Need to resolve the anomalies ➡ Short-Baseline Neutrino program

MicroBooNE and the SBN program

- Staged approach: MicroBooNE (phase 1) and the SBN program (phase 2) is a powerful way to address the short-baseline anomalies

- Progress on ICARUS and SBND construction and installation

- MicroBooNE and the search for the low-energy excess:

1. Strong understanding of the detector and highly developed event reconstruction
   New results and reconstruction techniques (with data), paving the way to future LAr detectors

2. Neutrino interaction measurements
   New physics results presented here

3. Towards low-energy excess: solid validation of ν_e and photon analyses
   First results on ν_e and γ selections

Many new results from MicroBooNE
Only few highlights presented here
See all the new Public Notes (http://microboone.fnal.gov/public-notes/)

The Short-Baseline Neutrino Program

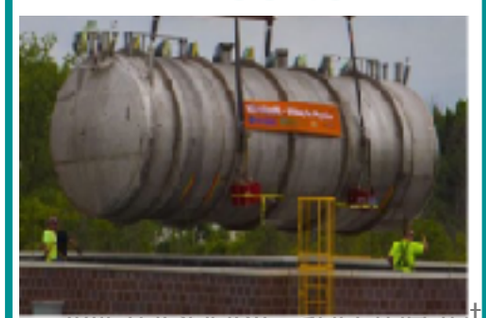
M = 85 ton



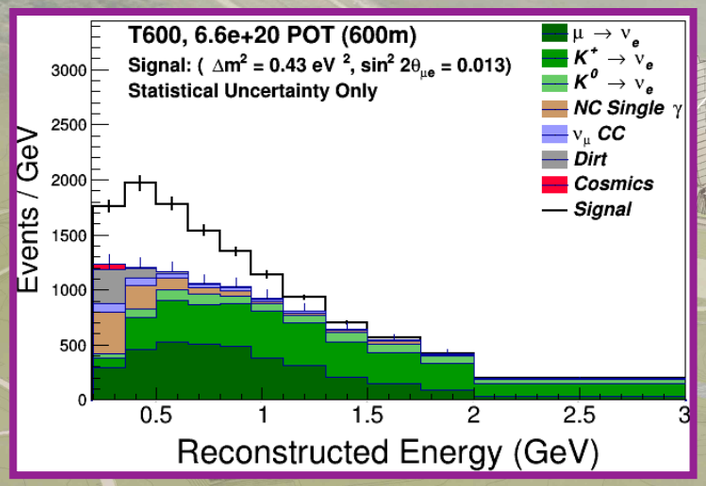
The Short-Baseline Neutrino Program

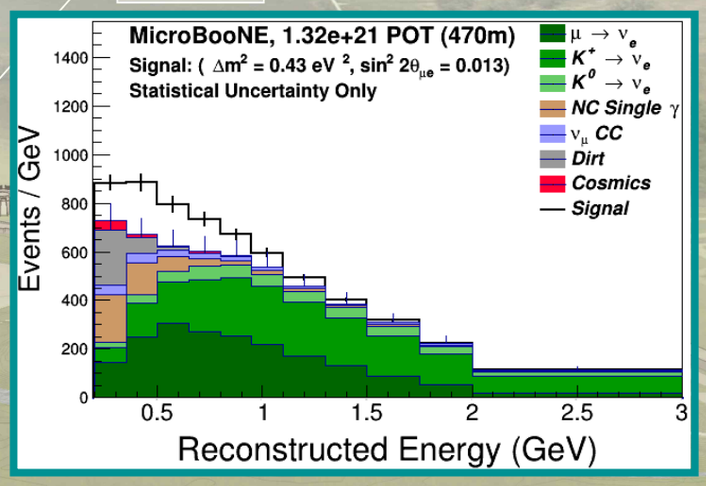
SBN Program

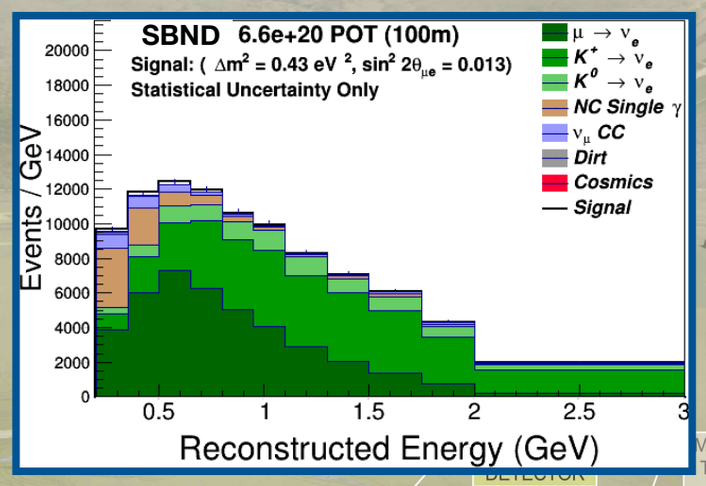
A three liquid argon detector experiment:

Phase 2

Example signal for a sterile neutrino (see SBN proposal for details)



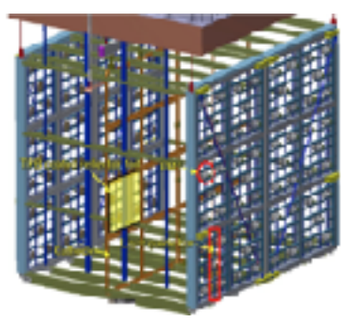




Far detector
L = 600 m
M = 476 ton

First detector
L = 470 m
M = 85 ton

Near detector
L = 110 m
M = 112 ton

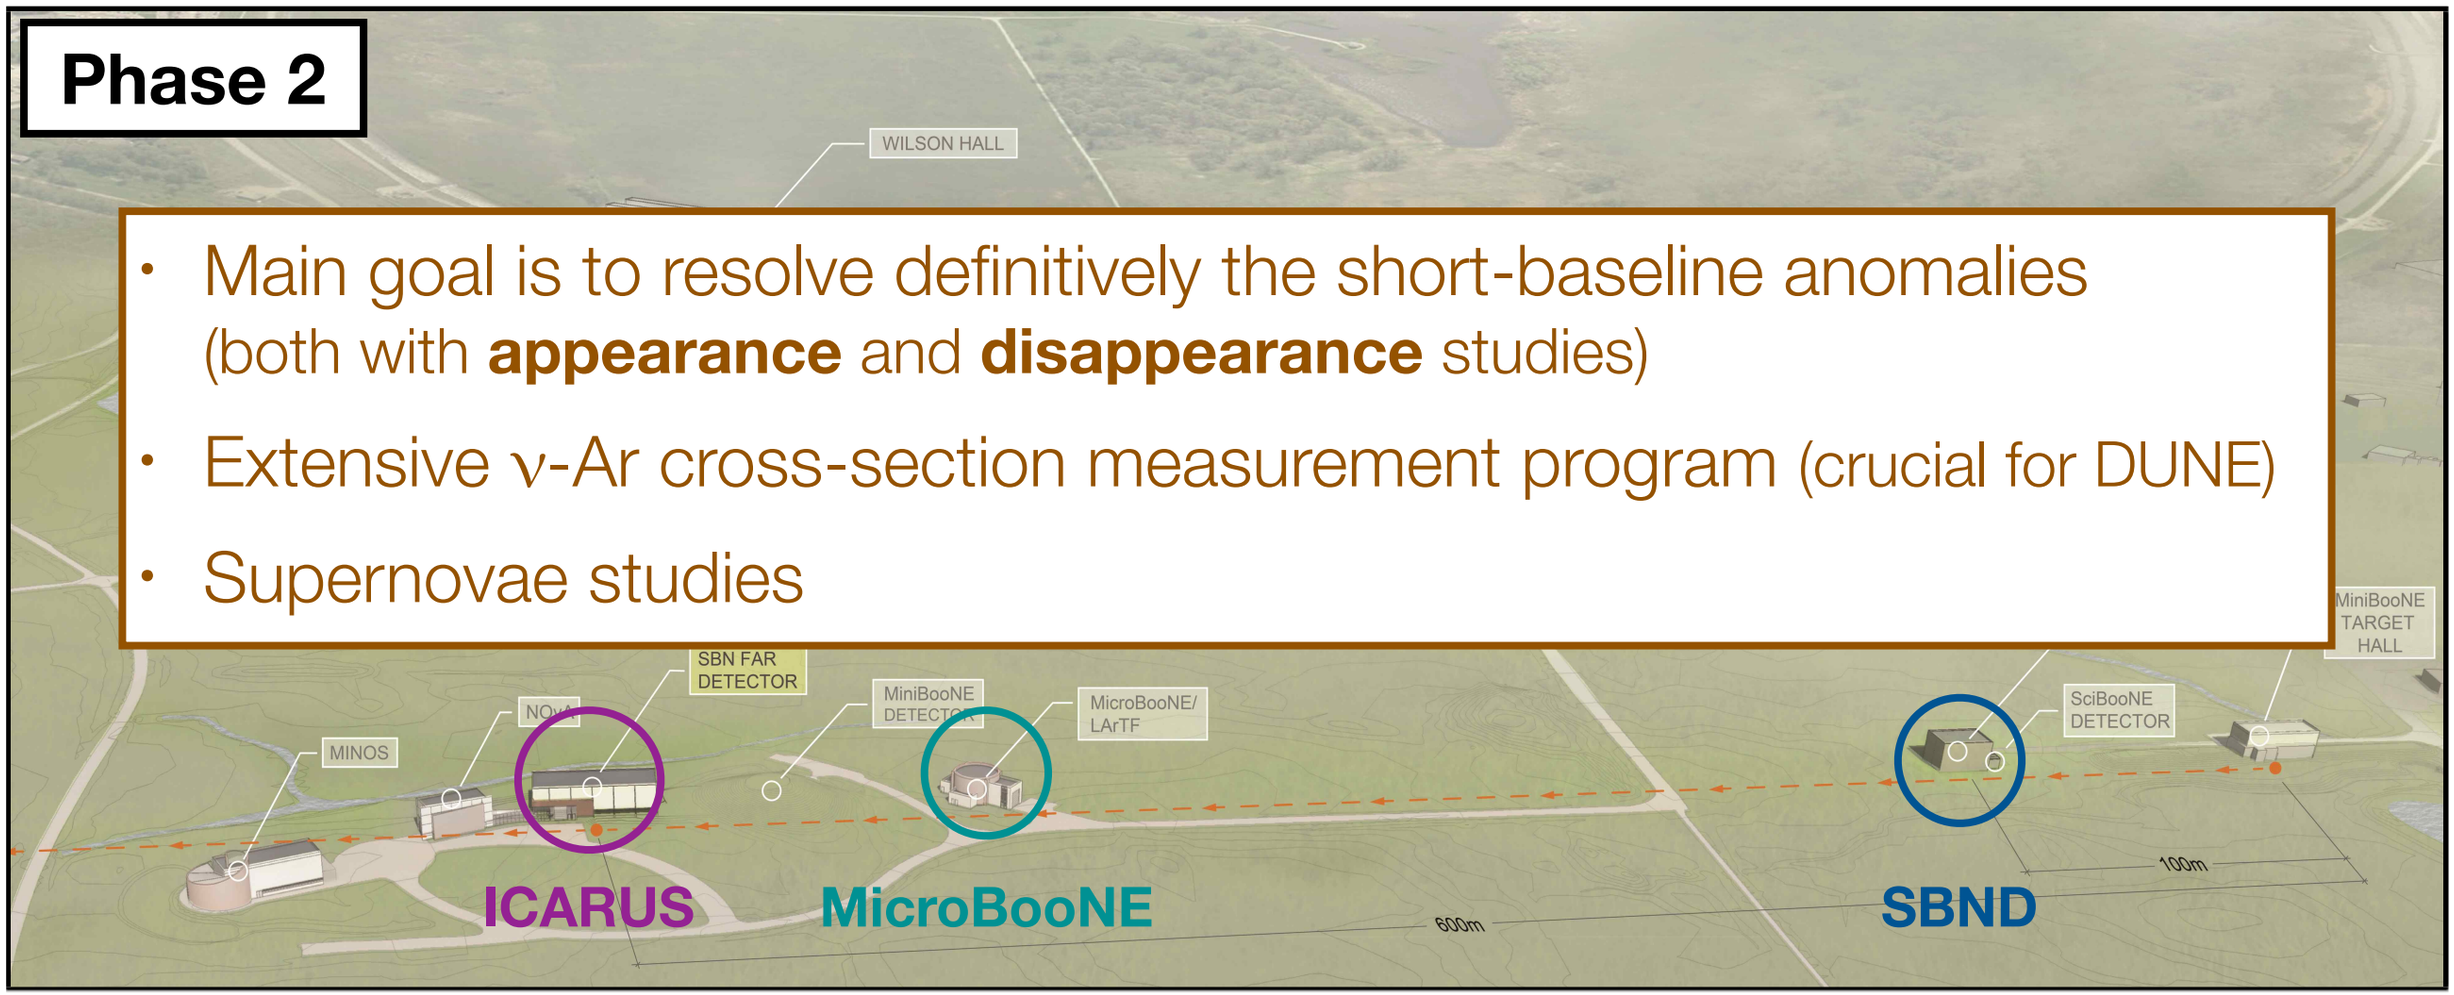


The Short-Baseline Neutrino Program

A three liquid argon detector experiment:

Phase 2

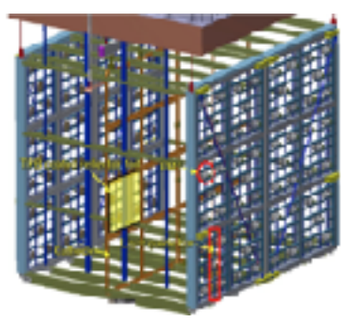
- Main goal is to resolve definitively the short-baseline anomalies (both with **appearance** and **disappearance** studies)
- Extensive ν-Ar cross-section measurement program (crucial for DUNE)
- Supernovae studies



Far detector
L = 600 m
M = 476 ton

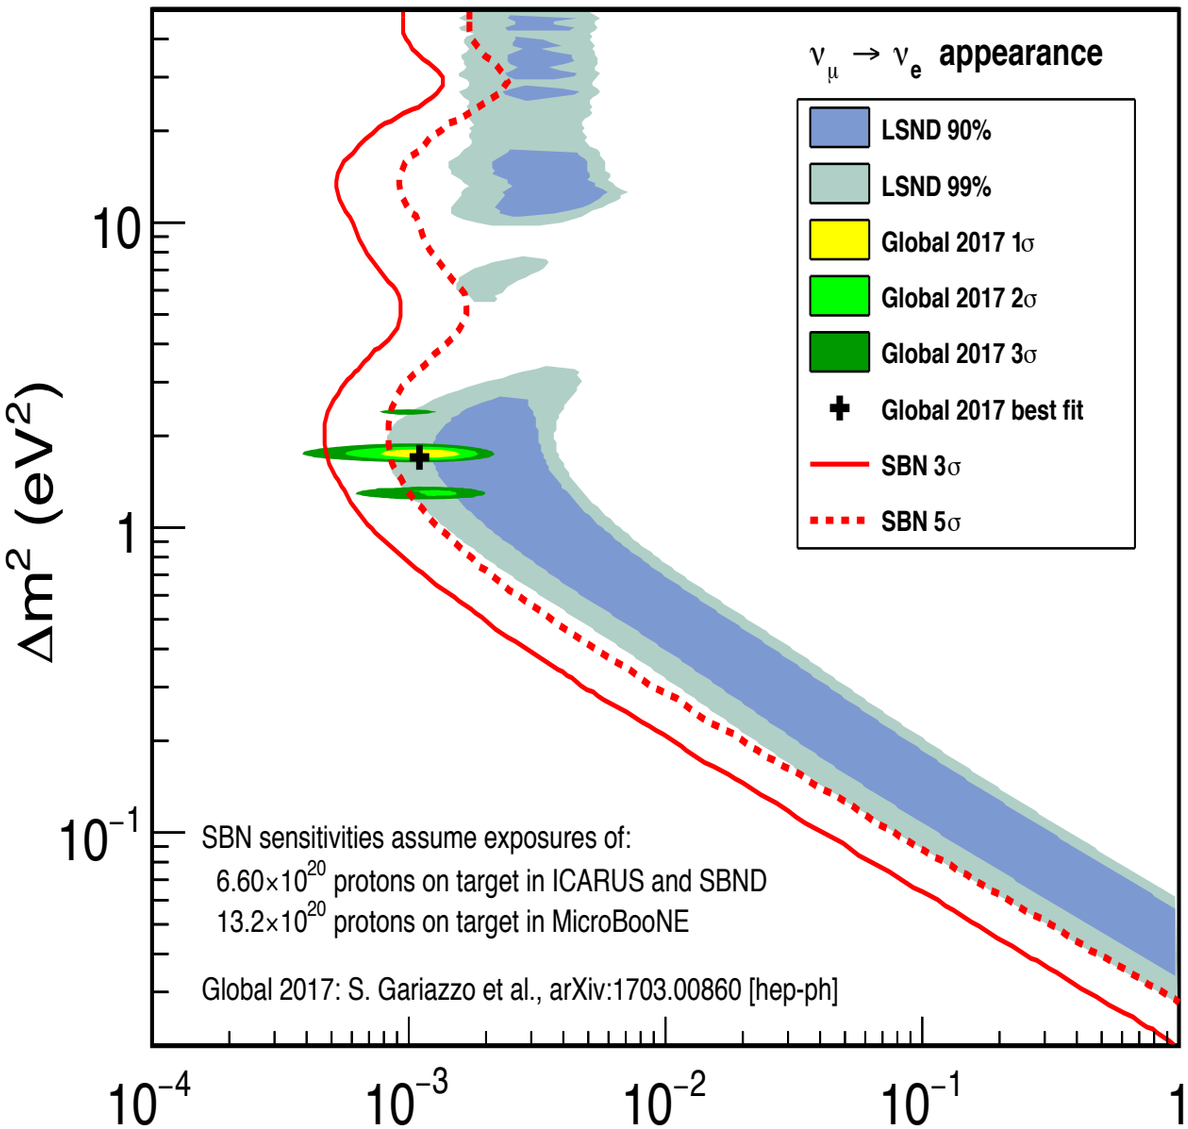
First detector
L = 470 m
M = 85 ton

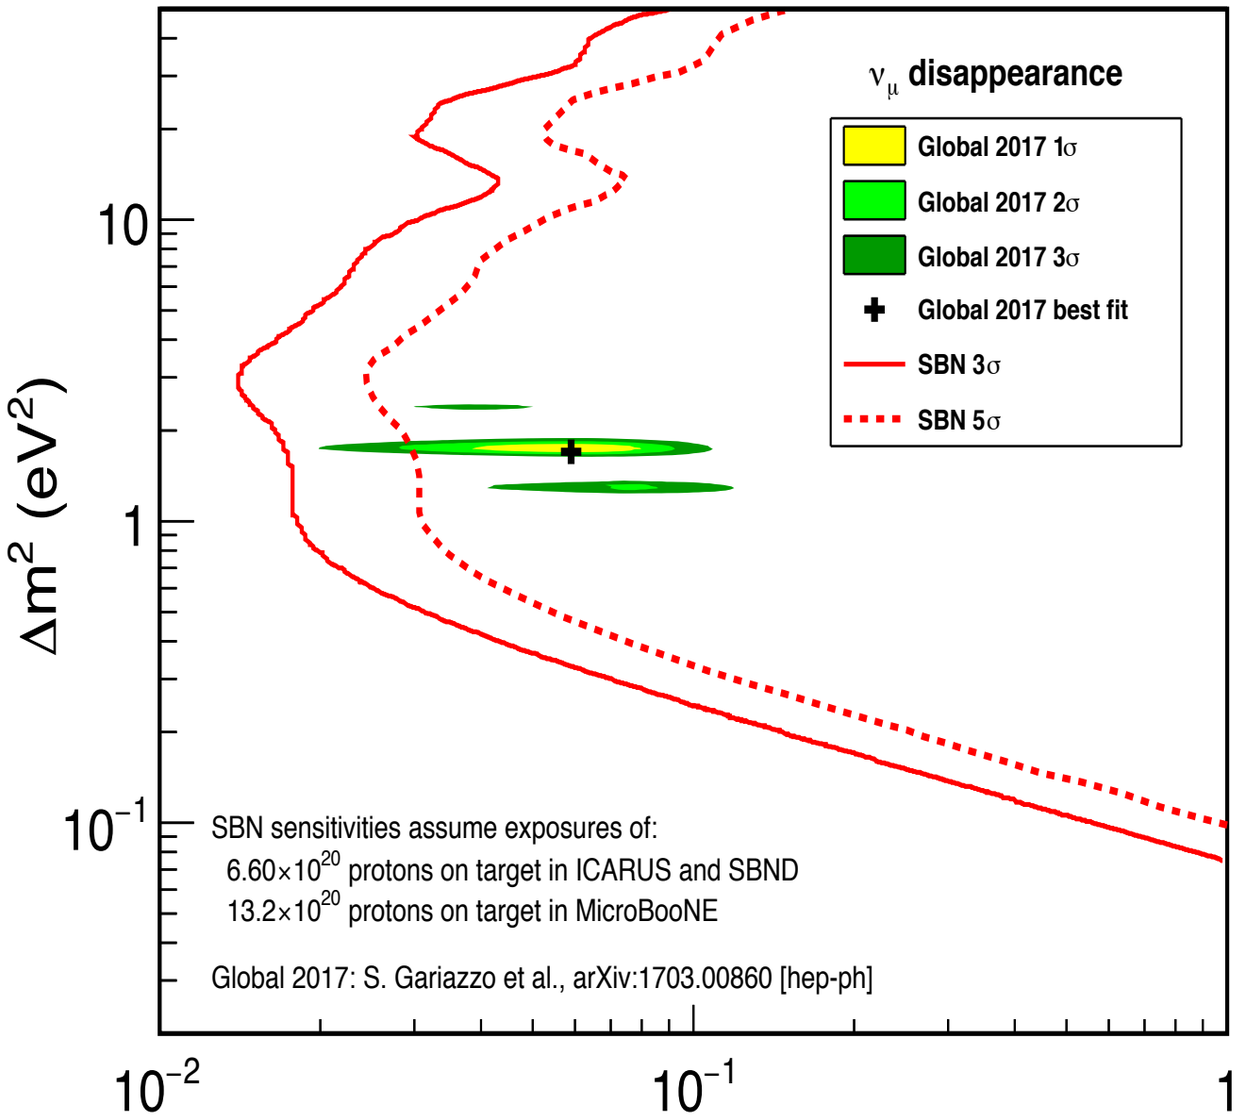
Near detector
L = 110 m
M = 112 ton



The Short-Baseline Neutrino Program

In the 3+1 sterile neutrino analysis context…





SBN Proposal: https://arxiv.org/abs/1503.01520

Definitive answer to the short-baseline anomalies in the next ~5 years

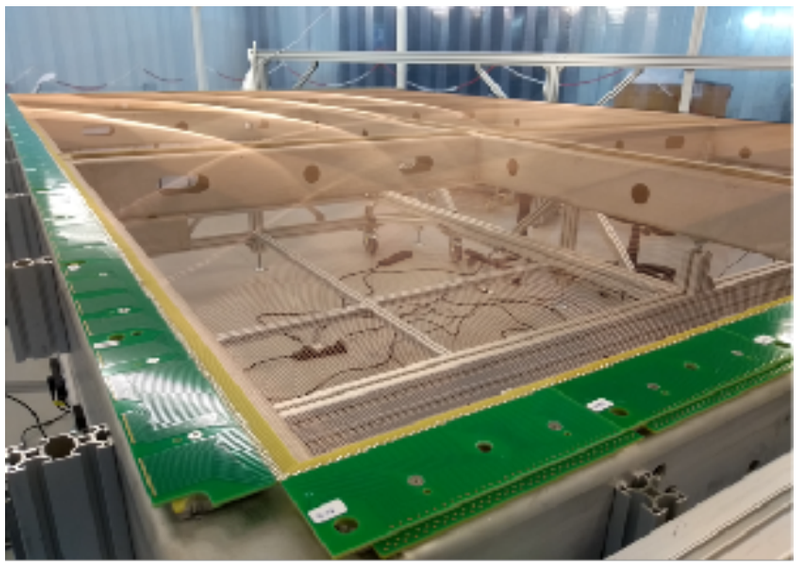
SBN (phase 2) current status: ICARUS and SBND

- Detector **installation** underway
- Planned data taking **2019**

- TPCs delivered at FNAL July 2017
- Warm vessel completed
- Cold shield under installation

- Detector **construction** underway
- Planned data taking **2020**

- CRT panels installed for preliminary beam data



- *Anode Plane Assemblies* and other components under construction (US & UK)

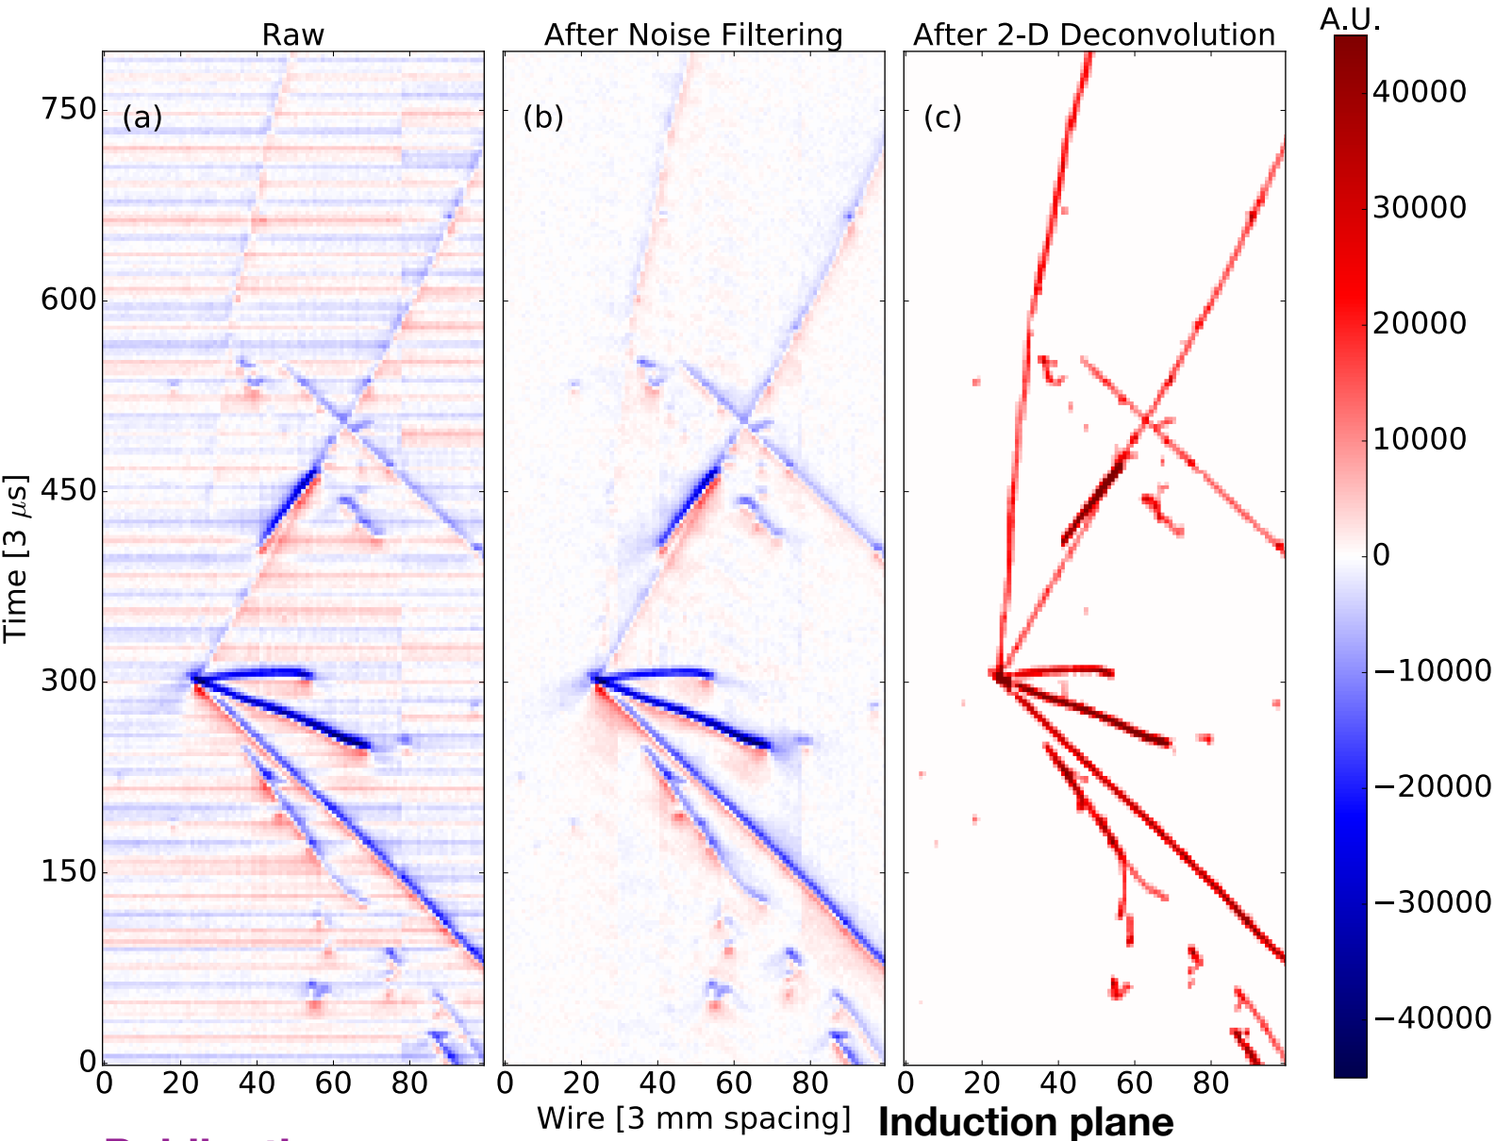
Understanding a LArTPC

Detailed characterization of the detector is key to our Physics and to our R&D mission for future detectors

Understanding a LArTPC

Detailed characterization of the detector is key to our Physics and to our R&D mission for future detectors



- Powerful filtering techniques can address many sources of noise
- Excellent characterization of multiple wire signal response (2d-deconvolution)
- Robust signal processing allows calorimetry in all three planes (**enabling induction planes**)

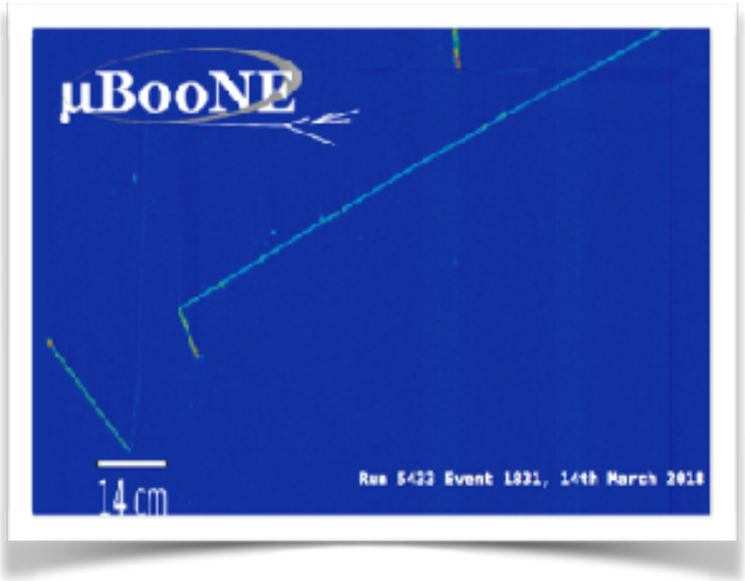
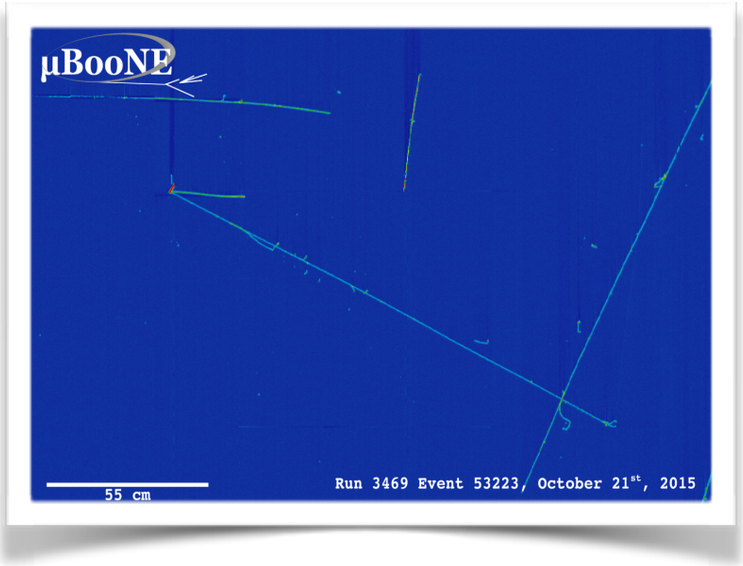
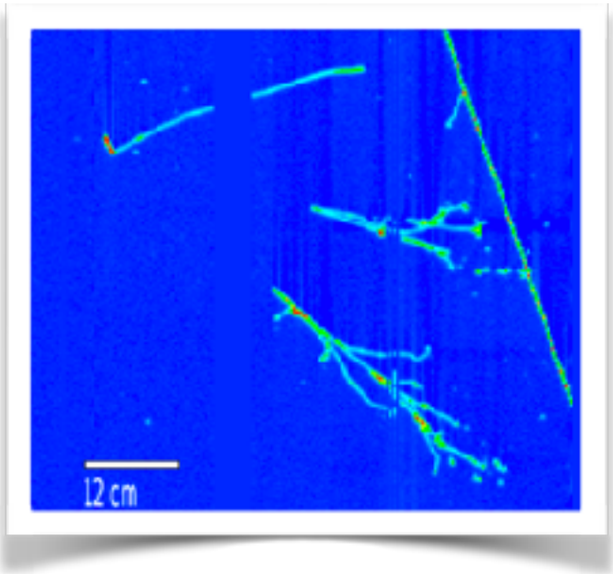
Neutrino interaction measurements

- Cross-section measurements on Ar are **essential for our low-energy excess analysis** and for future LAr experiments (DUNE)
- LArTPCs are powerful to study final state topologies and inform theoretical models (e.g. Charged particle multiplicity studies)
- First step is to perform a ν_μ CC inclusive measurement
- Follow with suites of exclusive channel measurements (by final states)
  - ✓ ν_μ CC 1μNp (where N ≥ 0)
  - ✓ ν_μ CC-π^0
  - ✓ ν_μ CC-$\pi^\pm$
  - ✓ High-statistics analyses







Neutrino interaction measurements

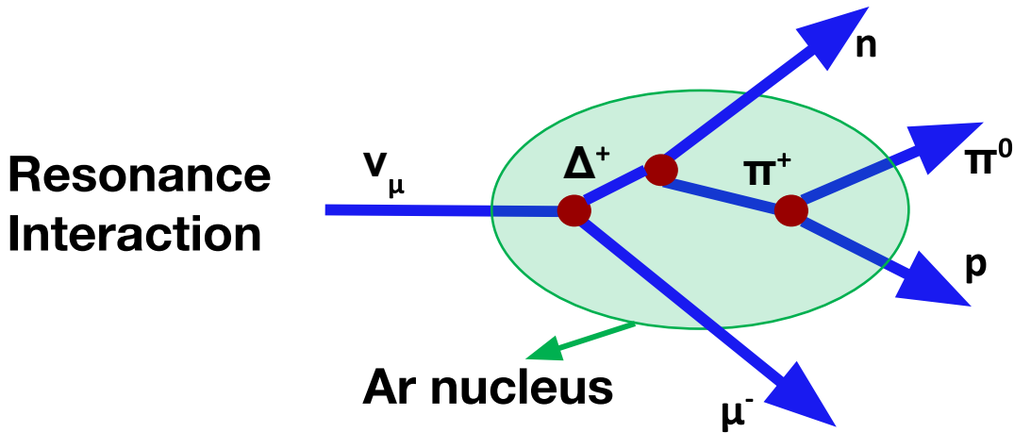
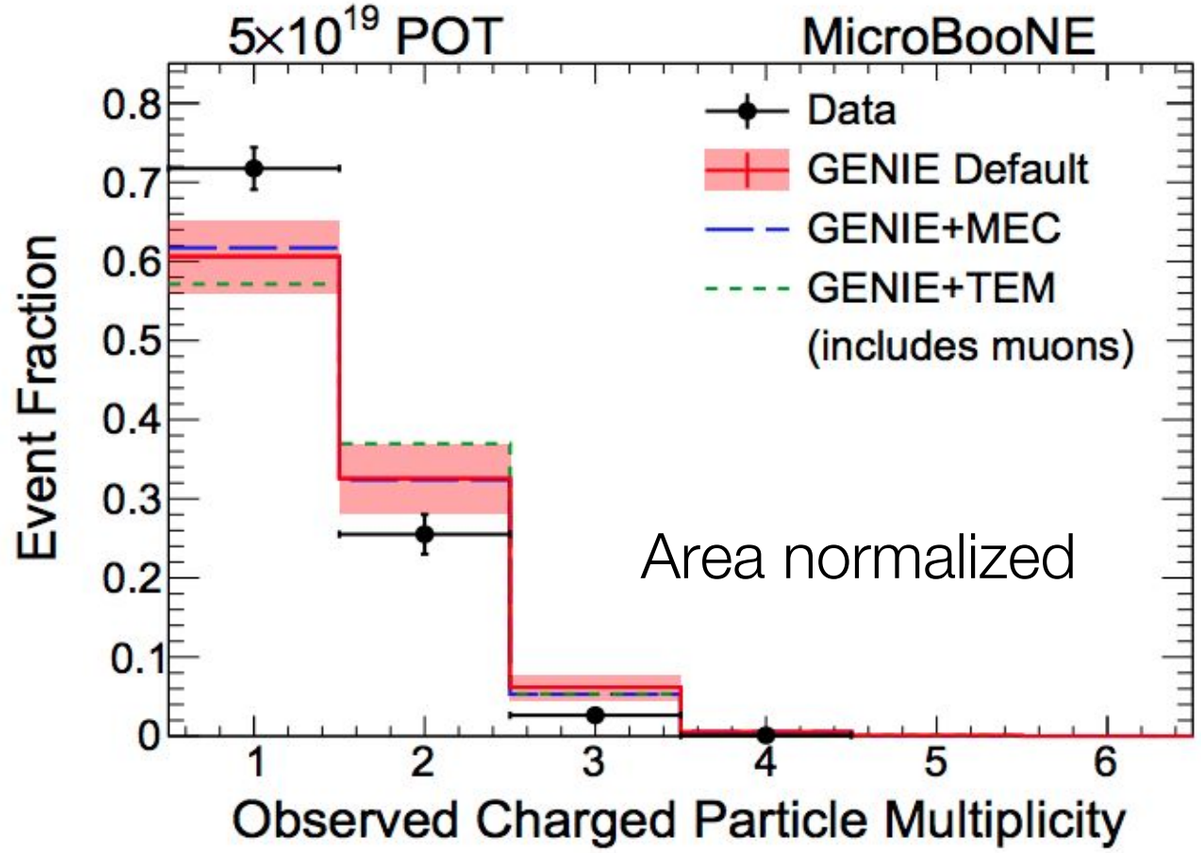
- Important step was to study the charged particle multiplicity (CPM) in ν_μ interactions
- Powerful way to validate nuclear models (and generators)
- First physics result!

Example of neutrino interaction with CPM = 2



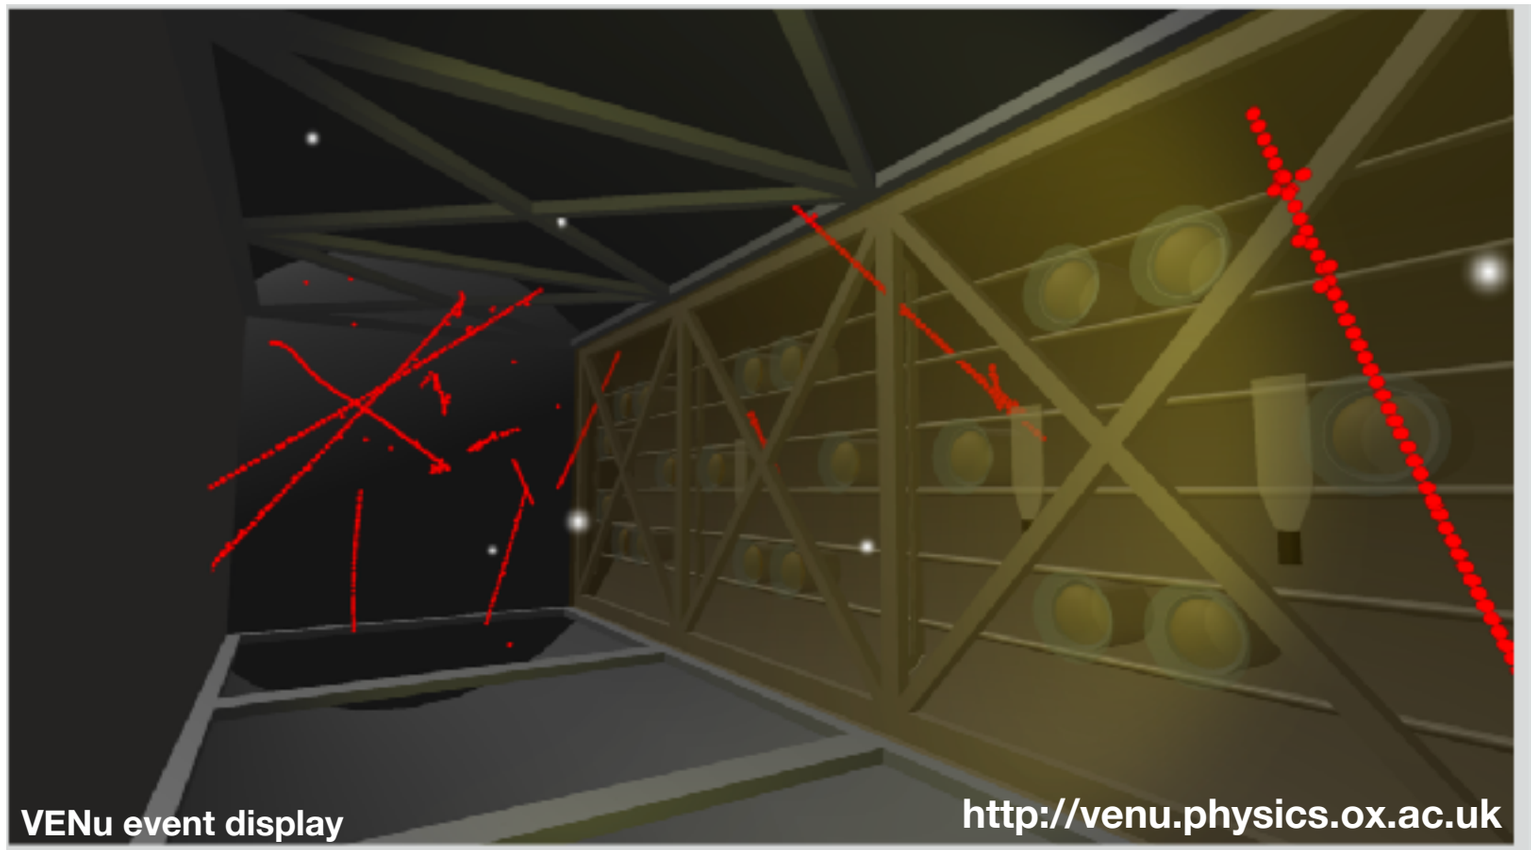


"Comparison of Muon-Neutrino-Argon Multiplicity Distributions Observed by MicroBooNE to GENIE Model Predictions", arXiv:1805.06887, submitted to PRD (2018)

Poster: A. Rafique, Comparison of Muon-Neutrino-Argon Multiplicity Distributions Observed by MicroBooNE to GENIE Model Predictions

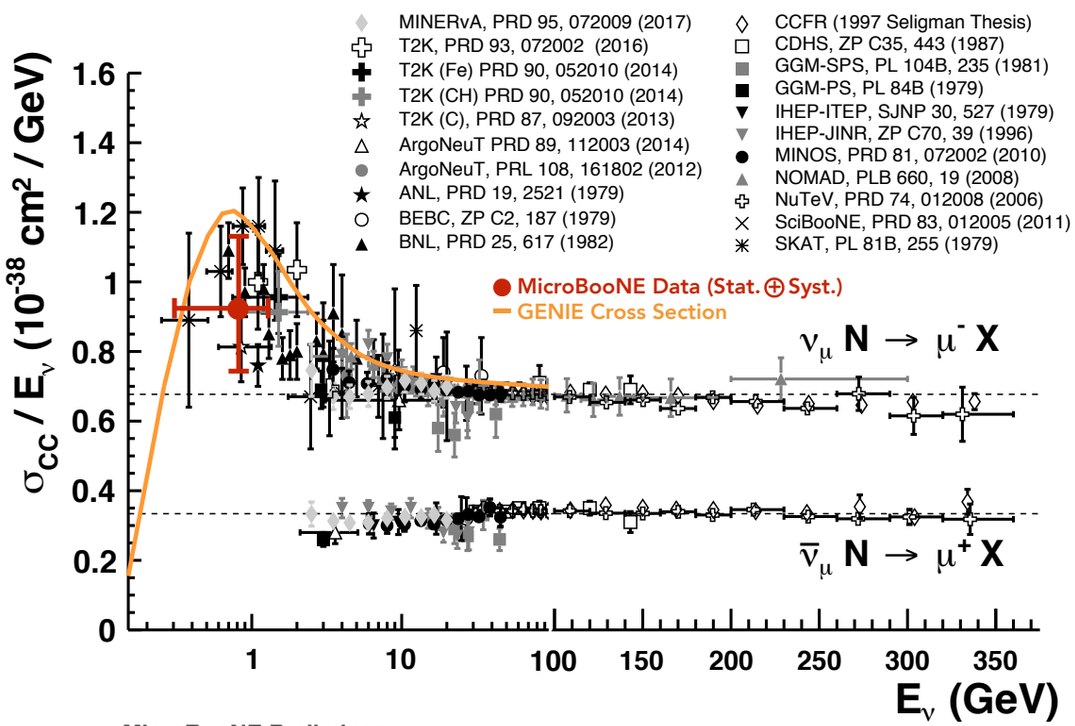
ν_μ CC Inclusive measurement

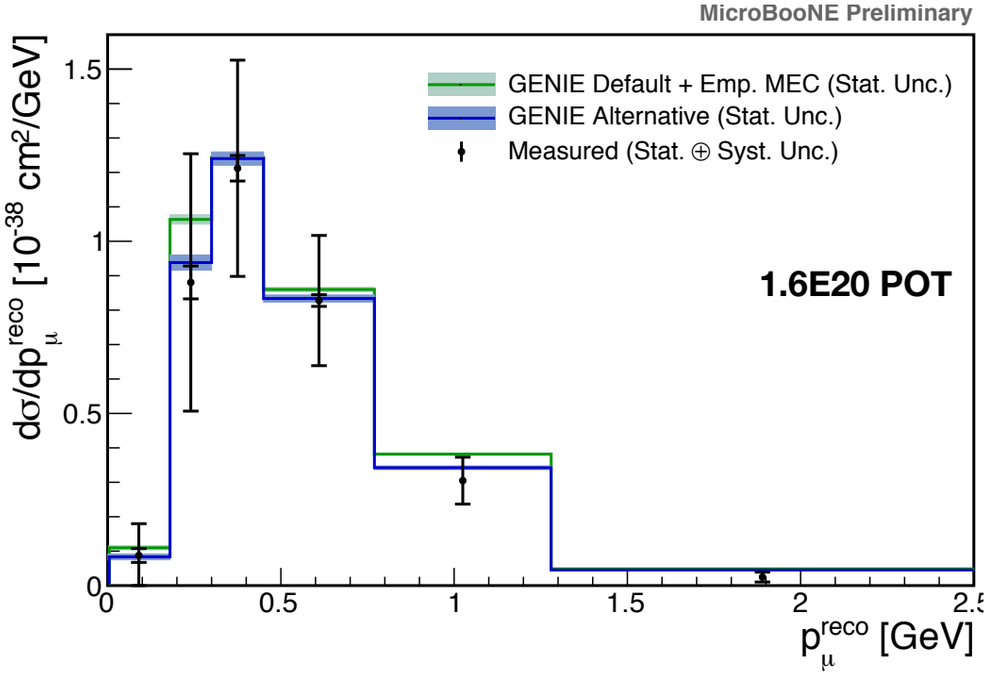
- Inclusive ν_μ CC interactions is the obvious first cross-section measurement
- It has been measured by many other experiments, making it a great benchmark
- Directly relevant to DUNE ν_μ CC signal

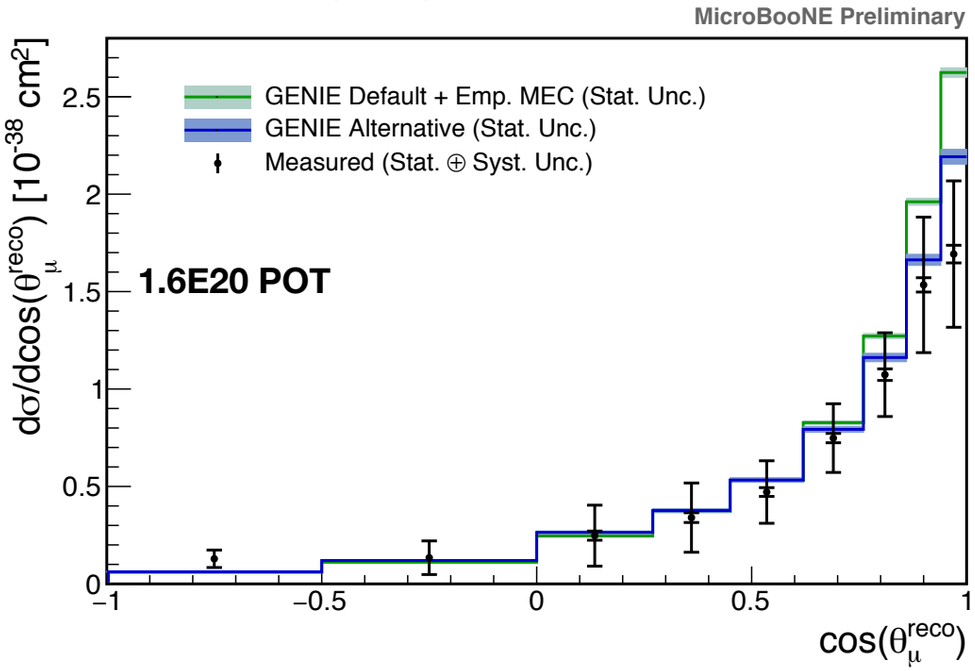


First public presentation of these results!

ν_μ CC Inclusive measurement







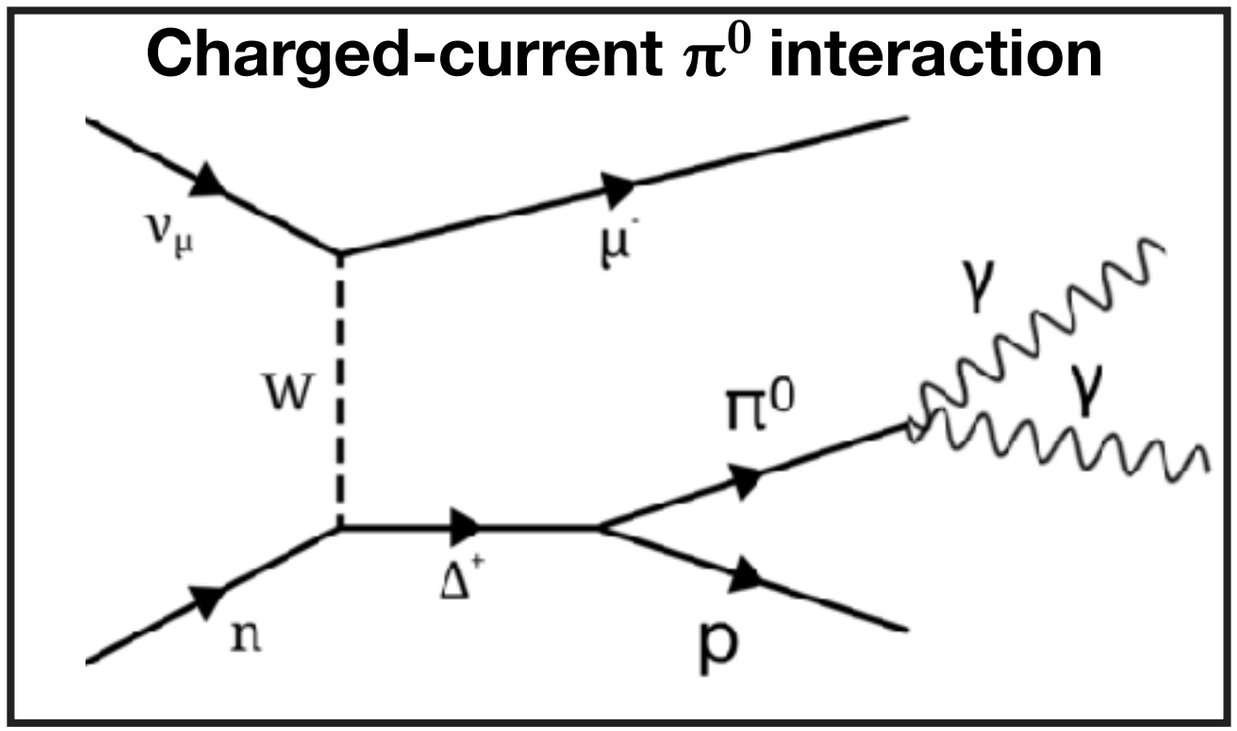
Double-differential cross section coming soon!

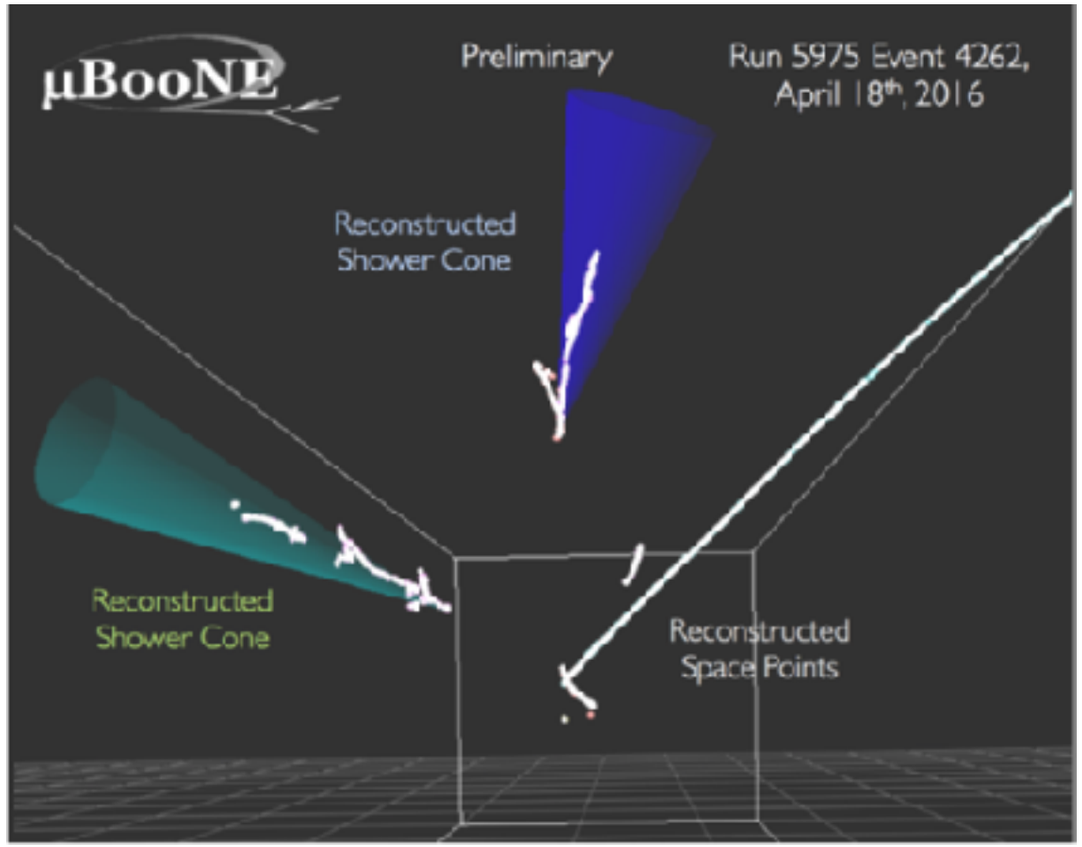
Poster: M. Del Tutto & A. Schukraft, First measurement of muon neutrino charged-current inclusive cross-section measurement in MicroBooNE

Public Note: MICROBOONE-NOTE-1045-PUB, 2018

CC-π^0cross-section measurement

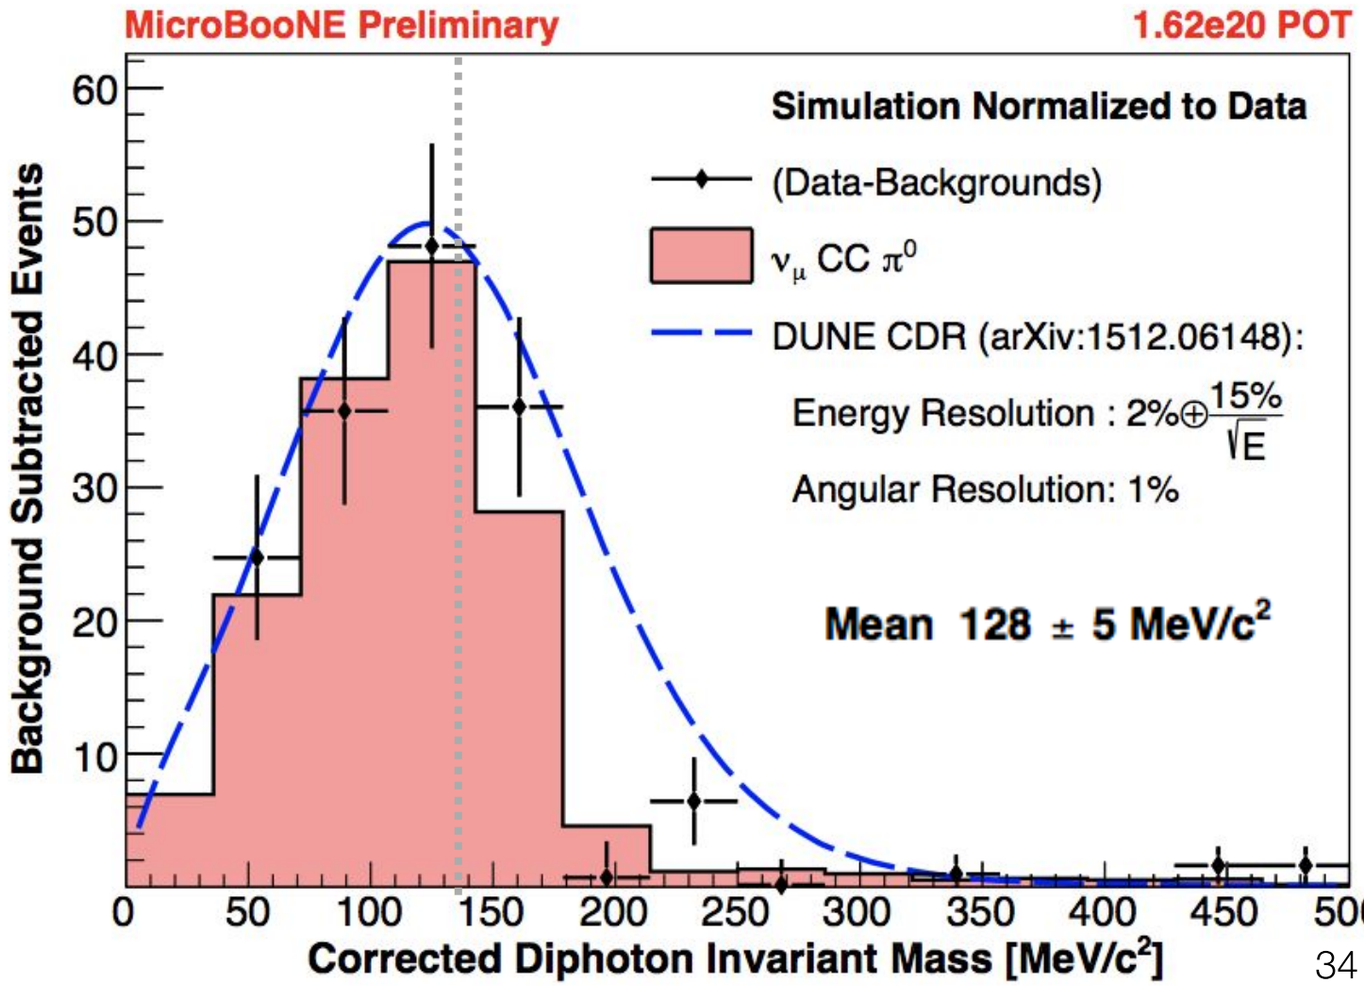
- Understanding π^0 is a crucial step towards searching for low-energy excess:
  - ✓Test shower reconstruction
  - ✓Validate electromagnetic shower energy resolution
- First measurement of CC-π^0 on Ar





CC-π^0 reconstruction and selection

Reconstruction of the π^0 mass peak:



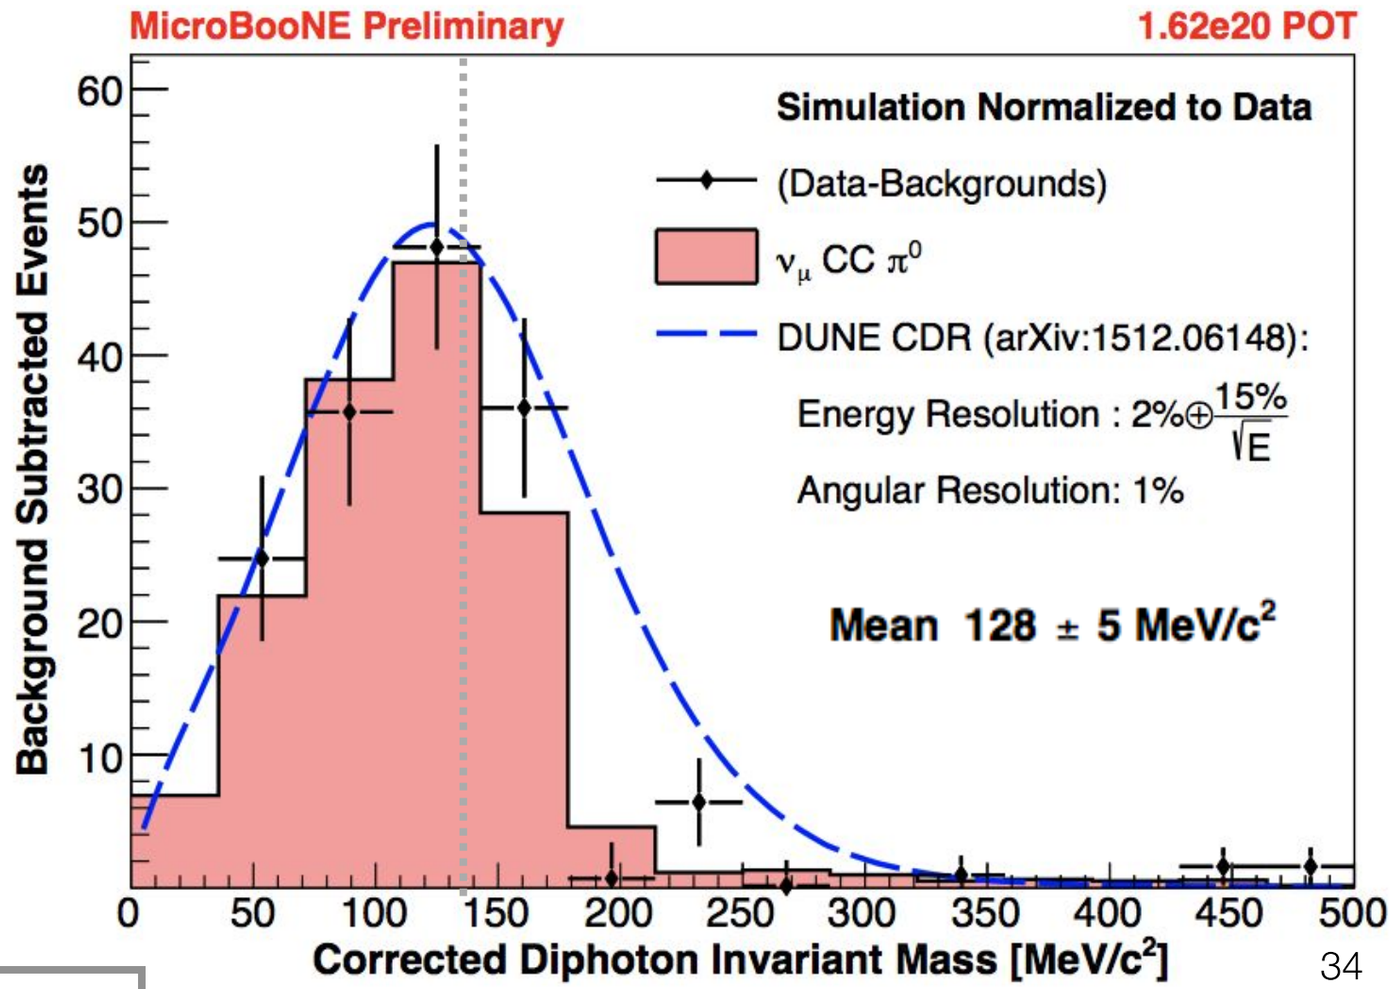
Mass of π^0: 135 MeV/c²

Poster: J. Zennamo, First measurement of muon neutrino charged-current neutral pion production in LArTPC

Public Note: MICROBOONE-NOTE-1032-PUB, 2018

CC-π^0 reconstruction and selection

Reconstruction of the π^0mass peak:



Total cross section:

Mass of π^0: 135 MeV

$$\left\langle \sigma^{\nu_\mu \mathrm{CC}\pi^0} \right\rangle_\Phi = (1.94 \pm 0.16\ [\mathrm{stat.}] \pm 0.60\ [\mathrm{syst.}]) \times 10^{-38}\ \frac{\mathrm{cm}^2}{\mathrm{Ar}}$$

Next steps: Higher statistics analysis → differential cross-section measurement

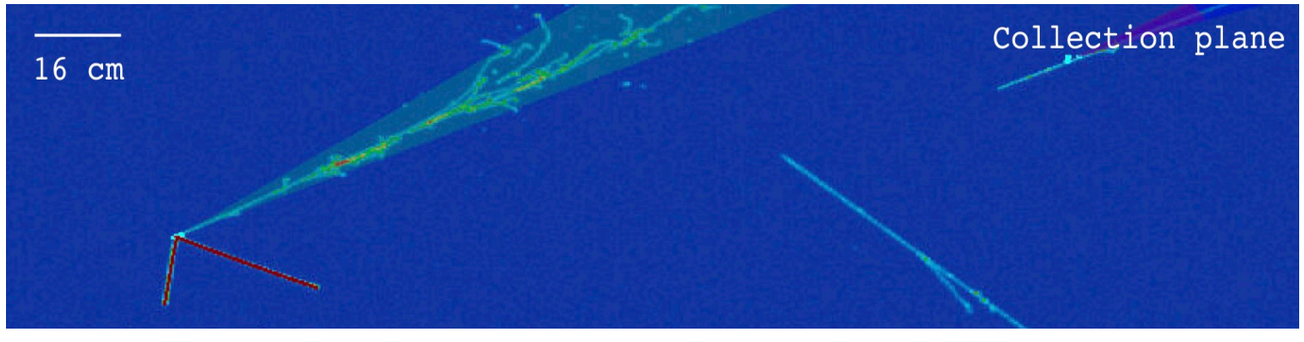
Poster: J. Zennamo, First measurement of muon neutrino charged-current neutral pion production in LArTPC

Public Note: MICROBOONE-NOTE-1032-PUB, 2018

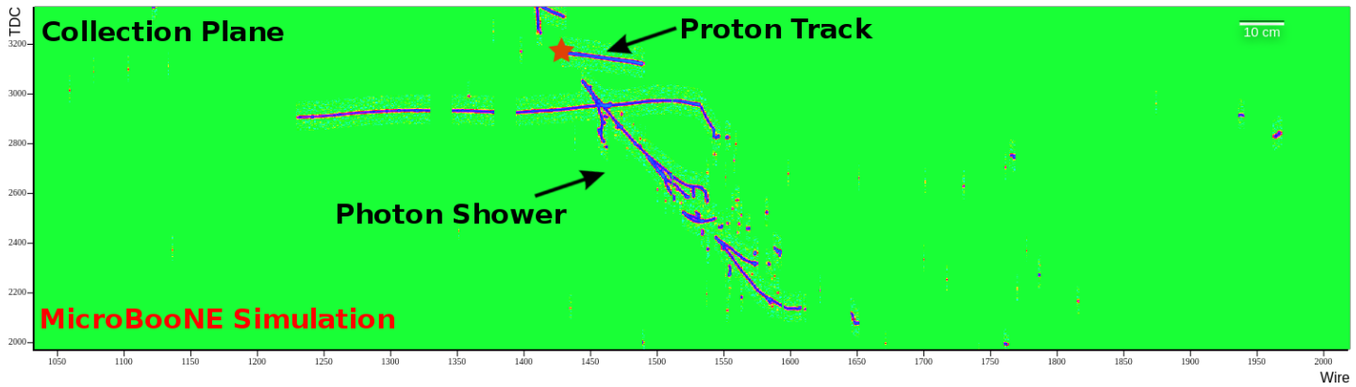
Towards the low-energy excess

Our current plan

- Several complementary LEE analyses:
  - ➡ ν_e analyses
    - ✓ 1e1p (Deep Learning)
    - ✓ 1eNp (Pandora)
    - ✓ Inclusive: 1e (Pandora, WireCell)
    - ✓ …
  - ➡ Single photon analyses
    - ✓ 1γ0p (Pandora)
    - ✓ 1γ1p (Pandora)
    - ✓ …



Example of reconstructed nue signal MC event



Example of reconstructed photon signal MC event

Crucial for testing different LEE models (e.g. 3+1 neutrinos, NC Δ radiative decays,…)

Towards the low-energy excess

Our current plan

- Several complementary LEE analyses:
  - ➡ ν_e analyses
    - ✓ 1e1p (Deep Learning)
    - ✓ 1eNp (Pandora)
    - ✓ Inclusive: 1e (Pandora, WireCell)
    - ✓ …
  - ➡ Single photon analyses
    - ✓ 1γ0p (Pandora)
    - ✓ 1γ1p (Pandora)
    - ✓ …

New Public Notes and Posters

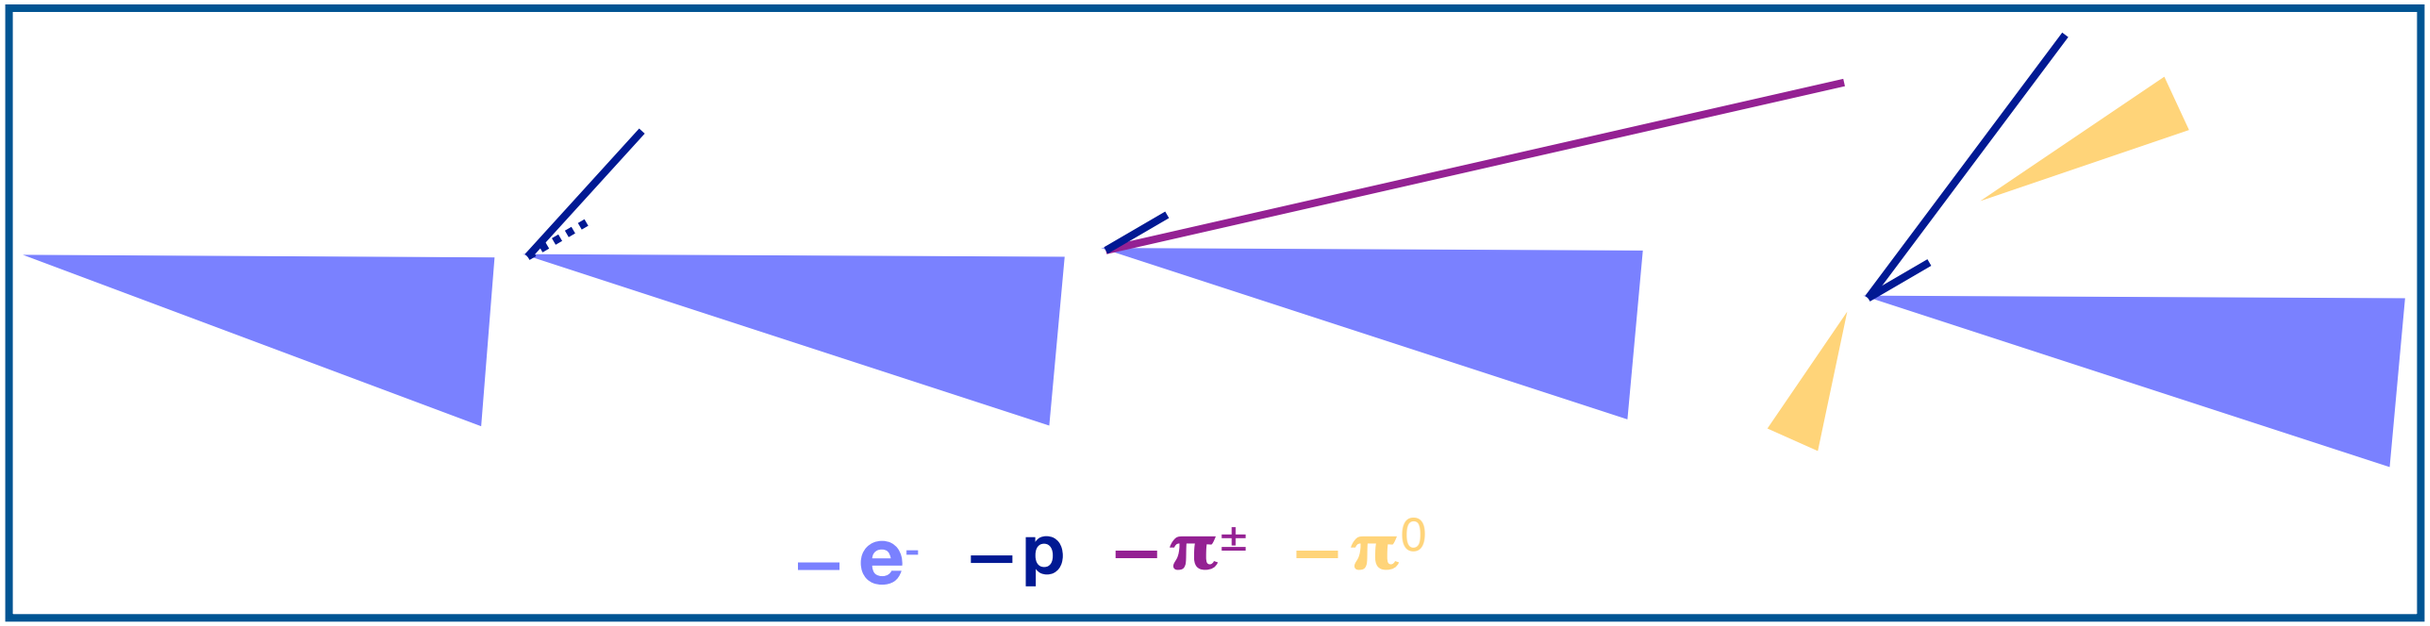
3. **M. Ross-Lonergan, MicroBooNE tests of the MiniBooNE low-energy excess, MICROBOONE-NOTE-1043-PUB, 2018 Finalist!**

- Blind search strategy → Very small open data sample (~4%) to develop robust and careful analysis
- Large NuMI beam open data sample available for cross-checks
- We first want to perform our cross-section measurements to provide strong understanding of the interactions and backgrounds

ν_e analysis

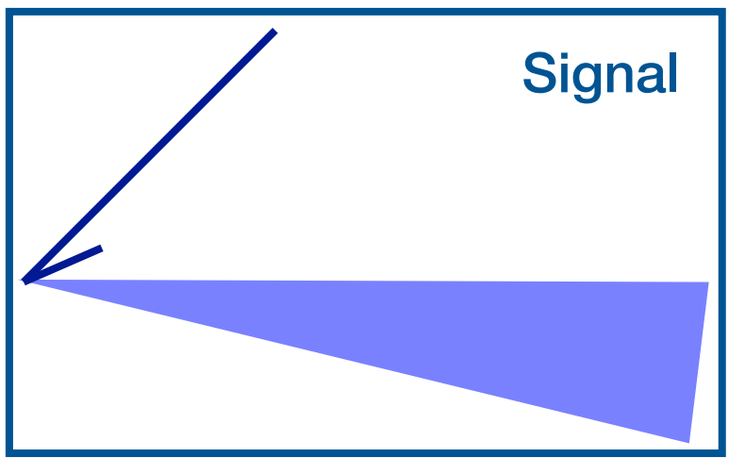
- Many different possible channels to study ν_e
- Each have different characteristics
- Power of LArTPC will allow for disentangling the potential effects of the analyzed channels

Example of signal topologies for ν_e

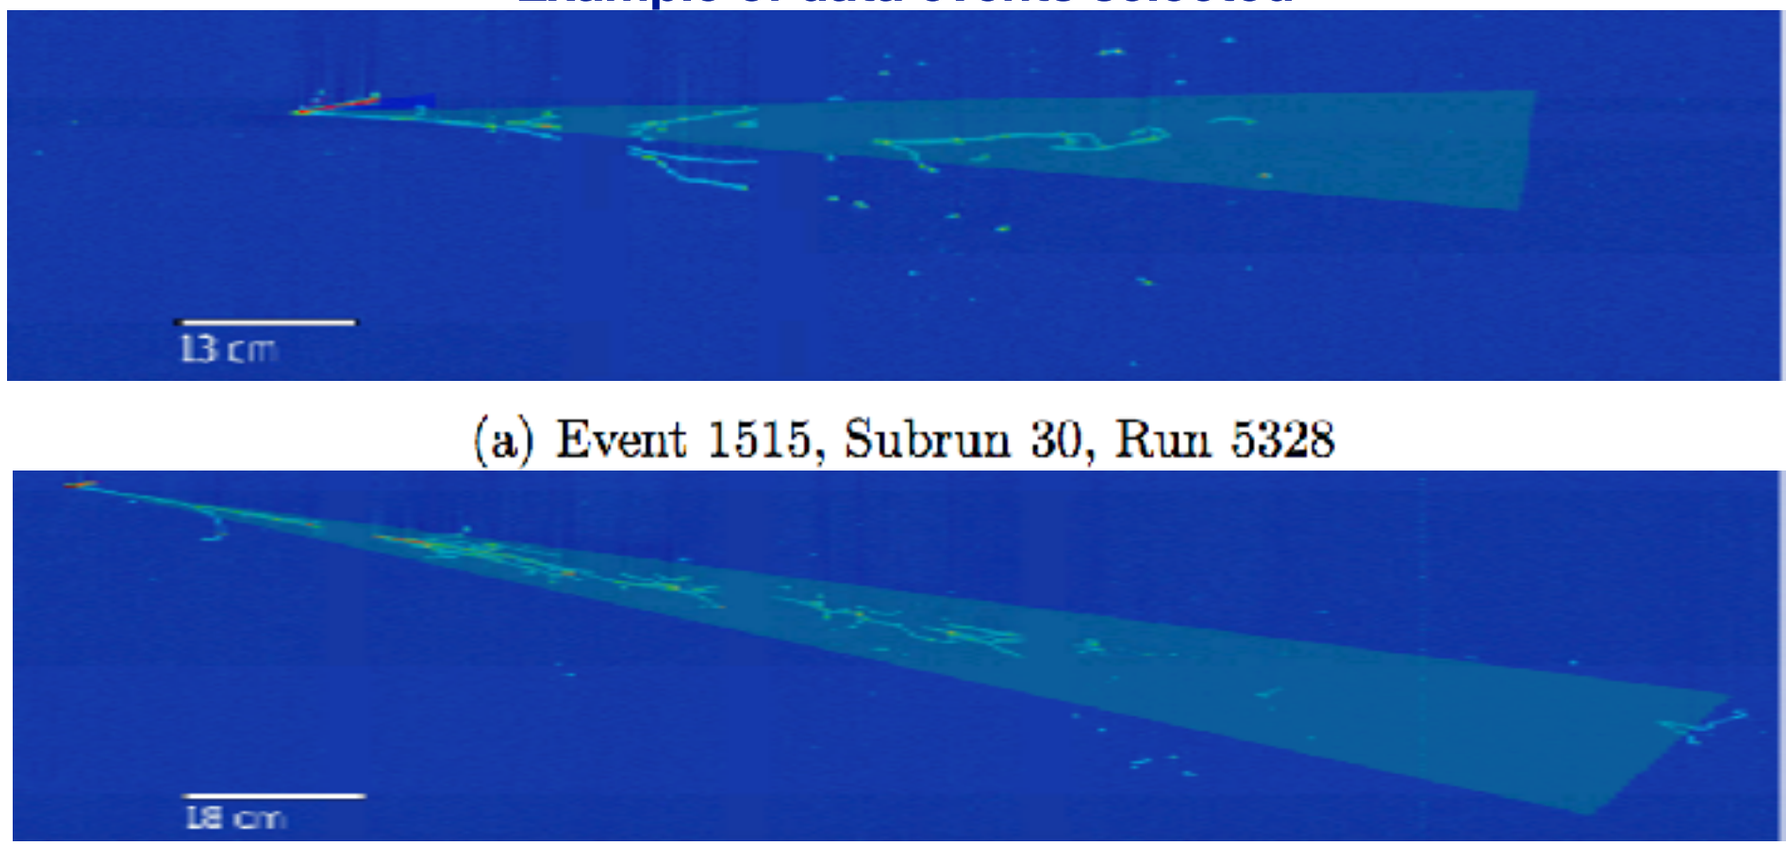


ν_e analysis

One of our first analyses focuses on the signal most similar to the MiniBooNE CC0π definition: 1 electron + N protons



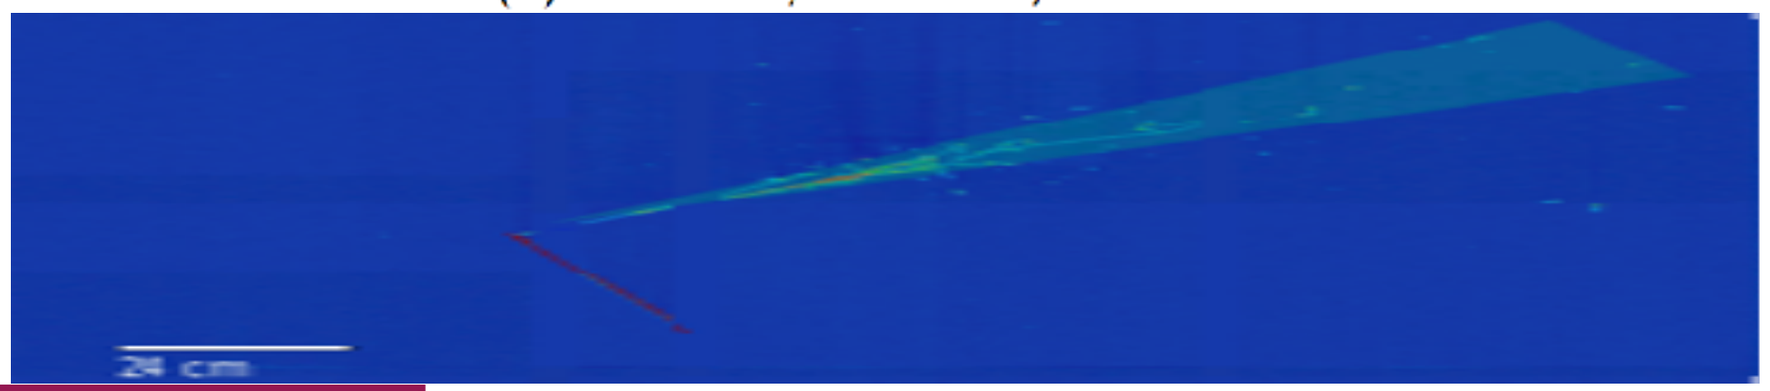
Example of data events selected



(a) Event 1515, Subrun 30, Run 5328

(b) Event 31, Subrun 0, Run 5513

Selected nue data events



(c) Event 3710, Subrun 74, Run 5906

Public Note: MICROBOONE-NOTE-1038-PUB, 2018

MicroBooNE summary

- MicroBooNE is an important milestone for LArTPC development and is providing invaluable LAr data - useful for future detectors
- We have been working at understanding the detector effects (noise, diffusion, recombination, space charge effect…), which are essential to understand our physics - **many new results!**
- We have made great progress on automated event reconstruction in LAr using **data** - significant progress in parallel to our physics results
- First physics results are presented (ν_μ CC inclusive differential cross section and CCπ^0 total cross section) and many more are underway
- We have performed our first fully automated ν_e and single photon selections and are addressing the improvements needed for the low-energy search

Towards the full SBN program

- MicroBooNE has been trailblazing the automated neutrino data reconstruction in LArTPC and in calibration techniques, which should provide a head-start for the other two experiments (note: all surface detectors → cosmic mitigation)

- The first stage (MicroBooNE) of the program will provide an answer of the origin of the MiniBooNE excess

- SBND will provide an unoscillated spectrum to identify the origin of a potential excess, in addition to an unprecedented amount of neutrino data on argon. Construction is underway with data taking planned for 2020

- ICARUS will provide the high-statistics coverage of a wide oscillation parameter space to give a definitive answer to the short-baseline anomalies. Construction is progressing well with data taking planned for 2019

- SBN is a definitive program to address LSND/MiniBooNE anomalies in the immediate future (~5 years)

SBN Program

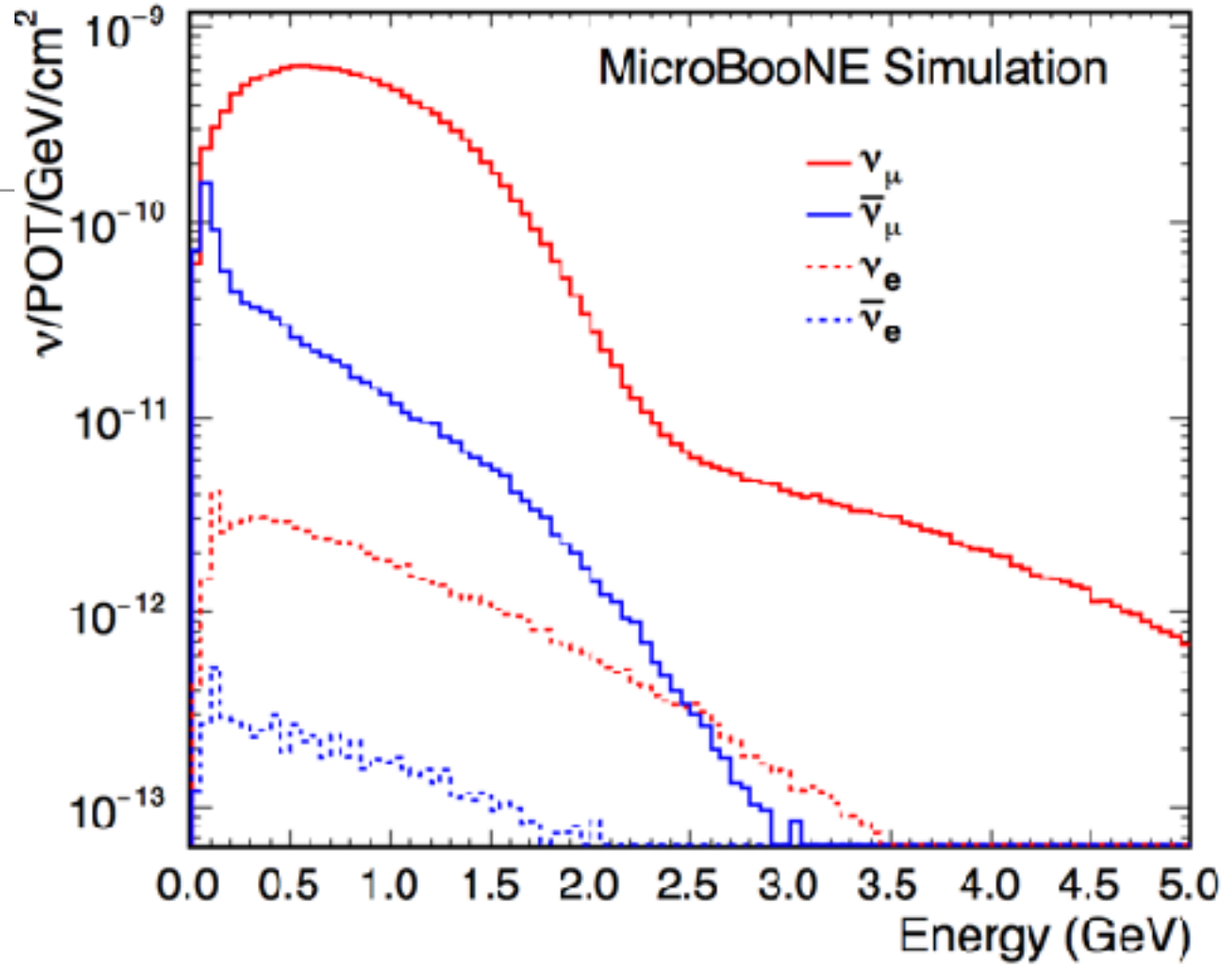
SHORT-BASELINE NEAR DETECTOR SBND

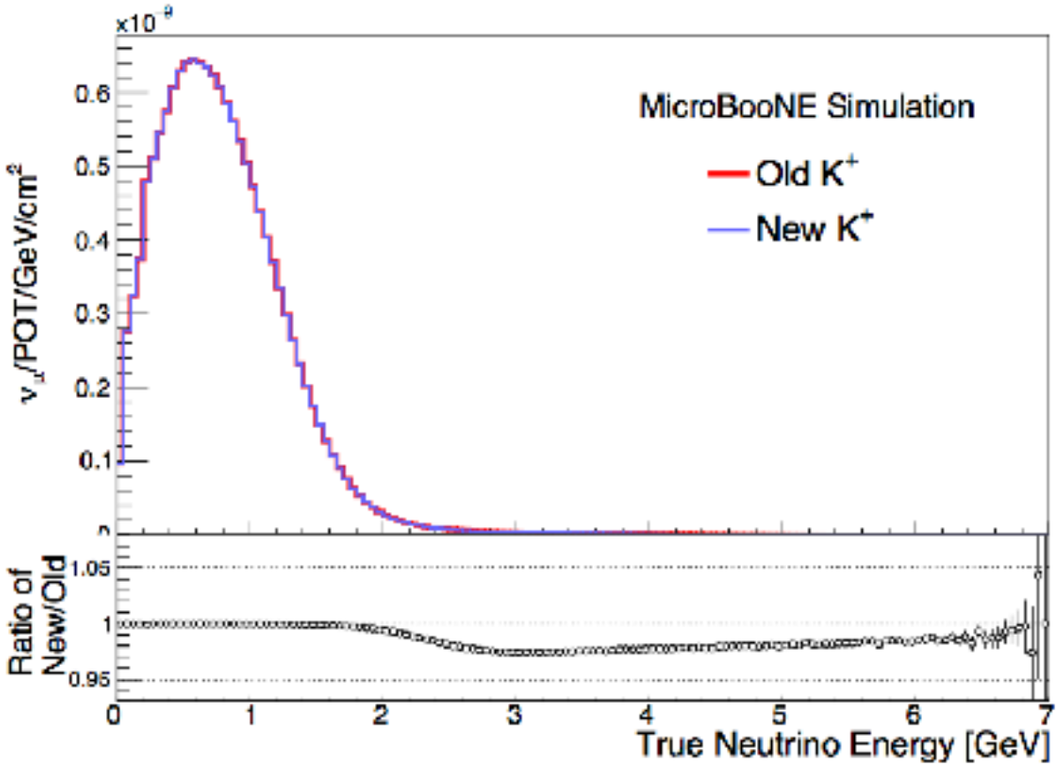
μBooNE

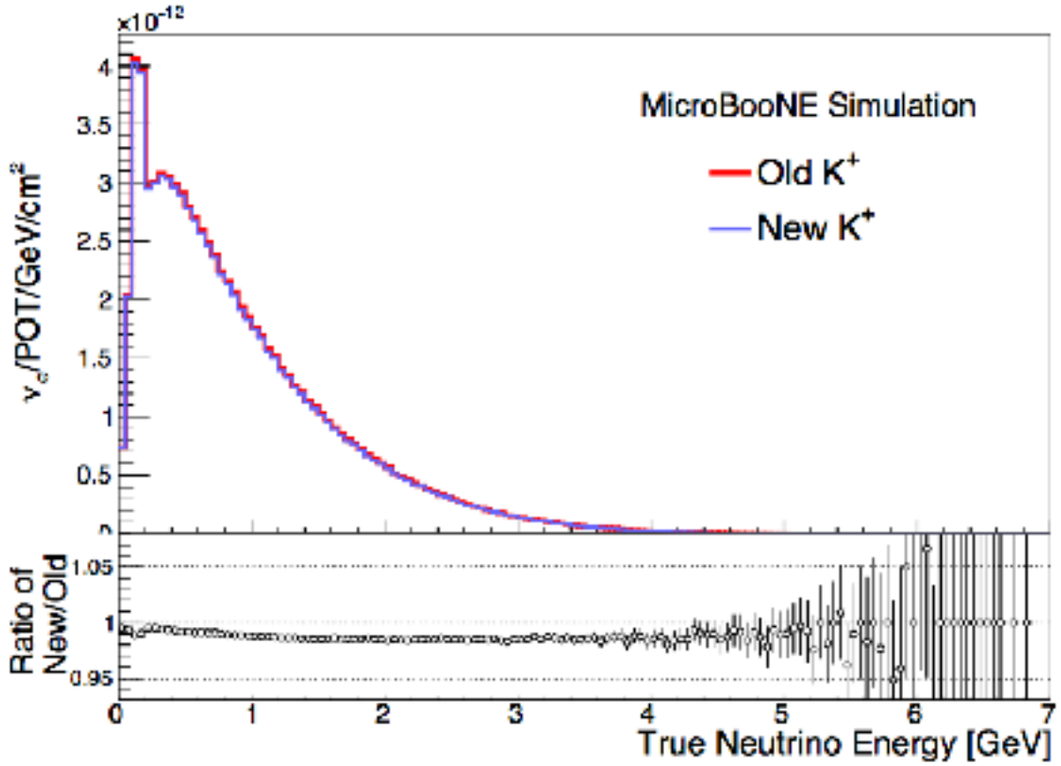
ICARUS

BNB flux

- MicroBooNE flux production based on MiniBooNE flux predictions
- New systematics study for MicroBooNE



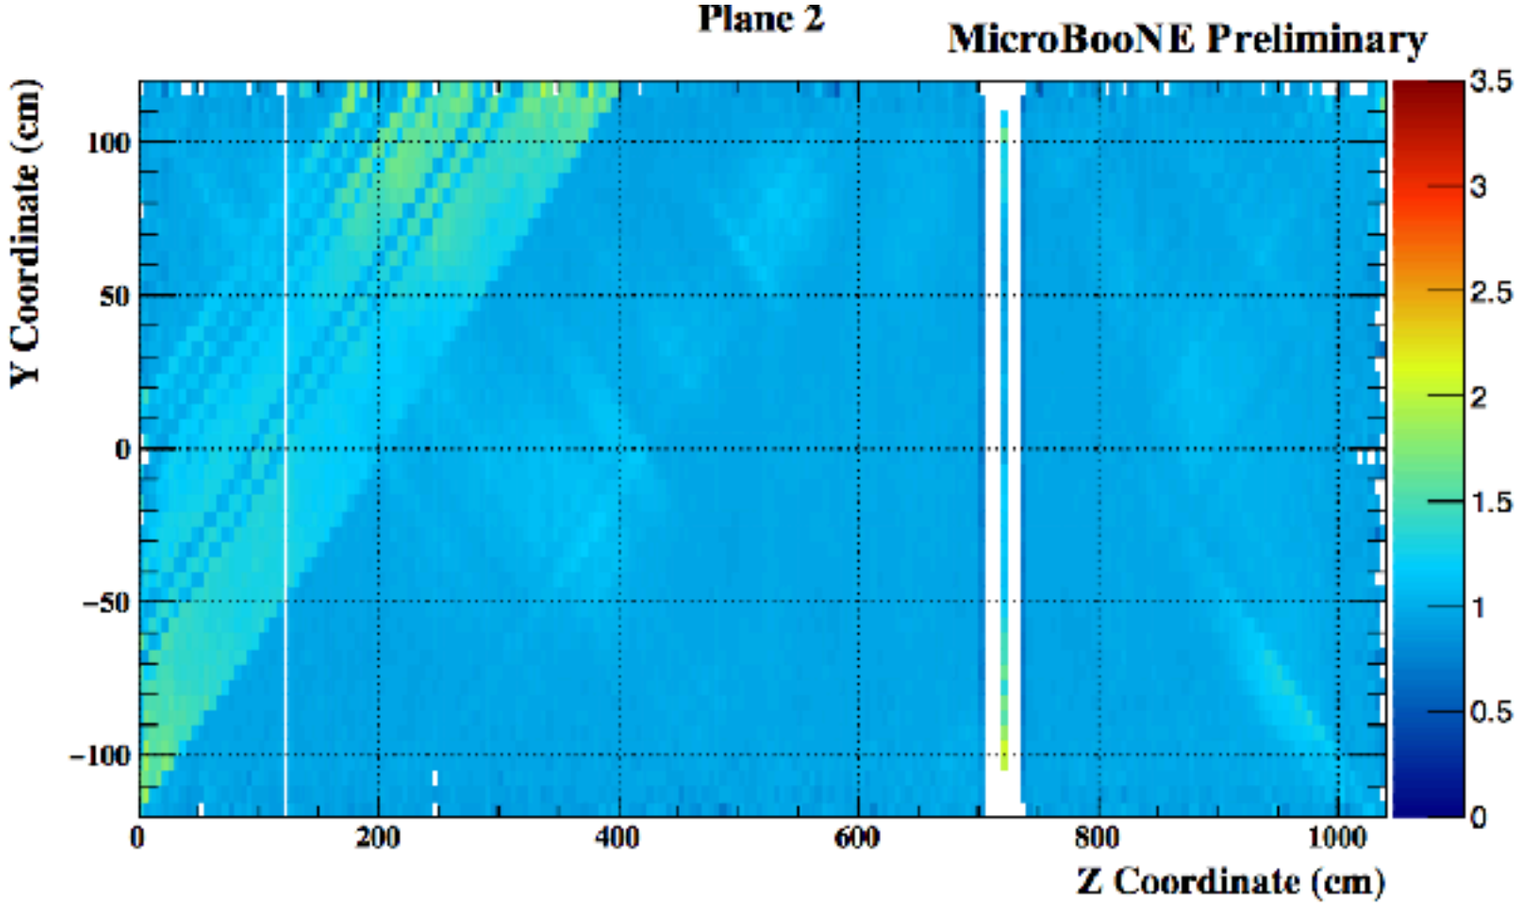


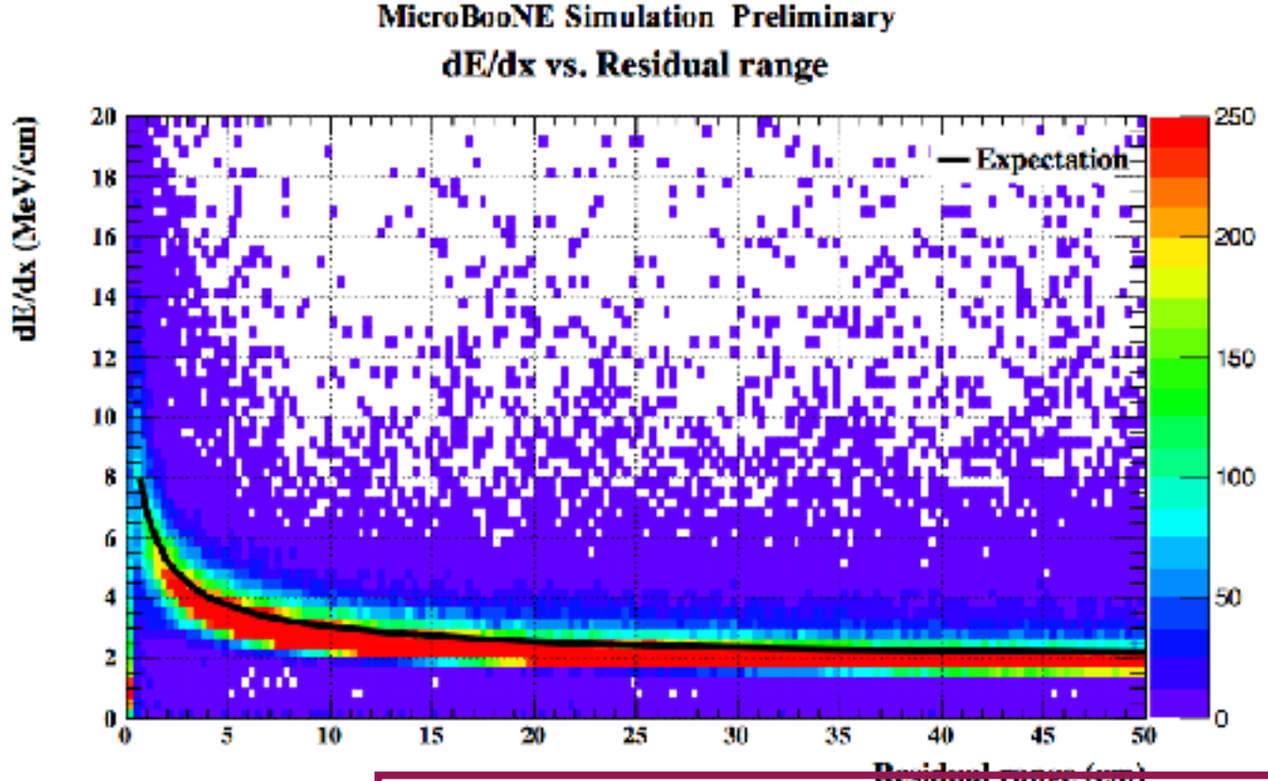


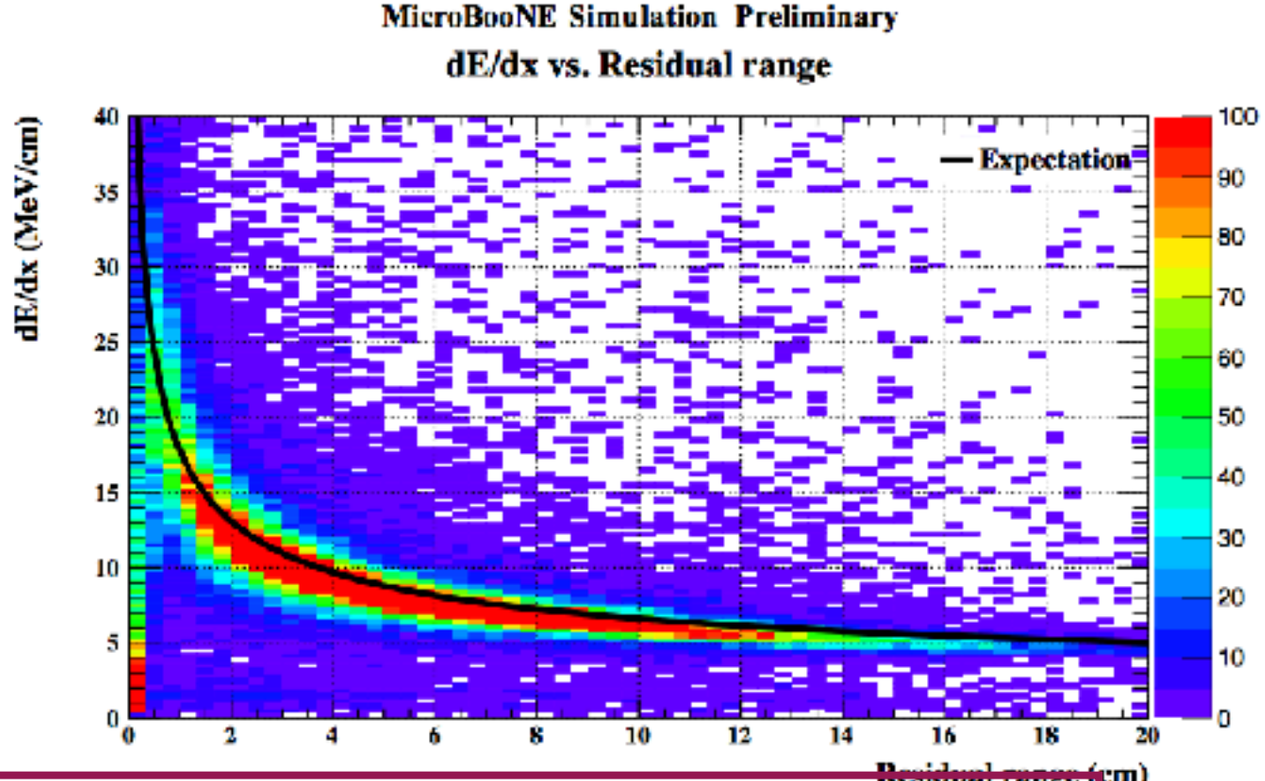
Public Note: MICROBOONE-NOTE-1031-PUB, 2018

Calibration

- YZ correction factors derived from data (Feb-May 2016). Time variation also studied.
- Calibrated dE/dx for stopping muons and stopping protons





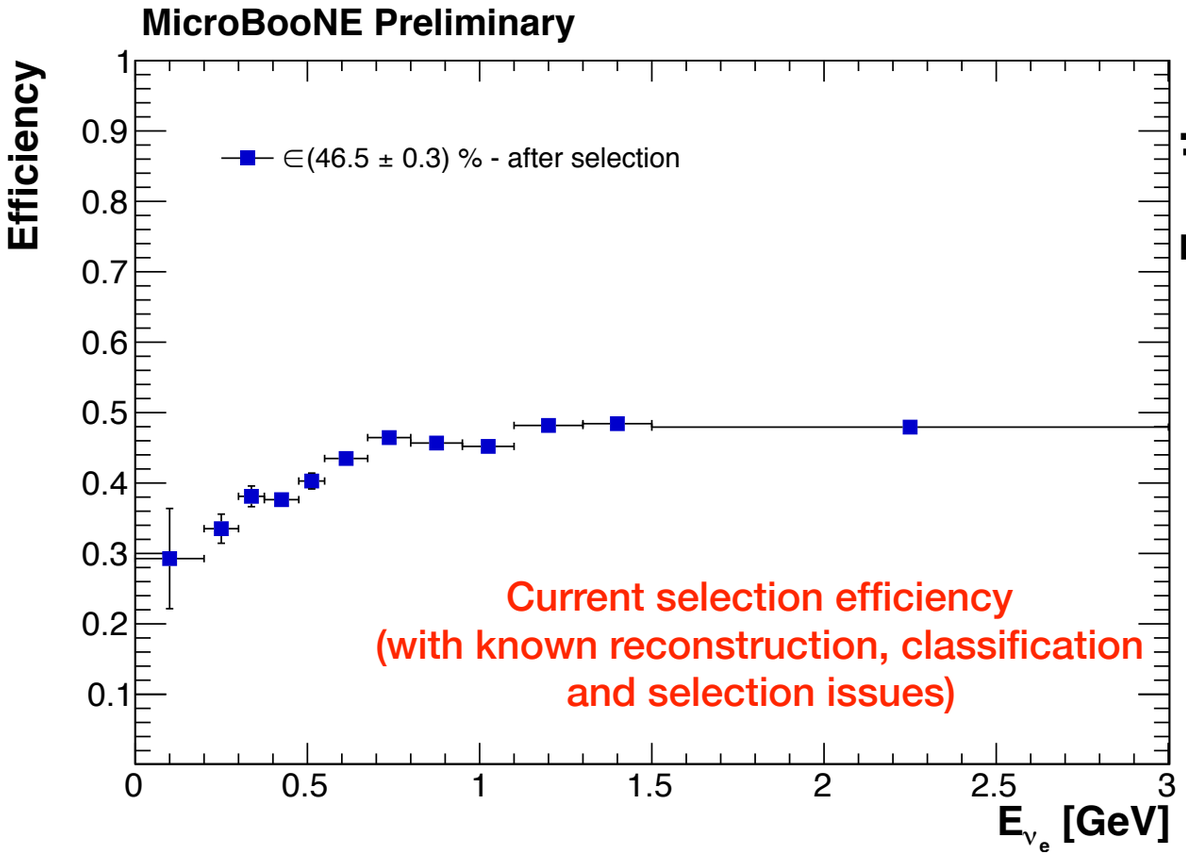


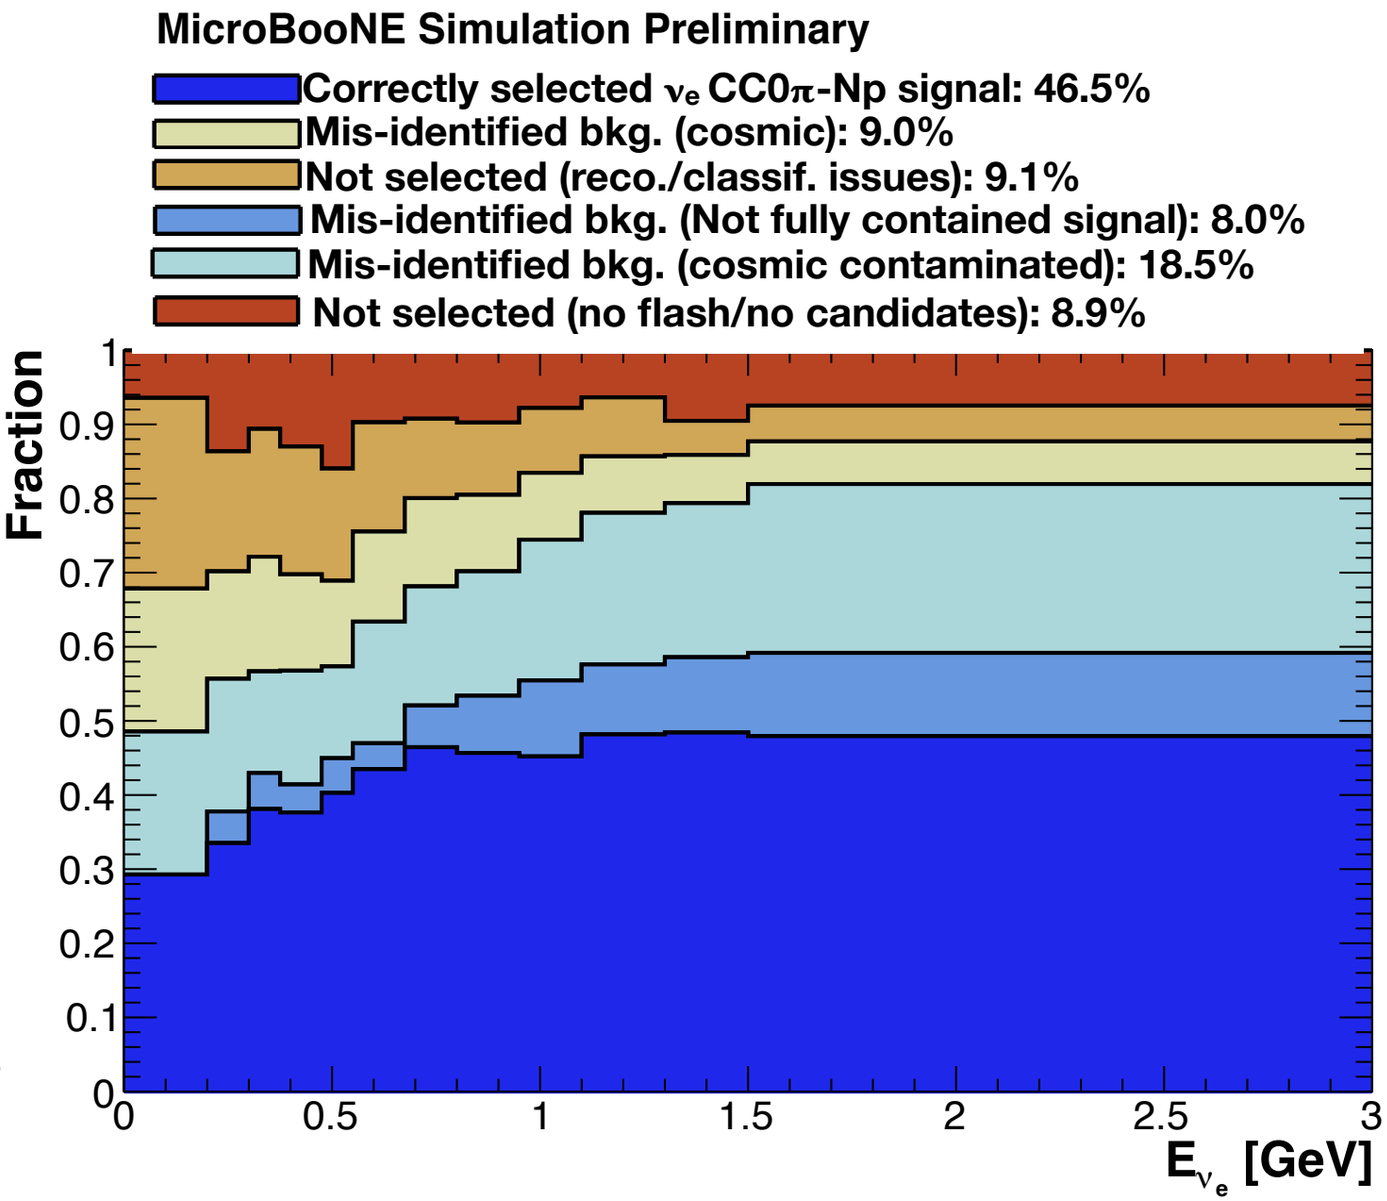
1. "Detector Calibration using through going and stopping muons in the MicroBooNE LArTPC", MICROBOONE-NOTE-1048-PUB, 2018

ν_e analysis

One of our first analyses focuses on the signal most similar to the MiniBooNE CC0π definition: 1 electron + N protons

Selection efficiency for 1e+Np





Poster: R. Soleti, Electron-neutrino reconstruction in MicrobooNE using the Pandora pattern reconstruction

Public Note: MICROBOONE-NOTE-1038-PUB, 2018

Low-energy excess analysis

- The currently ongoing ν_e (and other) analyses have informed us of where improvements are needed
  - ➡ Improved cosmic removal techniques + cosmic-ray tagger system
  - ➡ Robust PID will be implemented
  - ➡ Calorimetry on the 3 planes will improve the dE/dx measurements
  - ➡ Low energy reconstruction/classification improvements will increase the low energy efficiency
  - ➡ Continue to develop the Machine Learning analyses has they are very promising
- Perform end-to-end analysis with new improvements
- Validate analysis with side-bands
- Use NuMI ν_e events to validate the analysis with high statistics
- Perform the single photon analyses

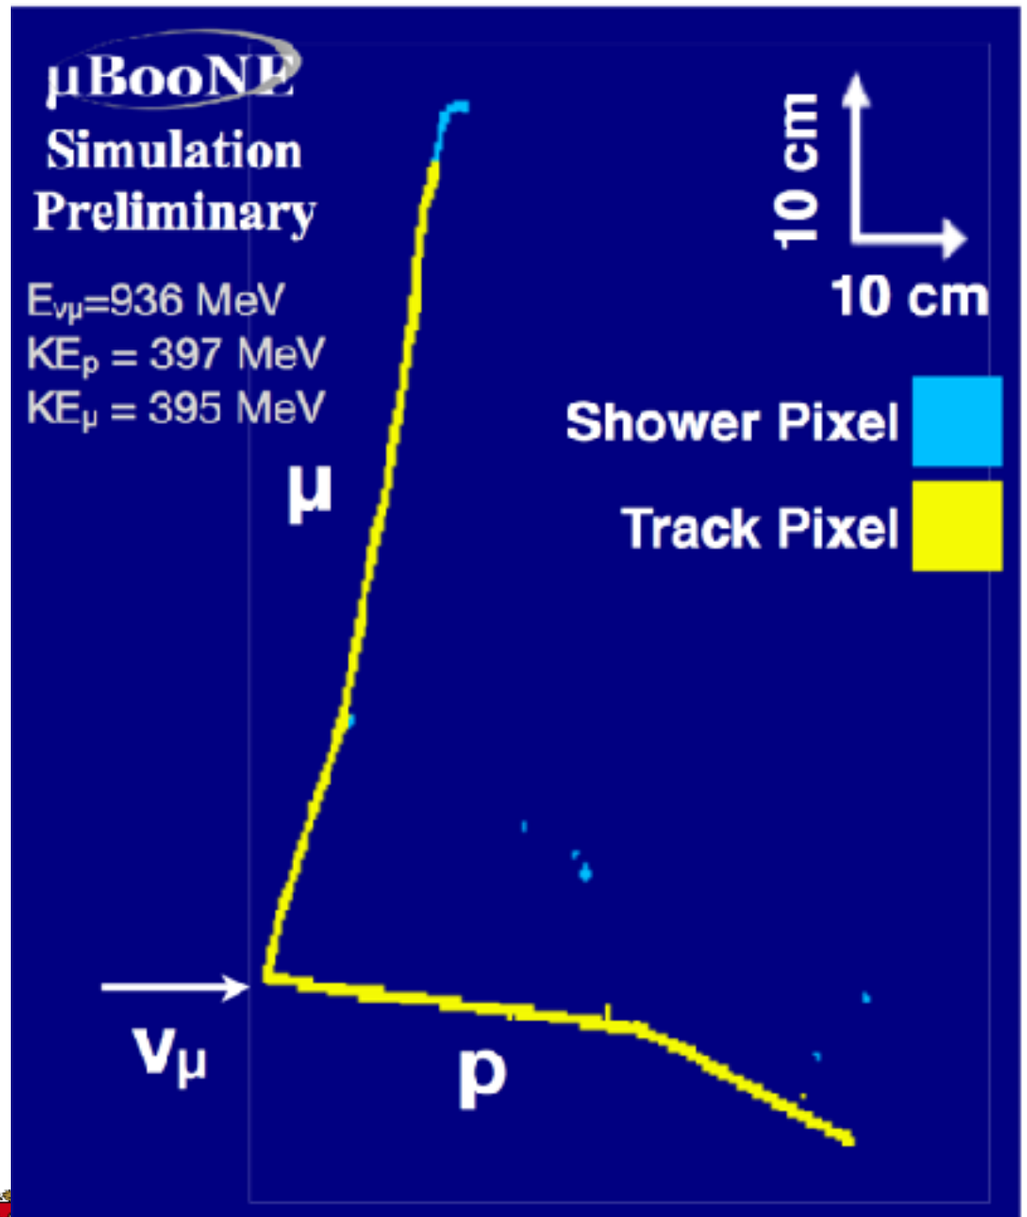
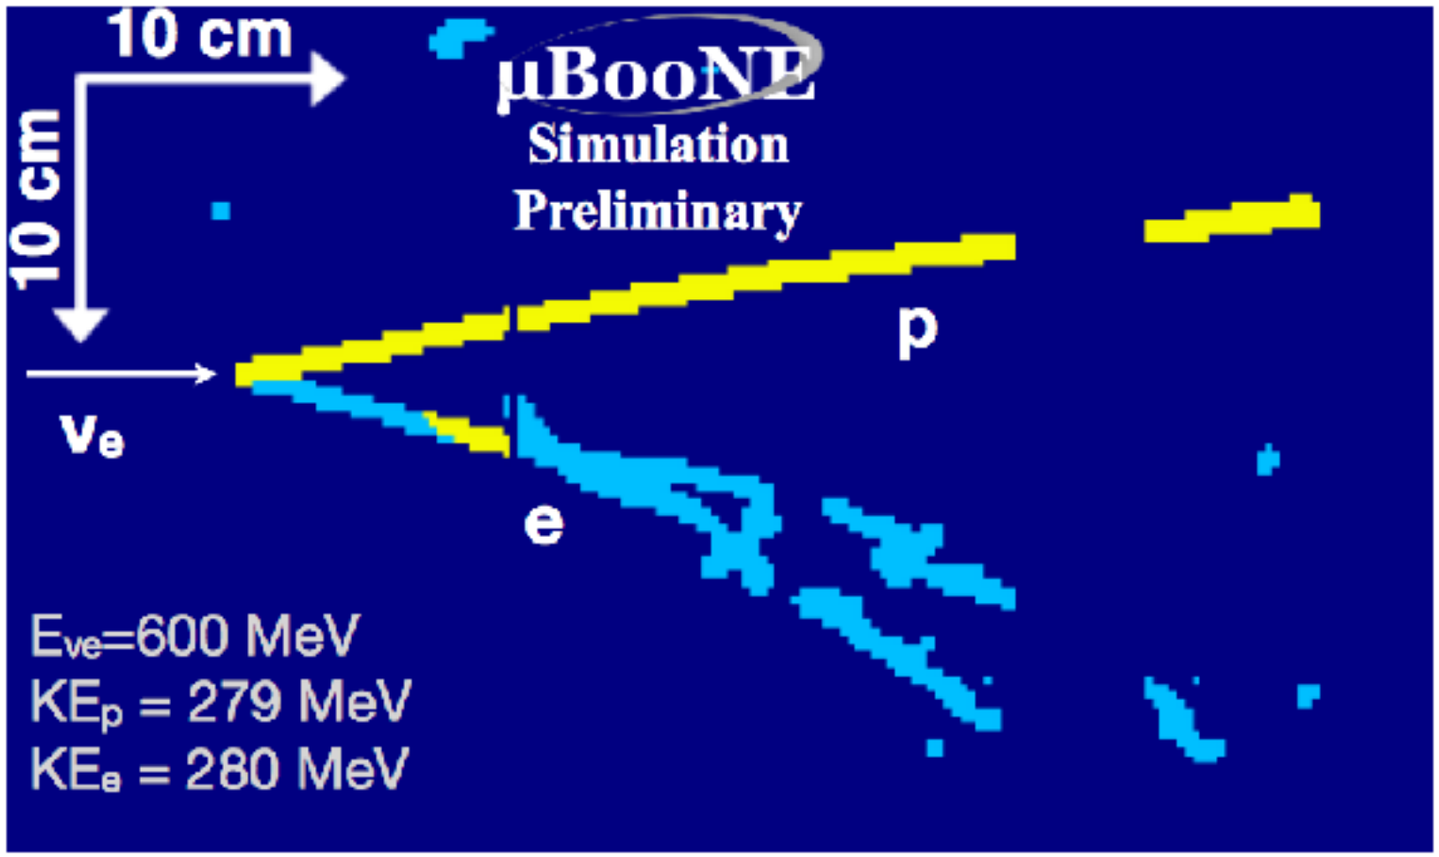
Deep Learning

Example of SSNET pixel labeling





Noise Filtering in MicroBooNE

- Initial data taking indicated significant “noise” on TPC waveforms above what was expected by the reconstruction team
- Significant effort undertaken on the part of many people to identify the various sources of noise and other issues
  - Identification of the sources of noise seen on the waveforms:
    - Low frequency “coherent” noise due to voltage regulators on the service boards
    - Harmonic noise due to HV power supplies
    - High frequency “Burst” noise probably associated to PMT HV supply
  - Understanding other issues impacting waveforms
    - Misconfigured channels - wrong gain and/or shaping time
    - Shorted channels
    - Periodic saturation of ASIC’s
- Sophisticated software noise filtering mitigation package put in place

Publication

Signal Processing

- Digitized signal we measure differs from the actual ionization deposited by the original particle due to several effects:
  - Physics of the drift: recombination, electron lifetime, diffusion, etc.
  - Electric field signal response on the wires (field response)
  - Electronics response

- The Signal Processing stage has as its primary goal to unfold the field and electronics responses to recover the number of ionization electrons passing by each wire at each sampled time.
  - Recombination, lifetime, diffusion, etc., are addressed in the reconstruction and analysis stages
