...Ma quella c'era una primitiva monofanerica del quattro per dieci metri circa e questo era disegnato a penna su un foglio di carta. Il quale era disegnato da un architetto romano che si chiamava Vitruvio. Il quale era disegnato da un architetto romano che si chiamava Vitruvio. Il quale era disegnato da un architetto romano che si chiamava Vitruvio.

A Ltri di giunchi (seguita pur Vitruvio) ricoprono i loro tuguri.

Wooden architecture has been recognized as an object of growing interest of scientific research even on international scale, not only from the architectural point of view but also from theoretical approaches. Vitruvius' old theory of the «primitive hut» caused the notion that all architecture and classical compositional models would come from the first «wooden hut» designed by our ancestors.

The theme of the «primitive hut» has always existed and the topic of the ancient wooden shelter has included in the wider theme of the relationship between Architecture and Nature, or rather Human Being and Nature.

**Eyes can see just what our mind already knows.** Johann Wolfgang Goethe

**The eyes see only what the mind is prepared to comprehend.** Robertson Davies

Culture and Experience are fundamental for the interpretation and evaluation of determinated values.

**Poplar**

**PIOPPO TREMULO** (*Populus tremula L.*)

Famiglia: Salicaceae  
Genere: Populus

**Descrizione:** sono alberi caratterizzati da radici che si allungano in profondità, per questo motivo sono estremamente resistenti a condizioni climatiche estreme. Hanno una crescita molto veloce, in 20 anni riescono già a raggiungere la loro altezza massima. Il pioppo tremulo è uno dei pioppi più piccoli che arrivano ai 10,50 m di altezza e a 6 m di larghezza. Ha foglie rotonde molto dentellate. Sputano in primavera e rimangono sull'albero fino quasi all'inverno successivo, voltando verso un colore giallo chiaro nel tardo autunno.

**Legno:** con alburno bianco ben distinto dal durame più scuro, è tenero ed omogeneo, ma di valore mediocre.

**Impiego:** scandole e decorazioni.

**Spruce**

**ABETE ROSSO** (*Picea abies L.*)

Famiglia: Pinaceae  
Genere: Abies

**Descrizione:** è un albero molto longevo, il suo areale di vegetazione naturale è estremamente vasto dalle Alpi, attraversando la Germania, Scandinavia, Polonia, varie zone dei Balcani raggiungendo la Russia di cui copre la metà settentrionale debordando in parte sulla Siberia, sino al limite Nord della vegetazione arborea. Si caratterizza per un tronco dritto e cilindrico, molto resinoso, corona lungamente piramidale e acuta, corteccia liscia, sfaldata in piccole squame. Questa specie ha rami così fitti da presentare una struttura quasi perfettamente conica arrivano ad un'altezza di oltre 60 m. Gli aghi di abete hanno di solito la punta smussata e il profilo piatto, sono morbidi al tatto. Lunghi da 2,5 a 5 cm, variano di colore dal verde scuro al verde-azzurro sulla pagina superiore, mentre hanno una tintina argentea su quella inferiore.

**Legno:** di colore bianco-opaco, senza durame apparente e con anelli annuali ben distinti e regolari ed evidenti vasi resiniferi.

**Impiego:** strutture portanti.

**Pine**

**PINO** (*Pinus Sylvestris*)

Famiglia: Pinaceae  
Genere: Pinus

**Descrizione:** sono conifere predominanti nelle regioni vicine alla Siberia, ma si incontrano anche nell'Europa Centro Settentrionale. Soportano sia il terreno umido che quello secco. Ha aghi rigidi verde-azzurri e, sui rami superiori, una corteccia bruno-arancio, che si stacca in falda. Il pino ha un rapido sviluppo quando è giovane raggiungendo in poco tempo l'altezza massima che arriva, a seconda dei casi, a 30- 48 m. È una pianta molto longeva e resinosa. La forma dei fusti è fortemente influenzata dalle condizioni ambientali. Offrono un gran quantitativo di legname. Hanno forme coniche allargate finché sono giovani, ma con l'età si arrotondano e appiattiscono.

**Legno:** alburno bianco e durame roccioso, con anelli distinti, è resinoso, tenero e di facile lavorazione.

**Impiego:** strutture portanti.

**Birch**

**BETULLA** (*Betula alba L.*)

Famiglia: Betulaceae  
Genere: Betula

**Descrizione:** raggiunge in età adulta i 20-25 metri di altezza, poco longevo, non supera infatti gli 80 anni. È un albero a crescita rapida per raggiungere la sua altezza massima, infatti, impiega circa vent'anni. I rami sono sottili, le foglie piccole, verde chiaro, diventano gialle in autunno; la corteccia, liscia e sottile, con l'età diventa bianca, e sviluppa caratteristiche striature nere nei punti in cui si desquamano. I fiori sono dei lunghi amenti marroni-giallastri; i semi compaiono in autunno, sono gialli, contornati da una membrana marrone.

**Legno:** di colore bianco-giallognolo, sprovvisto di durame, omogeneo, elastico e tenero, poco durevole.

**Impiego:** finiture e parti decorative. Con la lana di betulla venivano eseguite le "guarnizioni" e imbotitture di tutte quelle parti soggette a ponte termico, ovvero lungo i bordi dei telai delle aperture e fra tronco e tronco nelle pareti esterne, affinché la non perfetta aderenza fra le superfici dei tronchi posti uno sopra l'altro non generasse comunque degli intercapedini causa di dispersioni.

It is known that wooden architecture is one of the oldest building systems adopted by the majority of people belonging to different geographic areas. Over time they have developed **building techniques dictated by local characteristics**, the availability of the raw material on site and the geomorphological and climatic characteristics of the area. . In spite of these facts, it is often possible to discover **strong similarities in different contexts**, especially in planning compositions of villages and in the choices of manufacturing solutions. Research-theory-practice triangle has offered new insights into the world of wooden architecture, different sectors of investigation have found mutual interaction in 2D and 3D new digital representations.

Wooden Architecture represents one of the oldest building systems adopted by the majority of people that developed construction techniques in respect of the local tradition.

Today this **vast** and **unique wooden world heritage** is strongly needing to be **surveyed and cataloged**. Fires and abandonment for negligence are the main factors which are jeopardizing the preservation of this architecture; **every year too many wooden buildings still disappear because of these main reasons.**

Preserving Wooden Heritage project is born from the urgent necessity to **keep** and **preserve** wooden architecture by developing systematic specific technical procedures of interventions based on scientific survey, 2D/3D representations for diagnostic analysis and cataloging of the elements with census activities.

Accurate survey operations constitute the fundamental basis for critical analysis on the development of a context, a village, an architecture as well as for planning specific interventions:

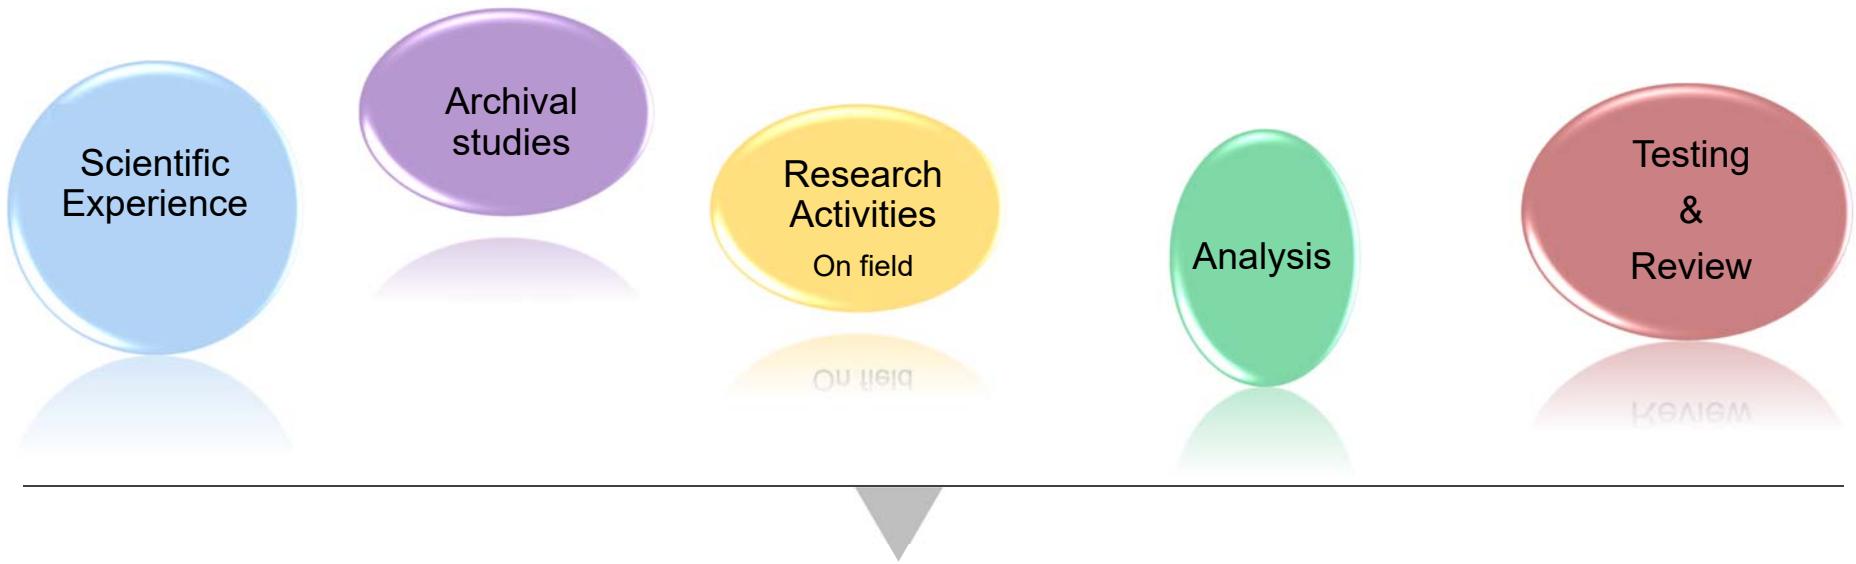

→ CONSERVATION

→ RESTORATION

→ RE-USE AND NEW PLANNING

This important challenge has the purpose to obtain new technical methods, **procedures** and **protocols**, fundamental for technicians and operators.

Develop **systematic specific technical procedures** of interventions based on:

▼  
Digital Survey  
Activities

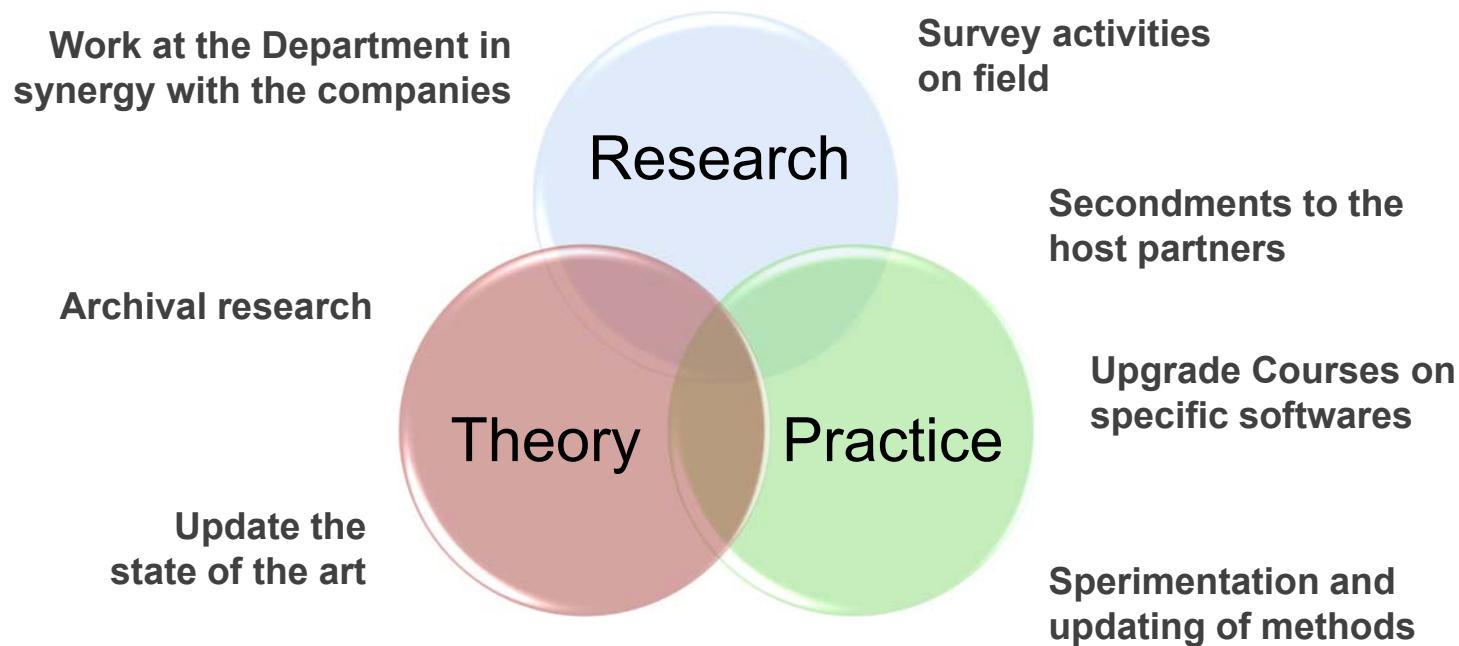

▼  
2D/3D representations  
for diagnostic analysis

▼  
Cataloging of the  
elements with census  
activities

Obtain a **complete description** of a wooden architecture as a sort of echography by including analysis of practical matters with different techniques.

Define the main tangible and intangible values, fundamental for preserving not only the historical memory of the place but mainly the authenticity of the architecture with its intrinsic characteristics.

This project wants to address a new scientific approach of **how-to-do research** on wooden buildings for practical interventions with respect to scientific foundations.

In this sense **Research-Theory-Practice triangle** will offer new insights into the world of timber architecture and wooden heritage preservation.

The research approach of this study is based on cultural ecology where historic **preservation and restoration**, both in theory and methods, **are seen as part of a wider process, sustainable development**.

Evolution of technology

Evolution of programmes  
And software

Development of the laser scanner  
survey **technology** and  
**methodologies**

**Traditional survey:** need to select the information already in the survey phase

**Digital survey:** acquisition of a large number of information that the surveyor will have to select in the second phase

Accurate surveying operations constitute the fundamental basis for designing any kind of architectural project and critical analysis. Innovative methods for survey and geo-reference data on architecture allow technicians to acquire exact knowledge of the current status of the object studied. **True metrical information and data are fundamental for understanding the formation and development of an architectural entity, village, or city, as well as for planning interventions for conservation and restoration activities.**

Newest technologies still must be based on technical knowledge in architecture and its environment. Cool equipment is not sufficient for producing technical documentation. We **constantly** need to push and improve our knowledge (curiosity?) increasing both our skills and critical point of view. Observe, analyse, sketch for the understanding of reality. If we assume these aspects technology can give us all the best support in our research activities.

## PLACE

### COLLOCATION

### LA PARTE SUD

La parte sud è la zona maggiormente investita dal flusso turistico. In prossimità dell'ingresso del museo, è situato uno scalo portuale con delle attività commerciali. Da qui i visitatori hanno la possibilità di dirigersi direttamente verso l'area principale, ossia verso il Complesso della Pogost. Proprio per questo motivo, il paesaggio di questa zona appare più antropizzato e studiato, provocando in parte una perdita di autenticità del luogo naturale.

## LA MODELLAZIONE 3D

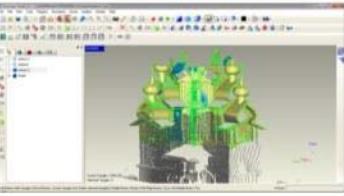

METODOLOGIE A CONFRONTO

Supporto informatico: Geomagic Studio

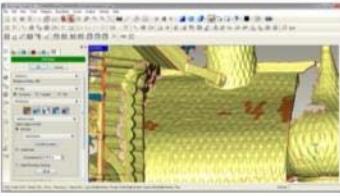

Il primo approccio alla modellazione è stato effettuato con il programma Geomagic Studio. Questo software di reverse engineering permette di importare porzioni di nuvola provenienti da un progetto di scansioni laser scanner, elaborare quando sono ancora in formato nuvola di punti quindi trasformarle in una mesh poligonale per elaborare un modello globale dell'oggetto. L'elaborato finale è buono nella sua globalità ma presenta importanti lacune nei dettagli.

Dopo aver importato le porzioni di nuvola si eliminano tutti i punti di disturbo, che potrebbero interferire l'operazione di triangolazione.

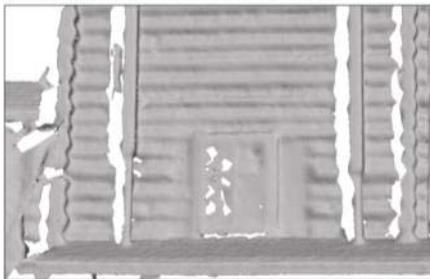

Dopo aver effettuato la trasformazione in mesh, si regolano i parametri che modificano rugosità e levigatezza delle superfici.

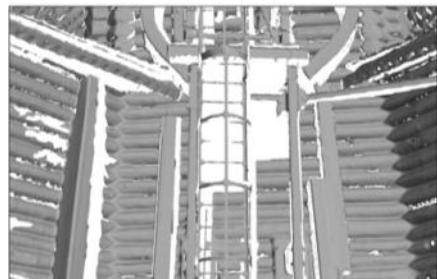

Le parti nelle quali non si ha alcun riempimento vengono ricostruite attraverso la creazione di mesh.

## SCANSIONE

Fase nella quale avviene l'acquisizione da parte del laser dell'immagine del luogo e dei punti nello spazio. La scansione deve essere pre-impostata definendo la densità dei punti della nuvola e l'angolo zenitale e azimutale da effettuare rispetto all'orizzonte.

1. Il modello 3D viene aperto in ambiente 3ds Max ed esportato in .fbx file.

2. Il modello in .fbx viene importato in ambiente Lumion.

3. Creazione del terreno attraverso il confronto con le fotografie panoramiche, generali o di dettaglio del contesto.

4. Attraverso le curve di livello elaborate su Autocad è possibile lavorare con le pendenze del terreno.

I menu a tendina messi a disposizione all'interno del programma Lumion consentono una buona gestione del trattamento del sistema ambientale, delle superfici e dei volumi precedentemente elaborati in ambiente RhinoCeros. Il programma offre inoltre della ampie e utili librerie relative alle vegetazioni (dai diversi tipi di alberature, a vegetazione bassa, sino ai diversi manti erbosi o sterriati), alle textures relative a un'ampia gamma di materiali differenti. Fra i cataloghi a disposizione si ha anche la possibilità di gestire gli sfondi del cielo, la posizione del sole e il sistema delle ombre.

Traditional house # 107

Photographs were taken to all the historic houses, round to 360°, trying to describe all the elements of traditional architecture and dwelling especially on those architectural and decorative details typical of the Karelian wood architecture.

New building # 034

Also the new buildings were photographed in order to develop models that can describe the provision volumetric and the color of surfaces.

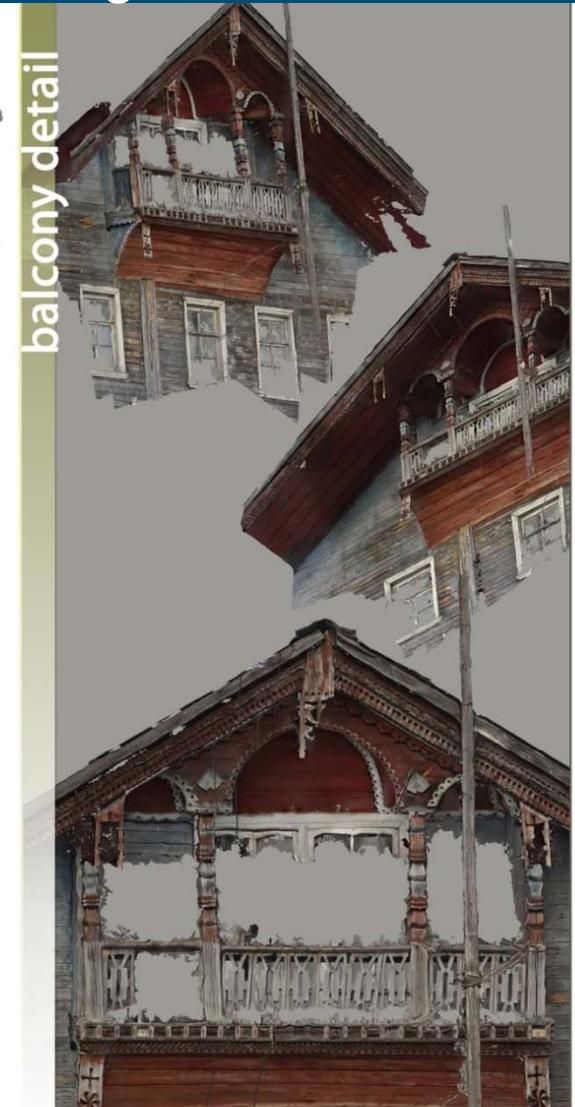

Traditional with new elements building # 013

The historic houses with outbuildings have experienced problems for the methodology of taking photographs, with large volumes with different provisions planimetric have constrained the movement around the houses and the high number of pictures.

monumental building # 002

The monumental buildings such as the historic chapel of the village have called attention to the methodology of shots of the photographs. presents of trees or other obstacles has linked the shooting to more steps and important post production.

Fase operativa di acquisizione delle foto necessarie per ricostruire tridimensionalmente un modello meshato e texturizzato dei particolari architettonici lignei dell'architettura tradizionale careliana. I semplici modelli 3D possono costituire un'importante base metricamente affidabile e cromaticamente realistica per svolgere analisi specifiche sullo stato di conservazione e comprensione dello stato di degrado del legno.

1. Allineamento delle foto: dopo aver caricato le foto all'interno del progetto di PhotoScan, deve essere eseguito l'allineamento geometrico. In questa prima fase il programma individua la posizione spaziale della telecamera per ciascun fotogramma e genera una nuvola di punti.

2. La ricostruzione tridimensionale è un'operazione computazionalmente intensiva e può richiedere molto tempo, a seconda della quantità di dati da processare e della risoluzione delle foto caricate.

3. L'operazione di texturizzazione colorizzare attraverso le cromie reali tratte direttamente dalle fotografie l'oggetto analizzato. Le proprietà relative all'operazione di mappatura consentono di

# Documentation of Wooden Architectural Heritage

The first step of the analysis has included the study of the rural settlement from the general to the particular for understand the plan and the different types of relations. We underline the relations of the physical structure made by full and empty spaces. Full spaces are represented by the lower level of micro areas (the space related by stocades or administrative limits to the main houses) and the natural green areas; the empty spaces are organised according with the different type of access in the place focused on principal and secondary paths.

For each micro area the analysis has gone deeper until the understanding of the relations between environmental and rural systems, building-building, empty-full spaces, street system, other elements. The micro areas correspond at the organization system of the village. During the analysis is important to define the limits and the main aspects on which architectural elements are inside. For each micro areas the analysis has included the study of the singular environmental and urban situation inside this real or absent perimeter: corresponds to each walled structure in the village. For each architectural units we define the system of census analysis designing a database schedules containing all the descriptors for describe typology, function and condition state of the building.

Main characteristics of the buildings

- Typology of the roof
- Decorative elements
- Disfiguring elements
- Foundation systems
- State of preservation

Concerning the decorative elements, there are two main typologies: structural elements that become decoration (as for example parts of the roof structure, balustrades and so on), or decorations directly applied to the external surface of the constructions (as for example the coating, that respond also to the functional need to preserve the structures).

The degradation typologies can be divided into two groups: anthropic and biological.

In the village of Korja, buildings in different preservation state may be found: there are old and abandoned houses, together with new houses without any typical karelian characteristics, and new constructions that are an attempt of integration with the landscape.

Design of the census document

Census of Korja Village: Analysis of the Architectural and Structural Elements for the Understanding of the State of Conservation

KM 01 001

Identification code

Different typologies of location of the building units

Location

- Next to the lake
- Close to the main road
- Close to a secondary road
- Close to a stream
- Inside a defined perimeter
- At the edge of the forest

Composition

Group

Visibility

Visible

GENERAL INFORMATION

Identification of the micro-area in the village context

Identification of the analyzed building inside its micro-area

General plan

Aerometric view

Function

- Residential
- Sauna
- Pantry
- Garage
- Toilet
- Canopy
- Barn
- Greenhouse
- Doghouse
- Absent
- Warehouse

Covering of the roof

- Wood
- Asbestos
- Bilaminous panels
- Wooden shingles
- Glass

Construction

- Blockbau

Coating

- Yes
- No

Presence of decorative elements

Identify the material

Identify the construction technology

Presence of coating

Identify ornaments

General analysis of the conservatory state of the building unit

General analysis of the conservatory state of the roof

Analysis of structural state of the building

Present state

General state of preservation

- Good
- Bad

Disfiguring elements

- Mold
- Lacks
- Carries
- Fire
- Structural oxidation
- Knotshakes
- Anthropic degradation
- Mosses
- None
- Cracks
- Other

Roof conditions

- Without damage
- With damage

Presence of structural instabilities

Analysis of degradation state of materials

Material of the external surface of the roof

Analysis of roof morphology

Sketches of the main and secondary facades

Example of the visibility from the main road of the village

Second step  
GENERAL INFO

This first section of the census document is about general information of the building unit and its location in the village context. After this, the visibility of every building unit in the main road of the village has to be analyzed, as well as the main functions that the construction has.

Third step  
ARCHITECTURAL ANALYSIS

The second section of the document deals with the description of both the architectural and structural elements of the building unit. Then the analysis of the roof morphology and its state, and it ends with the description of the Roof Typology and the materials that are used in its external surface.

Fourth step  
STATE OF PRESENT

The third section of the building unit in the day in which the census operation is developed; it includes some specific features, such as the presence of structural instabilities, the Presence of structural instabilities and the examination of the Disfiguring elements that could be present.

GENERAL INFORMATION		ARCHITECTURAL ANALYSIS		PRESENT STATE	
Identification of the micro-area in the village context		Identification code		Location	<input type="checkbox"/> Next to the lake <input checked="" type="checkbox"/> Close to the main road <input type="checkbox"/> Close to a village road <input type="checkbox"/> Close to a stream <input checked="" type="checkbox"/> Made a defined perimeter <input type="checkbox"/> At the edge of the forest
Identification of the analyzed building inside its micro-area		Different typologies of location of the building units		Composition	<input type="checkbox"/> Group <input type="checkbox"/> Isolated
Identification of the main functions hosted in the building units		Relation of the building with its context		Visibility	<input checked="" type="checkbox"/> Visible
Analysis of the composition of the building unit		Example of the visibility from the main road of the village			
Identification of the foundation material		Sketches of the main and secondary facades			
Identification of the construction technology		Analysis of roof morphology			
Presence of coating		Material of the external surface of the roof			
Identification of ornaments					
General analysis of the conservatory state of the building unit		Analysis of degradation state of materials			
General analysis of conservatory state of the roof					
Analysis of structural state of the building					
<b>Census of Korja Village</b> Analysis of the Architectural and Structural Elements for the Understanding of the State of Conservation KM 01 001					
Location <input type="checkbox"/> Next to the lake <input checked="" type="checkbox"/> Close to the main road <input type="checkbox"/> Close to a village road <input type="checkbox"/> Close to a stream <input checked="" type="checkbox"/> Made a defined perimeter <input type="checkbox"/> At the edge of the forest					
Composition <input type="checkbox"/> Group <input type="checkbox"/> Isolated					
Visibility <input checked="" type="checkbox"/> Visible					
<b>GENERAL INFORMATION</b>					
Location <input type="checkbox"/> Next to the lake <input checked="" type="checkbox"/> Close to the main road <input type="checkbox"/> Close to a village road <input type="checkbox"/> Close to a stream <input checked="" type="checkbox"/> Made a defined perimeter <input type="checkbox"/> At the edge of the forest					
Composition <input type="checkbox"/> Group <input type="checkbox"/> Isolated					
Visibility <input checked="" type="checkbox"/> Visible					
<b>ARCHITECTURAL ANALYSIS</b>					
Facade 1 Volume: Simplex / Complex Foundation: Absent / Concrete / Wood / Stone and concrete / Other Roofing: Double pitched roof Covering of the roof: Double wood					
Facade 2 Volume: Simplex / Complex Foundation: Absent / Concrete / Wood / Stone and concrete / Other Roofing: Double pitched roof Covering of the roof: Double wood					
Sketches of the main and secondary facades Analysis of roof morphology Material of the external surface of the roof					
<b>PRESERVE STATE</b>					
General state of preservation: Good Roof conditions: Without damage Presence of structural instabilities: No					
Disfiguring elements: Mold, Lacks, Cares, Fire, Metal oxidation, Ringshake, Amropic degradation, Mosses, None, Cracks, Other					
Analysis of degradation state of materials					
<b>Census of Korja Village</b> Analysis of the Architectural and Structural Elements for the Understanding of the State of Conservation KM 01 014					
Location <input type="checkbox"/> Next to the lake <input checked="" type="checkbox"/> Close to the main road <input type="checkbox"/> Close to a village road <input type="checkbox"/> Close to a stream <input checked="" type="checkbox"/> Made a defined perimeter <input type="checkbox"/> At the edge of the forest					
Composition <input type="checkbox"/> Group <input type="checkbox"/> Isolated					
Visibility <input checked="" type="checkbox"/> Visible

## Concluding considerations on the results achieved

The results of these research activities have highlighted that the development of strategies of interventions for preservation of cultural heritage MUST today be based on UPDATED DOCUMENTATION.

# Documentation of Wooden Architectural Heritage

DIPARTIMENTO DI  
ARCHITETTURA

It is evident that the careful acquisition of the data has a fundamental role in validating each decision. The importance of the documentation becomes even more valuable considering the conservation in its widest sense, thinking about the “physical characteristics” and the “immaterial intrinsic elements”

## Urgent needs

- | The use of cheap and untraditional materials is altering and undermining the structural image of these places.
- | Pay attention to the repairs that need to be started immediately.
- | Plan periodical surveys can help a technical and deep understanding of the structures studied in order to check their state of maintenance and operate with fast, safe coherent actions when needed.

The loss of knowledge of this wide wooden heritage, the disappearance of the traditional cultural identity and the memory of these places is compromising the conservation of wooden traditional architecture.

The elaboration of new typologies of analysis on the architectural and landscape heritage has represented a strong, high, urgent necessity.

## CREDITS:

Research activities and results

Karelia research project has been carried out at the Department of Architecture of Florence DIDA and Department of Civil Engineering and Architecture DICAR of the University of Pavia, Italy. Scientific Responsables: Prof. S. Bertocci, Prof. S. Parrinello. Images and data under copyrights. Sara Porzilli has been Technical Coordinator for project of Laser scanning survey and postproduction of the Pogost Complex on Kizhi Island in Karelia (Russia).

DICAr

Research activities and results of Lamminaho farm house have been carried out at the School of Architecture at the University of Oulu jointly with Museovirasto ans Senate Properties. Materials are under copy rights. Survey and Postproduction carried out by Sara Porzilli.
