımı için de önemlidir. Turunçgiller ticari açıdan en önemli meyve cinslerinden biridir. 2006 yılında, tatlı portakalın (*Citrus ×*

sinensis) ilk Citrus kloroplast genomu yayınlanmış (Bausher ve ark. 2006) ve sonraki çalışmalar için referans genom olarak kullanılmıştır. Citrus (28) ve Citrus ile ilişkili cinslerin (6) 34 kloroplast genomunun filogenetik analizi, turunçgillerin aynı ortak ataya sahip olduğunu göstermiştir (Carbonell ve ark.2015; Caspermeyer ve ark. 2015). Dört gende (matK, ndhF, ycf1 ve ccsA), tek nükleotid varyasyonları ve ekleme / silme frekansları ortalamadan açıkça daha yüksek olduğu ve bu genlerin pozitif olarak seçildiğini göstermiştir. MatK geni, tip II intronların eklenmesinde rol oynayan bir maturazı kodlar ve matK dizisi genellikle filogenetik ve evrimsel çalışmalarda kullanılır. MatK'nın pozitif seçilimi sadece turunçgillerde değil, diğer birçok bitki türünde de yaygın olarak görülmektedir. Aslında, 30'dan fazla bitki grubunun matK genlerinde pozitif seçilime uğradığı gösterilmiştir, bu da genin bir dizi farklı ekolojik seçici baskıya maruz kaldığını göstermektedir. ndhF geni, kloroplast NAD(P)H dehidrojenaz (NDH) kompleksinin bir alt birimini kodlar. Kloroplast NDH monomerleri yüksek ışık stresine duyarlıdır, bu da ndh genlerinin stres iklimlendirmesinde de rol oynayabileceğini düşündürmektedir. Bu çalışmalar, matK ve ndhF'nin Avustralya türlerinde pozitif seçim gösterdiğini ve potansiyel olarak sıcak, kuru bir iklime adaptasyonlarına katkıda bulunduğunu göstermiştir.

### **Biyoteknolojik Uygulamalarda Kloroplast Genomunun Kullanımı**

Son on yılda, kloroplast genomu öncelikle bitki koruma ve verim artışı için çok önemli olan biyotik stres toleransını artırma potansiyeline sahip hedef genlerin ekspresyonuna odaklanmıştır. Böcek zararlılarından kaynaklanan verim kaybı birçok ülkede çok ciddi boyutlarda olabilmektedir. Kloroplastlarda Bt proteininin hiper ekspresyonu ile sağlanan pamuk kurdu direncine ek olarak, geliştirilmiş biyotik stres toleransının yakın zamanda ortaya çıkan başka birçok çarpıcı örneği de bulunmaktadır (Lee ve ark. 2011). Retrosiklin-101 ve Protegrin-1, birçok kültür bitkisinde verim kaybına neden olan *Erwinia yumuşak çürüklüğü* ve tütün mozaik virüsüne (TMV) karşı koruma sağladığı ortaya çıkmıştır. *Pinellia ternata* aglutinin (PTA) geninin kloroplast genomunda ifade edilmesiyle yaprak bitlerine, beyaz sineklere, lepidopteran böceklere ve bakteriyel ve viral patojenlere karşı çoklu direnç elde edilmiştir. 40'tan fazla transgen kloroplast genomuna stabil bir şekilde entegre edilmiş ve kloroplast genomu içinde ifade edilmiş olup, yenilebilir ürünler olan lahanaya (*Brassica oleracea*) (Liu ve ark. 2007), soya fasulyesi (Dufourmantel ve ark. 2004,2005) ve patlıcanda (*Solanum melongena*) böcek direnci de dahil olmak üzere önemli agronomik özellikler kazandırmıştır. Soya fasulyesi, kolza tohumu (*Brassica napus*) ve mısırdan elde edilenler gibi tohum yağları, E vitamininin başlıca diyet kaynağıdır. Ayçiçeği (*Helianthus annuus*) tohumu yağı gibi sadece

birkaç tohum yağı, önemli bir E vitamini öncüsü olan  $\alpha$ -tokoferolü yüksek seviyelerde içerir.  $\gamma$ -Tokoferol,  $\alpha$ -tokoferolün biyosentetik öncüsüdür ve  $\gamma$ -tokoferol metil transferaz ( $\gamma$ -TMT) tarafından katalize edilen  $\alpha$ -tokoferol biyosentetik yolunun hız sınırlayıcı adım olduğunu düşündürmektedir.  $\gamma$ -tmt geninin kloroplast genomunda gerçekleştirilen biyoteknolojik uygulamalarla  $\gamma$ -TMT'nin aşırı ekspresyonu nedeniyle iç kloroplast zarfının çoklu oluşmuş ve tohumlarda  $\gamma$ -tokoferolün  $\alpha$ -tokoferole dönüşümü yaklaşık on kat artmıştır. Benzer şekilde, likopen  $\beta$ -siklaz genlerinin domates plastid genomuna eklenmesi, likopenin provitamin A'ya ( $\beta$ -karoten) dönüşümünü belirgin fenotipik değişikliklerle artırmıştır (Kato ve ark. 2000).

### **Sonuç**

Bitki hücrelerinin evrimi sırasında cpDNA önemli bir azalmaya uğramıştır. Atasal kloroplastların birçok geni cpDNA'dan hücre çekirdeğine aktarılmıştır. Kloroplast proteinlerinin çoğu çekirdek tarafından kodlanmıştır. Ancak kloroplast genomlarının yine de bitki türlerine bağlı olarak 50 ila 200 arasında temel proteini kodladığı belirlenmiştir. Yapılan araştırmalarda kloroplastların yarı bağımsız organeller olarak kabul edildiği ancak çekirdek ile sürekli yakın ilişki içinde olduğu belirlenmiştir. Özellikle yüksek bitkilerin kloroplastlarının, fotosentezi gerçekleştirerek Dünya'daki yaşamı sürdüren metabolik merkezler olduğu ortaya çıkmıştır. Bu süreçte bitkiler güneş enerjisini, suyu, mineral toprakları ve karbondioksiti kullanarak organik bileşikler sentezler. cpDNA, bitki türleri arasında hem boyut hem de alabilecekleri biçim açısından farklılık gösterir. Son cpDNA çalışmaları, bu moleküllerin hem çok dallı doğrusal hem de dairesel yapılar alabildiğini göstermektedir. Tüm bunlar bir araya geldiğinde, kloroplastların içinde meydana gelen çeşitli ve oldukça karmaşık bir genetik sistemin görüntüsünü vermektedir. Kloroplast genetik mekanizmasının anlaşılması, kloroplastların işleyişinin ve içlerinde meydana gelen süreçlerin tam olarak açıklanabilmesi için temel koşullardan biridir. Böylece evrimden domestikasyona kadar olan süreçte önemli bir destek olan kloroplast genomu bitki ıslahının da büyük gelişmelerin olmasına olanak sağlayacaktır.

**Abstract**

Changing feed composition could achieve synchronization of energy and N supply to the rumen. The utilisation of distinct components could modify microbial or tissue metabolism for reasons other than dietary nutrient supply patterns. Advantages are due to the presence of individual species or the higher species diversity in the pasture mixture. Higher species diversity may enable particular advantages. The identification of the plants that contribute to the pasture seems to have a greater influence on the increase in pasture dry matter production than species diversification.

**Keywords:** Alternative forages, *Ocimum basilicum*, basil

## **Introduction**

Over 40% of Earth's surface is covered by grasslands, with grazing areas accounting for the biggest portion of all land uses, covering over 40 million km<sup>2</sup>. With livestock production making about 50% of the world's agricultural GDP, it is a significant economic activity. Since forage grasses are the most widely used animal feed worldwide, forages are particularly significant in livestock production systems. A variety of intensively managed monocultures with high stocking rates and high inputs (such as fossil fuels, fertiliser, and herbicides) that may be periodically replanted are examples of grazed ecosystems. Other examples include permanently managed grasslands, rangelands, and semi-arid savannas that serve as low-input ecosystems (Peters et al., 2013). Natural re-vegetation techniques, especially grazing management, have the potential to revitalise vigour and speed the spread of beneficial species. Due to low precipitation in arid and semiarid rangelands, where artificial re-vegetation would entail the establishment of suitable species either by seed or by transplanting seedlings, grazing management alone may not be able to speed the succession towards preferred species. The two primary methods used to replenish a depleted rangeland are restoration and rehabilitation. Rehabilitating or artificially establishing a new type of vegetation that differs from the pure native vegetation is known as artificial recovery, while restoration, also known as biological recovery, refers to returning the ecosystem to its original state (Le Houerou, 2000). Increases in biomass, plant cover, organic matter, soil micro- and macroorganisms, improved water intake and turnover, reduced evaporation, and runoff are examples of biological or artificial recovery. By preventing cattle and humans from entering the target region, biological recovery may be achieved. Rangelands may be restored for a variety of reasons, including erosion management, wind barriers, sand dune fixation, landscaping, and the production of fodder and timber (Le Houerou, 2000). The gradual decline in secondary productivity and diversity, together with the issue of how to handle these shifts, is a key problem for dry and semiarid regions. The task of maintaining and enhancing arid and semi-arid ranges is never easy. Many rangeland theoretical models have been established, and a small number of them are now being evaluated in various rangeland ecosystems across the globe (Ahmad and Islam, 2011).

## **Multispecies forages**

Decoupling the increase of environmental contamination from productivity is one of the main goals in modern agricultural systems. Using varied (multispecies) pastures could help achieve this goal. It may be possible to improve the yearly herbage growth and N usage efficiency of intensively managed pastures by diversifying their species composition. The importance of

well-adapted plant functional types is emphasised by the finding that the presence of particular species in the sward has a greater bearing on herbage production and N dynamics than the number of species present in the sward. It has also been demonstrated that adding forbs to pastures, such as plantains and chicory, helps lower the nitrogen content of urine patches and lowers the possibility of nitrogen leakage from grazed pastures. The yields of herbage per year from varied blends are higher than those from simple combinations. Greater species diversity in pastures can increase plant N uptake (Vibart et al., 2016). Dairy farms are highly complex systems, with interactions among paddocks within the grazing rotation. The system as a whole may be affected by management choices made for a single paddock (Pembleton and Rawnsley, 2011). New fodder species have historically been incorporated into dairy systems using the distinct monoculture approach. The design and administration of two or more grazing platforms are necessary for this integration technique. Although there are effective examples of this technique in place, at least one of the monocultures frequently performs poorly overall due to the higher level of grazing management expertise and the periodic conflicts between the grazing requirements of each platform. This has hindered the species' ability to be widely adopted. A more effective way to increase pasture variety is to incorporate new species into the relatively basic grass-legume binary mixture that already exists. According to Pembleton et al. (2015), more species diversity should enable the use of particular advantages offered by other species without requiring more inputs or management. On the other hand, there is a worry that a sward's diversity will raise the management and inputs needed to achieve and sustain these benefits. Increasing the diversity of species in pastures enables each species to take advantage of niches. There are two types of niches: temporal (induced by seasonal weather patterns) and spatial (caused by variations in the soil). Niches can also happen when a species underutilizes a resource (such water or space), giving another species opportunity to take advantage of it (Sanderson et al., 2004). This particular form of niche exploitation may take several years to manifest (Tilman et al., 2001). During periods of soil moisture deficits, Sanderson et al. (2005) found that during a two-year grazing study, there was less herbage DM accumulation from a two-species (orchardgrass–white clover) mixture than from three species (orchardgrass, white clover, and chicory), six species (orchardgrass, tall fescue, perennial ryegrass, red clover, birdsfoot trefoil, and chicory), and nine species (the six-species mixture plus white clover, alfalfa, and Kentucky bluegrass). Herbage accumulation was similar across all treatments during the second year. But during the third year of the trial, the majority of the combinations were going back to white clover–orchardgrass, and the variation between treatments was getting less.

Herbage accumulation is not always positively impacted when a sward's species diversity is increased (Sanderson et al., 2004). Whether the advantages are due to the presence of individual species or the higher species diversity in the pasture mixture has been a major open question in multi-species research. According to recent assessments (Pembleton et al., 2015; Vibart et al., 2016) of the effects of pasture species diversity on grazing systems, the presence of particular, well-adapted species was found to be more significant in driving herbage production and N dynamics than the total number of species. Increasing species richness in a system with limited resources might not increase herbage productivity; instead, it might only result in a more equitable distribution of these resources. It is proposed that functional diversity and the complementarity of niche-use among species in a sward can lead to transgressive overyielding (Cardinale et al., 2007).

### **Alternative species**

The identification of the plants that contribute to the pasture seems to have a greater influence on the increase in pasture dry matter production than variety diversification. Reports from New Zealand pastures with perennial ryegrass, white clover, red clover, chicory, plantain (*Plantago lanceolata* L.), lucerne, and perennial ryegrass (Nobilly et al., 2013) as well as from south western Victorian pastures with tall fescue, cocksfoot, white clover, red clover, and chicory (Tharmaraj et al., 2014) corroborate this. In each case, the presence of heat- and drought-tolerant plants including plantains, lucerne, and chicory was linked to an increase in summertime dry matter production. Increasing species variety in a pasture can enhance the forage's nutritional qualities (Woodward et al., 2013), for example, by reducing concentrations of neutral detergent fibre (NDF). Additionally, species diversity might enhance the animal's food supply and, consequently, the digestive system's nutrient synchrony (Yang et al., 2010). But rather than being a result of the diversity of the pasture itself, this is probably mediated by the addition of species (such as legumes and forbs) that have lower NDF levels and digestibility parameters (Sanderson et al., 2006). In contrast to basic pastures, cows grazing 30 different types of pastures produced more milk in recent experiments (Totty et al., 2013). However, other studies found no overall improvement in milk production (Soder et al., 2006). Increases in milk yield have been noted in pastures with three species of perennial ryegrass, white clover, and plantain, or seven species (Pembleton et al., 2015): perennial ryegrass, white clover, tall fescue, prairie grass, chicory, plantain, and lucerne. Season to season variations exist in the correlation between increased diversity of sowed species and increased milk production. When there has been an increase in milk production, it usually results from a drop in the diet's NDF content

linked to an increase in the amounts of forbs (plantains and chicory) and legumes (red clover and lucerne) (Totty et al. 2013; Woodward et al., 2013).

The complementarity between grasses and legumes utilized in these swards are beneficial, since they can convert available resources to high quality forage. Commonly utilized forbs in multispecies swards have historically included ribgrass/ribwort plantain (*Plantago lanceolata* L.), chicory (*Cichorium intybus* L.), yarrow (*Achillea millefolium* L.), sheep's parsley (*Petroselinum crispum* Mill.) Fuss], burnet (*Sanguisorba minor* Scop.), cat's ear dandelion (*Hypochoeris radicata* L.), and caraway (*Carum carvi* L.) (Sanderson et al., 2003).

Condensed tannins (CT) were investigated in early animal research, and plants containing CT, including *lotus*, were used in grazing tests that decreased the amount of protein that degraded in sheep rumen (Barry and Manley, 1984). On order to evaluate the effects of CT on dairy cows, grazing tests with lotus seeded in a mixed pasture with ryegrass and forbs were conducted more recently. But other species outcompeted the lotus, and it never managed to establish (Totty et al., 2013). Multispecies swards that graze are generally thought to have higher DMI, though this hasn't always been seen. McCarthy et al. (2020) found no changes in overall DMI between multispecies and grass or grass-legume swards in their meta-analysis comparison. In comparison to grass or grass-legume swards, multispecies swards often have lower NDF concentrations, which are thought to have an impact on DMI. Additionally, the milk yield in multispecies swards increased by 1,20 kg d<sup>-1</sup> per cow, according to the researcher. For cows grazing multispecies swards, the analyses also revealed significant increases in milk component output, with increases in energy-corrected milk (ECM), fat, protein, and combined fat and protein. The variations in nutrient concentrations of multispecies swards are probably responsible for these variations in the composition of milk components.

When grazing cattle are fed chicory and plantain instead of ryegrass, it has also been demonstrated that the ruminative chews and rumination time are decreased (Gregorini et al., 2013). A decrease in ruminative chews may indicate increased breakdown of particles upon ingestion, which would lessen the need for ruminating and speed up the removal of digesta from the rumen. The rumen's digesta must be removed in order to make room for feeding, which increases intake overall. These effects are contingent upon the quantity chosen by the grazing animal as well as the pasture's overall proportion of fodder forbs (plantains or chicory). Increased selection for these species is probably going to have an impact on their persistence, which will reduce their prevalence in the pasture. Anti-quality factors have also been reported from multispecies swards, mainly as a contribution from the forb component (Jaramillo et al.,

2021). The nutritive value of pasture can be affected by plant secondary metabolites in both nutritional and anti-nutritional ways (Barry et al., 2002). One of the most researched plant secondary metabolites is condensed tannins, which have the potential to impact animal nutrition by shielding proteins from ruminal breakdown. Anthelmintic medications have traditionally been used to control gastrointestinal parasites; however, it has been noted that cattle, sheep, and goats have higher parasite resistance to standard anthelmintics (Min and Hart, 2003). Current studies are looking into alternate strategies for controlling gastrointestinal parasites. Evidence suggests that more diverse forage plants could prevent weeds from invading grassland ecosystems (Tracy and Sanderson, 2004). It is challenging to pinpoint the precise processes of suppression in multispecies swards because high productivity is frequently positively connected with increasing forage diversity. Nonetheless, it's been proposed that more soil cover increases resource efficiency and decreases the amount of area available for weeds to invade and establish themselves in the swards. It's crucial to remember that pasture productivity and fodder accumulation don't necessarily mean the same thing, particularly in situations where weed invasion could boost pasture biomass and the animals don't choose these species when grazing or in situations where weeds might be harmful (Jaramillo et al., 2021). In an effort to enhance animal performance, health, and product quality, aromatic herbs and their extracts have been added to animal diets as feed additives in recent years. The broad spectrum of antimicrobial antioxidants found in aromatic herbs, as well as their ability to stimulate digestion and appeal to the senses, are the reasons behind their use (Kosmidou et al., 2006).

#### **Basil (*Ocimum basilicum*)**

The herb basil, or *Ocimum basilicum* L., is native to South America, Africa, and Asia's subtropical zones. *O. basilicum* exhibited antibacterial activity against a number of isolates of *Vibrio* spp. The antibacterial action seen in *O. basilicum* essential oils may be attributed to chemical components such as rosmarinic acid (Shabih et al., 2022). One of the most used herbs in cooking is basil. Sweet basil is one of the most widely utilized types of the more than 12 culinary basil herb kinds in cooking. Three primary components, linalool, estragole, and eugenol, were responsible for the scent of basil leaves and stems (Li and Chang, 2016). It is estimated that there are between 50 and 150 species of *Ocimum* in the world. Basil's water-soluble extracts are a rich source of flavonol glycosides and phenolic acids, while its essential oil is a rich source of terpenoids. The beneficial properties of wild basil are most likely linked to the crop's significant flavonoid, alkaloid, tannin, saponin, and terpene content. In male Wistar rats with acetic acid-induced colitis, three products made from basil (1) linalool-rich essential oil, (2)

seed ethanolic extract, and (3) seed mucilage have demonstrated positive effects (do Nascimento et al., 2023). An erect branching herb, 0.6 to 0.9 m high, glabrous, more or less hispidly pubescent. Stems and branches are green or sometimes purplish. Leaves of *Ocimum basilicum* are simple, opposite, 2.5-5 cm or more long, ovate, acute, entire or more or less toothed or lobed with a cuneate and entire base. The petiole is 1.3-2.5 cm long. The leaves have numerous dot-like oil glands which secrete strongly scented volatile oil. Whorls densely racemose, where the terminal raceme is usually much longer than the lateral ones. The bracts are stalked, shorter than the calyx, ovate and acute. Calyx is five mm long, enlarging in fruit and very shortly pedicelled. Its lower lip with the two central teeth is longer than the rounded upper lip (Bilal et al., 2012). *Ocimum basilicum* was evaluated by Umar et al. (2012) in a rat model of hypertension, on the factors that cause the hypertension and its aftereffects (myocardial hypertrophy, renal function). *Ocimum basilicum* may reduce hypertension, according to the results. *Ocimum basilicum* showed no discernible dose dependence; the lowest dose produced the same results as the largest, four-fold larger dose. Additionally, *Ocimum basilicum* affects lipid metabolism and platelets. *Ocimum basilicum*, like all herbals, is undoubtedly composed of numerous ingredients. Further research is required to determine the constituents involved in the current impact and whether the substances responsible for *Ocimum basilicum*'s effect on platelets are the same or different. In a rat model of Alzheimer's disease, Gradinariu et al. (2015) examined the potential anxiolytic and antidepressant properties of inhaled basil essential oils derived from *Ocimum sanctum* L. and *Ocimum basilicum* L. The effects of inhaled basil essential oils were investigated, including their anxiolytic and depressive properties. In the forced swimming test, the rats treated with beta-amyloid showed the following: a reduction in exploratory activity (number of crossings), an increase in swimming time, and a decrease in immobility time. Consequently, the rats' behaviour greatly improved after being exposed to basil essential oils, indicating potential anxiolytic and antidepressant effects. The findings imply that several exposures to basil essential oils may be helpful in reducing anxiety and depression associated with Alzheimer's disease. According to the Harnafi et al. (2009) study, a high-fat diet heavy in cholesterol, lard, and cholic acid caused hyperlipemia. Animals were split into three groups at the start of the experiment: a normolipidemic control group (NCG), a hyperlipidemic control group (HCG), and a group that received basil treatment (BTG). Sweet basil significantly reduced liver and plasma total cholesterol and triglycerides after ten weeks of therapy. A comparable outcome was noted for the concentrations of LDL cholesterol in plasma. Additionally, there is a noteworthy

ameliorative effect of the basil extract on increased levels of the LDL/HDL-C ratio and the atherogenic index (AI). Researchers came to the conclusion that *O. basilicum* might be useful in treating hyperlipidemia and associated cardiovascular illnesses because it might contain polar compounds that can lower plasma lipid content.

Khaki et al. (2011) divided the thirty male Wistar rats ( $n = 10$ ) into two treatment groups ( $n = 20$ ) and a control group ( $n = 10$ ). For 40 days, *O. basilicum* extract was given to the first treatment group at a dose of  $1.5 \text{ g kg}^{-1}$  body weight and to the second group at a dose of  $3 \text{ g kg}^{-1}$  body weight. Rat testes tissues were extracted from each group member at the end of the test period, and sperm was then extracted from the epididymis and ready for examination. When compared to the control group, the experimental group, which got the first treatment, had significantly higher levels of total testosterone serum, sperm concentration, sperm motility, and percentage of sperm viability. This implied that the extract from *O. basilicum* would be a potential therapy for improving the parameters of healthy sperm. In adult female cyclic Wistar rats, Bilal et al. (2013) examined the effects of a hydroalcoholic extract of *Ocimum basilicum* Linn. leaves on ovulation, implantation, and pregnancy maintenance. The antioviulatory, antiimplantation, and abortifacient properties of *Ocimum basilicum* leaf extract ( $364 \text{ mg kg}^{-1}$  and  $624 \text{ mg kg}^{-1}$ ) were investigated. Each day for the 15 days when the first experiment's rats were treated, the vaginal smears of the rats were observed. To verify its antioviulatory effect, the amount of cholesterol in ovarian tissue was estimated, and its histology was examined. The animals in the second and third trials were treated from the first to the seventh and from the eighth to the sixteenth day of pregnancy, respectively. In two studies, laparotomies were performed on the tenth and twentieth days of pregnancy, respectively, to measure the number of implantations and litter size. Pain control was examined between the treatment groups. There was a noteworthy ( $P < 0.001$ ) increase in the length of the diestrus phase and estrus cycle. Additionally, a noteworthy rise in the cholesterol content in ovarian tissue and a significant decrease in ovarian weight were noted ( $P < 0.001$ ). It was discovered that the treated group's uterus weighed less. A histological report revealed that the ovarian parenchyma had a sizable corpora lutea. In rats administered with both extract dosages, there was no discernible antiimplantation nor abortifacient impact. *Ocimum basilicum* hydroalcoholic extract prolongs the diestrus phase and throws off the estrus cycle, which in turn interferes with regular ovulation. Amrani et al. (2006) assessed the lipid-lowering potential of an aqueous extract of *Ocimum basilicum* in rats that had been hyperlipidaemic due to Triton WR-1339. Animals who received an intraperitoneal injection of Triton ( $200 \text{ mg kg}^{-1}$ ) developed hyperlipidemia.

Following the injection of Triton, the rats were split into three treatment groups: rats treated with fenofibrate, plant extract, or hyperlipidemia. Rats treated with *Ocimum basilicum* extract (0.5 g 100 g<sup>-1</sup> body weight) had plasma cholesterol, triglycerides, and LDL-cholesterol levels that were, at 7 hours after the Triton injection, 50%, 83%, and 79% lower than those treated with Triton alone. In contrast, HDL-cholesterol was 129% higher. Total cholesterol, triglycerides, and LDL cholesterol dropped by 56%, 63%, and 68%, respectively, at 24 hours after *Ocimum basilicum* was administered, whereas HDL cholesterol did not significantly rise in comparison to the Triton treated group. The extract from *Ocimum basilicum* exhibited a much greater hypolipidemic impact than treatments with fenofibrate. Additionally, it was shown that the aqueous extract of *Ocimum basilicum* has a very strong antioxidant capacity. These findings suggest that *Ocimum basilicum* extract may include antioxidant and hypolipidaemic compounds, and that hyperlipidemic patients may benefit from using it as a treatment agent.

Certain scented plants may appeal to poultry. Essential oils and fragrant plant extracts are the foundation of aromatherapy (El Jeni et al., 2021). The choice of four distinct grown aromatic plants for free-range laying hens has been discovered by quantitative studies (Kosmidou et al., 2006). Twenty 50-week-old laying chickens were employed. Every day, they were allowed access to a specially designed pasture that was enhanced with *Anethum graveolens* (dill), *Petroselinum crispum* (parsley), *Origanum vulgare* (oregano), and *Ocimum basilicum* (basil). Each of the four aromatic plants was grown independently. Throughout the observation period (d 1 to 3), hens were consistently seen to visit the *Ocimum basilicum* region more frequently than the other plant locations. The average percentage of hens that visited the areas of *Anethum graveolens*, *Petroselinum crispum*, *Origanum vulgare*, *Ocimum basilicum*, and 8.4%, 6.1%, and 4.5%, respectively, were recorded on day 1. In contrast, the values on days 2 and 3 were 20.5%, 5.3%, 11.6%, and 5.3%, and 21.6%, 5.5%, 9.7%, and 5.0%, respectively. *Ocimum basilicum* was consistently and distinctly preferred (51% of the total number of chickens). Of the three fragrant plants, 24% of the chickens had a preference for *Petroselinum crispum*. This study suggests that although some aromatic plants may be preferred, hens can eat planted aromatic plants in the grazing area. Based on resemblance and distinctiveness, homoeopathy has the potential to be a useful nutritional approach for animals that can help lower the need for antibiotics (Doehring and Sundrum, 2016).

**Conclusions**

It may be beneficial to add basil in small amounts to the feed of animals raised in closed environments and under stress, in order to improve animal psychology without overdoing it. Excessive use may prevent pregnancy.

**ÖZET**

**Amaç:** Bu araştırma hemőirelerin sađlık teknolojilerini deđerlendirmesi ile yapay zekaya yönelik tutumu arasındaki iliŐkinin belirlenmesi amacıyla yapıldı. **Yöntem:** AraŐtırmanın verileri, 15 Aralık 2023-15 Őubat 2024 tarihleri arasında toplandı. Bu araŐtırmanın evrenini bir devlet hastanesinde çalıŐan 404 hemőire oluŐturdu. Verilerin toplanmasında tanıtıcı bilgi formu, sađlık personeli sađlık teknolojileri deđerlendirme tutum ölçeđi, yapay zekâya yönelik genel tutum ölçeđi akademik okuryazarlık ölçeđi kullanıldı. **Bulgular:** ÇalıŐmaya katılan hemőirelerin %66.6'sının 18-30 yaŐ aralıđında olduđu, % 60.9'unun kadın olduđu, %58.9'unun bekar olduđu, %70.3'ünün lisans mezunu olduđu, %53.2'inin çalıŐma yılının 4-6 yıllarında olduđu, %57.7'sinin vardiyalı çalıŐtıđı, %40.6'sının diđer servislerde çalıŐtıđı bulundu. AraŐtırma kapsamına alınan hemőirelerin Sađlık Teknolojilerini Deđerlendirme Tutum Ölçeđi puan ortalaması 4.10±.552, Yapay Zekaya Yönelik Genel Tutum Ölçeđi puan ortalaması 3.30±.539 olarak bulundu. Hemőirelerin Sađlık Teknolojilerini Deđerlendirme Tutum Ölçeđi Puanları ile Yapay Zekaya Yönelik Genel Tutum Ölçeđi puan ortalamaları arasında pozitif yönde orta düzeyde anlamlı bir iliŐki bulundu (p<0.001). **Sonuçlar:** Hemőirelerinin sađlık teknolojilerini deđerlendirme tutumu ile yapay zekaya yönelik tutumu arasında anlamlı iliŐki olduđu saptandı.

**Anahtar sözcükler:** Hemőire, sađlık teknoloji, yapay zeka.

**DETERMINING THE RELATIONSHIP BETWEEN NURSES' EVALUATION OF  
HEALTH TECHNOLOGIES AND THEIR ATTITUDES TOWARDS ARTIFICIAL  
INTELLIGENCE**

**ABSTRACT**

**Objective:** This research was conducted to determine the relationship between nurses' evaluation of health technologies and their attitudes towards artificial intelligence. **Method:** The data of the study was collected between December 15, 2023 and February 15, 2024. The population of this research consisted of 404 nurses working in a public hospital. Introductory information form, healthcare personnel health technologies evaluation attitude scale, general attitude scale towards artificial intelligence, academic literacy scale were used to collect data.

**Results:** 66.6% of the nurses participating in the study were between the ages of 18-30, 60.9% were women, 58.9% were single, 70.3% had a bachelor's degree, 53.2% were in the 4-6 years of their working years. It was found that 57.7% worked in shifts and 40.6% worked in other services. The mean score of the Health Technologies Evaluation Attitude Scale of the nurses included in the research was found to be  $4.10 \pm .552$ , and the mean score of the General Attitude Scale Towards Artificial Intelligence was  $3.30 \pm .539$ . A positive, moderately significant relationship was found between the Nurses' Health Technologies Evaluation Attitude Scale Scores and the General Attitude Scale Towards Artificial Intelligence score averages ( $p < 0.001$ ).

**Conclusion:** It was determined that there was a significant relationship between nurses' attitudes towards evaluating health technologies and their attitudes towards artificial intelligence.

**Keywords:** Nurse, health technology, artificial intelligence.

## **GİRİŞ**

“Yapay zeka” terimi ilk kez 1956 yılında Amerika Birleşik Devletleri'ndeki Dartmouth College'da düzenlenen bir konferansta tanıtıldı. O tarihten bu yana kavram ve kullanımı birçok değişikliğe uğradı (Russell S.J., Norvig P., Davis E. 2010). Başlangıçta yapay zeka yalnızca bilgisayar bilimi alanıyla ilişkilendiriliyordu (Schwab K. 2017). Ancak yavaş yavaş sağlık bilimlerine de yöneldi ve insanlar için sağlık hizmetlerinin ve sistemlerinin kalitesinin iyileştirilmesinin büyük önemi nedeniyle (World Health Organization, 2017) yapay zekanın hastalıkların tanı, bakım ve tedavisinde kullanılmasına önemli katkı sağladı (Liu X., Faes L., Kale A.U., et al. 2019). Yapay zeka kullanımı hemşirelerin iş yükünü de etkiliyor. Yapay zeka, yüksek riskli hastaların yaşamı tehdit eden durumlarını tahmin etmek ve uyararak için halihazırda kullanılıyor (Mann S, Arora Y, Anand S. 2020). Ayrıca hemşirelere hastaların ihtiyaçlarını ve isteklerini anlamaları için daha fazla zaman tanımaktadır (Booth R.G. 2016). Yapay zekanın sağlık hizmetlerinde kullanılması olası parlak ve umut vericidir ve kullanımı, sağlık çalışanları arasındaki hata ve ihmal olasılığını azaltma ve maliyet tasarrufu sağlama konusunda önemli bir etkiye sahip olabilir (Jones L.D., Golan D., Hanna S.A., Ramachandran M. 2018). Ancak yapay zekanın doğrudan hasta bakımında kullanılmasının hemşire-hasta iletişimini zayıflattığı yönünde endişeler bulunmaktadır (Cabitza F., Rasoini R., Gensini G.F. 2017; Karches KE. 2018). Bununla birlikte olası teknik hatalar ve teşhis modellerinde problem yaratabilir (Scott I.A., Carter S.M., Coiera E. 2021; Sunarti S., Fadzlul Rahman F., Naufal M., Risky M., Febriyanto K., Masnina R. 2021). Hemşireler tarafından tıbbi yapay zeka ile ilgili teknolojilerin benimsenmesi, onların bilgisi, kabulü ve tutumu gibi faktörlerle yakından ilişkili olabilir. Bu nedenle bu faktörlerin dikkate alınması ve ölçülmesi sağlık sistemleri ve yapay zeka geliştiricileri için gereklidir (Scheetz J., Rothschild P., McGuinness M., et al. 2021). Ayrıca yapay zekanın mevcut durumuna ve hemşireler arasındaki kabul oranına da dikkat etmek gerekir (Abuzaid M.M., Elshami W., Tekin H., Issa B. 2022). Teknolojinin gelişmesi ve bilginin hızlı bir şekilde yayılması donanımlı bireylere olan ihtiyacı daha da artırmıştır. Çünkü günümüzde gerek özel işletmeler gerekse de kamu kurum ve kuruluşlarında, çağın gerekliliklerine uygun nitelikte bilgi ve teknolojik açıdan yeterli bireylerin istihdam edilmesi önemli görülmektedir (Kim, J.M., 2017; Sadoughi, F., et al. 2017). Teknolojik donanıma sahip olan bu bireyler kurumların amaçlarına ulaşması, sunduğu hizmetleri daha etkili ve verimli bir şekilde gerçekleştirebilmesi, hedef kitle ile sağlıklı bir iletişimin kurulabilmesi, örgütsel yapı içerisinde iş birliğinin ve organizasyon kültürünün

geliştirilmesi ve en önemlisi de rekabet düzeyinin artırılması gibi özellikler bakımından vazgeçilmez düzeyde önemlidir (Kuşcu, F.N., Yılmaz, F.Ö., & Karatepe, H. K. 2022).

Bu çalışma, hemşirelerin sağlık teknolojilerini değerlendirmesi ile yapay zekaya yönelik tutumu arasındaki ilişkinin belirlenmesi amacıyla yapılmaktadır. Yapılan literatür taramasında hemşirelerin sağlık teknolojilerini değerlendirmesi ile yapay zekaya yönelik tutumu arasındaki ilişkinin belirlenmesi konusunda sınırlı sayıda araştırmaya rastlandı. Bu nedenle bu araştırmanın literatüre önemli bir katkı sağlayacağı düşünülmektedir. Bu amaç doğrultusunda bu çalışmanın araştırma soruları şunlardır:

1. Hemşirelerin sağlık teknolojilerini değerlendirme düzeyleri nedir?
2. Hemşirelerin yapay zekaya yönelik tutum düzeyleri nedir?
3. Hemşirelerin sağlık teknolojilerini değerlendirme düzeyleri ile yapay zekaya yönelik tutum düzeyleri arasında bir ilişki var mı?

## **MATERYAL VE METOT**

### **Araştırmanın Amacı**

Araştırmada hemşirelerin sağlık teknolojilerini değerlendirme düzeyleri ile yapay zekaya yönelik tutum düzeyleri arasındaki ilişkinin belirlenmesi amacıyla nicel araştırma yöntemlerinden ilişkisel tarama modeli kullanıldı.

### **Araştırmanın Yapıldığı Yer ve Zaman**

Araştırma 15 Aralık 2023-15 Şubat 2024 tarihleri arasında bir devlet hastanesinde gerçekleştirildi.

### **Araştırmanın Evren ve Örneklemi**

Araştırmanın evrenini araştırmanın yürütüldüğü tarihler arasında bir devlet hastanesinde çalışan tüm hemşireler oluşturdu. Örneklemine ise 15 Aralık 2023-15 Şubat 2024 tarihleri arasında çalışmaya dahil olmayı kabul edenler oluşturdu.

### **Veri Toplama Araçları**

**Kişisel Bilgi Formu:** Formda yaş, cinsiyet, medeni durumu, eğitim durumu, çalışma yılı, çalışma şekli, çalıştığı klinik gibi tanımlayıcı özelliklerini belirlemeye yönelik toplam yedi sorudan oluşmaktadır.

### **Sağlık personeli sağlık teknolojileri değerlendirme tutum ölçeği (SPSTDTÖ)**

Kuşcu, Yılmaz ve Kuşcu Karatepe (2022) tarafından geliştirilen SPSTDTÖ 23 sorudan ve 3 boyuttan oluşmakta olup; 1.-4. sorular ölçeğin kapsam boyutunu, 5.-11. sorular farkındalık boyutunu, 12.-23. sorular fayda boyutunu oluşturmaktadır. Ölçekte ters kodlama bulunmamaktadır. 5'li Likert tipinde hazırlanan ölçek "1-Kesinlikle katılmıyorum, 2-

Katılmıyorum, 3-Kararsızım, 4-Katılıyorum, 5- Kesinlikle katılıyorum” şeklinde derecelendirilmektedir. 1’e yaklaştıkça Sağlık Teknolojisi Değerlendirmenin düşük puana sahip olduğu, 5’e yaklaştıkça ise yüksek puana sahip olduğu çıkarımında bulunulabilir. Kuşcu vd. (2022) tarafından yapılan çalışmada ölçeğin Cronbach Alpha değerinin 0,959 olduğu belirtilmiştir. Bu çalışmada ise Cronbach Alpha değeri 0,948 olduğu tespit edilmiştir. Bu değer de SPSTDTÖ’nün yüksek derecede güvenilir olduğunu göstermektedir (Kalaycı, 2017; Uzunsakal ve Yıldız, 2018).

### **Yapay Zekâya Yönelik Genel Tutum Ölçeği (GAAIS)**

Bu ölçek Schepman ve Rodway (2020) tarafından geliştirilmiştir. Bireylerin yapay zekaya yönelik genel tutumlarını ölçmek amacıyla ölçekte 12’si olumlu ve 8 madde olumsuz olmak üzere toplam 20 madde bulunmaktadır. Öğeler beşli Likert tipi (1 = Kesinlikle katılmıyorum, 5=Kesinlikle katılıyorum) olarak puanlanmıştır. Doğrulama araştırmasında iki faktörün Cronbach alfa değerleri olumlu genel tutumlar için 0,88 ve olumsuz genel tutumlar için 0,82 iken, olumlu alt ölçekler için 0,84 ve olumsuz alt ölçekler için 0,80 olarak hesaplanmıştır ve her ikisi de iyi bir iç tutarlılığı temsil etmektedir. Kaya ve ark. (2022) Türkçe geçerlik ve güvenilirlik araştırmasında Faktör yapısı aynı zamanda Schepman ve Rodway tarafından yapılan doğrulama araştırmasıyla da benzer sonuçları ortaya çıkardı; çünkü KMO 0,90 ve Bartlett testi anlamlıydı.

**Verilen toplanması:** Veriler toplanmadan önce araştırmanın amacı ifade edildikten sonra araştırmaya dahil olmayı kabul eden hemşirelerin yazılı onamları alındı ve soru formları araştırmacı tarafından uygulandı. Verilerin toplanması işlemi yaklaşık 15-20 dakika sürdü. Veriler, Google Forms aracılığı ile toplandı.

**Verilerin Analizi:** Verilerin analizinde SPSS (Statistical Package For Social Sciences) 22.0 paket programı kullanıldı. Tanımlayıcı verilerin analizinde sayı, ortalama, yüzdeler dağılımlar, standart sapma kullanıldı. Ölçeklerin güvenilirlik katsayıların hesaplanmasında Cronbach alfa katsayısı ve ölçekler arasındaki ilişkiyi saptamak için Pearson Korelasyon analizi kullanıldı. Ölçekler arası korelasyon katsayıları; çok zayıf (0.00-0.25), zayıf (0.26-0.49), orta (0.50-0.69), güçlü (0.70-0.89) ve çok güçlü (0.90- 1.00) olarak sınıflandırıldı.

**Araştırmanın Etik Yönü:** Araştırmanın yapılabilmesi için bir üniversitenin bilimsel araştırma ve yayın etik kurulundan ve araştırmanın yürütüleceği hastaneden gerekli yazılı izinler alındı. Veriler toplanmadan önce hemşirelere araştırmanın amacı, elde edilecek sonuçların ne amaçlarla kullanılacağı açıklandı. Bununla birlikte araştırmaya dahil olup olmamasının isteğine bağlı olmasını ifade edilerek "Özerkliğe Saygı" ilkesi, araştırmaya katılan hemşirelerin

bilgilerinin gizli tutulacağı belirtilerek "Gizlilik ve Gizliliğin Korunması" ilkesi yerine getirildi. Araştırmada İnsan Hakları Helsinki Deklerasyonu'na sadık kalındı.

**Araştırmanın sınırlılıkları ve genellebilirliği:** Araştırma anket yöntemi ile veriler elde edildiğinden bu tür araştırmaların taşıdığı sınırlılıklar bu araştırmada da geçerlidir ve bulgular araştırmaya katılan hemşirelere genellenebilir.

## **BULGULAR**

**Tablo 1.** Hemşirelerin Sosyo-demografik Özelliklerine Göre Dağılımı(n=404)

<b>Yaş</b>	<b>Sayı</b>	<b>%</b>
18-30	269	66.6
30-45	113	28
45 ve üzeri	22	5.4
<b>Cinsiyet</b>		
Kadın	246	60.9
Erkek	158	39.1
<b>Medeni Durumu</b>		
Bekar	238	58.9
Evli	166	41.1
<b>Eğitim Düzeyi</b>		
Lise	21	5.2
Ön Lisans	55	13.6
Lisans	284	70.3
Lisans üstü	44	10.9
<b>Çalışma Yılı</b>		
0-3 yıl	37	9.2
4-6 yıl	215	53.2
7-9 yıl	82	20.3
10 yıl ve üzeri	70	17.3
<b>Çalışma Şekli</b>		
Vardiya	233	57.7
Gündüz	171	42.3
<b>Çalıştığı Klinik</b>		
Dahili servisleri	59	14.6
Cerrahi servisleri	50	12.4
Acil servisi	67	16.6
Yoğun bakım servisleri	64	15.8
Diğer servisler	164	40.6

Çalışmaya katılan hemşirelerin %66.6'sının 18-30 yaş aralığında olduğu, % 60.9'unun kadın olduğu, %58.9'unun bekar olduğu, %70.3'ünün lisans mezunu olduğu, %53.2'inin çalışma yılının 4-6 yıllarında olduğu, %57.7'sinin vardiyalı çalıştığı, %40.6'sının diğer servislerde çalıştığı bulundu (Tablo 1).

**Tablo 2.** Hemşirelerin Sağlık Teknolojilerini Değerlendirme Tutum Ölçeği ve Yapay Zekaya Yönelik Genel Tutum Ölçeği Puan Ortalamaları (N=404)

Ölçekler ve Alt Boyutları	$\bar{x} \pm SD$	Min	Max
<b>Sağlık Teknolojilerini Değerlendirme Tutum Ölçeği</b>	4.10±.552	1.95	5.00
Kapsam boyutu	4.07±.693	1.50	5
Farkındalık boyutu	4.29±.610	1.86	5
Fayda boyutu	4.01±.590	2	5
<b>Yapay Zekaya Yönelik Genel Tutum Ölçeği</b>	3.30±.539	1.60	4.94
Yapay Zekaya Yönelik Negatif Tutum	3.61±.757	1	5
Yapay Zekaya Yönelik Pozitif Tutum	2.85±.835	1	5

Araştırma kapsamına alınan hemşirelerin Sağlık Teknolojilerini Değerlendirme Tutum Ölçeği puan ortalaması 4.10±.552, Yapay Zekaya Yönelik Genel Tutum Ölçeği puan ortalaması 3.30±.539 olarak bulundu (Tablo 2).

**Tablo 3.** Hemşirelerin Sağlık Teknolojilerini Değerlendirme Tutum Ölçeği Puanları ile Yapay Zekaya Yönelik Genel Tutum Ölçeği Puan Ortalamaları Arasındaki İlişki

Ölçekler	Sağlık Teknolojilerini Değerlendirme Tutum Ölçeği	Yapay Zekaya Yönelik Genel Tutum Ölçeği
Sağlık Teknolojilerini Değerlendirme Tutum Ölçeği	R = 1	.377**
Yapay Zekaya Yönelik Genel Tutum Ölçeği	R = ,377**	1
	P = ,000	P = ,000

\*\* . Correlation is significant at the 0.01 level (2-tailed).

Hemşirelerin Sağlık Teknolojilerini Değerlendirme Tutum Ölçeği Puanları ile Yapay Zekaya Yönelik Genel Tutum Ölçeği puan ortalamaları arasında pozitif yönde orta düzeyde anlamlı bir ilişki bulundu ( $p<0.001$ ) (Tablo 3).

## **SONUÇ VE ÖNERİLER**

Hemşirelerinin sağlık teknolojilerini değerlendirme tutumu ile yapay zekaya yönelik tutumu arasında anlamlı ilişki olduğu saptandı. Araştırmanın sonucunda sağlık teknolojilerini değerlendirme tutumu ile yapay zekaya yönelik tutumu arasında orta düzeyde pozitif yönlü bir ilişki olduğu belirlendiğinden hemşirelerinin sağlık teknolojilerini değerlendirme tutumu ile yapay zekaya yönelik tutumu bir bütün olarak incelenmesinin önemli olduğu düşünülmektedir. Bu doğrultuda hemşirelere yönelik sağlık teknolojileri ve yapay zeka hakkında eğitim programları düzenlenmelidir. Bu programlar, hemşirelerin teknolojiyi kullanımını teşvik etmeli ve teknolojiye olan güvenlerini artırmalıdır. Sağlık teknolojileri firmaları, hemşirelerin ihtiyaçlarına uygun ürünler geliştirirken onların geri bildirimlerini dikkate almalı ve ürün geliştirme süreçlerine dahil etmelidir. Hemşireler, teknoloji firmalarıyla iş birliği yaparak yapay zeka uygulamalarının kullanımını optimize etmek için danışmanlık yapabilirler.

**Özet**

Tarihsel süreç içerisinde, özellikle yabani hayvanlardan ve doğa olaylarından korunma amacıyla ortaya çıkan topluluk halinde yaşama fikri, başta insanların küçük yerleşim birimleri oluşturmalarını sağlamıştır. Bu yaşam tarzı zamanla gelişmiş ve nüfus artışı, teknolojinin ilerlemesi, buluşların artması gibi sebepler yerleşim birimlerinin büyümesine sebep olmuş, sonuç olarak da bugün adına kent denilen yaşam alanlarını ortaya çıkarmıştır. Kentler, doğal ve yapılı çevrenin sentezlenmesiyle oluşan mekanlardır. Kuruldukları yere ait doğal özelliklerin yanı sıra, insan eliyle oluşturulmuş tarihi, kültürel, mimari vb özelliklerin etkisiyle birlikte her geçen gün değişmekte ve şekillenmektedir. Bir kentin sahip olduğu ayırıcı özellikler ve faktörler, onun diğer kentlerden farklılaşmasını ve adına “kentsel kimlik” denilen bir kimlik kazanmasını sağlamaktadır. Göç, günümüzde küresel ölçekte önemli bir fenomen haline gelmiştir ve kentler, göçün en yoğun yaşandığı ve etkilerinin en belirgin hissedildiği yerlerdir. Göç kavramı, Türk Dil Kurumu (TDK) sözlüğünde; “*Ekonomik, toplumsal ve siyasi sebeplerle bireylerin veya toplulukların bir ülkeden başka bir ülkeye, bir yerleşim yerinden başka bir yerleşim yerine gitme işi, taşınma, hicret, muhaceret*”, olarak tanımlanmaktadır. Uluslararası Göç Örgütü (IOM) tarafından hazırlanan göç terimler sözlüğüne bakıldığında ise; “*İnsanların grup halinde veya bireysel olarak uluslararası bir sınırı geçmeleri veya bir devlet içinde yer değiştirmeleri, kısaca süresi, yapısı ve nedeni ne olursa olsun insanların yer değiştirdiği nüfus hareketleri*” olarak tanımlandığı görülmektedir. Göçün kentlerdeki sosyal, ekonomik ve kültürel yapıları nasıl şekillendirdiği ve kent kimliği üzerindeki etkileri, araştırmacılar ve planlamacılar arasında büyük bir ilgi konusudur. Bu çalışma, küresel göçün kentsel kimlik üzerindeki etkilerini peyzaj mimarlığı perspektifinden inceleyerek, kent peyzajının ve çevresel düzenlemelerin göçmenlerin kimlikleri ve kent kimliği arasındaki etkileşimde nasıl bir rol oynadığını anlamayı amaçlamaktadır.

**Anahtar Kelimeler:** Göç, Kentsel Kimlik, Peyzaj Mimarlığı

**THE EFFECTS OF GLOBAL MIGRATION ON URBAN IDENTITY FROM THE  
PERSPECTIVE OF LANDSCAPE ARCHITECTURE**

**Abstract**

The concept of residing in communities, which developed over time, primarily for the purpose of safeguarding against wildlife and natural occurrences, allowed individuals to establish small settlements. This way of life has evolved gradually, with factors such as population growth, technological advancements, and the rise of inventions contributing to the expansion of settlements. As a result, urban areas known as cities have emerged in the present day. Cities are created by combining the natural and constructed environment. Apart from the inherent natural characteristics of their surroundings, cities undergo constant transformation and development, shaped by the influence of human-made elements such as history, culture, architecture, and more. The unique characteristics and factors of a city allow it to distinguish itself from other cities and acquire an identity known as "urban identity". Migration has emerged as a significant global phenomenon in contemporary times, with cities serving as the primary focal points where migration takes place intensely, and its impacts are profoundly felt. The Turkish Language Association (TDK) dictionary defines the concept of migration as "*the act of individuals or groups moving from one country to another, or from one settlement to another, for economic, social, and political reasons, encompassing both emigration and immigration*". According to the migration terminology dictionary compiled by the International Organization for Migration (IOM), migration is defined as "*the movement of individuals or groups across an international border or their displacement within a state. In essence, it refers to population movements involving the relocation of people, irrespective of their duration, composition, or reasons.*" The impact of migration on the social, economic, and cultural fabric of cities, as well as its influence on urban identity, is a subject of significant interest for researchers and planners alike. The objective of this study is to explore the influence of urban landscapes and environmental regulations on the interplay between immigrant identities and urban identity. By examining the impacts of global migration on urban identity through the lens of landscape architecture, we seek to gain a deeper understanding of this dynamic relationship.

**Keywords:** Migration, Urban Identity, Landscape Architecture

## **INTRODUCTION**

Migration has been an existing phenomenon since the beginning of human history. It is possible to explain the concept of migration in various ways: Migration is a population movement that involves geographical displacement, affecting the economic, cultural, social, and political aspects of society (Özer, 2004). Migration primarily refers to changing one's location. Individuals move from one region to another for various reasons. This situation can be either permanent or temporary. It is noted that migration can also include movements related to education, work, short-term stays, and the possibility of returning to the original location (Sağlam, 2006). The person who carries out the migration process is referred to as a "migrant" or "refugee" (Koçak and Terzi, 2012). Throughout human history, migrations have occurred due to various factors. These factors include the desire to benefit from unevenly distributed economic opportunities, as well as ecological pressures and forced displacements caused by social authorities such as states, settlements, and wars (Kaygalak, 2009). Migration is not specific to any one place; it is inevitable wherever humans exist. The underlying causes of migration are similar across most countries worldwide (Koçak and Terzi, 2012). Migration directly impacts urbanization and often has negative effects. Intense migration movements in cities lead to problems such as unplanned urbanization, increased crime rates, infrastructure and transportation issues, and unemployment (Bozkurt and Ayfer, 2018). Additionally, migrants facing adaptation challenges in cities, poorly executed migration movements, and the resulting rapid urbanization can lead to changes or even deterioration of urban identity.

## **THE PHENOMENON OF MIGRATION**

Throughout history, people have constantly moved from one place to another to find shelter and create new living spaces. Sometimes, they are forced to migrate away from their habitats due to unfavorable climate conditions, wars, diseases, and pressures (Güreşçi, 2011). In modern times, numerous scientific research studies and definitions have been conducted regarding migration. According to Yalçın (2004), migration is "a geographic and social displacement movement from one place to another, driven by economic, political, ecological, or individual reasons, aiming for short, medium, or long-term return or permanent settlement." Another definition describes migration as the process of individuals relocating from one settlement area (village, city, town) to another in order to continue a part or the entirety of their lives (Üner, 1972). Migration involves moving individuals from one spatial area to another, carrying their unique problems with them (Bozkurt and Ayfer, 2018).

Although the phenomenon of migration varies in each country, it is evaluated in a similar manner. Place, time, and space are important concepts in migration. Migration can be divided into two categories: internal and international migration. Internal migration includes seasonal, voluntary, compulsory, labor, and permanent migrations, while international migration is classified as brain drain, exchange, and labor migrations (Bozkurt and Ayfer, 2018).

International migration refers to the movement of people from one country to another. These migrations can be voluntary or forced. With the increase in transportation and communication facilities, migrations between countries have also increased. Additionally, reasons such as war, famine, natural disasters, and terrorism lead to forced international migrations, while the desire for a better quality of life can lead to voluntary international migrations (Şahin, 2010; Koçak and Terzi, 2012). These global-scale migrations, especially mass-scale international migrations, cause various changes in the country and city that is being migrated to. Alongside the physical and social changes in the city's structures, changes in the identity of the migrated city are often observed.

#### **URBAN, URBANIZATION, URBAN IDENTITY AND MIGRATION**

The dominant form of settlement in our era, the city, represents a new dimension of the reflection of interpersonal relationships and physical space throughout human history. The emergence of neighborhoods and spaces in cities, as well as their demographic and economic structures, differentiate one city from another. The city not only signifies a new economic organization and a changed physical environment but also represents a new social order that influences human behavior and thoughts (Es and Ateş, 2010). In its broadest sense, the city is a complex and dynamic mechanism where non-agricultural and agricultural production is controlled, distribution is coordinated, and non-agricultural production is based on supporting it. It is a place where technological changes have brought about organization, specialization, and division of labor to the highest level, where a large population size and density are required due to the demands of various functions. The city is characterized by increased social heterogeneity, integration, and the continuous operation of this complex mechanism. With all these characteristics, the city is a product of the post-Industrial Revolution era (Es and Ateş, 2010). Urbanization refers to the process of population accumulation that is accompanied by increasing levels of organization, division of labor, and specialization, resulting in changes in human behavior related to cities. It is also indicative of the increase in the population living in cities and the number of cities. Urbanization began with the Industrial Revolution and is a social

phenomenon that emerged with modernization. Alongside various impacts of the Industrial Revolution, there are three significant outcomes: differentiation in social structure, innovation in production, and rapid population mobility (urbanization) (Kaya et al., 2008).

In Turkey, urbanization developed in parallel with industrialization in the 1950s. With industrialization, the number of factories in cities increased. As the number of factories grew, people who became unemployed in rural areas started coming to cities in search of work. As a result, rural-to-urban migration occurred, initiating the process of urbanization (Koçak and Terzi, 2012). In the process of social change, urbanization, which is both a dependent and independent variable, exhibits a complex characteristic in terms of its causes and consequences. Urbanization, defined as "changes that affect the private lives, economic, social, and political behaviors of people living in them, and require certain activities of the state" due to the accumulation of population in cities and the increase in the number of cities resulting from the high distribution rate and settlement of these excesses in areas outside the city, which enables the rapid growth of production, trade, and services through industrialization, is a social dimension of a transformation process that requires planned and programmed intervention because it gives rise to many social problems (Es and Ateş, 2010). In general, the concept of identity can be defined as distinctive characteristics that differentiate living beings or objects. At the same time, the concept of identity brings about comparison among similarities and reveals the distinctive features possessed in comparison to others. In terms of cities and architectural products, the notion of identity and urban image encompasses a broad definition primarily highlighted by its visual dimension, as well as encompassing natural, geographical, cultural products, and social life norms. Urban identity and related urban images are formed within the urban space over a long period of time and sometimes consist of very different components. Urban images create shared values that people living in the city can sacrifice for and these values persist between generations (Ulu and Karakoç, 2004). Cities symbolize the product of a social group (Laborit, 1990). In this regard, cities are identity-bearing structures with their unique identity, personality, image, and way of life (Alver, 2017). Identity requires the identification of an object, its differentiation from other things, and its acceptance as an entity, which expresses the singularity and uniqueness of identity (Lynch, 2018). In the identity of each city, the distinctive characteristics that have been sustained over time are preserved (Keleş, 2005). In this context, urban identity reflects the unique character and differences of the city and consists of the interactions of identity elements that give the city its distinctiveness (Ertin, Zülfikar and Atik, 2015; Oktay, 2011). The identities of cities are accumulations of

slowly growing, changing, and having a long historical past (Tekeli, 1991). Cities do not emerge suddenly but are formed over time, gaining their personality and identity, and encompassing differences and uniqueness (Aliğaoğlu, 2018). Urban identity, being the differentiation of cities in terms of their inherent characteristics, is a reflection of the culture inherent to the city. Identities in urban space are constructed through urban culture and continue to exist with this culture. Cities manifest as spaces where different cultures encounter, intertwine, or conflict (Özbey, 2022). The physical changes observed in neighborhoods where migrants predominantly settle have the potential to alter both the lifestyle patterns of the migrants and the overall urban aesthetics. While the encounter of different cultures allows for cultural exchange and enhances cultural richness, it also leads to cultural shifts within society. These daily life differences are evident within buildings, their immediate surroundings, streets, neighborhoods, and eventually throughout the entire city, leaving traces of the migrant community. This situation particularly affects historically significant cities and urban areas, causing them to lose their values, eroding their identities, and damaging the connection between the urban population and their city. The sense of belonging of the local population to the city is shaken. To prevent this situation, it is crucial for local governments to actively participate in the process and ensure that urbanization and urban development movements are carried out in a way that does not lead to cultural shifts (Çetinkaya Karafakı, 2023). Potential cultural shifts can disrupt the urban identity and put cities at risk of losing their identity.

## **CONCLUSION**

The structure of urban identities is shaped by different migration patterns. Internal and external migrations, individual and mass migrations, temporary and permanent migrations, forced and voluntary migrations, skilled and unskilled migrations, and regular and irregular migrations all play a significant role in the formation of urban identities. With these migrations, the identities of cities are being reshaped (Özbey, 2022). Migrations play an important role in the spread of urban identities because they are not just spatial movements but also social and cultural movements (Yalçın, 2004; Canatan, 2013). Migrants carry their values, traditions, relationship patterns, and essentially their identities to the places they migrate to, and they interactively reconstruct their identities in the migrated space. Migrants become part of the migrated society and continue to maintain their connection with their place of origin, reconstructing their identities. With migrations, the identities of migrants also spread to a wider area. This phenomenon, often observed in rural-to-urban migrations, is also seen in migrations between

---

cities. Urban identities spread to a broader space with migrations. They encompass their new spaces, influence them, and mutually transform each other (Özbey, 2022). Migration creates cultural diversity through interactions on urban identity. The demographic changes in the city contribute to the formation of cultural diversity, as migrants from different cultures affect the social and cultural fabric. Additionally, migrations bring about transformations in the physical environment of the city. Generally, migrants in newly settled urban areas establish new residential areas where they can maintain their own cultures and lifestyles. This also alters the fabric of the city. The natural and cultural heritage that reflects a part of the city's urban identity can change and transform with migrations, allowing for the emergence of new heritages. What is important here is the preparedness of the city to adapt to the new order in the most suitable and fastest way possible as a result of migration movements.

**Özet**

Günümüzün en önemli kavramlarından biri olan teknoloji, yaşamın her alanında varolan ve kullanılan bir olgudur. Teknoloji sayesinde, bilgi üretmek, işlemek, planlamak, tasarlamak, paylaşmak, iletişim kurmak vb kolay ve pratik bir şekilde gerçekleşmektedir. Bunun yanı sıra yapılması amaçlanan işin teknolojik araçlarla daha kısa sürede gerçekleştirilmesi de zaman tasarrufu sağlamaktadır. Teknolojinin insanoğluna sunduğu en önemli gelişmelerden biri de yapay zeka kavramıdır. Yapay zeka kavramı genel olarak makinenin akıllı davranışlar sergileyebilmesidir. Akıllı davranışsa sırasıyla algılama, akıl yürütme, öğrenme, iletişim kurma, karışık ortamlarda hareket etmeyi kapsamaktadır. Uzun vadede yapay zekanın hedefi insanların yapabileceği şeyleri en az onlar kadar hatta onlardan daha iyisini yapabilen makineler geliştirmektir (Nilsson, 1998). Diğer bir tanımda ise Luger ve Stubblefield (1998), yapay zekayı “akıllı davranışın otomasyonu ile ilgilenen bilgisayar biliminin dalı” olarak tanımlamaktadır (Karabulut, 2021). Günümüzde, peyzaj mimarlığı disiplini giderek daha fazla yapay zeka teknolojilerinin etkisi altında gelişmekte ve dönüşmektedir. Yapay zeka, peyzaj tasarımı ve planlaması süreçlerinde yaratıcı ve yenilikçi çözümler üretmek, sürdürülebilirlik hedeflerini desteklemek ve kullanıcıların ihtiyaçlarını en iyi şekilde karşılamak için bir araç olarak kullanılmaktadır. Yapay zekanın diğer meslek disiplinlerine olduğu gibi peyzaj mimarlığı açısından da çok önemli olduğu ve gelecekte yapay zeka destekli çalışmaların artacağı, yapay zeka destekli tasarım ve planlamaların gelecekte önemli bir trend haline geleceği yadsınamaz bir gerçektir. Bu çalışmada yapay zekanın peyzaj mimarlığı çalışmaları açısından kullanım örnekleri üzerinden birtakım değerlendirmeler yapılmıştır.

**Anahtar Kelimeler:** Yapay Zeka, Tasarım, Planlama, Peyzaj Mimarlığı

**AN EVALUATION ON ARTIFICIAL INTELLIGENCE SUPPORTED DESIGN AND  
PLANNING IN LANDSCAPE ARCHITECTURE: TRENDS AND APPLICATIONS**

**Abstract**

Technology, a pivotal concept of our time, permeates and finds application in every facet of life. Thanks to technology, tasks such as producing, processing, planning, designing, sharing, communicating, and more can be carried out with ease and practicality. Moreover, the utilization of technological tools allows for the accomplishment of tasks in a shorter timeframe, thereby saving valuable time. One of the significant advancements bestowed upon humanity by technology is the concept of artificial intelligence. The general notion of artificial intelligence entails the capacity of machines to demonstrate intelligent behavior. Intelligent behavior encompasses the abilities of perceiving, reasoning, learning, communicating, and acting within intricate environments. In the long run, the objective of artificial intelligence is to create machines capable of performing tasks at least as well as, if not better than, humans (Nilsson, 1998). In an alternate definition, Luger and Stubblefield (1998) define artificial intelligence as "the field of computer science concerned with automating intelligent behavior" (Karabulut, 2021). Today, the field of landscape architecture is undergoing a progressive evolution and transformation, driven by the impact of artificial intelligence technologies. Artificial intelligence serves as a valuable tool in generating imaginative and inventive solutions within landscape design and planning processes. Its application aids in advancing sustainability objectives and effectively catering to the requirements of users. Undoubtedly, artificial intelligence holds immense significance not only in landscape architecture but also in various other professional fields. It is evident that AI-supported studies will continue to grow in the future, with AI-backed design and planning emerging as a significant trend in the times to come. Within this study, several evaluations were conducted, focusing on the practical applications of artificial intelligence in the context of landscape architecture studies.

**Keywords:** Artificial Intelligence, Design, Planning, Landscape Architecture

## **INTRODUCTION**

Artificial intelligence is a branch of science that deals with the simulation of intelligent behavior in computers. When this concept emerged with the aim of mimicking human intelligence, McCarthy and his colleagues (1955) interpreted it as the ability to define any characteristic of human intelligence, such as learning, precisely, implying that its simulation could be achieved. According to Jack Copeland, who works in this field and has written various books on artificial intelligence (2000), human intelligence consists of a series of separate components rather than a single ability or cognitive process. Nowadays, artificial intelligence encompasses various subfields, ranging from general areas such as perception and reasoning to specific tasks such as diagnosing diseases, playing chess, writing poetry, and proving mathematical theorems (Russel & Norvig, 2002; Üstün, 2020). Additionally, artificial intelligence technology can be encountered in different fields such as facial recognition, voice recognition, medical diagnosis, language translation, and credit application evaluation (Bentley, 2019; Yıldırım and Demirarslan, 2020). In the fields of architecture and engineering, various artificial intelligence tools are predominantly used to investigate design processes (Brown, 2005; Üstün, 2020).

Today, it is possible to come across developments related to artificial intelligence in every aspect of life. To briefly mention these developments, patent applications for designs generated by artificial intelligence (URL-1, 2024), granting citizenship to a robot by Saudi Arabia (URL-2, 2024), organizing exhibitions for artworks created by robots (URL-3, 2024), the establishment of a mega city in Saudi Arabia where the number of robots is said to surpass the number of humans (URL-5, 2024), and the efforts by Neuralink company to merge human intelligence and artificial intelligence (URL-6, 2024) can be given as examples (Yıldırım and Demirarslan, 2020). Today, the use of artificial intelligence in designs is inevitable, as it is already being utilized in various fields.

## **DESIGN, DESIGNING, AND ARTIFICIAL INTELLIGENCE**

Design can be defined as the form that something planned to be created takes in the human mind through various actions. Although the concept of design encompasses meanings such as designing, planning, shaping, and conceptualizing, it is difficult to provide a complete definition of its content. However, in various studies, design is described as a solution plan for any problem, as an idea (Demirarslan, 2006). As emphasized by many designers, the built environment that emerges as a result of the design process is shaped as a repetition of a series

of events in a chronological order, and although the products may be different, the process itself contains various patterns (Baran Ergül et al., 2022).

The concept of artificial intelligence refers to systems that mimic human intelligence, gradually educating themselves based on the information they are given or collect from the environment, and producing outputs based on the knowledge they acquire. Nowadays, artificial intelligence-based decision support systems receive intense interest from researchers, and the number of studies in this field is increasing day by day. These types of artificial intelligence-based decision support systems are used in many disciplines with the general aim of assisting experts in their respective fields, increasing the accuracy of decisions, reducing human errors, and making life easier (Baran Ergül et al., 2022). The use of artificial intelligence in solving design problems and enabling more informed, objective decisions about the resulting products began with the use of computer models in architectural design decision support mechanisms. In addition to traditional systems in architecture, these models, when used with algorithm-based methods in well-defined problems, can provide appropriate solutions (Baran Ergül et al., 2022). The development of technology over time has provided designers with various means of spatial transfer. The primary tool used in these transfers is computers. According to Görgül (2001), when the designer transforms their sketches, ideas, and preliminary designs - which they produce by using the representation tools in their "database" such as plans, geometry, and three-dimensionality - by blending them with numerous factors such as accumulated knowledge, intuition, and perception, computers come into play. With the integration of computers into human life, advancements have been made in the fields of Computer-Aided Design (CAD) and Computer-Aided Manufacturing (CAM) (Yıldırım and Demirarslan, 2021). Today, hand drawing continues depending on the designer's approach, especially during the study/sketch phase. However, the advantages provided by technology, such as efficiency, speed, flexibility, ability to make changes, and present proposals to clients, are utilized, and the working process is supported. Another advantage of digital platforms is their ability to provide a means of expression for individuals with limited technical drawing knowledge (Yıldırım and Demirarslan, 2021). Artificial intelligence applications and/or different artificial intelligence-supported software are used in design disciplines. Landscape architecture is one of these disciplines.

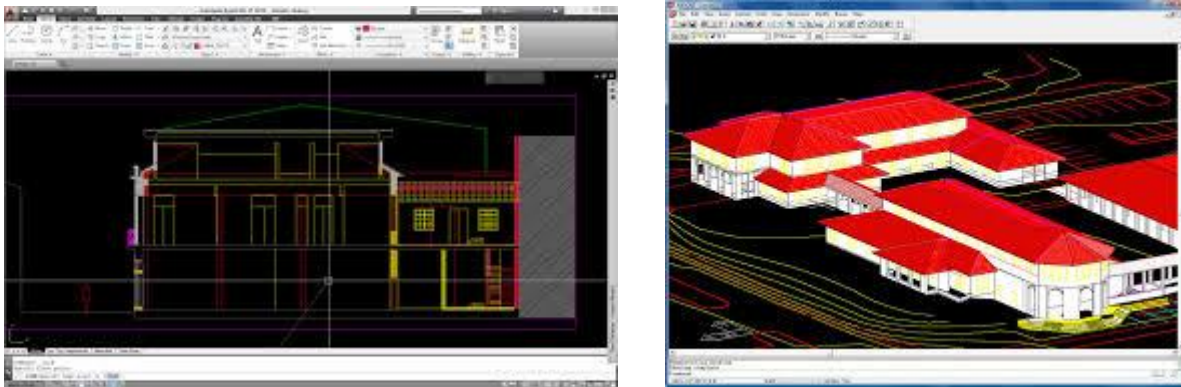

## **ARTIFICIAL INTELLIGENCE APPLICATIONS IN LANDSCAPE ARCHITECTURE**

Artificial intelligence applications in landscape architecture vary in the forms of genetic algorithms, machine learning, data analytics, remote sensing, and geographic information systems. Genetic algorithms are used as a method for optimizing design parameters, image processing and modeling techniques, simulation generation, and making design decisions.

Machine learning algorithms are particularly used in analyzing large datasets and optimizing design decisions. These algorithms provide support in various aspects, from color selection to material choice. Data analytics, remote sensing, and geographic information systems are commonly preferred in landscape planning studies. These software types are utilized for conducting terrain analysis, revealing the current state of the land, or creating accurate projections. Some artificial intelligence-supported programs used by landscape architects include:

➤ Autodesk Autocad:

It is a software used for both two-dimensional and three-dimensional designs. It is also preferred by landscape architects, just like in other professional disciplines (Figure 1).

**Figure 1.** Autodesk AutoCAD image (URL-7, 2024)

➤ Google SketchUp:

SketchUp is a user-friendly software used for three-dimensional modeling. It is one of the fastest methods for elevating landscape designs to the third dimension (Figure 2).

**Figure 2.** Google SketchUp image (URL-8, 2024)

➤ Lumion:

Lumion is a software that is widely preferred today and allows for the creation of highly realistic visualizations and animations. It is particularly one of the most used tools by landscape architects for outdoor design projects (Figure 3).

**Figure 3.** Lumion image (URL-9, 2024)

➤ GIS Software:

In landscape planning studies, terrain analysis, creating base maps, spatial analysis applications, and other purposes, the most preferred software within geographic information systems is ArcGIS (Figure 4).

**Figure 4.** ArcGIS image (URL-10,2024)

➤ Vectorworks Landmark:

Another software that provides support to landscape architects in design and project processes (Figure 5).

**Figure 5.** Vectorworks Landmark image (URL-11, 2024)

➤ DynaSCAPE:

It is a supportive software, particularly used in landscape designs and the preparation of presentation drawings (Figure 6).

**Figure 6.** DynaSCAPE image (URL-12, 2024)

➤ Land F/X:

Another software specifically designed for landscape architects is Land F/X (Figure 7). With Land F/X, designers can create irrigation systems in landscape areas and select project elements using the libraries of palettes available in the software.

**Figure 7.** Land F/X image (URL-13, 2024)

In addition to the software programs mentioned above, there are also many other software programs used. This study has provided examples of a few for reference purposes.

## **CONCLUSION**

The advancement of technology has accelerated and facilitated access to information in today's world. Human beings, who need to keep up with the fast-paced lifestyle, have focused on computer technologies to spend their time efficiently and effectively, discovering and continuing to explore innovations that make life easier in this field. Among these discoveries, artificial intelligence stands out. Nowadays, time can be saved with software integrated with artificial intelligence. Artificial intelligence-supported software is used in the field of landscape architecture, just like in other professional disciplines. While it is entirely possible for artificial intelligence to be present in architectural applications, in some cases, its implementation depends on the designer's initiative. When the accuracy of the project data is known and accepted with certainty, artificial intelligence inference may not require the involvement of designers. However, in cases where inferences vary depending on various parameters, the need for designers persists alongside artificial intelligence systems (Barın Ekin and Benli Yıldız, 2023).

**ÇINKONUN MALATYA KİLİ İLE ADSORPSİYON KİNETİĞİNİN PSEUDO-  
SECOND KİNETİC ORDER MODELDEN TÜRETİLMİŞ DOĞRUSAL  
MODELLERLE ANALİZİ**

**Dr. Öğretim Üyesi Nilgün Onursal (ORCID:00000-0002-2460-6475)**

Department of Science and Mathematics Education, Siirt University, Siirt, Turkey

**Email:**nilgun.onursal@gmail.com

**Özet**

Çinko elementi endüstride yaygın kullanıma sahip bir metaldir. Diğer ağır metallerle beraber çevre ve sağlık sorunlarına neden olmaktadır. Çinkonun sulu çözeltilerden gideriminde adsorpsiyon alternatif bir yoldur. Yalancı-ikinci dereceli kinetik model, adsorpsiyon kinetiğine ait modeller içerisinde en çok başvurulan ve özellikle divalent metallerde deneysel verilere en uygun olan modeldir. Esasen non-lineer olan modelden literatürde 6 adet doğrusal denklem türetilmiştir. Dal ve Onursal'ın 2023'te bu modelden türettikleri 2 doğrusal modelin de literatüre eklenmesi ile modele ait doğrusal tip denklemlerin sayısı 8'e yükselmiştir. Bu çalışmada bu yeni modellerden Tip 7 için çinko elementi kullanılmış olup, deneysel verilerden sekiz adet grafik elde edilmiştir. Analiz sonucuna göre; kinetik verilerin uyum derecesi sırasıyla tip 6 > tip 1 = tip 7 > tip 2 = tip 5 > tip 3 = tip 4 şeklindedir. Regresyon analizi ise  $R^2$  değerlerine göre yapılmış olup  $R^2 = 0,9910$  olarak bulunmuştur.

**Anahtar Kelimeler:** Adsorpsiyon kinetiği, Yalancı-İkinci Dereceli Kinetik model, Doğrusal Regresyon, Çinko, Kil

**ANALYSIS OF ADSORPTION KINETICS OF ZINC WITH MALATYA KILO WITH  
LINEAR MODELS DERIVED FROM PSEUDO-SECOND KINETIC ORDER  
MODEL**

**Abstract**

The element zinc is a metal widely used in industry. Together with other heavy metals, it causes environmental and health problems. Adsorption is an alternative way to remove zinc from aqueous solution. The pseudo-second order kinetic model is the most commonly used model of adsorption kinetics and is the most suitable model for experimental data, especially for divalent metals. Six linear equations have been derived from the essentially non-linear model in the literature. With the addition of 2 linear models derived from this model by Dal and Onursal to the literature in 2023, the number of linear type equations of the model increased to 8. In this study, zinc element was used for Type 7, one of these new models, and eight graphs were obtained from experimental data. According to the analysis result; The degree of fit of the kinetic data is respectively type 6 > type 1 = type 7 > type 2 = type 5 > type 3 = type 4. Regression analysis was performed according to R<sup>2</sup> values and R<sup>2</sup> was found to be = 0.9910.

**Keywords:** Adsorption kinetics, Pseudo-Second Order Kinetic model, Linear Regression, Zinc, Clay

## **Giriş**

Sanayinin gelişimine bağlı olarak üretimin artması daha fazla ağır metal kullanımını beraberinde getirmektedir. Doğal olarak buda kirlilik ve sağlık problemlerine yol açmaktadır. Nüfuslar artmakta ve buna paralel olarak teknoloji ye olan talepte artmaktadır (Onursal, et al., 2019), ( Canpolat & Altunkaynak, 2022). Artan ağır metal kirliliği hava, su ve toprağı kirletmekte ve besin zinciri aracılığı ile tüm canlıları olumsuz etkilemektedir ( Wang & Guo , 2020). Bu da insanoğlunu soruna çözüm bulmak için çeşitli araştırmalara sevk etmektedir. Özellikle canlıları kanserojen etkiye sahip olan bu toksik maddelerden koruma yolları araştırılmaktadır. (Onursal, et al., 2020),. Bu çözüm yöntemlerden ucuz maliyetli, yaygın ve kolay uygulanabilir olan adsorpsiyon ile atık sulardan ağır metallerin giderimidir. Şayet sorpsiyon süreci iyi tasarlanırsa yüksek verim elde etmek mümkün olmaktadır ( Dal, et al., 2021). Adsorpsiyon, sıvı veya gazdan kütle transferi aracılığı ile katının yüzeyinde maddenin birikmesi olayıdır (Altunkaynak, et al., 2021). Adsorpsiyon kinetiği ise adsorplayıcı ile adsorplanan arasındaki temas süresinin nasıl ve hangi aşamalarda gerçekleştiğini bulmamıza yardımcı olmaktadır (Altunkaynak, 2022). Bunun dışında adsorpsiyonun doğasını, afinitesini, mekanizmasını ve aktivasyon enerjisini anlamamızı sağlamaktadır. Adsorpsiyon kinetiği tüm Dünya’da çalışılmakta ve geliştirilerek deneysel veriler modellenmektedir. Bunlardan en önde geleni yalancı-ikinci dereceli kinetik modeldir:

### **1.1. Yalancı-İkinci Dereceli Kinetik Model**

Ho ve McKay tarafından 1998 yılında öne sürülen model, non-lineer yapıda olup eşitlik.1’deki gibi ifade edilmektedir: (Ho & McKay, 1998 b).

$$q_t = \frac{q_e^2 k_2 t}{1 + q_e k_2 t} \quad (1)$$

Burada;

qt; t anında, adsorplayıcı tarafından gram başına adsorplanan madde miktarı (mgg<sup>-1</sup>)

qe; dengeye gelindiğinde adsorplayıcı tarafından gram başına adsorplanan madde miktarı (mgg<sup>-1</sup>)

t; temas süresidir. (min).

k<sub>2</sub>; adsorpsiyona ait hız sabiti (min<sup>-1</sup>) ni temsil etmektedir (Dal & Onursal, 2023).

Zaman içerisinde modele ait lineer denklemler de geliştirilmiştir Ho, Lagergren’in ‘ikinci dereceli eşitliği’nin lineer formunu türetmiştir ve karıştırılmasınlar diye, eşitlik 1998’den beri ikinci dereceli kinetik model ‘pseudo-second-rate order’ olarak anılmaktadır (Ho, 2005).

Bu denklemler Tablo.1’de verilmiştir.

Type 1 
$$\frac{1}{q_e - q_t} = \frac{1}{q_e} + k_2 t \quad (1)$$

Type 2: 
$$\frac{1}{q_t} = \frac{1}{q_e} + \frac{1}{K_2 q_e^2} \frac{1}{t} \quad (2)$$

Type 3: 
$$q_t = q_e - \frac{1}{K_2 q_e} \frac{q_t}{t} \quad (3)$$

Type 4: 
$$\frac{q_t}{t} = k_2 q_e^2 - k_2 q_e q_t \quad (4)$$

Type 5: 
$$\frac{1}{t} = -k_2 q_e + k_2 q_e^2 \frac{1}{q_t} \quad (5)$$

Type 6: 
$$\frac{t}{q_t} = \frac{1}{K_2 q_e^2} + \frac{1}{q_e} t \quad (6)$$

Tip 7: 
$$t = \frac{1}{k_2} \frac{1}{q_e - q_t} - \frac{1}{k_2 q_e} \quad (7)$$

## 2. Materyal ve Metod

Bu çalışmada kullanılan kil Malatya ilinden temin edilmiştir. Tüm kimyasallar Sigma firmasından alınmıştır. Zn (NO<sub>3</sub>)<sub>2</sub>. 3H<sub>2</sub>O adsorbat olarak kullanıldı. Deney 308 K’de gerçekleştirildi. Yalancı ikinci dereceden denklemin sekiz farklı doğrusallaştırılmış versiyonu için Malatya kili (MK) yüzeyine adsorbe edilen Zn<sup>2+</sup> ile deneysel veriler elde edilmiştir. Hesaplamalar microsoft@excel 2010 program ile yapılmıştır. Modele ait 8 doğrusal tipe ait grafikten elde edilen denklemlerden R<sup>2</sup>, q<sub>t</sub> ve k<sub>2</sub> sabitleri bulunmuştur. En küçük kareler yöntemi Regresyon analizi için kullanılmış ve lineer denklemin uygunluk derecesi araştırılmıştır.

## BULGULAR

Zn(II) iyonunun MK ile adsorpsiyon kinetiğinde zamana karşı ölçülen anlık değişimlerinden hesaplama yolu ile edilen q<sub>t</sub> değerleri arasındaki ilişkiyi gösteren kinetic çalışma grafiği şekil 1’de gösterilmiştir.

Şekil 1. 308 K sıcaklığındaki MK'nin çalışma grafiği

Yukarıdaki deneysel verilerin Tablo.1'de gösterilen lineer tiplere uygulanması ile şekil 2-8'de gösterilen grafikler elde edilmiştir:

Tip-1

Şekil 2. 308 K sıcaklığındaki MK üzerine Zn<sup>2+</sup> ait Tip 1 grafiği.

Tip-2

Şekil 3. 308 K sıcaklığındaki MK üzerine Zn<sup>2+</sup> ait Tip 2 grafiği.

Tip-3

Şekil 4. 308 K sıcaklığındaki MK üzerine Zn<sup>2+</sup> ait Tip 3 grafiği.

Tip-4

Şekil 5. 308 K sıcaklığındaki MK üzerine Zn<sup>2+</sup> ait Tip 4 grafiği.

Tip-5

### **Sonuç**

Çinko elementi endüstride yaygın kullanım alanı olan bir metaldir. Kullanım miktarı ile paralel olarak çevre ile kontamine olan metalin sudan giderilmesi için adsorpsiyon kolay, ucuz ve etkili bir yöntem olarak diğer yöntemlere alternatiftir (Onursal, et al., 2019). Adsorpsiyon kinetiği adsorpsiyon çalışmlara içinde özel bir yer alır. Adsorpsiyon kinetiği için en yaygın ve özellikle metaller için deneysel verilere en uygun model, yalancı-ikinci dereceli kinetik modeldir. Dal ve Onursal'ın literatüre iki yeni tip sunması ile literatürdeki Yalancı-ikinci dereceli kinetik modelden türetilen model sayısı sekizi bulmuştur.

Bu çalışmada Malatya kilinin (MK) adsorplayıcı olarak adsorplayıcı olarak kullanıldığı çalışma 308 K sıcaklığında gerçekleştirilmiştir. Kinetik veriler Yalancı- İkinci dereceli kinetik modelin 7 doğrusal tipine uygulanmıştır. Oluşturulan grafiklerden elde edilen sabitler tablolaştırılmıştır.  $q_e$  miktarları ise  $15,65 < 16,03 < 16,35 < 16,85 < 17,35 < 17,82 < 18,35$  olup en yüksek  $q_e$  değeri  $18,35 \text{ mgg}^{-1}$  değeri ile 6 tipine aittir.  $K_2$  sabitleri ise  $0,0025 < 0,0023 < 0,0018 < 0,0016 < 0,0011 < 0,0007 = 0,0007$  şeklinde sıralanmaktadır. . Regresyon analizi en küçük kareler yöntemi ile yapılmıştır. Buna göre modele ait doğrusal tiplerin uygunluk derecesi  $0,9910 < 0,9423 = 0,9423 < 0,8238 = 0,8238 < 0,7385 = 0,7385$  tür. Tip 6'nın, 0,991 gibi yüksek  $R^2$  değeri ile deneysel verilere en uygun tip olduğu görülmüştür.

**ÖZET**

Kobalt elementi çeşitli amaçlarla sanayide kullanılan, kanserojen bir ağır metaldir. Killer, ağır metallerin sulu çözeltiden gideriminde adsorplayıcı olarak yaygın biçimde kullanılmaktadırlar. Bu çalışmada Co (II)'nin sulu çözeltiden giderilmesi için adsorplayıcı olarak kullanılan kil (SK), Sivas Yıldızeli yöresinden alınmıştır. Adsorpsiyon çalışması çalkalamalı su banyosunda 298 K sıcaklığında yapılmıştır. Deneysel veriler Langmuir, Freundlich, Temkin, Elovich, H-J ve HJOD izoterm modellerine uygulanmıştır. Aynı sıcaklıkta gerçekleştirilen kinetik çalışmada ise veriler PFO, PSO, Weber-Morris ve Elovich kinetik modellerine uygulanmıştır. En küçük kareler yöntemine göre yapılan regresyon analizi sonucu izotermilerin deneysel verilere uygunluk derecesi Langmuir > HJOD > Temkin > Freundlich > Elovich > H-J olarak tespit edilmiştir. En yüksek  $R^2$  değeri 0,985 olarak bulunmuştur. Kinetik çalışmalarda ise Elovich > Weber- Morris > PFO > PSO olarak bulunmuştur.  $q_m = 188.68 \text{ mgg}^{-1}$  ve  $q_e = 111 \text{ g}$  olarak bulunmuştur. Her ne kadar kinetik çalışmaya 270 dakikaya kadar devam edilmişse de 90. Dakikada kinetiğin % 90'ın üzerinde denge noktasına yaklaştığı görülmüştür. Dolayısıyla SK kilinin hem adsorplama kapasitesi hem de adsorplama hızı ile Co (II) adsorpsiyonu için ucuz, seri ve etkili bir adsorplayıcı olarak uygun olduğu görüşüne varılmıştır.

**EXAMINATION OF THE REMOVAL OF COBALT (II) FROM AQUEOUS  
SOLUTION BY MIXED TYPE SIVAS/YILDIZELI CLAY IN TERMS OF  
ISOTHERM AND KINETIC**

**ABSTRACT**

Cobalt element is a carcinogenic heavy metal used in industry for various purposes. Clays are widely used as adsorbents in the removal of heavy metals from aqueous solution. In this study, clay (SK) used as adsorbent to remove Co (II) from aqueous solution was taken from Sivas Yıldızeli region. Adsorption study was carried out in a shaking water bath at 298 K temperature. Experimental data, were applied to Langmuir, Freundlich, Temkin, Elovich, H-J and HJOD isotherm models. In the kinetic study carried out at the same temperature, the data were applied to PFO, PSO, Weber-Morris and Elovich kinetic models. As a result of the regression analysis performed according to the least squares method, the degree of conformity of the isotherms to the experimental data was determined as Langmuir > HJOD > Temkin > Freundlich > Elovich > H-J. The highest R<sup>2</sup> value was found to be 0.985. In kinetic studies, it was found as Elovich > Weber-Morris > PFO > PSO and  $q_m = 188.68 \text{ mgg}^{-1}$  and  $q_e = 111 \text{ g}$ . Although the kinetic study was continued up to 270 minutes, it was observed that the kinetics approached the equilibrium point by over 90% at the 90th minute. Therefore, it was concluded that SK clay is suitable as a cheap, rapid and effective adsorbent for Co (II) adsorption with both its adsorption capacity and adsorption rate.

## **GİRİŞ**

Bulduğumuz yüz yıl teknoloji çağı ve nüfusun kontrolsüz bir şekilde artması ile birçok sorunu beraberinde getirmektedir. Çünkü git gide artan tüketim alışkanlıklarının değişimi sonucu kaoslar yaşanabilmektedir. (Çokadar, İleri, Ateş, & İzgi, 2003). Bunun temel nedenlerinden birisi insanın ihtiyaçlarını karşılamak adına Dünyada az gelişmiş, gelişmekte olan ya da gelişmiş ülke olsun tümünde endüstriyel faaliyetlerin artması ve buna bağlı olarak atıkların oluşmasıdır ( Dal M. C., Onursal, Arıca, & Yavuz, 2021). Bu atıkların uygunsuz şekilde bertaraf edilmeleri birçok soruna neden olmakta ve toksik etkiyi arttırmaktadır.

Buna bağlı olarak, bu toksik maddelerin besin zinciri aracılığıyla tüm canlı organizmaları da tehdit ediyor olmasıdır (Dal & Onursal, Two new linearized equations derived from a pseudo-second-order kinetic model., 2023). Özellikle 1970 yıllardan beri kullanılan, son kullanma tarihi geçmiş olan pestisitler sorununa da çözüm bulunamamıştır. Bunlar insan vücudunda birikebilen tehlikeli atıklardır. Dahası bunlar genellikle kanserojen ve mutajenik bileşiklerdir ( Piekarski, Ignatowicz, & Dąbrowski, 2022). Bu toksik maddeler su kütlelerinde çok düşük konsantrasyonlarda dahi oldukça ciddi sağlık ve çevre sorunları oluşturmaktadır. Özellikle madencilik, dericilik, tekstil, ilaç, gübre, metal kaplama gibi faaliyetler sonucu su kirliliği artmakta ve ölümcül salgınlara neden olmaktadır (Mustapha, et al., 2019), ( Altunkayna, Canpolat , & Yavuz , 2021). Su yaşam için neredeyse hava kadar gerekli temel maddelerden birisidir. Besin maddesi olduğu gibi bünyesinde barındırdığı mineraller ve bileşikler ile canlıların biyokimyasal reaksiyonunun oluşumunun en önemli unsurları arasındadır. Suyun görevleri arasında vücudun pH dengesini korumak, gıda ve kalıntı maddeleri uygun yerlere taşımak ta bulunmaktadır (Buldağ, 2018). Bunların dışında ağır metaller de son yüzyılda aşırı kullanılmaya başlanmış bertaraf edilmesi sıkıntı oluşturmaya başlamıştır. Toprağa ve suya sızan ağır metal atıklarının bertarafı için çok yoğun araştırmalar yapılmakta ve çeşitli yöntemler geliştirilmektedir. Bu yöntemlerden en çok tercih edileni ise adsorpsiyondur.

## **Ağır Metaller**

Ağır metal tanımlanacak olunursa, fiziksel yönden yoğunluğu 5 g/cm<sup>3</sup> den büyük olan açık renkli ve metalik özellikleri bulunan elementlere denmektedir. Bu grupta ki element sayısı altmıştan fazladır. Bunlar içerisinde Çinko, bakır, mangan, kobalt, kadmiyum, kurşun, cıva ve nikel sayılabilir (Demir & Yalçın, 2014). Bazı ağır metallerin düşük geri dönüşümü, sınırlı miktarda rezervinin olması ve tedarik etme riski ile benzersiz özelliklerinin olması, onların stratejik metaller olarak ifade edilmesini sağlamıştır. Kobaltta bunlardan biridir (Conte, Díez, Brigitte, Gómez , & Rodríguez , 2023).

### **Kobalt**

Her türlü elektronik cihaz için şarj edilebilir iyon-lityum pillerin üretilmesi için gerekli olan katot malzemesinin kullanımı yönünden kobalt, en önemli stratejik metallere biri olarak kabul görmektedir (Conte, Díez, Brigitte, Gómez , & Rodríguez , 2023). Bunun yanı sıra çalışmalar endüstrilerdeki düzensiz uygulamalar ve kaynak dağıtımındaki aşırı dengesizlik nedeniyle mevcut kobalt madenciliği uygulamalarını ve tedarik zincirinin hem sürdürülemez hem de çevreye zararlı olduğunu göstermektedir (Amoo , et al., 2023).

### **Kil Mineralleri**

Tanecik boyutu 2µm' den daha küçük olan kayaç malzemelere kil; tanecik boyutu 2µm ' nin altında olan tabakalı silikatlara ise kil minerali denmektedir. Birçok çeşidi vardır. Kaolinit, illit, smektit ve vermikülit, montmorillonit bunlardan bazılarıdır. Genel formülleri ise;  $[Si_{3-4}Al_{0-1}O_{10}] (Al, Mg, Fe)_{2-3} (Ca, Mg, Na, K) (OH)_{2-8} .nH_2O$  olarak verilmektedir (Demir & Yalçın, 2014).

### **Materyal ve Metod**

Bu çalışmada Sivas ili Yıldızeli ilçesinden temin edilen kil kullanılmıştır. 100 °C' de kurutulup Retsch Marka bilyalı öğütücüde öğütülmüştür. Kilin karakterizasyonu XRF, SEM, EDAX, BET (Quantachrome Nova Win)markalı cihazda yaptırılmıştır. Sivas kilinin (SK) analiz sonuçları aşağıda verilmiştir. Adsorpsiyon çalışmaları Memmert Marka çalkalyıcılı banyoda 298 K sıcaklığında gerçekleştirilmiştir. Adsorpsiyon deneyleri denge ve kinetik çalışmalar diye iki grupta ele alınmıştır. Çözelti konsantrasyonları Unicam 929 model AAS cihazı ile ölçülmüştür. Elde edilen ham veriler Microsoft excell®2010 programı ile hesaplanmıştır. Bu veriler ışığında oluşturulan grafiklerden elde edilen sabitler tablolaştırılmıştır.

### **XRF analizi**

Kilin XRF analizi yaptırılmış ve sonuçlar aşağıdaki tabloda verilmiştir.

Tablo 1. Sivas/Yıldızeli Kilinin XRF analizi Sonucu

Numune İşareti	LOI %	Al <sub>2</sub> O <sub>3</sub> %	CaO %	Fe <sub>2</sub> O <sub>3</sub> %	K <sub>2</sub> O %	MgO %	MnO %	Na <sub>2</sub> O %	P <sub>2</sub> O <sub>5</sub> %	SiO <sub>2</sub> %	TiO <sub>2</sub> %
Sivas Kili	10.50	14.7	3.7	7.5	1.0	4.3	0.1	0.1	<0.1	57.1	0.6

Şekil 2 ve tablo1 verileri incelendiği zaman SEM-EDX ve XRF sonuçları ile mikroskobik ve makroskobik veriler arasında bir tutarlılık olduğu ve birbirlerini desteklediği görülmektedir.

### SEM-EDAX Analizi

Şekil 2. Kilin metal ile etkileşimi sonucu elde edilen EDX diyagramı.

Bu tablodaki veriler ile şekil 2'deki diyagram incelendiğinde, SK tarafından kobalt'ın adsorplandığı anlaşılmaktadır.

### BET analizi

BET (Braun Emmet Teller) analizinde numuneye 105 °C sıcaklıkta 20 saat boyunca vakum işlemi uygulanmış olup, yüzey alanı 153,364 m<sup>2</sup>/g olarak ölçülmüştür.

## **Adsorpsiyon Kinetik Modelleri**

### **Kinetik çalışmalar**

Adsorpsiyon prosesi zamana bağlı olarak gelişmektedir. Adsorpsiyon kinetiği ise, adsorplayıcı ile adsorplanan arasındaki denge temas süresini ifade etmektedir. Yani adsorplanan ile adsorplayıcının doyuma ulaşmaya dek geçen süredir. Bunun yanı sıra adsorpsiyonun hangi mekanizma ile gerçekleştiğini tespit eden pek çok kinetik model mevcuttur. Bunlardan en çok tanınan ve kullanılanlar arasında PFO (Pseudo- first-order model), PSO (Pseudo-second-order model), Elovich model ve Weber and Morris (W&M) model) olduğu söylenebilir ( Altunkaynak , Canpolat, & Yavuz, 2023).

$$\ln(q_e - q_t) = \ln q_e - k_1 t \quad (1)$$

-PSO modeli aslında adsorpsiyon hızı ve aktif yüzey mevkiilerinin sayısı ile doğru orantılı olduğundan, bir anlamda Langmuir modelini takip etmektedir. 1999 yılında Ho- Mckay bu eşitliği aşağıdaki biçimde oluşturmuşlardır (Ho & McKay, 1999b).

$$\frac{t}{q_t} = \left( \frac{1}{k_2 q_e^2} \right) + \left( \frac{1}{q_e} \right) t \quad (2)$$

-Elovich modeli ampirik bir modeldir ve en önemli iki varsayımı ise, adsorpsiyon süresine bağlı olarak artan aktivasyon enerjisi ile adsorbanın yüzeyinin heterojen olması şeklindedir. Elovich denklemini ise;

$$qt = ( 1 / \beta ) \ln(\alpha. \beta) + ( 1 / \beta ) \ln t \quad (3)$$

şeklindedir. Burada;

$\beta$ , yüzeye ait aktivasyon enerjisi ( $E_a$ ) ile ilişkili desorpsiyon sabitini ( $gmg^{-1}$ )

$\alpha$ , başlangıçtaki adsorpsiyon oranını ( $mg (g dk)^{-1}$ )

$q_t$ , t zamanda adsorplanan madde miktarını ifade etmektedir. (Kanmaz, 2022).

- Weber and Morris, kendi adlarıyla yayımlanan bu modeli, parçacık içi difüzyon sürecini tanımlamak için geliştirmişlerdir. Bu model aşağıdaki bağıntıda verildiği gibidir; (Wang & Guo, 2020).

$$q_t = k_{W\&M} t^{\frac{1}{2}}, \quad (4)$$

Burada  $k_{w\&M}$ , Weber-Morris sabitidir.

### **Bulgular**

Bu çalışmada 298 K sıcaklığında çalışılan SK kilinin yüzeyine adsorbe edilen  $Co^{2+}$  için deneysel veriler kinetik modellerden PFO, PSO, Elovich ve Weber-Morris modellerine uygulanmış, konsantrasyon izotermi ise; Langmuir, Freundlich, Harkins-Jura ve HJOD modellerine uygulanmış olup elde edilen grafik ve tablolar aşağıda verilmiştir.  $Co(II)$  iyonunun

SK ile adsorpsiyon kinetiğinde zamana karşı anlık ölçülen derişimlerinin hesaplanması suretiyle elde edilmiş olan  $q_t$  değerleri arasındaki ilişkiyi veren grafik şekil 1.de verilmiştir.

Şekil 1. Co<sup>2+</sup>'nin SK ile adsorpsiyon kinetiğinde  $q_t$ -t ilişkisi grafiği.

Grafikten de anlaşıldığı üzere artan zamana bağlı olarak, doyma durumuna göre  $q_t$ 'deki artış hızı yavaşlama eğilimindedir. Eğri, sonsuz zaman dilimine doğru gittikçe  $q_t$  değerine yakınsamaktadır. Deneylerden elde edilen verilerin uygulandığı kinetik modeller şekil 2 ile şekil 5 aralığında gösterilmiştir.

### Kinetik Çalışmalar

Şekil 2. 298 K sıcaklığındaki Co<sup>2+</sup>'nin PFO grafiği.

Şekil 3. 298 K sıcaklığındaki Co<sup>2+</sup>'nin PSO grafiği.

Şekil 4. 298 K sıcaklığındaki Co<sup>2+</sup>'nin Elovich grafiği.

Şekil 5. 298 K sıcaklığındaki Co<sup>2+</sup>'nin Weber-Morris grafiği.

Grafiklerden elde edilen sabitler ise tablo 2'de verilmiştir.

**Tablo.2.** Co (II)'nin SK kili adsorpsiyonuna ait kinetik veri sonuçları

İzoterm modelleri olan angmuir, Freundlich, Harkins-Jura ve HarkinsJura-OnursalDal (HJOD)' a deneysel veriler uygulanmış ve elde edilen grafik ve tablolar aşağıda verilmiştir.

### İzoterm Çalışmaları

İzoterm eğrileri, çözeltinin içerisinde kalan madde ile adsorplanan madde miktarına karşı çizilerek elde edilmektedir. Genellikle artan sıcaklığa bağlı olarak adsorpsiyonunda arttığı gözlemlenir. Bu çalışmanın verileri Langmuir, Freundlich, HJ ve HJOD'a uygulanarak aşağıdaki grafikler elde edilmiştir.

**Şekil 6.** 298 K sıcaklığındaki  $\text{Co}^{2+}$ 'nin  $q_e$ - $C_e$  ilişkisi grafiği.

**Şekil 7.** 298 K sıcaklığındaki  $\text{Co}^{2+}$ 'nin Langmuir grafiği.

### Sonuç

Ağır metallerin canlı ve özellikle insan sağlığına olumsuz etkileri bilinmekte ve bu etkiler araştırılmaktadır. Kritik hammadde olarak tanımlanan kobalt metali diğer taraftan ağır toksik etkisi ve kanserojen olması nedeni ile çevreden uzak tutulması gereken bir elementtir. Adsorpsiyon kobaltın giderimi için alternatif bir yöntemdir. Bu çalışmada adsorplayıcı olarak seçilen Sivas kili (SK) ile 298 K sıcaklığında çalkalayıcılı su banyosu ile Co(II) iyonunun adsorpsiyonu çalışmaları kapsamında izoterm ve kinetik çalışması yapılmıştır. İzoterm çalışmaları sonucu elde edilen hamveriler Langmuir, Freundlich, Elovich, H-J ve HJOD izoterm modellerine uygulanmıştır. Kinetik çalışmalardan elde edilen veriler ise Pseudo- First Kinetic Order Model (PFO), Pseudo- Second Kinetic Order Model (PSO), Intra Particle Diffusion Model (Weber-Morris) ve Elovich kinetik modellerine uygulanmıştır. En küçük kareler yöntemine göre yapılan regresyon analizi sonucu izotermilerin deneysel verilere uygunluk derecesi Langmuir > HJOD > Temkin > Freundlich > Elovich > H-J olarak tespit edilmiştir. En yüksek  $R^2$  değeri 0,985 olarak bulunmuştur. Kinetik çalışma için yapılan regresyon analizi modellerin deneysel veriye uygunluk derecelerinin Elovich > Weber- Morris > PFO > PSO olarak bulunmuştur. İzotermelerde  $q_m = 188.68$  g ve kinetik çalışmada  $q_e = 111$  g olarak bulunmuştur. 90 dakikada denge noktasına % 90 yaklaşıldığı tespit edilmiştir. Sonuç olarak SK kilinin Co (II)’nin adsorpsiyonu için uygun bir adsorplayıcı olduğu kanaatine varılmıştır.

**ÖZET**

Günümüz eğitiminde etkin olan kullanılan yapılandırmacı yaklaşım, bilginin aktif katılımını ve bireysel olarak yapılandırıldığını ortaya koymaktadır. Çocuk gelişiminde bireysel farklılıklar söz konusu olduğunda her çocuğa öğrenme şansı verilmesi, aktif uyarıcılarla karşı karşıya olması, öğretimde kullanılan yöntem, teknik ve materyallerin çeşitliliği ve ulaşılabilirliği aynı oranda değildir. Bu yüzden çocukların etkin öğrenme süreçlerinde yaş ve gelişim düzeylerine uygun etkinliklerin planlanarak, çeşitli konularda bilgi ve beceri edinmeleri, yeni kazanımlar elde etmeleri sağlanmalıdır. Bu noktada çocuklar için bilimsel bilginin verimli şekilde öğrenilip, kavram yanılgılarını ve oluşabilecek mantıksal boşlukları en aza indirebilecek yöntem ve yaklaşımların kullanılması son derece elzemdir. Yapararak yaşayarak öğrenme sürecinin desteklenmesi, bilimsel bilginin gelişmesi ve uygulanmasında yeni modellere ve öğrenme stratejilerine yer verilmesi, öğrenmenin gerçekleşmesi sürecinde çocuğu desteklemektedir. Deneyler her yaş grubu çocuk için eğlenceli, somut, geleneksel yöntemlerin aksine keşif temelli bir öğrenme sunar. Her yaş grubu çocuk için fen ve doğa etkinliklerin planlanması, bilginin doğrudan aktarılacak değil buluş yoluyla deneyimlenmesine izin vererek, çocukların farklı konularda yeni kazanımlar elde edilmesine de olanak sağlar. Ezberci yöntemlerin aksine bu tür etkinlikler; çocuğun araştırması, inceleme ve gözlem yapabilmesi noktasında bilimsel bir temel oluşturmanın yanında bu tür iç içelik çocuğun gelişim alanlarına olumlu yönde katkı sağlar. Sonuç olarak derleme niteliğindeki bu çalışmada erken çocukluk döneminde ki çocukların bilgiyi somut hale getirerek aktif deneyimleme fırsatı yakalayacakları farklı ( buharlaşma, süblimleşme, tek hücreli canlı deneyleri vb.) konulara ilişkin deneysel örneklerle yer verilmiştir.

**Anahtar Kelimeler:** Çocuk gelişimi, Deney, Fen ve Doğa

**CONTRIBUTION OF EXPERIMENTAL ACTIVITY EXAMPLES PREPARED FOR  
CHILDREN TO LEARNING**

**ABSTRACT**

The constructivist approach used in today's education reveals the active participation of knowledge and its individual configuration. When it comes to individual differences in child development, each child is given a chance to learn, faces active stimuli, methods used in teaching, variety of techniques and materials and their availability are not at the same rate. Therefore, it should be ensured that children acquire knowledge and skills in various subjects by planning activities suitable for age and development levels in effective learning processes and to obtain new achievements. At this point, it is extremely important for children to learn scientific knowledge efficiently and to use methods and approaches that can minimize misconceptions and logical gaps. Supporting the process of living learning by doing, introducing new models and learning strategies in the development and application of scientific knowledge supports the child in the process of learning. Experiments offer exploration-based learning unlike traditional, concrete methods that are fun for all age group children. The planning of science and nature activities for each age group child allows children to experience new achievements in different subjects, not through direct transfer of knowledge, but through invention. Unlike ezberci methods, such activities; in addition to creating a scientific basis for the child to research, examine and observe, this kind of inner steel contributes positively to the development areas of the child. As a result, in this compiled study, children in early childhood will have the opportunity to materialize information and experience it actively (evaporation, sublimation, single-celled live experiments, etc.) Experimental examples of subjects are given.

**Keywords:** Child development, Experimentation, Science and Nature

## **GİRİŞ**

Çocuklar çevresinde olup bitenleri gözlemleyerek dış dünyayı araştırır ve çevresinde olup biten pek çok şeyi algılamaya çalışır. Farklı zamanlarda algıladığı bilgilerin birbirleri ile bağlantısını ya da farklılıklarını anlamaya çabalar ve gelişim alanlarını şekillendirir. Çevresinde gördüğü nesnelere, olayları merak eder ve bu merakını giderebilmek için neden-sonuç ilişkisi kurmaya çalışır. Kimi zaman “Rüzgârın nasıl oluştuğunu, kuşların nasıl uçtuğunu ya da yağmurun nasıl yağdığını gözlemler, bu durumlara dair sorular sorar, gözlem, keşif ve deneysel etkinlikler yapar. Merak ettikleri konular olduğunu çevresindekilere de gösterir. Doğası gereği doğuştan meraklı ve keşfetmeye istekli olan çocuk bu özelliği sayesinde, matematik, fen ve benzeri pek çok alanlara ilişkin bilimsel kavramları da zamanla keşfetmeye başlar. Bu keşif arzusu, onların bilimsel düşünmeyi ve problem çözme becerilerini geliştirmelerine yardımcı olur. Hayal güçlerini serbest bırakmalarına ve farklı çözüm yolları düşünmelerine olanak tanıyan deneysel çalışmalarla günlük hayatta iç içe olmaları çocukların yaşamlarında bu yönüyle önemli bir role sahiptir (Çetin Çetin, T., Yavuz, S., Tokgöz, B., Güven, G. (2012), Can Yaşar, M. ve Aral, N. (2010). Bu keşif sürecinde deneysel etkinliklere yer vermek; çocukların ilgi duydukları alanlara odaklanmalarına dahası bilim dünyasına olan ilgilerini artırmalarına da yardımcı olur. Yaşamın erken dönemlerinden başlayarak bilimsel uygulamaların bir parçası olmak, çocuğu merak ve sorgulamaya teşvik eder. Böylece ileri ki yaşlarda derinlemesine bilimsel çalışmalara yönelmeleri de sağlanabilir. Bilimsel düşünmeyi ve problem çözme becerilerini başarıyla kullanmalarına yardımcı olacak uygulamalar çocukların bilimsel süreç becerilerini kazanmaları için önemlidir (Çetin T. ve ark.,2012, Akman, Üstün ve Güler, 2003). Çocukların olayları tek bir bakış açısıyla değerlendirmelerini sınırlandırmak, aynı olay veya nesne için farklı bakış açılarının olabileceğini göstermek, kavramların somut hale getirilmesi sağlamak için deneysel çalışmalardan faydalanmak bu sayede nesnenin farklı özelliklerini keşfetmeleri için fırsatlar sunmak çocuk gelişimi için destekleyicidir. Bu gerekçeler ışığında çocukların, duyularını kullanarak gözlem yapma, tahminde bulunma, tahminlerini arkadaşları ile paylaşma, tahminlerini araştırma ya da deneylerle test etme çalışmaları ile fen-doğa uygulamalarına aktif katılımlarını sağlayacakları etkinlikleri deneyimlemeleri gelişimleri açısından elzemdir. Başka bir ifade ile bilimsel süreç becerilerini geliştirirken, çocukların olayların neden-sonuç ilişkilerini anlamalarına ve farklı olayları birbiriyle ilişkilendirmelerine yardımcı olacak eğitim uygulamalarında deneysel çalışmalara yer vermek önemlidir. Kısacası deneyler günlük hayatın bir parçasıdır. İnsan, yaşamın her aşamasında bir doğa olayı ile karşılaşma ve karşılaştığı bu yeni olayı da temelde merak duygusu ile birlikte öğrenme isteğini geliştirmek çocuğun dünyayı

daha derinlemesine anlamasına yardımcı olur (Güler ve Bıkmaz, 2002; Karamustafaoğlu, 2006).

### **Deneysel Çalışmaların Çocuklara Katkıları Nelerdir?**

Dünyayı anlamak ve keşfetmek için bir araç olarak kullanılan bilim çocuğun içinde yaşadığı doğayı ve evreni, bilinen somut ve tarafsız unsurlar aracılığıyla anlamasını kolaylaştırır (Çapan, 2019). Deney değişkenleri değiştirme ve kontrol etme sürecidir. Bu süreç diğer tüm süreçlerle birleşerek, gerekli birçok araç gereci beceriyle kullanarak uygun bir düzenek kurmayı, değişkenleri değiştirip kontrol ederek veriler elde etmeyi, bu verileri kaydedip değerlendirerek model oluşturmayı, verileri yorumlamayı, sonuca varmayı ve yapılanları raporlaştırmayı içeren bir süreç olarak ifade edilir ( Tan ve Temiz, 2003).Çocuğun karşı karşıya kaldığı olayları, durumları gözlemlemesi, araştırması ve sonuçlara varmasını sağlayan bu süreç çocukların merak duygularından yola çıkarak olayları ve nesnelere tanımlarını sağlayarak günlük yaşamlarında gerekli olan çeşitli becerileri kazanmalarına da katkı sağlar. Yaratıcı düşünme yeteneğinin gelişmesi için temel basamak nitelikte olan deneysel etkinlikler aynı zamanda düşüncelerini ifade etmelerini de sağlar. Olay ve durumlara ilişkin yorumlama becerini kullanan çocuk; deneme-keşfetme ve araştırma yoluyla bilişsel olarak kendisini de destekler. Aşağıda alan yazında yer alan deneysel çalışmalarının çocuklar üzerindeki etkilerindeki olumlu etkilerini ortaya koyan bazı çalışmalara yer verilmiştir. Dejonckheere ve arkadaşları tarafından (2016) yapılan çalışmada; dört okul öncesi (4-6 yaş) sınıfı karşılaştırılmıştır. Çocuklara toplamda 15 deneysel etkinlik yaptırılarak sınıflar arasında farklı bilimsel olguları keşfetmeye çalışmışlardır. Örneğin ağırlığın ve pozisyonun denge üzerindeki etkisini keşfetmek için çeşitli boyutlardaki bardaklara su doldurulmuş ya da sesin etkisi farklı deneylerle keşfedilmeye çalışılmıştır. Çalışma sonunda deneylerin derinlemesine öğrenmede teşvik edici olduğu, çocukların daha sonra ne olacağına veya başka bir şey olursa ne yapılabileceğine dair tahminlerde bulunabildikleri belirtilmiştir.Civelek ve Akamca (2018) tarafından yapılan araştırmada ise 6 yaş toplam 14 çocuk çalışma grubunu oluşturmaktadır. Çalışma kapsamında, araştırmacı tarafından bilimsel süreç becerilerinin beş alt becerisine (gözlem yapma, sınıflama, tahmin etme, ölçme ve sonuç çıkarma) ait etkinlikleri içeren açık alan eğitim modülü hazırlanmış 8 hafta deney grubuna uygulanmıştır. Sonuç olarak açık alan etkinliklerinin; çocukların gözlem yapma, sınıflama ve ölçme becerilerini geliştirmede sınıf içi etkinliklerden daha etkili olduğu görülürken, açık alan etkinliklerinin çocukların tahmin etme ve sonuç çıkarma becerilerini geliştirmede sınıf içi etkinliklerden daha etkili olmadığı sonucuna ulaşılmıştır.

Ünal ve Aksüt (2021) tarafından yapılan “4-6 yaş çocuklarına etkinlik temelli STEM eğitiminin bilimsel süreç becerilerine etkisinin incelenmesi” adlı çalışma toplamda 48 çocukla (19 deney, 29 kontrol) gerçekleştirilmiştir. Etkinlik Temelli STEM Eğitimi Uygulamalarının çocukların bilimsel süreç becerilerini olumlu yönde desteklediği sonucuna ulaşılmıştır.

### **SONUÇ**

Kısacası deneyler çocukların doğaya olan merakını ve ilgisini teşvik ederek dünyayı anlama, keşfetme ve sorgulama yeteneklerini geliştirmelerine yardımcı olur. Ancak, bu süreçte bilinçli ve gelişimsel olarak uygun seçimler yapmak önemlidir. Çocuklar sadece bilim bilgisi edinmekle kalmaz, aynı zamanda dünyayı anlama sürecini somutlaştırır. Belirli bir planlama yapmanın yanında, benzer özellikler yönünden ayırım yapmayı da öğrenir. Örneğin bir cevizi insan beyni ile bir mantarı insan kulağına benzeterek basit analoglar oluşturur. Deneyler yoluyla kavramlar ve kavramlar arasındaki aşamaları belirler bunları farklı nesnelere ilişkilendirir. Örneğin bir ipeğin oluşum süresince koza, ipek ve kumaş ilişkisini kurar. Çocuğa ebeveynleri ve eğitimcileri tarafından yeterli ve teşvik edici ortamların sunulması, olumlu bir bakış açısına sahip olmaları deneysel çalışmalara ilgi duymaları açısından önemlidir. Çocuklar profesyonel olarak deneysel çalışmalara yetkin olmasalar da zihinsel olarak merak ettikleri sorulara yanıt bulabilir deneysel çalışmalar yoluyla meraklarını giderebilirler. Bilgiye ulaşmanın kolaylaşmasının yanında bilgi kirliliğinin fazlalaştığı bir çağda doğru bilgiye ulaşmak için gerekli eleştirel ve bilimsel düşünme becerilerine sahip bireyler yetiştirmesi için yaparak-yaşayarak öğrenme fırsatı için deneysel uygulamalardan yararlanılması çocuklar için gereklidir.

### **ÖZET**

Günümüzde doğal kaynakların azalması ve enerji tüketiminin artması sebebiyle yenilenebilir ve çevre dostu doğal malzemeler üzerine yapılan araştırmalar giderek artmaktadır. Endüstriyel alandaki gelişmelerin artmasıyla birlikte petrol bazlı plastiklerin üretimi de artmaktadır. Biyolojik olarak doğada bozunmayan bu plastiklerin artması, çevre kirliliğine yol açmakta ve insan sağlığı açısından da risk oluşturmaktadır. Çevre dostu, biyo bazlı ve yüksek performanslı kompozit malzemelerin üretimi ve geliştirilmesi de giderek önem kazanmaktadır. Son yıllarda kompozit malzeme üretiminde ve plastiklere alternatif olarak kullanılan selüloz kaynaklı malzemelerin üretimi ve geliştirilmesi için çeşitli çalışmalar yapılmaktadır. Selüloz, bitkisel ve hayvansal kaynakların yanı sıra bakterilerden de kolaylıkla temin edilebilen, ucuz, yenilenebilir, biyobozunur, biyoyumlu ve doğada en bol bulunan doğal bir polimerdir. Selüloz, yüksek fiziksel ve mekanik özellikleri, kolay ulaşılabilirliği ve çevre dostu olması gibi avantajlarından dolayı biyo bazlı malzeme üretiminde giderek daha fazla tercih edilmektedir. Selüloz kullanılarak elde edilen biyolojik malzemelerden biri ise selüloz nanofibrillerdir (NFC). NFC'ler, 10-100 nm arasında değişen selüloz moleküllerinin çok ince uzun lifler halinde düzenlenmesiyle elde edilen nano boyutlu malzemelerdir. NFC'lerin içerisindeki fibriller, kristalin ya da amorf yapıda olabilmektedir. NFC'ler, selüloz liflerinden mekanik, kimyasal, asit veya enzimatik ön işlemlerle üretilen, yüksek özgül dayanıma ve sertliğe, düşük termal genleşmeye ve yoğunluğa sahip olan ve çeşitli alanlarda kullanılabilen biyo-esaslı nanomalzemelerdir. NFC'ler tarım ve gıda atıklarının yapısında bulunan selülozdan da üretilmekte ve böylece bu ürünlerin ekonomik değeri daha yüksek ürünlere dönüştürülmesine katkı sağlanmaktadır. Bu çalışmada da çeşitli tarımsal ve gıda atıklarından elde edilen NFC'lerin kompozit film üretiminde kullanılması potansiyeli araştırılacaktır.

**Anahtar Kelimeler:** Selüloz, selüloz nanofibril, kompozit film, nanomalzeme

## **COMPOSITE FILM PRODUCTION FROM CELLULOSE NANOFIBRILS**

### **ABSTRACT**

Nowadays, research on renewable and environmentally friendly natural materials is increasing due to the decrease in natural resources and the increase in energy consumption. With the increasing developments in the industrial field, the production of petroleum-based plastics is also increasing. The increase in these plastics, which do not biodegrade in nature, causes environmental pollution and poses a risk to human health. The production and development of environmentally friendly, bio-based, and high-performance composite materials are becoming increasingly significant. In recent years, various studies have been carried out for the production and development of cellulose-based materials used in the production of composite materials and as an alternative to plastics. Cellulose is an inexpensive, renewable, biodegradable, biocompatible, and the most abundant natural polymer in nature, easily sourced from plant, and animal sources as well as bacteria. Cellulose is increasingly preferred in the production of bio-based materials due to its advantages such as high physical and mechanical properties, easy accessibility, and environmental friendliness. One of the biological materials obtained using cellulose is cellulose nanofibrils (NFC). NFCs are nano-sized materials obtained by arranging cellulose molecules ranging from 10-100 nm into very thin long fibers. The fibrils in NFCs can be crystalline or amorphous. NFCs are bio-based nanomaterials that are obtained from cellulose fibers through mechanical, chemical, acid, or enzymatic pretreatments, have high specific strength and stiffness, low thermal expansion and density, and can be used in various fields. NFCs can also be produced from the cellulose in the structure of agricultural and food wastes and thus contribute to the transformation of these products into products with higher economic value. In this study, the potential of using NFCs from various agricultural and food wastes in composite film production will be investigated.

**Keywords:** Cellulose, cellulose nanofibril, composite film, nanomaterial

## **1. GİRİŞ**

Petrol kaynaklı doğada bozunmayan plastikler çevre kirliliğine sebep olduğu için, son zamanlarda biyo bazlı kaynaklardan, yenilenebilir, biyobozunur, çevre dostu ve düşük maliyetli alternatif malzemeler geliştirmek için yoğun çaba sarf edilmektedir (Xiao et al., 2015). Biyobozunur, yenilenebilir, düşük maliyet ve toksik olmama gibi üstün özelliklere sahip dünyada en çok bulunan biyo bazlı hammaddelerden biri de selüloz polimeridir (Bastante et al., 2021). Selüloz, çeşitli arıtma yöntemleriyle nanoselüloza (NC) dönüştürülebilmektedir. NC'ler, farklı yöntemlerle selüloz nanofibril (NFC), bakteriyel nanoselüloz (BNC) ve selüloz nanokristal (CNC) olmak üzere üç farklı türde sentezlenebilmektedir (Silva et al., 2020).

Nanofibriller, çeşitli işlemlerle (fiziksel, kimyasal ve diğer işlemler) amorf bölgeler boyunca enlemesine bölünerek elde edilen, hemiselülozik matrise bağlanan sert selülozik mikrofibrillerdir. Nanofibriller, yüksek en boy oranına, yüksek spesifik yüzey alanına sahip, düşük maliyetli, toksik olmayan takviye malzemelerdir (do Lago et al., 2020). Nano boyuttaki selüloz liflerinden meydana gelen NFC'ler ise selüloz liflerinin çapının nano boyuta getirilerek küçültülmesiyle üretilmektedir. Mekanik arıtmanın yanı sıra NFC, bazı kimyasal ve enzimatik işlemler kullanılarak da üretilebilmektedir. NFC'lerin elde edilmesinden sonra çeşitli işlemlerle (kimyasal aşılama ve adsorpsiyon gibi) özellikleri değiştirilerek uyumlulukları artırılmakta ve davranışları değiştirilebilmektedir. Örneğin adsorpsiyon veya kimyasal aşılama ile hidrofiliği azaltılabilmekte, yeni özellikler kazandırılmakta ve böylece uygulama alanı genişletilebilmektedir (Rol et al., 2019). NFC'ler, yüksek mekanik özelliklere ve bası ütüne özelliklere (biyobozunurluk, düşük maliyet, yenilenebilirlik, yüksek mukavemet ve düşük termal genleşme gibi) sahip olduğundan termoplastik matris malzemelerde dolgu maddesi olarak kullanılabilir. Bu özellikler NFC'lerin kompozit malzemeler için iyi bir takviye dolgu maddesi olmasına imkan sağlamaktadır. NFC'lerin kullanıldığı alanlardan birisi de nanokompozit film üretimleridir. Selüloz nanofibrillerin, nanokompozit üretiminde takviye olarak kullanıldığı pek çok çalışma mevcuttur (LakshmiBalasubramaniam et al., 2022; Oun & Rhim, 2015; Qing et al., 2015). Selüloz nanofibriller farklı alanlarda kullanılmakla birlikte yüksek hidrofiliği özellikleri ve jel benzeri davranış göstermeleri kullanımlarını sınırlamaktadır (Rol et al., 2019).

NFC'ler filmlere dönüştürülebilmekte ve doğada bozunmayan ve çevre kirliliğine yol açan plastik ambalajların yerine alternatif olarak kullanılabilir. Geleneksel olarak NFC filmler, vakumlu filtreleme, döküm, daldırılmalı kaplama, döndürerek kaplama, sürekli kaplama gibi farklı yöntemler kullanılarak üretilebilmektedir. Ancak kullanılan bu yöntemlerin bazı

kısıtlamaları olduğundan geniş ölçekte uygulanamamaktadır. Film üretimlerinde filmlerin homojen olmaması, kaplama işleminden sonra filmlerin filtreden ayrılması gibi bazı sorunlar yaşanmaktadır (Nadeem et al., 2022).

Selülozik nanofibriller, genel olarak katma değeri düşük olan ve çevre sorunu yaratan tarımsal sanayi yan ürünlerinden ve atıklardan elde edilebilmektedir. Dünya çapında yaygın olan tarım ve ormancılık faaliyetlerinden elde edilen bu yan ürünler, kolay bulunabilirlikleri göz önüne alındığında mükemmel sürdürülebilir ve yenilenebilir selüloz kaynaklarıdır (do Lago et al., 2020). Bu çalışmanın amacı çeşitli tarımsal ve gıda atıklarından elde edilen NFC'ler kullanılarak hazırlanan kompozit film üretimlerini incelemektir.

## **2. SELÜLOZ**

Selüloz dünyada en yaygın ve en bol bulunan polimerlerden biridir. Keten, kenevir, pamuk, jüt, yüksek miktarda selüloz içeriğine sahip bitkilerden sadece birkaçıdır. Selüloz, bakteriler ve omurgasız deniz canlıları (*tunicates*) tarafından da sentezlenebilmektedir. Selüloz bir karbonhidrat olarak sınıflandırılmasına rağmen, monosakkaritlerden sentezlenebilmesi veya hidrolize edilebilmesi sebebiyle diğer organik bileşiklerden farklı olduğu vurgulanmaktadır (Verma et al., 2024).

Selüloz, birçok biyolojik atıkta lignin ve hemiselülozdan meydana gelen bir matris ile çevrelenen fibriller halinde bulunmaktadır. Bu atıklardan selülozun ayrıştırılması için bazı yöntemler kullanılmaktadır (buhar patlatma, klor içermeyen yöntem, Organosolv yöntemi ve iyonik sıvılar yöntemi gibi). Fakat bu yöntemlerin, selüloz eldesinde düşük verim ve yüksek maliyet gibi bazı sınırlamaları bulunmaktadır (Zainal et al., 2021).

### **2.1. Nanoselüloz**

Nanoselüloz (NC), son yıllarda çeşitli endüstriyel uygulamalar için dikkat çeken benzersiz özelliklere sahip bir biyomateryal olarak kapsamlı şekilde araştırılmaktadır. NC, doğada bol miktarda bulunan bir polimer olan selülozdan üretilmektedir. Üstün özellikleri arasında yüksek en-boy oranı ve yüksek yüzey alanı, iyi mekanik, mukavemet ve biyoyumluluk özellikleri bulunmaktadır (Leong et al., 2023). Uygulanan ön işleme bağlı olarak, çeşitli bitkisel kaynaklardan ekstrakte edilen iki çeşit nanoselüloz bulunmaktadır: bunlardan biri selüloz nanokristalleri (CNC)'ler diğeri nanofibrillenmiş selüloz (NFC) veya mikrofibrillenmiş selüloz (MFC) olarak da adlandırılan selüloz nanofibrilleri (CNF'ler)'dir. CNC'ler selülozun amorf bölgelerinin kimyasal hidrolizi ile elde edilirken, NFC'ler selüloz süspansiyonunun mekanik bir işleme tabi tutulmasıyla elde edilmektedir. Bakteriyel selüloz çok saf olan ve esas olarak  $\alpha$ -selülozdan oluşan ve değiştirilmesini kolaylaştıran üçüncü bir nanoselüloz türünü

oluşturmaktadır. Bu üçüncü tip nanoselüloz, karakteristik şerit benzeri nanofibriller oluşturan bakteriler tarafından üretilir ve bunları elde etmek için mekanik işlemlere gerek yoktur (Rol et al., 2019). NC'ler ham maddelerden enzimatik hidroliz, asit hidrolizi ve mekanik işlemler olmak üzere çeşitli yöntemlerle elde edilebilmektedir. Bu yöntemler ile NC'ler pektin, hemiselüloz veya lignin zincirlerinden ayrılmaktadır. NC eldesinde iki farklı yaklaşım kullanılmaktadır: lignoselülozik biyokütlenin fiziksel veya kimyasal olarak parçalanmasını içeren yukarıdan aşağıya yaklaşım ve oksidasyon fermantasyonu yoluyla bakteriyel selülozu esas alan aşağıdan yukarıya yaklaşımdır. Belirtilen yaklaşımlar NFC'ler, CNC'ler ve BNC gibi farklı nanoselüloz çeşitlerinin elde edilmesine imkan sağlamaktadır (Leong et al., 2023).

### **2.1.1 Bakteriyel Nanoselüloz (BNC)**

Bakteriyel nanoselüloz (BNC), iyi bir esnekliğe, yüksek en-boy oranına, gerilme mukavemetine, yüksek su tutma kapasitesine ve benzersiz özelliklere sahip, oldukça kristalli, yüksek polimerize yapıda bir nanomalzemedir. Yüksek saflıkta selüloz, büyüme ortamına ve fermantasyon işlemlerine bağlı olarak çeşitli fiziksel ve kimyasal özelliklere sahip olarak üretilebilmektedir. Genel olarak güvenli biyomalzemelerden biri olarak kabul edilen BNC, çok çeşitli biyomedikal uygulamalarda kullanılmaktadır (Zhou et al., 2023).

BNC'ler, üstün özelliklere sahiptir ve bitkisel kaynaklardan üretilen nanoselülozdan farklı olarak, lignin ve hemiselülozun uzaklaştırılması için ön işleme gerek olmamaktadır, çünkü ultra ince ağ yapısına sahip saf selüloz ve 20-100'lük karakteristik şerit benzeri mikrofibriller olarak sentezlenmektedir. Daha yüksek su tutma kapasitesi ve hidrofilitiklik gibi geliştirilmiş mekanik özelliklere sahip BNC'lerin, bitkiden elde edilenlerle karşılaştırıldığında özellikle farmakoloji, biyoteknoloji, medikal ve gıda endüstrisi, gibi daha geniş alanlarda uygulanması imkanı bulunmaktadır (Fey et al., 2020; Jeremic et al., 2019; Khan et al., 2023; Ullah et al., 2024; Zhou et al., 2023).

### **2.1.2 Selüloz Nanokristalleri (CNC)**

CNC'ler, selülozun amorf kısımlarının kimyasal, fiziksel ve biyolojik işlemlerle ayrıştırılmasıyla üretilen yüksek kristalli çubuk şeklinde nanomalzemelerdir (Zheng et al., 2024). CNC'ler, geleneksel nanomalzemelerle karşılaştırıldığında, iyi biyobozunurluk, yenilenebilir kaynaklardan mükemmel kullanım özellikleri ve çok miktardaki hidroksil gruplarının varlığı sayesinde kolay kimyasal modifikasyon gibi avantajlara sahiptir. Ayrıca selüloz ve türevleriyle iyi bir uyumluluk göstermesi ve yüksek gerilme mukavemeti (10 GPa), yüksek elastik modül (150 GPa) ve yüksek kristallik (%60-%90) gibi yüksek mekanik özelliklere sahip olması sebebiyle CNC'lerin önemi giderek

artmaktadır (Hu et al., 2024). Yüksek lif içeren çeşitli tarımsal ve gıda atıkları CNC üretimi için potansiyel malzemelerdir (Zheng et al., 2024). Domates posası (Moradi & Fathi, 2023), fındık kabukları (Ebrahimi et al., 2024), liçi kabuğu (Ma et al., 2023) gibi bazı gıda atıklarının selüloz nanokristal üretiminde kullanılabileceği bildirilmiştir.

### **2.1.3 Selüloz Nanofibriller (NFC)**

Yeşil ve sürdürülebilir ambalaj malzemelerinin üretilmesinde ilgi çeken malzemelerden biri olan NFC'ler yüzeyindeki çok sayıda hidroksil grubunun varlığı, modifikasyon imkanı ve farklı polimerlerle (örneğin, karboksimetil selüloz (CMC), polivinil alkol (PVA), kitosan gibi) çapraz bağlanarak ilave edildiği kompozit ambalajın mekanik, antioksidan, antimikrobiyal, UV koruyucu, termomekanik ve reolojik özelliklerini geliştirebilmektedir. Gelişmiş biyokütle malzemelerinden biri olan NFC'ler, selüloz liflerinden izole edilebilir ve nano boyutlara (bir mikronun birkaç yüzde biri ve hatta daha küçük) kadar rafine edilebilmektedir. NFC'ler, yüksek basınçlı homojenizasyon, rafinasyon, yüksek yoğunluklu ultrasonikasyon, bilyalı öğütme ve çift vidalı ekstrüzyon dahil olmak üzere farklı mekanik tekniklerle üretilebilmektedir (Lu et al., 2024). NFC'ler, yaklaşık olarak 3 nm çapında hem amorf hem de kristal yapılarda mikro ölçekli uzunluklara sahip, esnek ve uzun liflerden meydana gelen birbirine bağlanmış bir ağdan oluşmaktadır. NFC'ler geniş yüzey alanı, kolay üretim süreci, yüksek en boy oranı, çevreye olan faydaları, yüksek mekanik ve mukavemet özellikleri, düşük maliyet ve sıcaklık stabilizasyonu gibi birçok işlevsel özelliklere sahip nanomalzemelerdir. Bu özellikleri NFC'leri sentetik polimerler için uygun bir alternatif haline getirmektedir (Saberı Riseh et al., 2023). NFC'ler otomobil parçaları, ambalaj ve inşaat malzemeleri gibi alanlar dahil olmak üzere farklı endüstrilerde kullanılmaktadır. NFC'ler kimyasal kaynaklı materyallere olan ihtiyacı en aza indirerek malzemelerin çevreye daha az zarar vermesini sağlamaktadır. NFC'ler ilaç sektöründe, yara iyileşmesinde, doku mühendisliğinde ve biyosensör alanlarında da kullanılmaktadır ve bu alanlarda ileriye dönük çalışmalar yapılmaktadır. Elektriksel iletkenlikleri ve yüksek yüzey alanları nedeniyle NFC'ler, süper lityum iyon piller ve süper kapasitör gibi enerji depolamaya yarayan cihazlarda elektrot olarak kullanılabilmektedirler. İnce gözenek yapıları ve yüksek en-boy oranı sayesinde NFC'ler hava su ve filtreleme sistemlerinde kullanılabilmektedir. Selüloz nanofibriller alanındaki araştırmalar ilerlemeye devam ettikçe, farklı endüstrilerde potansiyel uygulamaları da umut verici olmaktadır (Prasad et al., 2024).

### **3. NFC ELDE ETME YÖNTEMLERİ**

Selüloz polimeri çeşitli kaynaklardan elde edilmektedir. Selüloz kaynakları, doğadaki kökenine göre bitkisel, hayvansal veya bakteriyel olsa da çevre açısından, hammadde seçimini değerlendirmek önemlidir (García et al., 2016). Selüloz polimeri, odun veya bitkilerde lignin ve hemiselülozun kombinasyonu şeklinde bulunmaktadır. Selüloz yüksek işlevsellik özellikleri sayesinde birçok endüstriyel alanda kullanılmaktadır. Selülozun kullanımı, nanoselüloza (NC) ve selüloz nanometaryallerine dönüştürüldüğünde daha da genişletilebilmektedir. Rafine etme, homojenleştirme (homojenleştiriciler ve mikroakışkanlaştırıcılar kullanılarak) ve öğütme NFC'lerin üretimi için en yaygın yöntem olarak kabul edilse de üretimlerinde daha faydalı çözümler bulmak için başka yöntemler üzerinde de çalışılmaktadır (Nechyporchuk et al., 2016). Mekanik fibrilasyon NFC'leri selülozik mikrofibrillerden izole etmek için kullanılmaktadır. Homojenleştirme, rafine etme, mikro akışkanlaştırma ve mikro öğütme gibi işlemler selülozik elyafların defibrilasyonu için uygulanan diğer mekanik yöntemlerdir. Mekanik işlemlerde uygulanan kuvvetler NFC'in boyutları ve özelliklerine etki etmektedir. Buhar patlaması, yüksek yoğunluklu ultrasonikasyon, kriyo-ezme ve yüksek hızlı harmanlama da kullanılan mekanik yöntemlerdir. Mekanik işlemler sırasında yüksek enerji tüketimi meydana gelmektedir. Çeşitli kimyasal, fiziksel veya enzimatik ön işlemlerle enerji tüketimi azaltılabilmektedir (Nadeem et al., 2022).

**Kullanılan Bazı Yöntemler:**

**Yüksek Basıncılı Homojenizasyon:** Yüksek basınçlı homojenizasyon, en uzun ve en yaygın kullanılan NFC hazırlama yöntemidir. Bu yöntemin prensibi, selüloz dispersiyonunun yüksek basınç koşullarında (>150 MPa) homojenizasyon valfinin küçük akış kanalından tekrar tekrar geçirilmesidir. Bu işlemde elde edilen NFC'lerin büyük boyutta olması nedeniyle tek başına NFC'lerin hazırlanmasında kullanımını kısıtlamaktadır.

**Mikro Jet:** Yüksek basınçlı homojenleştirme yöntemine benzeyen mikro jet teknolojisinde selüloz dispersiyonu N şekilli veya Y şekilli bir kanaldan ultra yüksek basınç (>300 MPa) kullanılarak birkaç mach hızında geçirilerek NFC'ler üretilmektedir.

**Öğütme (Milling):** Milling (öğütme) yönteminde esas olarak, elyaf parçacık boyutunu azaltmak amacıyla selüloz elyafını kesmek ve ovalamak için bir taşlama diskinin veya bir planeter bilyenin (gezegen bilyeli değirmen) mekanik kuvveti ve sabit bir yivli diski kullanılır. Öğütme yöntemiyle hazırlanan nanoselülozun parçacık boyutu esas olarak öğütme diskleri arasındaki mesafeye bağlıdır.

**Ultrasonik Uygulama:** Ultrasonik işleme NFC'lerin hazırlanması esas olarak sıvıdaki (selüloz dispersiyonu) yüksek enerjili, akustik dalgalar ve yüksek ve düşük frekansların sürekli etkisi altında ses akışı iletimi tarafından oluşturulan bir dizi sürekli büyüyen ve kopan akış alanı kabarcıklarının (kavitasyon) ortak hareketine dayanır. Ultrasonik işleme elde edilen lifin boyutu ve verimi ultrasonik zamanla ultrasonik güç arasındaki güçlü bir ilişkiye dayanmaktadır.

**Düşük Sıcaklıkta Presleme:** Düşük sıcaklıkta presleme yöntemi, su veya alkali ile şişirilmiş selüloz dispersiyon sıvısının sıvı nitrojen kullanılarak düşük sıcaklıkta dondurmak, selüloz hücrelerinin içinde buz kristalleri oluşturmak ve ardından yeniden dondurma sisteminde güçlü bir kesme ve darbe uygulanması esasına dayanır. Selülozik hücreler tarafından oluşturulan buz kristalleri kırılabilir hale gelir, böylece hücreler kırılır ve nanoselüloz serbest bırakılır ve ayrışır.

**Buhar Patlaması:** Buhar patlaması yöntemi, selülozun iç yapısını içten dışa doğru yok etmek için içine nüfuz eden yüksek basınçlı buharın hızlı salınımının kullanılması esasına dayanır. Bu yöntem çoğunlukla endüstride bitkilerden selülozu saflaştırmak için kullanılır.

**Elektrospinning (Electrospinning):** Bu yöntem, selülozun bir çözelti haline getirilmesini gerektirir, ardından güçlü bir elektrik alan ortamı altında iğne şeklindeki enjeksiyon portundan küçük bir selüloz jeti çıkarılarak bir Taylor konisi oluşturulur ve ardından çözelti buharlaştıkça nanoselüloz oluşur. Bu yöntemin en büyük avantajı farklı parçacık boyutlarında ve tekdüze boyutlara sahip nanoselüloz elde edilmesidir.

**Çözücü Yöntemi:** Çözücü yöntemi elektrospinning yöntemine benzerlik göstermektedir. İlk olarak, selüloz spesifik bir çözücü ile şişirilir ve dağıtılır. Daha sonra selülozu fibrilleştirmek için ultrasonik olarak dağıtılır veya kuvvetlice karıştırılır. Ayrıca, çözünme sistemine çözücü olmayan bir faz eklenmesi selüloz fibrilasyon oranını artırabilir.

**İyonik Sıvı Metodu:** İyonik sıvı yönteminde ahşap selülozu çözmek ve ayırmak için organik katyonlar veya inorganik/organik anyonlar kullanılır. İmidazol iyonik sıvılar ahşap selülozunun işlenmesinde en yaygın kullanılan iyonik sıvılardır ve selülozun ayrıştırılması için yaygın olarak kullanılırlar. Çözünmeden sonra, selüloz iyon çözeltisi sistemi, selülozun hızla çökmesini sağlamak ve nanoselülozu hazırlamak için elektrospinning veya püskürtme ile selülozu yeniden çökeltmek için koşulları değiştirir. Bununla birlikte, genellikle, iyonik çözeltisinin oda sıcaklığındaki reaksiyonu yüksek viskozite, düşük katı-sıvı oranı, yüksek fiyat ve toksisite gibi dezavantajlara sahip olduğundan nadiren kullanılmaktadır (Yi et al., 2020).

NFC'nin mekanik işlemlerle üretimi sırasında yüksek enerji tüketimi, NFC'yi enerji verimli yöntemlerle üretmeye odaklanılmasını sağlamaktadır. Kimyasal ön arıtma yoluyla NFC üretimi düşük enerji tüketimi ve fibrilasyonun verimliliğini artıran bir yöntemdir. TEMPO yoluyla

oksidasyon, asetilasyon, karboksimetilasyon ve periodat-klorit oksidasyonu NFC elde etmek için uygulanan kimyasal arıtma yöntemleridir. NFC eldesi sırasında enerji tüketimini azaltmak için kimyasal ön işlemler mekanik işlemden önce uygulanmaktadır (Nadeem et al., 2022).

Enerji talebini azaltmak ve kationizasyon, karboksimetilasyon ve TEMPO aracılı oksidasyon dahil olmak üzere mekanik etkiyi kolaylaştırmak için izole edilmiş selüloza çeşitli kimyasal işlemler uygulanabilmesi ve giderek daha verimli olmasına rağmen, bu kimyasalların CNF üretimi için kullanılmasıyla ilgili önemli çevresel sorunlara neden olduğu bildirilmektedir. Selüloz fibrilasyonunu mekanik yöntemlerle kolaylaştırmada kullanılan yeni bir yaklaşım olarak enzimatik işlemlerin kullanılabilmesi ifade edilmektedir (Rossi et al., 2021). Bu yaklaşım, enzimlerin yüksek substrat özgüllüğü nedeniyle, fibrilasyon için enerji tüketiminin azaltılmasına ve bunun çevre dostu yönlerine bağlı olarak giderek daha fazla ilgi görmektedir. Enzimatik işlemlerle NFC üretim yöntemi, zehirli ve toksik kimyasallar kullanılmadan NFC üretiminde alternatif bir yöntem olarak kullanılmaktadır. Enzimatik işlem, mekanik arıtmadan önce bir ön arıtma yöntemi olarak uygulanmaktadır. Enzim dozajına ve işlem süresine bağlı olarak fibrilasyonun NFC üretimindeki etkinliği değişmektedir. Bu yöntemle daha ince NFC üretilebilmekte fakat liflerin en boy oranının daha düşük olabileceği dikkate alınmalıdır (Nadeem et al., 2022).

Gıda endüstrisinde kullanılan ambalajların, gıdaları dış etkilerden korumasının yanı sıra bir diğer işlevi de içerisindeki içeriğin görülebilmesini sağlayan yüksek şeffaflıkta olmasıdır. Ambalajın geçirgenlik ve bariyer özellikleri, ambalajlanan gıdanın su buharı ve oksijen teması ile bozulmasını engellemede önemli bir konudur (Nguyen et al., 2021).

Günümüzde plastikten üretilen ambalajlar ciddi anlamda çevre kirliliğine neden olmaktadır. NFC'den üretilen filmler petrol bazlı doğada çözünmeyen ambalajlara karşı güvenilir ve çevre dostu birer alternatif olarak görünmektedir. NFC'ler çeşitli yöntemler kullanılarak biyo bazlı filmlere dönüştürülebilmektedir. Bu filmlerin üretiminde kullanılan yöntemlerden bazıları döküm, vakumlu filtreleme, püskürtme, döndürerek kaplama, sürekli kaplama, daldırma kaplama gibi uygulamalardır (Nadeem et al., 2022).

#### **4. NFC KOMPOZİT FİLM UYGULAMALARI**

NFC'ler yüksek mukavemet, ısı direnci, kolay bozunma ve diğer avantajları ile benzersiz özelliklere sahip doğal selüloz ve nanomalzemelerin optimal kombinasyonu sayesinde plastiklerin yerini almada daha çok tercih edilmektedir. NFC filmler ambalajlama, takviye bileşen olarak ve esnek elektronik cihazlar gibi çeşitli uygulamalarda kısmen plastik filmlerin yerini almaktadır (Shi et al., 2022). NFC takviyeli PVA esaslı kompozit filmlerin şeffaf, hafif,

esnek, doğada parçalanabilir ve şekillenmesi kolay özelliklere sahip olması NFC'yi takviye bileşeni olarak birçok uygulamada (ambalaj malzemelerinin, hassas optik cihazların, otomobil camlarının ve esnek ekranların üretiminde) mükemmel bir aday haline getirmektedir (Xiao et al., 2015).

Yer fıstığı kabuğundan izole edilen selüloz nanoliflerinin biyokompozit elde etmek amacıyla takviye malzemesi olarak kullanıldığı bir çalışmada, yer fıstığı kabuğu kimyasal-mekanik işlemlerden sonra vakumlu emdirim (impregnation) yöntemiyle elde edilmiş selüloz nanoliflerinin 15-20 nm aralığında düzgün çapta olduğu ve biyokompozitlerin ince bir ağ yapısında olmalarını sağladığı bildirilmiştir. FESEM görüntüleri ile lifli parçaların oldukça düzgün yapıya sahip olduğu ve PVA'nın şeffaflığını sağladığı gözlemlenmiştir. Elde edilen kompozit filmlerin optik olarak esnek ve şeffaf olduğu ve NFC'lerle birleştirildikten sonra yüksek termal ve mekanik özellikler gösterdiği anlaşılmıştır. Hazırlanan nanokompozitlerin modül ve çekme mukavemeti saf PVA'ya göre 0,6 GPa'dan 6,0 GPa'ya ve 31 MPa'dan 125 MPa'ya kadar yükseldiği ve fiber oranının %80'e kadar arttığı tespit edilmiştir. Işık geçirgenliğinin ise %7 oranında azaldığı ifade edilmiştir. Elde edilen sonuçlara göre elektro-optik ve tıbbi cihaz uygulamalarında kullanılan PVA kompozitlerinde selüloz nanolif takviyesinin yüksek verimlilik özellikleri sağladığı anlaşılmıştır (Wang & Li, 2015).

Selüloz kaynağı olarak atık hindistan cevizi kabuğunun kullanıldığı çalışmada çeşitli kimyasal ön işlemler, hafif TEMPO aracalı oksidasyon (TEMPO/NaClO/NaClO<sub>2</sub>, pH = 4,8) ve arka arkaya ultrasonik ayırma uygulanarak yüksek katma değerli hindistan cevizi selüloz nanofibrilleri elde edilmiştir. Selüloz nanofibrillerinin kristallikleri, fonksiyonel grupları, termal stabiliteleri ve morfolojileri açısından detaylı bir şekilde karakterize edilmiştir. Dolgu maddesi olarak hindistan cevizi selüloz nanofibrillerinin (CNFC), biyobozunur PVA bazlı filmler için potansiyel takviyesi araştırılmış ve CNFC/PVA kompozit filmlerin kopma uzaması, çekme mukavemeti ve termal stabilitesi gibi özelliklerinin özellikle %3 CNFC uygulandığında önemli derecede arttığı görülmüştür. Ortalama 5,6-1,5 nm çapa sahip hindistan cevizi NFC'lerin yüksek zeta potansiyeli sayesinde sulu ortamda yüksek oranda dağılabildiği ve uygun konsantrasyonda PVA filminin temel özelliklerini güçlendirilebileceği vurgulanmıştır (Wu et al., 2019).

Muz kabuğundan elde edilen selüloz nanoliflerinin (NFC) nanokompozit filmlerde takviye maddesi olarak kullanıldığı çalışmada, NFC'ler muz kabuğundan enzimatik hidroliz yoluyla ayrıştırılmış ve çözücü döküm yöntemi ile NFC'ler hazırlanmıştır. NFC'lerin nanokompozit film özellikleri ve hücre canlılığı üzerindeki etkisi incelenmiştir. NFC'lerin ilave edilmesiyle

hazırlanan kompozit filmlerin topografyası ve pürüzlülüğü, taramalı elektron mikroskobu (SEM) ve atomik kuvvet mikroskobu (AFM) teknikleriyle analiz edilmiş ve filmlerinin mikro yapısını önemli ölçüde değiştirdiği gözlemlenmiştir. CNF'lerin nişasta matrisine eklenmesinin, muz nişastasını filmlerinin su bariyerini ve mekanik direncini arttırmada etkili olduğu ancak nanokompozit filmlerin yüksek opaklık ve düşük parlaklık sergilediği ortaya konulmuştur. Bu sonuçlara göre olgunlaşmamış muz kabuğu, biyobozunur filmlerde matris ve takviye malzemesi olarak kullanılabilir potansiyel bir NFC kaynağı olarak görülmüş ve gıda ambalaj olarak kullanılabilirliği belirtilmiştir (Tibolla et al., 2019)

Mısır samanı çekirdeğine (CSC) NFC ilave edilerek iyi mekanik özelliklere, etkili su buharı bariyeri, yüksek UV bariyeri ve yeterli düzeyde bakteri engelleme özelliklerine sahip nanokompozit filmlerin geliştirildiği bir çalışmada, NFC/CSC filmlerinin yapıları ve CSC ve NFC arasında oluşan reaksiyon FTIR, XRD, SEM, TG VE DMA ile analiz edilmiştir. Analizler sonucunda nanokompozit filmin gerilme ve yırtılma mukavemetinin iyileştiği, su buharı bariyer özelliğinin arttığı, yüksek UV bariyer ve antibakteriyel özellik kazandığı görülmüştür. CNF/CSC filmleri kullanılarak paketlenen sarımsak ve sütün daha az ağırlık kaybettiği, şeklini ve rengini daha iyi koruduğu belirlenmiştir. Ayrıca CNF/CSC filmleriyle paketlenen sarımsak ve sütün CNF filmi kullanılarak paketlenenlere kıyasla daha uzun süre bozulmadan kaldığı ve çeşitli dış faktörlerin (mikroorganizmalar, nem vb.) etkilerinin azaltıldığı tespit edilmiştir. Bu araştırma ile elde edilen NFC/CSC nanokompozit filmin potansiyel gıda ambalaj malzemesi olarak kullanılabilirliği bildirilmiştir (Li et al., 2023).

Jackfruit (*Artocarpus heterophyllus*) meyvesinin kabuğuna mum alma, orta dereceli alkali delignifikasyon ve hidrojen peroksit ile ağartma gibi ön işlemlerden sonra organik-inorganik karışım asit hidrolizi ve homojenizasyon işlemleri kullanılarak selüloz nanofibrillerin (NFC) ekstrakte edilerek NFC'lerin elde edildiği bir çalışmada NFC'ler TEM, PXRD, TGA/DTA DLS, XRD-EDX ve FTIR ile karakterize edilmiş ve NFC'lerin ortalama çapı 28 nm, kristallik indeksi %87,36 ve kristal boyutu 3.38 nm olarak ölçülmüştür. Elemental analiz sonucunda NFC'lerin %48,02 karbon ve %51,98 oksijen içerdiği ve mükemmel saflıkta olduğu bildirilmiştir. Jackfruit meyve kabuğundan ekstrakte edilen NFC'lerin organik/inorganik nanokompozitlerin sentezinde kullanılabilirliği vurgulanmıştır (Rubiyah et al., 2023).

Başka bir çalışmada ise selüloz, mısır sapı, yaprağı ve koçanından oluşan mısır atığından (corn stover) alkali ve delignifikasyon işlemleri ile %93'ün üzerinde saflıkta ekstrakte edilmiştir. Elde edilen selülozun boyutu yüksek basınçlı homojenizasyon yöntemiyle mekanik kesmeyle azaltılmış, homojenizatörden otuz kez geçirilerek selüloz nanofibriller üretilmiştir. Üretilen

NFC'nin uzunlukları mikron olarak ölçülmüş çapları ise 5-50 nm aralığında belirlenmiştir. Mısır atığı selülozundan yüksek basınçlı kesmeyle ve kesmeden üretilen filmlerin mekanik özellikleri karşılaştırılmıştır. Kesilmeden yapılan filmlerin düşük mekanik özellikler sergilediği, selülozdan kesilerek NFC ile üretilen filmlerin ise daha yüksek mekanik özellikler gösterdiği belirlenmiştir (Xu et al., 2018).

Meyan kökü kalıntılarında, soda-antrakininon hamurlaştırma ve ardından peroksiasetik asit ağartma ile enzimatik ön işlem ve yüksek basınçlı homojenizasyondan oluşan bir kombine işlemler neticesinde NFC'nin hazırlandığı bir çalışmada, enzimatik ön işlemlerin meyan kökü hamurundan hazırlanan selüloz nanofibrilleri (ETNFC) üzerindeki etkileri incelenmiş ve ETNFC'lerin net bir nanofibril yapıda olduğu ve yüksek koloidal stabilite gösterdiği anlaşılmıştır. ETNFC filmlerine kitosan nanofibril (CHN) ve lignin nanopartikülleri (LNP'ler) eklenmiş ve CHN veya LNP'lerle birleştirilmiş selüloz kompozit filmlerin iyi termal stabilite ve hidrofobiklik özellikleri gösterdiği belirlenmiştir. ETNFC filmiyle kıyaslandığında, ETNFC@LNPs-%5 filmi daha yüksek UV bariyer yeteneği ve termal stabilite gösterdiği fakat ışık geçirgenliğinin ise azaldığı belirlenmiştir. ETNFC@CHN-%5 filminin de gelişmiş mekanik özellikler ve benzer ışık geçirgenliği gösterdiği bildirilmiştir. Sonuç olarak meyan kökünden elde edilen kompozit filmlerin ambalaj endüstrisinde potansiyel materyaller olarak kullanılabilmesi bildirilmiştir (S. Wang et al., 2020).

Pirinç samanından elde edilen NFC'lerin, polikaprolaktonun (PCL) yapısını güçlendirmek için kullanıldığı bir çalışmada, filmler eriyik harmanlama yöntemi ile hazırlanmış ve NFC/PCL kompozit filmlerin yapı ve özellikleri çeşitli yöntemlerle analiz edilmiştir. PCL matrisine az miktarda NFC ilave edildiğinde NFC'nin homojen şekilde dağıldığı, ancak NFC içeriği %5'e ulaştığında ise NFC'lerin kısmen topaklaştığı belirlenmiştir. NFC'lerin eklenmesiyle PCL'nin kristal yapısı ve erime sıcaklığının neredeyse değişmediği ancak NFC/PCL kompozitleri için kristalleşme sıcaklığının ve su absorpsiyonunun arttığı, termal stabilitenin ise azaldığı bildirilmiştir. Kompozit filmlerdeki NFC içeriğinin %10'u geçmesi durumunda gerilme mukavemetinde düşüş olduğu ve yüksek miktarlarda NFC eklemenin ise filmlerde termal stabilite ve hidrofobiklik özelliklerinde olumsuz etkiye neden olduğu tespit edilmiştir. Bu çalışma ile pirinç samanından elde edilen NFC ile takviyelendirilmiş PCL filmlerin çeşitli ambalaj ve biyomedikal alanlarda kullanılabilmesi bildirilmiştir (Qiao et al., 2022).

Yulaf samanından NaOH ile alkali muamele ve mekanik defibrilatörden ardışık beş geçiş sonrasında nanofibrillerin elde edildiği çalışmada, işlemler sonunda nanofibrillerin çapında daha fazla azalma meydana geldiği, topaklanmanın azaldığı ve yüksek verimle malzeme elde

edildiği bildirilmiştir. Farklı yüzdelerdeki yulaf samanı nanofibrilleri döküm yöntemiyle hazırlanmış ve manyok nişastası bazlı biyonanokompozitler elde edilmiştir. Bu nanokompozitlerin bariyer özellikleri (su buharı geçirgenliği, temas açısı ve çözünürlük), mekanik özellikleri (young modülü, kopma uzaması, gerilme mukavemeti ve delme kuvveti), renk, opaklık ve morfoloji özellikleri çeşitli analiz yöntemleriyle incelenmiştir. Yulaf samanı NFC'leri, ilave edilmiş filmlerin sertliğinde artış ve buna bağlı olarak esnekliğinde azalma meydana gelmiştir. Yulaf samanı nanofibrilleri ilavesinin artışıyla nanokompozit filmlerin sudaki çözünürlüğü ve su buharı geçirgenliğinin azaldığı belirlenmiştir. Belirlenen etkilerin genellikle NFC ilavesinin %30'dan yüksek olduğu durumlarda görüldüğü ifade edilmiştir. %30-50 oranında NFC ilavesinin bu nanokompozit filmlerin mekanik ve bariyer özelliklerinde iyileşme sağladığı tespit edilmiştir. Yapılan çalışmanın geleneksel polimer malzemelere sürdürülebilir yeni alternatifler kazandırmada önemli olduğu sonucuna ulaşılmıştır (do Lago et al., 2020).

## **5. SONUÇ**

Çalışmanın amacı tarımsal ve gıda atıkları kullanılarak elde edilen NFC'lerin kompozit filmlerin üretiminde kullanılma potansiyelini ortaya koymaktır. Doğada bozunmayan plastik bazlı malzemeler giderek daha ciddi çevresel sorunlara yol açmakta ve bu malzemelere alternatif kullanılacak malzeme arayışları devam etmektedir. Plastik bazlı malzemelere alternatif olarak kullanılacak biyo esaslı malzemelerin önemi her geçen gün daha iyi anlaşılmaktadır. Doğa dostu, biyouyumlu, biyobozunur özelliklere sahip selüloz esaslı nanomateryallerin kompozit film üretiminde kullanılması ve alternatiflerine kıyasla üstün mekanik, kimyasal ve fiziksel özelliklere sahip olması petrol bazlı malzemelerin yerine kullanılacak iyi bir alternatif olduğunu göstermektedir. Bu alternatif biyomalzemelerden birisi de tarımsal ve gıda atıklarından üretilebilen selülozik nanomateryallerdir (CNC, NFC ve BNC). Ancak selülozik nanomateryallerden biri olan NFC'lerin plastik malzemelere alternatif olarak kullanılabilmesi ve yaygınlaşabilmesi için bu konuda daha fazla araştırmaya ihtiyaç duyulmaktadır. Bununla birlikte sürdürülebilir çevre, kaynakların verimli kullanılması ve atıkların katma değerli ürünlere dönüştürülebilmesi açısından tarımsal ve gıda atıklarından NFC'lerin üretilmesinin önemli olduğu sonucuna varılmıştır.

**ABSTRACT**

Iron is an important trace element for living organisms as it participates in a range of metabolic processes, such as oxygen transport, energy metabolism, nucleotide synthesis, and electron transport. Although vital, excessive amounts of iron can be toxic, therefore, its concentration needs to be maintained within an ideal range. Iron homeostasis is regulated and maintained by iron metabolism. Thus, iron metabolic homeostasis is required for the optimal functioning of fundamental physiological processes. Iron homeostasis in humans is regulated by balancing iron uptake with intracellular utilization and storage. Dietary iron is absorbed by duodenal enterocytes and binds to transferrin in the plasma. Transferrin limits the production of toxic free radicals and is responsible for ferric-ion delivery into cells. The iron homeostasis system maintains transferrin saturation at physiological levels.

**Keywords:** Diabetes, Insulin resistance, Iron metabolism

The maintenance of iron homeostasis is essential for proper endocrine function. A growing body of evidence suggests that iron imbalance is a key factor in the development of several endocrine diseases. Nowadays, ferroptosis, an iron-dependent form of regulated cell death, has become increasingly recognized as an important process to mediate the pathogenesis and progression of type 2 diabetes mellitus (T2DM). It has been shown that ferroptosis in pancreas  $\beta$  cells leads to decreased insulin secretion; and ferroptosis in the liver, fat, and muscle induces insulin resistance. Understanding the mechanisms concerning the regulation of iron metabolism and ferroptosis in T2DM may lead to improved disease management (Gao H, Jin Z, Bandyopadhyay G, Wang.,2022).

Iron is an important trace element for living organisms as it participates in a range of metabolic processes, such as oxygen transport, energy metabolism, nucleotide synthesis, and electron transport. Although vital, excessive amounts of iron can be toxic, therefore, its concentration needs to be maintained within an ideal range. Iron homeostasis is regulated and maintained by iron metabolism (Kerimova R.C.,Ağayeva A.H.,Quliyeva N.T.,İsmayılova K.İ.,2023).

Thus, iron metabolic homeostasis is required for the optimal functioning of fundamental physiological processes. Iron homeostasis in humans is regulated by balancing iron uptake with intracellular utilization and storage. Dietary iron is absorbed by duodenal enterocytes and binds to transferrin in the plasma. Transferrin limits the production of toxic free radicals and is responsible for ferric-ion delivery into cells (Krümmel B, von Hanstein AS, Plötz T, Lenzen S.,2022).

The iron homeostasis system maintains transferrin saturation at physiological levels. During iron metabolism, less than 10% of the iron demand is met by intestinal absorption, and the remaining iron is exported by ferroportin. Ferroportin is regulated by hepcidin, which is a peptide hormone and is often secreted by hepatocytes. Abnormal iron metabolism mainly presents as iron deficiency or overload, which triggers multiple pathological changes such as ferroptosis. Ferroptosis is an iron-dependent form of non-apoptotic cell death, characterized by iron overload and lipid hydroperoxides accumulation (Santos M, Anderson CP, Neschen S.,2020).

With the continuous development of this research, Dixon et al. first proposed the concept of ferroptosis, based on its distinct morphological characteristics and function in 2012. Ferroptosis was defined as an iron-dependent form of regulated cell death that involves the iron-catalyzed accumulation of lethal lipid peroxides. Under physiological and pathological conditions, cell death is an inevitable and important function in biological processes and marks the end of cell

life. Cells undergoing ferroptosis have different morphological and metabolic characteristics from other known forms of cell death (such as apoptosis, necrotizing apoptosis, and pyroptosis) . Morphologically, ferroptosis mainly occurs in cells, presented as decreased mitochondrial volume, decreased or no mitochondrial cristae, and increased bilayer membrane density; however, the nuclear size remains unchanged . Ferroptosis is regulated by many aspects of iron metabolism, including iron absorption, transport, storage, and utilization (Marku A, Galli A, Marciani P, Dule N.,2021).

In addition, ferroptosis-inducing factors can affect different pathways of glutathione peroxidase directly or indirectly , resulting in a decreased capacity of antioxidants and accumulation of lipid reactive oxygen species (ROS) in cells, culminating in oxidative cell death. Thus, ferroptosis regulation is closely related to the metabolism of iron, lipids, amino acids, and glutathione. Evidence shows that Abnormal ferroptosis is closely related to the occurrence and progression of various diseases, including metabolic diseases, such as T2DM (Gao H, Jin Z, Bandyopadhyay G, Wang G.,2022).

Iron plays an important role in insulin secretion function in pancreas  $\beta$  cells. Tf-Fe<sup>3+</sup> is absorbed into pancreas  $\beta$  cells through DMT-1 . The pancreas  $\beta$  cells strictly control iron homeostasis, to avoid excessive harmful free iron. Consequently, Fe<sup>2+</sup> is reserved in the labile iron pool (LIP), where iron is sequestered by ferritin (a unique cytoplasmic iron storage protein) . Fe<sup>2+</sup> is bound in ferritin for the synthesis of iron-dependent proteins in the cytoplasm or mitochondria . In extracellular, the pancreas  $\beta$  cells release hepcidin, which binds transferrin and induces their internalized (Kim JD, Lim DM, Park KY.,2020).

Studies have shown that transferrin mediates a positive feedback mechanism for iron regulation in the process of glucose-stimulated insulin secretion . Fe<sup>2+</sup> in the Labile iron pool (LIP) is involved in insulin secretion, via three pathways. Although iron can be found in almost all intracellular organelles, iron is predominantly consumed by mitochondria which is the primary source of cellular iron metabolism. Synthesis of heme and Fe-S clusters, used for electron transport proteins, occurs in the mitochondria. Under high-glucose stimulation, glucose enters the pancreas  $\beta$  cells via glucose transporter 2 (GLUT-2) and undergoes glycolysis before entering the mitochondria, which leads to increased ATP production (Santos M, Anderson CP, Neschen S.,2020).

Numerous studies have shown that ferroptosis plays an important role in the development and progression of type 2 diabetes mellitus (T2DM) and complications (Krümmel B, von Hanstein AS, Plötz T, Lenzen S.,2022).

T2DM is a serious global health concern. Physical inactivity and an unhealthy diet are the major T2DM risk factors, and an increasing disease prevalence is observed in children and younger adults. High levels of ferroptosis, mediated by multiple metabolic pathways and signals, can lead to insulin resistance (IR), abnormal metabolism in the liver and fat, and neurological and vascular diseases. Human blood glucose homeostasis is primarily regulated by insulin and glucagon, which promote glycogen synthesis and breakdown, respectively. It has been shown that iron metabolism is involved in different processes of human glucose metabolism such as insulin secretion, liver metabolism, and fat metabolism, and maintains blood glucose homeostasis in multiple organs and tissues (Gao H, Jin Z, Bandyopadhyay G, Wang G.,2022). The relationships among iron metabolism, T2DM, liver function, and liver injury are complex (Gong Z, Qin Y, Wang Y, Liu X.,2022).

Hepatocytes play a dual role in iron metabolism: they serve as the main site of iron storage and regulate blood iron content by secreting regulatory hormones, such as hepcidin, which controls plasma iron content by binding to transferrin in intestinal epithelial cells and iron circulating macrophages. The binding of transferrin to hepcidin triggers transferrin degradation, thereby reducing transferrin levels. Hepcidin expression is primarily regulated by the BMP-SMAD signaling pathway. In addition, hepatocyte metabolism is regulated by iron. Studies have shown that the iron-sequestering ferritin H chain (FTH) is synthesized in hepatocytes to limit iron-induced hepatic glucose-6-phosphatase (G6Pase) expression and oxidative inhibition. FTH maintains endogenous glucose production, through hepatic gluconeogenesis, which is necessary for hypoglycemic prevention (Tang W, Li Y, He S, Jiang T, Wang N, Du M, et al.,2022).

In multiple models of IR, researchers have found that iron overload leads to the development IR. It was shown that hepatic gluconeogenesis is increased in mouse models of hereditary haemochromatosis. In db/db mice, iron overload aggravates IR and increases hepatic gluconeogenesis. In hypoxia and iron deficiency mouse models, iron restriction caused hypoglycemic, in part due to reduced hepatic gluconeogenesis, possibly due to the activation of the hypoxia-sensing pathway. In the context of the functional interplay between iron metabolism and liver gluconeogenesis, studies have shown that iron can alter the circadian rhythm of hepatic glucose production and affects liver gluconeogenesis(Kerimova R.C.,Hüseynzadə X.R.,2023).

Inappropriate hepcidin synthesis has been shown to play a role in the pathogenesis of T2DM and its complications. Insufficient hepcidin expression results in iron overload, which triggers

ROS synthesis which in turn plays a major role in the pathogenesis of  $\beta$  cell exhaustion and IR-mediated T2DM. Increased hepcidin expression leads to increased intracellular iron sequestration and is associated with T2DM complications (Marku A, Galli A, Marciani P, Dule N.,2021).

A growing number of evidence supports the role of ferroptosis in the initiation and progression of various metabolic diseases such as T2DM. However, several questions need to be addressed before the therapeutic potential of ferroptosis-targeted agents can be clinically evaluated. Plasma ferritin concentration is currently used as a ferroptosis biomarker in preclinical studies. However, it is non-specific and is present in other types of cell death and several pathological conditions. The lack of ferroptosis-specific biomarkers has been a long-standing bottleneck, limiting the development of ferroptosis-targeted clinical applications. To date, no clinical trials have investigated ferroptosis-specific inhibitors for metabolic disease treatment. Most of the research uses selective inhibition of ferroptosis, which has been shown to substantially improve pancreatic  $\beta$  cells function in various animal models. Large population-based datasets are urgently needed to determine whether selectively blocking ferroptosis can improve T2DM and its complications (Tang W, Li Y, He S, Jiang T, Wang N, Du M, et al.,2022).

The relationship between iron metabolism and glucose homeostasis is now widely recognized. Iron has been shown to affect glucose homeostasis in organs and cells, such as pancreas  $\beta$  cells, hepatocytes, and adipose tissue. In addition, iron metabolism is related to the brain-gut axis and circadian rhythm. Iron metabolism disorders result in insufficient insulin secretion and IR; however, the relationship between iron metabolism and T2DM and its complications was unclear until the discovery of ferroptosis. Excess levels of free reactive iron cause tissue damage and oxidative cell death. Different drugs and compounds for lipid peroxidation have been widely studied for the treatment of T2DM induced by iron overload. However, there is a lack of clinical research at this stage and preclinical research is paving the way for the development of effective ferroptosis-specific antagonists for the clinical treatment of T2DM (Gao H, Jin Z, Bandyopadhyay G, Wang.,2022).

**ABSTRACT**

Thymic hyperplasia could be true thymic or lymphoid hyperplasia. It is usually found incidentally or could present with compressive symptoms or systemic symptoms due to autoimmune disease like myasthenia gravis. The diagnosis is made through a chest CT or MRI. Treatment for symptomatic patients is mostly thymectomy. This activity describes pathophysiology, evaluation, and management of thymic hyperplasia and highlights the role of the interprofessional team in the evaluation and treatment of patients with thymic hyperplasia. The production of functional T-cell is choreographed by thymic epithelial cells that guide them in proliferation, maturation, and survival. The thymic epithelial cells are compartmentalized into two main populations medullary thymic epithelial cells and cortical thymic epithelial cells. These populations are further segregated into distinct subpopulations having specific molecular and functional roles. There are two major etiologies of thymic hyperplasia. It could be congenital or acquired. The congenital thymic hyperplasia can be hypo functioning or hyperfunctioning and is found to be the result of neuroendocrine disturbances, usually within the hypothalamic-hypophyseal system. Thymic hyperplasia with hypo functioning thymus would lead to immune deficiency. Hyperfunctioning thymic hyperplasia could lead to autoimmune diseases, most commonly myasthenia gravis, but the relationship has also been found with graves' disease and collagen vascular disorders. Acquired thymic hyperplasia can also result in hypo functioning or hyperfunctioning thymus.

**Keywords:** Thymus gland, Persistent hyperplasia, Physiological changes, Diagnosis

Thymic hyperplasia could be true thymic or lymphoid hyperplasia. It is usually found incidentally or could present with compressive symptoms or systemic symptoms due to autoimmune disease like myasthenia gravis. The diagnosis is made through a chest CT or MRI. Treatment for symptomatic patients is mostly thymectomy. This activity describes pathophysiology, evaluation, and management of thymic hyperplasia and highlights the role of the interprofessional team in the evaluation and treatment of patients with thymic hyperplasia (Jinguji M, Nakajo M, Nakajo M, et al.,2017).

The thymus got its role in T-cell differentiation discovered a few decades ago before the 1960s it was considered vestigial. Though largely known as a lymphoid organ and for its role in T-cell differentiation, thymus also has an endocrine role that includes manufacturing thymosin that regulates T-cell differentiation and other humoral factors that regulate cell growth, maturation and guide the process of mineralization. The thymus is the principal location for T-cell lymphopoiesis (Zhao M, Xing J, Tang X.,2022).

The production of functional T-cell is choreographed by thymic epithelial cells that guide them in proliferation, maturation, and survival. The thymic epithelial cells are compartmentalized into two main populations medullary thymic epithelial cells and cortical thymic epithelial cells. These populations are further segregated into distinct subpopulations having specific molecular and functional roles (Haider U, Richards P, Gianoukakis AG.,2017).

Thymic hyperplasia alludes to an increase in the size of thymus due to an increase in the number of cells. Thymus achieves its peak size around puberty and then atrophies slowly. Thymic hyperplasia is not always pathological, but the growth of the thymus to a certain degree not anticipated for a patient's age raises the alarm and should lead to further investigation (Kadouri N, Nevo S, Goldfarb Y.,2020).

There are two major etiologies of thymic hyperplasia. It could be congenital or acquired. The congenital thymic hyperplasia can be hypo functioning or hyperfunctioning and is found to be the result of neuroendocrine disturbances, usually within the hypothalamic-hypophyseal system. Thymic hyperplasia with hypo functioning thymus would lead to immune deficiency. Hyperfunctioning thymic hyperplasia could lead to autoimmune diseases, most commonly myasthenia gravis, but the relationship has also been found with graves' disease and collagen vascular disorders. Acquired thymic hyperplasia can also result in hypo functioning or hyperfunctioning thymus (.Priola AM, Priola SM.,2014).

Acquired thymic hyperplasia is usually a rebound phenomenon in patients who have undergone chemotherapy, have had thermal burns, cardiac surgery, or after discontinuation of oral steroids

as the thymus is susceptible to fluctuations in corticosteroids (Kerimova RC., Ağayeva A.H., Quliyeva., 2023).

Thymic masses are the most common abnormal growths in the anterior mediastinum. Among the pediatric population, thymic hyperplasia is the most common benign tumor of the anterior mediastinum. In adults, the incidence is increased between the '40s and '50s; it is similar in men and women. An increased incidence among Asians has been reported compared to other races. Thymic hyperplasia is mostly discovered incidentally in about 50% to 70% of patients with myasthenia gravis. 75% of the patients with myasthenia gravis have thymic disease. Out of 75 %, 85% have thymic hyperplasia, and 10% to 15% have thymoma (Jinguji M, Nakajo M, Nakajo M, et al., 2017).

**There are two morphological forms of thymic hyperplasia:** It is characterized by an increase in the size and weight of thymus due to an increase in the number of thymic epithelial cells. The normal histology of the thymic cells is preserved. This form of thymic hyperplasia is more prevalent among children and young male patients. It is not associated with autoimmune diseases. The most common presentation of this type is usually respiratory distress or peripheral blood lymphocytosis (Zhao M, Xing J, Tang X., 2022).

**Lymphofollicular hyperplasia:** It is caused due to hyperplastic lymph follicles within the thymus. The follicles stem in the medulla and interlobular septal space that shifts the parenchyma of the thymus. [These reactive lymphoid follicles are similar to normal follicles. Histologically these lymphoid follicles have numerous diverse lymphoid cells supplemented with germinal center cells of different sizes and macrophages containing cellular debris. Thus, the main characteristic of lymphofollicular thymic hyperplasia is the development of ectopic germinal centers and neo-angiogenesis. This form of thymic hyperplasia is associated with autoimmune diseases like myasthenia gravis or graves' disease (Zhao M, Xing J, Tang X, Sheng X., 2022).

A comprehensive history and a detailed physical examination are necessary to evaluate patients with thymic hyperplasia, focusing on its signs and symptoms. Thymic hyperplasia is usually discovered incidentally after imaging is performed for an unrelated chest complaint. The thymus is located in the anterior mediastinum closely related to airways and major blood vessels. Thymic hyperplasia can compress these structures, causing the following symptoms: Shortness of breath, Dysphagia, Cough, Loss of appetite (Radojevic N, Medenica S., 2017).

The thymus is located near the superior vena cava, and a massive true thymic hyperplasia could compress it, leading to superior vena cava syndrome. The superior vena cava syndrome would present as: Swelling of face, neck, and upper chest, Cyanosis, Headaches, Dizziness.

The lymphofollicular thymic hyperplasia is associated with autoimmune diseases like myasthenia gravis, Graves disease, or collagen vascular disorders. Patients with these autoimmune disorders can present with varying signs and symptoms depending upon the underlying disorder (Farmakidis C, Pasnoor M, Dimachkie MM.,2018).

**Myasthenia gravis:** It is a neurological autoimmune disease caused by autoimmunity against the acetylcholine receptor component of the neuromuscular junction. The lymphofollicular form of thymic hyperplasia is evidently involved in the pathogenesis of myasthenia gravis with anti-acetylcholine receptor antibodies. It is characterized by a fluctuating degree and varying amalgamation of weakness in an ocular, bulbar, limb, and respiratory muscles. T-cell dependent autoantibodies attack the acetylcholine receptors on the postsynaptic membrane leading to muscular weakness (Kadouri N, Nevo S, Goldfarb Y.,2020).

**Graves disease:** The relation between thymic hyperplasia and Graves' disease was first described in 1912. Patients with Graves' disease should undergo a thorough evaluation of thymus. There seems to be a complex hormonal and immunological mechanism involved, but the exact pathogenesis is unclear. Most patients with Graves disease can be diagnosed with thymic hyperplasia by undergoing clinical evaluation and radiological studies. The treatment of hyperthyroidism due to Graves disease leads to the rapid resolution of thymic hyperplasia (Radojevic N, Medenica S.,2017).

**Laboratory studies:** Acetylcholine receptor antibodies may be positive in some patients with thymic hyperplasia, pointing towards the presence of myasthenia gravis.

**Imaging:** The thymic hyperplasia is usually discovered incidentally on radiographical imaging for pre-op of some elective surgery or unrelated chest complaints. The findings of a chest radiograph can range from subtle mediastinal findings to large mass or widened mediastinum.

**Chest X-Ray:** A frontal chest X-ray of infants and young children show a strikingly large thymus and a sail sign can be seen. The thymus normally remains visible on the radiograph till the age of 3 years. On conventional radiography, thymic hyperplasia usually appears normal (Zhao M, Xing J, Tang X, Sheng X.,2022).

**Chest CT-scan:** Contrast-enhanced computed tomography is typically used for thymic abnormalities not detected on conventional radiography. In most cases, chest CT-scan is diagnostic. Chest CT-scan can provide comprehensive information about mediastinal

abnormality, inclusive of its location, size, relation to surrounding structures, and it can also give you information about the presence of fluid, fat, or calcifications within the tissue. CT-scan of a hyperplastic thymus exhibits diffuse enlargement, preserved contour, normal blood vessels, and a mixture of lymphoid tissue and fat. This precise information is important, especially involvement or compression of related structures in order to plan treatment or resection in severe cases (Budavari AI, Whitaker MD.,2002).

**PET-CT:** A hyperplastic thymus demonstrates only mild uptake of fluorodeoxyglucose as compared to marked uptake in case of malignancy.

**Chest MRI:** Chemical shift MRI usually demonstrates chemical shift artifact between in-phase and out of phase images and can help differentiate thymic hyperplasia from thymic neoplasia. It can be challenging to differentiate between normal and hyperplastic thymus; so following guidelines should be used to identify a normal thymus:

**Massive thymic hyperplasia:** Asymptomatic patients with diffusely enlarged thymus glands can be followed up expectantly because they have a negligible incidence of significant thymic disease. The major treatment of massive thymic hyperplasia is surgical resection (Haider U, Richards P, Gianoukakis AG.,2017).

**Lymphofollicular hyperplasia:** The management of lymphofollicular type of thymic hyperplasia depends on how it manifests. Depending upon the signs and symptoms, it could have the following approaches towards treatment (Yang J, Liu C, Li T, Li C.,2017).

**Myasthenia gravis:** Acetylcholinesterase inhibitors such as physostigmine or pyridostigmine could be used for the symptomatic treatment of myasthenia gravis resulting from thymic hyperplasia. These agents act by inhibiting hydrolysis of acetylcholine in synaptic cleft leading to the availability of more acetylcholine to interact with remaining acetylcholine receptors not yet effected by autoantibodies. Corticosteroids can help improve the symptoms of myasthenia gravis, especially in the case of myasthenic crisis. However, the exact mechanism by which steroids act to help with symptoms has not been well understood. Plasma exchange therapy could also help improve symptoms of myasthenia gravis, and it is relatively less costly. Thymectomy is the surgical removal of the thymus gland. There is evidence that thymectomy leads to remission and decreased drug dependency (Kerimova RC.,Ağayeva A,H.,Quliyeva.,2023).

**Graves disease:** Thymic hyperplasia due to Graves' disease usually resolves as the hyperthyroidism is treated and is under control. Patients with thymic hyperplasia can present differently. The patient could present with compressive symptoms such as dyspnea, dysphagia,

cough, horner syndrome, superior vena cava syndrome, or systemic symptoms like weakness and blurry vision due to autoimmune disease like myasthenia gravis. But usually, the thymic hyperplasia is an incidental finding. The newly diagnosed patient should be given emotional support and detailed information about the condition, its treatment, prognosis, and effects on everyday life (Budavari AI, Whitaker MD.,2002).

**Asymptomatic patient:** If the thymic hyperplasia is asymptomatic, the patient should be guided about follow up, and observation until the condition remains asymptomatic and steps that will be taken if somehow the condition starts showing symptoms in the future (.Priola AM, Priola SM.,2014).

**Compressive symptoms:** The patients presenting with compressive symptoms should be informed about the cause of symptoms and the possibility of surgery, i.e., thymectomy, to relieve the symptoms (Farmakidis C, Pasnoor M, Dimachkie MM.,2018).

**Myasthenia gravis:** Myasthenia gravis patients should be informed about possible associated between thymic hyperplasia and their condition and the possible need for surgery, i.e., thymectomy in the future to improve their symptoms if the medications and plasma exchange therapy fail to improve the symptoms.

**Thymic hyperplasia and Graves disease:** In the case of thymic hyperplasia associated with hyperthyroidism due to grave disease, the patient should be guided that the hyperplasia will subside if hyperthyroidism is controlled (Zhao M, Xing J, Tang X.,2022).

The patient should be provided with educational material about the disease. Flow charts, diagrams, and videos should be used to explain each and every aspect of the disease, treatment, and lifestyle changes. Until the patient fully understands everything and is satisfied with the provision of care (Yang J, Liu C, Li T, Li C.,2017).

It is the responsibility of healthcare professionals that the patient has a good understanding of the disease and the appropriate treatment available for the disease. Thymic hyperplasia is usually an incidental finding and can cause significant anxiety among patients. It is vital for healthcare providers to provide emotional support to the newly diagnosed patient. The approach to hyperplastic thymus should be multidisciplinary, including primary care physician, physician assistant, nurse practitioner, radiologist, pathologist, thoracic surgeon, neurologist, and an endocrinologist in order to establish a definitive diagnosis and provide appropriate treatment (Zhao M, Xing J, Tang X, Sheng X.,2022).

If the diagnosis of thymic mass is an incidental finding, a biopsy should be performed to differentiate thymic hyperplasia from thymoma or other malignancies and make a definitive

diagnosis. Patients who are asymptomatic and have no local or systemic manifestations can be closely monitored by primary care providers. Patients with serious manifestations such as superior vena cava syndrome or myasthenia gravis should be referred to a thoracic surgeon for thymectomy (Kadouri N, Nevo S, Goldfarb Y.,2020).

**ABSTRACT**

Obesity is a critical risk factor for the development of type 2 diabetes (T2D), and its prevalence is rising worldwide. White adipose tissue (WAT) has a crucial role in regulating systemic energy homeostasis. Adipose tissue expands by a combination of an increase in adipocyte size (hypertrophy) and number (hyperplasia). The recruitment and differentiation of adipose precursor cells in the subcutaneous adipose tissue (SAT), rather than merely inflating the cells, would be protective from the obesity-associated metabolic complications. In metabolically unhealthy obesity, the storage capacity of SAT, the largest WAT depot, is limited, and further caloric overload leads to the fat accumulation in ectopic tissues (e.g., liver, skeletal muscle, and heart) and in the visceral adipose depots, an event commonly defined as lipotoxicity. Excessive ectopic lipid accumulation leads to local inflammation and insulin resistance (IR). Indeed, overnutrition triggers uncontrolled inflammatory responses in WAT, leading to chronic low-grade inflammation, therefore fostering the progression of IR. Severe obesity is associated with elevated risks of adverse health consequences. The prevalence of obesity is rising worldwide, and if the trend continues, global prevalence will reach 18% in men and 21% in women by 2025. A positive energy balance between energy intake and energy expenditure results in weight gain and obesity. Many factors, including genetics, epigenetics, and lifestyle factors, have been

implicated in obesity pathogenesis. In most cases, no single factor is exclusively responsible for the development of obesity.

**Keywords:** Adipozogenital obesity, Metabolic complications, Pathophysiology, Clinical manifestations, Adipose tissue

Obesity is a critical risk factor for the development of type 2 diabetes (T2D), and its prevalence is rising worldwide. White adipose tissue (WAT) has a crucial role in regulating systemic energy homeostasis. Adipose tissue expands by a combination of an increase in adipocyte size (hypertrophy) and number (hyperplasia). The recruitment and differentiation of adipose precursor cells in the subcutaneous adipose tissue (SAT), rather than merely inflating the cells, would be protective from the obesity-associated metabolic complications. In metabolically unhealthy obesity, the storage capacity of SAT, the largest WAT depot, is limited, and further caloric overload leads to the fat accumulation in ectopic tissues (e.g., liver, skeletal muscle, and heart) and in the visceral adipose depots, an event commonly defined as lipotoxicity (Kerimova R.C., Ağayeva A.H., Abiyev H.Ə., Cəfərova Z.İ., Məmmədov Ş.Ə., 2023).

Excessive ectopic lipid accumulation leads to local inflammation and insulin resistance (IR). Indeed, overnutrition triggers uncontrolled inflammatory responses in WAT, leading to chronic low-grade inflammation, therefore fostering the progression of IR. This review summarizes the current knowledge on WAT dysfunction in obesity and its associated metabolic abnormalities, such as IR. A better understanding of the mechanisms regulating adipose tissue expansion in obesity is required for the development of future therapeutic approaches in obesity-associated metabolic complications (Biondi, G.; Marrano, N.; Borrelli, A.; Rella, M.; 2022).

Severe obesity is associated with elevated risks of adverse health consequences. The prevalence of obesity is rising worldwide, and if the trend continues, global prevalence will reach 18% in men and 21% in women by 2025. A positive energy balance between energy intake and energy expenditure results in weight gain and obesity. Many factors, including genetics, epigenetics, and lifestyle factors, have been implicated in obesity pathogenesis. In most cases, no single factor is exclusively responsible for the development of obesity. Rather, obesity results from the interaction of these factors and these combinations can vary over time and between individuals. Dietary and lifestyle interventions can be adequate to treat obesity and prevent metabolic alterations. Moderate and progressive weight loss improves metabolic function in different tissues and contributes to dose-dependent changes in the main adipose tissue biological pathways. Nevertheless, these approaches are difficult to maintain in the long term (Porro, S.; Genchi, V.A.; Cignarelli, A.; Natalicchio., 2020). The primary cause of T2D is obesity-driven insulin resistance (IR) in white adipose tissue (WAT), liver, and skeletal muscle, combined with impaired secretion of insulin by pancreatic  $\beta$ -cells to overcome this resistance. Obesity-induced IR is also linked to a wide cluster of obesity-associated metabolic abnormalities, such as dyslipidemia, non-alcoholic fatty liver disease (NAFLD),

hypertension, coronary heart disease, and stroke (Genchi, V.A.; D’Oria, R.; Palma, G.; Caccioppoli.,2021).

Insulin reduces blood glucose by inducing glucose uptake in insulin-sensitive tissues (skeletal muscle, adipose tissue, and liver) and by inhibiting glucose production in liver. IR occurs when the insulin-sensitive tissues lose insulin response. In this scenario, insulin-mediated glucose uptake is impaired in the insulin target tissues. This failure is a result of the insulin signaling pathway inhibition. Nonetheless, an overall paradigm has been strengthened by many studies over several decades in which overnutrition in predisposed individuals leads to IR in peripheral tissues. This effect increases blood glucose levels, which in turn stimulates the  $\beta$ -cell insulin secretion (Biondi, G.; Marrano, N.; Borrelli, A.; Rella, M.;2022).

There are several hypotheses to explain the mechanisms responsible for IR in obese subjects. These mechanisms include adipose tissue dysfunction/lipotoxicity, inflammation, mitochondrial dysfunction, hyperinsulinemia, and endoplasmic reticulum (ER) stress. Although there is no theory for a unifying mechanism, most of these factors are typically and concomitantly associated with obesity. Here, we review the current knowledge of WAT dysfunction in obesity and its associated metabolic abnormalities (Kaare, M.; Mikheim, K.; Lilleväli, K.; Kilk, K.,2021).

WAT is a complex organ and has primary roles in energy homeostasis control. Adipocytes not only act as a reservoir for energy storage and utilization, but also sense energy demands and secrete paracrine factors to regulate other metabolic tissues. In a high energy state, for example, leptin is secreted from adipocytes to reduce food intake centrally and increase energy expenditure. However, in obesity, WAT may become severely dysfunctional and not expand properly to store the energy excess. This induces ectopic fat deposition in other tissues that regulates glucose homeostasis, an event commonly defined as “lipotoxicity”. This mechanism leads to systemic IR and an increased risk of T2D (Porro, S.; Genchi, V.A.; Cignarelli, A.; Natalicchio.,2020).

Numerous deleterious effects have been associated with the unhealthy expansion of the WAT, including inflammation, fibrosis, hypoxia, altered adipokines secretion, and mitochondrial dysfunction, each of which could represent a new therapeutic target in the obesity treatment. In prolonged positive energy balance conditions, adipocytes expand cell size and number to compensate the need for increased lipid storage. These cells inevitably reach a limit at which additional anabolic pressure cannot be accommodated, due to cell and tissue expansion limitations. Reaching this threshold causes stress in adipocytes and initiates an inflammatory program in response to this stress (Genchi, V.A.; D’Oria, R.; Palma, G.; Caccioppoli.,2021).

In obesity, “healthy” WAT expansion is achieved by recruiting and differentiating adipose precursor cells rather than infiltrating fat into mature adipocytes. Alterations in the precursor cell commitment and subcutaneous adipose tissue (SAT) adipogenesis are associated with the metabolic complications of obesity. When the storage capacity of SAT, the largest adipose tissue depot, is exceeded, further caloric overload leads to the fat accumulation in ectopic tissues (liver, skeletal muscle, and heart) as well as in the visceral depots (Fernandes Negrıs Lima, T.; Nackeeran, S.;2020).

It has been largely demonstrated that excessive lipid accumulation in ectopic tissues leads to local inflammation and IR . The ectopic fat accumulation in the pancreas, for example, contributes to  $\beta$ -cell dysfunction, and recent studies in human have proved that the bariatric surgery can improve  $\beta$ -cell function by decreasing pancreatic fat accumulation . A marker of ectopic fat accumulation in human is the increased visceral/intra-abdominal fat accumulation, associated with abdominal obesity . Independently of body mass index (BMI), adipose tissue dysfunction, increased visceral and ectopic fat accumulation, and inflammation may contribute to unhealthy obesity and associated IR (Kaare, M.; Mikheim, K.; Lilleväli, K.; Kilk, K.,2021).

To review the adipose tissue remodeling in obesity and associated metabolic comorbidities, it is essential to examine how the morphology can change depending on the adipose tissue location. The adipose tissue is classified, according to the regional distribution, as SAT (located under the skin) and visceral adipose tissue (VAT; associated with internal organs), and it is diffused throughout the entire human body . The sites of adipose tissue accumulation are strictly conserved across several species . The development and formation of these two adipose tissue types are different, and even in adult life, they show different functions and structures . Adiposity is a polygenic trait; several genes control phenotypic variability , and multiple pathways regulate its development (Kerimova R.C.,Ağayeva A.H.,Abiyev H.Ə., Cəfərova Z.İ., Məmmədov Ş.Ə.,2023).

Different studies report that fat distribution is strongly associated with IR, the main risk factor for T2D and cardiovascular disease (CVD) . A systematic review and meta-analysis of observational studies by Zhang et al. demonstrates that the accumulation of VAT is the strongest predictor of IR. Nevertheless, obesity indices (total fat mass, BMI, and waist circumference) and adipose tissue depots (intra-abdominal and total abdominal fat) are significantly correlated with IR . Other human studies have also shown that the accumulation of lipids in the abdominal SAT correlates with the onset of IR and T2D. Central adiposity rather than peripheral adiposity is an important risk factor in establishing metabolic diseases (Yu, S.Y.; Choi, Y.; Kwon, Y.I.; Lee, O.-H.; 2021).

In response to a positive energy balance, dynamic mechanisms reorganize the adipose tissue by changing the number and size of mature adipocytes. In the meantime, the precursor cells of the stromal vascular fraction begin to be recruited and committed towards the adipocyte lineage. Hypertrophic adipocytes secrete paracrine factors (hormones and cytokines), which facilitate preadipocytes recruitment and promote their differentiation into mature adipocytes. These events are generally defined as adipose tissue remodeling. In obesity, alteration in adipose tissue remodeling may induce the dysregulation of adipose tissue secreted cytokines, leading to local and systemic inflammation and impaired adipogenesis of precursor cells, as further discussed later in this review (Perrini, S.; Cignarelli, A.; Quaranta, V.N.; Falcone., 2017).

In addition to the regional distribution of fat, the adipocyte morphology (hypertrophy vs. hyperplasia) contributes to the obesity-associated metabolic abnormalities. In a chronic state of positive energy balance, the adipocyte size reaches a critical threshold before recruiting precursor cells to increase the adipocytes number. Spalding et al. demonstrated that the adipocyte number is tightly regulated and determined during childhood, suggesting that the increase in cell size is the main plasticity mechanism in response to an energy imbalance. Adipose tissue hyperplasia is considered as a “recovery mechanism” to overnutrition. The adipocytes that reach the critical cell size become lipid-overloaded and insulin-resistant, and adipose tissue hyperplasia attempts to repair metabolic alterations (Yu, S.Y.; Choi, Y.; Kwon, Y.I.; Lee, O.-H.; 2021).

Pluripotent mesenchymal stem cells (MSCs) can develop into several cell types, including adipocytes, myocytes, chondrocytes, and osteocytes. These stem cells are located in the vascular stroma of adipose tissue as well as in the bone marrow; indeed, bone marrow-derived cells account for approximately 10% of the SAT cell population and are therefore increased by up to 25% in obese people. MSCs, when appropriately stimulated, undergo a multistep process of commitment in which the progenitor cells become restricted to the adipocyte lineage. Accordingly, adipogenesis can be divided into two phases: commitment (or determination) and terminal differentiation. Determination results in the conversion of the stem cell into a preadipocyte, which cannot be distinguished morphologically from its precursor cell but has lost the potential to differentiate into other cell types. In the second phase, the terminal differentiation, the preadipocyte takes on the characteristics of the mature adipocyte that acquires the necessary machinery for lipid transport and synthesis, insulin sensitivity, and the secretion of adipocyte-specific proteins. All of these steps are controlled by a network of interacting transcription factors operating to coordinate the expression of many hundreds of proteins responsible for establishing the mature fat cell phenotype (Perrini, S.; Cignarelli, A.; Quaranta, V.N.; Falcone., 2017).

For a long time, the role of adipose tissue has been underestimated, and it has been considered a merely storage organ. The obesity pandemic has put a spotlight on adipocyte function, and we now recognize it as an endocrine organ essential in regulating systemic energy homeostasis. Obesity and the associated metabolic diseases are rapidly increasing and, in our opinion, the dysfunction of adipose tissue is the central mechanism for the development of these complications (Fernandes Negris Lima, T.; Nackeeran, S.;2020).

A deep understanding of the molecular mechanisms responsible for adipose tissue dysfunction is needed. Impaired adipose tissue plasticity also synergizes with age-related metabolic defects to exacerbate metabolic disorders. Understanding the molecular alterations that regulate defective adipose tissue plasticity may identify therapeutic targets to enhance the expandability and function of adipose tissue. Lifestyle interventions as exercise and diet are effective in promoting a healthy adipose tissue expansion, although these approaches are difficult to maintain in the long term. Recently, adipogenesis has emerged as a possible therapeutic target to enhance adipose tissue health. Increasing adipogenesis during weight gain can counteract the negative metabolic consequences of obesity. However, a remaining issue is to address these mechanisms in human (Biondi, G.; Marrano, N.; Borrelli, A.; Rella, M.;2022).

**ABSTRACT**

The role of the adrenal glands in your body is to release certain hormones directly into the bloodstream. Many of these hormones have to do with how the body responds to stress, and some are vital to existence. Both parts of the adrenal glands the adrenal cortex and the adrenal medulla perform distinct and separate functions. Cortisol is a glucocorticoid hormone produced by the zona fasciculata that plays several important roles in the body. It helps control the body's use of fats, proteins and carbohydrates; suppresses inflammation; regulates blood pressure; increases blood sugar; and can also decrease bone formation. This hormone also controls the sleep/wake cycle. It is released during times of stress to help your body get an energy boost and better handle an emergency situation. Adrenal glands produce hormones in response to signals from the pituitary gland in the brain, which reacts to signaling from the hypothalamus, also located in the brain. This is referred to as the hypothalamic pituitary adrenal axis. As an example, for the adrenal gland to produce cortisol, the following occurs: The hypothalamus produces corticotropin-releasing hormone (CRH) that stimulates the pituitary gland to secrete adrenocorticotropin hormone (ACTH). ACTH then stimulates the adrenal glands to make and release cortisol hormones into the blood. Normally, both the hypothalamus and the pituitary gland can sense whether the blood has the appropriate amount of cortisol circulating. If there is too much or too little cortisol, these glands respectively change the amount of CRH and ACTH that gets released. This is referred to as a negative feedback loop. Excess cortisol production can occur from nodules in the adrenal gland or excess production of ACTH from a tumor in the pituitary gland or other source.

**Keywords:** Adrenal gland, Shell layer, Medicinal failure

**An adrenal gland is made of two main parts:** The adrenal cortex is the outer region and also the largest part of an adrenal gland. It is divided into three separate zones: zona glomerulosa, zona fasciculata and zona reticularis. Each zone is responsible for producing specific hormones. The adrenal medulla is located inside the adrenal cortex in the center of an adrenal gland. It produces stress hormones, including adrenaline. The adrenal cortex and adrenal medulla are enveloped in an adipose capsule that forms a protective layer around an adrenal gland (Kərimova R.C., Hüseynova G.A., Nəcəfova T.M., Abiyev H.Ə., 2023).

The role of the adrenal glands in your body is to release certain hormones directly into the bloodstream. Many of these hormones have to do with how the body responds to stress, and some are vital to existence. Both parts of the adrenal glands the adrenal cortex and the adrenal medulla perform distinct and separate functions. Each zone of the adrenal cortex secretes a specific hormone. The key hormones produced by the adrenal cortex include: Cortisol is a glucocorticoid hormone produced by the zona fasciculata that plays several important roles in the body. It helps control the body's use of fats, proteins and carbohydrates; suppresses inflammation; regulates blood pressure; increases blood sugar; and can also decrease bone formation. This hormone also controls the sleep/wake cycle. It is released during times of stress to help your body get an energy boost and better handle an emergency situation (Kərimova R.C., Abiyev H.Ə., Hüseynova G.A., 2023).

Adrenal glands produce hormones in response to signals from the pituitary gland in the brain, which reacts to signaling from the hypothalamus, also located in the brain. This is referred to as the hypothalamic pituitary adrenal axis. As an example, for the adrenal gland to produce cortisol, the following occurs: The hypothalamus produces corticotropin-releasing hormone (CRH) that stimulates the pituitary gland to secrete adrenocorticotropin hormone (ACTH). ACTH then stimulates the adrenal glands to make and release cortisol hormones into the blood (Shaffer ML, Baud O, Lacaze-Masmonteil T., 2019).

Normally, both the hypothalamus and the pituitary gland can sense whether the blood has the appropriate amount of cortisol circulating. If there is too much or too little cortisol, these glands respectively change the amount of CRH and ACTH that gets released. This is referred to as a negative feedback loop. Excess cortisol production can occur from nodules in the adrenal gland or excess production of ACTH from a tumor in the pituitary gland or other source. This mineralocorticoid hormone produced by the zona glomerulosa plays a central role in regulating blood pressure and certain electrolytes (sodium and potassium). Aldosterone sends signals to the kidneys, resulting in the kidneys absorbing more sodium into the bloodstream and releasing

potassium into the urine. This means that aldosterone also helps regulate the blood pH by controlling the levels of electrolytes in the blood (Kang TS, Choi HY, Park SH.,2018).

These hormones produced by the zona reticularis are weak male hormones. They are precursor hormones that are converted in the ovaries into female hormones (estrogens) and in the testes into male hormones (androgens). However, estrogens and androgens are produced in much larger amounts by the ovaries and testes. The adrenal medulla, the inner part of an adrenal gland, controls hormones that initiate the flight or fight response. The main hormones secreted by the adrenal medulla include epinephrine (adrenaline) and norepinephrine (noradrenaline), which have similar functions (Alexandraki KI, Grossman A.,2019).

Among other things, these hormones are capable of increasing the heart rate and force of heart contractions, increasing blood flow to the muscles and brain, relaxing airway smooth muscles, and assisting in glucose (sugar) metabolism. They also control the squeezing of the blood vessels (vasoconstriction), helping maintain blood pressure and increasing it in response to stress (Shaffer ML, Baud O, Lacaze-Masmonteil T.,2019).

Like several other hormones produced by the adrenal glands, epinephrine and norepinephrine are often activated in physically and emotionally stressful situations when your body needs additional resources and energy to endure unusual strain. The two common ways in which adrenal glands cause health issues are by producing too little or too much of certain hormones, which leads to hormonal imbalances. These abnormalities of the adrenal function can be caused by various diseases of the adrenal glands or the pituitary gland (Shaffer ML, Baud O, Lacaze-Masmonteil T.,2019).

**Adrenal insufficiency** is a rare disorder. It may be caused by disease of the adrenal glands (primary adrenal insufficiency, Addison's disease) or by diseases in the hypothalamus or the pituitary (secondary adrenal insufficiency). It is the opposite of Cushing syndrome and is characterized by low levels of adrenal hormones. The symptoms include weight loss, poor appetite, nausea and vomiting, fatigue, darkening of skin (only in primary adrenal insufficiency), abdominal pain, among other. The causes of primary adrenal insufficiency may include autoimmune disorders, fungal and other infections, cancer (rarely), and genetic factors (Paragliola RM, Corsello SM.,2019).

Although adrenal insufficiency usually develops over time, it can also appear suddenly as an acute adrenal failure (adrenal crisis). It has similar symptoms, but the consequences are more serious, including life-threatening shock, seizures, and coma. These may develop if the condition is left untreated. Adrenal insufficiency can also result from a genetic disorder called

congenital adrenal hyperplasia. Children who are born with this disorder are missing an essential enzyme necessary to produce cortisol, aldosterone or both. At the same time, they often experience excess of androgen, which may lead to male characteristics in girls and **precocious puberty** in boys (Paragliola RM, Corsello SM.,2019).

Congenital adrenal hyperplasia can remain undiagnosed for years depending on the severity of the enzyme deficiency. In more severe cases, infants may suffer from ambiguous genitalia, dehydration, vomiting and failure to thrive. Sometimes, adrenal glands may develop nodules that produce too much of certain hormones. Nodules 4 centimeters or larger and nodules that show certain features on imaging increase suspicion for malignancy. Both benign and cancerous nodules may produce excessive amounts of certain hormones, which is referred to as a functional nodule. Functional tumors, malignant tumors or nodules greater than 4 centimeters are recommended to be referred for surgical evaluation(Shaffer ML,Baud O, Lacaze-Masmonteil T.,2019).

Cushing syndrome results from excessive production of cortisol from the adrenal glands. The symptoms may include weight gain and fatty deposits in certain areas of the body, such as the face, below the back of the neck called a buffalo hump and in the abdomen; thinning arms and legs; purple stretch marks on the abdomen; facial hair; fatigue; muscle weakness; easily bruised skin; high blood pressure; diabetes; and other health issues (Alexandraki KI, Grossman A.,2019).

Excess cortisol production can also be triggered by overproduction of ACTH by a benign tumor in the pituitary gland or tumor elsewhere in the body. This is known as Cushing Disease. Another common cause of Cushing syndrome is excessive and prolonged consumption of external steroids, such as prednisone or dexamethasone, which are prescribed to treat many autoimmune or inflammatory diseases (e.g., lupus, rheumatoid arthritis, asthma, inflammatory bowel disease, multiple sclerosis, etc.) (Kang TS, Choi HY, Park SH.,2018).

Hyperaldosteronism results from overproduction of aldosterone from one or both adrenal glands. This is characterized by increase in blood pressure that often requires many medications to control. Some people can develop low potassium levels in the blood, which can cause muscle aches, weakness and spasms. When the cause is adrenal oversecretion, the disease is called Conn syndrome (Martin-Grace J, Dineen R, Sherlock M.,2020).

**Pheochromocytoma** is a tumor that results in excess production of adrenaline or noradrenaline by the adrenal medulla that often happens in bursts. Occasionally, neural crest tissue, which has similar tissue to the adrenal medulla, may be the cause of overproduction of these hormones.

This known as a paraganglioma (Kərimova R.C.,Huseynova G.A.,Nəcəfova T.M.,Abiyev H.Ə.,2023).

Pheochromocytomas may cause persistent or sporadic high blood pressure that may be difficult to control with regular medications. Other symptoms include headaches, sweating, tremors, anxiety and rapid heartbeat. Some people are genetically predisposed to developing this type of tumor. Malignant adrenal tumors (adrenal cancer), such as adrenocortical carcinoma, are rare and often have spread to other organs and tissues by the time they are diagnosed. These tumors tend to grow fairly large and can reach several inches in diameter (Shaffer ML,Baud O,Lacaze-Masmonteil T.,2019).

Cancerous adrenal tumors can be functional and release excess of one or more hormones accompanied by corresponding symptoms, as listed above. Patients may also experience abdominal pain, flank pain or a feeling of abdominal fullness, especially when the adrenal tumor gets very large. Not all cancers found in adrenal glands originate from the gland itself. The majority of adrenal tumors are metastasis, or cancer spread, from another primary tumor elsewhere in the body (Martin-Grace J, Dineen R, Sherlock M.,2020).

**ABSTRACT**

The Hypothalamic-pituitary-adrenal (HPA) axis is comprised of the hypothalamus, pituitary gland, and adrenal glands. It regulates the body's adaptive response to stress. Stress is a huge factor as it can mess up every single hormone. In particular progesterone, one of the most important hormones for fertility and pregnancy, is not only produced by the corpus luteum of the ovary, but is also produced by the adrenal glands. This means that if you are under a lot of stress then your adrenal glands may have shut down your production of progesterone in favour of stress hormones such as cortisol and adrenaline. I really believe this was a huge factor in my fertility journey and is likely to be a major factor with a lot of women in this day and age. When we are under stress our body tends to shut down our reproductive hormones as getting pregnant is not essential for our survival. The stress response serves to prioritise survival over less essential physiological functions, inclusion growth, and reproduction.

**Keywords:** Pregnancy, Adrenal glands, Stress, Pathology

The Hypothalamic-pituitary-adrenal (HPA) axis is comprised of the hypothalamus, pituitary gland, and adrenal glands. It regulates the body's adaptive response to stress. Adrenal fatigue, or HPA Axis dysfunction which is otherwise known, is when our adrenal glands function below normal levels, usually as a result of prolonged, chronic stress. The adrenal glands are situated on top of the kidneys and regulate our stress response by producing stress hormones such as cortisol and adrenaline in response to stress. Long term stress can lead to the depletion of the adrenal glands and can result in imbalances in the production of cortisol. When the body is in a long-term stress state, non-essential functions that are not important for immediate survival such as the digestive system, reproduction system, and thyroid start to slow down or switch off altogether (Bernard, V.; Young, J.; Binart, N.,2019).

The hypothalamic - pituitary - adrenal (HPA) axis, when activated by stress, exerts an inhibitory effect on the female reproductive system. Corticotrophin-releasing hormone (CRH) inhibits hypothalamic gonadotropin-releasing hormone (GnRH) and glucocorticoids inhibit pituitary luteinizing hormone and ovarian estrogen and progesterone secretion (Studerus, E.; Ittig, S.; Beck, K.,2021).

The inhibition of luteinizing hormone (LH) can have a negative effect on follicular development and oocyte quality, so if high AMH and low egg quality is an issue for you then it is essential that stress is addressed as HPA Axis dysfunction is connected to poor egg quality. Follicular fluid from follicles whose oocytes were not fertilised had levels of cortisol significantly higher than levels in follicular fluid from follicles containing successfully fertilised oocytes. This suggests that high levels of glucocorticoids negatively influences the ability of an oocyte to become fertilised (Collée, J.; Mawet, M.; Tebache, L.,2021).

Here are some of the most common symptoms of adrenal fatigue or HPA Axis dysfunction: Exhaustion, fatigue, Waking up unrefreshed after a long sleep, 3 pm energy crash, Craving sugar, coffee, or salt, Tired in evenings but gets second wind after 10 pm and stays up late, Hormone imbalances, low progesterone, low thyroid. Infertility and recurring miscarriage. Weight gain, Blood sugar issues (Ibáñez, L.; Oberfield, S.E.,2017).

Without a healthy balance of hormones, getting pregnant or staying pregnant can be a challenge. It is also very hard for anyone to have a healthy hormone balance unless your life is in balance. For optimal hormonal health, we need to balance all areas of our lives, whether physical and emotional. These include: Work and a sense of purpose, Family and relationships, Exercise - not too much or not too little, Diet, Sleep, relaxation, and me-time. Having fun, Gut health, allergies,

and infections, Nutritional deficiencies, Physical alignment and pain (Pandey, A.K.; Gupta, A.; Tiwari.,2018).

Stress is a huge factor as it can mess up every single hormone. In particular progesterone, one of the most important hormones for fertility and pregnancy, is not only produced by the corpus luteum of the ovary, but is also produced by the adrenal glands. This means that if you are under a lot of stress then your adrenal glands may have shut down your production of progesterone in favour of stress hormones such as cortisol and adrenaline. I really believe this was a huge factor in my fertility journey and is likely to be a major factor with a lot of women in this day and age. When we are under stress our body tends to shut down our reproductive hormones as getting pregnant is not essential for our survival. The stress response serves to prioritise survival over less essential physiological functions, inclusion growth, and reproduction (Bernard, V.; Young, J.; Binart, N.,2019).

Stress also leads to an increase in the production of cortisol (a stress hormone) from the adrenal glands, which inhibits the body's main sex hormones GnRH (gonadotropin-releasing hormone) and subsequently suppresses ovulation (by inhibiting the release of LH and FSH). In men, stress can have a negative effect on sperm health. Stress hormones affect the hypothalamus, pituitary glands, and reproductive organs. Chronic stress can lead to adrenal issues, which can downregulate your thyroid gland and lead to an underactive thyroid, which can contribute to fertility issues and affect your energy levels and sense of wellbeing. Stress is not just being busy. If you have an injury, infection, gut issue, or food intolerance that is causing inflammation and uncomfortable symptoms, this is stressful for your body as well. These situations can weaken the immune system and can become a form of stress that impacts your adrenal and thyroid glands (Collée, J.; Mawet, M.; Tebache, L.,2021).

So, if you are on a fertility journey then maybe it is time to take stock and consider what is causing you the most stress in your life, whether it is emotional or physical and what steps do you need to take to try and reduce this (Vander Borgh, M.; Wyns, C.,2018).

Although the link between stress and reproductive dysfunction has been well-established and extensively investigated in nonhuman animals, where additional variables can be tightly controlled, the question of whether stress directly impedes fertility in humans remains difficult to conclusively examine (Kərimova R.C., Vəliyeva Z.Y., Məşədiyeva Bayramova S.Ə.,2022).

Psychological stress experienced by female or male partners of infertile couples has been associated with lower conception rates in at least some cases. However, there have been a number of methodological challenges and conflicting findings facing research in the area. These

include the lack of prospective longitudinal studies on the general population, the use of nonstandardized measures of stress, and the fact that the majority of human studies have been conducted on couples attending fertility clinics with, likely, underlying physical and/or hormonal causes of infertility. There is also the important consideration that stress is a normal facet of life, thereby making nonstressed control groups very difficult to source. Stress is usually dealt with by an appropriate and regulated neuroendocrine response, but although psychological stress affects us all at some point, individuals differ in the impact this has on their physiology, including fertility. These individual differences may explain why some studies have demonstrated substantial reproductive implications of psychological distress, whereas others have found small effect sizes or no association. It is likely that individuals experiencing extreme or long-term stress or those more vulnerable to its effects may be particularly vulnerable to fertility consequences (Alkadi, H. A.,2020).

Infertility itself can be highly stressful. Many of those who struggle with infertility seek help from assisted reproductive technology treatments. These treatments, including in vitro fertilization, can involve invasive techniques that place an additional burden of stress on the couple in addition to the stress associated with an inability to conceive. The effects of stress may therefore be particularly detrimental for couples undergoing assisted reproductive technology, leading in some couples to more treatment cycles to conceive, resulting in discontinuation of treatment before achieving pregnancy, and potentially contributing to the low overall success rates. Similarly, pre-existing psychological conditions, such as anxiety, depression, and high levels of distress, can have a negative effect on assisted reproductive technology outcomes. The same group was not able to replicate this finding in a separate study in 2009. However, patients who are prone to anxiety, depression, or high stress levels may particularly benefit from psychosocial support during the treatments (Kərimova R.C., Vəliyeva Z.Y.,Məşədiyeva Bayramova S.Ə.,2022).

Stress itself has been a controversial concept since its first description in physiology by Cannon and Selye early last century. However, a stressor (the stimulus) can broadly be considered an intense, nonroutine challenge to homeostasis resulting in a nonspecific response that includes general activation of the hypothalamic-pituitary-adrenal (HPA) axis and sympathomedullary systems. Each stressor can also activate a more specific signature response. Here we will refer to “stress” as the stimulus and the stress response as the body’s reaction to the stimulus (Ibáñez, L.; Oberfield, S.E.,2017).

Although there are myriad types of stress, they can be loosely categorized into “physical” and “psychological” stress based on the immediacy of the impact on the body and the endocrine and neuronal responses they elicit. Physical stressors (interoceptive, homeostatic, systemic) are those involving an immediate disturbance of tissue integrity and a specific activation of the central amygdala and rostral A1 and A2 brainstem noradrenergic cells in addition to general HPA axis and sympathomedullary activation (Dutta, S.; Sengupta, P.,2021).

Psychological stress (neurogenic, psychogenic, emotional) involves a threat to tissue disturbance rather than a direct injury and a specific medial amygdala and caudal A1 and A2 brainstem noradrenergic pattern of neuronal activation (Alkadi, H. A.,2020).

Acutely, within seconds to minutes, both physical and psychological stress generally activates the sympathomedullary system leading to the release of adrenaline and noradrenaline, which increase heart rate, blood pressure, respiration, and blood glucose levels to facilitate attention and action directed at combatting the stress. Within minutes the HPA axis is activated, with corticotropin-releasing hormone (CRH)- and arginine vasopressin-expressing cells in the medial parvocellular region of the paraventricular nucleus of the hypothalamus stimulating the release of CRH from axonal terminal boutons in the median eminence, which, in turn, stimulates corticotrophs in the anterior pituitary gland to release adrenocorticotrophic hormone (ACTH) into systemic circulation. By approximately 20 to 30 minutes after the onset of the stress, ACTH is acting at the melanocortin-2 receptors on the adrenal cortex to stimulate the synthesis and release of glucocorticoids into the circulation. Glucocorticoids remain elevated for ~60 to 120 minutes after the onset of an acute stressor and have roles in immunosuppression, glucose uptake and mobilization, fat storage, and memory consolidation, among others. Glucocorticoids also negatively feed back onto glucocorticoid and mineralocorticoid receptors, chiefly in the hippocampus and hypothalamus, to inhibit further activation of the paraventricular nucleus of the hypothalamus (PVN) so suppressing ongoing activation of the HPA axis once the stressor has been resolved (Vander Borgh, M.; Wyns, C.,2018).

The two most supportive nutrients for the adrenal glands are vitamin C and vitamin B5 (pantothenic acid). The adrenal glands need both vitamin B5 (pantothenic) and vitamin C to function optimally and produce adrenal hormones (Dutta, S.; Sengupta, P.,2021).

**Vitamin B5 (pantothenic acid):** Vitamin B5 (pantothenic acid) enhances adrenal function as it is involved in the production of adrenal hormones that help counteract stress and is involved in energy metabolism. Vitamin B5 is known as the ‘anti-stress’ hormone and a deficiency can

result in adrenal dysfunction. Vitamin B5 is found in many foods and is also manufactured by our gut flora so a deficiency is not that common. However, people who have diets high in refined processed foods and have poor gut health are more likely to be deficient. Some of the best food choices of vitamin B5 are brewers' yeast, liver, egg yolks, fish, chicken, lentils whole grains, cheese, peanuts, cashew nuts, dried beans, green peas, cauliflower, mushrooms, and avocados. Deficiency symptoms include fatigue, depression, allergies, poor digestion, blood sugar issues, vomiting, abdominal cramps, skin problems, tingling in hands and feet, and recurring upper respiratory symptoms (Collée, J.; Mawet, M.; Tebache, L.,2018).

Supplementation with about 500mg of Vitamin B5 can be helpful if fatigue is an issue. If you are supplementing with a single B vitamin it is also important to take a separate B complex with all the B group vitamins in and preferably activated in case of methylation issues. In addition, I like to also supplement with a whole B complex with all the B group vitamins together. This is because the B complex vitamins are a family and work synergistically together and an excess in one B vitamin over the long term can cause deficiencies in others (Pandey, A.K.; Gupta, A.; Tiwari.,2018).

**Vitamin C :** Vitamin C increases adrenal function as it is involved with the production of adrenal hormones. The adrenal glands store and utilise vitamin C, so when the body is under prolonged stress, vitamin C levels in the adrenal glands can be depleted. This is why it is an essential nutrient to take every day if you are experiencing periods of stress, especially as vitamin C is a water-soluble vitamin that is easily excreted from the body. In terms of fertility, a diet rich in vitamin C can protect against genetic abnormalities in both male and female. The ovaries are very rich in vitamin C which highlights the importance of this nutrient. It helps to promote ovulation and improve progesterone levels by lengthening the luteal phase. Vitamin C deficiency during pregnancy has been linked to an increased risk of miscarriage (Collée, J.; Mawet, M.; Tebache, L.,2018).

In men, it has been shown to help with sperm quality, protect sperm from DNA damage, and keep sperm from clumping together making them more motile. Vitamin C levels in the body are reduced by stress, smoking, and infections. Here are some signs that you could be deficient in vitamin C: poor immunity, poor wound healing, rough bumpy skin, bleeding gums, easy bruising, fatigue, and dandruff. Some of the best sources of vitamin C are: citrus fruits such as oranges, lemons, limes, tangerines, grapefruit, rose hips, acerola berries, strawberries, red and green peppers, broccoli, potatoes, tomatoes, asparagus, and Brussel sprouts (Studerus, E.; Ittig, S.; Beck, K.,2021).

**Özet**

Endüstriyel, mesleki ve evsel faaliyetler gibi farklı kaynaklar sebebiyle petrol, yağ ve organik çözücüler gibi kirleticiler tarafından oluşturulan su kirliliği tüm canlıları ve çevreyi olumsuz etkilemektedir. Bu sorunun çözümüne yönelik olarak, suyun yağsı kirleticilerden etkin bir şekilde arındırılması için bir dizi çalışma yapılmaktadır. Bu çalışmaların bir kısmı, polimerik üç boyutlu sorbentlerin hazırlanması ve yüzey modifikasyonu üzerinedir. Özellikle, yüzey modifikasyonu kullanılarak malzeme yüzeyinin pürüzlülük ve yüzey enerjisi parametreleri ele alınıp su temas açısının 90 ila 150°'nin üzerine çıkarılması ile hidrofobik/süperhidrofobik malzemeler elde edilmesi amaçlanmaktadır. Yaptığımız çalışmanın odak noktası, gelişmiş malzemelerin tasarımı ve uygulaması için etkin bir yaklaşım olan yüzey modifikasyonudur. Bu amaç doğrultusunda, dopaminin alkali sulu ortamda oksidatif polimerizasyonu ile oluşan polidopamin (PDA) ticari melamin sünger (MS) üzerine eş zamanlı kaplanmıştır. Oluşturulan PDA esaslı yüzeyde malzemeye ileri modifikasyonlara olanak tanıyan fonksiyonel gruplar da kazandırılmıştır. Bununla birlikte, dopaminin polimerizasyonu ile ilgili olarak substrat yüzeyinde birikimde sıklıkla karşılaşılan sorunlar ele alınmıştır. Bu sorunların başında, uzun birikim-reaksiyon süresi ve kaplamanın zayıf stabilitesi gelmektedir. Bu problemlerin üstesinden gelinebilmesi için polimerizasyon ortamında reaktif oksijen türleri üretebilecek bir katalizör sisteminden yararlanılmıştır. İlk olarak polimerizasyon süresine katalizör etkisinin incelenmesi için  $\text{CuSO}_4$ ,  $\text{H}_2\text{O}_2$  ve farklı molar oranlarda  $\text{CuSO}_4$  ve  $\text{H}_2\text{O}_2$  karışımı reaksiyon ortamına eklenmiştir. Çözeltilerin renk değişimleri ve UV-Vis absorbansları takip edilerek elde edilen sonuçlara göre ortamdaki  $\text{H}_2\text{O}_2$  miktarı arttıkça PDA için karakteristik olan pikin absorbans değeri artmıştır. Daha sonra, değişen  $\text{Cu}^{2+}/\text{H}_2\text{O}_2$  katalizör oranlarında sentezlenen PDA ile kaplanmış MS'ler hazırlanmıştır ve katalizör oranının mekanik özellikler üzerindeki etkisi incelenmiştir. Bu çalışmanın sonucunda elde edilen ürün, yapısal olarak kararlı bir ara ürün olarak değerlendirilmiş ve ileri modifikasyonlara uygun olduğu tespit edilmiştir. Bu bulgu, su kirliliği sorununa etkili bir çözüm sunma amacıyla literatüre bir katkı yapmayı hedeflemektedir.

**Anahtar Kelimeler:** dopamin, melamin, katalizör sistemi, mekanik davranış

**INVESTIGATION OF CATALYST EFFECT IN THE PREPARATION OF PDA  
BASED MELAMINE SPONGES**

**Abstract**

Water pollution from various sources, such as industrial, commercial and domestic activities, containing pollutants such as crude oil, oil and organic solvents, adversely affects all living organisms and the environment. In order to address this problem, a number of studies have been carried out to effectively purify water from oily pollutants. Some of these studies focus on the preparation of three-dimensional polymeric sorbents and surface modification. Specifically, the aim is to achieve hydrophobic/superhydrophobic materials by controlling parameters such as surface roughness and surface energy through surface modification, resulting in a water contact angle of 90 to 150° or higher. The focus of our study is on surface modification, which is an effective approach for the design and application of advanced materials. For this purpose, polydopamine (PDA) formed by oxidative polymerisation of dopamine in an alkaline aqueous medium was simultaneously coated onto a commercial melamine sponge (MS). Functional groups were also introduced onto the PDA-based surface to allow further modification of the material. However, the problems often encountered in the deposition on the substrate surface related to the polymerisation of dopamine have been addressed. The main problems are the long deposition-reaction time and the poor stability of the coating. In order to overcome these problems, a catalyst system capable of generating reactive oxygen species in the polymerisation environment was used. Firstly, CuSO<sub>4</sub>, H<sub>2</sub>O<sub>2</sub> and a mixture of CuSO<sub>4</sub> and H<sub>2</sub>O<sub>2</sub> at different molar ratios were added to the reaction medium to investigate the effect of the catalyst on the polymerisation time. According to the results obtained by monitoring the colour changes and UV-Vis absorbance of the solutions, the absorbance value of the peak characteristic for PDA increased with the increased amount of H<sub>2</sub>O<sub>2</sub>. Subsequently, MS coated with PDA synthesised at different Cu<sup>2+</sup>/H<sub>2</sub>O<sub>2</sub> catalyst ratios were prepared and the effect of the catalyst ratio on the mechanical properties was studied. The product obtained as a result of this study was evaluated as a structurally stable intermediate and found to be suitable for further modifications. This finding is expected to make a contribution to the literature in order to provide an effective solution to the problem of water pollution.

## **Giriş**

Günümüzde yağlı atık suyun deşarjı su kütlelerinin ortamını bozmaya devam etmektedir. Son yıllarda fabrika deşarjları, açık deniz taşımacılığı ve petrol aramaları nedeniyle petrol sızıntıları giderek yaygınlaşmaktadır. Bu durum sadece ekonomi üzerinde olumsuz bir etki ortaya çıkarmakla kalmayıp, aynı zamanda son derece ciddi ekolojik hasara da neden olmaktadır. Yerçekimi yöntemi, santrifüj yöntemi, yerinde yakma yöntemi ve biyolojik arıtma yöntemi gibi geleneksel endüstriyel yağ/su ayırma yöntemlerinin kullanımı kolay olmasına rağmen, düşük ayırma verimliliği, ikincil kirlilik ve yağlı atık su arıtımında düşük geri dönüşüm oranı gibi dezavantajları vardır. Alternatif olarak, halihazırda kullanımda olan bazı sorpsiyon malzemeleri, yüksek maliyet, düşük seçicilik, sınırlı geri kazanılabilirlik ve büyük ölçekli üretimdeki zorluk gibi dezavantajlara sahiptir. Bu nedenle, daha yüksek enerji verimliliği, kullanılabilirlik, performans ve çevresel özelliklere sahip yeni yağ/su ayırma malzemelerinin geliştirilmesi son yıllarda popüler bir araştırma alanı haline gelmiştir (L. He et al., 2024; Z. He, Wang, & Ma, 2024). Süngerler, köpükler ve arojeller gibi üç boyutlu sorbentler, yağ/su ayırma alanında geniş uygulama olanaklarına sahiptir. Bu malzemeler arasında melamin sünger (MS) üç boyutlu gözenekli esnek bir malzemedir. Düşük işlem maliyeti, iyi mekanik özellikler ve esneklik sergilediğinden yağ/su ayırma uygulamalarının ele alınmasında büyük avantajlara sahip olduğu açıktır. Ancak MS'ler amfifilik özelliklerinden dolayı doğrudan yağ ve suyu ayırmak için kullanılamazlar. Bu nedenle denizdeki petrol sızıntılarının, sanayi ve evsel atık yağların arıtılması için belirli yöntem ve malzemelerle hidrofobik olarak modifiye edilmesi gerekmektedir (L. He et al., 2024; Weldemhret, Park, & Song, 2024). Katı bir malzemenin süperhidrofobik özelliklere sahip olması için gerekli iki koşul sırasıyla yüzey pürüzlülüğünün artması ve yüzey enerjisinin azalmasıdır (Getaneh, Temam, Nwanya, Ejikeme, & Ezema, 2023; L. He et al., 2024). MS'nin hidrofobik/süperhidrofobik modifikasyonunda genellikle daldırarak kaplama, karbonizasyon ve yerinde kimyasal reaksiyon teknikleri tercih edilmektedir (Dong et al., 2023; Okutan, 2023; Stolz et al., 2016). Bu tekniklerin arasında yer alan yerinde kimyasal reaksiyon yöntemi, belirli bir substratın yüzeyinde doğrudan kimyasal reaksiyona yönelik bir yöntemdir. Genellikle redoks, polimerizasyon ve plazma biriktirme gibi yöntemleri içerir (L. He et al., 2024).

Yağ/su ayırma için MS üzerinde yapılan kimyasal modifikasyonları incelediğimizde, biyoyapışkan malzemelerden olan PDA ile yapılan modifikasyon çalışmalarını karşımıza çıkmaktadır. Yapısındaki bir protein yardımıyla midyeler, çeşitli substrat yüzeylerine güçlü bir şekilde yapışma gösterirler. Bu proteini moleküler yapısal olarak taklit eden dopamin, kendi

kendine polimerizasyon yoluyla herhangi bir maddeyle sağlam kovalent ve kovalent olmayan ara yüzey etkileşimleri oluşturabilir. Bu bağlamda, MS yüzeyine PDA tabakalarının yapışması, pürüzlülük sağlamak ve MS'nin sonraki kimyasal modifikasyonları için çeşitli fonksiyonel grupların yapıya yerleştirilmesi gibi fırsatlar sunabilir. Ancak dopaminin polimerizasyonu herhangi bir substrat yüzeyinde birikiminde karşılaşılan genel sorun uzun birikim-reaksiyon süresi, zayıf homojenlik ve kaplamanın zayıf stabilitesi olarak karşımıza çıkmaktadır (Famkar, Pircheraghi, & Nazockdast, 2022; Jintao Wang et al., 2015). Bu durumda da polimerizasyon esnasında reaktif oksijen türleri üretebilecek bir katalizör sisteminden yararlanılmasıyla daha kararlı ve homojen polimer tabakalarının oluşumu sağlanabilmektedir (Z. Wang et al., 2023). Bu çalışmada, dopaminin alkali sulu ortamda oksidatif polimerizasyonu ile oluşan PDA'nın ticari MS üzerine eş zamanlı kaplanması esnasında polimerizasyon ortamında reaktif oksijen türleri üretebilecek bir katalizör sisteminden yararlanılmasının mekanik özellikler üzerine etkisi incelenecektir.

### **Malzeme ve Yöntem**

Çalışmada Basotect marka ticari MS, etanol, dopamin hidroklorür, Tris-HCl çözeltisi ve katalizör sistemi olarak  $\text{CuSO}_4:\text{H}_2\text{O}_2$  kullanılmıştır. Deneysel çalışmada ilk olarak UV-Vis analiziyle dopaminin polimerleşmesi takip edilmiştir. Farklı oranlarda katalizör sistemi kullanılarak hazırlanan numunelere ait kodlar Tablo 1'de verilmiştir. Daha sonra ticari MS'nin PDA ile modifikasyonu gerçekleştirilmiştir. Son olarak da hazırlanan süngerlere FTIR analizi ve basma testi yapılmıştır (Okutan, 2023).

## Araştırma ve Bulgular

İlk olarak dopamin içeren Tris-HCl çözeltisi hazırlanarak oda sıcaklığında polimerleşmenin zamana bağlı olarak ilerlemesi takip edilmiştir. PDA oluşumu çözelti renginin zamanla siyaha doğru değişmesiyle kendini göstermektedir. İlk 60 dk. içerisinde çözeltiden belirli hacimde alınan numunelere UV analizi yapılmıştır. Dopaminin polimerizasyonuna atfedilebilecek olan absorbans değeri okunarak elde edilen veriler zamana karşı grafiğe geçirilerek meydana gelen değişim incelenmiştir. Benzer şekilde  $M_{CuSO_4}:M_{H_2O_2}$  oranı Tablo 1'deki gibi değiştirilip  $CuSO_4:H_2O_2$  dopamin çözeltisine ilave edilerek ilgili çözeltilerden alınan numunelere UV-Vis analizi yapılmıştır ve absorbans değerindeki değişim takip edilmiştir (Şekil 1).

Absorbans zaman grafiğinde çeşitli dopamin çözeltilerinin reaksiyon süresine karşı 460 nm'deki absorbans değeri gösterilmektedir.  $CuSO_4:H_2O_2$  içeren çözelti 60 dk. içinde siyaha dönüşmüştür ve görünür partiküller oluşmamıştır. UV/Vis spektrumları 460 nm'de dopaminin polimerizasyonuna atfedilen karakteristik bir pik göstermiştir. Absorbans K1 için kademeli olarak yaklaşık 2,5'a kadar yükselmiştir; bu değer diğer çözeltilerden daha yüksektir. Bu süreçte,  $CuSO_4$  dopamini oksitlemek için bir oksidan görevi görür ve  $CuSO_4:H_2O_2$  dopamin polimerizasyonunu tetiklemek için hidroksil gibi çok sayıda reaktif oksijen türü üretir. Bununla birlikte, dopamin polimerizasyonunun  $H_2O_2$  tarafından bastırılabilmesi unutulmamalıdır. Bunun olası bir nedeni  $H_2O_2$ 'nin dopamin polimerizasyonunun bir ara ürünü olmasıdır; yüksek konsantrasyonu polimerizasyon reaksiyonunu bir dereceye kadar tersine çevirebilir (Zhang et al., 2016). Görüldüğü üzere K6 numunesi katalizörsüz olan K0 dan daha düşük absorbans vermiştir. Sonuç olarak  $CuSO_4:H_2O_2$  oranını değiştirerek dopaminin polimerizasyon hızının ayarlanabileceği görülmektedir.

Şekil 1. Farklı oranda katalizör içeren dopamin çözeltilerinin absorbans spektrumu (solda) ve zamana göre absorbanslarında meydana gelen değişim (sağda).

Şekil 2'den Tris-HCl çözeltisine sıra ile  $\text{CuSO}_4$ ,  $\text{H}_2\text{O}_2$  ve dopamin ilavesiyle meydana gelen renk değişimleri ile 1 saat sonunda çözeltilerde gözlenen renk değişimleri görülmektedir. 4:1  $\text{CuSO}_4:\text{H}_2\text{O}_2$  molar oranına göre hazırlanan K1 numunesi UV-Vis grafiğinden en yüksek absorbanza sahip olması nedeniyle en iyi seçim olacağı düşünülmüştür. Yine de MS yüzeyine modifikasyon yapıldığında net durum görülmek istenmiştir ve her oran için MS'ye 1 saat polimerizasyon süresi boyunca PDA kaplanması uygun görülmüştür.

Şekil 2. MS üzerine PDA modifikasyonu.

Ön yıkanmış MS'ler belirli miktarda katalizör içeren Tris-HCl çözeltisi içerisine daldırılmıştır. Ardından çalkalayıcı su banyosunda UV-Vis analizine göre belirlenen süre olan 1 saat ve karşılaştırma için maksimum süre olarak seçilen 24 saat için modifikasyon işlemi gerçekleştirilmiştir. Daha sonra çözeltilerden çıkarılan süngerler yıkama ve kurutma işlemlerine tabi tutulmuştur.

Şekil 3. Üst sıra soldan sağa doğru ticari MS, K0, K1, K2, K3, K4; alt sıra soldan sağa K5, K6, K4(3sa), K4(6sa), K4(24sa) olmak üzere modifiye edilmiş MS'ler.

Şekil 3'de kurutulduktan sonra süngerlerde meydana gelen renk değişimleri modifikasyonsuz süngere nazaran görülmektedir. Burada süngerlerdeki renk değişimine göre UV-Vis analizinde

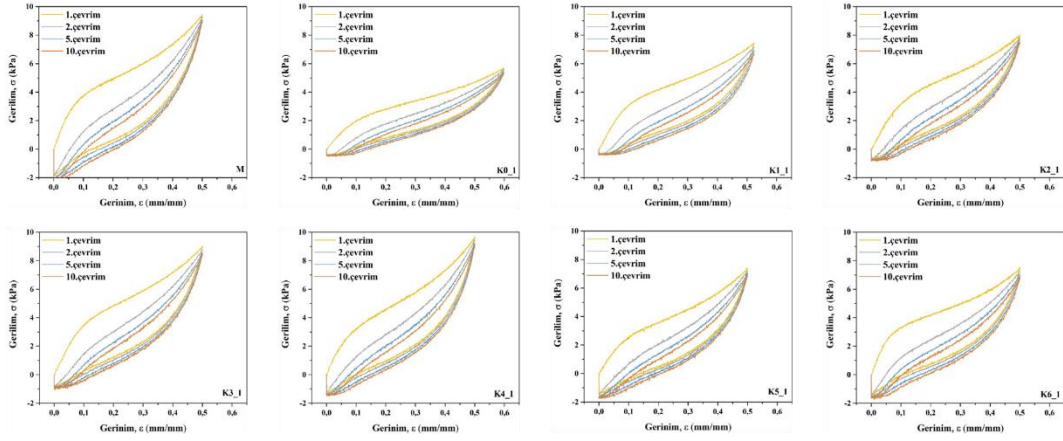

belirlenen K1 yerine K4 numunesi ile devam edilmesine karar verilmiştir. Modifikasyon süresinin etkisi de K4 numunesi ile incelenmiştir. Bu numuneye 3, 6, 12 ve 24 saatlik modifikasyon işlemleri yapılmıştır. 24 saatlik modifikasyon işleminin ardından, uzun süreli çalkalama sebebiyle süngerlerin çoğunda birbirlerine sürtünmelerinden kaynaklanabilecek gözle görülür bir aşınma olduğu tespit edilmiştir.

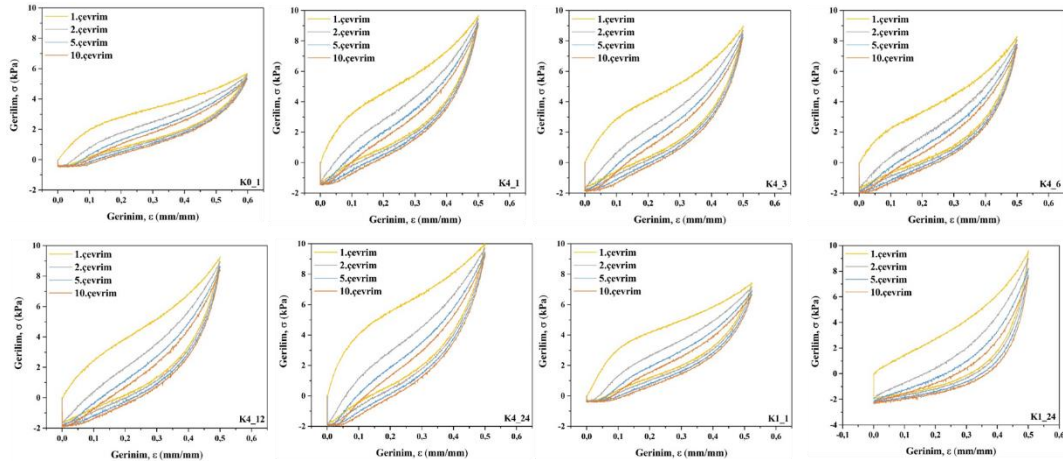

Şekil 4. Tüm numunelerin FTIR spektrumları.

Şekil 4’de tüm numunelere ait FTIR spektrumları verilmiştir. MS sırasıyla triazin halkası bükülmesi ve C-H bükülmesine karşılık gelen 830 ve 980  $\text{cm}^{-1}$ ’de belirgin pikler göstermiştir. 1370 ve 1453  $\text{cm}^{-1}$ ’deki pikler C-H deformasyon titreşimine atfedilmektedir. Modifikasyonsuz MS’nin spektrumu 3385  $\text{cm}^{-1}$ ’de N-H (ikincil amin) gerilmesine atfedilebilen bir pik sergilemiştir. Bu karakteristik piklerin tümü, modifikasyonsuz süngerin bir tür melamin süngeri olduğunu doğrulamaktadır. PDA modifikasyonundan sonra hazırlanan MS’lerin spektrumları modifikasyonsuz olaninkine benzerdir.

PDA, MS ile -OH grupları ve N-H grupları arasındaki hidrojen bağları ve C-H grupları ve N-H grupları arasındaki kovalent bağlar aracılığıyla etkileşime girmektedir. İlk şekilde PDA’nın karakteristik pikleri görülmektedir. N-H gerilmesi haricinde, 3100-3400  $\text{cm}^{-1}$ ’de geniş pikler O-H germe titreşimlerine atfedilebilir ve PDA’nın hidroksil grubuna karşılık gelmektedir. Bu pikin şiddetinde meydana gelen değişim hidrojen bağının söz konusu olduğuna işaret etmektedir. Bunun dışında belirtmek gerekir ki MS piklerinde çok büyük değişimler söz konusu değildir. Bu durum da fiziksel tutunmanın daha etkin olabileceğini göstermektedir (Mendez et al., 2023; Tan & Zhang, 2022; Jiaqi Wang et al., 2021).

Şekil 5. 1 saat süre ile modifiye edilen süngerlerin döngüsel sıkıştırma eğrileri (soldan sağa olmak üzere üst sıra MS, K0, K1, K2; alt sıra K3, K4, K5, K6).

Şekil 6. Farklı sürelerde modifiye edilen süngerlerin döngüsel sıkıştırma eğrileri (soldan sağa olmak üzere üst sıra K0(1sa), K4(1sa), K4(3sa), K4(6sa); alt sıra K4(12sa), K4(24sa), K1(1sa), K1(24sa)).

Şekil 5 ve 6'da farklı oranlarda katalizör ile hazırlanan numunelerin döngüsel sıkıştırma eğrilerini görmekteyiz. Basma testinde modifiye edilmiş ve edilmemiş süngerlerin mekanik davranışını değerlendirebilmek için süngere belirli bir deformasyon oranı (maksimum %50 gerinim, 5 mm/dk. deformasyon hızı) uygulanmış ve stres (gerilim) tepkisi ölçülmüştür. Şekildeki eğrilerde elastik alana (tersinir deformasyon) karşılık gelen başlangıç bölgesi doğrusaldır. Yükleme ve boşaltma süreci arasında, mekanik enerjinin dağılmasından dolayı test edilen tüm süngerlerin gerilim-gerinim eğrilerinde bir histerez (gecikme) mevcuttur. Bu durum, test edilen süngerlerin enerji yarma özelliklerine işaret etmektedir. 1. ile 2. çevrimler arasında belirgin olarak gözlenen bu enerji, stres altındaki hücre duvarlarının kırılmasından veya viskoelastisiteden kaynaklanabilir. Tüm numunelerde gözlenen ve modifikasyonsuz ticari MS için karakteristik olan bu deformasyon davranışının gözlemlendiği birinci çevrimden sonraki

çevrimlerde elde edilen sıkıştırma-yük boşaltma çevrimi birinciden farklıdır ve literatürde benzer davranış sergileyen malzemeler bulunmaktadır. PDA ile modifikasyon sonrasında MS'e göre bazı süngerlerde uygulanan maksimum kuvvetin kısmen azaldığı ve şekil değiştirmenin arttığı görülmektedir. Bununla birlikte modifikasyon adımları MS'nin yapısal formunu ve elastik davranışını bozmamıştır. Örneğin katalizörsüz numune olan K0(1sa) 1:4 oranında  $\text{CuSO}_4:\text{H}_2\text{O}_2$  katalizörüyle hazırlanan K1(1sa)'e göre daha az kuvvetle daha fazla şekil değiştirmiş, ayrıca tüm katalizörlü numuneler K0'a göre daha yüksek gerilimde şekil değiştirmiştir. MS'nin basma dayanımı %50 gerinimde 9,3 kPa civarında iken, ki bu değer literatürle uyumludur, basma dayanımı K1 için 7,15; K2 için 7,7; K3 için 8,6; K4 için 9,3; K5 için 7,1 ve K6 için 7,0 kPa civarındadır. Katalizör oranı 2:1 iken (K4) gözlenen mekanik davranışın ticari süngere oldukça benzer olduğu değerlendirilmiştir. K6'nın modifiye bir numunedense daha ziyade MS gibi davrandığı düşünülmektedir. Çünkü hem UV analizinden hem de kaplama sonrası renginden PDA kaplamasının kararlı ve homojen olmadığı gözlemlenmiştir. K1 ve K4 kodlu süngerler için farklı sürelerde kaplama sonrası mekanik davranış da incelenmiştir.  $\text{H}_2\text{O}_2$  yoğun katalizör içeren K1 için 24 saat modifikasyon yapıldığında aynı şekil değiştirme için daha fazla kuvvet uygulandığı görülmektedir, ancak eğrinin eğimi de azalmıştır. Katalizör oranı  $\text{CuSO}_4$  yoğun olan (2:1 oran) numune K4 için mekanik davranışta çok anlamlı bir değişim olmadığı ancak zamanla eğrinin eğiminin de kısmen arttığı görülmektedir (Okutan, 2023; Okutan et al., 2023).

Şekil 7. %50 gerinim ve 5 mm/dk. deformasyon hızında süngerlerin sıkıştırma modülleri.

Gerilme-gerinim eğrisi, literatürde bildirildiği gibi süngerlerin elastik bükülmesi nedeniyle %10'un altındaki ilk gerinimlerde yaklaşık doğrusal bir elastik rejime sahiptir. Bu son şekilde tüm numuneler için 1. ve 10. çevrimler için sıkıştırma testi gerilim-gerinim eğrilerinden hesaplanan sıkıştırma modülleri verilmiştir. Ticari MS'nin sıkıştırma modülünün hem katalizörsüz hem de katalizörlü ortamda PDA ile modifiye edilen süngere göre görece daha yüksek olduğu ancak 24 saat reaksiyon süresi sonucunda elde edilen ve 2:1 oranında katalizör içeren örneğinin modülünün ticari örneğe oldukça yakın olduğu tespit edilmiştir. Ek olarak tüm numuneler için 1. ve 10. çevrimler arasında sıkıştırma modülünde meydana gelen azalma yüzdesi ticari numuneye benzerdir. Hatta bazıları için ticari olandan daha azdır. Bu da ilgili numunelerin 10 çevrim sıkıştırma sonrasında mekanik kararlılıklarını işaret etmektedir (Okutan, 2023; Okutan et al., 2023).

## Sonuç

Yapılan çalışmada, tüm süngerlerin mekanik davranışı basma testi ile incelendiğinde, bir sıkıştırma çevriminden sonra tüm numunelerin mekanik direncinin azaldığı, bununla birlikte tekrarlanan çevrimlerde iyi geri kazanılmış elastik davranış sergileyen süngerlerin başlangıç şekline büyük ölçüde döndüğü görülmüştür. Katalizör katkısıyla MS yüzeyine kaplanan

PDA'nın H<sub>2</sub>O<sub>2</sub> yoğun olmayan katalizör sistemlerinde katalizörsüz olana nazaran daha yüksek kuvvet altında şekil deęiřtirdięi tespit edilmiřtir. Modifiye sünger 10 çevrim sonunda büyük bir yapısal deęiřime uğramamıřtır. Dolayısıyla bu modifiye süngerin muhtemel pratik uygulamalarda çok önemli olan ideal elastikiyet ve basınç dayanıklılıęına sahip olduęu düşünmektedir.

### **Teřekkür**

“Polidopamin Esaslı Melamin Sünger ile Yaę/Su Ayırma Etkinlięinin İncelenmesi” bařlıklı projeye, 2209-A Üniversite Öğrencileri Arařtırma Projeleri Destekleme Programı 2023 Yılı 2. döneminde verdięi destekten ötürü Türkiye Bilimsel ve Teknolojik Arařtırma Kurumu'na (TÜBİTAK'a) teřekkür ederiz.

**ÖZET**

Kaynağı legal olmayan bir paranın legal gösterilerek ekonomik faaliyetlere dâhil edilmesi durumu kara para aklama olarak ifade edilmektedir. Kara para aklama, tarihsel süreç içerisinde farklı medeniyetlerde çeşitli yöntemler ile denenmiştir. Bu durum ekonomik, sosyal ve toplumsal olarak pek çok sorunu da beraberinde getirmiştir. Teknolojinin gelişmesi neticesinde yeni yöntemler ortaya çıkmış ve bu yöntemler para aklama konusunda güncel formatlara uygun hale dönüştürülmeye çalışılmıştır. Modern yöntemler, klasik yöntemlerin güncel halleri gibi işleyişe konu olmuş ve trilyonlarca dolarlık ekonomik maliyeti beraberinde getirmiştir. Kara para aklama faaliyetlerinin minimum seviyeye indirilebilmesi için hem ülkeler kendi yasaları çerçevesinde hareket etmekte olup hem de uluslararası kuruluşlar ülkeler için bazı çözüm önerileri sunmaktadır. Uluslararası kurum ve kuruluşlar kara paraların ülkeler arası hem fiziki hem de dijital ortamda taşınması konusuna özellikle eğilmektedir. Bunun temel nedeni ülkelerarasında ekonomik işbirliklerinin gelişmesi için kara para aklamanın çok ciddi bir tehlike arz etmesidir. Türkiye'nin yeni yöntemlere karşı yasal düzenlemeleri arttırması gerekmele birlikte uluslararası işbirliği kapsamında diğer ülkelerin hem mali hem de hukuki pozisyonlarından faydalanması gerekmektedir. Uygulanabilecek olası yeni yöntemler kapsamında önceden tedbir alınması, son dönemde kara para aklanması kapsamında oldukça popüler olan kripto para düzenlemelerinin sürekli güncel tutulması ve kara para aklamanın ülke ekonomisine verdiği zararların topluma aktarılması toplumsal reaksiyonlar için elzemdir.

**Anahtar Kelimeler:** Kara para aklama, uluslararası işbirliği, kripto para

**MONEY LAUNDERING CRIME AND RELATED REGULATIONS**

**ABSTRACT**

Money laundering is defined as money laundering when money whose source is not legal is included in economic activities by pretending to be legal. Money laundering has been tried with various methods in different civilizations throughout history. This situation has brought about many economic, social and social problems. As a result of the development of technology, new methods have emerged and efforts have been made to transform these methods into current formats for money laundering. Modern methods operate like the current versions of classical methods and have brought about economic costs of trillions of dollars. In order to minimize money laundering activities, countries act within the framework of their own laws and international organizations offer some solution suggestions for countries. International institutions and organizations pay particular attention to the issue of transferring black money between countries both physically and digitally. The main reason for this is that money laundering poses a very serious danger for the development of economic cooperation between countries. Although Turkey needs to increase legal regulations against new methods, it also needs to benefit from both the financial and legal positions of other countries within the scope of international cooperation. It is essential for social reactions to take precautions within the scope of possible new methods that can be applied, to keep the cryptocurrency regulations, which have recently become extremely popular within the scope of money laundering, constantly updated, and to convey to the society the damage that money laundering causes to the country's economy.

**Keywords:** Money laundering, international cooperation, cryptocurrency

## **GİRİŞ**

Paranın kaynağını bilme ve bu doğrultuda paranın yolculuğu hakkında bilgi sahibi olmak devletlerin arzuladığı bir durumdur. Bu kapsamda devletler gelirin kaynağını bilerek tüm aşamaların kayıt altında olması yönüne çaba sarf ederler. Yasa dışı yollardan elde edilen ya da yasa dışı yollardan elden çıkarılmaya çalışılan paralar kara para kapsamına girmektedir. Kara paranın legal hale getirilmesi yani aklanması pek çok farklı yöntemle olabilmektedir. Geleneksel yöntemlerin etkisi azalmamakla birlikte sürekli yeni aklama yöntemleri ortaya çıkmaktadır. Özellikle teknolojik gelişmeler, bankacılık sektörünün ilerlemesi, sigortacılık sektörünün kapsamının genişlemesi, kripto paraların barındırdığı özellikler, kara para aklamanın yöntem değiştirmesine neden olmaktadır. Klasik yöntemler ile nakit paranın ülke dışına çıkarılma çabası, yerini dijital ortamda yeni yöntemlere bırakmış ve bu durum paranın takibini zorlaştırmıştır. Kara para aklama suçunun önüne geçebilmek için var olan kanuni düzenlemelerin yeterli olmadığı dönemlerde kanunlar güncellenmiş ve kapsam genişletilmiştir. Bununla birlikte özellikle uluslararası işbirlikleri büyük önem arz etmektedir. Vergi cennetlerinin sürekli olarak yatırımları ülkelere alabilme çabalarının yanında kimi dünya ülkeleri de kaynağını sorgulamadan bazı durumlara göz yummaktadır. Paranın takibinin yapılması, suç teşkil eden bir para için gerekli yaptırımların yapılması uluslararası işbirliğine ihtiyaç duyulan bir husustur. Aklama işleminin her aşamasında uluslararası işbirliğinin olması kara para aklamanın önüne geçmekte ve ülke ekonomilerinin zarar görmesini engellemektedir.

### **Kara Para Aklama ve Tarihsel Süreci**

Kara para hacmi sürekli büyümektedir. Bununla birlikte devletler kara para ile mücadele konusunda yeni adımlar atmakta ve yeni çözümler geliştirmektedir. Kara para kapsamlı, elde edilen gelirler ülkeleri sosyal, siyasal ve ekonomik anlamda tehdit etmekte olup özellikle son yıllarda teknolojinin etkisiyle ortaya çıkan dijital yöntemler mücadelenin farklı bir boyuta geçmesi sonucunu ortaya çıkarmaktadır. Kara para hacminin büyümesi ve ilgili paraların ülkeler arasında yer değiştirmesi pek çok ülkede huzursuzluk yaratmakta ve bu kapsamda yeni politikalar ortaya konma zorunluluğunu getirmektedir (Ünlü, 2019). Suç teşkil eden bir eylemden elde edilen bir gelirin yasal olmayan kaynağının gösterilmemesi maksadıyla, legal bir kaynak aracılığıyla elde edilmiş gibi ortaya konması kapsamındaki işlemler ve eylemler aklama olarak ifade edilmektedir. Kara para aklama kavramı bununla birlikte gerçek ve tüzel kişilerin suçlarını saklamak ya da illegal yöntemlerle elde edilen gelirlerine legal bir görüntü kazandırarak elde edilen varlıkların kaynağını, hareket sürecinin ve kime ait olduğunu gerçek durumundan ayrı bir biçimde ortaya konan süreçleri belirtmektedir (Aydoğan, Akpınar, 2016).

Tarihsel süreç içerisinde kara paraya M.Ö 2000’li yıllarda rastlanılmaktadır. O dönemde Çinli tüccarların kara para aklama çabaları ile günümüzdeki yöntemler arasında bir takım benzerlikler bulunmaktadır. Mali literatüre kara paranın girişi ise 1970’li yıllardan itibaren olmuştur. Mali para o dönemlerde haksız kazanç ile birlikte rekabette de olumsuzlukları beraberinde getirmiştir. 1980’lerden itibaren teknolojik gelişmeler ile birlikte piyasalar gelişmeye başlamış, illegal yollardan elde edilen paralar aklanarak mali sistemlere entegre edilmeye başlamıştır (Doğan, Yıldız, 2021).

### **Karapara Aklama Aşamaları**

Karapara aklama genel itibariyle üç aşamada yapılmaktadır. Bu aşamalar sırasıyla yerleştirme, ayırma ve bütünleştirme aşamalarıdır.

### **Yerleştirme**

Genel itibariyle fazla miktarda ve nakit olan paralar suç kaynaklı kara para potansiyeli barındırmadılar. Bireyler nakit olmayan araçlar ve kredi kartı gibi farklı yöntemler kullandıklarından dolayı yüklü miktardaki nakit paralar dikkat çekmektedir. İlgili paranın nakit halden kurtulabilmesi için mali sisteme dahil edilmesi veya yurtdışına çıkarılması amaçlanır. Kara para aklayanlar için en zor, aklamayı engellemek isteyen merciiler için ise kolay olan bu yöntem yerleştirme olarak adlandırılmaktadır (Başak, 1998).

### **Ayırma**

Ayırma aşamasında nakit olmaktan çıkan paranın mevcut kaynağından uzaklaştırarak yetkili makamların paranın izini kaybettirme amacı vardır. Böylelikle paranın bulunmasının imkansız hale gelmesi amaçlanmaktadır. Bu aşamada para bankacılık sistemine entegre edilmiş ise kaynaktan uzaklaştırmak daha kolay hale gelmektedir. Burada karmaşıklık, sıklık ve hacim ile ilgili mali işlemler yapılmakta ve denetimden sorumlu kurumların paranın izini kaybetmesi amaçlanmaktadır (MASAK, 2024).

### **Bütünleştirme**

Yerleştirme ve ayırma aşamalarının ardından son aşama olarak bütünleştirme aşaması gelmektedir. Bu aşamada yasal bir zemine oturtulmuş bir varlıktan bahsetmek mümkündür. Kara para kaynaklı herhangi bir yatırımın hangi para ile yapıldığı veya paranın kaynağının ne olduğu sorularına maruz kalmamak adına kara para suçtan uzaklaşmış bir forma gelmektedir. Yine burada diğer bir önemli nokta ise ülkede yapılan yatırımın karşısında sessiz kalınmasıdır. Küresel rekabet kapsamında bazı ülkeler yatırımcıları ilgili sorularla karşı karşıya bırakmaktan imtina etmektedir (Kara, 2018).

### **Karapara Aklama Yöntemleri**

Karapara aklamanın çeşitli yöntemleri bulunmaktadır. Bu para aklama yöntemlerinin bazıları klasik yöntemler olmakla birlikte uzun yıllardır bu yöntemler kullanılmaktadır. Klasik para aklama yöntemleri arasında şirinler yöntemi, parçalama yöntemi, vergi cennetleri yöntemi, oto finans borç yöntemi, hayali ithalat-ihracat yöntemi, paravan şirketler ile para aklama yöntemi, kumarhaneler aracılığıyla kara para aklama yöntemi ve fiziki olarak parayı yurtdışına çıkarma yöntemi bulunmaktadır (Ünlü, 2019). Teknolojinin gelişmesi ile birlikte dijitalleşme, beraberinde pek çok yöntemi de beraberinde getirmiştir.

Kriptoparaların kullanılması ve yaygınlaşması süreci son dönemde en popüler olan yöntemler arasında sayılmaktadır. Bitcoin'in sahip olduğu bir takım özellikler karapara aklama ile ilgili cezbediciliği de beraberinde getirmektedir. Bitcoin'in dijital olması, merkezi olmaması, anonimliğinin bulunması, tüm kullanıcıların özel şifrelerinin bulunması, gönderilirken herhangi bir ülke sınırlamasının bulunmaması, işlem hızlarının yüksek olması ve özellikle kripto para transferlerinde işlem ücretlerinin düşük olması kara para aklamak isteyen bireylerin ve şirketlerin ilgisini çekmektedir (Oral, Yeşilkaya, 2021).

Son yıllarda kullanılan bir diğer yöntem ise sigortacılık kapsamındaki kara para aklama yöntemleridir. Sigorta sektörünün her geçen gün büyümesi kara para aklamak isteyenlerin ilgisini çekmektedir. Özellikle sahte hasarlar kapsamında kara para aklanmakta ve ülke ekonomilerine zarar verilmektedir. Sigorta şirketlerinin fonlarını transfer edebilmeleri ve farklı yatırım araçları kullanmaları durumları da kara para aklanmasında kullanılan aracı unsurlar arasında yer almaktadır (Aydoğan, Akpınar, 2016).

### **Kara Para Aklama ile ilgili Mevzuatı**

Yeni dünya düzeni içerisinde ekonomik hayata yeni yöntemler eklenmesi, finans piyasalarında derinleşmenin olması, teknolojinin ilerlemesi gibi hususlar hem bölgesel, hem ulusal hem de uluslararası işbirliklerinin önemli hale gelmesine neden olmaktadır. Kara para aklanmasının önlenmesi kapsamında ülkelerin kanunlarının paralel ve uyumlu olması mücadele kapsamında büyük önem arz etmektedir (Çelik, Koçağra, Güler, 2000).

Türkiye'de suçtan kaynaklı olarak elde edilen gelirin aklanması kapsamında ilk olarak 19.11.1996 tarih ve 4208 sayılı Kara Paranın Aklanmasının Önlenmesine Dair Kanun yürürlüğe girmiştir. İlgili Kanun'un kapsamında suç kapsamında sayılan fiiller neticesinde elde edilen paralar, bütün kıymetli evraklar, mallar, para birimlerinin dönüşümleri neticesinde elde edilen menfaatler yer almaktadır (Erdağ, 2007). 4208 sayılı Kanun'un bazı hususlarda eksik kalması yeni bir kanun ihtiyacını beraberinde getirmiştir. Bu doğrultuda 11.10.2006 tarihinde 5549

Sayılı Suç Gelirlerinin Aklanmasının Önlenmesi Hakkında Kanun kabul edilmiştir. İlgili Kanun 18.10.2006 tarih ve 26323 sayılı Resmi Gazetede yayınlanmasının akabinde yürürlüğe girmiştir (26323 sayılı Resmi Gazete). Bununla birlikte 5237 sayılı Türk Ceza Kanunu'nun Suçtan Kaynaklanan Malvarlığı Değerlerini Aklama başlığını taşıyan 282. Maddesinde suç kavramının kapsamlı bir şekilde açıklamasını içermektedir. Ulusal kanunların dışında kara para aklama ile mücadele kapsamında uluslararası sözleşmelerde büyük önem taşımakta ve mücadelenin daha kapsamlı yapılmasına zemin hazırlamaktadır. Örnek olarak Türkiye'nin de anlaşmanın tarafları arasında yer aldığı Sınırşan Organize Suçlara Karşı Birleşmiş Milletler Sözleşmesinin Suç Gelirlerinin Aklanmasının Suç Haline Getirilmesi başlıklı altıncı maddede suç gelirleri ile ilgili kapsamlı açıklamalar yer almaktadır. Sınırşan Organize Suçlara Karşı Birleşmiş Milletler Sözleşmesinde aklama filli ifade edilirken; suç geliri olan malvarlıklarının kaynaklarının gizlenerek ya da farklı gösterilerek dönüştürülmeleri ya da devredilmeleri, bir malvarlığının kaynağının yerinin ya da hareketlerinin gizlenmesi, tesellüm anında suç geliri olduğu bilinmesine rağmen yardım yataklık, yol gösterme gibi davranışlarda bulunulması sayılmaktadır (Hazine ve Maliye Bakanlığı, 2024).

## **SONUÇ**

Yasadışı yollardan elde edilen bir parayı yasal gibi gösterebilmek adına çaba sarfetmek ve farklı yollara başvurmak suç teşkil etmektedir. Bu suçlar hem ülke ekonomilerini hem de küresel ekonomiyi tehdit etmektedir. Ülkeler elde edilen gelirlerin kaynaklarını bilmek ve bu doğrultuda vergilendirerek kamu için gelir elde etmeyi amaçlarlar. Bu amaca ulaşamaması durumunda yatırımlar azalacak, refah seviyesi düşecek, pek çok ekonomik gösterge bu durumdan olumsuz etkilenecektir. Kara para aklama hususu çok uzun yıllardan beri farklı yöntemlerle denenmekle birlikte Türkiye özelinde son dönemlerde magazinsel bazı figürlerin yaptıklarıyla kamuoyunda geniş yer bulmuştur. Kara para aklanmasının önlenmesi için yasaların doğru bir biçimde uygulanması kadar aklama çabasının ilk aşamada önüne geçilmesi gerekmektedir. Yine sadece tek bir ülkenin çabası yeterli olmayacaktır. Kaynağı önemsemeden sadece ülkeye yatırım yapılması çerçevesinde olaya bakmak kısa vadeli olarak ekonomiye olumlu etki gösterse bile uzun dönemde beraberinde pek çok olumsuzluğu da getirecektir. Bu doğrultuda; uluslararası işbirliğine önem verilmeli, uluslararası kurumların almış oldukları kararlar yasal mevzuatlar ile paralellik göstermelidir. Uluslararası anlaşmalara imza atan ülkeler vergi cennetleri gibi ülkelere birlikte yaptırımlarda bulunmalıdır. Yine bir diğer önemli husus son on yıllık süreçte popüleritesi hızla artmakta olan kripto paraların dünya genelinde yasal bir zemine oturması için çaba sarf edilmelidir.

**AN OVERVIEW OF ARTIFICIAL INTELLIGENCE (AI) APPLICATIONS IN  
AGRICULTURAL BIOTECHNOLOGY**

**Assist. Prof. Dr. Yeter ÇİLESİZ (ORCID: 0000-0002-4313-352X)**

Department of Field Crops, Faculty of Agricultural Sciences and Technology, Sivas  
University of Science and Technology, Sivas, Türkiye

**Email:** ycilesiz@sivas.edu.tr

**ABSTRACT**

Artificial Intelligence (AI) is revolutionizing agricultural biotechnology by enhancing productivity, improving crop quality, and enabling sustainable farming practices. Agricultural biotechnology has revolutionized farming and food production, bringing advancements that have significantly increased yield, improved resistance to pests and diseases, and enhanced nutritional quality. Recently, the integration of Artificial Intelligence (AI) has further accelerated these advancements, providing innovative solutions to complex agricultural challenges. AI applications in agricultural biotechnology span from crop monitoring and disease prediction to genetic modification and sustainable farming practices. AI in agriculture can be used for a variety of technological advancements. This includes consulting services, data analytics, the internet of things, and the use of cameras and other sensors, among other things. AI in agriculture will become competent enough to produce better predictive insights by examining various data sources such as weather, soil, crop performance, and temperature. This investigated the risks in agriculture, such as interoperability, safety and security, data dependability, and unanticipated socio-ecological consequences of using ML models to optimise yields This article provides a comprehensive overview of AI applications in agricultural biotechnology, highlighting advancements in crop management, pest control, plant breeding, and soil health monitoring.

**Keywords:** Artificial intelligence, biotechnology, plant breeding

## **INTRODUCTION**

Biotechnology firms are now leveraging AI/ML solutions to develop autonomous robots that handle important agricultural tasks such as harvesting crops at a much faster pace than humans. Computer Vision and DL algorithms are leveraged to process and analyze the data captured by drones. This helps in monitoring crop and soil health. ML algorithms help in tracking and predicting various environmental changes including weather changes that impact the crop yield. Digital transformation is also having a strong impact on the field of smart agriculture. Artificial Intelligence (AI) refers to the simulation of human intelligence processes by machines, particularly computer systems. These processes include learning (the acquisition of information and rules for using it), reasoning (using rules to reach approximate or definite conclusions), and self-correction. Agricultural biotechnology involves using scientific tools and techniques, including genetic engineering, molecular markers, molecular diagnostics, vaccines, and tissue culture, to modify living organisms: plants, animals, and microorganisms. The integration of AI into agricultural biotechnology offers significant potential for enhancing efficiency and sustainability (Holzinger et al., 2022; Kalmar et al., 2022; Naqvi et al., 2022).

### **Importance of AI in Agriculture**

The global agricultural sector faces numerous challenges, including climate change, a growing population, and the need for sustainable practices. Traditional methods are often insufficient to address these issues effectively. AI, with its ability to process large amounts of data and make intelligent decisions, can help overcome these challenges by improving productivity, reducing resource wastage, and enabling more precise and efficient farming practices. Stress physiology of crops effected by water and nutrient limitation can be directly addressed by advances in remote sensing beyond solutions that are already used in agriculture for biomass estimation, crop type classification, and mapping of soil characteristics. The use of AI together with low-cost multi-channel sensors as well as remote sensing to collect big data requires infrastructure with data security. These technologies can also be applied to identify new crop phenotypes that are more efficient in resource use and resistant to highly variable climate conditions. Phenotyping has become a key discipline of plant sciences in the last decade. Sensor developments and “big data” technologies have driven phenotyping as a main field of application in breeding to meet better the challenges of global change with increasing pressure from abiotic and biotic stresses (Barnab et al., 2008; Barnes et al., 2017; Holzinger et al., 2021).

### **AI in Crop Management**

#### **- Precision Agriculture**

Precision agriculture aims to optimize field-level management concerning crop farming. AI plays a critical role in this by analyzing data from various sources such as satellite imagery, weather forecasts, and soil sensors. These analyses help farmers make informed decisions about planting, fertilizing, and harvesting crops, thereby maximizing yields and minimizing environmental impact (Fiorani and Schurr, 2013).

#### **- Crop Monitoring and Yield Prediction**

AI algorithms can monitor crop health by analyzing images taken by drones or satellites. Machine learning models detect signs of stress or disease in plants early on, allowing for timely interventions. Additionally, predictive analytics uses historical and real-time data to forecast crop yields, helping farmers plan better and reduce losses (Tester and Langridge, 2010).

#### **- Irrigation Management**

AI-driven irrigation systems optimize water usage by analyzing data on soil moisture, weather conditions, and crop requirements. These systems ensure that crops receive the right amount of water at the right time, which conserves water resources and enhances crop health and yields (Jalal et al., 2021).

### **AI in Pest and Disease Control**

#### **- Early Detection Systems**

AI-based early detection systems use image recognition and machine learning to identify pests and diseases at an early stage. These systems can analyze images from cameras installed in fields or from drone footage to detect anomalies indicating the presence of pests or diseases, allowing for quick and targeted responses (Holzinger, 2019).

#### **- Integrated Pest Management (IPM)**

Integrated Pest Management (IPM) combines biological, cultural, physical, and chemical tools in a coordinated way to manage pest populations. AI enhances IPM by providing predictive models and decision-support systems that help farmers choose the most effective and sustainable pest control methods. For instance, AI can predict pest outbreaks based on weather patterns and crop conditions, allowing farmers to take preventative measures (Ribaut et al., 2010; Jung et al., 2021).

### **AI in Plant Breeding**

#### **- Genomic Selection**

Genomic selection involves using genetic information to predict the performance of plants and select the best candidates for breeding. AI tools, such as machine learning algorithms, analyze genetic data to identify genes associated with desirable traits. This accelerates the breeding process and enhances the development of crops with improved yield, disease resistance, and climate resilience (Hesami and Jones, 2020; Zhu et al., 2016).

#### **- Trait Prediction and Improvement**

AI models can predict how different genetic variations will express in terms of traits like yield, drought tolerance, and pest resistance. By analyzing vast amounts of genomic and phenotypic data, AI helps breeders identify the best genetic combinations for developing superior crop varieties. This not only speeds up the breeding process but also reduces the costs associated with traditional breeding methods (Zhang et al., 2021).

### **AI in Soil Health Monitoring**

#### **- Soil Quality Analysis**

AI applications in soil health involve using sensors and imaging technologies to collect data on soil properties such as moisture, pH, nutrient levels, and organic matter content. Machine learning algorithms analyze this data to provide insights into soil health and recommend appropriate management practices. This helps in maintaining soil fertility and preventing degradation (Dharmaraj and Vijayanand, 2018).

#### **- Soil Management Practices**

AI-driven systems can recommend soil management practices based on continuous monitoring and analysis of soil data. These systems provide guidance on fertilizer application, crop rotation, and other practices that improve soil health and enhance crop productivity. By optimizing soil management, AI contributes to sustainable agricultural practices and long-term soil conservation (Jha et al., 2019).

### **Challenges and Future Prospects**

#### **- Challenges**

The integration of AI in agricultural biotechnology is not without challenges. Data availability and quality are significant issues, as AI models require large amounts of high-quality data to function effectively. Technical challenges include the need for advanced infrastructure and computational resources. Additionally, there are ethical and regulatory concerns related to data privacy and the use of AI in decision-making processes (Bannerjee et al., 2018; Smith, 2018).

**- Future Prospects**

Despite these challenges, the future of AI in agricultural biotechnology is promising. Advancements in AI technologies, such as improved machine learning algorithms and more sophisticated sensors, will enhance the capabilities of AI applications in agriculture. The continued development of AI-driven solutions will help address global food security challenges, promote sustainable farming practices, and improve the resilience of agricultural systems to climate change. AI-enabled technologies use data like temperature, precipitation, wind speed, and solar radiation in combination with ML algorithms and images taken by satellites and drones to predict weather conditions, analyse crop sustainability, and evaluate farms for the presence of diseases or pests and inadequate plant nutrition. Farmers with Wi-Fi connectivity may use AI applications to receive an AI-tailored farm plan. Using AI-driven solutions that enhance output and income without diminishing priceless natural resources, farmers can fulfil the global need for higher food supply and profitability. Farmers can use AI to get real-time insights from their fields, identifying areas that need irrigation, fertilisation, or pesticide treatment. Innovative farming practices such as vertical agriculture may help increase food production while using lesser resources. As a result, herbicides are used less, harvest quality is improved, profits are increased, and significant cost savings are realised. AI tools collect high-resolution aerial images and data on irrigation systems needed for the fields. AI aids in the detection of soil issues such as clogs and leaks. It assesses and rates the soil's poor condition; AI assists in increasing farm productivity. The net output from the field is improved by automated and autonomous farming operations, AI-enabled productions, and yield management. AI-assisted picking, packing, and sorting enhances food production, packaging, and sorting. Farmers benefit from its assistance in comprehending agricultural data insights related to temperature, precipitation, wind speed, and solar radiation. Farmers' problems, such as climate change and insect and weed infestations that lower yields, may be resolved through AI solutions. AI will be used in agriculture to improve the entire agriculture process (Eli-Chukwu, 2019; Waleed et al., 2020; Mor et al., 2021.)

**Conclusion**

Artificial Intelligence (AI) has been extensively applied in farming recently. To cultivate healthier crops, manage pests, monitor soil and growing conditions, analyse data for farmers, and enhance other management activities of the food supply chain, the agriculture sector is turning to AI technology. It makes it challenging for farmers to choose the ideal time to plant seeds. AI helps farmers choose the optimum seed for a particular weather scenario. It also offers

**VI. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY  
SCIENTIFIC STUDIES**

*April 09-16, 2024 / Lisbon, Portugal*

---

data on weather forecasts. AI-powered solutions will help farmers produce more with fewer resources, increase crop quality, and hasten product time to reach the market. AI aids in understanding soil qualities. AI helps farmers by suggesting the nutrients they should apply to increase the quality of the soil. AI can help farmers choose the optimal time to plant their seeds. Intelligent equipment can calculate the spacing between seeds and the maximum planting depth. An AI-powered system known as a health monitoring system provides farmers with information on the health of their crops and the nutrients that need to be given to enhance yield quality and quantity. AI is transforming agricultural biotechnology by providing innovative solutions to longstanding challenges. From precision agriculture and pest control to plant breeding and soil health monitoring, AI applications are enhancing productivity, sustainability, and resilience in agriculture. As technology advances, the integration of AI in agricultural biotechnology will continue to evolve, offering new opportunities for improving global food security and promoting sustainable agricultural practices.

**ABSTRACT**

Food security, defined as the availability, accessibility, and affordability of food to all people at all times, is a fundamental pillar of global well-being. However, the growing global population, climate change, and diminishing arable land are significant challenges to achieving food security. Modern plant biotechnology emerges as a crucial tool in addressing these challenges by enhancing crop yield, improving nutritional quality, and ensuring resilience to biotic and abiotic stresses. This article explores the various facets of modern plant biotechnology and its role in securing a sustainable food supply for the future.

**Keywords:** Food security, plant biotechnology, quality

## **INTRODUCTION**

### **Advancements in Genetic Engineering**

Genetic engineering, a cornerstone of modern plant biotechnology, involves the direct manipulation of an organism's genes to achieve desired traits. Techniques such as CRISPR-Cas9 have revolutionized genetic engineering, allowing for precise and targeted modifications (Wada et al., 2020; Ahmad, 2023).

#### **1. Increased Crop Yield**

By inserting genes that promote growth and development, scientists have created high-yielding crop varieties. For instance, Bt corn, which contains a gene from the bacterium *Bacillus thuringiensis*, is resistant to certain pests, reducing crop losses and increasing overall yield.

#### **2. Enhanced Nutritional Content**

Genetic engineering has also been used to biofortify crops with essential vitamins and minerals. Golden Rice, enriched with Vitamin A, is a prime example, designed to combat Vitamin A deficiency in developing countries (Ahmad, 2023).

#### **3. Stress Tolerance**

Crops engineered to withstand extreme weather conditions, such as drought, heat, and salinity, are crucial in the face of climate change. Drought-tolerant maize and salt-tolerant rice are examples of crops that can thrive in adverse conditions, ensuring stable food production (Basonde and Andhare, 2014).

### **Role of Genomics and Marker-Assisted Selection**

Genomics, the study of an organism's entire genome, has provided insights into the genetic basis of important agronomic traits. Marker-assisted selection (MAS) leverages genomic information to accelerate the breeding process (Habibi-Najafi and Lee, 2014; Webb et al., 2018).

#### **1. Disease Resistance**

By identifying genetic markers linked to disease resistance, breeders can develop varieties that are less susceptible to pathogens. This reduces the reliance on chemical pesticides, promoting sustainable agriculture.

#### **2. Quality Traits**

Traits such as taste, texture, and shelf life can also be improved through MAS. For example, tomatoes with longer shelf life and wheat with improved baking quality are products of genomic-assisted breeding (Yin ve Qiu, 2019).

### **Biotechnological Approaches to Sustainable Agriculture**

Sustainable agriculture aims to meet the needs of the present without compromising the ability of future generations to meet their own needs. Biotechnological innovations play a vital role in this regard (Militao et al., 2022).

#### **1. Biopesticides and Biofertilizers**

Biotechnological advancements have led to the development of environmentally friendly biopesticides and biofertilizers. These products, derived from natural sources, reduce the environmental impact of conventional agricultural practices.

#### **2. Crop Rotation and Polyculture**

Biotechnology facilitates the development of crop varieties suitable for rotation and polyculture systems, enhancing soil health and reducing pest outbreaks.

#### **3. Precision Agriculture**

The integration of biotechnology with precision agriculture techniques, such as drone technology and satellite imagery, allows for the precise application of inputs, optimizing resource use and minimizing environmental impact (Clark et al., 2020).

### **Biotechnology in Combating Post-Harvest Losses**

Post-harvest losses significantly impact food security, as a substantial portion of harvested crops is lost due to spoilage and pests. Biotechnology offers solutions to reduce these losses.

#### **1. Storage and Preservation**

Genetic modifications can extend the shelf life of perishable crops, reducing spoilage. For example, the Flavr Savr tomato was engineered for longer shelf life, reducing waste during transportation and storage.

#### **2. Pest Control**

Biotechnological solutions, such as RNA interference (RNAi), target specific pests without harming beneficial insects, reducing post-harvest losses due to pest infestations (Asmamaw ve Zawdie, 2021).

### **Ethical and Regulatory Considerations**

While the benefits of modern plant biotechnology are evident, ethical and regulatory considerations are paramount to ensure safe and equitable use (Govender, 2021).

#### **1. Safety Assessments**

Rigorous safety assessments are conducted to evaluate the potential risks of genetically modified organisms (GMOs) to human health and the environment. Regulatory frameworks ensure that only safe and effective biotech crops are commercialized.

## **2. Public Perception and Acceptance**

Public perception of biotechnology varies, with concerns about GMOs and their impact on health and the environment. Transparent communication and education are essential to build public trust and acceptance.

## **3. Intellectual Property Rights**

The ownership and control of biotechnological innovations raise ethical concerns, particularly regarding the accessibility of these technologies to small-scale farmers. Policies promoting fair access and benefit-sharing are crucial to address these issues (Liu et al., 2017).

## **Future Prospects and Challenges**

The future of plant biotechnology holds immense potential for achieving food security, but several challenges remain (Bickel et al., 2000).

### **1. Research and Development**

Continued investment in research and development is critical to harnessing the full potential of plant biotechnology. Interdisciplinary collaboration and innovation are essential to address emerging challenges.

### **2. Climate Change**

Adapting to and mitigating the effects of climate change requires resilient crop varieties. Biotechnology offers solutions, but their implementation must be complemented by sustainable agricultural practices.

### **3. Global Collaboration**

Achieving food security is a global challenge that requires international collaboration. Sharing knowledge, resources, and technology can accelerate progress and ensure food security for all (Bickel et al., 2000).

## **Conclusion**

Modern plant biotechnology is a powerful tool in the quest for global food security. Through genetic engineering, genomics, and sustainable agricultural practices, biotechnology enhances crop yield, nutritional quality, and resilience to stress. However, ethical and regulatory considerations, along with continued research and global collaboration, are essential to fully realize its potential. As we move forward, the integration of biotechnology with sustainable practices will be key to ensuring a stable and secure food supply for future generations.
