

APPENDIX B-1
CONSENT FORMS

PARTICIPANT INFORMED CONSENT

IRB #

Informed Consent to Participate in Research

If you are a parent, as you read the information in this Consent Form, you should put yourself in your child's place to decide whether or not to allow your child to take part. Therefore, for the rest of the form, the word "you" refers to your child.

If you are a child, adolescent or adult who is reading this form, the word "you" refers to you.

You are being asked to take part in a research study. This form tells you about the study. The Principal Investigator (the person in charge of this research) or a co-worker of the Principal Investigator will also describe this study to you and answer all of your questions. Before you decide whether or not to take part, read the information below and ask questions about anything you do not understand. Your taking part is entirely your choice.

1. Name of the Subject ("Study Subject")

2. Title of Research Study

A Randomized Double-blind Trial of Fluconazole Versus Voriconazole for the Prevention of Invasive Fungal Infections in Allogeneic Blood and Marrow Transplant Patients

3. Principal Investigator Contact Information

IRB #

Contact information for emergencies after hours or on weekends or holidays:

Call (xxx) xxx-xxxx, the in-patient Bone Marrow Transplant Unit. Ask to speak to the Charge Nurse.

4. Sponsor and Source of Funding or Other Material Support

The sponsor of this study, The National Institutes of Health (NIH), is providing the study drugs and research tests free of charge to study subjects through the Blood and Marrow Transplantation Clinical Trials Network (BMT CTN), a group of 32 U.S. transplant centers.

5. What is the purpose of this study?

You are being asked to take part in this research study because you are having a blood or bone marrow transplant (BMT) using cells from another person.

One of the most common side effects of BMT is a decrease in the number or strength of infection fighting cells (white blood cells) in the body. Infections are caused by bacteria, viruses or fungi. When white blood cell numbers are low or the cells are weak, the body can't fight infections. For this reason, all BMT patients take drugs to prevent infection by these germs.

Fungal infections are one of the worst forms of infection. One of the drugs used to both prevent and treat fungal infections is called fluconazole. Fluconazole prevents some, but not all, types of fungal infections. Voriconazole is a newer antifungal drug that can treat more types of fungal infections than fluconazole. But, voriconazole has more side effects than fluconazole. Although voriconazole is used to treat severe fungal infections, it has not yet been tested for the prevention of fungal infections.

The purpose of this study is to compare fluconazole and voriconazole in the prevention of fungal infections in blood or marrow transplant patients where another person is the donor. About 600 patients will take part in this study at many centers around the country.

IRB #

6. What will be done if you take part in this research study?

Before starting treatment in this study, your doctor will check your general health. This will include a physical exam and taking blood (about 3 teaspoons or 10-20 mL for adult patients). A CT scan of the chest will be required if the results of the baseline galactomannan blood draw are not available. A CT scan is a type of x-ray that takes many detailed pictures. A chest CT scan results in an estimated dose of 0.8 rem, equivalent to 2.25 years of naturally occurring background radiation in the United States. A CT scan of the abdomen and/or sinuses may be required. An abdomen CT results in 1.1 rem, equivalent to 3 years. A head (sinus) CT results in 0.55 rem, equivalent to 1.7 years of background. If you are a female able to have children, a pregnancy test will also be performed. If you are pregnant, you will not be able to take part in this study.

If you choose to take part in this study, you will be randomly assigned (much like the toss of a coin) to receive either fluconazole or voriconazole. You and your study doctor will not know whether you are receiving fluconazole or voriconazole. This is called a double-blind study. In an emergency, the name of your drug can be obtained quickly. Treatment will begin on the day of your transplant (Day 0).

Since voriconazole is given twice per day and fluconazole only once per day, a placebo (a pill with no active drug or a salt water infusion) will be used to keep us from knowing which drug you are receiving. You will take the assigned drug twice a day. Whenever possible, the drug will be given as pills. If you are unable to take pills, the drug will be given over two hours by an IV infusion through your catheter. If you have been assigned to fluconazole, one of the pills (or infusions) will be a placebo since fluconazole is normally taken once daily.

You will continue the study drug until 100 days after your transplant. At around 90 to 100 days, your doctor will test your immune function and review your immunosuppressive drugs. If your risk of fungal infection is high, you will stay on study drug until 180 days. The study drug will stop by 180 days. But your doctor can give you an antifungal drug for longer if he/she believes you need it.

While you are in the study, your doctor will conduct routine and study-specific tests (such as x-rays, CT scans, or blood tests) and check you for a fungal infection. The table below shows when you will have study-required blood tests. The tests are described after the table.

IRB #

Time	Amount of Blood per Draw (adults)*	Type of Test / Purpose** Standard of Care^S / Investigational^I
Pre transplant	1 teaspoon (5 mL) 1 teaspoon (5 mL) 1 teaspoon (5 mL)	Liver function tests ^S / eligibility Galactomannan assay ^S / eligibility Future testing ^I / research
3x/week until engraftment	1 teaspoon (5 mL)	CBC ^S / blood chemistry
1x/week until Day 100. Also on Day 120, 150 and 180 if patient remains on study drug	1 teaspoon (5mL)	Liver function tests ^S / check for bad side effects
Day 14 and 28	1 teaspoon (5 mL)	Pharmacokinetics (PK) ^I / test for drug levels
2x/week, Days 1 – 60	1 tablespoon (15 mL)	Galactomannan (GM) assay ^S and Investigational Fungal Diagnostics ^I / tests for fungal infections
1x/week***, Days 61 – 100	1 tablespoon (15 mL)	GM assay ^S and Investigational Fungal Diagnostics ^I / tests for fungal infections
If you have bad side effects	1 teaspoon (5 mL)	PK ^I / test for drug levels
If doctor suspects you have a possible fungal infection	4 teaspoons (20 mL) at onset 1 tablespoon (15 mL) 2x/week for up to 14 days while on empirical antifungal therapy	PK ^I / test for drug levels, GM assay ^S and Investigational Fungal Diagnostics ^I / tests for fungal infections GM assay ^S and Investigational Fungal Diagnostics ^I / tests for fungal infections
If you get a fungal infection	4 teaspoons (20 mL) at onset 1 tablespoon (15 mL) 2x/week for 4 weeks and then once every 2 weeks for 8 weeks, for a total of 12 samples	PK ^I / test for drug levels, GM assay ^I and Investigational Fungal Diagnostics ^I / tests for fungal infections GM assay ^I and Investigational Fungal Diagnostics ^I / measure response to treatment

* Pediatric patients less than 12 years old will provide one-half of the required amounts of blood. The center may make adjustments in blood volumes collected from patients less than 12 years old to meet the institution’s Human Investigation Committee Guidelines.

** Tests that are typically done for your care are considered standard of care. These tests will be charged to you. Tests that are done solely for research purposes are considered investigational and will not be charged to you.

*** Patients will be tested twice weekly from Days 61-100 if they (1) received a T cell depleted transplant (a transplant where certain white cells have been removed to reduce the risk of GVHD) and post transplant GVHD prophylaxis (medications designed to prevent GVHD), or (2) have or have had GVHD (a condition in which the donated cells recognize the recipient’s cells as non-self and attack them) requiring systemic therapy, or (3) are taking steroids.

IRB #

Blood (1 tablespoon or 15 mL) will be taken prior to the transplant to determine eligibility for the study. A small sample (1 teaspoon or 5 mL) will be saved for future testing.

Blood samples (1 teaspoon or 5 mL) will also be taken 3x/week to determine engraftment (when the infused stem cells begin to multiply its own cells in your bone marrow). Engraftment typically occurs within 1-4 weeks post-transplant.

Weekly blood tests (about 1 teaspoon or 5 mL) will be taken for the first 100 days (and on Day 120, 150 and 180 if you remain on study drug) to check for bad side effects. Blood (1 teaspoon or 5 mL) will also be taken to measure drug levels at about Day 14 and 28, plus if you develop any bad side effects possibly related to the study drug, and at the start of a fungal infection. Usually, blood can be taken from your central venous catheter. In addition, we will also take blood (about 1 tablespoon or 15 mL), twice a week for the first 60 days of the study, and extra samples if your doctor suspects you have an infection to see if new tests can detect a serious fungal infection earlier and more easily than current tests.

Blood samples will also be taken once per week from Days 61-100 unless: (1) you received a T cell depleted transplant and received post-transplant GVHD prophylaxis or, (2) you are on steroids, or (3) you have or have had acute GVHD requiring systemic therapy. Then blood samples will be taken twice weekly from Days 61-100. Other tests will also be done to see which treatment is more effective in treating infections.

If your doctor suspects a fungal infection he/she may give you a drug (amphotericin B, Ambisome, Abelcet, Amphotec or Caspofungin) to treat it while he/she is reviewing your symptoms. You will continue to receive the study drug. If the tests do not show a fungal infection, your doctor will stop the other drug within 14 days. If your doctor believes that you need the other drug after 14 days, then he/she will continue it but the study drug will stop. You will continue to be tested as part of the study for the full year. Your doctor will still do the research tests, including the blood tests described above just as if you were taking the study drug.

If you get a fungal infection, the study drug will be stopped and another therapy will be discussed with you. This could include voriconazole if your doctor believes it to be the best choice. Your blood will be tested twice weekly for four weeks and then once every two weeks for eight weeks, for a total of 12 samples, to test your response to treatment.

This study will employ a new test approved by the FDA for detecting fungal infections in adults using blood samples. It is called the galactomannan test.

IRB #

Galactomannan is a part of the fungus that gets into the blood of infected patients. Some (1 teaspoon or 5 mL) of the blood samples described above will be used for this test.

This galactomannan test will be used with other standard tests to check you for certain kinds of fungal infection. The results will be used along with your medical history, physical check up, and other laboratory tests to judge whether you have or may have an infection. If you have a procedure on your lungs known as a bronchoscopy to test for an infection, a small part of the fluid obtained will be saved for later testing by the galactomannan test and other investigational tests to see if these new tests are better than the tests used now. The galactomannan test will also be used to test response to treatment if you develop an infection.

It is not yet clear if the galactomannan test will be better than the old tests and it is possible that it may not be as good in patients receiving one of the study drugs and certain other antifungal drugs, including amphotericin B and caspofungin. One good thing about this new test is that it requires only a sample of blood rather than a biopsy of tissue or other more uncomfortable tests. It also may show infection earlier. However, it may not be as exact. This could mean that if the test is positive and you really are not infected, you may receive treatment you don't need or if the test is negative and you really are infected, you may not receive treatment you need. For these reasons, your doctor will be using several kinds of tests for your safety. Results from this study will be used to measure the new test's value.

After your treatment is complete, we would like to keep track of your progress until 12 months after your transplant. To do this, we will contact you or your local doctor.

7. Will You Provide Samples for Research?

Genetic material is any sample of blood, tissue, fluid, etc. that is obtained from you. You will be asked to provide samples of blood, tissue and fluid to be used solely for future research and testing in laboratories where we are studying fungal infections. These samples will not require additional procedures. Your name will not be on these samples. You do not have to agree to provide these research samples to participate in the study.

If you agree, a small blood sample (1 teaspoon or 5 mL) will be drawn pre-transplant and saved for future testing. Additional blood samples (2 teaspoons or 10 mL) will be taken, if you agree, each time samples are drawn to test for galactomannan. Usually the blood can be drawn from your central venous catheter at the time of other blood collections. If this is not possible, then it would be drawn directly from a vein.

IRB #

If you agree, small samples of tissue or fluid (1 mL) will be collected post-transplant and saved for future testing. These samples will be taken from samples that are collected for diagnosis of potential fungal infections. Additional procedures are not required.

The samples collected for research purposes will be sent to laboratories that have contracts with the National Marrow Donor Program (NMDP) to conduct these research tests. They will be labeled with unique codes that do not contain information that could identify you. A link to this code does exist. The link is stored at the Data Coordinating Center for the Blood and Marrow Transplant Clinical Trials Network (BMT CTN). The staff at the laboratories where your samples are being tested do not have a link to this code. Your samples will be stored at these laboratories until the entire sample has been used for the research tests or until the end of the study.

If any of your samples are leftover after the research studies are completed, these samples will either be destroyed or be sent to the National Heart Lung and Blood Institute (NHLBI) sample repository in Maryland. If your leftover samples are sent to the repository, they will be given an anonymous code. These leftover samples stored at the repository can never be linked to you. Any research performed on these left-over samples must first be approved by an advisory panel at the NHLBI.

If you agree to allow your blood, tissue and fluids to be kept for research, you are free to change your mind at any time. We ask that you tell [the Principal Investigator] in writing and let him/her know you are withdrawing your permission for your samples to be used for research. The mailing address is on the first page of this form. Any unused samples will be destroyed. **You are free not to take part in this future research and still take part in the other parts of the study. There will be no change in your care if you decide not to give these extra samples. Please mark your choice below for each sample:**

(1) Pre-transplant 5 mL blood sample

- I agree to have a blood sample drawn pre-transplant for future research and testing.
- I do not agree to have a blood sample drawn pre-transplant for future research and testing.

(2) Post-transplant 10 mL blood samples taken each time blood samples are taken for the galactomannan (GM) assay

- I agree to have blood samples drawn post-transplant for future research and testing.
- I do not agree to have blood samples drawn post-transplant for future research and testing.

IRB #

(3) Post-transplant tissue and fluid samples each time samples are taken post-transplant for diagnosis of fungal infections

- I agree to have tissue and fluid samples collected post-transplant for future research and testing.
- I do not agree to have tissue and fluid samples collected post-transplant for future research and testing.

Signature

8. What are the possible discomforts and risks?

Cancer treatments can cause bad side effects, some of which may be life threatening or could kill you. The drugs used in this study may cause all, some, or none of the side effects listed below. Also, there is always the chance of unexpected new side effects.

The most common side effect in patients who have received voriconazole has been a change in eyesight that was often described as a “brightness” in vision that usually lasts less than one hour. Some patients treated with voriconazole have reported temporary glare or blurred vision. The effect may begin within 30 minutes after taking a dose of voriconazole and lasts an average of one-half hour but may last up to one hour. You should not drive or operate machinery during these periods. The next most common side effect was abnormal liver tests.

The following side effects have been reported in more than 1% of patients who have received voriconazole: a reaction at the site of injection, photosensitivity (a rash caused by sunlight), weakness, dizziness, headache, trouble sleeping, dry mouth, nausea, stomach pain, and low potassium levels. Other side effects that have been reported in at least one patient that was treated with voriconazole include: skin rash, skin erythema (redness), psoriasis (scaling) with eosinophilia (an abnormal blood condition), hypoglycemia (low blood sugar), hepatitis (liver disease), nausea, vomiting and jaundice (yellow skin), pancreatitis (a disease of the pancreas with pain in the stomach), decrease in the number of cells in the bone marrow (this was reported in a patient who had leukemia before starting voriconazole), and irregular heartbeat. An irregular heartbeat resulting in death occurred during treatment in a patient who had a history of an irregular heartbeat before entering the study. The patient also had a history of cancer and was on chemotherapy and many other drugs (including a potassium infusion, which may have affected the heart beat). In addition, an irregular heartbeat possibly related to taking voriconazole with the medications pimozide,

IRB #

quinidine, dofetilide, and quinupristin-dalfopristin (an antibiotic) has been reported. One patient with leukemia, who was also taking this antibiotic, was hospitalized because of faintness and palpitations (rapid heartbeats).

Voriconazole may increase or decrease levels of other commonly prescribed drugs and non-prescription drugs. Drugs known to interact with voriconazole include warfarin, phenytoin, cyclosporine, tacrolimus, sirolimus, rifabutin, omeprazole and rifampin. Other drugs that may interact with voriconazole include ritonavir, lovastatin (and other statins), benzodiazepines, sulfonamides, clarithromycin, terfenadine, astemizole, cisapride, dihydropyridine calcium channel blockers (verapamil, diltiazem), certain chemotherapy drugs (vinca alkaloids) and cabamazepine. We ask that you consult with your doctor before starting new drugs or increasing the dose of any drug including non-prescription drugs or herbs such as St. John's Wort. Grapefruit juice should be avoided. Other drugs that you may be taking may need to be changed or stopped in order for you to receive voriconazole.

The most frequent side effects after treatment with fluconazole affect the gastrointestinal tract (stomach and intestines) such as nausea and vomiting. Other side effects include dizziness, headache, skin rash, and liver problems. Serious side effects which have been reported with fluconazole include: liver damage which included deaths primarily in patients with serious medical conditions; elevated liver tests; severe skin disorders; hepatitis (liver disease), jaundice (yellow skin), irregular heartbeats or heart function changes; and acute allergic reactions.

The risks of drawing blood from a vein include discomfort at the site of puncture; possible bruising and swelling around the puncture site; rarely, an infection; and, uncommonly, faintness from the procedure.

Only you, the person for whom it has been prescribed, can take the study drug. If the drug is not packaged in a childproof container, you should keep it out of the reach of children and persons who have limited ability to read or understand. By federal law, this drug cannot be given or transferred to anyone for whom it is not prescribed.

As noted earlier, a new test, the galactomannan test, will be used along with other tests to see if you have an infection and will be used to test your response to treatment if you develop an infection. It is possible that this test may be less exact in patients taking one of the study drugs (voriconazole) when compared to the other (fluconazole). It is hoped that information from the study will help show that the new test can quickly and easily detect fungal infections.

IRB #

Throughout the study, the researchers will tell you of new information that might affect your decision to remain in the study.

If you wish to discuss the information above or any other discomforts you may experience, you may ask questions now or call the Principal Investigator or contact person listed on the front page of this form.

9a. What are the possible benefits to you?

Although this study cannot be guaranteed to be of benefit to you, it is hoped that your taking part may prevent you from getting a fungal infection. A possible advantage of this study is that one antifungal treatment may prevent fungal infections better than the other. However, you may not benefit from this treatment. The use of the galactomannan test along with other diagnostic tests may allow us to more quickly and more easily diagnose fungal infections and determine how well you respond to treatment if you develop an infection. However, there is no guarantee that this test is better than the currently available tests.

9b. What are the possible benefits to others?

Future patients may benefit from the results of this study.

10. If you choose to take part in this study, will it cost you anything?

Your cost for care on this research study will not be higher than for standard treatment for this disease. The BMT CTN will cover the cost of the study drug. You will remain responsible for the costs of standard treatment for your disease. Your insurance provider may not cover all or part of these costs. You or your family will have to pay installments based on your verified ability to pay. Any questions about these charges should be discussed with the Principal Investigator of the study.

11. Will you receive payment for taking part in this research study?

No.

IRB #

12. What if you are injured because of the study?

If you experience an injury that is directly caused by this study, only the professional medical care you receive at the [participating clinical facility] will be provided without charge. You or your insurance provider will pay hospital expenses. No other compensation is offered. If you have any questions about study-related injuries, you may call [insert name of person at institution] at [insert phone number].

13. What other options or treatments are available if you do not want to be in this study?

Taking part in this study is entirely up to you. You are free to refuse to be in the study, and your refusal will not affect current or future health care you receive at this institution. You and your doctor will discuss any other treatment options available to you.

The current standard therapy for preventing fungal infections in patients receiving bone marrow or stem cell transplant is fluconazole. Your doctor will review other treatments with you.

14a. How can you withdraw from this research study?

If you agree to be in this study, you are free to change your mind. At any time you may withdraw your consent to be in this study and for us to use your data. If you withdraw from the study, you will continue to have access to health care at [participating clinical facility]. If you decide to withdraw, we ask that you tell [the Principal Investigator] in writing; his/her mailing address is on the first page of this form. If you do withdraw your consent, there will be no penalty and you will not lose any benefits to which you are otherwise entitled. You will be asked to return any unused study drug. You will also be asked to return for a checkup before you stop your study drug. Even if you withdraw, or your doctor withdraws you, from the study, you are asked to have research tests conducted and allow the study investigators to collect that information.

If you have any questions about your rights as a study subject, you may call the Institutional Review Board (IRB) office at (xxx) xxx-xxxx.

14b. If you withdraw, can information about you still be used and/or collected?

If you withdraw from the study, we ask that you agree that we can continue using all information about you that has already been collected as part of the study prior to your withdrawal, and to continue to allow your doctor to tell us about your progress until 12 months after your transplant. You may, of course, say no.

IRB #

14c. Can the Principal Investigator withdraw you from this research study?

You can be taken off the study (with or without your consent) for any of the following reasons:

- You do not qualify to be in the study because you do not meet the study requirements. Ask your doctor if you would like more information about this.
- You need a medical treatment not allowed in this study.
- The investigator decides that continuing in the study would be harmful to you.
- The study treatments have a bad effect on you.
- You become pregnant and the study treatment could be harmful to the fetus.
- You are unable to keep appointments or take study drugs as directed.
- Other study-specific reasons; for example, if the dose of study drug you are taking has been found to be unsafe.
- The study is cancelled by the Food and Drug Administration (FDA) or the National Institutes of Health (NIH).

15. How will your privacy and the confidentiality of your research records be protected?

Study records that have your name will be kept private as required by law. You will not be identified by name in the central study records. Your records will be given a unique code number. The key to the code will be kept in a locked file in the Principal Investigator's office. Authorized persons from [the participating clinical facility], the hospital or clinic (if any) involved in this research, and the Institutional Review Board have the legal right to review your research records and will protect their confidentiality to the extent permitted by law. This research study is sponsored by and conducted with funds from the National Institutes of Health; therefore, the sponsor, the Blood and Marrow Transplant Clinical Trials Network (BMT CTN), the investigators conducting this study and the FDA also have the legal right to review your research records. Otherwise, your research records will not be shown to anyone without your consent unless required by law or a court order.

If the results of this research are published or presented at scientific meetings, your name will not be disclosed.

Information related to or resulting from your stem cell transplant will be reported to the Center for International Blood and Marrow Transplant Research (CIBMTR). The CIBMTR is a voluntary organization of basic and clinical scientists working together in an effort to gather

IRB #

information on results of stem cell and marrow transplants. This information is used to guide clinical decisions and identify ways to improve transplant outcomes. Scientific data or medical information (not identifiable with you) that could be useful to others may be presented at meetings and/or published in medical journals.

16. Expiration date for retention of records

The study results will stay in your research record at (*insert Institution*) for at least six years or until after the study is completed, whichever is longer. At that time either the research information not already in your medical record will be destroyed or your name and other identifying information will be removed from such study results. Research information in your medical record will be kept indefinitely.

17. How will the researcher(s) benefit from your being in this study?

In general, presenting research results helps the career of a scientist. Therefore, the Principal Investigator may benefit if the results of this study are presented at scientific meetings or in the scientific press. In addition, the sponsor is paying the Principal Investigator to conduct this study.

18. HIPAA² authorization to use and disclose individual health information for research purposes

- a. Purpose: As a research participant, I authorize the Principal Investigator and the researcher's staff to use and disclose my individual health information for the purpose of conducting the research study entitled *A Randomized, Double-blind, Trial of Fluconazole vs. Voriconazole for Prevention of Invasive Fungal Infections in Allogeneic Blood and Bone Marrow Transplant Patients*.
- b. Individual Health Information to be Used or Disclosed: My individual health information that may be used or disclosed to conduct this research includes: demographic information (e.g., age, date of birth, sex, weight), medical history (e.g., diagnosis, complications with prior treatment), physical examination findings, and laboratory test results obtained at the time of work up and after transplantation (e.g., CT scan, blood tests, biopsy results).

² HIPAA is the Health Insurance Portability and Accountability Act of 1996, a federal law related to privacy of health information

IRB #

- c. Parties Who May Disclose My Individual Health Information: The researcher and the researcher’s staff may obtain my individual health information from:

(list hospitals, clinics or providers from which health care information can be requested)

- d. Parties Who May Receive or Use My Individual Health Information: The individual health information disclosed by parties listed in item c and information disclosed by me during the course of the research may be received and used by the following parties:

- Principal Investigator and the researcher’s staff
- Dr. John Wingard, Study Chairperson and staff/laboratories at University of Florida College of Medicine
- Dr. Thomas Walsh, Study Chairperson and staff/laboratories at NIH/NCI/POB
- Staff/laboratories identified in the protocol for the evaluation of other laboratory samples; e.g., Dr. Patricia Fraser/Harvard
- National Heart, Lung and Blood Institute (NHLBI) and the National Cancer Institute (NCI), both of the National Institutes of Health (NIH), study sponsors
- Blood and Marrow Transplant Clinical Trials Network (BMT CTN), data coordinating center
- U.S. government agencies that are responsible for overseeing research such as the Food and Drug Administration (FDA) and the Office of Human Research Protections (OHRP)
- U.S. government agencies that are responsible for overseeing public health concerns such as the Centers for Disease Control (CDC) and federal, state and local health departments.

- e. Right to Refuse to Sign this Authorization: I do not have to sign this Authorization. If I decide not to sign the Authorization, I will not be allowed to participate in this study or receive any research-related treatment that is provided through the study. However, my decision not to sign this

IRB #

authorization will not affect any other treatment, payment, or enrollment in health plans or eligibility for benefits.

- f. Right to Revoke: I can change my mind and withdraw this authorization at any time by sending a written notice to the Principal Investigator to inform the researcher of my decision. If I withdraw this authorization, the researcher may only use and disclose the protected health information already collected for this research study. No further health information about me will be collected by or disclosed to the researcher for this study.
- g. Potential for Re-disclosure: My individual health information disclosed under this authorization may be subject to re-disclosure outside the research study and no longer protected. Examples include potential disclosures for law enforcement purposes, mandated reporting or abuse or neglect, judicial proceedings, health oversight activities and public health measures.
- h. This authorization does not have an expiration date.

IRB #

ASSENT SIGNATURES: For subjects under the age of 18 years.

Assent of Minor

I have been told what I will be asked to do if I am in this study. I have been told that I don't have to be in this study. I may quit the study at any time, and no one will be mad at me. I have had a chance to discuss the study and ask questions. My questions have been answered. I agree to be in the study and do what I am asked to do so long as I continue in the study.
