DESIGN FOR OPEN ACCESS PUBLICATIONS IN EUROPEAN RESEARCH AREAS FOR SOCIAL SCIENCES AND HUMANITIES

Developing network and e-infrastructure strategy

Design Study and Roadmap for the OPERAS e-infrastructure

June 2018

DRAFT VERSION

DESIGN FOR OPEN ACCESS PUBLICATIONS IN EUROPEAN RESEARCH AREAS FOR SOCIAL SCIENCES AND HUMANITIES

Deliverable 2.4
Design study and roadmap for OPERAS e-infrastructure

Grant Agreement number	:	731031
Project acronym	:	OPERAS-D
Project title	:	Design for Open Access Publications in European Research Areas for Social Sciences and Humanities
Funding Scheme	:	INFRASUPP-03-2016
Project's coordinator Organization	:	CLEO-CNRS
E-mail address	:	pierre.mounier@openedition.org
Website	:	http://www.operas-eu.org
WP and tasks contributing	:	WP2
WP leader	:	CLEO-CNRS
Dissemination level	:	Public
Due date	:	June 2018
Delivery date	:	June 2018

Contents

I.   Foreword

The following report, OPERAS Design Study, has been composed thanks to the OPERAS-D project. The report joins several studies that explore the landscape of OPERAS' field of activity, establish the technical mapping of the OPERAS Consortium, survey users' needs regarding scientific communication and academic publishing, and finally look ahead to the development of the governance structure and business model of the future infrastructure within the ESFRI framework. The initial survey included in the first draft of the study have been updated since then and completed by two additional ones: a study that evaluates the visibility of open access books disseminated by a selection of OPERAS partners on the Web and in the most known indexes, and a legal study that prepares for the incorporation of OPERAS as a legal entity. This final edition of OPERAS design study also includes the validation of future OPERAS services by the Core Group against a SWOT analysis and additional documents prepared to support the hearing of OPERAS by ESFRI.

One word can synthesize what these studies and reports tell us about OPERAS' field of work: fragmentation. Hence, the OPERAS vision and mission which arises naturally from this finding: integration.

A.   The structure of research in social sciences and humanities

Fragmentation, as evidenced by the Landscape Study in this report, is one of the major characteristics of the communication and publication sector in humanities and social sciences: an impressive number of small size players of different types operate across the European Research Area to offer communication and publication services to researchers. The reasons behind this situation can be analyzed at multiple levels, but those reasons shouldn't overshadow the most important one: the scientific community they serve is itself highly fragmented.

Many studies and authors have explored and revealed the fragmentation of the research landscape in the humanities and social sciences (see the Scientific Case), across multiple disciplines and sub-disciplines, as well as in small research units, and, of course different languages. To take a striking example, the recent INTERCO-SSH project, that studies internationalization of SSH found that, despite the growing importance of English as a communication language in social sciences and even humanities, the need for academic publications in native languages remains central in many cases. According to the same project findings, most of the time internationalization of SSH doesn't mean going from local to global, rather it goes through what is described as transregional integration which reflects the structure of scientific networks that connect researchers across national boundaries and not always globally.

Therefore, the particular structure of the publishing sector in social sciences and humanities, composed of small and many players serving local scientific communities and specializing in narrow fields of research, cannot be considered as a flaw, but in fact more as a feature, an adaptation to the reality of the scientific ecosystem in these disciplines. The flaw emerges, however, when the actors playing in the field operate as isolated beings, unaware of what others are doing, reinventing the wheel in their own corner or even competing through unfair practices. In such circumstances, fragmentation turns into disintegration and the scientific community which needs efficient partners to circulate ideas and research findings across borders could be negatively impacted. The flaw is also apparent when the whole system experiences a global change in which all players need to redefine and renew their mission,

OPERAS·D   *Design Study*

the services they deliver, and consequently their workflow, business model and tools. The global change experienced by everyone is well known: the digital turn and its consequence: Open Science.

B.   Open Science in practice

Open Science has so far mainly been debated as a principle. And as a principle, a growing part of research funders – funding agencies, ministries and the European Commission - seem inclined to adopt it. In 2016, the Dutch government took the opportunity of its European presidency to push for a new stage in the development of Open Science, from principle to reality, resulting in the The Amsterdam call for action on Open Science. But, as mentioned in the document, to put Open Science into practice requires strong coordination between the different stakeholders of the scientific community: researchers, funders and national authorities, libraries and finally…publishers. That's why the implementation of Open Science in humanities and social sciences is a specific challenge for a sector that is currently loosely connected and highly fragmented.

As it appears from the Technical Mapping study undertaken during the OPERAS-D project, the structuration of OPERAS partners in terms of technologies used, types of services offered to the community but also and may be even more importantly, the business models and workflows, is heterogeneous. Therefore, to increase integration in terms of interoperability and complementarity through cooperation across different institutions and European countries with their particular academic cultures, requires a particular effort which is, in many cases, beyond their reach on their own as resources are limited for each of them. Yet, the same study reveals that divergence is not total, particularly at a technical level, with most partners having chosen more or less the same technological bases, adopting more or less the same standards, and aiming more or less at the same practices. The whole challenge resides in this 'more or less' that reflects on the one hand the need for flexibility that fits local contexts, but on the other hand presents serious obstacles to practical integration. For decades, players in the scholarly communication field haven't felt a particular motivation to become more integrated.

Cooperation between scholarly communication players locally or nationally, often remains loose, and limited to exchange of information during scientific and professional conferences (such as Elpub, APE, ALPSP), and exchange of rights during book fairs (such as Frankfurt, London, Turin). In the print era and at the very beginning of the digital turn, networking was enough. But the recent development of Open Science changes everything, and at a fast pace, especially when it comes to putting into practice the goal of the European Commission to set up a European Open Science Cloud within a few years. For this purpose, networking is not enough anymore and integration must be achieved in reality for disciplines that would otherwise risk being left behind. Indeed, if SSH disciplines do not integrate with the Open Science Cloud, the entire scientific ecosystem will fail to reach its full potential since it will be missing the publications and other research outputs from half of the scientific disciplines.

C.   The 'long tail science' model

How can many small collections of materials provided by many small teams integrate in practice? OPERAS, as a Research Infrastructure project, aims to provide a sensible and practical answer to this question. The intellectual model that governs the way the OPERAS project is structured, and the main choices that have been made to plan its development,

has been aptly summarised by a European Commission officer during an informal conversation about EOSC and how OPERAS could contribute to it: The main challenge OPERAS wants to tackle is the integration of 'long tail science' into the Open Science framework. This long tail model operates at two levels: the definition of services the future infrastructure will offer, and the type of structuration it will adopt for its operation.

The plan adopted by OPERAS for its services and their structuration is the result of numerous studies undertaken by OPERAS partners (see the Bibliography in this report), individually or collectively, and of seminars, workshops and conferences attended together where a continuous conversation was fed and progressively structured. For the record, the original idea of setting up an infrastructure for open scholarly communication in SSH came from a workshop organized by Victoria Tsoukala (EKT), Emmanuelle Corne (AEUP), Pierre Mounier (OpenEdition), Eelco Ferwerda (OAPEN) and Brian Hole (Ubiquity Press) during the Elpub conference in 2014. From that starting point and those five original participants, representing a variety of situations and experiences, to today with more than 30 partners from 11 countries participating in the project, the important work of designing the infrastructure has taken place.

D. Designing the services

The design of future OPERAS services has culminated in an online survey to test OPERAS' proposition against users' needs, in particular those of researchers, libraries and publishers, the most important stakeholders for OPERAS. The main principle that has emerged from this Design Phase is the need to define future OPERAS services at several levels and distribute them following a principle of subsidiarity.

1. First level: shared services

At a first level, the partners offer communication and publication services to their community, whether it is regional, national or limited to a specific language. At this level, what OPERAS proposes is not to merge the existing services into a pan-European one, but on the contrary to support the partners to improve and upgrade the services they already offer to their own users. During the Design Phase it was identified that specific support is needed in the following three key areas:
− The definition and adoption of best practices that allows for a common level of quality and compliance with Open Science principles
− Research and development activities aimed at developing publishing tools and technologies that partners can use from a shared toolbox in their adoption of common best practices and to support the redefinition of their workflows
− Support for innovative open access business models by developing shared components such as a common market place, a journal flipping mechanism and a funding model that involves libraries in supporting open access.

As such, OPERAS services have been designed as 'shared services' between partners, aimed at supporting and improving their existing activity, not replacing it.

2. Second level: EOSC integration

A second level of more integrated services then had to be defined, to prepare content to be accessed and used through the EOSC. This level of services was more difficult to design

because EOSC is in its first stage of development and has not yet been put into practice. It was decided that the best way to prepare for future integration is to upgrade existing dissemination platforms in the OPERAS Consortium with rich metadata and machine-readable content allowing for efficient text and data mining from third parties. We started with a specific project within the H2020 framework programme, focusing on open access books platforms which required specific development, as books are the most difficult objects to integrate considering their specificities. The HIRMEOS project allows for the implementation of standard identifiers such as DOI, ORCID and Fundref for books, but also other more innovative types of metadata, such as reader annotation and new usage metrics.

More importantly, HIRMEOS was used to test and deploy a common methodology that enables different partners operating platforms based on different software and technologies to implement common standards. Based on a uniform definition of implementation levels, and a governance framework that commands distribution of work among partners, the HIRMEOS method will be used in the future development phase of OPERAS to extend standards implementation beyond the project, beyond the five dissemination platforms participating in it, and of course beyond the books themselves.

Considering the specificities of SSH content and the importance of its distribution across several languages rather than one, it was clear to OPERAS partners that special attention should be paid to multilingualism to facilitate the process of integration into the EOSC. In the development of the infrastructure, it is therefore planned to undertake specific work, first on the alignment of metadata describing content with ontologies in several languages, and second to support metadata translation that improves content discoverability.

3.   Third level: OPERAS platforms

Finally, the most important services to be delivered at European level, which are meant to address all stakeholders' needs across the European Research Area and across different languages:

−   Research funders and libraries need a certification service to implement their open access policies for the former and to deliver good quality content to their users for the latter. This service has to be delivered globally because certification needs to be independent from local constraints and free from local interests; in all cases, certification must come from external authorities.

−   Researchers need an open and efficient Discovery platform to find content relevant to their research topics. Since SSH researchers read if not write in several languages, the platform should be able to support multilingual content, which is a sufficient reason to set it up globally, and index different types of content: publications of course, but also primary data and other grey literature content. The Discovery platform will also serve as the main interface with the EOSC.

−   Society and different types of socio-economic actors (media, citizen, administrations and SMEs) need more than just access to academic content. In the context of citizen science which is implied by the definition of Open Science, they need a common framework to collaborate with research teams to achieve research projects that tackle their specific concerns, namely societal challenges. Therefore, OPERAS will prepare and deploy a Research for Society platform that addresses those needs that will be open to be used across all disciplines, including both SSH and STM, in a multidisciplinary perspective.

4. Towards a web of services

In its 2016 report on open science infrastructures, Putting down roots, Securing the future of open access policies, Knowledge Exchange highlight the need of a strong complementarity and interoperability between the different types of services that have to be offered to the academic community: "the fundamental challenge for the implementation of OA policies is the need to develop a fully functioning OA infrastructure from the current disparate collection of services". Six main categories are identified in the report, through which OPERAS services can be distributed.

E. Planning OPERAS development

The promise to deliver three pan-European platforms by the OPERAS project could be considered too ambitious, potentially exceeding the Consortium's resources and capability. This might be true if the aim of OPERAS was to build those platforms from scratch and to develop them at the same time. However, the method adopted during the Design Phase was to identify existing platforms provided by OPERAS partners and to upgrade them with the new functions they will need to deliver and scale up to the European level. The maturity of the three chosen platforms is different, which will allow for smooth development phasing across the Design, Preparation and Construction stages of the infrastructure:

– The certification platform is the first to be developed. Based on the existing Directory of Open Access Books (DOAB: http://doabooks.org), operated by OAPEN and OpenEdition, its main development is currently supported through the HIRMEOS project to upgrade the structuration of the platform in terms of workflow organization and technical capability. The development of DOAB as OPERAS' certification platform is currently supported across the Design and early Preparation Phase of OPERAS within the HIRMEOS project.

– The Discovery platform is based on the very mature Isidore platform (http://rechercheisidore.fr) developed by the French Research Infrastructure Huma-Num. Launched in 2011, Isidore has proved its sustainability at least at national level, and, with more than a million visits a year, it is clearly meeting researchers' needs. From a technological perspective, Isidore meets much more than the minimal criteria to be compliant with a state-of-art digital delivery platform. Following the principles of the web of data, Isidore enriches indexed content with metadata aligned across several scientific vocabularies and provides access to data through several means, including a Sparql Endpoint. The planned development of the Discovery platform will extend Isidore to a wide array of different languages from French, English and Spanish which are currently supported, and will be delivered during the Preparation Phase.

– The Research for Society platform is the less mature of the three platforms. Its main development will take place during the Construction Phase after prototyping during the Preparation phase. Its envisaged starting point will be the Hypotheses platform which, as an academic blogging platform is completely mature. With more than 2,000 active blogs, and a structured user community in several of the most important European languages (French, English, German, Spanish, Portuguese, Italian), the Hypotheses platform, operated by OpenEdition, has already reached a pan-European scope. Nonetheless, many components are still to be developed to set up a real usable environment to support collaboration across academic boundaries.

These three platforms will be complemented with other services that come from specific projects within OPERAS network. HIRMEOS project in particular enabled OPERAS partners to build and develop new services that will be integrated eventually in the infrastructure: a CDN in particular and an open metrics services.

F.   Structure the infrastructure

1.   Set up the governance scheme

Having defined the services OPERAS will provide and planned the timeline along which they will be implemented, the last component that had to be designed was the structure of the infrastructure supporting the services, including its governance scheme and future business model. The plans resulted from a specific study achieved during the OPERAS-D project and included in the report. Here again, the structure adopted reflects the particular landscape of the SSH community. For such a community, a centralized infrastructure wouldn't address the complexity of SSH activity, but given its fragmentation, the risk that the infrastructure could lose its direction was taken into consideration. In this matter, the experience of other European Research Infrastructures, close to OPERAS in their scope and the users they serve, was enlightening and helped us to ensure a delicate balance between centralization and federation. The principles that have been adopted to prevent loss of guidance and lack of integration are, first, to rely on a strong hub for coordination, supported by one institution and the Coordinator, and, second, to create a legal entity early in the course of the development, to prepare final incorporation into an ERIC.

The choice of OpenEdition as Coordinator and host of the hub, results from its position in the Consortium, its size and, of course the commitment coming from its supporting institutions and national authorities for the development of OPERAS. Placed in Aix-Marseille University, the management team will be strongly embedded in the OpenEdition team (50-60 persons), will benefit from OpenEdition's supporting institutions (Aix-Marseille University, CNRS, EHESS, Avignon University) and will be located in the Technopole of Chateau-Gombert, an institution that incubates a large number of high technology companies and scientific laboratories. OpenEdition's capacity to coordinate such a project was assessed through an evaluation exercise performed in June 2017 by an external audit company (the executive summary of the report is included in this Design Study).

Lessons from other infrastructures were also learnt, showing that to prepare and set up a pan-European entity is a long and difficult process. On the other hand, infrastructures which are not incorporated as a legal entity and perpetuate only through projects can lose consistency and drift in different directions following the divergent opportunities defined by the projects they run through. Therefore, OPERAS aims at preparing for ERIC incorporation through an intermediary stage, the creation of an international association that on the one hand will reflect the current organization of the project, and on the other will prepare for the organization of the future ERIC, and ensure a progressive transition towards implementation and start operating the functions of the infrastructure: project management through the hub, independent scientific monitoring, political representation of the Member States and executive participation of the partners.

2.   Community Management

To be effective and change the landscape of scholarly communication in Europe, OPERAS must be able to gather a high number of partners, and manage and coordinate them. For this reason a light commitment scheme was defined, allowing small size partners, with few resources, to participate in the project through thematic Working Groups that align with the

structuration of the services OPERAS will deliver. The Working Groups will be used to prepare the future H2020 projects that will support the development of the infrastructure.

With a large community composed of many partners, a more complex structuration is needed. A Core Group was created during the Design Phase, gathering the partners willing to commit more than the others, to organize their national community and manage the Working Groups. In the future, the Core Group will transform into an Executive Assembly and gather National contact points as well as other representatives. The management office installed in the hub will support the work of the different groups and ensure effective coordination between partners at different levels.

OPERAS also coordinates with other ESFRIs such as DARIAH, CLARIN, CESSDA, and e-infrastructures such as OpenAIRE, as well as other projects that complement OPERAS' core activity such as ENRESSH, and international partners such as Scielo.

3. Business model

Finally, we had to define a business plan to finance the development of the infrastructure, that reflects its structuration. The funding of the hub and the project management team is ensured by the Coordinator, OpenEdition is supported by French authorities, and the development of the services will be funded through projects. The participation of the partners in Working Groups and Core Groups is self-sustained through in-kind contribution.

When the infrastructure is in operation after the creation of the ERIC, another business plan will be adopted, relying on Member States' annual contribution to fund the hub and project funding to develop new services. OPERAS platforms will be operated by identified partners who will support the operational costs of the platforms. They will be funded through a mix of upfront funding and commercialization of premium services.

G. Conclusion

OPERAS' name epitomizes in many ways the mission that guides its development plan. First and foremost, OPERAS stands for 'open access in the ERA through scholarly communication'. This name is not only an astute way to align keywords in a single sentence; it means something more. It means that for the partners of this common effort, open access to publication shouldn't be defined outside and independently from the scientific community. Since the Second World War, scientific publication has been progressively outsourced to commercial entities by scientific institutions, which seemed a good solution in the first place to improve quality by professionalization. But control was progressively lost by the scientific community over a strategic part of its activity, the part that conditions its very existence as a community: communication. Some forward-thinking scholars and librarians in the 1980s started to become alarmed by the situation and considered the path that had been taken during the previous decades to be a tragic mistake. Different initiatives were taken from there, scarce and small at the beginning, to allow the scientific community to take back control over its own communication system. This movement took different forms, from the creation of new university presses to the commitment of research libraries to content dissemination from their institution, and all these took another dimension when Internet became the standard. Then the open access movement started and led to a new and more complete concept, Open Science. But all this evolution shouldn't overshadow its origins and its original meaning: the need for the scientific community to reclaim its own communication system.

That is why we, the OPERAS partners, consider that the best way to achieve open access movement in Europe, is to do it *through* scholarly communication, which simply means *from*

within the scientific community, by close cooperation between its different stakeholders and always considering primarily its specific needs over all other considerations, in particular commercial. That is why when we tried to define our initiative, to put a name on what we were aiming at, it came to us very naturally that we were on the course of creating an infrastructure, but more importantly, a *Research* Infrastructure that should stand by the researchers and operate *inside* the scientific community to support an essential part of its activity: scholarly communication.

OPERAS is also a metaphor, of course. Opera is one of the most sophisticated and complex performance arts, because it involves so many different components, symphonic music, lyrical art, drama, and even visual art through scenery and costumes. To perform it correctly, it requires thorough understanding between all the different performers, strong coordination and close cooperation. And then, after a long preparation, when the time for the performance has arrived, the complex machinery must become invisible and serve the artwork smoothly and gently as if it was all natural. An inspiring model, certainly.

Pierre Mounier
OPERAS Coordinator
June 2018

II.   Methodology

The design study is the final deliverable of the Operas-d project. It's has been prepared upon a three-step methodology: a) literature review and data collections, b) case studies and network development and finally c) recommendations and dissemination.

A.   Literature review and data collection

The first step has two parts: desk research which summarizes and identifies the existing state of the art and the empirical research, with case study interviews, surveys, focus groups, that gathers information both about current practices and policies and about stakeholders in Open access publishing in Humanities and Social Sciences in Europe. The result is the Landscape study of Open scholarly communication in Europe which explores the OPERAS field of activity.

During this first part information about technical and services requirements and about business and governance model has been also gathered. The report Technical mapping of OPERAS network describes the technical organizational and informational system and the digital publishing architecture of the Operas members. A first online survey on services has been conducted. An initial work on governance and business model has been also produced.

This part has been concluded by a validation workshop in Amsterdam that brought together also the Operas members outside the Operas-d project. The goal was to validate the outcomes of the first stage of the project and also to create complementarities with stakeholders in different geographical areas. During the validation workshop the OPERAS Working groups on different topics has been officially launched.

B.   Case studies and network development

In the second step, a series of case studies and surveys have been conducted based on the results of the first step about the technical requirements and the business and governance model for a European infrastructure for open access publishing in SSH.
An online survey on optimizing e-infrastructure investments for OPERAS members and of creating complementarities has been finalized.
The survey on Use and impact of OA monographs addresses the challenges associated with tracking the use and impact of Open Access monographs across open global digital networks. There were 3 subtasks: mapping the visibility, flagging technical issues and identifying opportunities for OA monographs.

A study on technical conditions to set up distributed and interoperable infrastructures has been conducted. A compilation of EOSC documents has been prepared and interviews on organization and management issues have been done with coordinators or directors or distributed infrastructures. A Draft design plan for future services operated through OPERAS and roadmap for their deployment has been structured.
An intermediary workshop has been organized in the middle of the process in December 2017 in order to validate the reports cited above. Moreover a focus group has been organized in January 2018 with Operas members to validate the list and architecture of the future services and to help to establish a roadmap for the deployment of new services.

The second step also includes network development. After the identification of the key stakeholders, an exploratory phase has been conducted aimed at long term community building for the e infrastructure. This part includes workshops, participation in external meetings and events and visits to potential future partners for the e infrastructure. At the end

of the second step a report of the network development and the community building has been drafted.

C. Recommendations and dissemination

Using the findings of the research activities during the first two steps, a SWOT analysis has been conducted during the final validation workshop in Bonn in April 2018, to establish recommendations contributing to establish the roadmap of the infrastructure roadmaps for the e - infrastructure for open access publishing in SSH.

In more detail, the network development collaborations will be strengthened with the establishment of new standards and good practices.
For the technical development a design plan proposes the establishment of new services with a roadmap for its deployment.
A final business and governance model is proposed with a legal framework. Each working group has presented their work at the OPERAS Conference which took place from 31 May – 1 June 2018 in Athens, Greece.
The recommendations were also introduced during a final conference in Athens and disseminated during the final 2 months of the project.

III. Scientific Case Main Findings

The vision of Open Science is premised on a paradigmatic shift in research practices and scholarly communication. In its multidisciplinary scope, with a focus on social sciences and humanities (SSH), OPERAS addresses those disciplines that are particularly in need of a major initiative to perform the transformation towards Open Science and evolve their innovative potential[1]. The challenges facing scholarly communication in the SSH have been well documented in various studies and academic conferences in recent years[2].

A. Science as communication

The traditional approach for the representation of scholarly communication, which separates publication from research and considers publications as a subsequent output and manifestation, is based on a flawed communication model. This misinterpretation affects the approach of open access as it entails the implementation of global models that are detached from the reality of research as a communication practice. For a long time, several researchers, such as Latour and Woolgar[3], Garvey[4], Galison[5] and more recently Nielsen[6]

have evidenced on the contrary how science should be literally conceived as a communication practice. Furthermore, as a social activity involving a wide range of interactions, the continuous model of communication in scholarship[7] requires infrastructure to serve as dynamic and interactive networks. The concept of an extensive scholarly record[8] including innovative methods and formats demands a framework of fluid but identifiable, distributed but interlinked units[9]. OPERAS adopts these concepts throughout its full research lifecycle support and the synergies build on the connection of distributed infrastructures, institutions and entities.

B.   The specificity of Social Sciences and Humanities

SSH scholarly communication practices differ substantially from STM, which has been exposed even more in electronic publishing, culminating in the primary publication format of journal articles in STM versus monographs in the SSH. The monograph format reveals other specificities in terms of episteme, workflow, collaboration, relationship between theory and fieldwork, and elaboration and construction of the argumentation based on evidence in those disciplines[10]. Academic books are poorly integrated in commercial databases and the format of monographs is often excluded from OA policies, initiatives, and copyright exceptions[11]. The evaluation of research outputs in areas with very low uptake of bibliometric and scientometric evaluation (such as SSH) is currently a major issue at European level[12]. In addition, more studies and reports suggest that the scholarly communication ecosystem is currently suboptimal, lacks the transition to Open Science and doesn't support enough innovation[13] while changes are prevented by few commercial players[14]. OPERAS encounters these barriers in its efforts to strengthen scholarly-led initiatives, publicly funded research institutions and infrastructure service providers, who are developing domain-specific models for scholarly communication and implementing tailor-made services in order to close the gap in the research fields of SSH as an immediate impact while fostering the evolution of open scholarly communication practices in the long run.

SSH research is frequently grounded in specific cultural areas, which implies communication in native languages and not only in English as the scientific lingua franca[15]. The approaches towards internationalization of the humanities and transregional research has led to international collaborations and communication networks but has not resulted in few core publication organs as in STM, since national books and articles in the native languages remain dominant, as evidenced by the recent INTERCO-SSH project[16]. As a result most SSH communication and publication service providers are not working at global level, but rather at national or regional level, leading to the fragmented landscape already described. A connection of the distributed publication and communication infrastructures with the implementation of a multilingual discovery service will provide a direct, beneficial impact on the outreach and internationalization potential of SSH research.

C. Engagement with society

The impact of SSH research on society has been a rising topic in the academic and the public sector[17]. While SSH research is fundamental to the production of knowledge, it also contributes to the economic domain, although the center of its impact lies in the increase of civic capital[18]. However, SSH clearly has the potential for a more intense engagement with the public[19]. An adequate framework for open scholarly communication adopting the models for collaboration and participation, as proposed in OPERAS, will serve for different stakeholders including the non-academic sector and citizens. Based on engagement, research and public will be able to collaborate during the research period. While ideas and concepts of innovative scholarly communication have been discussed broadly[20], implementations at a larger scale remain a desideratum. Finally, the iterative and discursive process in hermeneutic methods, which have truncated the SSH from developments in the publishing system, as well as the bond to local communities in native languages, which has decelerated the internationalization of the SSH, now hold an immense potential for an inspiring model of Open Science with direct societal impact, based on continuous communication.

D. OPERAS and the Digital Humanities

OPERAS achieves the implementation of Open Science in the SSH community. As such it integrates digital humanities (DH) programmes that aim at renewing research practices in the humanities and social sciences through intensive use of digital technologies[21]. The diversity of the fields of SSH make it impossible to cover it in its entirety by a single infrastructure. In the humanities, DARIAH focusses on digital methods for analysis and data-centered lifecycles. CLARIN specializes in text and language data and its processing. CESSDA connects the digital archives of the social sciences contributing to a rich data pool at a European level which also includes the European Social Survey and SHARE. The focus on data-driven research of all these ERICs reflects the fundamental importance of open data and digital source material in the SSH as a catalyst for innovative research[22]. OPERAS cooperates with these consortia on several levels for exchange of knowledge, and connects to the underlying infrastructures for exchange of data, but addresses the gaps from a more general, wider scope through substantial additions to the infrastructure landscape: from digital methods and open data towards digital scholarship and Open Science.

However, the transition to Open Science and the adoption of open innovation principles relies not only on open data sources but also on open communication and participatory processes[23]. Thus, in addition to the computer-aided analysis, the sharing of findings through scientific conversation, the quality assurance and review processes, the editing and writing workflows, the tracking and acknowledgement of core research activities, i.e. the 'scholarly primitives'[24], also have to be supported and integrated in the Research Infrastructure landscape.

IV.   Landscape study (EKT)

A.   Introduction

OPERAS (Open access in European Research Area through Scholarly communication) (**http://operas-eu.org**) network aims at introducing "the principles of Open Science and ensuring effective dissemination and global access to research results, particularly in the Social Sciences and Humanities (SSH)".[25] This aim will be achieved by uniting and improving existing and uncoordinated publishing and communication services and infrastructures across European member states under research infrastructures so as to address these challenges and improve the way research is carried out, communicated and evaluated within the SSH. This will result to a significantly more advanced and efficient open access publishing system.

The core group of the OPERAS network is currently implementing OPERAS-D (Design), Horizon 2020 funded project (Grant Agreement: 731031), which aims to support[26] the development of a European digital infrastructure for open access scholarly communication, particularly in the SSH. The project aims to address the long-term requirements for the development of the digital infrastructure and community building and to expand towards other parties within and beyond Europe and in diverse fields of the SSH.[27]

- The present Report is a deliverable for Work Package 2 (WP2) "Developing network and e-infrastructure strategy" which has the following objectives:
- To identify and examine existing and emerging policies and practices in open access SSH publishing within the OPERAS network and beyond it, in particular in Europe
- To identify the key stakeholders involved in open access SSH publishing in Europe and beyond
- To explore ways of optimizing e-infrastructure investments for OPERAS members and of creating complementarities
- To explore avenues for the creation of a long-term e-infrastructure strategy and community building
- To develop the OPERAS design study and implementation roadmap.

To reach these objectives, the OPERAS-D team has conducted an analysis of academic and grey literature to identify and examine existing and emerging practices in open access publishing in the SSH, map the key stakeholders and outline key challenges in the open access publishing landscape and potential issues to be addressed by the OPERAS network. The study will focus primarily on the European environment, but will also present international initiatives of interest to the current analysis. The core findings of this desk review are in turn expected to feed-in the design study and the roadmap that will define governance models, structures and scientific and technical concepts for future services and the requirements for long-term sustainability (T2.3) as well as the design of the business model that will address the purpose and economic logic of OPERAS (T4.1).

---

[25] OPERAS (Open Access in the European Research Area through scholarly communication) **http://operas-eu.org**

[26] The core group comprises a limited number of strategic partners of the OPERAS network: OpenEdition, OAPEN, the Max Weber Foundation (MWS), the National Documentation Centre (EKT), UCL Press, the University of Coimbra, the University of Zadar, and the Institute of Literary Research of the Polish Academy of Sciences.

1. Milestones in the Open Access Movement

a. The three Bs: Budapest, Berlin and Bethesda

Three important initiatives stand out in the open access movement: the Budapest, the Berlin and the Bethesda declarations. The **Budapest Open Access Initiative** (BOAI) released in 2002 comprises a set of principles for open access to scholarly journal literature. The BOAI is considered as one of the key initiatives in the open access movement as "it was the first initiative to use "open access"….the first to articulate a public definition, the first to propose complementary strategies for realizing OA, the first to generalize the call for OA to all disciplines and countries and the first to be accompanied by significant funding".[28] The Budapest declaration defines open access as

"free availability on the public internet, permitting any users to read, download, copy, distribute, print, search, or link to the full texts of these articles, crawl them for indexing, pass them as data to software, or use them for any other lawful purpose, without financial, legal, or technical barriers other than those inseparable from gaining access to the internet itself".[29]

The BOAI initiative has had major impact on the adoption and promotion of open access. The initiative highlighted communication as the foundation of the scientific enterprise. Its aim was to "accelerate research, enrich education, share the learning of the rich with the poor and the poor with the rich, make this literature as useful as it can be, and lay the foundation for uniting humanity in a common intellectual conversation and quest for knowledge." [30]

On the occasion of its tenth anniversary the initiative was supplemented by a set of recommendations to reaffirm the BOAI "statement of principle, …statement of strategy, and …statement of commitment". The recommendations focus on policy, licensing and reuse, infrastructure and sustainability, advocacy and coordination.[31]

Fifteen years later in 2015, a survey was launched to gather feedback so as to take stock of the collective effort. Responses were received from 69 countries around the world. A working group synthesized the feedback received and will provide updated recommendations. A reflection written by Jean Claude Guedon, one of the pioneers of the open access movement was released on that occasion. The document entitled "Open Access: Towards the Internet of the Mind" noted that the variety of forms that open access has taken over the years do not always conform with the notion as it was originally conceived and that in some instances these variations are the product of the power play between different actors and compromises. The document also notes that from a publishers' perspective, open access has been reshaped in a new way posing the question of whether open access is perceived as a

[30] Ibid.

[31] Budapest Open Access Initiative, op. cit.

communication system to support science or as a business model used to reinforce the position of publishers.[32]

The second milestone in the open access movement is the **Berlin Declaration**. The Berlin Declaration on open access to knowledge in the sciences and humanities is the outcome of the Berlin Conference organized in 2003 by the Max Planck Society and the European Cultural Heritage Online (ECHO) project aimed at creating a new web-based research environment. The conference brought together national and international research organisations, research funders, libraries, learned societies, etc. Since then, annual follow-up workshops have been organized. The Berlin Declaration aims "to promote the Internet as a functional instrument for a global scientific knowledge base and human reflection and to specify measures which research policy makers, research institutions, funding agencies, libraries, archives and museums need to consider".[33] The Declaration supports the transition to the electronic open access paradigm by encouraging researchers to make their research outputs openly available (on the basis of the principles of the open access paradigm), developing means for evaluating open access contributions and journals to maintain quality assurance and good scientific practice, recognizing open access publications in tenure evaluations.[34]

The **Bethesda Statement on Open Access** was also released in the same year. The purpose of the statement was "to stimulate discussion within the biomedical research community on how to proceed, as rapidly as possible, to the widely held goal of providing open access to the primary scientific literature".[35] The statement provided a working definition for open access publication and subsequently the reports of the working groups of institutions and funding agencies, libraries and publishers, scientists and scientific societies.

In discussing the catalyst role these initiatives have had in the uptake of open access, the role individuals like Peter Suber (the drafter of the Budapest Open Access Initiative) and Jean Claude Guedon have had in this process should also be acknowledged. What is even more interesting is that, as Martin Paul Eve notes, while the history of open access seems to be science-centric, some of the landmark initiatives stem from researchers in the humanities.[36]

b.   *Pathways to Open Access*

There are broadly two (structured) ways for providing Open Access to scientific outputs: self-archiving (the Green route) and open access publishing (the Gold route).

In **self-archiving** (**the Green route**) the author deposits (archives) the published article or the final peer-reviewed manuscript in an online repository. This can be done at the time of publication or after publication as some publishers request that the manuscript be made open

after a specific time period has elapsed (embargo period).[37] Repositories usually run on open source software and make use of common technical standards which enhance their interoperability, while they are indexed by search engines like Google Scholar that enhances the visibility and impact of their content. Repositories can be general, subject-based or institutional. Prominent examples of subject-repositories include arXiv (high energy physics and related fields), RePec (economics) and PubMedCentral (life sciences). In terms of institutional repositories, the University of Southampton is considered a pioneer as it developed the first one in 2000.

In **open access publishing** (**the Gold route**) the article is published immediately in open access. Open access publishing entails a variety of business models and stakeholders: from large commercial publishers to small non-profit ones. Some publishers charge article processing charges (APCs) which shift the cost from the reader to the author (and the latter's host institution or funding agency).[38] A recent OpenAIRE report[39] identifies three sub-components of Gold open access publishing:

Gold – Hybrid: subscription-based journals providing an open access option through an offsetting agreement or APC payment
Gold –APC: articles available in open access, upon payment of a publication fee to the publisher by authors, funders or institutions
Gold no – APC: publication in a fully open access journal

The Directory of Open Access Journals (DOAJ) and the Directory of Open Access Books (DOAB) are a valuable source for identifying open access publishers.

c.   *Policies and Mandates*

In addition to the importance of the declarations discussed in the previous section, open access has been boosted further through the adoption of policies and mandates by research organization and research funders.

ROARMAP (The Registry of Open Access Repository Mandates and Policies) provides important information regarding the uptake of open access policies worldwide. Following the revamping of ROARMAP -undertaken in the framework of the PASTEUR4OA project- with a new classification scheme for policies that records far more detail and provides more extensive search functionality, ROARMAP now includes more than 600 policies, the majority of which are found in European countries. Of these 2/3 are institutional policies and about 10% funder policies.[40] It is evident that both research organisations and funders are key driving forces behind the transition to an open access environment through the funds they use, the policies and mandates they adopt, etc.

Looking at the total (not just mandatory) number of policies worldwide it is evident that Europe is leading the way. A further interesting fact is that while Europe has approximately 25% of the world's researchers (in FTE) it has twice the number of open access policies as North America who in turn is second in terms of researchers (22%).[41]

Figure 1: Number of Open Access policies worldwide
As shown in the PASTEUR4OA report approximately half of the policies are mandatory: this is important as mandatory policies work better than voluntary ones. For the purpose of the PASTEUR4OA study, a policy was defined as mandatory if it required deposit of articles in a repository (Green open access) or required open access publishing for articles (Gold open access).

In addition to revamping ROARMAP, PASTEUR4OA undertook a policy effectiveness exercise which looked into the types of policies that successfully deliver open access and the clauses that are more effective. The examination of the factors that enhance policy effectiveness were prompted by the fact that the number of open access material does not reflect the increase in the number of open access policies observed over the previous years. The analysis[42] conducted provided a list of criteria around which policies should align to maximize their effectiveness. These are the following:
- Must deposit (mandatory policy)
- Deposit cannot be waived
- Link deposit with research evaluation.

At the EU-level, the **European Commission's** 2012 Recommendation on access to and preservation of scientific information[43] called on member states to improve their policies and practices on access and preservation. Open access (for publications and research data) has been further strengthened in Horizon 2020 through specific requirements in the Grant Agreement (articles 29.2 and 29.3) and the Work Programme. The core argument behind the open access mandate is that information already paid for by the public purse should not be paid for again each time it is accessed or used, and that it should benefit European companies and citizens to the full. According to the Horizon 2020 Guidelines on open access to scientific publications and research data, each beneficiary must ensure open access to all

---

[41] Ibid.

[42] The study focused on institutional policies alone as research funder policies are more difficult to monitor.

[43] European Commission (2012a) Commission Recommendation of 17.07.2012 on access to and preservation of scientific information, Brussels, C(2012)4890 final.

peer-reviewed scientific publications, relating to its results.[44] While the Guidelines note that the dominant type of publication is the journal article, grant beneficiaries are also encouraged to provide open access to other types of publications like monographs, books, conference proceedings and grey literature.[45] The mandate applies to all scientific disciplines.

More recently, the EU's support on open access has been further strengthened through the 2016 Council decision reaffirming the EU's commitment "to further promote the mainstreaming of open access to scientific publications by continuing to support a transition to immediate open access as the default by 2020".[46] In such context, the Commission, the member states and relevant stakeholders are invited to catalyze this transition. The European Commission has lately used the broader term "Open Science" aimed at describing "the on-going evolution in the modus operandi of doing research and organizing science" which is in turn enabled by Big Data and Digital Technologies.[47] This new paradigm entails important and on-going transitions in the way research is performed, researchers collaborate, knowledge is shared and science is organized.[48] A key component of Open Science is open access to publications and research data.[49] To support further open science initiatives, the European Science Monitor (commissioned by the European Commission- DG Research and Innovation) to assess developments and trends both over time and among countries and scientific disciplines.[50]

At member state level,[51] the Research Councils in the UK (**RCUK**) have adopted an open access policy since 2005. RCUK as public bodies charged with investing public money in research, place particular importance in making research outputs publicly available for the benefit not only of other researchers, but also for users in business, charitable and public sectors, and the general tax-paying public. This is in turn expected to ensure maximum economic and social return. The RCUK policy aims "to achieve immediate, unrestricted, on-line access to peer-reviewed and published research papers, free of any access charge". The policy applies to peer-reviewed research articles (including review articles not commissioned by publishers) and conference proceedings. The policy supports both Green and Gold routes, even though RCUK has a preference for immediate open access. APCs and other related charges are covered through open access block grants provided to eligible research institutions. The policy also acknowledges disciplinary differences and has made place for adjustments by allowing different embargo periods.[52] The RCUK policy applies both to the ESRC[53] (the Economic and Social Research Council) and AHRC (the Arts and

[53] Economic and Social Research Council. "Open Access to Research Outputs" http://www.esrc.ac.uk/funding/guidance-for-grant-holders/open-access-to-research-outputs/

Humanities Research Council). The latter states that it does not (at least at this stage) require monographs funded by AHRC to be made openly available.[54]

HEFCE (The Higher Education Council for England) in its "Policy for open access in Research Excellence Framework 2021" (REF) sets out the details of a requirement that certain research outputs should be made openly accessible to be submitted to the next REF. The policy applies to journal articles and conference proceedings, but not monographs, book chapters or other long forms of publication and sets specific deposit, discovery and access requirements.[55] The policy is a Green one as it requires deposit in an institutional repository. In relation to access requirements, in case of an embargo period the output must meet the access requirements as soon as possible and no later than one month after the end of the embargo.

Turning to North America, **NIH** (the National Institutes of Health) requires that the public has access to the published results of NIH funded research. It therefore requests researchers to submit their final peer-reviewed journal manuscripts that arise from NIH funding to the digital archive PubMed Central and the manuscript to be made openly available no later than 12 months after publication date.[56]

At institutional level, the open access policy at the **University of Liege** is the most effective policy at global level with 87% of the university's research articles currently being deposited in the institution's repository (ORBi). The policy which at the time of adoption (2008) was innovative requires immediate deposit of research articles upon acceptance for publication. In cases of embargo periods the item remains restricted until the end of the embargo.[57] To maximize compliance it was made clear that only items deposited in ORBi would be taken into account in either individual or collective assessments within the University, including assessments for promotion and tenure. The policy's main aspects include the mandatory deposit of peer-reviewed articles in ORBi, deposit at acceptance for publication, the deposit cannot be waived, open access for deposited items (respecting publisher embargo periods), deposit as a precondition for research evaluation or assessment. The policy's effectiveness has been so significant that it has been copied by a number of other universities. Since its adoption the university (both the Rector himself and the library) has heavily supported its implementation.[58]

A further example of open access policy is that of the **University of Turin**, an OPERAS partner. The policy requires deposit to the institutional repository no later than the publication date, while open access is provided when the publisher permits. The policy, which has been in effect since 1st November 2013, applies to peer-reviewed manuscripts, books, book sections, monographs, conference proceedings, etc.[59] **Gottingen** University also regards "open access as the central publication strategy for the future, which will improve the supply of information in science in the long term".[60] While the policy requests the deposit of published

items, it does not specify when the deposited item should be made openly accessible and it does not also link deposit with evaluation.[61]

d. *Infrastructures*

Open access policies are a critical condition for the support of open access, yet a further significant factor for their success is the availability of the necessary infrastructure. These can take different forms, with the most frequent one being open access repositories. According to **OpenDOAR** (the directory of open access repositories) currently there are 3.339 repositories worldwide with 45,2% (1.510) of them located in Europe. As highlighted by Pablo de Castro the number of European repositories is the direct result of the work carried out through DRIVER and OpenAIRE projects.[62] At EU level, OpenAIRE supports the EU's requirements for open access to publications and data, among others, through the Zenodo repository, a catch-all repository for EC funded research.[63] The same study also argues that an additional indicator for understanding a country's readiness for supporting an open access policy is to look at the OpenAIRE statistics on content collection. As noted in the previous section, researchers can use the SHERPA services (SHERPA RoMEO) for information regarding the self-archiving policies of journals. A more recent development at the EU level relates to the creation of the European Open Science Cloud (EOSC) which aims to create a trusted environment for hosting and processing research data to support EU science.[64]

Source: https://www.openaire.eu/member-states-overview

DOAJ and DOAB are a further important information source for researchers seeking information on open access publishers. The Directory of Open Access Journals (DOAJ) is a community-curated online directory that indexes and provides access to high quality, open access, peer-reviewed journals. DOAJ was launched in 2003 at Lund University (Sweden) with the aim "to increase the visibility and ease of use of open access scientific and scholarly journals, thereby promoting their increased usage and impact". The Directory currently includes more than 9.000 journals, representing about 27% of the world's scholarly peer-reviewed journals. DOAJ is diverse and inclusive: it covers all academic disciplines from 128 countries and many languages. Journals and articles are categorized using the Library of Congress Classification. As such, it is the main venue for authors seeking information for

quality open access journals. In early 2017 COAR published the initial outcomes of the next generation repositories working group for public comment.[65]

Journals included in DOAJ can be removed if they are no longer open access, if they have been inactive (have not published during the last year) or have not published enough articles in this year, or have ceased publishing, if the journal website or url does not work, if there is evidence of editorial misconduct, if the journal does not adhere to best practice and if they fail to submit application with the specified time frame. DOAJ has also developed the DOAJ Seal of Approval for Open Access journals (DOAJ Seal). The DOAJ Seal is a mark of certification to those journals that achieve a high level of openness, adhere to best practice and high publishing standards.[66] Notwithstanding its usefulness, Heather Morisson in a recent article provides a critical evaluation of the service and points to some areas for further improvements. These include a clear separation of information targeting different audiences/ users (publisher and other user), the need to limit the potential for confusion as a result of

[66] Directory of Open Access Journals (DOAJ) https://doaj.org/

the limiters available for journal and article specific search, the need to revisit the application form in terms of the mix of questions included.[67]

The Directory of Open Access Books (DOAB) is a discovery service for Open Access monographs. It currently provides a searchable index and links to the full texts of 7814 academic peer-reviewed books and chapters from 205 publishers. DOAB covers multiple subject areas and determines specific requirements for the inclusion of books in its directories. All books listed in DOAB have an open access license, and collaborating publishers are screened for their peer review policies.

The uptake of open access policies is further supported by other mechanisms or tools such as CRIS (Current Research Information Systems) and publishing platforms, with the latter discussed in more detail in the following sections.

Overall, despite the increase in the uptake of open access policies worldwide and the development of the necessary infrastructure significant disciplinary differences can still be observed. According to Archambault et al. (2014)[68] the Green Route is particularly present in physics and astronomy (25.6%) and economics and business being the leading filed in SSH (11.3%) of papers), while the Gold Route is prevalent in S&T (58% of samples papers) and low in general arts, humanities and social sciences (2.6%). It should be noted that the report looks only at papers and at other forms of scholarly communication like monographs. The higher rates of open access in the above mentioned disciplines should also be linked to the prevalence of appropriate infrastructure (i.e. repositories) like arXiv etc., discussed in the previous section.

B. Open Access Publishing in SSH

1. The Landscape

The scholarly publishing market is an "intermediary market", as researchers are both producers and consumers of research. According to a recent study commissioned for the OpenAIRE project, the market for scholarly journals is estimated at $10 billion per year[69] with open access representing an aspect of this ecosystem. Within the open access ecosystem, SSH disciplines are moving mu ch slower when compared to STEM. Open access has been adopted much earlier in the sciences, with high-energy physics being one of the strongest advocates, despite the fact that prominent figures of the open access movement emerged from the humanities. A further factor which has contributed to the boost of open access are mandates from research funders and institutions as discussed in the previous section.

Turning to the slow uptake of open access in the SSH as compared to STEM, Peter Suber argued that discrepancies in the adoption of open access can be attributed to a number of economic and cultural reasons. Focusing in particular in the humanities, he argues that the different pace with which STEM and SSH have transitioned to open access can be explained

[69] Jonhson, R., Fosci, M., Chiarelli, A., Pinfield, S., Jubb, M. (2017) Towards a competitive and sustainable OA market in Europe- A study of the Open Access Market and Policy Environment, A study prepared for the OpenAIRE2020 project on behalf of the European Commission, Research Consulting, https://blogs.openaire.eu/wp-content/uploads/2017/03/OA-market-report-28Final-13-March-201729-1.pdf

by the higher journal prices in STEM fields which put increasing pressure on library and university budgets, combined with the availability of more funding in STEM fields (allowing researchers to pay APCs charged by open access journals while strengthening the taxpayer's argument for open access). Furthermore, Suber notes the reliance of humanities on books (in contrast to STEM fields where journal articles are dominant) and the slower decline in demand in humanities.[70] While Suber's article was published more than a decade ago the points made are still valid, despite the progress made over this period. Chris Armbruster argues that although journal price increases have been more pronounced in STEM compared to SSH, the latter have understood that open access applies to the same extent in SSH.[71] As Martin Paul Eve notes the degree of adoption of open access by different disciplines may also be related to their market orientation and thus the extent at which the industry could profit from using the results of publicly funded research.[72] Eve offers two explanations for the under-representation of SSH within the open access movement: the difference in communication channels of SSH and science and the lower degree of engagement of those working in SSH in a critique of their publication practices.[73]

Despite the overall slow uptake, social scientists have followed the natural sciences by developing the **Social Science Research Network (SSRN)** which is meant to be what ArXiv is to physicists. SSRN is an electronic repository founded in 1994 from a group of scholars. It is composed of 24 specialised networks in each of the social sciences. The SSRN eLibrary contains almost 725.000 papers from 334.339 researchers across 30 disciplines.[74] In May 2016 it was announced on twitter that Elsevier has acquired SSRN, a move which seems to mark a shift of the strategy towards services and the monetization of data and analytics. The acquisition has given rise to a number of concerns from the open access community and a number of researchers have regarded this as a breach of trust.[75]

Research Papers in Economics (RePEc) is another collaborative effort to enhance dissemination of research in economics (and related sciences). The decentralized bibliographic database contains over 2 million research pieces (working papers, journal articles, books, book chapters and software components).[76]

2. Journals

a. The Development of Open Access Journal Publishing

Open access journals constitute a core component in the translation of open access principles into practice. The rapid growth of open access (journal) publishing during the period 1993-2009 seems to continue during the 2000s with the average annual growth rate of 18% for the number of journals and 30% for the number of articles.[77] A more recent study from CREATE shows the rapid growth of open access journals over the past decade with

[77] Laakso, M. Welling, P., Bukvova, H., Nyman, L., Bjork, B.C., Hedlund, T. (2011) The Development of Open Access Journals Publishing from 1993 to 2009, PLoS ONE, 6(6) e20961, https://doi.org/10.1371/journal.pone.0020961

major increases between 2005 and 2011 being noted in Asia, Europe and the United States.[78]

In studying the development of open access journal publishing, Laakso et al. (2011) distinguish between three periods: the pioneering years, the innovation years and the consolidation years. The first period (the Pioneering Years: 1993-1999) is marked by the rather aggressive growth of open access articles and journals. The "business model" most commonly used was based on voluntary labor combined with the use of institutional (university) web browsers free of cost. Technical solutions have been quite simple during this period. The Innovation Years (2000-2004) are marked by the emergence of new business models and the introduction of APCs, mostly in the STEM disciplines. Important initiatives of the period include the launch of Public Library of Science (PLOS), the release of several declarations like the "three Bs" discussed in the previous section, the digitization of printed journals, and the experimentation with the hybrid model (which allows authors of articles in traditional journals to open up their articles for a fee).

Overall, the period is marked by the increased visibility of open access. The third period (the Consolidation Years: 2005-2009) has witnessed significant developments in relation to infrastructures supporting open access (like the emergence of DOAJ as a key index of open access journals and the wide use of Open Journal Systems software). Important steps have also been made in relation to licensing with the emergence of licenses suitable for open access journals, like the Creative Commons (CC) licenses. Open access has been further supported during this period through funder and institutional mandates and in particular through the acknowledgment of related costs as eligible and/or the creation (at institutional level) of related funding mechanisms.

b.   *Business Models*

Open access is not cost free: associated costs are covered through a variety of business models, which are examined in the following paragraphs.

Article Processing Charges (APCs)

APCs are the most commonly used method for financing open access publishing. APCs are charged by open access journals, but can also be charged by subscription based journals to authors who want to make their publication available with open access. These journals are referred to as hybrid journals.

The introduction of APCs has important implications on the publishing landscape, as it changes the relationship of the key stakeholders involved. The use of APCs impacts on authors' choice of journals, while it also affects publishers' strategies, whose target group in financial terms is now the author and not the subscriber.

The use of APCs has led to the emergence of certain misconceptions. The most widely held ones are those supporting that most open access journals have APCs and that APCs are too high. Several studies over the past years have examined publication fees (either by surveying authors or by obtaining related information from journal websites) and provide interesting findings. Reporting from the SOAP project survey, Dallmeier-Tiessen et al. (2011) show that 12% of article authors had paid APCs themselves, while 31% had used part of their research funding to cover APCs even though this amount was not specifically intended for paying such fees. They also report that 50% of the respondents had published in open

---

[78] Frosio, F. (2014), op. cit.

access without paying a related fee: the percentage of those who had not paid an APC is much higher in the humanities and social sciences and significantly lower in life sciences.[79] A different study shows APCs to be significantly higher in professionally published journals than in journals published by learned societies, universities or scholars.[80]

A more recent study looking into institutional spending on access publication fees in Germany reported the average payment at €1.298, with a total of 94% of the articles included falling within the €2.000 limit set by the DFG. The study also confirms the findings of a previous one, whereby APCs for hybrid journals are on average higher than those for fully open access journals. In an effort to increase transparency on publication fees, research funders like the Wellcome Trust and the Austrian Science Fund (FWF) have disclosed their expenditures, a practice also followed by Jisc.[81]

A number of research funders and institutions have set up open access publication funds to assist researchers. To support further open access, the European Commission launched a pilot to fund open access publications arising from finalized FP7 projects through the OpenAIRE project. The launch of the pilot is strongly linked with both the Commission's Communication "Towards better access to scientific information: Boosting the benefits of public investment in research"[82] and the Commission's Recommendation "on access to and preservation of scientific information".[83] The pilot (known as the **FP7 post-grant pilot**) aimed to provide an additional instrument to make FP7 project results openly available by dedicating 4 million euros for this action. The pilot run from March 30th 2015 to April 30th 2017. Following careful consideration from the European Commission, OpenAIRE has been asked to extend the pilot for another ten months (until the end of February 2018).[84]

To benefit from the available funding, publications (journal articles, monographs, book chapters and conference proceedings) had to comply with specific criteria as determined by OpenAIRE.[85] Considering the criteria and the timeframe, approximately 4.000 outputs (which equals to some 2% of overall FP7 publications) were considered as eligible. The mid-term evaluation of the pilot showed that as of November 30th, 2016 OpenAIRE had approved 700 funding requests, with 94% of them being requests for journal articles. In parallel, the evaluation highlighted the uneven uptake of the pilot which does not reflect the allocation of FP7 funding across EU member states, a fact which can be attributed to the different levels of institutional support provided and policy support.[86]

[86] Jonhson, R., et. Al. (2017) op. cit. Annex A

In addition to the above action, from August 2016 the Pilot launched an instrument to provide economic support to open access journals and platforms which do not charge APCs. The maximum available budget was 200.000, which funded a total of 11 bids. To be eligible, journals or platforms had to comply with specific criteria.[87]

Centralised funds

A different mechanism for funding APCs is through the operation of centralized funds. An example is **SCOAP3** (Sponsoring Consortium for Open Access Publishing in Particle Physics) a global partnership of 3.000 libraries, funding agencies and research institutions from 47 countries and international organisations. SCOAP3 pays for APCs, by redirecting funds and turning subscription journals in high energy physics to open access. The project was launched in 2014 and since then it supports 4.500 open access articles per year. The amount contributed by each country is based on its share of worldwide scientific output. Copyright stays with authors while the use of CC-BY licenses allows text and data mining.[88]

Turning to institutional level, the **University of Nottingham** set up in 2006 an open access central hub. The claimants of the fund over its first five years were from medical and life sciences, while the mean average cost per article in 2010-2011 was £1.216. Payments over the fund's first five year period have been made to 70 publishers. The usage of the fund has been growing -even though in 2011 it was reported that this was still at relatively low levels.[89]

In 2016 the **National Library of Sweden** (through openaccess.se) and SwePub initiated a pilot project in cooperation with higher education institutions in the country looking into the possibilities of establishing an open national repository for APCs which will enhance transparency over the APC market.[90]

Open access publishing infrastructures

In terms of infrastructures, publishers use either proprietary or open source software: among the latter the **Open Journal Systems (OJS)** is the most widely used one. As Tsoukala notes, the information available on the different platforms does not always provide a comprehensive picture of the full range of the services offered.[91] OJS is a journal management and publishing system developed by the Public Knowledge Project (PKP)[92] to expand and improve access to research.[93] OJS was released in 2001 as open source software. OJS aims at "making open access publishing a viable option for more journals, as open access can increase a journal's readership as well as its contribution to the public good on a global scale".[94] In 2016 the OJS version 3.0 was launched. OJS is installed locally (and also controlled locally), while editors can configure the requirements, sections, review process etc. It supports online submission and management of all content. In addition, it provides subscription module with

[93] Public Knowledge Project- Open Journal Systems https://pkp.sfu.ca/ojs/

[94] Ibid.

delayed open access as an option. Comprehensive indexing of content is also part of the global system.[95]

In an effort to have a more precise picture regarding the number of journals using OJS, PKP undertakes an annual exercise to count the journals using OJS as their publishing platform. This is not as simple as it may sound as there is no requirement to register or inform PKP of the fact that OJS is being used. By developing an automated web crawling system, PKP was able to identify in 2015 32.000 journal instances. By filtering further, PKP was able to identify that half of these instances were not used and had no content. By applying what they identify as "somewhat arbitrary criteria" whereby an OJS journal was included if it had published at least 10 articles 8.286 journals were identified as using OJS for the management and/or publishing of their content for 2014. While these numbers should be considered as estimates as PKP may have missed some instances, the exercise shows an increase in the uptake of OJS throughout the years.[96] This observation also highlights the expansion of a publishing environment based on open access and open software.

EKT eJournals Publishing Platform

EKT's ePublishing platform is an innovative service to support open access publishing in Greece. The platform enables the research community of the country to transition from a print-only mode of work to online working environments and enhance the visibility and impact of their research outputs. Emerging within an ecosystem with no prior experience or open access oriented culture, it enables the cultural shift towards open and collaborative scientific practices and the open science/ open access paradigm. EKT eJournals is in full alignment with EKT's strategy of providing open access infrastructures and services to stakeholders in Greece, free of charge and is the main electronic publishing infrastructure of this type at national level.

The eJournals platform is based on EKT's successful collaboration with non-profit research organisations and scientific societies focusing primarily – but not limited- on the Social Sciences and Humanities. The development of the service has been made possible through the use of structural funds. The service was launched in 2007, initially as an ejournals platform providing access to scientific content by collecting, storing and distributing to the scientific community research outputs. Since then, it has developed further and currently hosts three distinct platforms for journals, monographs and conference proceedings.

eJournals uses OJS version 2.4.8 and currently hosts more than 7.500 articles from 27 publishers. The platform provides a wide range of services to publishers including among others web hosting, online management of the publishing process, OJS training, technical support, helpdesk service, consulting services in producing guidelines and

---

[95] Ibid.

[96] https://pkp.sfu.ca/ojs/ojs-usage/

Hrčak is the central portal of Croatian scientific journals. It currently hosts 429 journals and 161.134 journal articles (155.602 articles with full text) in the following areas: natural sciences, technical sciences, biomedicine and healthcare, biotechnical sciences, social sciences, humanist sciences, art, interdisciplinary areas of knowledge and interdisciplinary fields of art. The portal was developed with the support of the Ministry of Science, Education and Sport; it is developed and maintained by the SRCE- University of Zagreb, University Computing Centre and was initiated by the Croatian Information and Documentation Society. The platform is fully compatible with OpenAIRE Guidelines for Literature Repository Managers 3.0 and thus papers published in the platform are visible via the OpenAIRE portal.[97]

In Turkey TUBITAK ULAKBIM provides online hosting services and workflow management system for academic journals through the Dergi Park (Journal Park) platform. **Dergi Park** was launched in September 2013 to improve the quality and support academic publishing in Turkey, to enhance the visibility and usage of national academic journals and to ensure the implementation of the ULAKBIM journal management system efficiently. The platform hosts peer-reviewed academic journals published in Turkey in the following subjects: social sciences and humanities, engineering and basic sciences, health sciences, life sciences, law and sport sciences. The platform hosts already published journals but also welcomes new ones. A "Participation Contract" is signed between the two parties, i.e. Dergi Park and each participating journal to protect mutual rights. All services offered are free of charge. The number of journals included in Dergi Park was in January 2017 1.424, yet no information is provided at an aggregate level on the number of those providing full access to their content, but rather this information can be found on a journal level basis. As the total number of journals published in Turkey is estimated at 2.300, Dergi Park aims to expand so as to be able to cover all of them.

At its initial phase Dergi Park used OJS; yet, this became inefficient as the number of journals increased. A new system –ULAKBIM Journals System (UJS)- has been developed to be

---

[97] Hrcak- Portal of Scientific Journals of Croatia, http://hrcak.srce.hr/ accessed 6 April 2017.

compatible with new technologies and enable easier handling and faster workflow. The new system has been put into service since 2017. For articles in Dergi Park to be assigned a DOI (digital object identifier), journals need to at least meet one of the following requirements: be indexed in TR Index, WoS or Scopus, be included in DOAJ, and manage all the publishing process from submission of manuscripts to publication within the Dergi Park system. In March 2017, the number of journals having been assigned a DOI was 319. [98]

Open Edition uses **Lodel**, an open source software for academic electronic publishing. Documents to be published through Lodel may be prepared locally with a word-processor (MS Word, OpenOffice) or directly edited online. Lodel converts automatically Word or OpenOffice documents to XML/TEI by means of models. Lodel is particularly respectful of scientific edition conventions, such as footnotes, the structure of the text, the different character sets corresponding to non-latin languages, diacritical signs, small capitals, hard spaces. The software facilitates uptake of digital publishing practices by editorial staffs, enabling them to upload the journal on their own, without having to rely on computer specialists.[99]

Further important open access initiatives outside Europe are SciELO and Redalyc. **SciELO's** (the Scientific Electronic Library Online) regular operation was launched in 1998 following a one-year pilot project. The initiative was launched four years before the Budapest Declaration which is regarded as a landmark in the development of the open access movement. SciELO's aim was twofold: to create the infrastructure and capacities for publishing on the web selected Brazilian peer-reviewed journals from a variety of disciplines, and to increase the visibility, use and impact of indexed journals. The network currently covers 15 Ibero-American countries and South Africa. The majority of journals are managed by scientific societies or academic institutions and in some rare occasions by commercial publishers. By 2016, the network had published more than 400 thousand articles, receiving 1.5 million downloads per day and thus making SciELO the major DOAJ provider. Over the years, both the publishing and interoperability functions have been improved on the basis of new methodologies and technologies in scholarly communication. Notwithstanding its importance, the main weakness of SciELO is related to the low impact of its journals as measured by citations.[100]

Redalyc (Red de Revistas Cientificas de America Latina y el Caribe, Espana y Portugal) is a bibliographic database and digital library of open access journals supported by the Universidad Autonoma de Mexico. Redalyc provides access to 1200 scientific journals and more than 535.000 full text articles from the social sciences, arts and humanities and sciences from 22 Ibero-American countries and published by more than 500 institutions. The majority of journals covered are from the social sciences (705 journals) followed by sciences (349 journals). [101]

3.   Data Publishing in SSH

The increasing interest of the publishing community towards open access has more recently encompassed open (research) data and has led to the emergence of new publishing products: data journals. Data journals are community peer-reviewed open access platforms

[101] Redalyc- http://www.redalyc.org/home.oa

for publishing, sharing and disseminating data that cover a wide range of disciplines. As their primary purpose is to expose datasets, data papers contain information on the acquisition, methods, and processing of specific data sets. The published papers are cross-linked with approved repositories, citing data sets that have been deposited in such repositories or data centres.

Despite the existence of different requirements for submission, review and publication, the Australian National Data Service (ANDS)[102] points to a number of requirements that seem to be quite common among data journals:

- Deposit of data in an approved repository with specific metadata description and with guidelines on file format and size
- Citation and identifiers: journals may require a digital object identifier (DOI) or other persistent identifier and may also define or recommend specific data citation format
- Researcher profile: journals may require information on author affiliation or other information on their research profile
- Copyright and licensing: in addition to copyright licensing issues for data may also be asked

Data papers are of particular importance to researchers for whom research data is a primary research output, as they provide academic accreditation for data scientists, but also as the publication cycle is usually shorter than that of a traditional journal. Like traditional journals, data journals also have impact factors, while a number of them also support "altmetrics"[103] which track the number of views, downloads, social media "likes" and "recommendations", ultimately enhancing further data publication.

As the RECODE project pointed out (Tsoukala et al. 2015),[104] STEM publishers were the first to acknowledge the significance of open access to research data and have supported open access to research data through the adoption of mandatory policies that require authors to deposit the underlying data in certified repositories and make them openly available. This interest of STEM publishers has also been translated in the emergence of data journals.

Yet, data journals also exist in SSH. Ubiquity Press, an open access publisher, is among the publishers with a number of data journals in the SSH.

The Journal of Open Archaeology (JOAD)

The Journal of Open Archaeology (JOAD), published by Ubiquity Press, features peer-reviewed data papers with high reuse potential. Datasets should be deposited in a data repository under an open license (such as creative commons zero). The journal applies a peer review process to all submitted data papers against two criteria: the paper content and the

4. Monographs

a. *The evolving landscape of open access monographs*

Monographs and monograph publishing in particular have also been affected by the changes observed in scholarly communication. As in the case of journals, digital technologies have created new avenues for sharing and using available knowledge that monographs can profit from. Digital publications increase access and thus discoverability of monographs, while open access has opened up channels for the development of new business models which build on those of open access journals. These new opportunities have in turn raised important issues in terms of the extent at which the current publishing model responds effectively to this new and evolving ecosystem.

Before examining the monograph publishing landscape it is important to define what a monograph is. A monograph can be defined as a long, academic and peer-reviewed work on a single topic usually written by a single author. The term "monograph" can also include edited collections by multiple authors. The interest in studying monograph publishing stems from the fact that monographs along with other long forms of research publications -like edited books- have an important place within many disciplines and in particular in arts, humanities and social science. As a long form of publication, they offer the space and length for a full examination of a topic and the presentation of ideas that could not necessarily fit within a journal article. Monographs are therefore important channels for researchers to communicate their research outputs and their work more generally and also important in shaping the careers of academics. As highlighted by OAPEN (2013:7) "[this] long form of communication remains an essential part of the scholarly landscape in the humanities and social sciences (HSS).... [and] important career makers for academic seeking work".

The arguments for supporting open access monographs relate to the declining sales of monographs (also referred to as the monograph crisis), the increasing number of open access mandates from research funders and the increasing need of researchers (especially from the SSH) to showcase the public impact of their work.[105] Open access monograph publishing is seen as the solution to the declining position of conventional publishing models as a result of rising production costs and the increasing pressure on budget libraries.[106] According to Gatti and Mierowski (2016) while the conventional model remains successful, when looking into the profits of publishers, declining sales mark the model's failure in relation to the dissemination aspect. The HEFCE report (2015) takes a more cautious stance arguing

[106] Ferwenda, E. Snijder, R., Adema, J. (2013) OAPEN-NL. A project exploring Open Access monograph publishing in the Netherlands, Final Report https://www.oapen.org/content/reports#OAPEN-NL

that the picture in the UK does not suggest a decline in the position of the monograph. On the basis of this observation, the report argues that related arguments should have a broader and more positive foundation. The same report notes two further important points. First, that lack of usage over a short timescale is not necessarily an adequate indication of whether a particular book should have been acquired. Second, that university libraries despite their importance are not the only customers for monographs.[107] The case for open access monographs needs therefore further consideration of issues like the business models proposed and their implications for the academic community, licensing (as many rely on material protected by copyright) and the wider implication for different stakeholders in the ecosystem.

Despite the opportunities offered by technology and the functional limitations of the print book, electronic publishing of monographs is still not as widespread as journals. Martin Paul Eve (2014) argues that these social and technological barriers which differentiate monograph from journal publishing may be over-stated; nonetheless he notes that the transition to open access monograph publishing should ensure the preservation of those aspects of monographs which are seen as of most use/ importance to scholars.[108] Early initiatives have focused on releasing out-of-print books openly as part of retrodigitization initiatives with print-on-demand options, to digitally born new monographs in open access and new university press and library press initiatives. OpenEdition[109] for instance –through its OpenEdition Books platform- offers a digitization and XML encoding support programme. The platform aims to build an international library and encourage the development of open access in the long run. It currently contains 3.800 books from 67 publishers in SSH. [110]

The increasing interest in making monographs open access is strengthened further by initiatives and mandates from research funding organisations. The European Commission through its Horizon 2020 programme and its open access mandate is a prominent example. According to the mandate, "under Horizon 2020, each beneficiary must ensure open access to all peer-reviewed scientific publications" relating to the project's results".[111] While the dominant type of publication within the scope of the Commission's mandate is the journal article, "[g]rant beneficiaries are also strongly encouraged to provide open access to other types of scientific publications including monographs, books, conference proceedings, grey literature".[112] The European Research Council (ERC) open access guidelines recommend the OAPEN Library as a repository for monographs and book chapters.[113]

At a national level, UK funding bodies have recently issued a statement to extend open access policy to include monographs by the time of the third Research Excellence Framework (REF) in the mid-2020s.[114] Annex C on open access and monographs of the

[114] Martin Paul Eve (2017) The starting pistol has been fired- now it the time to heed the drive towards open access books. LSE Impact blog, 7 March 2017, http://blogs.lse.ac.uk/impactofsocialsciences/2017/03/07/the-

Consultation on the Second Research Excellence Framework clearly acknowledges the importance of open access monographs by stating that "in the long term, however, we want to see the benefits that open access has brought to journal articles extended to other research outputs, including monographs".[115] The interest in open access monographs is further supported by the HEFCE report on the subject. Focusing on the UK experience, the report discusses the policy implications, acknowledging at the same time that the UK does not act in isolation. On the basis of this point, the report should (also) be regarded as a contribution to related debates and practices.[116] In contrast to HEFCE, the Wellcome Trust already includes in its open access mandate books and book chapters that have been authored or co-authored by the Wellcome Trust grant holders. The latter are required to make these outputs available through PubMed Central Bookshelf or Europe PMC as soon as possible with a maximum embargo of six months. The preferred license is CC-BY, nonetheless the Wellcome Trust also accepts CC-BY-NC and CC-BY-NC-ND.[117] Moving beyond Europe, the Australian Research Council requires open access to any publication arising from an ARC supported project (which also covers books and book chapters).[118]

OAPEN[119] (Open Access Publishing in European Networks) project (2008-2010) co-funded by the EU is a further initiative aimed at achieving a sustainable publication model for academic books in the SSH and improving the visibility and usability of high quality academic research in Europe. Following the completion of the European project OAPEN operates as a foundation (non-profit organization). The foundation has been established by the University of Amsterdam, the University of Leiden, the university Library of Utrecht University, the Netherlands Academy of Sciences (KNAW), the National Library of the Netherlands, and Amsterdam University Press.[120] OAPEN currently operates two platforms: OAPEN Library and the Directory of Open Access Books (DOAB). The OAPEN Library hosts 2.500 publications from more than 100 publishers from 18 countries. The services provided relate to quality assurance, aggregation of publications, digital preservation and dissemination. As seen in the previous section, OAPEN is also currently managing DOAB, a discovery service for open access books, which currently lists 7.824 academic peer-reviewed books and book chapters from 205 publishers.[121]

Building on the European OAPEN project two additional ones have been set up: OAPEN-NL and OAPEN-UK. The OAPEN-NL aimed at gaining experience with the publication of open access monographs in the Netherlands. The project sought to do so by publishing 50 monographs (from 9 publishers) in open access in a variety of subjects and collecting data on usage, sales and costs. The project concluded that while "no significant effect of Open Access on monograph sales could be found" there was significant increase in digital usage,

[119] Martin Paul Eve notes that the leading studies in open access monographs (OAPEN-NL, OAPEN-UK, Jisc Collections and the HEFCE monograph investigation) have been produced by stakeholders with an interest in open access.
[120] OAPEN (Open Access Publishing in European Networks). http://www.oapen.org/content/organisation
[121] DOAB (Directory of Open Access Books). http://www.doabooks.org/

that there was no observed citation benefit to a book being open access and that the open access edition was cheaper to produce than the total cost of a conventional monograph. Eve (2014) notes that these findings could be interpreted in different ways: the absence of effect could be justified by the low embeddedness of the open access route, while the absence of citation benefit by the long publishing cycles observed in the humanities in contrast to the short period of the report. As a consequence, the author sees these results more as an interesting and valuable starting point.[122] The project's results have fed-in the recommendations' report that targets key stakeholders in the academic book publishing like funders, libraries, publishers, authors and aims at improving open access for monographs.[123]

OAPEN-NL Overall Recommendations

- Monographs (peer reviewed academic books), particularly books that are the result of publicly funded research, should be made available in an Open Access edition.

- Funders and libraries should accept CC-BY-NC licenses, to allow publishers to sell premium editions.

- Funders and libraries with a preference for Open Access deposit (Green Open Access) should allow a reasonable embargo period, to allow publishers cost recovery of publications.

- Funders and libraries with Open Access publication funds should require transparent fee structures for publication charges.

- Funders and libraries with policies for Open Access monographs should encourage or require deposit in a central, dedicated repository for monographs.

- There remains a need for awareness building and further education and dissemination of information about Open Access publishing. Continued advocacy towards authors and other stakeholders by funders, publishers and libraries as well as by authors themselves is needed to battle the misconceptions that exist about Open Access publishing

OPERAS·D

Design Study

Open Access monograph publishing in the Netherlands. Final Report.

The second project, OAPEN-UK gathered evidence to support stakeholders in making informed decisions on the future of open access scholarly monograph publishing. According to the OAPEN-UK Report[124] the transition towards open access monographs requires changes in three areas: attitudes and perceptions; systems, policies and processes; business models. With regard to the first area the report provides some interesting insights: while author interviews confirm their positive attitude towards open access publishing, there is considerable variation in terms of their views on who would benefit from increased access, how open access would be implemented and the benefits and costs involved for other players. Attitudes are also shaped by the career stage of each researcher and his/her previous experiences of publishing. In addition, the report notes that the same misconceptions regarding open access journals are found in the case of open access monographs which relate to their perceived lower standard (in comparison to traditional print monographs). The project's final report also provides a set of recommendations grouped in three categories: a) supporting informed decision making by all stakeholders, b) taking collaborative action and c) enabling projects, research and experimentation.[125]

Jisc has also published a report on the basis of the results of a project that aimed to explore potential future services to support open access monograph publishing. The recommendations highlight the need for good practice guidelines on various aspects of open access book publishing that seem of particular interest to publishers, especially new university presses (but also conventional ones), the importance of setting up a central workflow for aggregating books which would also enable improvements (like adding DOIs or ORCIDs) and the need to catch up in the area of altmetrics.[126]

b.   The costs of Monographs

The support for open access monographs is further complicated by the costs incurred in such process as "publishing involves more than simply releasing a digital file onto the web".[127] These costs may include administering peer-review, editing, typesetting, copyediting etc. which "are not fixed, nor are they particularly well known".[128] Nonetheless, a number of studies have tried to shed light on these costs showcasing how challenging this task can be.[129]

OAPEN has estimated the average cost for creating a monograph in the Netherlands to be slightly over € 12.000. Half of the amount is spent on creating a first digital copy, while a third of the total cost is spent on printing and binding paper copies. This amount is based on the budgets of 50 books, published by 9 different publishers.[130] A more recent study from ITHAKA

[128] Ibid.

[129] Related studies include those by Walters and Hilton (2015) and Eve (2014).

[130] OAPEN (2013) op. cit.

S+R looking at 382 titles from 20 presses members of the Association of American University Presses found costs to range from $ 15.140 to $ 129.909. According to the study, the largest cost item relates to staff time especially time devoted to activities of acquisition, which seems to be a core activity closely linked to reputation and thus least likely to be outsourced. A further important finding suggests that presses on good financial status are those who tend to be larger and with multiple streams of revenues a factor which allows them to cross-subsidize their monographs either through their journals list like in the case of Chicago Press, or through their textbook programme like the Yale University Press.[131] As Moore (2016) argues, the high costs reported may be related to marketing and commissioning and the expected economic return.[132]

Rupert Gatti from Open Book Publishers (OBP)- the biggest open access academic publisher in the UK- in a recent blog estimated the average cost per title to be around $10.500 with the largest share of the cost (60%) being devoted to title set up. This covers staff costs and everything else that is part of the daily activities. The rest of the cost covers the cost of sales, distribution and overheads. The estimates are based on data gathered from 18 books published between September 2014 and August 2015.[133]

In calculating the cost of monographs attention should be given to the differences in the definitions of costs, the inclusion of data from different publisher types as well as national market differences etc. which can lead to significant deviations in the numbers provided.

c.   *Business models for open access monographs*

The HEFCE *Monographs and Open Access* project identified a total of six business models: traditional publisher, new university presses, mission-oriented OA, freemium OA, aggregator/ distributor and author payment model. In proposing this taxonomy the report acknowledges the difficulties associated with identifying models due to (among other) the ongoing experimentation which characterizes the field and the fact that this is still a market in its early stages of development.[134] The HEFCE reports assessed the different models according to the following criteria: quality, sustainability, dissemination, diversity, innovation and integrity. Quality is an aspect taken seriously by all publishers as, on the one hand, it increases credibility to academics while, on the other hand, it impacts on the long-term sustainability of a publisher. Sustainability has different implications for the different models: it can create long term challenges for New University Presses and mission oriented presses as funds are not always easy to secure in the long term, while freemium models seem to be in a more advantaged position which is nonetheless linked with the extent at which authors will want something more than basic open access. Turning the focus on the dissemination aspect, the report argues that while more established publishers might be more advantaged, the increase in the sophistication of search engines and web discovery tools might help smaller publishers. Innovation is also expected to be promoted through certain models. The study does not provide any firm conclusion in relation to the effects of open access models

on the diversity of the publishing landscape. Finally, it concludes that none of the models is likely to damage the integrity of the system. [135]

New University Presses (NUP)

New university presses account for the majority of open access monograph publishing. Their establishment aims at filling the gap between professional publishing activities and digital repositories providing infrastructure. A common element of these initiatives is their close relationship with institutional libraries and their strong commitment to open access publishing.[136] NUP see themselves as providing an outlet for certain types of research and as enabling researchers to publish their research outputs with institutional support. At the same time though, NUP entail an entrepreneurial component as universities can profit through charging author fees[137] (to those outside the university), while increasing the university's visibility and thus its capacity to attract further funding and collaborators.

As in the case of the traditional publishing model quality is strongly linked with institutional prestige (the higher this is, the easier it becomes to attract authors and disseminate books). Publicity becomes important though it can lead to what is referred to as "vanity publishing" which can have adverse effects on quality. An additional important factor that NUP need to consider is the balance between encouraging academics within the institution to publish with the press while maintaining their attractiveness/ appeal to those outside the institution (and thus minimize any perceptions about favoritism towards affiliated researchers).[138]

Within the OPERAS network, **Gottingen University Press** is a typical example. Gottingen University Press was established in 2003 as a service of the Gottingen State and University Library and is part of the Electronic Publishing department. The press offers innovative services primarily to the members of Gottingen University and covers a wide range of disciplines (sciences, life sciences, SSH). It is managed by an editorial board made of the representatives of the various faculties and the University Medical Centre Gottingen. The press publishes within two categories: the "Universitatsdrucke" and the "Universitatsverlag": the former does not entail any review of the content (even though quality control is still performed for typesetting, layout and image quality) while the latter is reserved for publications of high quality which undergo a review process. Notwithstanding the differences in each publication type, there seems to be a trend for "hybrid" publications which combine open access publishing with print on demand. Regarding author's rights, the press leaves authors and editors as many rights as possible. In terms of the business model chosen this is based on a cost-recovery approach.[139]

Beyond the EU, important initiatives can be found in Australia. The **Australian National University Press** (ANU)[140] is among the most known. It was established in 2003 to explore and enable new scholarly publishing, making it the first Australian primarily electronic academic publisher. The primary focus of the press is the production of scholarly works. Submitted manuscripts (following initial consideration from the Editorial Board who examines

[140] Originally established as ANU E Press it changed its name to ANU Press in 2014 to reflect the changes in the publication industry.

the extent at which the proposal is of interest) undergo a double blind peer-review with at least two referees and at least one of them being external to ANU. The e-books are available in a range of formats (pdf, epub, html). All works are also available for purchase through the print on demand service. All the above formats are generated from a single source file xml. In 2014, ANU Press celebrated its 500th title.[141] The **Monash University Press** is a further interesting example as it is hosted in Australia's largest university. It publishes mainly in the social sciences and humanities following a rigorous process of peer review. Books are available in an e-book format, while print versions are also available for purchase.[142]

Mission-oriented OA

The mission-oriented open access is related to the belief that the monograph crisis calls for some form of intervention which could entail funding for open access or be part of a broader approach in relation to the role of monographs in tenure decisions. In a number of related initiatives one can discern what could be called a "by academics for academics" approach: under this model the available formats are usually the basic (html and pdf), with only a few added services available. Emphasis is placed on quality assurance as an essential component for establishing and maintaining credibility and less on aspects like dissemination, marketing and preservation. What is of equal importance is the absence of a clear funding mechanism raising important issues in terms of quality and long-term sustainability. As pointed out in the London Economics report "while starting an open access publishing operation is relatively easy, growing it into a sustainable operation is not" and this is even more relevant in the case of mission-oriented open access.

Freemium Open Access

Under this business model, the open access versions of monographs are available alongside the premium version for a price. In practice, almost all open access book publishers use some form of hybrid model by providing an open access edition and offering other editions/ features for sale. The most common among these extra features is the print-on-demand, but it can also include hypermedia, social features etc. This model implies a distinction between what is regarded as "core" and what is seen as a "value added service". The distinction is not fixed and is expected to change over time as a result of many factors, changes in technology being one of them. As most readers still prefer a printed version for longer texts, the e-book is not expected to substitute the printed book in the same way as e-journals have substituted printed journals.[143]

A typical example of the freemium model is the **OECD Publishing**: OECD makes all its publications available for free in html form, while those interested in acquiring other forms can do so by buying the premium editions and services enabling the recovery of all costs. The **Open Edition Freemium** is a programme for the development of open access academic publishing in SSH. The programme is offered exclusively to institutions (libraries, campuses, research institutes) with the aim to create an innovative and sustainable publishing model. The Open Edition Freemium is comprised of two strands: one for books and one for journals. In the case of books acquisition provides permanent access to pdf and epub versions. Books can be purchased on an individual basis or in bundles.[144] **Athabasca University Press** in

[144] Open Edition Freemium for Books. http://www.openedition.org/13052

Canada is a further interesting example. Athabasca University has been the first in Canada to establish an open access scholarly press. Access to all titles is free over the internet, and whenever possible the publications are licensed with Creative Commons, while print versions are also available for sale.[145]

Aggregator/ Distributor

Aggregators focus more on the technical aspects through functions like aggregation, distribution, quality assurance, discovery and preservation aimed at increasing availability and discoverability.

Aggregators both complement publishing and also work with other aggregators and/or service providers to enhance visibility and discoverability. In addition, they can also be considered as standard setters, especially when it comes to issues like licensing arrangements or technical upgrades. In the case of aggregators one has to take into consideration the fact that they can end up operating like a "tipping market" dominated by a single one with adverse effects on competition and innovation. A further point to be considered relates to the fact that their operation requires significant investments both in personnel and infrastructure of upfront nature.

Focusing on the funding side, **Knowledge Unlatched** (KU) supports open access monographs in SSH by collecting funds from libraries to pay publishers. In this way the cost is reduced for libraries participating in the project in comparison to the purchase of single print copies and/or e-books. The initiative not only offers opportunities for reducing costs but also for expanding readership. The KU Select 2016 includes 343 titles from 54 publishers with 269 having pledged their support.[146] **Luminos,** which is the University of California Press new open access program for monographs is a further example: it is based on a partnership were costs and benefits are shared. Membership fees from participating libraries go towards the cost of publication. [147]

Author Payment

Under this model, costs (known as author publication charges) are recovered from authors or their host/ funding organisations. While the risk for the publisher is reduced as the cost is shifted to the author, this practice can place researchers from institutions with limited financial capacities in a disadvantaged position.

C. Open Peer Review

Open Peer Review (OPR) is the buzz word of the moment in the scholarly communication sector. Even though it remains quantitatively marginal compared to "traditional peer review" (blind review) in the academic sector, there is a growing literature on the subject and more discussions about it in the scientific conferences than in the past. It has been extensively discussed, for example, during the 20th International Conference on Electronic Publishing, where Göttingen University team presented surveys, initiatives and experiments in different disciplines[148]. This was one of the outcomes of a dedicated task in OpenAire2020 project.

[148] OpenAIRE. "Openaire's Experiments in Open Peer Review / Report". Zenodo, September 22, 2016. doi:10.5281/zenodo.154647

In discussing open peer-review two points should be acknowledged. First, that the term "open peer-review" is not limited to one specific practice of open reviewing, but captures instead a family of practices.[149] In its simplest form it is about conducting the review traditionally, and then releasing publicly the name of the reviewer and the review. Other forms are more interactive and open: in these cases, comments are made on the draft version of the manuscript immediately upon its release. Comments can be made either by several reviewers or anyone wishing to review the manuscript before publication. In that case OPR tends to be crowdsourced reviewing. The combination of OPR with annotation and commenting features that comes with web publishing gives way to conversational reviewing by creating conversation threads around papers. In some cases, the open conversation can be combined with traditional reviewing; this is "post publication peer review", sometime named also "open peer comment".

The second point is that the emergence and expansion of OPR within the academic sector has been fueled by growing concerns in the last years about scientific integrity. Surveys show that retraction rate in scientific publications is growing due to a growing number of mistakes, frauds and sometimes hoaxes that remain unnoticed throughout traditional reviewing process[150]. The growing number of papers to be reviewed, the growing complexity of data to be verified before validating a paper, but also the growing competition between research teams that pushes them to publish more often and more quickly than in the past put pressure on the traditional reviewing system and make it more and more obsolete in the new environment. For some commentators, OPR can help fixing what appears to be a broken scientific system.

The development of OPR in the scholarly communication system must be contextualized with the development of the open science paradigm[151]. Open Science means not only opening the access to publications and data, but also the whole scientific workflow to obtain more transparency and reliability of the research results. Open Science is a general movement aiming at opening the "black boxes" of research and OPR is a part of that process. In general, OPR is practiced and promoted by new editorial initiatives that position themselves as pioneers in the general movement to open science: F1000Research, PeerJ, PubPeer, The Winnower, ScienceOpen. Older initiatives, that were forerunners for the development of open access, such as PLOS One and Pubmed (through Pubmed Commons) offer OPR as an option to researchers[152].

Finally, most of the discussions about OPR revolves around the advantages and drawbacks of losing anonymity in the process[153]: on one side, anonymity protects authors against prejudiced judgments from reviewers on their work and reviewers from pressures that could

The ups and downs of peer review. Adv. Physiol. Educ. 31, 145–152. doi:10.1152/advan.00104.2006.

come from their direct or indirect links with the authors. On the other side, despite formal procedures of anonymization, in many domains, anonymity cannot be guaranteed in practice because of the specialization constituting very small communities where it's easy to identify an author based on the subject of the paper and the other authors cited. This is particularly true in humanities and social sciences. All in all, OPR opens the debate whether research integrity should be guaranteed through approaches based on how reviewing practices should be in theory or are in reality.

In 2015, OpenAire supported 3 experiments aiming at implementing OPR in different contexts:

- Open Scholar CIC developed a module to be implemented on Dspace repositories. The Open Peer Review Module (OPRM) allowed for implementing invitation management to reviewers, management of reviews, commenting functionalities and a reputation engine. The aim of the reputation engine is to build quantitative indicators based on the quantity and quality of the reviews as well as on the reputation of the reviewers. So far, the OPRM has been implemented on CSIC repository and another one in Spain.
- The Winnower is a post-publication open peer review platform allowing authors to submit their paper and request reviews from the scientific community. During the OpenAire experiment, The Winnower developed a module to connect with OpenAire repository and fetch metadata, facilitating reviewing.
- OpenEdition experiment is the only one deliberately targeting humanities and social sciences. OpenEdition achieved an OPR and Open Commentary experiment with Vertigo, a Canadian journal in environmental sciences. The experiment involved Vertigo blog on Hypotheses.org platform as a publishing venue for paper drafts and reviews, with the adjunction of hypothes.is plugin for detailed annotation. OpenEdition approach to OPR was to invest on human mediation rather than on the development of tools, considering OPR needs specific curation regarding the management of reviewers and authors relations during the whole process[154].

In general, very few examples of OPR exist in humanities and social sciences. It must be noted that one of the early adopters was a reference journal in anthropology – *Current anthropology* – which chose to publish papers reviews (named "Responses" and inserted at the end of the articles tex) from 1959, long before the whole idea became so discussed about. Innovative platforms such as Ubiquity Press must be acknowledged as opening the way for OPR in those disciplines. HIRMEOS[155], a H2020 project implementing added value services on top of 5 important open access academic books publishing platforms will use hypothes.is plugin to allow for open annotation on the full text of the books. It is planned that an experiment will be achieved in the course of the project for post-publication OPR using this feature; that would be a premiere for academic books.

As far as humanities and social sciences academic communities are concerned, OPR is an important topic to watch. Collective discussions are regularly organized on the question of quality control for journals and books in those disciplines and OPR should definitely be a part of it. The discussion should be based on lessons learned from experiments such as those achieved by OpenEdition and HIRMEOS and on literature reviews such as the one that OpenAire produced during its OpenAire2020 project. Finally, the discussion should involve

[154] Julien Bordier. Évaluation ouverte par les pairs : de l'expérimentation à la modélisation : Récit d'une expérience d'évaluation ouverte par les pairs. " https://hal.archives-ouvertes.fr/hal-01283582

researchers through scholarly societies, publishers through their national associations – and European with AEUP -, and research funding organizations. OPERAS consortium, as a collective endeavor to develop an infrastructure for open scholarly communication at European level could be the right player to organize such a discussion involving the concerned stakeholders, in partnership with its sister infrastructures OpenAire and Dariah.

D. Conclusions - Policy Implications

> **In the SSH, uncoordinated activities and lack of common standards complicate the transition to Open Science and OA publishing as standard practice**
>
> **Issues to be addressed**: Common standards
> best practices
> business models
> research and development
> future services
> multilingualism
>
> **OPERAS as a model of distributed infrastructure for scholarly communication**
> - OPERAS addresses effectively existing interoperability and interconnectivity issues in the OA publishing landscape.
> - Moreover, it fosters the future development of complementarities and enables all concerned parts to extend the outreach of high quality research and scholarship.
> - OPERAS designs governance models and implements solutions that will enhance stakeholders' capacity to correspond to all needs emerging from the transition of science to the digital paradigm.
> - OPERAS' extensive membership of key institutions (research centres, universities, service providers) from several MS sets the foundations for the essential shift at national level and ensures the operational capacity and sustainability at EU level.

OPERAS-D (Design) project aims at supporting the core group members of OPERAS network in the development of an e-infrastructure for open access publications in the SSH. As a first step towards this aim, the project conducted a landscape study to identify key stakeholders involved in open access publishing, to explore existing and emerging practices, initiatives and challenges. The analysis will allow the project to identify the issues that need to be addressed by the OPERAS network in moving forward and in further supporting open access publishing especially in the SSH by addressing the challenges involved in renewing the scholarly communication practices in the digital age and in the context of Open Science. This initiative acquires further importance in the case of SSH, as they lag behind in terms of exploiting the full potential of the open web.

The study has confirmed the existence of multiple actors and practices in the open access publishing ecosystem. This publishing landscape is by no means static but rather continuously evolving as a result of the increasing uptake of open access publishing (powered also by funder and institutional policies and mandates) and the progress observed on the infrastructure level. In terms of actors, the open access publishing system is characterized by their large number and their diversity, as they include from university presses to smaller scholarly initiatives offering varying levels of services and relying on different sources of funding.

Despite the existence of important and pioneering initiatives, further effort is required in order to support a truly innovative vision for scholarly publishing in the digital age. In the SSH, uncoordinated activities and lack of common standards complicate the transition to Open Science and OA publishing as standard practice. Moreover, fragmentation of institutional publishing initiatives and limited dissemination of publications entails particular difficulties for infrastructure providers -such as institutional libraries and publishing platforms- in elaborating collectively adopted models and publishing practices. Important issues to consider are the necessity of proposed initiatives to be participatory and federated and the need to establish a common framework focusing on the introduction of common standards. Issues of governance and interconnectivity will also be important.

This report reflects the perceived need for coordinated initiatives (by MS and at EU level) aiming at the defragmentation of the open access publishing market in the SSH. In light of the recent developments within the open access policy framework, the ongoing discussion on the potential of integrated infrastructures as well as the diversity of actors involved in scholarly communication, more thought needs to be given to how existing publishing initiatives will be incorporated into an overarching infrastructure that will reduce exiting inconsistencies.

To move academic research more thoroughly into the public domain is to create a substantial alternative source of public information that would support innovative communication methods and realise the goal of increased collaboration across existing infrastructures.

In this context, the more recent proposal regarding the creation of an innovative public information infrastructure (the European Open Access Platform)[156] seems to have attracted attention. Combined, the European Open Science Cloud and the European Open Access Platform may serve as a robust starting point for the development of EU-wide infrastructures dedicated to effectively disseminating peer-reviewed scientific output. Notwithstanding the outreach and impact of such initiatives, existing infrastructures and services may not fulfill researchers' needs. As large-scale e-infrastructures play an increasingly important role in supporting innovative research activities and enabling scholarly communication, a number of significant challenges have yet to be met in the open access scholarly publishing landscape. Special focus should be given to the establishment of a common policy framework and the formulation of action plans at EU level to strengthen scientific publishing towards a sustainable approach along the following lines:

- Common standards: a common set of practices and principles applied and evaluated by e-infrastructure providers at all stages of the publishing process
- Best practices: introduction of innovative and sustainable operational models that produce best results and maintain high quality content and minimum technical standards
- Business models: conceptual, administrative and financial arrangements corresponding to current challenges and OA publishing needs
- Research and Development: services to identify and implement corporate publishing and communication models or enhance the interoperability and complementarity of existing infrastructures
- Future services: a roadmap to achieve these goals according to the requirements for long term sustainability

---

[156] Fecher, B., Friesike, S., Peters, I., Wagenr, G. (2017) Rather than simply moving from "paying to read" to "paying to publish", it's time for a European Open Access Platform, LSE Impact Blog, 10 April 2017, http://blogs.lse.ac.uk/impactofsocialsciences/2017/04/10/rather-than-simply-moving-from-paying-to-read-to-paying-to-publish-its-time-for-a-european-open-access-platform/ and also for a response: Ross-Hellauer, T. (2017) OpenAIRE as the basis for a European Open Access Platform, OpenAIRE Blog, 5 May 2017, https://blogs.openaire.eu/?p=1961

Future initiatives should aim precisely at creating a centrally governed European infrastructure for the coordination of the OA publishing ecosystem and establish new synergies that could further the implementation of Open Science and introduce more effective ways of scholarly communication. Especially designed to cover the needs of the SSH research community, OPERAS addresses effectively existing interoperability and interconnectivity issues in the OA publishing landscape. Moreover, it fosters the future development of complementarities and enables all concerned parts to extend the outreach of high quality research and scholarship.

OPERAS designs governance models and implements solutions that will enhance stakeholders' capacity to meet global challenges and correspond to all needs emerging from the transition of science to the digital paradigm. Furthermore, its extensive membership of key institutions (research centres, universities, service providers) from several MS sets the foundations for the essential shift at national level and ensures the operational capacity and sustainability of an EU-wide incorporated infrastructure.

V. Visibility of Open Access Monographs (KU Research)

A. Objectives

This task addresses the challenges associated with tracking the use and impact of Open Access monographs across open global digital networks.
The task is broken into three parts:

- Mapping the digital visibility of OA monographs made available by the OPERAS network;
- Flagging technical challenges specific to the collection of metrics on usage and impact for OA monographs;
- Identifying opportunities for the more effective integration of information relating to the use of OA monographs into metrics and altmetrics ecosystems

B. Background

OPERAS is a distributed Research Infrastructure (RI) project for open scholarly communication. Its main goal is "to introduce the principle of Open Science and ensure effective dissemination and global access to research results in the Social Sciences and Humanities (SSH)". The network includes a wide range of mainly European Open Access publishers and research institutions, and is in the process of engaging with a wider international network of potential partners.

The OPERAS Network includes a diversity of participants with differing interests, ranging from traditional publishers with a growing portfolio of Open Access content, through to OA only presses. It includes publishers as well as platforms, technology providers and research institutions. The diversity in OPERAS network participants makes available a range of different financial models, priorities, and technical concerns. The network also continues to grow over time, increasing in both numbers and types of stakeholder organisation. In particular 2017 brought the Latin American SciELO platform to OPERAS as an international partner alongside nine other new partners based in Europe.

OPERAS works in a range of areas. Through its seven working groups and two main H2020 projects its aim is to provide technical and social infrastructures that support Open Access publishing and optimising the use of scholarly content with a focus on Social Sciences and Humanities (SSH). While the network is not exclusively focussed on scholarly books, its focus on SSH means a greater emphasis on questions that relate to books than in many more Science, Technology, Engineering and Medicine (STEM) focussed projects and efforts.

1. The challenge of tracking scholarly books

While the modes and advantages of Open Access for journal articles are now broadly accepted, at least in STEM subjects, the funding models, technology, and most importantly, the advantages for Open Access books pose more of a challenge. Issues that are specific to SSH often combine with issues that are peculiar to book publishing and dissemination. In broad terms there are three areas where books pose a particular challenge compared to journal articles:

1. Digital books are not necessarily made available through a publisher

controlled website and may be made available through multiple online platforms.

2. The technical infrastructure for cataloguing, indexing and discovering digital and online books is more recent than that for journal articles and is less consistent and reliable as a result. Dependence on intermediaries for the distribution of digital books means that monograph publishers and platforms also have less direct experience with these systems than tends to be the case for journal articles.

3. Traditionally, book publishers have focussed on the sale of print copies to intermediaries and have had less direct interactions with readers. Existing performance indicators are largely driven by measures of physical distribution. Print remains an important, and often parallel, part of book publishing.

When we consider Open Access books specifically this raises a number of issues. Firstly many of the platforms that exist for distributing books and bibliographic metadata were built with licensed content in mind. This leads to a range of assumptions about tracking of users, their institutions, and their usage that are not applicable to freely accessible Open Access books.

In comparison to journal articles, which made a transition to digital formats much earlier than has been the case for books, the challenges associated with making a shift towards open access are occurring in the context of an incomplete transition to digital distribution and funding models for HSS books.The diversity of HSS monograph publishers - which include many small publishers, as well as library-based and independent presses, adds an additional layer of complexity to the process of integrating OA digital books into digital landscapes of discoverability and use. Firstly publishers often do not host their own digital books on sites under their control but leave this to other platforms. Open Access platforms (such as OAPEN and OpenEdition Books) have developed in parallel with traditionally licensed platforms (such as JSTOR). Established platforms for traditionally licensed content, including JSTOR and Ingenta have also begun to create programs and infrastructure to support Open Access content. Some publishers have begun consciously making the same content available via a variety of distribution sites in order to maximise the visibility and use of digital monographs.[157] The availability of services intended to help publishers to ensure that Open Access books are optimally integrated into pathways of discovery and use is increasing.

As platforms hosting open access books are maturing and systems for integrating OA content into digital landscapes become part of scholarly workflows, a second issue has emerged. An illustrative example of this is the challenge of applying the Crossref Digital Object Identifier (DOI) infrastructure, developed largely for journal articles, to books. DOIs serve two functions. They are both unique and persistable identifiers for scholarly works, and a *referral* mechanism by which a user may follow a link to arrive at a specific scholarly work. DOIs work well when applied to a single

---

[157] Examples of publishers making Open Access books available via several platforms include the four presses discussed in the study *Exploring the Uses of Open Access Books via the JSTOR platform,* available at: http://kuresearch.org/PDF/jstor_report.pdf

version of record of a journal article that can be found on a website under publisher control, particularly when the demand and use of print copies has been largely replaced by online discovery. DOIs are more problematic for books that might be found on multiple sites in digital form, where the repository is not under the control of the publisher[158]. Challenges of ensuring that correct redirection addresses are maintained in the absence for commercial incentives to ensure that OA content is easy to locate create additional resourcing challenges, particularly for the many smaller publishers operating in the OA monograph space.

The tangle of technical issues involved in identifying and discovering books, combined with a relative lack of investment by platforms in tracking the usage and conversations around books content leads to a reinforcement of a third challenge. Many publishers and presses remain focussed on traditional metrics and KPIs for monograph publishing. These are not focussed on the *usage* of books but on *distribution* through intermediaries - traditionally measured in terms of sales (which also assumes that all publishers make the same effort to sell their books equally). This in turn means a limited demand from presses for detailed information about the use of books, as well as limited capacity to influence the metrics and reporting services provided by platforms.

2. The importance of understanding digital visibility for Open Access books

With the shift towards Open Access, the question of visibility is crucial. It is perhaps a little harsh to describe traditional metrics as counting copies in warehouses. Nonetheless, even as a straw-person argument it illustrates the point that distribution based measures are simply not helpful for tracking the impact of freely accessible books with online distribution. This is particularly the case given the significantly greater per item investment for books compared to journal articles. Demonstrating the potential value of investing in Open Access, and identifying where that value is realised and the return on investment is greatest is critical to supporting the transition to a future where Open Access is the default for scholarly books.

Another important aspect for books is the degree to which they will be accessible to entirely new, and perhaps unexpected, audiences. Scholarly books, much more so than journal articles, have potentially much wider audiences than they currently reach, particularly given the price of many scholarly monographs.

The question of visibility is therefore a complex one. It is clear that there is a need to track scholarly use, including citations and downloads within institutions, as well as the potential to track use and interest by wider publics. We can track the communities that discuss books and ask about how they discover and interact with these texts both online and in print. We can expect books to influence and impact society in ways that are very difficult to track and may not involve a visible trace of usage that we can measure.

---

[158] It is worth noting that such multiple-location problems are increasing for journal articles with the increasing frequency of self archiving and preprint repositories. Solving this problem well for books may be of value in turn for the journal community. Crossref is currently piloting an approach for supporting multiple DOI for books with the intent of offering coordinated lookup.

The promise for Open Access scholarly books is immense, but the risks and the potential need for investment are also large. If we are to have an evidence-led conversation on strategies for investment, then we need to track the visibility, discoverability, and ultimately the use and impact of scholarly books. In turn, this evidence base will help to change the culture of publishing in HSS, leading perhaps to a greater concern with how an author and the support services in a press can help to shape a work so as to maximise its potential for use and impact.

C. Survey of OPERAS Partners

As part of the visibility project we surveyed OPERAS partners in order to understand how they engage with usage and other data relating to the titles that they publish or host. In particular we were interested in how partners saw the value of such data and how they were interacting with it. We had 18 responses to the questionnaire contributed by presses, platforms, and data and technology providers. The survey was not intended to be quantitative or representative but to provide a view into the thinking and needs of partners. We therefore do not report quantitative results but a qualitative interpretation and categorisation of the responses. The questionnaire rubric is available in Appendix X.

1. Findings

Partners are particular about how they describe themselves. While a range of options were presented from which survey participants could choose (publisher, platform etc) many participants chose 'other' to provide a free text answer. Sometimes this was to provide greater specificity (e.g. "a library running a press") and sometimes to step outside the categories provided. This was particularly the case for contributors who were involved in funding OA books and other technical platforms.

This echoes the diversity of participants in the OPERAS network. It also suggests a heterogeneity in the ecosystem which we believe to be an important and distinguishing characteristic of book publishing and of scholarly publishing in SSH more generally.

OPERAS partners that are book publishers or book platforms are collecting a range of data. Every respondent who indicated that they were either a publisher or a platform, or both, stated that they (or their partners) were collecting usage data in some form. This ranged from simply collecting web analytics through a tool like Google Analytics or Piwik through to more sophisticated data collection and management pipelines.

Respondents generally showed a good awareness of the technical systems that were involved in collecting data, describing specific tools and systems, as well as standards, principally COUNTER. Named web analytics were fairly evenly split between Google Analytics, which provides a centralised and easily managed means of tracking web usage and Piwik, an open source tool that provides many of the same data collection functions but runs locally, meaning data is not transmitted to Google.

Respondents also showed an awareness of specific limitations in their systems, in several cases describing difficulties in obtaining data specifically on subsets of their collection. Distinctions were made between views and downloads in several cases, although there was limited evidence of that distinction being used in analysis. The

two largest hosting platforms OAPEN and OpenEdition Books were the only two to specifically mention the COUNTER standard, with OAPEN passing data to IRUS-UK to generate COUNTER download counts.

The use, processing, and quality assurance of data is patchy. While the awareness of usage data was good, there were substantial differences in the way that data were being used, or indeed not being used. This was connected to differences in the sophistication of data processing and the existence of documented or automated processes. Several publishers and platforms used manual or ad hoc processes to collect data and in several cases there was an indication that data was being collected but not necessarily used.

While the wording of the question focused on 'processing' ('Do you have a process for gathering and managing usage data relating to your OA books?') we had hoped to elicit commentary on data management and quality assurance. However, while issues of data quality were implicit in some answers ("Download data is sent to IRUS-UK who create COUNTER compliant data", "PHP scripts calculate and produce COUNTER metrics...to COUNTER V4...V5 will be implemented [in]...2018") quality assurance processes, such as data validation or cross-checking procedures, re-use of data in internal systems were not specifically mentioned.

The general lack of concern with quality assurance was consistent with the variety of uses that data was put to. In some cases the use of the data was explicitly limited (e.g. "The books we publish are selected on the basis of scholarly merit", "Decisions are now based on print circulation, or number of e-books sold through commercial platforms") to subsidiary and management issues. Others explicitly noted that usage was a key indicator of performance and important for reporting to stakeholders. This was particularly where a case was being made for Open Access, either to authors or to other stakeholders. Several respondents reported being unsure what it could be used for but nonetheless had a sense that it was, or would become, important, with plans for future work in development.

A desire for standards and consistency is in tension with a need for flexibility and contextualisation. Several respondents raised the issue of gathering and integrating data from multiple platforms as a challenge. Of these a number expressed a desire for simplified and standardised tools that could achieve this. At the same time respondents were concerned both about the advisability of combining data from multiple sources, their capacity for analysis of such complex data, and the uses and misuses it might be put to.

> *Analyzing usage data is difficult and can easily lead to wrong assumptions about the impact of a OA book. In our case this could be detrimental to our [authors institutions], which tend to compare their "success" to [other institutions]. This means that we clearly need to understand what the usage data is telling us before we have any use for it.*

A number of respondents expressed a desire for a "dashboard" or other visualisations that could bring multiple data sources together. The consequent need for data integration and standardisation to achieve this was mentioned in one or two responses but awareness of the challenges of comparison across sources appeared to be limited. There was some evidence of a conflation of visualisation with data integration.

Respondents are small organisations with limited capacity. There is a desire for coordination and shared services, infrastructures, standards. A common thread in the responses was that the publishers and platforms who are engaged in Open Access scholarly book publishing are relatively small. This is both a challenge and an opportunity. They have limited capacity to develop internal processes and systems are looking for shared services and platforms to assist in developing usage data capabilities.

> *It would be of great help if we could have a main service from where we could manage all the information related to statistical usage data.*
> *[To engage more effective with usage data we would like a]...consortium agreement with Google on how to gather and access usage data.*
> *We would like to see an usage aggregation service that consolidates usage data from different hosting partners into one standardised report in an automated way. In turn, this should translate into an usage dashboard that can be embedded into platforms and allows customers to use different filters to analyse usage by publisher, region, etc.*
> *[one of our biggest challenges is...optimizing workflow, how to do more work with small resources.*

What emerges overall is a picture in which platforms and publishers are implementing tools and approaches locally and using what they are provided with to some degree. There is generally a good technical awareness of the tools being deployed, but less apparent awareness of data curation and quality assurance issues.

Many of the challenges arise from issues of data integration and standardisation. Small, and even medium-sized, players have limited capacity to engage with detailed standards or technical development. Equally there are limitations on what capacity a small organisation can provide to investigate the meaning and context of the data being generated. The majority of data use seemed to be in promotion or advocacy rather than strategic decision making. Concerns were raised about the misuse of usage data or a lack of understanding of its limitations by downstream users.

D. Mapping the digital visibility of OA monographs made available by the OPERAS network

The idea of 'visibility' is not one that has been theorised in detail in existing library literature. Studies tend to focus on issues of information retrieval, addressing precision and recall for a specific information seeking task.[159] 'Visibility' as a concept also at least suggests a concern with serendipitous discovery or non-directed information seeking. In our case we are also concerned specifically with open access books, so 'visibility' presumably includes the clarity of information making about the availability of freely accessible copies of a work.

---

[159] The information retrieval literature focuses naturally on questions of precision and recall with visibility used as a non-technical term in many cases. Criticisms of web-based indicators often focus on the idea that they measure "mere visibility" without strictly defining it. Models that link discovery to usage with a sophisticated application of proxies are rare although see Haustein, Bowman and Costas (2016) in *Theories of Informetrics and Scholarly Communication*, Sugimoto (ed), De Gruyter, Berlin, and essays by Wouters and Cronin in the same volume.

Ideally we would address the full range of information seeking behaviours, testing for instance the presence of a known book in specific catalogues, the likelihood of a book rising to the top of results for a well-crafted search query, and the potential for serendipitous discovery in a potential reader's regular work-flow. However, developing a well grounded taxonomy of visibility is beyond the scope of this report. We have therefore focussed on testing a range of information sources for the presence and quality of information on a specific set of identified books.

1. Identifying the target books

We developed a simple typology of OPERAS partners involved in the publication of OA monographs; and OPERAS partners involved in the hosting of OA monographs.

OPERAS partners involved in publishing OA monographs were contacted and basic information about their approach to the dissemination of OA books was requested. A metafile for the OA books published by each press was also requested.

In order to maximise the quality of our communications with publishers a personalised approach to email communications was chosen. This included sending an initial email explaining the purpose of our work package and requesting a metafile, as well as specific information needed in order to clarify technical points. Wherever possible we drew on information gathered in WP3.1.

There was substantial variation in the format and content of metadata provided by the various OPERAS partners. The provided files included Excel, XML, and OAI-PMH feeds. Some partners provided metadata feeds rather than a single output metadata file. These variations also reflected diversity within the partners in their activities as well as in their capacity and workflows. For example, IBL Pan is not a publisher of traditional monographs but involved in alternative approaches to OA books.

Publisher	Provided Metadata?	Format	Comments
UCL Press	Yes	ONIX	
IBL Pan	No		Not publishing traditional monographs
Coimbra University Press	No		Don't currently produce a single metafile as a standard process.
Göttingen University Press	Yes	OAI-PMH XML	
Open Book Publishers	Yes	They sent us an Excel xlsx file	
Ubiquity Press	Yes		Produces OAPEN compliant OAI-PMH

SHARE Press	Yes	OAI-PMH XML	

Table 1. Provision of metadata by OPERAS Partners

Ubiquity Press does not maintain a single meta datafile relating to published books but relies on OAPEN for onward metadata distribution (they are currently developing their own feeds for MARC records). In contrast, while UCL Press also uses OAPEN as a platform and generates OAI-PMH from their internal hosting platform. UCL Press maintains a separate metadata master file.

The metadata provided also showed some weaknesses in the handling of internal information by OPERAS partners. For instance, a small proportion of ISBNS (51 out of 11,000) provided by partners either did not validate via the internal check-sum or could not be automatically validated through a standard regular expression. This suggests that the metadata provided to this project is not generally re-used in internal systems where such errors would be discovered.

Overall, the initial findings in terms of the quality and availability of data from OPERAS partners was that it was inconsistent between partners, and of variable quality. As we will see this leads to a range of problems in information retrieval and visibility analysis.

2. Testing for 'visibility'

To address the question of visibility we conducted three broad kinds of survey:
1. Presence in relevant catalogues.
2. Visibility in web search.
3. Visibility in general information workflows.

The first approach was to survey whether the selected books could be identified within specific catalogues. The catalogues selected for examination were selected to cover common sources for books and open access content. These were WorldCat, BASE, Google Books, DOAB and OpenAIRE. We used their API by searching title and author, to check weather the titles were in their catalogue and to identify the repositories hosting most of these titles.

In each case a search was run using identifiers or titles, with the aim of exhaustively identifying all books that could be confirmed as being available in each catalogue. We used the WorldCat classification API to identify the subjects for each title using ISBN numbers.

We used Bielefeld Academic Search Engine (BASE) which harvests OAI metadata from institutional repositories and other academic digital libraries that implement OAI-PMH. We also checked the titles and their authors via the OpenAire API. As of November 2017, OpenAIRE contains around 23 million documents from 980 compatible data providers. The OpenAire system covers a higher proportion of titles from OAPEN and OpenEdition Books compared to BASE which covers the OBP corpus more completely. Both repositories support search via DOI but not by ISBN, and were designed primarily with journal articles, rather than books, in mind. We also used the Google Books API and compared its results with the DOAB metafile in order to identify whether ISBNs for individual titles were registered in both catalogues.

The second form of visibility was the presence of the book in web search. We used

the Webometric Analyst 2.0 tool developed by the group of Thelwall et al.[160] to analyse both the number of pages discovered with a search of the book's title and author's surname, and their top and second level domain names. This gives some indication of geographic location (via country TLDs) and of domain of interest (via TLDs and SLDs, e.g. '.ac.uk' or '.edu' vs '.com or '.com.au').

Finally, we examined a range of services for evidence of activity or presence that would support the visibility of books. We investigated the reported OA status of books with DOIs using the oaDOI service as well as the presence of ISBNs and DOIs relating to the target books in the ORCID 2017 public data dump. We additionally provided Altmetric.com with a complete list of DOIs and ISBNs which was used to interrogate their dataset for information on social and mainstream media that could be linked to one of the target books.

a.   *Visibility of Target Books in Specific Catalogues*

Surprisingly, BASE shows relatively poor coverage overall. In most cases the general catalogues of content show fairly good coverage, but for BASE this is not the case. The visibility results are dominated by the large number of books from OpenEdition Books and from OAPEN. The aggregate results therefore hide some substantial differences between book sources. In particular it is the 29% representation of OpenEdition Books books in BASE, and about 50% coverage of OAPEN that drives the lower numbers for BASE overall.
Figure 1. Shows the overall results for all the books in our set across the full range

---

[160] Thelwall, M. (2009). Introduction to Webometrics: Quantitative Web Research for the Social Sciences. San Rafael, CA: Morgan & Claypool.

of 'discovery services'. Overall we see good coverage of the books in this set in DOAB, Google Books, OpenAIRE and WorldCat. There is also some form of web search results for most of the books. By contrast, presence in Altmetric results and in ORCID is much less comprehensive.

Coverage in DOAB is uniformly good across all sources of content, OpenAIRE coverage is generally good but weak for EKT, Gottingen, and Napoli University, and a similar pattern is seen for WorldCat, except that Gottingen has excellent WorldCat coverage. Overall the larger three sources (OAPEN, OBP, OpenEdition Books) show better visibility in these catalogues.

There are no obvious differences between catalogue visibility on the basis of language. The analysis here is challenging as a smaller number of European languages cover the majority of books and different content sources have differing language focus. Therefore the question of visibility by language is confounded with that of the visibility by source. Dutch books appear to be underrepresented in both DOAB (58% absent) and WorldCat (65% absent) but well represented in BASE (80%) and OpenAIRE (96%). This may be due to the fact that a significant number of books from the Netherlands in OAPEN do not have an open licence and are therefore not in DOAB (which is in turn feeding WorldCat).

OPERAS Partner	Google Books	OpenAIRE	DOAB	BASE	World Cat
	(% present)	(% present)	(% present)	(% present)	(% present)
ekt	0	0	100	0	17
Gottingen University Press	89	42	98	39	96
Napoli University Federico II	44	28	97	34	28
OAPEN	73	91	92	49	85
Open Book Publishers	99	74	100	86	94
OpenEdition Books	89	93	99	29	90

Table 2. Visibility of OPERAS partner books in a range of catalogues.

b. *Visibility of Target Books in Web Search*

Web visibility was determined by running searches with the title and author's name. This provided a score as well a list of referring sites. Due to small numbers it is not

possible to draw any comparative conclusions between platforms in terms of their web visibility.

In general terms each platform saw a similar pattern with a high variability in web presence across the collection i.e. some books show a significant web presence with many showing only a small presence. This is an expected pattern given the different level of interest expected across such a large corpus of books. As the corpus also includes older books some references may also not be to the online open access versions.
Figure 2. Box-plot showing the number of websites associated via web-search with each published book in the corpus. Each dot represents a single book. The box and line shows the mean and one standard deviation for each host platform.

This form of analysis may be of value in identifying both books with high web visibility and also those which would benefit from additional marketing activity. The analysis is relatively straightforward with the Webometrics tool and can provide quite rich information. As an example we look at how different languages feature in terms of their visibility. This analysis gives a sense of both the relative proportion of books in different languages as well as a comparative sense of visibility.
Figure 3. Distribution of web-presence by language of book. Languages are ordered by the mean number of linked websites. For most common languages, the means are within a single standard deviation of each other indicating no statistically significant difference.

In this case we see the dominance of French and English in this corpus (density of points) alongside German, Dutch, Spanish and Italian as other well represented languages. Overall we see no strong or significant difference between the web visibility of these books based on language. While a bias towards English might be expected this does not seem to be the case. This is at least in part due to the strong focus on French (and other non-english) language books by OpenEdition Books.

A different form of analysis is to look at Top Level Domain (i.e. country codes) in URLs referring to these books by the language of the book. This provides an interesting insight at an aggregate level as to the interest in books from different countries in different languages. Here we show the most represented language of book for each country top level domain. This reveals a logical pattern with Latin America showing a preference for Spanish books, with the exception of Suriname (Dutch, the official language), French Guiana and Brazil (French). Francophone and Anglophone Africa are quite clearly distinct and East Timor shows the expected preference for Portuguese. France, the Netherlands, Germany and Italy all show a preference for their native language. There are apparently unexpected results which deserve more analysis on a larger corpus. Spain, Portugal, and Brazil all show a preference for French which is mostly likely due to the limited presence of Portuguese books in this corpus.

Top publication language by Webometrics TLD
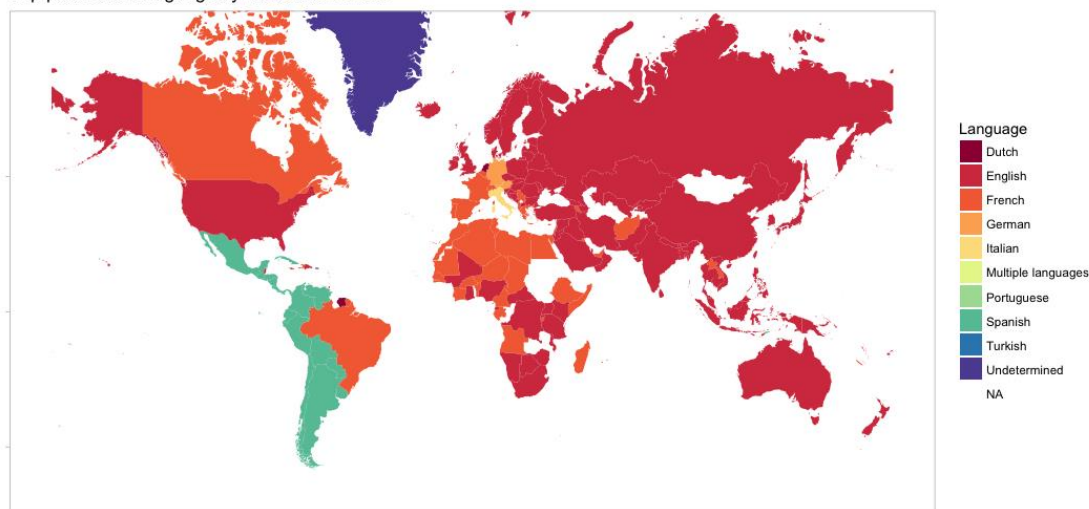

Figure 4. Top Publication Language by top-level domain. For each country code (e.g. '.uk.') the most visible book (the one referenced by the most search results) was identified and its language identified. Latin America has a higher visibility of spanish-language books and francophone and anglophone Africa are clearly visible.

c.   *Visibility in General Scholarly Information Workflows*

To examine the visibility of OPERAS partner books in general scholarly workflows we examined a number of sources of information. The first of these is the oaDOI service that provides information on open access status of objects identified by Crossref DOIs. This service is being deployed in a range of library systems and within Web of Knowledge by Clarivate - so accurate information on open access books is of value.

The second source of visibility data was Altmetric.com, which provides data on mainstream and social media activity for scholarly works. Finally we searched the ORCID public data dump for 2017 for the presence of DOIs and ISBNs associated with OPERAS partner books. These would in most cases have been added by the authors to their profiles.

In all three cases we saw extremely poor visibility. Of the 636 DOIs that were available for this analysis within the OPERAS corpus only 41 were returned as Open Access by the oaDOI service. Only 31 were present in the ORCID data dump. The oaDOI service is limited to providing information on DOIs, which is only relevant for ~10% of the corpus, but the reasons for the poor results merit further investigation. It is likely to be a combination of a service that is focussed on journal articles and the general variability in quality of metadata provided by OPERAS partners.

Only 160 ISBNs were identified in the ORCID data dump suggesting that overall there is little encouragement from either publishers, platforms or author's institutions to include information on book-length works in ORCID profiles. This may also represent a lack of support for the automated ingestion of book metadata to ORCID, which in turn would need to be supported by more consistent and complete metadata streams from publishers or platforms.

The data obtained from the Altmetric.com service is more interesting and also more informative. Nearly 1000 of the OPERAS books show some form of activity tracked

by Altmetric.com, either mainstream or social media. The vast majority of these are on the OAPEN platform with a further contribution from OBP and OpenEdition Books. The dominance of OAPEN is possibly related to the presence of <meta> tags on OAPEN records.[161] Another 304 books are registered in the service but show no activity, again dominated by books from OAPEN followed by OBP. These are stub records that have been created for institutional customers of the Altmetric.com service where book authors are affiliated.

The Altmetric.com service was originally targeted at journal articles, with one primary location online at the publisher website. A large part of its value offering is a high quality aggregation of online references to articles that is achieved by tracking all the relevant URLs that refer to an article, rather than just DOIs as is common for some other services. This is much more challenging for books that often reside at multiple locations. Therefore the service works to actively track and aggregate URLs relevant to books that are of interest, particularly those published by authors based at institutions that are Altmetric.com service.

This is important because it illustrates how engagement with a downstream service can help motivate the gathering of relevant metadata to improve data aggregation and analysis. More generally it shows how the provision of good metadata, in this case a curated list of all the URLs where a book might be found, can prime a service to collect higher quality data. It is important to note that the responsibility for providing this kind of data, does not currently belong to anyone in the supply chain. Making a community decision about where to locate that responsibility and how partners might provide data is a role that OPERAS might take.

3.   Findings

The metadata held and managed by OPERAS partners is inconsistent and variable in quality. Collecting and aggregating data from multiple OPERAS partners was a challenge due to inconsistency in bibliographic metadata processes and formats. Several partners were not explicitly included in the analysis because separate data was not available, and some analysis is limited by issues with the data provided. This includes ISBNs that appear to be incorrect.

These data quality issues create a number of downstream challenges. Firstly analysis is more challenging and involves more manual work, raising the cost and limiting the generalisability of findings. Secondly it creates a relative lack of interest amongst downstream data aggregators and providers in collecting data relating to books. Books offer particular challenges and the market remains focussed on journal articles. Nonetheless as we note below, there is interest in handling books better, which would be encouraged by the provision of more consistent and complete metadata.

The visibility of OPERAS partner books in catalogues varies by publisher. OPERAS partners have clearly focussed on different catalogues to optimise the visibility of their content. Given the heterogeneity of OPERAS partners this is not surprise. It is also evidence of a lack of crosstalk between catalogues. Again, the provision of standardised bibliographic metadata could aid both small and large publisher and platforms in gaining more visibility across all the relevant catalogues.

---

[161] Euan Adie, Altmetric.com, personal communication

Evidence can be obtained that books relevant to specific regions gain interest and attention in that region. On aggregate we have shown evidence from the analysis of country top level domains that books are often more discussed and written about in countries where the language of the book is common. We have previously shown how web visibility and country-level usage analysis can demonstrate local usage of single books. This new analysis shows that similar information can be gained at a corpus level.

While we did not see an obvious visibility bias for languages that appear frequently in the OPERAS corpus, it may be the case that rarer languages do see a bias. It may also be the case that the lack of bias is due to strong representation of French work by OpenEdition Books. We did see less visibility for books in Greek, Arabic and Russian (i.e. in different scripts) however the small numbers here limit any statistical conclusions.

The variable quality of book metadata creates challenges in analysing visibility consistently. Throughout this analysis we have had challenges in comparing like with like due to the differences in metadata completeness and quality. Similarly this will create challenges within individual partners seeking to do similar analyses. Finding ways to maintain, use and deliver high quality metadata at low cost, probably through the development of shared platforms, offers multiple benefits for OPERAS partners including better internal information, greater ease in tracking and better engagement with downstream collectors and analysts of data.

The variable quality of book metadata creates challenges for downstream data aggregation and analysis providers. In discussion with a series of downstream data providers including oaDOI and Altmetric.com the issues of tracking information for books was raised. These downstream providers are aware that of limitations in their data collection for books and have an interest in improving quality and completeness of the data they collect. In most cases they currently appear to be limited to manually updating data based on direct interactions with customers.

In general there is a question for those engaged in the production of books and open access books in particular as to who they want to design and implement solutions. By default the sector will get systems focussed on journal articles and STEM output processes. There is interest in engaging, but without a concerted effort from the providers of book content this is unlikely to be well integrated with book production.

E. Digital Visibility Challenges and Opportunities for OPERAS Partners

The promise of Open Access scholarly monographs is multi-faceted. First it provides easier and more efficient access to scholarly work for scholars. Secondly it offers access to previously expensive content to broader communities of interest who either do not have access to, or would not think to use, an academic library. In particular the free distribution of content online offers to bring together communities of interest around a specific topic. These communities may be small as well as diverse and geographically distributed. Their engagement with, and ultimately their input into scholarship has the potential to strengthen public support and enrich and diversify its impact.

To achieve this promise it is not sufficient that open access monographs be available, they must also be visible and also accessible to these diverse audiences. OPERAS

partners, funders, platforms, and publishers are already delivering on the issue of availability. Here we address the question of visibility. As has been discussed visibility is a complex issue. Visible to who? Under what circumstances? After what kinds of search? Mapping all the possible discovery pathways is a future challenge.

In this work we have taken a deliberately narrow scope. We start with the assumption that high quality and consistent bibliographic metadata at source is key to enabling the wide range of services and systems that will support discovery and visibility in diverse contexts. Our focus in these recommendations and issues is therefore on the way in which consistent metadata provision and dissemination through common channels provides a route towards visibility.

1. Challenge - The quality and consistency of OPERAS Partner metadata is variable

An early finding of the work package and consistent throughout the survey, the provided metadata, and the completeness of records in third party systems was variability in both the format, completeness, and quality of metadata. In the survey there was qualitative evidence of differing degrees of concern and interest with specific issues, relevant to specific presses and platforms. In the metadata provided there were substantial inconsistencies in format, completeness and validity. For instance the small but significant presence of identifiers that were invalid (51 ISBNs that did not validate) was an issue.

Further downstream in the data and discovery process there was clear evidence of a lack of consistency in metadata delivery. As will be discussed below this at least in part a result of diversity in the mission and goals of specific OPERAS partners and their capacity to focus on internal metadata systems. It is also a function of existing discovery and metadata systems only recently grappling with the issues of books. However, in a distributed and global information ecosystem the provision of consistent, correct, and high quality metadata is a necessary condition of optimising for visibility and discovery.

2. Challenge - Diversity of gathering, cleaning, reporting usage data across OPERAS partners makes comparison difficult

Usage data was a focus of the survey work and previous work by KU Research has focussed on usage data collected by the OPERAS partner UCL Press[162] as well as for four presses using the JSTOR platform.[163] It was not part of the visibility mapping exercise, at least in part because the previous work and survey showed that a comparison is not feasible.

OPERAS Partners that host content collect data differently, clean that data differently, and report it differently. Even where a standard protocol is used, for instance where data is referred to as "COUNTER Compliant" or "COUNTER Protocol" there is evidence of substantial differences in collection, management, exclusions and reporting. In some cases this relates to differences in the definition of access status and in some just in differences in technical systems.

---

[162] http://dx.doi.org/10.17613/M6H49K

[163] http://kuresearch.org/PDF/jstor_report.pdf

Details of internal operations tend to be sensitive as is the release of data, particularly where it is likely to be used for comparisons. Data quality issues currently mean that any comparison is likely invalid, but equally without an increase in transparency for data collection and reporting the development of best practice is unlikely. Legal, ethical and trust issues are also a significant challenge (see below).

In particular the small scale of many OPERAS partners means that they will not have the capacity to develop their own in-house expertise and systems. Adoption of good practice to generate high quality data will depend on sharing the burden of capacity building in some way. That in turn, cannot happen until there is a framework that provides sufficient trust to allow the sharing and comparison of data and its management.

3. Challenge - Application of existing systems is not always straightforward for books

Existing systems for digital and online research discovery and distribution have been largely built with journal articles in mind. The implicit assumption of a single Version of Record, hosted on a publisher-controlled website, that only rarely goes through any change is built into metadata creation, identifier systems, discovery and distribution channels. The dominant means of delivery for journal articles is now online with print a niche provision in many disciplines. In contrast for books, print still remains the focus for many publishers and the engagement with online and digital supply chains reflects that.

The confusion and inconsistency in coining and distributing Crossref DOIs and ISBNs is one example of this. Even though the set of OPERAS partners are focussed on online and digital as open-access focussed providers, there is confusion and inconsistency in the use of identifiers. Partner-provided metadata files referred to many different types or 'versions' of DOIs and ISBNs ('electronic', 'online', 'print', different file formats, platforms), in addition to the inconsistent provision of DOIs at the chapter level.

As noted elsewhere the scale of OPERAS partners and book providers in general means that the technical capacity is not necessarily available internally to engage with these issues and systems. In addition, as small players, OPERAS partners and others often do not have the levels of staff capacity to engage directly in community efforts to develop greater consistency in data practices.

The lack of applicability to books also plays out downstream. Systems such as Altmetric.com are able to exploit the (generally) single and predictable online location of journal articles to connect Crossref DOIs to URLs and aggregate mentions. For books Altmetric.com needs to undertake this work in a manual and directed fashion because there is no straightforward way to discover all the locations of a book online, and therefore to understand when social or mainstream media is linking to a copy. This challenge is also exacerbated by inconsistent practice and quality of metadata provided by publishers and platforms.

It is worth noting however that journal articles will start to face some of the same issues as green open access increases alongside preprint adoption. OPERAS partners could take a lead on developing best practice for identifying multiple locations online and take a leadership role in supporting the next generation of discovery and identifier infrastructures.

4.   Challenge - Diversity of approaches, goals and definitions creates challenges for developing common platforms

As we have noted in several places in this report there is enormous diversity in the missions, goals, and activities that different OPERAS partners undertake, even those that might be categorised together as "publishers" or as "platforms". This plays out in many ways, in the different assumptions that various partners bring to engaging with external platforms, but also in the needs for reporting and the strategic goals that drive decision making.

One example of this is the different definitions of what constitutes "open access" amongst various OPERAS partners. OpenEdition Books and Open Book Publishers offer a set of freemium offerings where some formats of the book are free but others are charged for. Others deliver only one freely accessible online format. At the same time demonstrating the use of online content appears important for most partners. This leads to a situation where usage data is sensitive and potentially competitive but also not readily comparable.

In the longer term it will become necessary to address questions as to whether formats for screen reading (some of which may have restricted functionality) are more "visible" than epub and fully downloadable PDF, and how digital visibility relates to print sales. The diversity of OPERAS partners is a strength in providing offerings for different parts of the scholarly community. It will also be a challenge in divining how the investment in visibility supports different communities. The small scale and competitive nature of OPERAS partners means that finding ways to share information and best practice will be critical. The diversity of goals, funding streams and contexts will be a challenge in delivering that.

5.   Challenge - A lack of engagement with data governance and ethics runs the risk of creating problems

While not a technical issue, the issue of data governance appears a substantial risk for OPERAS partners in two areas. Firstly there is significant variability in awareness of the implications of handling and analysing user logs. While some partners use Piwik as a local tool to collect logs many use Google Analytics. While Google Analytics (and other Google services) will presumably meet the standards being introduced under the General Data Protection Regulation in Europe there is a growing sense that they don't meet the ethical expectations of the scholarly community.

Survey answers and parallel work in the HIRMEOS project suggests to us that while some partners are sensitive to these issues the majority are not. Further, it is not clear that the technical capacity exists to properly address issues of privacy that arise as the desire for more granular information on usage and visibility grows. Future work should address the legal liability issues that arise from holding such logs and the forms of analysis, data sharing, and data retention that are appropriate for our community.

A related issue is that of governance frameworks for data sharing. If the goal of OPERAS network is to support shared best practice and capacity building, then this

will necessarily involve data transparency and sharing. As noted, usage data in particular can be highly sensitive, in addition to implicating privacy regulations. Building a framework in which trusted parties can benefit from data and tool sharing will be crucial for achieving the goals of the OPERAS network.

6. Opportunity - OPERAS can act as a growing network for best practice and capacity building

A theme with many of the challenges is that of coordination and sharing the burden of developing technology and best practice. That in turn is a substantial opportunity for OPERAS to develop a network which can support partners in sharing the development and implementation of best practice. The ongoing growth of the OPERAS network is a positive sign in this sense.

OPERAS could benefit from building its own capacity to act as a hub for initiatives or even to act as a node for the coordination of resources. While it's current role as a focus for grant funded activities is a good step in this direction building up a long term capacity to deliver value for partners will support sustainability of the network as well as providing a focus for future activities.

The diversity of partners within OPERAS means that there already is both knowledge and existing best practice that could be shared from within the network. Building internal trust will be important, and this suggests that some of the issues raised above on governance arrangements should be tackled early. This will also need to develop a global focus to include other key players. If successful, OPERAS could play a key role in ensuring a continuing diversity of scholarly book publishing organisations in contrast to the continuing concentration of journal publishing and the issues that that brings.

7. Opportunity - Downstream suppliers and aggregators of data will respond positively to better and more consistent metadata provision

While we have focussed on the inconsistency of metadata provided by OPERAS partners, the deficiencies of downstream systems in handling books, and the consequent gap, we have also seen a desire to engage and improve these systems. In particular downstream systems face challenges in connecting identifiers to a complete set of online locations (URLs) and clarity on the use of metadata to signal access state and other issues.

If practice can be systematized and the overall quality of metadata improved, there are therefore significant opportunities to improve the visibility of open access books in these systems. There is also an opportunity to engage with these systems to ensure that the interests of OPERAS partners are served in implementation decisions that will need to be made.

There are unresolved questions of where in the supply and distribution system the responsibility for creating, managing, and distributing metadata lies. As noted elsewhere these decisions were largely made by default in the journal article system. For books with the complex relationships between publishers, aggregators, platforms and discovery tools these responsibilities are less clear. Who should register DOIs? Who is responsible for maintaining landing pages? For different editions and versions? How can multiple competing platforms work together to enable discovery?

While the answers to these questions are beyond the scope of this report, working to resolve them is an opportunity for OPERAS to take a leadership role as well as to maximise the visibility and usage of OPERAS network books in ways that are appropriate and suitable for OPERAS partners.

F. Appendix A - Survey Questions

Tracking the Uses of Open Access Books

As part of OPERAS-D Work Package 3.2 the Knowledge Unlatched Research team are gathering information about how OPERAS partners gather, manage and engage with usage data relating to open access books.

In order to ensure that we capture perspectives of OPERAS network members we would be grateful if you could spend a few minutes completing this survey.

1. Email address *
2. Would you describe your organisation as: *Check all that apply.*
A publisher of open access monographs
A platform hosting open access monographs published by others
Both a publisher of open access monographs and a hosting platform
Other:
3. What kind of data about how your open access books are being used is available to your organisation?
4. Do you have a process for gathering and managing usage data relating to your OA books? If yes please describe it to us.
5. Who uses data about the usage of open access books within your organisation?
6. Does usage data impact on decisions made by editorial, marketing or other departments? If so, how?
7. What are the biggest challenges for your organisation when it comes to dealing with usage data about OA books?
8. What kinds of tools or services would help your organisation to engage more effectively with usage data?

G. Appendix B - Survey Responses

2. Would you describe your organisation as:

Would you describe your organisation as:

18 responses
- A publisher of open access monographs (4)
- A platform hosting open access monographs published by others (5)
- Both a publisher of open access monographs and a hosting platform (3)
- a library running a press that publishes OA monographs
- A tool used by open access (and other types) publishers and platforms
- A platform of search allowing the access to digital data in SSH
- A platform funding open access monographs published by others
- An academic marketplace for journals that publish articles in open access.
- An organisation flipping subscription journals to Fair Open Access
- A publisher of open access monographs, a University involved in promoting Open Access

3. What kind of data about how your open access books are being used is available to your organisation?

- online editions & downloads: weblogs - with analytics (GA, COUNTER). We collect usage data from several other third party platforms - incl Google Books, OpenEdition Books, WorldReader, ...
- Download statistics, access log
- Piwik analysis, usage data supplied by repository software (DSpace), CrossRef analytics for our DOI, OAPEN usage statistics
- Download data, website usage
- We collect data on what is annotated. We've not looked into it, but we could run domain based queries on the platforms. Not sure if we could look by publisher, but maybe...
- We provide data about OA usage of our books to our organization. It is a crucial demonstration to them of the value of UCL Press
- Counter compliant downloads
- Available to Coimbra University Press (CUP) are mainly the data about the number of visualizations and downloads of the monographs, the rate of broken accesses and books accepted in indexing databases.
- We are using data generated by Piwik.
- Full-text PDF downloads by institution, PDF downloads by region (geolocation), views
- Not applicable
- For its books, OpenEdition Books (OE) gathers information both on access and usage.
  - Access metrics:
    - nb unique visitors (distinct IPs)
    - nb of views (distinct sessions)
    - nb of page views (distinct pages)
  - Usage metrics:
    - views/downloads of chapters (sorted by books, publisher's collection, authors, referrers)
  - COUNTER metrics:
    - BR1: books (PDF and epub downloads only)
    - BR2: chapters
    - BR3: books or chapters (unauthorized access)
- The books of the Presses universitaires de Liège in open access are available on OpenEdition Books Freemium. Data are coming from this platform.
- We are a publisher of monographs and use both an external repository (http://rcin.org.pl/ibl/dlibra) to deposit books and journals, as well as our own platform (http://nplp.pl/) for extended monographs.
- Available tools:
  - Repository: Google Analytics, WebLog Expert   number of downloads
  - NPLP: Google Analytics
  - Alas only stats available for repository are for all books (incl. other institutions), so we are not able to monitor the usage of our books only,
    - Data: (Standard GA data): visits, unique users, bots, pages displayed (all data for different time periods: daily, weekly, monthly)
    - User access data, monograph views, monograph downloads, Google Analytics
- Available data is related to loading books on the platform, to download users, to visualizing the series main page, the monograph abstract page and press main page

4. Do you have a process for gathering and managing usage data relating to your OA books? If yes please describe it to us.

- This the heart of HIRMEOS WP6 - we have drivers collecting data from all third party sites. We store in database which we query for specific usage questions. Which data is aggregated depends on the question.
- The download statistics are collected by means of a wordpress plugin.
- not really yet, we do ad hoc analysis if requested by authors
- Download data is sent to IRUS-UK who create COUNTER compliant data. Based on that data, OAPEN creates reports for publishers.
- Not at the moment.
- We gather data from our institutional repository manually and put it into a spreadsheet (weekly). We are sent data from other platforms that host our books and we enter that manually into the spreadsheet (varies from twice a year to monthly)
- Yes, gathering through third party IRUS-UK, and creating periodic usage reports for customers
- Usage data is provided by page view count, Crossref DOI and Sushi Counter protocol.
- We don't manage usage data much at the moment. We will soon change our whole system (perspectivia.net) and use MyCoRe. After the final migration of perspectivia.net, we will see how to manage usage data and if we need to develop a process for managing usage data.
- Yes, (as you know ;))by working together with OAPEN we receive quarterly reports on the usage data for the titles we fund. We analyse the quarterly reports and upload this as spreadsheet to our platform to inform our customers about usage. However, this is a rather manual process and would benefit significantly from more automation.
- N.a.
- OE metrics are based on Awstats results with further processing made by PHP scripts.
- Access logs contain the raw access data
- Awstats delivers the access metrics based on the logs
- PHP scripts calculate and produce the usage metrics from access metrics
- PHP scripts calculate and produce COUNTER metrics (BR1, BR2, BR3)
- COUNTER metrics are at the moment produced according to COUNTER V4; COUNTER V5 will be implemented on January 1st 2018.
- Not especialy
- We do not monitor the usage regularly, but we would like to develop procedures to do so.
- EKT has developed an online application that gathers and manages usage data
- Within the platform there's a tool for importing /exporting data in different format (onyx, xml etc.), for creating usage statistics and custom reports

5. Who uses data about the usage of open access books within your organisation?

- Displayed on our website. Regular reports made to authors and to libraries.
- The download statistics are publicly displayed after each item
- all five staff members
- Publishers that are members of OAPEN
- N/A
- It is used by a number of different departments such as Research and Global Engagement, to demonstrate the reach and impact of the open access books we publish.
- All
- We are a section of the University of Coimbra and the main usage of the data that is collected and gathered is made by the Administration of the University and some specific Investigation Centers that are responsible for that analysis and data management.
- The editorial staff perspectivia.net and partly the scientific editorial boards of our institutes.
- Sales & marketing team
- N.a.
- Usage metrics are used primarily by the publishers, who have specific access to the display page and its searching features.
- Usage metrics exposed through COUNTER are also used by the libraries who subscribed one of the Freemium OE's offer.
- Within OE, usage metrics are used by:
  - the OE Books team
  - the IT team
- the management team
- Me as director of the Presses universitaires
- Director of the Institution and publisher management
- Service owners and collaborating publishers (upon request)
- The staff working at open access publishing

6. Does usage data impact on decisions made by editorial, marketing or other departments? If so, how?

- No (3)
- Marketing - we monitor sources of traffic, responses to marketing activities etc. Reports back to authors etc and in general 'marketing' of impact of OA publication process.
- we take it into account and plan to identify some KPIs, but as the press' rationale is serving Göttingen Campus with OA publishing options, usage data plays up to now only a minor role in the sense of understanding how well the service works overall, to gain narratives out of unexpected success stories or analyse the reach of our platforms
- N/A (not a publisher)
- It doesn't. The books we publish are selected on the basis of scholarly merit. Our marketing strategy is undertaken based on our assessment of the potential size of the audience. Our dissemination strategy is affected by usage data - we choose where to have our OA books hosted depending on the level of readership that we see.
- Indirectly. They are part of our performance as platform, and of our service to customers
- Yes, it has impact on CUP's editorial team. These data are important because they show us the impact and propagation of the several thematic areas of our contents. They allow us to define new strategic paths and directions, either for the contents that are being more distributed because of the open access politics, or for the ones that started to have more exposure and impact after the same open access benefits. At the same time that information gives us a method of action regarding the financial investments that could be taken or followed for the future.
- No, it doesn't impact any decisions.
- Yes, we are using it for the targeting of our sales and marketing to institutions. It supports the fundraising process of our titles.
- N.a.
- No specific information available on this aspect.
- To promote open access for new authors who are sometimes afraid of open access, I use data to explain to them the benefits in terms of visibility that open access offers.
- No. Decisions are now based on print circulation, or number of e-books sold through commercial platforms.
- Yes, It does. We are a Not-For-Profit Open Access Publisher. Usage data are important for us to assess the value of a collection and, consequently, to develop our promotional strategy to reach the largest number of readers.

7. What are the biggest challenges for your organisation when it comes to dealing with usage data about OA books?

- Accessing usage data from numerous platforms where the book is available. Aggregating usage data statistics collected in different ways by different platforms.
- Collecting and keeping data according the FAIR principles.
- I. So far, we lack a robust -- normalised, cleaned from robots, based on COUNTER -- data basis that would a) compile usage data from different sources, b) allow implementation of dashboards or data warehousing efforts and c) justify momentuous management decisions based on such data. II. Interaction with Google Books maintains to be a challenge, as Google repeatedly changes their interaction and access parameters. Although the data from Google is very valuable, we can't really use it as we often have data gaps and not enough time to close them let alone track why they happened in the first place.
- Optimizing workflow, how to do more work with small resources
- N/A No difference from other annotation data.
- Manual collation of stats that is only increasing with the number of books we publish and the length of time we have been in existence.
    a. Disseminating metadata to other platforms to increase usage
    b. Aggregating data from various platforms
    c. Technological/financial: to be able to provide usage data automated, online, in real time
- To decide which areas or collections should have a faster and direct intervention when it comes to display those contents in open access, and manage that effort with the need and vision of the financial investment that should embrace the whole process. To improve the quality and the external legibility and interconnectivity of the data provided.
- Since we (almost exclusively) host publications of our institutes abroad, we need to rise awareness why and how usage data is important to them and their researchers. Analyzing usage data is difficult and can easily lead to wrong assumptions about the impact of a OA book. In our case this could be detrimental to our institutes, which tend to compare their "success" to the other institutes. This means that we clearly need to understand what the usage data is telling us before we have any use for it. We also face strong restrictions concerning data security as we are a public entity (part of the German ministry for education).
- Different usage reporting formatting across hosting partners (JSTOR, OAPEN and Hathitrust all report different). Then it is also a challenge to obtain all this information, which consumes a lot of time right now. Finally, generating unified reports is done manual, which is not scalable.
- Regarding the books, the main challenge is the paradox of finding, on one hand, a measure that is standardized enough to allow for comparison and, on the other hand, a measure that is specific enough to provide useful information to our different partners. Therefore, alongside with the COUNTER metrics which give a good standardized measure mainly for libraries, OE has provided a usage metrics interface which relies on the documentary unit and its publication environment (authors, collections, etc.).
- We are a small structure. Data about OA books are only used in an empirical way.
- The construction of our repository's reporting system which makes it difficult to bowse daa about our content.
- No particular challenges have been identified yet
- It is a big challenge for our organisation to aggregate usage data about Open Access Books published under a Creative Commons Attribution Licence 4.0 and actively disseminated on different online platforms, such as our website, the institutional and disciplinary repositories, the social media etc.

8. What kinds of tools or services would help your organisation to engage more effectively with usage data?

- A range of visualisation tools that query the underlying database
- We mean usage data as a service to the public: every (open source) tool enabling us to offer

a richer and more informative representation of them would be welcome.

- To I. Import scripts to gather usage data from different sources via API, dashboard-like applications as in Piwik analysis to allow customised reports and chron jobs. To II. A consortium agreement with Google on how to gather and access usage data. Maybe this could be a smaller funded project.
- Automated reporting tools, including publishing results online.
- We use Metabase currently.
- We are currently working with KU Research to customize Tableau to provide an automated ingest tool and a dashboard to help us view the data in a simpler way, and to analyse it in new ways to better understand reader behavior.
- Aggregating from different platforms, displaying data (dashboard), automated reference extraction from pdf files (for submission to CrossRef)
- Although we know that some services can provide the usage data we want, such as Google Analytics or similar but that we still don't/can't use, what we really wish is a kind of data that are relevant respecting the origin/provenance/country of the visualizations and downloads of our contents. It would be of great help if we could have a main service from where we could manage all the information related to statistical usage data. It would also be extremely useful to be able to compare our data with those of other publishers, especially academic presses, and make a clearer contribution to typical institutional processes, like assessments/rankings and the displaying of big data.
- Right now we can only gather our isolated usage data. It would be great to be able to compare this with other usage data on similar topics or from similar platforms, maybe even from libraries.
- We would like to see an usage aggregation service that consolidates usage data from different hosting partners into one standardised report in an automated way. In turn, this should translate into an usage dashboard that can be embedded into platforms and allows customers to use different filters to analyse usage by publisher, region, etc.
- N.a.
- The existing services provided by OE seem for now sufficient to deliver detailed and accurate information on the metrics. The main challenge is the first level of raw data gathering: the tool used to collect connection metrics has to be able to distinguish thoroughly human connections from robots' connections. Awstats appears to be weaker than Piwik from this point of view but the counterpart is that Piwik produces large amounts of data uneasy to process.
- Tools and statistics from OpenEdition Books are very useful.
- A dissemination platform with stable reporting system (that is why we aim to publish our content through OpenEdition Books)
- We would like intelligent tools for automatic information integration of usage data extracted from different sources, such as publisher's website, Open Access repositories, social media platforms.

H. Appendix C - Analysis by platform/publisher

1. OAPEN

The OAPEN Library contains freely accessible academic books, mainly in the area of humanities and social sciences. OAPEN works with publishers to build a quality controlled collection of open access books, and provides services for publishers, libraries and research funders in the areas of deposit, quality assurance, dissemination, and digital preservation.

Books in the OAPEN Library are available for download in PDF format of the entire book (rather than individual book chapters).

In September 2017 the OAPEN Library metafile contained 3,888 books from 181 publishers - 2,231 of which were in English, 601 in German, 503 in Dutch.

Parameter	Number	%
Number of Books	3,888	100
Books with ISBNs	3,562	92
Books with DOIs	548	14

Count of titles present/absent in results from discovery services

Distribution of Media Events
Top publication language by Webometrics TLD
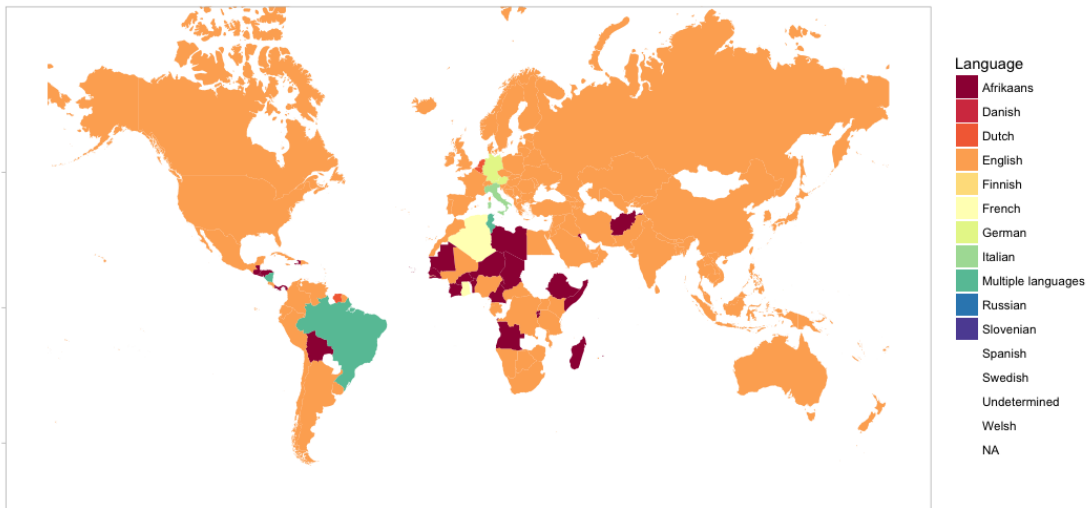

2. OpenEdition Books

OpenEdition is a web platform for books, journals, blogs and events in the humanities and social sciences. OpenEdition Books is run by the Centre for open electronic publishing (Cléo – UMS 3287), a unit that brings together the Centre National de la Recherche Scientifique (CNRS), the université d'Aix-Marseille, the École des Hautes Études en Sciences Sociales (EHESS) and the Université d'Avignon et des Pays de Vaucluse.

In September 2017 OpenEdition Books' metafile included 3,343 books from 69 publishers - including 2,610 in French, 303 in English and 215 in Spanish. More than half of the books hosted by OpenEdition Books are available in Open Access - generally via HTML. OpenEdition Books makes additional services available to libraries and institutions on a subscription basis.

Parameter	Number	%
Number of Books	3,343	100
Books with ISBNs	3,305	99
Books with DOIs	2,945	88 [164]

Count of titles present/absent in results from discovery services

---
[164] The original dataset from OpenEdition Books did not contain DOIs and that was used for the rest of the analysis. This updated figure was calculated from a new metafile provided by Open Edition Books in January 2018 which included DOIs. The remaining analysis is unchanged.

3.   Open Book Publishers

Open Book Publishers is an independent publisher of Open Access scholarly books based in the United Kingdom. Open Book Publishers makes books available in hardback, paperback and ebook editions, as well as in Open Access. Some of OBP's books are available for free HTML on-screen reading. Others are available in Open Access as fully downloadable PDFs or ePUBs. Open Book Publishers hosts books via its own servers. Open Book Publishers titles are also hosted by OAPEN, JSTOR and OpenEdition Books.

In September 2017 the Open Book Publishers metafile included 105 books, 103 of which are in English, 2 in French.

4. Göttingen University Press

Göttingen University Press is the publishing house of Göttingen University and has published scholarly texts by researchers affiliated with the university since 2003. The Press is strongly committed to Open Access publishing and makes use of Göttingen University's Open Access DSpace Archive. In addition to Open Access publishing services, Göttingen University Press also makes titles available in print-on-demand formats.

In August 2017 the Göttingen University Press metafile included 98 books, 70 of which were in German and 25 of which were in English.

5.   SHARE Press

SHARE Press is a not-for-profit open access publisher that operates as a collaboration between the Universities of Naples (Federico II, Istituto Orientale, Parthenope), Salerno, Sannio and Basilicata. As well as books, SHARE Press also publishes journals, research data and historical documentation. SHARE Press books are hosted via the University of Naples Federico II institutional repository.

In August 2017 the SHARE Press metafile included 32 books, all of which were in Italian.

Parameter	Number	%
Number of Books	32	100
Books with ISBNs	31	97
Books with DOIs	32	100

6.   EKT

EKT is the National Documentation Centre of Greece, located at the National Hellenic Research Foundation in Athens. EKT operates as national infrastructure: seeking to collect, organise, and preserve the entire Greek scientific, research and cultural output (content and data), while making it available at both a national and global level via their own repository. In August 2017 the EKT metafile included 6 books, all of which were in Greek.

Parameter	Number	%
Number of Books	6	100
Books with ISBNs	6	100
Books with DOIs	6	100

VI.   Technical mapping (OpenEdition)

A.   Context

The Technical Mapping is a deliverable of WP3, 'Technical and services requirements' of OPERAS-D project which has the objective to identify the services the OPERAS Consortium would have to develop in the future and the method of implementing them in a fully distributed infrastructure.To achieve this objective, OPERAS must first know better its own technical environment, which is very diverse and uneven and then involve users to identify clearly what services are needed by the stakeholder communities.

The technical mapping of the OPERAS environment is meant to provide a global description of the technical, organisational and information systems within the OPERAS Consortium. More precisely, the mapping has collected detailed information about workflows, softwares, development languages, data and metadata management, dissemination and distribution tools.

B.   Methods

The technical mapping has been done through a questionnaire sent to the different partners. Each of them has been sent a table structured alongside the most common types of digital publishing activities. As digital publishing is not standardized enough yet, a draft has been proposed to various individuals and profiles from the Consortium and then collectively validated. Ten OPERAS members have answered the questionnaire.

This work represents a first identification of practices, workflows and tools within the OPERAS Consortium. It is mainly a basic inventory. The categories used in the survey are going to be improved during the second semester 2017 through a collaborative process.

C.   Main Findings

1.   Preliminary remarks

This work represents a first identification of practices, workflows and tools within the OPERAS Consortium. The categories used in the survey can and must be improved later through a collaborative process. The responses are detailed and represent a reliable collection of all the information needed. Nevertheless, some answers indicate that the categories used for the survey were somehow too loose or too abstract. For instance, the questions about publishing on one hand and workflow on the other created some confusion and the same response could be found in each field. The metadata questions were difficult to classify because of their different types and use, but this aspect has to be better formalized in order to have a better description of the data management process within the Consortium. Compared to this first attempt, the main activities of the partners should therefore be defined anew in order to offer a better articulation between concepts and real practices.

For these reasons, we have decided not to follow the tables progression but to reorder the content of this report on the basis of the schema in Annex 1. This schema represents in a circular way the various activities and missions of the digital publishers involved in the OPERAS Consortium.

The sections below are an adaptation of this schema to our technical content (see table 'Functional architecture' in Annex 2). We will present the various functions from the more technical to the more abstract.

2.   Information system

Development language, Database, Size limit, Hardware

Leaving aside the front-end languages (HTML, CSS, JS), the general information collected regarding the development languages is two-fold:
·   a first group of participants benefits from an external IT system managed by their organization or a partner and don't have information on the topic;
·   another group is characterized by an in-house IT, that is an independent IT department or an operational autonomous set of IT skills (EKT, OAPEN, OBP, OE, SHARE, UGOE, UP).

In this second group, it will be useful, when many languages are involved, to understand better the usages of each language. In this way, it will be easier to identify potential collaborations.

It is interesting to note, however, that a majority of partners are PHP/MySQL users. With the exception of MWS (Python/Zope Object Database) and UGOE (XML publishing of Cocoon-Apache), all the others are using PHP alone or in combination with other languages.

The database and data size limit give us information about the present data management status and its possible evolution. For books and/or journals only, here are the database sizes:
·   less than 1 GB (OBP, SHARE books, UGOE)
·   around 2 GB (SHARE journals)
·   around 15 GB (OE Books)
·   around 30 GB (EKT, OE journals)
·   100 GB (MWS), 240 GB (UP)

This data should nevertheless be completed with additional information on the destination of the database and the existence or not of many databases for each DBMS.

Some partners indicated a data size input limit (EKT, OAPEN, UGOE, UP), ranging from 20 MB to 4 GB, and it could be interesting to know if it affects their practices and in which way.

As for the hardware, here is the essential distribution:
·   Virtual Machines: OBP (2 VMs)
·   Servers: MWS (2 rented servers), SHARE (3 servers), UGOE (1 server), UP (6 servers)
·   Servers and VMs: EKT (2 servers, n VMs), OE (21 servers, 40 VMs)

3.   Data and metadata processing

Indexing, Search functionality, Reference sets, Metadata standards, Identifiers

The processes which will create access points to the content or allow for its referencing are gathered in this section.
The indexing of the content is mainly handled in an automated way by the participants. A certain number of them use the full-text search provided by their publishing tool or repository application: OJS, OMP, E-prints or DSpace (EKT, SHARE, UniTo). Others are using a specific search engine like Solr (OE, UGOE) or Lucene (OAPEN). Some manual indexing is nevertheless used for completing the work of the application (UGOE, OBP) or for specific purposes (SHARE for Worldcat). Automated indexing also allows for a faceted search, but another set of questions could be useful in assessing the quality of the search functionality,

especially by evaluating the results for each facet. In fact, one participant indicates some poor results of the embedded search functionality of OJS/OMP.

A minority of participants also enrich their content with referenced subject headings: BIC, BISAC, VLB, LCSH (OAPEN, OE, UCL, UGOE). It is hard to assess how much these reference sets help the discoverability and if they are easy to maintain but more information on this question will be sought from the relevant partners.

Despite the similarities one would expect, the standard metadata used by participants are present with some variations (no one is using exactly the same set of standards); this will be looked at more closely from an interoperability perspective. As we are lacking information on the way these metadata are generated, it is hard to tell how difficult an adjustment would be; it is worth mentioning, though, some publishing tools that allow for this generation (e.g. OJS). The main generated standards are: DC, MARC, ONIX - rarer are DCQ and MARC XML. Alternative standards are: METS, NLM, RFC1807, ESE and PICA XML. Leaving aside the various functions of the standards (DC for PMH, ONIX for distribution, etc.), it might be appropriate to give some more information about the specific use for each standard to check how much they are effectively interoperable.

Identifiers are another kind of metadata and we wish to outline the rather wide use of interoperable identifiers. Alongside the HIRMEOS group (EKT, OAPEN, OE, UGOE) where DOI, ORCID and Funding registry are being implemented, others already have DOI (soon MWS, OBP, OLH, SHARE, UCL, UniTO, UP) or ORCID (OLH, SHARE, UniTo, UP).

On a related topic, which could have been investigated in the survey, it is interesting to mention that one partner is providing persistent URLs for its content (MWS).

4.   Publishing

Types, Number of documents, Printed copy, Publishing tools, Single source publishing

This section gathers the various elements of the OPERAS Consortium central activity of digital publishing.

The majority of the participants publish more than one type of document. Far from being limited to the more traditional journals and monographs, the types of documents handled by the participants cover almost the whole range of academic production. Alongside conference proceedings, textbooks and theses, we also find blogs, images, audio/video files, software or, potentially, any kind of data. It should be noted that sometimes the different types are handled with specific software, but this seems more related to the size of the organization (e.g. SHARE, UniTo).

The overall published content of the participants clearly gives a strategic position to the OPERAS Consortium. One partner remains isolated by its size and its variety (OE), but it would be interesting to know the trends and perspectives of each partner.

Print-on-demand services among the participants are more present than one might have expected (OBP, SHARE, UCL, UGOE, UniTo). If needed, this could allow for collaborative work or counsel.

As for the publishing tools, the first observation is the rather wide use of PKP's software (OJS, OMP) among the partners (EKT, SHARE, UCL, UniTo and soon MWS). This also obviously opens the possibility of collaborations and it already does for some of them. As

some participants in this group are not using only PKP's software for all their contents (UniTo, MWS) and others are using also different tools for their content (Lodel and Wordpress for OE), it might be interesting to investigate more in detail the relations tool/purpose and the reasons for the choices.

Another important aspect regarding the publishing tools is the development. Two partners are managing an entire publication process with their own software: OE (Lodel), UP (Rua/Jura). Others have a strong development activity (OBP) or have produced plugins (EKT, MWS). This could lead to fruitful technical collaborations useful to the OPERAS Consortium.

The publishing tools analysis can also include the single-source-publishing question. If it seems easier to have a single pivot format with only one publishing software (XML-TEI / Lodel for OE), other participants are also using as a pivot format the XML (MWS) or the PDF (UGOE). This aspect couldn't be detailed within the survey table but it surely must be developed by these partners.

The final observation to be clarified in the future: it wasn't always easy to tell what was the use made by the participants of each software or application. Detailed benchmarking in this area would help to understand the different uses better.

5. Dissemination

Distribution, Referencing, Harvesting, Metrics

The majority of the participants are using their own platform(s) to achieve their content's distribution (EKT, MWS, OAPEN, SHARE, UGOE, UniTo, UP). A smaller group is using other channels and, apart from one (OLH), it seems directly or partly related to their sales activity (OBP, OE, UCL, UP). In the last case (OBP, OE, UP), the number of distribution channels is logically very high. Even if of minor importance, we can note that the latter (OE) is externalizing the distribution process to electronic bookstores.

As for the referencing, it is more difficult to identify specificities. The main referencing entities among the partners are: DOAJ, DOAB, EBSCO. Nevertheless, not every participant has its contents referenced in each one and some referencing is sometimes more limited (MWS, UCL, OLH). Moving towards more uniform referencing throughout the Consortium would bring clear benefits.

On the other hand, almost every participant is maintaining an OAI repository for harvesting protocol. Even if differences obviously exist between the sets or the standards used, this remains a solid basis for an effective interoperability.

The situation regarding metrics appears rather disparate, even if some synergies seem possible. A certain number of partners is using or will use Google Analytics (OBP, OLH, SHARE, UCL, UP). Others are providing COUNTER statistics (EKT, OAPEN, OE, UniTo) - but some more information could be useful here as the production of COUNTER is rather complex for OE, while it seems automatic for UniTo with OJS. Some partners, finally, are using other applications: Piwik (MWS, OE, UP), Awstats (OE - soon completely replaced by Piwik), ALM metrics (SHARE).

6. Editing

Peer-reviewing, proofreading, typesetting

We put together in this 'editing' section peer-reviewing, proofreading and typesetting as being parts of the traditional publishing activity.Although not always directly involved in this editing work, most of the participants have it integrated to their own workflow. The situations are quite diverse, and present two extremes: from the participants who are not involved in editing (UniTO) to those who are traditional publishers (OBP and UCL). In between, we can find different levels of involvement.

As for the peer-reviewing, we can observe that the publishers amongst the participants, perform more or less directly peer-reviewing (UGOE, UCL, OBP). In the other cases (dissemination platforms), the peer-reviewing is a requirement or a recommendation (OE, EKT) - the difference between these will have maybe to be clarified in future surveys. The peer-reviewing of journals and books tend to be the same (e.g. two academic referees) but this also may need to be confirmed by each concerned participant.

Proofreading and typesetting are mainly undertaken by the editor and the author. Nevertheless, the same participants involved in the peer-reviewing also do the proofreading and the typesetting (OBP, MWS), but some also outsource these activities (UCL, OLH).

7.   Workflow

Process steps, Formats management, Access rights

Even though the status, services and organization of the Consortium partners is very different, the workflows used by the partners cannot be exactly similar. It was in fact difficult to give a clear and schematic representation of this section. Nevertheless, it should be possible to identify the tasks defining their mission, and more precisely their types, number and complexity.

The answers led to a first observation: those partners who use PKP publication tools (OJS, OMP) are heavily helped to structure and formalize their workflow. Although this gives a clear representation of the workflow, it is mainly 'author-oriented' and doesn't really focus on the digital publisher's work (the 'layout editor' in the OJS schema) Even if such a schema isn't necessary for the OPERAS Consortium, a short list of the main publishing activities would be useful to better assess the strengths and weaknesses of the partners' workflows. This list could be more or less the list of sections used in this report and is reflected by the various answers. For a better focus on the 'who does what when?', the list can be summarized in these specific digital publishing steps:
- Editing: peer-reviewing (partly effectuated, verified, requested?); copy-editing / typesetting (outsourced or not?); linear or circular process; access rights to the platform for authors or editors?
- Admission: document taken as it is sent; document modified (another format? Which one(s) with which tool?).
- Enrichment: adding metadata (for search, for dissemination, for archiving?).
- Dissemination: production of the output formats for the platforms; specific tasks related to the distribution outside the platform.

These various aspects can of course be amended or completed, but they would give some sound elements to evaluate the length, the complexity and the efficiency of the digital publishing process and would be useful for the training programs of the infrastructure which help new publishers to set up their press.

8. Organization

Status, funding, budget

Although these activities are strictly speaking outside the perimeter of technical mapping, organizational characteristics have technical implications: IT autonomy and size, ability to change of scale, HR availability, etc. Essentially, one dominant organizational model emerges from the survey: public status with institutional funding.
However, there are a few exceptions:
- OAPEN: a not-for-profit foundation with public institutional funding;
- OLH: a charitable company whose funding comes from library subscriptions;
- OpenEdition: a public organization which receives institutional funding and freemium sales revenue;
- OBP: a CIC (specific UK status allowing profits for public good) funded by grants, membership and sales;
- UP: Private Limited company (APC/BPC and fees for books and journals financing)

The information on budgets was rather poor and this will be collected in full on another occasion as it was somewhat peripheral to the technical investigation.

9. Prospects

A last set of questions tried to identify the interest of the partners in each other's features and tools or outside the OPERAS Consortium. It was probably a bit too soon to ask the participants which technical interactions were possible for them with or within the OPERAS Consortium; this report might help to identify possible collaborations.

Among the few suggested collaborations, however, we can note the interest for the HIRMEOS implementations: identification, annotation, entity recognition (OBP, SHARE, UniTo). A partner would be interested in changing its method of publication by using OJS (OBP), which is already used by other partners. As another potential development for the entire OPERAS Consortium, some participants would like enrich their system with data mining or text analysis (SHARE, UGOE).

D. Extension of the mapping: creation of a database

1. From the technical mapping to the technical database

The collection and analysis process led to the recognition that the technical mapping needed to be improved in order to be an effective basis for future OPERAS developments. The technical mapping is a first level of information collection from which material it is possible to build an upgraded and extended documentation. The upgrade will attempt to transform this mapping into a database that can function as a database for all member activities.
Like the mapping, the database will provide a description of the partners' technical environment and activities. It will help to share knowledge and identify possible collaborations throughout the consortium. However, the database is also meant to be the main source of information to build an orientation tool to help authors in finding and comparing the various options provided by the OPERAS consortium. In fact, the objective is to describe the platforms, the services, the expertise, the missions, the tools and technical environment of each OPERAS partner in order to provide standardized and yet thorough information to the community. We describe below the structure and content of such a database.

2. The OPERAS consortium database

The database is meant to be as detailed as the technical mapping but with extended scope. In order to provide useful material for a DBMS, it also have to use standardized content.
The database will be the tool for the new OPERAS members to describe thoroughly their activities and their technical organization. So as to add more consistency between the various works of consortium, it is partly based on the OPERAS research lifecycle (see Annex I).

The document to collect information from each partner is here: https://tinyurl.com/y9oe5xcj.
It describes the following topics:
- Identity
- Services: based on the OPERAS research lifecycle, which are the services operated?
  - Data discovery
  - Communication to peers
  - Peer review
  - Editing
  - Dissemination
  - Monitoring
  - Quality insurance
  - Literature review
- Applications: based on the same list, how are these services organized and operated?
- Users: what are the types and identity of the users?
  - Type: institution members, paying members, every user
  - Perimeter: Institution members, research domain community, national users, European users
- Business model: how the activity is funded?
  - National public funding
  - Institutional public funding
  - Services on fee
  - Project funding (regional, national, European)
- Data: what are the type and size of the data managed by the organization?
  - type of data
  - type of document
  - languages
  - size
  - licenses
  - database management
  - access type
- Technical infrastructure: what is the information system?
  - System administration
  - High availability features
  - Servers
  - Storage
  - Network

https://doi.org/10.5281/zenodo.1009561

VII. Usage survey (OpenEdition)

A. Objective

The OPERAS-D GA states that the online surveys "will be based on findings of the landscape study and will contribute towards gaining actual information on practices that will contribute to e-infrastructure integration across Europe."

Based on the findings of the Landscape study, the main objective of the surveys is to have detailed and statistical information on the current practices and collect suggestions regarding open scholarly communication. The surveys are meant to identify the gaps in the existing academic publishing ecosystem and verify how well the OPERAS RI is actually addressing the needs of the community. The findings will then serve as a basis to adjust or adapt the building parts of OPERAS.

There were two sessions of the OPERAS surveys: one during Spring 2017 (May-June), one during Autumn (Nov.-Dec.). The first session collected general information about the practices in open scholarly communication, information then refined through the second session, which was containing more open questions in order to get as detailed information as possible from the interviewees.

As part of the Network building, the survey for the publishers also contained the proposition to join the OPERAS consortium. Eight publishers showed interest for this proposition.

B. Method

The surveys were spread online using the Limesurvey software and differentiated for each type of stakeholders directly concerned by the construction of the OPERAS RI. The Spring surveys were addressed to five different audiences, all stakeholders in various capacities in open access: publishers, researchers, libraries, funders and the general public.

The Autumn surveys were addressed to the publishers, the libraries and the funders. Responses from the researchers during the Spring were sufficient in quantity and quality and didn't require further investigation. The socio-economic actors' survey hasn't been made again either because they seemed to remain a bit difficult to reach at this stage.

C. Overview

1. Participation

Congruent with the effort to reach identified persons rather than the entire web, the overall participation isn't very high. The small number of answers is also probably due to the fact that the OPERAS network had already been mobilized during the Spring surveys.

For the publishers, we received 21 responses (4 only partial). For the libraries, we received 36 responses (17 only partial). For the funders, although we were looking for a panel of approximately 10 agencies, we couldn't manage to collect more than 5 answers.

2. Countries

Even if the distribution by country doesn't reflect the real composition of the OPERAS consortium, it surely illustrates where are the more articulated OA communities within the same consortium. Netherlands, Germany and France are the countries from which we received more answers for both the publishers (for a total of 52%) and the libraries (for a total of 59%). Although less interested by these surveys, other countries of the consortium have sent some answers (Italy, Portugal, Greece, UK). Another interesting data is the willingness to answer from countries where the OPERAS partners still have little or no activity. This is the case of Switzerland in the libraries surveys. This is also the case of countries somewhat peripheral to OPERAS centre of gravity, especially from north or eastern Europe (Lithuania, Norway, Sweden).

The reason for the rather low statistics is probably also to be found in the choice to provide open questions: requiring a higher engagement from the interviewee, they surely were kind of selective. However, these open questions are also the reason why we have received some very detailed answers, like we will see hereafter.

Participation by country (Europe): Publishers

Austria 6%
Greece 6%
Italy 6%
Netherlands 18%
Lithuania 6%
Germany 17%
Norway 6%
Sweden 6%
France 17%
Other 6%
United Kingdom 6%
Participation by country (Europe): Libraries

Albania 5%
Italy 5%
Germany 27%
Norway 5%
Portugal 5%
Sweden 5%
France 11%
Netherlands 21%
Switzerland 16%
The table below represents the compilation data about the participation level for each survey and each stakeholder:

Nb of answers to the surveys for:		**Spring**	**Autumn**	**Total**
Researchers	Started surveys	248	na	248
	Completed surveys	164	na	**164**
Publishers	Started surveys	79	38	117
	Completed surveys	42	17	**59**
Libraries	Started surveys	111	36	147
	Completed surveys	43	19	**62**
Funders	Started surveys	7	16	23
	Completed surveys	3	5	**8**
Socio-economic actors	Started surveys	37	na	37
	Completed surveys	20	na	**20**

D. Publishers

As for the open access publishers, a preliminary remark should be that scattered actors imply a scattered landscape. In fact, in parallel to the interest for integrated services, there is also a need for centralized and dedicated information. On the other hand, despite obvious differences, we found some common characteristics in the publishers. There is a certain level of maturity, especially regarding standards, which has to be extended and improved. There is also a positive attitude precisely towards potential improvements to achieve: this is how we could analyze the expectations about training, the interest for structured formats or even advanced and new services.

1.   Typology

The first question about the publications' scientific domains shows that if the SSH publishers represent a strong community (47% publish only in SSH), an equal number publish both in SSH and in STEM (47%). This shows the adequation of OPERAS definition, which is to provide services and networking first to the SSH community, before their extension to other scientific communities in STEM.

In which scientific domains do you publish?
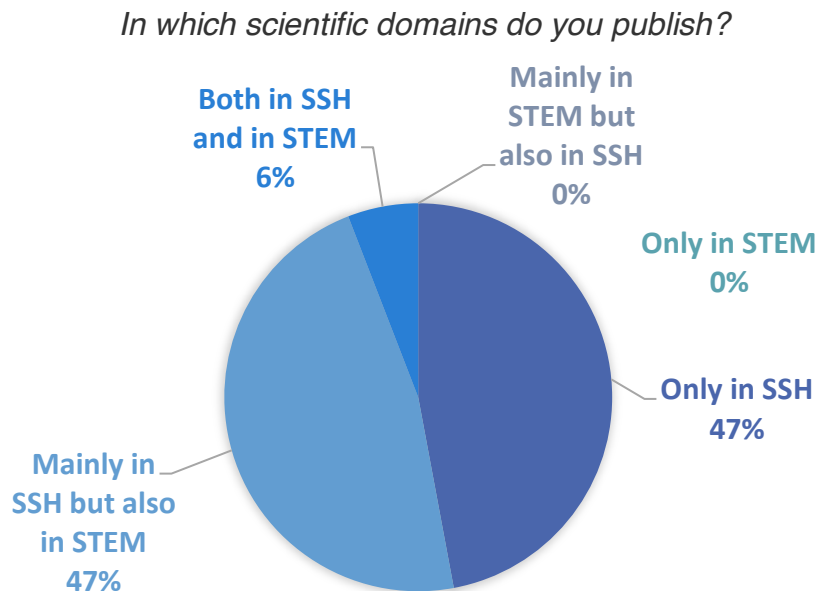

For the types of publication, it appears there is even less specialization. Among the publishers of our survey, a large majority publishes both journals and books (60%). More so, some of them indicated they also publish grey literature and other specific types (sheet music, enhanced forms of document). Even if these are not the most numerous cases, they show that OPERAS RI should be able to address these specific challenges in a near future.

Which type of document do you publish?

Journals only 10%

Books only 0%

Other 30%

Both journals and books 60%
As far as their business models are concerned, our publishers show more diversity. If the fragmentation of the OA landscape can be considered as a reliable result of the OPERAS Design Study, we have here other elements to illustrate this specificity. The question about business models allowed for multiple answers and the result is an average of 2 financing sources for each publisher. The final chart shows that, even with slightly different amounts, there are in fact three major coexisting models: revenues on sale (65%), BPC/APC (53%), OA institutional funding (47%).

What is your business model?
If one shouldn't be surprised that publishing, like other businesses, uses all the possible options to finance its activity, it's interesting to see that the three main options in this case are almost at the same level. This might be a sign that none of these models would be sustainable by itself and that the publishers have to compensate one by the other. Such business models seem therefore to be more empirical choices than elaborate solutions.

This lack of definition may also explain why the suggestions regarding the potential role of OPERAS in this matter cover very different aspects of the publishing business:

- dissemination: tools and support for wider and better dissemination

- information to authors: providing a list of publishers with their publishing options

- funding: organizing institutional funding or providing information on funding

Other suggestions concerned publishing tools. In fact, among all the suggestions not one is actually about the business models and on how to choose one. This can surprise when the comments show that financing seems sometimes difficult, sometimes rather complex. It seems that if the role of the OPERAS RI in this case is not clear for the publishers, it's also because the issues with business models are not really put in prospect. And this, precisely justifies the work currently made by the OPERAS Business Models Working Group, especially regarding the constitution of a business models marketplace.

Except for some specific cases, the access policies present a rather uniform landscape with a majority of full open access (12 out of 19 responses). In most cases there are no limitations based on types nor any kind of embargo. However, like it was

possible to infer from the business models description, the details of the access policies can vary in a significant way. Between those who declare they "offer different options at different prices" and those who provide "full open access immediately", we also find some publishers who provide OA only for funded publications and others who rely on funders or authors wishes.

More generally, this relates to the definition of open access, which ranges from free usage to gratis access. In fact, the free licenses question seems to describe the same landscape.

Do you have a free licensing policy and which are the free licenses you are using?
The practices or at least the policies are in majority in favor of the most open licenses (35% of CC-BY plus 26% of CC-BY-NC). It is worth noting that more open often means higher fees. And this is in fact one of the reasons of the difficulty to use the more open CC licenses: "CC-BY fees, especially for books, are beyond the budgets most authors have access to". Other main reasons are:

- fighting unfair commercial use (republication without attribution),
- tracking the use of the publications,
- scholars' reluctance and copyright issues (both a problem of free licensing

In your publishing workflow, what are the main formats for output data/documents?
Nevertheless, this shouldn't hide the fact that (many) other tools are currently used. Besides Open Journal Systems, we also find mentions of Lodel, Hyperwave, LateX, XML-Spy, Sigil. Some publishers didn't even list all the software they use.

The reasons that led the publishers to choose their software give more details about this situation. For making their choice of software, the publishers mention the lack of information on publishing tools made even worse by the constant shift affecting the software, the few number of stable open source software and the lack of advanced skills (e.g. for XML). There are in fact a lot of "by default" choices, where the solution is to use well known tools (OJS) or to externalize the publishing process. However, another group of publishers with more technical agility manages a clear workflow with dedicated tools. Here is one example of this group who uses:

- Indesign as the leading software
- PressBooks to try online production system for authors
- OJS to publish OA journals
- Sigil as it is simple open source to use Epub editing software

With no surprise, only two of the interviewees are already using a structured format (XML, LateX). But a majority declare to be interested in using a structured format in their workflow. Although it should be clarified how easy they think it would be to implement, it is a very interesting perspective for the OPERAS Working Group on publishing tools.

Despite the statements about the lack of information and skills in this area, some interviewees don't see how OPERAS RI could help them. This is probably due to the constantly shifting environment and the difficulty to identify the actions to take but it

shows also how much OPERAS still needs to communicate on its missions. Some needs and suggestions do come up, though, on what would improve their editing/publishing process:

- "Easy to use tools for authors, to create and proofread content within one (not publisher specific) XML-based format."

- "Training, software and web servers maintenance."

- "A special web editor like Fidus-Writer for submission, a workflow engine to handle the content's status, an open repository to store the content and to spread the meta-data"

In fact, the distinction of editing/publishing/dissemination tools within an actual workflow is not always easy but the dissemination can be defined by other functions and challenges which we tried to examine more closely.

3.   Enrichment and dissemination

a.   Metadata

A first minimal metadata enabling an efficient discoverability are the identifiers. Our panel of publishers show that best practices in this matter tend to be widely use also in the SSH community. Almost all of them are providing DOIs for their publications, whatever the size of the publisher. If the technology doesn't seem to be a problem (DOIs are often generated by the publishing software), the fee can be an obstacle to provide DOIs for each document when the publisher is small and isolated.

The author's identifiers like ORCID, on the other hand, are not as well spread. This is obviously due to the fact that they don't have yet the standard status of DOIs but it is also because there are already other identifiers for researchers at another level: international identifiers can coexist with national IDs. In fact, it appears that in this case, more than on the recommendations from every single publisher, the use of international identifiers relies in great part on the policies adopted by other types of stakeholders (national agencies, universities).

When investigating bibliographical and descriptive metadata, we can observe a landscape more disparate, constituted of different groups:

- publishers using no metadata standards

- publishers using only ONIX metadata for distribution

- publishers using tools which generate DublinCore and/or ONIX

- publishers having different sets of metadata

In the first case, it is worth noting the publishers have a workflow based on MS Office and a CMS like Wordpress. In the other cases, the metadata generation can sometime be externalized (for ONIX). But, even if there is a majority of publishers using standards, what strikes the most is that standardization itself is not standardized: there is no common set of metadata standards, there is no majority of DublinCore, ONIX or JATS standards and these coexist with others like NLM/BITS, MARC21. If the responses show that there is already a good basis to adopt best practices in this area in a more general fashion, there are also real challenges to achieve such a purpose. This is what express some suggestions:

- "We use DublinCore and ONIX and have to admit that it took us many years to master them, not in the least because of the variety in data requirement of the parties that take these metadata."

- "We would appreciate ONIX for any spreading of metadata. To have different formats (OAI, other XMLs for DOI registration...) is obstructive."

b. *Platforms*

The survey tried to identify the ways publishers disseminate their content and how they would assess their current solution. Three main groups of publishers emerges from this investigation, with specific comments and issues:

- a major group of publishers (14 out of 21) using and managing their own platforms. They state that this provides "a full editorial freedom, but a limited audience" and also that "it requires personnel and time ";

- another smaller group using both their own platforms and aggregators services: "We want to disseminate our content both through our own platform as well as via aggregated data in other databases. (…) The only important thing is that there should be links and other information available so that the end user can verify the reliability and academic rigor of the material ". Another publisher observed however that "third party aggregator platforms are costly";

- a last group externalizes dissemination to hosting providers. "By working with a platform provider that offers a customized solution, one benefits from the development roadmap (...). Less satisfying is the ensuing dependency on the capacity and skills of the chosen partner ".

This quick inventory shows that independence is important to our panel, not so much for technological reasons but mainly for intellectual ones. This is however a solution more demanding in terms of skills and time and raises issues for referencing and impact. In that sense, the most significant answer could be the case where a platform is used together with aggregators. Significant especially for the OPERAS RI where each platform could maintain its specificity while sharing common practices and benefiting from central referencing and advanced services.

c. *Advanced services*

For the advanced services, like in the Spring surveys, we focused on metrics and online annotations which will be implemented through the HIRMEOS project. Where we wanted to assess the level of interest for this specific services, we tried this time to collect more information on the actual practices in this regard.
A large majority (65%) of publishers uses metrics for their publications.

Do you use metrics to track usage of your publications?
The following question about the nature of the metrics collected was very generic ("Which metrics do you use?") and consequently the answers are altogether about types, tools and sources. As for the types, there are mentions of downloads, views and sometimes regional context. A minority also gathers citations metrics and another minority, not exactly the same, gathers altmetrics. If the main existing tools like Google Analytics and Matomo (former Piwik) are mentioned, other specific tools are used, like OJS plugin or Crossref for the citation metrics. The sources seem to be mainly the publisher's platforms but they can extend to Twitter/Facebook for altmetrics or platforms like Academia and Researchgate.

It is then obvious there is a rather high diversity of tools and types with a poorly uniform content of the metrics. If we consider also that there is a rough fifty-fifty distribution of publishers thinking they are well informed about the calculation of their metrics and publishers who don't, we understand that this kind of service still needs improvements and transparency. These challenges will in fact be addressed by the HIRMEOS implementation. This implementation could furthermore take into account the following suggestions:

- "A system that would better fit HSS: by not only charting citations from journals to journals, but also from books to books and from journals to books and vice-versa".

- "Metrics on how material is used in policy documents, news outlets, blogs, citations in Web of Science & Scopus".

About the online annotations, the situation appears to be more clear as only one publisher is currently providing the service (Hypothes.is for Pressbooks). But there is certain amount of publishers very interested or interested with caution by the prospect:

- publishers very interested and considering it: "This could be very powerful, in terms of increased usage and even impact of the publication being used";

- publishers rather interested but uncertain about researcher's engagement: "We are not yet sure of its adoption among authors and readers. Authors in many cases do not very actively engage with their work after publication";

- publishers having considered it but having renounced, mainly for authentication issues: "It is useful if adopted by multiple platforms but confusing to have an extra login requirement on top of platform authentication and personal login"

Just like for the editing/publishing workflow, we can observe for the dissemination process a rather high diversity of practices and advancement. And here also all the challenges are related to some point, as they all have consequences regarding OA publishing capacity to obtain a high level of visibility and research community engagement. The main difference being, in that case, building a common set of practices would perhaps be easier. When it would be difficult or simply not necessary to have everyone using the same publishing workflow, it is possible to start building actual common practices on the existing ground of standards and standards' awareness that we found in our panel.

4. Multilingualism

In the Spring surveys, we prepared a short set of questions about multilingualism, both for the publication in several languages and for the metadata of the publications. It showed that publication in several languages, by publishers and by researchers, was a very well-spread practice. The survey showed that, alongside with the use of English as science's *lingua franca* to gain visibility, the SSH community also managed a space for the other languages, mostly European, used by the researchers.

The Autumn survey investigated more in detail the question. The proportion of publications in several languages is here confirmed (83%), as is the proportion for the metadata in several languages (53%).

Do you provide publications in several languages?
Are the metadata also in several languages?
The languages of publication listed by the publishers could be divided by level of size in the following way:

- first, a majority of English as *lingua franca*;

- then, the main European languages;

- finally, specific research community languages.

Languages of publications
From the comments, it appears that every publisher publishes at least in English, but English is not always their main publication language. Furthermore, other languages than English like French or German are perceived as standards in specific fields. The list of languages in the figure can seem rather long and, in fact, only a few publishers publish in more than three languages. This specific cases are perhaps due to particular national situations with more importance given to minority or regional languages. In the overall, languages most spoken at international level (Chinese, Arabic, Portuguese) are not often used as publication languages. Last observation, the cases of translations are very seldom.

Another set of questions allowed for more detailed information on the motivations for publication in several languages.

Do you think that multilingualism in science is important for:
For 76% of the interviewees, multilingualism is important for fostering accuracy in science and 64% think it is important for preserving scientific and cultural vitality of their own language. These results show that multilingualism is clearly motivated and that it is a patent specificity of SSH community. In fact, the way research is conducted in SSH areas appears closely linked to language: multilingualism is not a communicational but an epistemological question. Also, publishers - and researchers through them - clearly identify their own role as an engagement for and with the society they are in.

The publishers made some suggestions for the role OPERAS could play to help to maintain and improve multilingualism:

- "Automated translation of some metadata, e.g. keywords based on a thesaurus"

- "A bilingual publication model would be very welcome",

- "All systems using metadata should be able to handle Unicode".

The challenge of mapping metadata mentioned by the first comment will indeed be addressed within OPERAS by the Discovery platform based on Isidore.

5.   OPERAS new services

A last question concerned the Certification platform OPERAS is starting to build from the DOAB: "The aim is to provide a certification service for open access monograph publishing platforms: a classification system of peer-reviewing procedures, a list of open licenses, and a tool to manage peer-review descriptions. How do you evaluate this prospect?".

Like in the Spring surveys, the publishers expressed a high interest with some specific requests:

- that it shouldn't be a new classification system of the publishers,

- that it shouldn't contain either rates for the PR procedures,

- that it would be good it has the support of large and recognized stakeholders.

Other interesting suggestions confirmed the certification service is on the good path and gave leads to improve it even more:

- "It sounds great to have an entry point for content. As long as you allow for other platforms to hold the same information. (...) A badge system similar to the one used in DOAJ might come in handy to ensure that the quality stamp is available on all local platforms as well."

- "certification should also evaluate sustainability and/of technical requirements, questions of archiving, monitoring and so on".

Although some answers showed a sort of fatalism due to a complex and sometimes inadequate ecosystem (on financial, technological or organizational side), the last comments about OPERAS new services shows that the OA publishers have the maturity and willingness to directly improve it.

E. Libraries

The Spring surveys aimed at having a general overview of the libraries' approach and assessment of open access publishing. It showed a rather high level of involvement but some details, especially technical, were sometimes lacking. The Autumn survey allowed for more detailed information.

Some definitions and specifications are needed in order to better understand the answers. In the libraries' survey, "open access" is generally intended as a delivery specificity, which means it can refer to open access only publishers, or commercial publishers providing also open access, or green OA repositories. At the same time, libraries often use two types of discovery tools: the catalog of their collections (OPAC) and a discovery tool (most of the time a third-party provider). If cataloguing defines the actions made through an OPAC and indexing could be the term for the actions conducted through a discovery tool, they both can be specific steps of the same process.

However, despite the uncertainty this lexical-practical description can make arise, a good summary of the situation could be found in this statement of an interviewee: "We want to give our users immediate access to all resources they need (OA or not OA), and from a discovery/delivery perspective OA is the ideal".

1. Open access support

A first set of questions investigated the general organization and activity as far as open access publishing is concerned.

What are the resources dedicated to open scholarly communication in your library?
At a large majority (79%), there are human resources dedicated to OA and they are directly installed in the library. This shows that for most libraries open access promotion and support is definitely considered as part of their mission. The importance given to OA implies however questions about the tools used or the training necessary to achieve such a mission.

To complete these first results, the question regarding the OA policies or actions let us see that, even if it is only for an average 50% of the libraries, there is a complete set of actions ranging from engagement to funding for researchers. In fact, the highest result (58%) shows that a certain amount of the libraries in our panel are already participating in collaborative actions for open access. Some of them are engaged in collaborative initiatives (58%, of which a part is already collaborating with OPERAS members) and the numbers prove these collaborations should be extended and improved as they correspond to an actual desire for coordination.

Does your library have specific policies for open access?

Your library have APC and/or BPC funds available for researchers. — 42%

Your library participates in collaborative initiatives for the dvelopment of open access (e.g. Knowledge Unlatched, OpenEdition Freemium). — 58%

Your institution (University or Library) has a mandate for Open Access. — 37%

Your University has signed the Berlin Declaration. — 53%
Another important role played by the libraries for the promotion of open access is of course the institutional publishing. The responses show that a majority of them (20 out of 36) provides at least one service for institutional publishing and sometimes more than one. A 53% provides a service for publishing journals and a 37% provides an open archive. Books dedicated services appears to be a bit more seldom (26%). Some comments for the "other" category teach us that libraries are also hosting data. This was slightly beyond the scope of this survey but it would be interesting, for the further development of OPERAS RI, to know which data they are hosting and if it is in the SSH area.

If you offer a service for institutional publishing, please specify the type of publication:
In fact, the analysis of the scientific domains covered by the libraries in our panel reveals there is a minority of specialized libraries. A 58% declares their coverage is both in STEM and in SSH. Only a 33% of them has a predominant coverage in SSH. We can infer from these results it is necessary, in order to collaborate better with libraries, to bring the same level of service for SSH OA publishing as in STEM.

In which scientific domains are these publications?
The last question about other forms of support for OA shows that libraries are an essential mediator between the research community and the OA publishers. In fact, passive information such as bookmarks or links are not the most important solutions. Most of the libraries (63%) provide training directly to their users.

Does your library provide other forms of support for OA publications?
The training aspect does often appear, among others, also in the suggestions for the development of the OPERAS RI:

- "Info kits for social science researchers"

- "Reliable lists of OA journals, basic and general trainings for open access topics, reliable license/rights information about publisher's policies "

- "Common criteria (metrics to measure research output, criteria to negotiate new publishing and licensing contracts with publishers, monitoring criteria to measure costs and research output)"

- "Support small publishers in getting this infrastructure, and bigger indexes in indexing smaller publishers. Support good infrastructure for OA publishing in smaller languages"

As we can see, the expectations are closely related to the users, that is the researchers, both as authors and as readers. In the first case, there is a request of transparency and centralized information. In the second case, a request for enhanced discoverability.

2.   Open access publications management

With the next questions, we tried to see how OA publications were managed by the libraries and especially if there were some specific actions or tools used to integrate them in the libraries' system.

A majority (63%) of libraries take specific actions to index OA content. The question is mixing cataloguing and indexing in order to avoid too much technical details. Therefore, we have to consider "indexing" in a broad sense.

Does your library index OA publications through its catalog or another discovery tool in order to provide direct access to these publications?
But precisely, like we said in introduction, the situation can vary greatly depending on the type of OA publications we are considering, for instance whether the indexing concerns an institutional repository or selected publications in a database. The indexing of selected publications can be achieved with a specific tool (often cited is Primo by Ex Libris): it offers a list of OA publications to be activated in the catalogue, sometimes with a supplementary manual cataloguing.

In the case of repositories managed by the libraries, the challenge is different because the objective is to make the publication visible in external databases. In this case, as it appears from the answers, the content is indexed externally in third-party generic indexes (Google Scholar, BASE) or in some cases in national indexes.

The same distinction should be made when considering this other aspect of OA management: the metadata. As seen by the libraries, identification metadata (DOI, ORCID) are not an issue for their indexing OA. In the case of activation of OA resources in a database, they are in fact not crucial. But, generally, there is also a good level of satisfaction regarding the bibliographic metadata. More precisely, it appears it is sufficient and standardized enough when there is an intermediary to take care of it: "OAPEN, Knowledge Unlatched, etc. are all delivering these metadata standards. In the ideal world, publishers would supply this data as well…".

Some answers, however, outline the lack of DOIs and ORCIDs, especially the last one in SSH publications. And the case of green OA can raise a great perplexity: "I see huge problems in that there is no clear licensing, often no ORCID, DOI, etc., or no indication that this is an open access resource ", says one of the interviewees. Another completes by saying that "In UNIMARC there is no specific field for OA". While this may seem like a detail, it shows how much the specificities of the OA publications still need to be adequately taken into account.

These remarks make us better understand the suggestions about the role of OPERAS in this matter:

- "Aligning publishers, libraries and consortia workflow delivering metadata"

- "The main problem is: who is creating the metadata for new publications? The researchers don't want to bother with it, and the librarians are busy enough with their other tasks

- "Metadata directly from the original source (i.e. the publisher) indexed in openly available global indexes for reuse everywhere"

These suggestions make it clear that something is missing between the multiple small OA publishers and the libraries and this should help to define the role OPERAS intends to play regarding standards and good practices.

3.   Open access publishers and providers

a.   Discoverability

The questions about discoverability of OA publications show that a majority of libraries are well aware of the existence of the trusted sources DOAJ (84%) and DOAB (64%). In fact, these are the tools they often use to find OA publications and they seem to provide a satisfying service.

However, if we take a closer look at the subject, we come to understand that there is still a lot of information scattered here and there and left to a benevolent serendipity. Leaving apart the fact that most of the time libraries rely on their indexing providers and they rarely look specifically for OA publications, when they do, they have to use other tools with DOAJ/DOAB (like BASE, OAIster) or simply find it difficult, especially as far as SSH is concerned. In fact, one of the interviewee states that they "use different index services (like Scopus, WoS, DOAJ, EHRI, etc.) but WoS and Scopus lack SSH content. And more specifically OA content".

b.   OA publications quality

Another set of questions was designed to specifically examine the service provided by OA publishers and OA publications hosts. It reproduces a series of questions used in the Spring survey and, like then (and perhaps even more abruptly), these questions received very few answers. Of course, we can relate this silence to the fact that libraries rarely have direct contact with publishers or open access providers. However, the truth is that the quality of OA publications is not measurable through such questions. The real problem is well framed by one interviewee: "The quality is the same as for closed access content if peer review and other technical quality standards are delivered. OA is a matter of distribution and should not be discussed in terms of editorial/quality differences". Which means, consequently, these quality standards have to be met and certified.

4.   Advanced services

In parallel to the current implementations of the HIRMEOS project, libraries were asked whether they use specific metrics for OA publications and the response was always negative. This suggests that this particular aspect of promoting open access should be covered and more widely advocated among libraries. Even if the use of metrics seems somewhat foreign to our panel, an open source tool for metrics/altmetrics will surely raise the interest of libraries.

Like in the Spring survey, the libraries were asked also if they were providing access to publications in several languages and the results are approximately the same with a 67% of "yes".

Do you provide access to OA publications in several languages?
Given the small number of answers (9), it is not easy to make conclusions but it perhaps means that, generally, publication in several languages is not a priority for the majority and/or it is not specifically related to OA. But when considering the answers of publishers on the same topic, one can ask why something so important for publishers doesn't look as important for the libraries. And in this case also, OPERAS could play the role of intermediary between both the players.

5.   OPERAS new services

As in Spring, the libraries were asked for their opinion on the future discovery platform of OPERAS. Based on the existing Isidore platform (https://www.rechercheisidore.fr), which is using various ontologies and controlled vocabularies, this platform could search not only through books and journals but will also index primary data and other research outputs. The prospect raises high interest from the libraries: "We need an international, institutionalized platform for opening up the open access content in the SSH". They also added interesting suggestions regarding:

- the user's side: "The user experience is key to making a good platform. Make it simple to use, provide good value to users".

- the collaborations: "It sounds interesting, but one should take care not to duplicate existing efforts like DOAJ, the Norwegian register etc."

The Certification platform presented also to the publishers received a unanimous interest, with comments on:

- open access advocacy: "Great idea! Quality management is a key factor in the acceptance of OA by researchers".

- books' specifics: "Make sure that you respect the existing peer-review practices for books (they are different from journal peer review)".

- quality information extension: "I would also be interested in knowing who finances OA-Books, so source of funding would be an interesting category".

The preliminary observations on definitions are somehow confirmed by the results: the different forms of open access imply different types of involvement in open access. A closer collaboration with the libraries, on the basis of the existing ones, seems a prospect as much expected as promising. And for this purpose, increasing the partnerships with libraries managing also institutional publishing appears to be

the adequate starting point.

F.   Funders

The survey for the funding agencies was exactly the same as the one we used during Spring. The number of answers (6) is obviously too small to allow for statistical analysis but the details of each one can give us a good idea of the general situation.

All the agencies[165] of our panel include open access policies in their programme and these are in some cases available on the web[166]. As it appears from the answers and the policies, the majority of the funding agencies don't include mandates for OA but rather recommendations. It would seem the difference is between foundations, which need to ensure their funding is used properly, and national public agencies, which have also a more generic open access advocacy mission in their country.

Both the green and the gold open access are accepted, even if the recommendations promote the former and add some conditions for the latter. While there can be differences in the accepted delay for self-archiving, the document to archive in a repository is most of the time the preprint (defined as "final peer-reviewed manuscript", i.e. without final proofreading, typesetting or formatting). In case the author chooses to publish in the hybrid model, the funders can provide specific financing for APCs. The conditions in this case can be about the copyright (mention of the funded author at the Fondazione Telethon) or the publisher's business model (avoid double-dipping at the FNR). Recommendations about licenses, on the other hand, appears very seldom. In any case, there are also conditions on the potential embargo period, which is of 6 months in general, with one exception for SSH (accepted 12 months embargo at the FNR).

Regarding the domains covered, precisely, FCT has the same specific embargo policy for SSH content as FNR. As far as the types are concerned, it seems that BPCs are not taken directly into account and that the policies mainly envisage journal publications. Nevertheless, the types listed in the policies can be very wide, for instance at the FCT: "scientific journals, conference proceedings, posters, books and book chapters, monographs, Masters and PhD theses". In fact, we also often find recommendations about the research data: "Where datasets are linked to the publication, these must be made freely available for validation and reuse" (FNR).

About the service providers recommended, especially in the case of self-archiving, the situations and practices are quite different from one agency to another. National agencies can rely on national generic repositories (e.g. RCAAP[167] in Portugal). In the case of gold OA, specific licenses for open access have sometimes been agreed

---

[165] See list of the funding agencies in Annex.

[166] Here are the links of the open access policies the funders indicated:

upon (e.g. Springer Open Choice[168] in Poland). A particular case is the university library which is managing a complete service from deposit (open repository) to publishing (OJS platform) coupled with an educational environment: this seems to ensure a rather autonomous process of production-dissemination. At another extremity, a topic-based foundation also expressly requires the use of a topic-based repository (PubMed Central[169] for Fondazione Telethon).

In this last case, in fact, the deposit in PubMed is also used to check the mandates have been met by using the PubMed ID generated for the publication. For the same purpose, another agency is using a dedicated tool to track Industrial Property (Clarivate[170]). A last one is using DOAB specifically for SSH content. At the same time, only 2 out of 6 interviewees declare they know and use Funding registry from Crossref. But from the answers, it seems

some of the others would be interested to use it as they lack the tools to track the outputs of their funding. In fact, one funding agency describes a situation where a registry based on funding would be helpful: "It would help if you could get a reference without searching the publisher, etc. By boolean search (combining search by author and by title for example), you could then have the reference you were searching for : it can be an article, a book, etc.".

The set of questions about publishing/disseminating OA platforms show little awareness or interest on the part of the funding agencies but the assessment of their services is generally good. Logically, the expectations towards OPERAS are not so much related to publishing itself but rather to the creation of a centralized infrastructure for OA content: "Generally, we need infrastructure (repositories) for publication and open data. (...) EU needs a coordinated policy towards international publishers to make OA more affordable and available quicker".

The last two questions were about the Certification platform. As the DOAB will serve as a basis for the future platform, the first question was meant to measure how much the DOAB was known and we found there is a 50/50 distribution between those who know DOAB and the others. This is a rather good basis to communicate about the Certification platform. At the same time, the comments on this platform are sometimes very positive, only some clarifications about usage and features are needed for the project to be fully endorsed.

This specific survey, whether we consider the level of participation or the content of the answers, shows there are still efforts to make to engage funders in OPERAS developments but also that OPERAS services could actually help them fulfil a part of their mission.

G. Main findings

1. Open Access variations

As we learned with the Spring surveys and can confirm with these Autumn surveys, there is a general need for rich metadata enabling both visibility and discoverability

---

[168] Springer Open Choice policy: http://www.springer.com/gp/open-access/springer-open-choice/springer-compact/springer-open-choice-for-polish-institutions/11027898
[169] Pubmed Central website: https://www.ncbi.nlm.nih.gov/pmc/
[170] Clarivate website: https://clarivate.com

for open access content. Transparency about publisher's business models, licenses policies, peer-reviewing processes are also a common request from researchers, publishers, libraries and funders.

However, specific needs of each stakeholder appear clearly from the results: publishers and common practices, libraries and coordination, funders and quality assessment. The researchers being, perhaps, a particular case as they would benefit from all these aspects, as authors and as readers.

2.   SSH and STEM

Without losing its specificity, open access in SSH can aim to reach the open access standards of STEM. While the publishing quality of SSH OA is generally recognized, some developments are still necessary to fully meet high level requirements: certification service, minimal set of metadata, advanced services and an integrated dissemination system.

The fragmentation characterizing the SSH landscape should not nevertheless be neglected but rather considered as an opportunity to test and spread effective common practices. Typical also of SSH research and deeply motivated, multilingualism is a specific challenge OPERAS has to and wants to address.

3.   OPERAS new services

The results of the Autumn surveys confirm that the platforms that will be implemented within OPERAS are validated by the community. The platform Research for Society raised interest from the researchers, and so did the Certification platform and the Discovery platform for the libraries and publishers.

The HIRMEOS implementations of identifiers, as well as advanced services like online annotations and open access metrics also confirm OPERAS and its related project HIRMEOS actually meet the expectations.

4.   Coordination challenges

More generally, it appears from the suggestions and comment that the various actors in the field feel a lack of coordination. Some specific efforts have to be done in order to liaise the production, enrichment and dissemination steps of open access in SSH. Alongside with the implementation and provision of new services, it seems necessary that OPERAS endorses this particular mission of helping coordinate not only the requests but also the achievements of each member of the community.

VIII. Design plan for the future services (OpenEdition)

A. Background

The Design plan for future services has been structured upon :
- the answers to the online survey aiming at identifying missing services in the current landscape of open scholarly communication (D2.3),
- the Hirmeos project implementations,
- the results of an Operas focus group meeting dedicated to the validation on OPERAS future platforms and services in January 2018,
- the synthesis interviews about organisational and management issues with other Research Infrastructures,
- a compilation of documentations on EOSC (European Open Science Cloud).
- the contributions from several Working Groups within the Operas framework.

B. Service provision Model

1. Principles

Even though each OPERAS service will follow its own path of development based on the availability of resources and its level of maturity, the aim of OPERAS infrastructure is to set a framework that drives the development of services from common principles widely adopted throughout the community. Several recent reports and publications clearly established those principles :

a. Fundamental principles

At a fundamental level, the paper named *Principles for Open Scholarly Infrastructure* by Lin and Cameron, widely recognized as a milestone in the collective conversation on the topic, provides OPERAS with a set of principles that can guide its plan for the development of future services : ""Everything we have gained by opening content and data will be under threat if we allow the enclosure of scholarly infrastructures. We propose a set of principles by which Open Infrastructures to support the research community could be run and sustained."

In particular, the following principles should be ensured:
- Governance: a system to ensure that the central services serve the community, not themselves or certain interest groups, to ensure that they are responsive to changing needs, etc;
- Sustainability: central services will need to have sustainable resources to meet their obligations and create trust;
- Insurance: the central services need to be open to create confidence and allow the community to retain control.

At the level of OPERAS, the general model entails practical question:
- How the relationship between services and OPERAS legal entity will be organised? How can we ensure that OPERAS and the central services remain aligned?
- How are the central services positioned? How do they relate to each other, in terms of their mission, purpose, target audience, value proposition, branding?
- How do we add new central services, or more general, determine which services can be defined and managed as 'central services'

b. Services structuration

Service provision to support open science policies is a critical domain that has not been properly addressed yet, as several recent reports have pointed out. Thus, the Knowledge Exchange Report published in 2016, *Putting down roots, Securing the future of open access policies*, "commissioned by Knowledge Exchange, explores the relationship between open-access policies and services. Drawing on a consultation with funders, institutions and service providers across the five Knowledge Exchange countries and beyond, it identifies the key services needed to successfully implement open-access policies, and suggests priorities for action in support of an open scholarly infrastructure."Interestingly, the report mentions that "the fundamental challenge for the implementation of OA policies is the need to develop a fully functioning OA infrastructure from the current disparate collection of services". It identifies 6 categories of services that support potentially the implementation of OA policies across the Knowledge Exchange countries :

Table 3: OA service categories and subcategories

Category	Function	Subcategories	Example services and activities
Underpinning services	Storage for scholarly outputs, unique identifiers, metadata and standards	Storage Identifiers Standards Metadata	ORCID FundREF NISO DOI
Abstracting /indexing (A&I) tools	To bring together, organise and systematise OA articles published from various platforms, allowing easy discovery and access from the public	N/A	DOAJ PubMed Directory of Open Access Books (DOAB) OpenAIRE BASE
Support and dissemination services	To provide information on various aspects of OA, from the generic (its rationale and objective) to the specific (individual journal and funder policies), and assist with capacity building	News / current awareness services Information / enabling services Business and technical planning advice Policy advisory services	SHERPA (Juliet, RoMEO) OpenDOAR
Repository services	To allow the deposit and discoverability of publications in OA repositories, enabling compliance with OA archiving policy provisions	Subject/national/ international repositories Repository software/ builders/hosting services/ registries Preservation services Repository infrastructure and interoperability	DSpace EPrints Europe PubMedCentral ArXiv Zenodo Fedora
OA publishing services	Services that support or facilitate OA publishing, and non-commercial facilitators of APC payments	Fees agents APC data collection OA publishing platforms	Open Journal System Quality Open Access Market (QOAM) ESAC
Monitoring services	To allow funders and institutions to monitor the effectiveness and impact of OA policies	Impact metrics (citations) Usage analysis tools	IRUS-UK ROBOT

The most important idea in this report is that OA infrastructure relies on a "web of services" relying closely on each other and that can't be considered independently from each other. That's why the list of OPERAS future services is more comprehensive than those that end users identified in the usage surveys. Some services for example underpin other OA communication services and are not well identified by users. It must be kept from the report that future services of OPERAS will have to be interrelated to each other and organized in a consistent catalog. That's why the plan for future services includes a "service provision mechanism" that secures consistency across the different services.

c. ***Services sustainability and governance***

A previous report published by Knowledge Exchange in 2013, *Sustainability of open access services - Phase 3: The Collective Provision of Open Access Resources,* provides a useful analytical framework to design sustainability models for future OPERAS services. The report states that "a sustainability model defines the economic logic of an infrastructure service and explains why the service should exist. A nonprofit initiative seeking to maximize mission impact requires this logic as much as a commercial firm seeking to maximize profit. Sustainability planning should be treated as an integral element of a service's design and purpose. Providing infrastructure services as public goods has inherent challenges that differ from market-based approaches and that impose specific requirements on the design of a sustainability model". In the case of OPERAS, OA services should be considered as public goods. Therefore, the business models that ensure their sustainability, even though they can vary, are limited by their particular nature and must be guided by a strong governance scheme that ensures a continuous control by the academic community over the service provision. Other parts of OPERAS design study deal with the general governance and business model of the infrastructure. The general scheme is that services won't be operated by the infrastructure as a legal entity, but by different operators in OPERAS consortium. A binding relationship between the infrastructure and the service operators has to be found, locking secured sustainability through funding with control. The legal study planned in OPERAS-D project will give more details about that point.

At a practical level, the report models the relations between sustainability and governance in a table that should be used in the future.

C. Identification of OPERAS services

1. General method

The design plan for future OPERAS services is a partially closed, partially open document. On the closed side, a set of core services has already been identified through a precise methodology achieved during OPERAS-D project. They are listed below. On the open side, a framework has been put in place to achieve further identification of future services with all partners, through working groups.

The main principle that has emerged from this Design Phase and in particular from the online survey to test OPERAS' proposition against users' needs, (researchers, libraries and publishers), is the need to define future OPERAS services upon different types of users. Six types of users has been identified and the different dimensions of OPERAS' work against those types can be represented as follow :

The maturity and distribution for the different services is uneven : some services that could address certain users' needs are not completely identified yet, or the existing node from which they could be developed don't exist yet, or there is no consensus yet in the community on the direction to which they could be developed. Some services though already meet the initial expectations : their development is already planned through specific projects

The first meeting of the focus group, composed by Operas Core Group members has validated the first services mature enough to be supported by specific projects. Those services will be supported by existing platforms : a Certification Service based on DOAB platform, a Discovery Service based on Isidore platform, and a Research for Society Service based on Hypotheses platform.

As shown in the following figures, the three services are :
1. not overlapping with publication platforms but rather complementing them at a level that could not be provided by them, individually
2. not overlapping with other scholarly communication infrastructures, namely OpenAire, but rather complementing it with other types of services.

The three OPERAS platforms delivering services towards different types of stakeholders will be complemented by other services more directly addressing the consortium needs. Here's the list of the working groups :

- Publishing Tools (coordinated by OpenEdition)
- Standards (coordinated by EKT)
- Best Practices (coordinated by Oapen)
- Advocacy (coordinated by MWS)
- Business models (coordinated by UCL Press)
- Multilingualism (coordinated by University of Coimbra)

- Platforms and services (coordinated by OpenEdition)

The working groups are currently preparing white papers identifying the state of art and the emerging trends in each topic and the developments needed by OPERAS partners to comply with the state of art or spearhead the emerging trends. The papers will be published during the month following the Athens Conference (May 31-June 1 2018) and will lay ground for future projects to set up the previously identified services. Notwithstanding the services have not been completely identified yet, their development is planned inside a general schedule defined accordingly to the ESFRI roadmap for OPERAS (see the Service provision mechanism below).

2. Service Provision Mechanism

The **service provision mechanism** will be structured during the preparatory phase 2018-2021 with initially a State of the art (in 2018) and a study on governance for service provision (2018 and 2019). The provision mechanism is being studied within the WG platforms and services which works on the aim and function of these services, the relationship and positioning within OPERAS and at European level, the sustainability and governance model of the services, including the mechanism for how to include new central services.

The **legal framework** for the service provision will be determined within the legal study under preparation within the D4.2 : Legal study and documentation which concerns the legal framework for OPERAS and the establishment of OPERAS as legal entity. This task includes external legal expertise, to draw up the necessary legal documentation. X-Oficio from Sweden has been chosen to work on the topic.

A first general overview for the service provision mechanism has been provided with interviews about organisational and management issues in distributed RI. From the interview analyses with five Research Infrastructures, it appears that the service provision depends also on the type of governances and the kind of relationships with the central hub and the national nodes.

The following schema illustrates some structural models for distributed RI.

■ Which structural models for distributed RIs exist?

A clear categorization of arrangements for collaborating facilities is not obvious. The OECD Report2on "International Distributed Research Infrastructures" distinguishes the following structural models, depending on the nature of the central coordination (red dot):

The obvious question is which of the models fit the above definition of a distributed RI by ESFRI And is still not conclusively answered.

Loose connection	
	OECD: "Network of distributed national nodes with no central coordination. Common operation can be supported by one or few nodes." This architecture does not correspond to the definition of distributed research infrastructures by ESFRI.

Central (shared) coordination	
	OECD: "Different distributed national nodes with a central coordinating mechanism supported by one node or several nodes or by an independent organisation. National nodes can function as national hubs of several distributed nodes in a given country, or there may be only one node per country."
	The nodes are not owned by the hub but have defined operational relations. This means that sites, entities, facilities are distributed and independent but crucial for infrastructure operation. Examples: • Digital RIs with data/signal at distributed locations but user access via the European RI ERI service • Networked physical regional/national infrastructures with local researchers access
	Multiple sites RIs have different places of operation and a central unit/coordinating mechanism. The distributed entities are owned by the legal framework.

Source: http://www.copori.eu/1420.php

Interviewed on these topics, M. Dowey (Jisc) explains that the difficulties are in differences of national structures and more in particular the scale, political landscape, how research is organized and the research community itself.
The success is to come up with a structure that can cope with it. Single national nodes can make sense or not.

The five interviewed Research Infrastructures are ERIC and have different relationships with national nodes.
- CERIC has a central site and one institution/country with contributes to open access facility. There are no nodes.
- EATRIS has 90 institutions, each country has a coordinating institutions with a national scientific director and a main contact point for a country. A direct contact from the central hub with institutes are possible for a project implementation to avoid to many links and hierarchy.
- DARIAH is related to national nodes through national coordination committees.
- BBMRI is completely independent of any institution. There are 19 countries members and one international organisation. The national nodes are nominated by the government. National nodes have a national coordinator which leads of the

activities in the country. The situation can be very different from one country to other : in Malta where national activities is with one institution or in Germany there are 150 biobanks.
- EGI has a membership at national level and single node in each country. The central hub is a legal organisation which hire the staff on facilitation side. The national nodes provides services.

Regarding to service provision more precisely it appears from the interviews that the service provision depends also on the type of relationships settled between the center and the national nodes or institutions.

The service provision is organized differently for the five interviewed Research Infrastructures accordingly to their specificities and governance models.
All have an ERIC status. 3 of them are in implementation phase since 2014. CERIC was created mid 2014 within a CE decision.

- **EATRIS** is since 2014 in operational phase. It has 90 institutions, 5 platforms with an infinite variety of services. Each country has a coordinating institute with a national scientific director and a main contact point. Centralized service concerns project support, for industrial and European project, legal guidance, IP etc. All institutions have a long term framework agreement.
  For Industry project a letter of engagement is signed and 5 - 8% of overheads are charged. If no contract is signed , the overheads are not charged. 2 FTE business developers are working on project support.
- **DARIAH** is an ERIC since 2014 and in operational phase. Each MS provide several services via VCC (Virtual Competence Center): the role of RI is to federate, coordinate and to provide skills through services which exist at the international level.
- **BBMRI** has several hundreds partners and a 3 levels of service provision: headquarters. National nodes: (which coordinates all the activities in the country) and individual partners. Services are provided also from the central hub for IT tools, legal and ethical services. The partners charter (quasi legal document) is signed for every service provision
- For **CERIC** the service is open access to facilities, which represents its core activity. The RI handles all the access activities, issue calls, and selection of the best proposal. The users can choose the facility. Normally more than one facility is required. The services provision is free for those who applies for calls and are selected.
- **EGI** follows http://fitsm.itemo.org/ which manages all the services life cycle, dealing also with support aspects. The services are free.

Hirmeos project
        Another step in the preparation of the service provision mechanism is also the HIRMEOS project. It was decided to upgrade existing dissemination platforms in the OPERAS Consortium with rich metadata and machine-readable content allowing for efficient text and data mining from third parties. We started with a specific project within the H2020 framework programme, focusing on open access books platforms which required specific development, as books are the most difficult objects to integrate considering their specificities. The HIRMEOS project allows for the implementation of standard identifiers such as DOI, ORCID and Fundref for books, but also other more innovative types of metadata, such as reader annotation and new usage metrics.

More importantly, HIRMEOS was used to test and deploy a common methodology that enables different partners' operating platforms based on different software and technologies to implement common standards. Based on a uniform definition of implementation levels, and a governance framework that commands distribution of work among partners, the HIRMEOS method will be used in the future development phase of OPERAS to extend standards implementation beyond the project, beyond the five dissemination platforms participating in it, and of course beyond the books themselves.

D. Services catalogue

The OPERAS catalogue is structured in 5 parts, based on the categories proposed by *Putting down the roots* Knowledge Exchange report, previously mentioned:
1. Underpinning services
2. Abstracting/indexing (A&I) tools
3. Support and dissemination services
4. Open Access publishing services
5. Monitoring services

E. Roadmap

The draft roadmap for services development is available here **Timeline**

	2018	2019	2020	2021	2022	2023	2024	2025	2026
1. UNDERPINNING SERVICES									
1.1 HIRMEOS project : identifiers, metadatas	■	■							
1.2 Research for society									
Project preparation	■	■							
Definition phase		■							
Design phase			■						
Implementation phase			■	■					
Follow up			■	■

1. Underpinning services

1.1 Storage, Identifiers, Standards, Metadatas

In the Hirmeos project it was decided to upgrade existing dissemination platforms in the OPERAS Consortium with rich metadata and machine-readable content allowing for efficient text and data mining from third parties. We started with a specific project within the H2020 framework programme, focusing on open access books platforms which required specific development, as books are the most difficult objects to integrate considering their specificities. The HIRMEOS project allows for the implementation of standard identifiers such as DOI, ORCID and Fundref for books, but also other more innovative types of metadata, such as reader annotation and new usage metrics.

More importantly, HIRMEOS was used to test and deploy a common methodology that enables different partners' operating platforms based on different software and technologies to implement common standards. Based on a uniform definition of implementation levels, and a governance framework that commands distribution of work among partners, the HIRMEOS method will be used in the future development phase of OPERAS to extend standards implementation beyond the project, beyond the five dissemination platforms participating in it, and of course beyond the books themselves.

1.2 Research for society collaboration service - Hypotheses platform

Society and different types of socio-economic actors (media, citizen, administrations and SMEs) need more than just access to academic content. In the context of citizen science which is implied by the definition of Open Science, they need a common framework to collaborate with research teams to achieve research projects that tackle their specific concerns, namely societal challenges.
Therefore, OPERAS will prepare and deploy a Research for Society platform that addresses those needs that will be open to be used across all disciplines, including both SSH and STM, in a multidisciplinary perspective.

The research for society collaboration service primary objectives are to promote citizen science and enhancing the research impact on society. Going beyond the current linear and vertical scholarly communication model, it will ensure and increase societal impact of research results, particularly in the humanities and social sciences.

This collaborative environment will provide a concrete technical support for citizen science by facilitating the implementation of research jointly conducted by teams of researchers and other socio-economic actors as previously defined. It will respond to three basic needs for the constitution and success of intersectoral and interdisciplinary teams: linking professionals that didn't know each other yet; access to funding sources (with an international database of calls for projects, an international network of funders, a crowdfunding tool); collaborative project management (management of rights and user profiles, connection to databases and data repositories, interoperability with other working environments, collaborative tools - in particular discussion and sharing - on textual and multimedia data).
This collaborative environment will also benefit from connections and interoperability with discovery tools in a digital document context, particularly for sharing documentary files created during collaborative research.

The research for society collaboration service will be built upon already existing tools, working on enhancing their usability and interoperability, and will be built, as a starting point, on the Hypotheses.org research community.

The Research for Society platform will be developed within a SWAFS-15: Exploring and supporting citizen science in April 2019. Others submissions for funding are already been made, in particular for realising a landscape study on open tools and for prototyping the common framework.

1.3 Support for web publishing (CDN)

During the development of HIRMEOS project, it appeared necessary and useful to offer a Content Delivery Network service to partners, to support the implementation of the annotation service on the platforms. The CDN would be offered first by Ubiquity Press to deliver to display and annotation javascript libraries : epub.js and pdf.js. The service could be extended to other libraries that OPERAS partners could use in the future to add extended features in their web publishing platforms. The service will be proposed from the second semester of 2018 for the two annotation libraries and could be extended after the end of the project in june 2019.

2. Abstracting/indexing (A&I) tools

2.1 Certification service

Research funders and libraries need a certification service to implement their open access policies for the former and to deliver good quality content to their users for the latter. This service has to be delivered globally because certification needs to be independent from local constraints and free from local interests; in all cases, certification must come from external authorities.

The certification platform will be implemented through the development phase of the DOAB platform during the preparation phase (2018-2021), to be fully operational in construction and implementation phase. (2022-2026).

More in particular during the preparatory phase the certification service will be developed in the framework of the Hirmeos project in 2018 and half 2019. The aim is to create and implement a certification system for peer review procedures and open licences for publishing platforms at the level of publishers, books, and book chapters. The WP has the following tasks : T.4.1 Governance and quality assurance of certification service (M2-M12),T4.2 Service development (M3-M12), T.4.3 Coordination, support and validation (M13-M17)

T.4.4-4.8 Implementation on the 5 platforms (M13-M16) which are Openedition, OAPEN, UP, EKT and OBP. For more information consult the [Hirmeos website](#).

2.2 Discovery service

Researchers need an open and efficient Discovery platform to find content relevant to their research topics. Since SSH researchers read if not write in several languages, the platform should be able to support multilingual content, which is a sufficient reason to set it up globally, and index different types of content: publications of course, but also primary data and other grey literature content. The Discovery platform will also serve as the main interface with the EOSC.

1. General roadmap

2019 - preparatory phase: building the governance and adapting the technical infrastructure.

2020/2022 - development phase: Scaling up Isidore, mapping the vocabularies in several languages using EOSC e-infra calls.

2021/2024 - production phase: Discovery platform in production, users feedback, additional services, interoperability with existing services (DARIAH-CLARIN marketplace, links with Research for Society platform).

The Discovery platform needs to be both implemented and governed. During the first phase, different workshops will be organized about the governance and the distribution of responsibilities (technical, scientific, financial) between Huma-Num (coordinator, main tool provider), OPERAS (the infrastructure which will then beneficiate from the platform) and the other partners. This work will be started earlier in order to make it to easy to organize the legal structure during the development and the production phase.

2. Strategy

The Discovery platform is an end-user service answering the needs of the whole SSH community. It aims to gather different research projects around a same service in order to facilitate sharing, exchange, reuse. It aims also to offer a service accessible to other types of stakeholders : citizens, institutions and companies. The Discovery platform is meant both to allow the researchers to find data and be able to reuse them and to allow other stakeholders to benefit from research results.

To build such a platform, three types of networks need to be activated or developed :
- SSH RIs, like DARIAH and CLARIN, and even more so with OPERAS;
- e-infrastructures to organize the integration in the EOSC;
- EASSH : an association for SSH in Europe linked with civil society.

The implementation phases will be achieved thanks to two H2020 calls, more precisely, the development and the production phases.

The Discovery platform is built on ISIDORE, a search engine developed by Huma-Num (CNRS). It has already reached at least a TRL6 level. The technology of ISIDORE will be duplicated thanks to an API which will be integrated with the platform. All the data currently harvested by ISIDORE will also be available but most of the content will come from OPERAS consortium. It implies first to align the thesauri in each field in each language and then to help the providers to organize their content for the harvest. The alignment of thesauri represents a huge task and will be the main part of the work.

However, the platform implies also to work on the harvesting methodology. It will be discussed and evaluated whether OAI-PMH is the best way or if another technology has to be used and how to prepare for this shift. The Handle identifiers will also be a part of this reflexion. Indeed, each data must have, on one hand, rich metadata (this is one of the main added-value of ISIDORE) and, on the other hand, be identified through persistent identifiers.

In the end, the platform will not be limited to the ISIDORE API but will offer a wider range of services: annotation, citation tool, authentication and profile management features, recommendations, social networking.

3.   Possible funding
- INFRAEOSC-4 "Connecting ESFRI infrastructures through Cluster projects" with ERICs in SSH: multilingualism; integration into EOSC
- INFRAEOSC-2 "Prototyping new innovative services" : additional services and implementation

[Use cases discovery tool](#)
Cf. Annex 1

3. Support and dissemination services

3.1 Support for best practices adoption

The definition and adoption of best practices that allows for a common level of quality and compliance with Open Science principles. The partners will be supported to implement the standards listed during the Preparation phase (2018-2021) and in their adoption of best practices.

Publishing is a composite activity that includes several components. Therefore, the adoption of best practices in academic publishing should address all aspects : service provision to authors, publishers agreements, peer-reviewing, editing, usage of open access licenses, dissemination, metrics and digital preservation. On each of these topics, best practices charts and lists have been elaborated by different academic and professional networks and already exist, gaining enough consensus in the community to be adopted by OPERAS consortium without the need for reinvention from the start. What has to be done is to identify the most accepted best practices for each case and plan for concrete and specific actions for their implementation by OPERAS partners.

The is a crucial domain however where best practices are not clearly established : management of the transition to Open Access. Although several "flipping mechanisms" are

proposed, none is widely considered as "best practice" over others. In that domain the debate in the academic community clearly lacks maturity.

3.2 Support for Standards implementation

Establishing a minimal common set of standards within the OPERAS consortium. Based on identification of basic requirements for high quality publishing process.
Listing of main actors of standards adoption and possible mediations between them and OPERAS partners.
The OPERAS Working Group for Common Standards has explored the workflows, mediums and technical standards that have recently emerged as a result of the changes brought about by the transition to Open Science. The WG has placed places focus on the importance of common standards, and traces the improvements required to ensure content quality and interconnectivity for scholarly output in the SSH and beyond.
CF. the Executive Summary in the Annex 3.

3.3 Support for Open access Business models

Support for innovative open access business models by developing shared components such as a common market place, a journal flipping mechanism and a funding model that involves libraries in supporting open access. The three components rely on existing successful services provided by FairOA, Knowledge Unlatched and OLH. The development of the support service will increase awareness, transparency and quality in that domain and provide funding to open the availability of the three services to more publishers.
The roadmap of development for the three components is based on the same pattern : prototyping during preparation phase and service in production during implementation phase

During the first semester of 2018 the Open Access Business models has been discussed within the Working Groups Business models. Please Cf. the Executive summary in the annex 4.

4. Open Access publishing services

Publishing toolbox service

Research and development activities aimed at developing publishing tools and technologies that partners can use from a shared toolbox in their adoption of common best practices and to support the improvement of their workflows.
During the preparation phase (2018-2021) publishing tool boxes and publishing catalogue will be set up, followed by shared training services documentation and guidelines during construction and implementation phase. (2022-2026)
During the first semester of 2018 the publishing toolbox service has been discussed within the Working Groups Tools. Please Cf. the Executive summary in the annex 2.

5. Monitoring services

Open access Books Metrics

The development of HIRMEOS project enables OPERAS to consider offering a permanent metrics service in the future and after the end of the project. The service will be composed of two components : a usage metrics service, operated by Open Book Publishers, that aggregates usage metrics (views, downloads) from a set of different publishing platforms and an alternative metrics service operated by Ubiquity Press that aggregates citation metrics from different data sources, particularly social media. The services will be offered freely to HIRMEOS partners until June 2019. No further technical development are required to provide the service but a legal framework must be provided to support the cost of the services and allow their provision to all OPERAS partners. The preparation of the framework will be done from march 2018 to june 2019.

F.   Some examples of KPI

In the framework of Esfri Submission KPI have been developed, among others, for Certification, Discovery and research for society service. The KPI have been quantified for design, preparation and construction phase.

Area	Activity	KPI	Metrics	Design	Preparation	Construction
Consortium						
	LoS	partners	number (no.)	23	30	40
	MoU	core group partners	no.	9	11	13
	EoS	supporting countries	no.	3	5	7
	National nodes	partners	no.	9	12	20
Cooperation						
	Associated partners	Global partners	no.	1	4	8
	Research Infrastructures		no.	2	3	4
Central platforms						
	Certification	platforms	no.	5	8	15
		publishers	no.	100	150	200
		publications	no.	5000	10 000	15 000
	Discovery	unique visits	GA/year	1 000 000	1 200 000	1 600 000
		searches	GA/year (sessions with search)	580 000	870 000	1 740 000
		downloads/views	GA/year	1 400 000	2 100 000	4 200 000
		impact	GA/year (direct links)	50 000	750 000	150 000
	Research for Society	research projects	no.	–	3	10
		blogs	no.	2 500	3 750	7500
		Engagement	posts and comments	337 849	500 000	1 000 000
		unique visits	PW/year	12 861 523	20 000 000	40 000 000
		impact	PW/year (direct links)	3 000 000	4 500 000	9 000 000

G.   Annex 1: Use cases Discovery Tool

1.   General Context

The Discovery Tool will be built on ISIDORE tool (developed by Huma-Num, CNRS). But it will involve several other partners and especially other services providers. The platform will be a part of the RI OPERAS. Needs to decide who will be the owner, who will be responsible for it, etc.

2. Legal Context (CE and H2020)

'Beneficiaries' means the legal entities who have signed the grant agreement (GA) with the Commission/Agency (i.e. participate in a project supported by an EU grant).

The **'coordinator'** is the beneficiary which is the central contact point for the Commission/Agency and represents the consortium (towards the Commission/Agency).
Applicants who accept the grant (by signing the GA) become beneficiaries of the grant and **are bound by the entirety** of its terms and conditions.

This means that the beneficiaries must:
- carry out the action (and especially the research work) as detailed in Annex 1 (technical implementation) and

- comply with all the other provisions of the GA and all the applicable provisions of EU, international and national law.

Other entities which participate in the action but do not sign the GA (including **linked third parties**, subcontractors, third parties giving in-kind contributions, etc.) are considered as third parties involved in the action (see Articles 8 and 9-14).

They are formally speaking not bound by the terms and conditions of the GA, although it implies certain obligations for them; conversely, the Commission/Agency has no formal contractual link with them.

H2020 > Chapter 4 > Section 1 > Article 14 151
This optional Article (together with the corresponding options in Article 6 and other provisions) will be inserted into the GA if the action is implemented with linked third parties.
Characteristics of implementation by linked third parties:

'Linked third party' :
- Linked third party does not charge a price, but declares its own costs for implementing the action tasks
- Linked third party itself performs certain action tasks directly and is responsible for them towards the beneficiary. Linked third parties do NOT sign the GA (and are therefore not beneficiaries).
- The beneficiary remains responsible towards the Commission/Agency for the work carried out by the linked third party.
- Moreover, the beneficiaries are financially responsible for any undue amount paid by the Commission/Agency as reimbursement of costs for their linked third parties — unless the GA foresees joint and several liability (see Article 44.1).
- Work is attributed to the linked third party (in Annex 1) and is usually carried out on its premises
- Work is under the full and direct control, instructions and management of the linked third party, who carries out this part of the action (with its employees).

Results:
Results are owned by the beneficiary that generates them.
'**Results'** means any (tangible or intangible) output of the action such as data, knowledge or information — whatever its form or nature, whether it can be protected or not — that is generated in the action, as well as any rights attached to it, including intellectual property rights.

Two or more beneficiaries own results jointly if:
(a) they have jointly generated them and

(b) it is not possible to:

(i) establish the respective contribution of each beneficiary, or

(ii) separate them for the purpose of applying for, obtaining or maintaining their protection (see Article 27).

The joint owners must agree (in writing) on the allocation and terms of exercise of their joint ownership ('**joint ownership agreement'**'), to ensure compliance with their obligations under this Agreement.
Unless otherwise agreed in the joint ownership agreement, each joint owner may grant non-exclusive licences to third parties to exploit jointly-owned results (without any right to sub-license), if the other joint owners are given:
(a) at least 45 days advance notice and
(b) fair and reasonable compensation.

Once the results have been generated, joint owners may agree (in writing) to apply another regime than joint ownership (such as, for instance, transfer to a single owner (see Article 30) with access rights for the others).
If third parties (including personnel) may claim rights to the results, the beneficiary concerned must ensure that it complies with its obligations under the Agreement.
If a third party generates results, the beneficiary concerned must obtain all necessary rights (transfer, licences or other) from the third party, in order to be able to respect its obligations as if those results were generated by the beneficiary itself.
If obtaining the rights is impossible, the beneficiary must refrain from using the third party to generate the results.

3.   Use case 1: HN + Public Partner or Private Partner

HN, responsible of the platform and relationships/engagement with a Pub. Partner.

Legal viewpoint: Huma-Num is the coordinator of the H2020 project. Other organisations part of the project are beneficiaries.
On a legal viewpoint, all the stakeholders have to comply with the Grant Agreement, which will define the objectives and the responsibilities related to the development of the service.
Concerning the ownership of the platform, "*results are owned by the beneficiary who generates them*". It means the platform won't belong exclusively to one party, but the

partners which will have developed it. A joint ownership agreement could be written clarifying the respective work of each stakeholder during the development of the platform, and who will manage it after the end of the project.

If the partner (public or private) is not part of the project, a contract will be negotiated between the partner and HN.

Governance viewpoint:
- The executive assembly of OPERAS is appointed to ensure the strategic aspects of the platform: positioning it in OPERAS global strategy, usefulness for the community, consistency with the other services.
- A project coordinator is appointed at HN, to coordinate the development with OPERAS and to work with the partner. Another person (a developer) can be designated to ensure the maintenance of the platform after the end of the project.
- The partner ensures the development and maintenance of the service. A project coordinator is designated.

Business Model viewpoint: the platform will be developed with the resources of the project. After the project, several solutions can be considered:

- The service is financed by HN : work on the platform (amount of time dedicated to the coordination/maintenance) is offered as a contribution to OPERAS. If the partner is private, HN ensures payments.

- other sources of funding: selling the added value of the service via a freemium access. On an administrative viewpoint, it would necessitate to create a PME.

4. **Use case 2: OPERAS (owner of the platform) + Partners involved in**

OPERAS is the owner of the platform and relationships with the services providers

Legal viewpoint:
AISBL belge:
https://www.google.fr/url?sa=t&rct=j&q=&esrc=s&source=web&cd=2&ved=0ahUKE wi7567axZbZAhXIuRQKHS55BRsQFgguMAE&url=http%3A%2F%2Fcms.horus.be %2Ffiles%2F99907%2FMediaArchive%2FCapacity_Building%2FADMIN%2Faisbl. doc&usg=AOvVaw1ayqtzHtg5-QtbS256YfaT

- **Governance/viewpoint:**

The executive assembly of OPERAS is appointed to ensure the strategic aspects of the platform: positioning it in OPERAS global strategy, usefulness for the community, consistency with the other services.

In this case, the executive assembly would also manage the service by leading the coordination of the work with the different partners (HN and other partners).

a. ***OPERAS organigram***
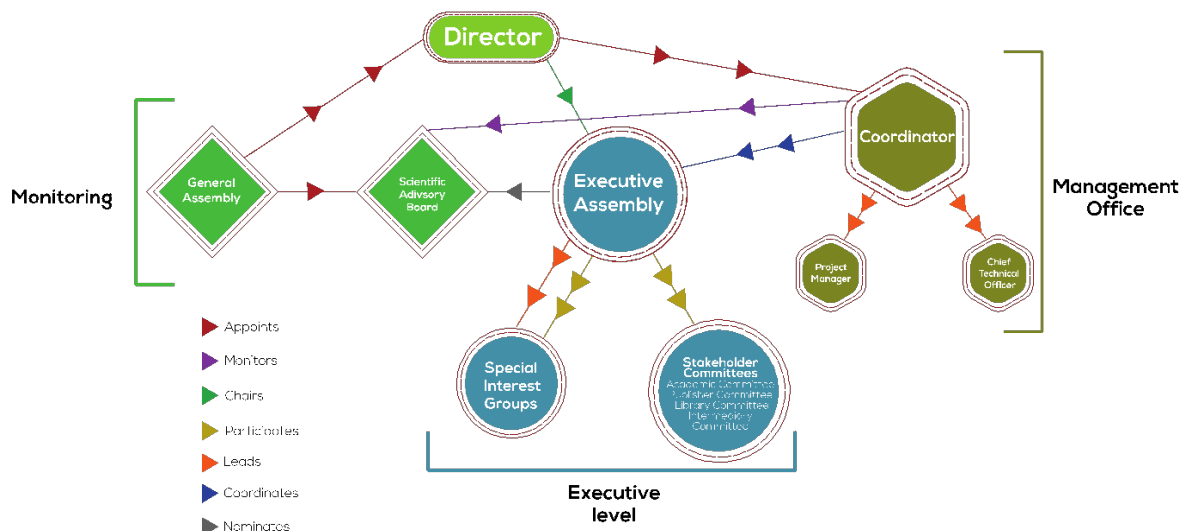

- ### **BM viewpoint:**

- The service is financed by OPERAS: maintenance hours and extra developments are paid. A service level agreement can be negotiated between OPERAS and the service provider to define the conditions of running and maintenance of the service (number of hours a month, conditions for extra-development…etc). It can be defined yearly.
- Development of a freemium model. In which extent a European infrastructure can develop this kind of model? On which features would the model be developed?

5. **Example of Service Level Agreement**

Parties

<INSTITUTION NAME>, throughout this Agreement, and <CUSTOMER>.

Contact

<SERVICE PROVIDER CONTACT DETAILS> and
<CUSTOMER CONTACT DETAILS>

Purpose and Applicability

This agreement defines the responsibilities of <INSTITUTION NAME> in the delivering of <SERVICE NAME> within DARIAH-EU from <DATE> to <DATE>.

Service Components

The service covered by this SLA is made up of the following (technical and logical) service components:
<List and description of relevant service components>

Service Level Objectives

Service Availability

1)   <INSTITUTION NAME> will provide service availability based on <SERVICE HOURS>

2) This availability will be calculated with :

<description of monitoring system and tools>
<description of the system of calculation>

3) Service Downtime is measured as :
<system of calculation>

Incident Handling

Disruptions to the agreed service functionality or quality will be handled according to an appropriate priority based on the impact and urgency of the incident. In this context, the following priority guidelines apply:
[Specific prioritization guidelines]

Service Maintenance

<SERVICE PROVIDER> shall provide Service Maintenance, including :

<specify tasks to perform>

If Service Maintenance is performed regularly :

<specify the hours of maintenance>

Service Maintenance may cause errors or unavailability of Services.
In this case :

<SERVICE PROVIDER> shall notify <SERVICE CUSTOMER> prior to performing any maintenance which would cause the unavailability of the service.

Customer responsibilities

[List and specification of any specific customer responsibilities]

Information security & data protection

The following rules for information security and data protection apply:
[Rules for information security and data protection]

Additional responsibilities of the service provider

[List and specification of any additional responsibilities or liabilities of the service provider]

Closing provisions
Specify in which conditions the agreement can be terminated.

H. Annex 2: Working Groups executive summaries

OPERAS has launched 7 working groups at the First OPERAS Validation Workshop, held on 26/27 June 2017 in Amsterdam, to explore future services OPERAS will develop. Each group is coordinated by an OPERAS core member and will develop a White Paper

1. Advocacy

The white paper first addresses the importance of open science for the SSH, highlighting the role of a distributed research infrastructure like OPERAS in advocacy for open access publishing models. It then focuses on the importance of SSH in open science, showing how open science benefits from a careful consideration of the needs of researchers in different disciplines. While OPERAS does not endorse a specific open access publishing model, infrastructure partners advocate for

publication processes that can meet the actual demand for open access, transparency and open source tools for scholarly communication.

This document is intended for all stakeholders actively involved in open access in the SSH. This includes publishers and publication platforms as well as libraries and infrastructure providers. However, the white paper ultimately focuses on advocacy for researchers at different career stages. It presents which benefits clearly arise from open access publishing for scholars and, in order to support stakeholders to advocate for open access when addressing researchers, the white paper examines researchers' concerns about open access publishing. These include but are not limited to reputation and research evaluation, financial issues, a lack of information, intellectual property rights and other legal concerns, and the availability of open access models.

It looks at experiences from OPERAS partners with regard to researchers' concerns to develop a message-tools matrix for researchers that demonstrates how to address these challenges. The white paper concludes with advocacy suggestion sheets for different stakeholders involved in open access in the SSH.

2. Tools (R&D)

The approach in OPERAS emphasizes the importance of building the open science scholarly communication infrastructure in SSH on community driven tools. In this perspective, the development of Open Source tools and the setup of a toolbox appears to be appropriate answers to the existing needs and evolutions in scholarly publishing.

Following a first discussion in the Working Group, participants discussed the partners' practices and needs to help focus the Working Group objectives on 3 functions:

- Peer review: interest in emerging practices such as open peer review, peer review tracking
- Authoring: interest in simple and all-in-one services, especially online and collaborative authoring
- Publishing: in particular, simple tools needed by small academic journals

The main results of the Working Group are:

- Notes on observed trends.
- A common approach and criteria for choosing tools
- A list of relevant tools detailing features and functionalities
- An analysis of the current needs of the partners

For Peer Review, the reviewing workflow is implemented in most open source software like OJS but developments are still needed to match the commercial software services. Similarly, the review tracking data available via services such as Publons is currently not open. The emerging trend for Open Peer Review represents an innovative area, both in terms of usage and tools.

For Authoring, we see a bloom of new collaborative tools. Promising open source software for editing structured scholarly content are being developed and are near to production, alongside commercial tools such as Authorea or Overleaf.

For Publishing, several open source software solutions are already used in production, but as the level of service expected from a publication service is rising and includes a growing number of third-party services, the community is considering ways of working together to combine their effort to be comparable with the state of the art of the commercial solutions.

The Operas partners are willing to go beyond this working group and consider engaging in follow-up projects, notably to help create a resource centre dedicated to providing the community with current information and support on scholarly communication software and tools, and to contribute to the effort in developing open source tools.

3. Standards

The OPERAS Working Group for Common Standards aims at exploring the workflows, mediums and technical standards that have recently emerged as a result of the changes brought about by the transition to Open Science. It places focus on the importance of common standards, and traces the improvements required to ensure content quality and interconnectivity for scholarly output in the SSH and beyond.

The White Paper on Common Standards comprises desk research and identifies key operational and technical aspects to be addressed by digital research infrastructures and service providers. It particularly sketches the landscape of Open Science in

Europe, focusing on the policy framework and the institutional initiatives at EU level; it also describes current and emerging research practices and highlights the needs of the stakeholders and communities engaged in scholarly communication.

Reference is specifically made to technical and operational standards for publishing infrastructures, and their importance in providing a digital scholarly communication framework that fosters content reuse, collaboration among researchers and enables the implementation of innovative research methods. To this end, the white paper identifies needs yet to be met, introduces 4 complementary areas (content quality and impact assessment, interoperability, availability and processability) for the introduction of common standards, and provides basic recommendations for their future implementation.

The white paper also examines where OPERAS members stand and assesses the work needed to reach these standards. As effective implementation of common standards is highly depended upon stakeholders' increased awareness and commitment towards more effective ways of conducting, presenting and communicating research, the white paper underlines the instrumental role of the OPERAS network in specifying new standards and updating existing ones. Finally, it drafts a roadmap for the community-wide adoption of standards.

4.   Business Models

The white paper on Business Models for Open Access proposes that there is no single ideal business model for Open Access that can be adopted as standard. It describes the current landscape in which there are multiple approaches to OA publishing, many of which are adopted by OPERAS members to suit their particular circumstances, although the APC and BPC models still predominate especially among commercial publishers. The paper describes the business models adopted by members both from the point of view of publishers, and of service providers such as Knowledge Unlatched, as well as looking at models emerging elsewhere such as in the USA and at national level in some European countries, where interesting collaborative approaches are being undertaken. The paper analyses the pros and cons of different models, and concludes with some suggestions for ways of bringing greater stability and sustainability to Open Access publishing models.

5. Best Practices

Publishing is a composite activity that includes several components. Therefore, the adoption of best practices in academic publishing should address all aspects : service provision to authors, publishers agreements, peer-reviewing, editing, usage of open access licenses, dissemination, metrics and digital preservation. On each of these topics, best practices charts and lists have been elaborated by different academic and professional networks and already exist, gaining enough consensus in the community to be adopted by OPERAS consortium without the need for reinvention from the start. What has to be done is to identify the most accepted best practices for each case and plan for concrete and specific actions for their implementation by OPERAS partners.

The is a crucial domain, however, where best practices are not clearly established : management of the transition to Open Access. Although several "flipping mechanisms" are proposed, none is widely considered as "best practice" over others. In that domain the debate in the academic community clearly lacks maturity.

6. Multilingualism

Scholarly publication is indisputably boosted by the use of the English language. However, it represents an impoverishment of certain research fields, in particular in Social Sciences and Humanities. In this scenario, the challenges for OPERAS are to support researchers that want to continue publishing in their own language and to develop transnational scientific cooperation at the same time. Thereof, the proposed intervention areas are: translation, multilanguage discovery tool and the endowment of national languages.

7. Platforms and Services

OPERAS as an infrastructure supporting open scholarly communication will provide a catalogue of services to the academic community. Despite their diversity, the services should follow common rules and principles to establish a common framework where they can be included and managed. The principles concern governance, sustainability and insurance. It entails to set up contractual relationships between the infrastructure and the service providers that reflects the principles mentioned earlier. Finally, there is a need to achieve a fully functional web of services that prevents gaps and overlaps regarding the users' needs. The list and structuration of OPERAS future services has been elaborated as a part of the infrastructure design study.

IX. OPERAS Business and Governance model and long-term strategy (OAPEN)

A. Introduction

The objective of work package 4 is to develop an overall business plan for OPERAS. This document presents the business plan and governance model for OPERAS. It is based on the Business and Governance model (M4.1). It was further developed in the subsequent Design study, which was submitted as part of the ESFRI application, and updated with the work done during the review process of the ESFRI application. In addition, the plan was updated with work done in various Core Group meetings.

The context for the OPERAS business and governance plan comes from the OPERAS application for the ESFRI Roadmap 2018[171], which is a simultaneous process to OPERAS-D. For the moment (as long as the ESFRI application process is ongoing), we have considered the requirements of the ESFRI application to provide the framework for this work package. Therefore, we will start with an outline of the ESFRI application regarding the business approach and governance of OPERAS.

B. ESFRI framework

1. Landscape

OPERAS tackles the challenge of renewing scholarly communication practices in the Humanities and Social Sciences (SSH) in the digital age and in the context of Open Science (OS). The landscape in this domain reveals an important array of initiatives (presses, library projects, platforms, service providers, researchers networks), innovative and with disruptive potential for some of them, but mostly small-size, localized, addressing small communities' needs, fragmented, not so much collaborative and communicating poorly with their peers. The players populating the scholarly communication landscape, particularly in Europe and particularly in SSH are therefore very fragile, and lack resources (in terms of skills, know-how and funding) to manage efficiently the digital turn and their integration in the European Open Science Cloud.

The current publishing system in the Social Sciences and Humanities is still late in exploiting the full potential of the open web. The landscape, as mentioned above, is dotted with myriads of small enterprises, some of them being adaptive to the new web environment, some of them still devoted to the paper format and suspicious about online diffusion, a feeling often shared with many researchers in these domains. It's also to be considered that, in such a fragmented environment, the quality of the editorial workflow and the tools to provide quality assurance can range from innovative online features to no features at all, a situation that negatively affects also the research evaluation systems.

When looking for scientific information, researchers still have to perform multiple, time-consuming queries on each of the single, small platforms of their reference publishers or on each library catalogue or institutional repository. In some cases of the time, we are talking about closed-access platforms, giving access to very narrow

---

[171] ESFRI: European Strategy Forum on Research Infrastructures, see http://www.esfri.eu/roadmap-2018

disciplinary works. When submitted to national or local research assessment exercises, researchers are in trouble in demonstrating the value of their research outputs, of the serious editorial workflow behind their work, of the real impact of their books.

In such a picture, it's difficult to think in terms of interdisciplinarity, internationalisation, or, merely, of visibility of a research which, in most of the cases, is funded by public money.

There is a number of initiatives dedicated to SSH scholarly communication in Europe that follows the guidelines of Open Science (such as OAPEN, OpenEdition, Ubiquity Press, Share Press, Perspectivia, UC Digitalis among others). They need to synergize at the level of the continent and improve their sustainability in terms of structural funding. They need to reach a critical mass together to be able to change the global landscape and drive other smaller and less advanced players onto the path to Open Science.

2. Vision

The challenges facing scholarly communication in the Humanities and Social Sciences (SSH) have been well documented in various studies and academic conferences in recent years[172]. It is generally been accepted that SSH disciplines require specific approaches to address the needs of all stakeholders and make the transition to digital practices and Open Science. In SSH, research and authorship are deeply connected and research and publication are linked through the editing process. Therefore, the lack of a specific model for humanities and social sciences based on open scholarly communication prevents a large part of the scientific community to integrate the Open Science framework by inadequate modelling.

There is currently no European infrastructure designed to support open scholarly communication in the humanities and social sciences. There are, however, a number of projects of various sizes whose organisational, technical, and financial sustainability is not guaranteed. This infrastructure project responds to this need for coordination at a European level. ERA needs to have all players of the field committed in a structural initiative to drive them onto a converging path. Other types of organization are too weak and give too little incentives to prevent the different players to diverge, experiment their own way without coordinating, and reinvent the wheel several times: this is the situation we are facing now. Professional associations (OASPA), networks (Going for Gold) and national infrastructures (OpenEdition, OAPEN, Hrcak, EKT, UC Digitalis) already exist but they are unable to structure alone the landscape in the long term at European level.

The different partners already work together on bilateral basis on specific projects[173]. If OPERAS was only a cooperation network it would be unable to move it to a wider and more global level of integration. The objective is to set up an operational framework for cooperation that drives players to global cooperation. Given the very fragmented landscape of academic publishing in Europe, especially concerning SSH, the sector obviously needs a major initiative that engages the players more effectively

---

[172] See our bibliography: http://operas.hypotheses.org/bibliography-links
[173] See HIRMEOS project to have examples: http://hirmeos.eu

than a loose network and more permanently than a project. It has to provide to all infrastructural services such as those described in the project to provide them concrete benefits to cooperation. Moreover, cooperation networks and projects can provide benefits to participating partners but are unable to change the landscape of a sector. What is needed is a common set of technologies, standards, services and models shared by a large number of players (several thousands of publishers, researchers, libraries, aggregators), across ERA countries in order to defragment the sector and build a common space allowing the development of open scholarly communication in SSH.

In most cases, players in the field tend to focus on their immediate environment. There is a lack of collaboration between north and south Europe, western and central Europe that can be reduced only through the building of a common infrastructure across ERA.

As a distributed research infrastructure, OPERAS aims at opening the many locks that prevent the sector to upgrade their practices and integrate the Open Science paradigm.

OPERAS will provide a pan-European platform dedicated to open scholarly communication including publications.

OPERAS will enable important actors from across Europe to work closer together in a joint vision that will strengthen their investment and work in the future. At the same time, it is envisioned that this Research Infrastructure (RI) will attract a significant pool of European researchers who will benefit from its services and collaborate in future innovative research and communication initiatives.

3.   Goal, Outcome, Mission

Main goal: To coordinate and pool university-led scholarly communication activities in Europe, particularly in the social sciences and humanities (SSH), in view of enabling Open Science as the standard practice

Outcome: A more efficient, fair, inclusive and sustainable scholarly communication ecosystem for European researchers

Mission: OPERAS aims to provide a pan-European infrastructure for open scholarly communication

4.   Strategy

The SSH scholarly communication is particularly fragile. Scattered among multiple small-scale actors and far from user friendly, its academic and editorial output varies in quality and is poorly funded, inaccessible and poorly referenced. This is exactly the contribution that this infrastructure project can offer, not by supplanting actors but by reinforcing their presence, initially by providing coordination and a distributed service infrastructure.

OPERAS will coordinate services, practices and technology across main actors in the SSH scholarly communications in Europe to provide joint services; to align activities of strategic actors and stakeholders (research institutions, libraries, platforms, publishers, funders) in their transition to Open Science, and in particularly scholarly communication; to develop common good practice standards for digital open access publishing, infrastructures, services, editorial qualities, business models

and funding streams, explore alternative measurements of impact in the SSH; offer sustained training along common standards to researchers and other stakeholders on all of the above.

The OPERAS organization and operation follows the principle of subsidiarity adopted by European Union: it means that each partner provides publication and communication services to their own scientific community, but collaborate and share their technologies, know-how, practices and efforts to:

1. Align their activities to increase the quality of services

2. Integrate into the European Open Science Cloud (EOSC) in particular to achieve interoperability

3. Provide integrated services at European level when there is a clear and defined added value

1) Regarding the first level (OPERAS Local), OPERAS partners provide services all along the research life cycle and provide altogether a federated open scholarly communication platform: The added value of OPERAS is to provide support to the partners regarding their current activities: information, training, adoption of best practices, sharing of tools and research and development, and improve their specialization and complementarity in terms of services and business models. The outcome of the proposed pooling of resources and coordination will be a much more efficient, fair, inclusive and sustainable scholarly communication ecosystem for European researchers, as well as an innovative one.

2) Regarding the second level (OPERAS EOSC), OPERAS drives the partners to adopt common standards (Pids, metadata, content structuration and communication protocols) and to upgrade their technical infrastructure to be able to interconnect with other parts on the EOSC. At European level, OPERAS increases connectivity and achieve collaboration with lower infrastructures (GEANT) and with complementary ones (DARIAH, CLARIN, CESSDA, OpenAire). The outcome will be a better integration of SSH disciplines in the common effort towards Open Science and make the resources available for the development of innovative services.

3) Regarding the third level (OPERAS platform), OPERAS develops integrated services at European level concerning certification, discovery and citizen science that cannot be local only. The three services will build on existing infrastructures that have proved their value and soundness, but currently lack resources to scale up:

   – The certification service will be based on the Directory of Open Access Books (DOAB) developed by OAPEN Foundation in collaboration with DOAJ: it will provide particularly to funders and research libraries an

international list of SSH open access publications that meet minimal quality criteria regarding peer-reviewing, licensing and information.

– The discovery service will be based on Isidore developed by Huma-Num. It will allow all European researchers in SSH to discover open access resources (data, publications and other materials) relevant to their research. The service added value consists of its ability to describe resources alongside disciplinary ontologies and to align them across several languages. The discovery service will then develop across Europe and enable researchers to find relevant publications and data in multiple languages.

– The Research for society service will be based on Hypotheses, currently the largest academic platform in the world with more than 2000 blogs. The service will develop social networking functionalities around Hypotheses to facilitate collaboration between researchers and socio-economic actors on research projects. The Research for society service offers a disruptive model for citizen science that complements impact with engagement. This service will be multidisciplinary and will convey STM disciplines as well as SSH to address societal challenges identified by the European Union.

C. Business model

The main objective of OPERAS is to build and maintain a sustainable network of partners and services, all tackling Open Access publishing in the humanities and social sciences. OPERAS as a consortium will put special effort in setting up standards for the involved e-infrastructures. As publishing is usually deeply rooted within disciplinary and national cultures, it will be important to have a de-centralized e-infrastructure, however bound together by common standards, mutually trusted networks and a high level of common understanding. Standards to be implemented in the networked infrastructure will cover data modeling (metadata schemes, enabling for linked open data, protocols, etc.), interoperability (metadata, content, interfaces etc.), service level agreements, expected performance rates, concepts of long-term archiving, storage policies, security and access rights. OPERAS is implementing a working group consisting of partner's delegates and external experts (members of advisory board or stakeholder board) to agree on common standards, monitor standards and consult partners and stakeholders who, especially at the beginning, are having difficulties in meeting those standards.

The central e-infrastructure services (Certification Service, Discovery Service, Societal challenges platform) will be provided by the partners, supported by their institutions. They will be developed through specific projects (HIRMEOS, INFRAEOSC, SWAFS and INFRADEV). The three integrated services provided by OPERAS will contribute to the EOSC ensuring effective integration of SSH publications and other documents.

1. OPERAS Certification Service will provide information about the quality of data (peer-reviewing and FAIR principles).

2. OPERAS Discovery Service, which is to be developed during preparation phase, will connect publications, data, researchers and projects to increase their findability, impact and re-use in the research community.

3. OPERAS Research for Science Service will contribute to the citizen science aim of the EOSC providing an effective framework for collaboration between researchers and socio-economic actors.

1.   OPERAS Stakeholders

Geographical: all ERA countries
Disciplinary: SSH and multidisciplinary
Types of stakeholders: academic institutions (scholarly communication services), publishers, platforms, service providers, research libraries, consortia.

2.   Key operating characteristics

The Business model should reflect the key operating characteristics[174]:
  – Audiences: the audiences or client segments that derive value from the service
  – Value proposition: the value that the service deliveres for which a specific client segment is willing to pay (financial or in-kind)
  – Core activities and resources to produce the service and support the funding model
  – Resource streams: the mechanisms by which the service generates income

a.   *Audiences*

The audiences for OPERAS can be divided into participating entities and target audiences:

Participating entities are OPERAS partners and Supporting countries (through ESFRI). OPERAS partners consist of the Core partners (including coordinating partner) and other partners.

Target audiences are OPERAS stakeholders (these can also be partners) and the research community:

  – academic institutions (scholarly communication services), research libraries

  – publishers

  – infrastructure services (platforms, service providers, consortia)

  – research community

  – socio-economic actors

---

[174] see Raym Crow – The collective provision of OA resources:
http://www.academia.edu/17342423/The_Collective_Provision_of_Open_Access_Resources

b. Value proposition

The value proposition for each of the audiences differs:

1. Partners: by collaborating within the OPERAS framework, partners are able to improve their performance in various ways. Benefits include: Extending reach and capacity; Developing new services for target groups; Building market position; Improving mission impact; Developing competitive advantage. These benefits are more pronounced for partners in relation to their level of involvement.

2. Coordinating country: the coordinating country has a specific advantage in the aim to achieve a transition to Open Science in HSS, by providing the hosting role. Leading the transition to OS in HSS; Building position in EOSC; Creating scale.

   – Supporting countries: supporting countries support the transition to OS in HSS and strengthen the position of national partners in OPERAS

   – Academic institutions: for Academic institutions, OPERAS provides a pan-European platform for the transition to OS, providing central and distributed OS services for researchers

   – Infrastructure services: for infrastructure services that are not an OPERAS partner, OPERAS provides a framework to support OS, through awareness, standards, training, etc.

   – Publishers: for publishers that are not an OPERAS partner, OPERAS supports the transition to OS and provides new services through its partner platforms.

   – Research community: for HSS researchers, OPERAS provides a dedicated and comprehensive platform for open scholarly communication.

   – Socio-economic actors: this is a very diverse audience, but socio-economic actors benefit from OPERAS by gaining increased access to research outputs and in particular from the Research for Society service, which provides a platform for exchange and collaboration with the research.

c. Resource streams

Each of the audiences contributes resources to OPERAS in certain ways:

   – Partners: the lead partner provides coordination of the development and eventual RI, and provides most of the in-kind support; core group partners support the coordination, support ESFRI process and provide in-kind support; the other partners also provide in-kind support.

   – Coordinating country: the coordinating country provides hosting and helps fund the development and operation of the RI

- Supporting countries: provide funding for the operation of the RI

- Academic institutions: provide access to research community, contribute through premium services

- Infrastructure services: extend distributed infrastructure, contribute through premium services

- Publishers: provide publications, contribute through premium services

- Research community: for the research community, all services are open and free to use. But researchers do contribute value to OPERAS through their usage of the services provided. One could argue that the researchers are the primary target audience and create the central value to OPERAS.

- Socio-economic actors: provide value through exchange and collaboration within the Research for Society service.

Table 1: OPERAS key operating characteristics.

Audiences		Value proposition	Contribution	Funding streams
Partners - lead	OpenEdition	Extending reach and capacity Developing new services for target groups Building market position Improving mission impact Developing competitive advantage	Coordination 2 FTE in-kind support	
Partners - core	Core group/ representing countries/ MoU		Support 0,2 FTE in-kind support	
Partners - other	LoS		0,1 FTE in-kind support	
Coordinating country	France	Leading transition to OS in HSS Building position in EOSC Creating scale	Host	Funding
Supporting countries -	Countries with EoS	Supporting transition to OS in HSS	Support	Funding
Researchers	All - HSS	Dedicated OS platform for HSS	Usage Attention	
Publishers	All - HSS	Providing new services	Publications	Contribution through premium services
Academic institutions	Europe	Platform for transition to OS OS Services for researchers	Access to researchers	Contribution through premium services
Infrastructure services	Europe	Framework supporting OS	Extending distributed infrastructure	Contribution through premium services
Socio-economic actores	Europe	Research for society service	Usage Attention	
Funders	Europe	Vehicle for transition to OS OS Services for researchers	Access to researchers	Contribution through premium services
EU	Europe	Contributing to EOSC	Support	Project funding

3. Business costs

OPERAS is an initiative gathering a large number of scholarly-led partners across Europe, most of them supported by public universities, particularly research libraries, with a few exceptions. As mentioned in the scientific case, most of them can sustain their own activity but lack resources to upgrade their technical infrastructure and/or develop new innovative services, or to scale them up to the European level. OPERAS will not fund directly partners activity, which should remain supported by the regional or national communities they serve based on their own cost-benefit analysis. The infrastructure will support them indirectly by helping them improve the quality of service they offer through R&D and coordination projects.

On the other hand, OPERAS infrastructure has to fund its own construction up to its incorporation as an ERIC and then support its own operational costs for coordination. It is planned that OPERAS operational costs after preparation and construction phases will remain extremely low. The business case for each of the 3 integrated services is that they will be independent and self-sustaining.

Therefore OPERAS costs can be divided into 4 parts:
1. Operational costs of the partners

2. Projects development cost and Infrastructure construction costs

3. Infrastructure operational costs

4. Integrated services operational costs

a. OPERAS partners operational costs

Each partner will remain independent regarding the funding of its activities. A large majority of OPERAS partners provide public infrastructure services to their regional or national scientific community. Their activity is therefore funded structurally by the public institutions supporting them. A minority of them are SMEs or not-for-profit independent organizations. The following table summarizes the economic model of the Core Group members, largely reflecting the situation of the consortium at large.

Table 2: Core partners and their business models

Name	Type	Institution/Organization	Business model
OpenEdition	Public	CNRS University of Aix-Marseille University of Avignon Ecole des Hautes Etudes en Sciences Sociales	Structural funding, freemium revenues, projects public funding
OAPEN	Not-for-Profit foundation	University of Amsterdam University of Leiden University of Utrecht Netherlands Academy of Science National Library of the Netherlands Amsterdam University Press	Revenues from services Projects funding https://www.OAPEN.org/content/about-annual-report-2015
Perspectivia	Public foundation	Max Weber Stiftung	Public funding
EKT	Public foundation	National Hellenic Research Foundation	Public funding
UCL Press	Public	University College of London (library)	Public funding and commercial revenues
IBL PAN	Public	Polish Academy of Science	Public funding Projects public funding
UC Digitalis	Public	Coimbra University	Public funding Projects public funding

b. Infrastructure development

The infrastructure development is planned to be funded through projects (INFRAEOSC and INFRADEV calls) and coordinator funding coming from the French national investment plan (2019-2026)[175], and structural funding. It is expected that FP8 (H2020) and FP9 EC funding will cover collaborative and R&D projects as well as the development of the integrated services. Coordinator funding will cover the central hub costs in terms of labor costs and physical hosting of the personnel. As stated in the MoU, Core Group partners will support in kind the development of the infrastructure through 20%FTE each.

c. OPERAS Infrastructure operational costs

After preparation and construction phases, the operational costs will be divided between coordination costs supported by the member states contributing to the ERIC, coordinator specific funding (for physical hosting) and the project funding supported by future EC calls within FP9.

---

[175] http://www.gouvernement.fr/pia3-5236

d.   *OPERAS integrated services operational costs*

The operation of the 3 integrated services will be supported by a mix funding composed of public funding coming from operators, sponsoring and commercialization of premium services (freemium model):
The certification service (DOAB) will be supported by OpenEdition (CNRS and Aix-Marseille University) and OAPEN as a joint venture through an independent, non-profit foundation. The operational costs of DOAB will be supported by shareholders contributions, sponsoring and income from premium services.
The discovery service (Isidore) will be supported by public funding through Huma-Num infrastructure.
The research for society service (Hypotheses) will be supported by public funding through OpenEdition infrastructure with additional revenues coming from premium services.
The overall principle that governs the OPERAS business case is similar to its structuration: modularity. Its sustainability is ensured by the conjunction of different streams of funding and a diversity of models used (local funding, structural funding, project funding, commercial revenues)

e.   *Financial target*

The financial target for OPERAS is 'cash-flow self-sufficiency'[176], by which we mean that external income covers all incremental operating expenses, but without covering fully loaded overhead costs and without recovering development investment.

'Cash-flow self-sufficiency' requires subsidy from the host institution:

(1)   Host institution provides in-kind overhead subsidy.

(2)   Initial development capital either grant- funded or subsidized.

(3)   Future capital investment subsidized by host institution or external funding.

f.   *Overall funding*

The overall figures are as follows:

DESIGN: €2.4 M (real)

PREPARATION: €8.6 M (estimated)

CONSTRUCTION: €9.2 M (estimated)

AVERAGE ANNUAL OPERATING COSTS: €1.6 M (estimated)

g.   *Cost details per phase*

In this section, we present the cost details per phase. Personnel costs are estimated on average at 50K a year. All evaluations are in Euro.

---

[176] see Raym Crow – The collective provision of OA resources (p.19)

Costs for the Design Phase (2015–2017): 2.4 M

– Central Hub: 1 coordinator, 1 project manager: 300K
– National nodes (Core Group) participation (since 2015): 20% FTE per partner (5 partners): 100K
– Other partners participation (since 2015) (20 partners): 10% FTE par partner: 200K
– Central Platforms (Certification service): OAPEN investment and HIRMEOS: 400K
– EOSC Integration: HIRMEOS (Books integration): 220K
– Shared Services development: HIRMEOS (PIDs and Entities recognition): 270K and FairOA: 530K
– Design Study: OPERAS-D: 400K

Costs for the Preparation Phase (2018–2022): 8.6 M

– Central Hub: 1 coordinator, 1 project manager, 1 technical officer, 3 project officers (from 2020), 1 communication officer (from 2020), 1 administrative officer (from 2020): 1 M
– National nodes (Core Group) participation: 20% FTE per partner (7 partners): 280K
– Other partners participation: 10% FTE per partner (25 partners average): 500K
– Central Platforms: Certification: 270K; Discovery service: 1.1M; Research for Society prototype: 700K
– EOSC Integration: HIRMEOS (annotation and metrics): 1M; SSH Output integration: 5M
– Shared Services: (Tools/R&D, best practices, business models): 2M
– Preparing legal entity: 20K

Costs for the Construction Phase (2022–2026): 9.2 M

I. Central Hub: 8 staff members (see preparation): 6 M
II. National nodes (Core Group) participation: 20% FTE per partner (10 partners): 400K
III. Other partners participation: 10% FTE per partner (30 partners average): 600K
IV. Central Platforms: Certification service: 360K; Discovery service: 1.6M; Research for society service: 1M
V. Shared Services: (Tools/R&D, best practices, business models): 7M
VI. ERIC incorporation: 120K

Annual operating costs: 1.6 M/year

– Central Hub: 8 staff members (see above): 400k/year
– Travel costs: 50K/year
– National nodes participation: 100K/year
– Other partners participation: (more than 30 partners) 200K/year
– Central Platforms operation: 330K/year
– Shared Services operation: Integration & innovation projects: 500K/year

4.　OPERAS budget

In this section we present the rationale and structure of the OPERAS budget. The

OPERAS development is divided into four main elements:

- Core infrastructure: all the support functions dedicated to the management of the infrastructure;
- Shared Services: the services that help the partners to improve and upgrade their own activities;
- EOSC integration: the developments needed to integrate OPERAS partners' content into the EOSC;
- Central Platforms: the three pan-European platforms that OPERAS will develop

a. Core infrastructure

Design Study: achieved in Design Phase (D). Costs were covered by OPERAS-D project.

Consortium building: costs are partners' time to participate in the Consortium groups: unstructured (D), in Working Groups and projects preparation in Preparation Phase (P), in Special Interest Groups in Construction Phase (C). Costs are calculated through in-kind contribution model (0.1FTE per partner).

Governance and Legal Framework: constitution of the Core Group (D) (calculated by in-kind contributions from members, 0.2FTE per partner), continuing in (P) and (C). Legal consulting costs will be added in (P) for the preparation of the AISBL and in (C) for the preparation of the ERIC.

Management and logistical work: Personnel costs in all phases (2FTE in (D), 8 in (P) and (C). Siting costs are not declared as they are part of OpenEdition offices.

b. Shared Services

Tools Research and Development: the establishment of the proof of concept was achieved through HIRMEOS project (D). The development of a toolbox (P) and the supporting documentation and training (C) will mainly generate salary costs, as well as marginal printing, distribution and travel costs.

Best Practice: consulting will be required in (P) to establish the guidelines and a fund will be constituted to be attributed through annual tender calls to partners in (P) and (C) who present projects to reconfigure their workflow in order to implement the guidelines.

Business models: the modules (journals flipping, library based BM, market place) have done design studies and experimentations during (D) but the costs are only partially available. Journal flipping development in (P) and (C) is phased by discipline. Costs are mainly to cover APCs during transition phases and support management and marketing activities (salaries). The development of the market place and the library-based business model in (P) will generate IT development, management and marketing costs in salaries and subcontracting. The development of the three modules will be supported during a transition period during (P) and/or (C) depending on the case, but will be sustainable afterwards (no operating cost for OPERAS).

c. EOSC integration

Books integration: costs are supported by HIRMEOS project that started during (D) and will continue during (P) (IT developments).

SSH output integration: will be done first through the constitution of a standards list (P) (consulting costs) and implementation on partners' platforms in (C) (IT development); then by the integration of the Discovery platform into EOSC (P) (IT development). A specific action on multilingualism will develop in two parts: first through alignment of ontologies on the Discovery platform during (P), then through a fund distributed to partners to support metadata translation through annual tender calls (C).

d. Central platforms

Certification platform: development costs in (D) and (P) covered by HIRMEOS project. Operating costs (P) and (C) in subcontracting for hosting, salaries for management.

Discovery platform: mainly salaries (P) for the development of the platform in IT, management, Information Science, communication.

Research for Society platform: rough estimations in (P) and (C).

e. Annual operating costs

Core Infrastructure: eight persons full time salaries and travel costs. Platforms: hosting costs and platform management in salaries.

Shared Services: ongoing integration and innovation projects.

The table below presents the overall budget for OPERAS.

Table 3: OPERAS budget

Total budget	Design 2015–2017	Preparation 2018–2022	Construction 2022–2026	Operation annual
Core infrastructure	**€ 1,000,000**	**€ 1,900,000**	**€ 2,720,000**	**€ 750,000**
Central hub	€ 300,000	€ 1,100,000	€ 1,600,000	€ 400,000
National nodes	€ 100,000	€ 280,000	€ 400,000	€ 100,000
Partners	€ 200,000	€ 500,000	€ 600,000	€ 200,000
Design study	€ 400,000			
Legal development		€ 20,000	€ 120,000	
Travel				€ 50,000
Hosting	in kind OE	in kind OE	in kind OE	in kind OE
Shared services	**€ 800,000**	**€ 2,222,000**	**€ 1,770,000**	**€ 500,000**
Tools/R&D	€ 270,000	€ 505,000	€ 600,000	
Best practises		€ 200,000	€ 200,000	
Business models	€ 530,000	€ 1,517,000	€ 970,000	
Integration & innovation				€ 500,000
EOSC Integration	**€ 220,000**	**€ 2,450,000**	**€ 1,800,000**	
Books integration	€ 220,000	€ 1,000,000		
SSH output integration		€ 1,450,000	€ 1,800,000	
Central Platforms	**€ 400,000**	**€ 2,070,000**	**€ 2,940,000**	**€ 330,000**
Certification	€ 400,000	€ 270,000	€ 360,000	€ 90,000
Discovery		€ 1,100,000	€ 1,580,000	€ 120,000
Research for Society		€ 700,000	€ 1,000,000	€ 120,000
Total	**€ 2,420,000**	**€ 8,642,000**	**€ 9,230,000**	**€ 1,580,000**

5.   Investment plan

As already outlined, the investment plan relies on different sources of funding:

- An important contribution from the Coordinator to operate the Central Hub (coordination staff) funded by 'Programmes Investissement d'Avenir' (PIA 2 and 3).
- Moderate contribution in-kind from partners depending on their level of commitment (Core Group or partners in Working Groups).
- FP8-9 funding to develop the infrastructure services and Central Platforms.

The **Consortium development** activities (Working Groups, Projects Preparation Consortia, Special Interest Groups, Core Group) costs are covered through in-kind contributions from partners: 0.1FTE per partner, 0.2FTE per Core Group member. OPERAS-D project (started in 2017, 400,000 euros) provides additional support to these activities.

The **Central Hub** is funded by the Coordinator, OpenEdition. In the Design Phase (D), the PMT was composed of two personnel holding permanent positions. The growth of the PMT up to eight persons in the Preparation (P) and Construction (C) phases will be funded through the highly strategic French investment program for the priority equipment 'Programme Investissements d'Avenir' stage 2 (PIA2 – 2012–2017: €7,000,000) and stage 3 (PIA3 – 2019–2029): €18,000,000.

The **Siting of the Hub** is ensured by OpenEdition in their premises at Aix-Marseille University (1000 sq. meters) from September 2017.

The **development of OPERAS activities** (Shared Services, EOSC Integration and Central Platforms) will be funded through H2020 and FP9 projects, namely:

- *HIRMEOS* project (started 2017, end in 2019) : €2,000,000 to support Shared Services and EOSC Integration activities;
- *SwafS-15-2018-2019*: Exploring and supporting citizen science (starting 2018, end in 2021): up to €2,000,000 to support the development of the Research for Society prototype;
- *INFRAEOSC-02-2019* (starting 2019, end in 2023): Prototyping new innovative services: €6,000,000 to support EOSC Integration and Discovery platform development;
- *INFRADEV-02-2019-2020*: Preparatory phase of new ESFRI projects (Starting 2019, end in 2023): €4,000,000 to support the development of Shared Services and the Certification platform in (P) and first year of (C)
- *Second INFRADEV* in FP9 (starting 2024, end in 2028): €4,000,000 to support all dimensions of the Infrastructure Construction: Central Hub, Shared Services, EOSC Integration, Central The INFRADEV funding in (C) will prepare the creation of the ERIC and support its operation in the first two years (2026–2028)

Table 4: Overview of costs and funding sources

Phase	Timeline	Costs	Funding sources	Specific Funding
Design	2015-17	2.4 M	OpenEdition 0.3 M Core group 0.1 M Partners 0.2 M EU project 1.3 M (various 0,5 M)	PIA2 HIRMEOS (EINFRA) OPERAS-D (INFRASUPP)

Construction	2022-26	9.2 M	Hosting country 1.6 M National nodes 0.4 M Partners 0.6 M EU project 6.7	PIA3 INFRADEV-2-2019-2020 INFRADEV2 Revenues from services
Operation	2026-	1.6 M (annual)	Hosting country 0.4 M National nodes 0.1 M Partners 0.2 M Members	ESFRI INFRADEV2 Revenues from services

6. Work Breakdown Structure

The table below presents the main project tracks (apart from the Core Infrastructure), in relation to ESFRI development and funding sources.

Table 5: OPERAS project tracks

Phase	Timeline	Shared Services	EOSC Integration	Central Platforms	ESFRI	Specific Funding
Design	2015–17	Bilateral projects; Working Groups; Proof of concept: HIRMEOS; Tools: Entities recognition	Books integration: PIDs (DOI, ORCID, Fundref)	Development of DOAB (2012), Isidore (2010), Hypotheses (2008); Certification service	Letters of support from institutions; Core Group MoU; Design Study; Countries EoS	HIRMEOS (EINFRA) OPERAS-D (INFRASUPP)
Preparation	2018–22	Toolbox; Best practices; Business models: Journal flipping model; Library based model; Services marketplace	Books integration: Open annotation and (Alt)Metrics. SSH output integration: Standards; Discovery; Multilingual systems	Discovery Service; Research for Society service: prototype	ESFRI Roadmap; Association; National nodes	PIA3 HIRMEOS (EINFRA) INFRAEOSC-02-2019 INFRADEV-02-2019-2020 SWAFS-15-2018-2019
Construction	2022–26	Toolbox; Best practices; Business models: Journal flipping model; Library based model; Services marketplace	SSH output integration: Standards; Discovery; Multilingual systems	Research for Society service	ERIC	PIA3 INFRADEV-2-2019-2020 INFRADEV2

The figure below presents the work breakdown structure. There are four main project tracks: Core infrastructure; Shared services; EOSC integration; Centrasl platforms. Each of these is subdivided into work packages and tasks. The tasks are colour coded to indicate the project phase within the overall ESFRI development.

1. CORE INFRASTRUCTURE

- 1.1 Design study
  - 1.1.1 Landscape study
  - 1.1.2 Technical mapping
  - 1.1.3 Services survey
  - 1.1.4 Business model
  - 1.1.5 Governance
- 1.2 Consortium Building
  - 1.2.1 Partners participation
  - 1.2.2 Working Groups
  - 1.2.3 Projects Consortia
  - 1.2.4 Special Interest Groups
- 1.3 Governance and legal framework
  - 1.3.1 MoU Core Group
  - 1.3.2 Transitional AISBL
    - 1.3.2.1 Legal study
  - 1.3.3 ERIC
    - 1.3.3.1 Legal study
- 1.4 Management and logistical work
  - 1.4.1 PMT
  - 1.4.2 Sitting
  - 1.4.3 Hub
    - 1.4.3.1 Management and coordination
    - 1.4.3.2 Project management
    - 1.4.3.3 Technical coordination
    - 1.4.3.4 Communication

2. SHARED SERVICES

- 2.1 Tools R&D
  - 2.1.1 Proof of Concept: HIRMEOS
  - 2.1.2 Publishing tools catalogue
  - 2.1.3 Publishing toolbox
  - 2.1.4 Documentation and training
- 2.2 Best Practices
  - 2.2.1 Guidelines
  - 2.2.2 Implementation
- 2.3 Business Models
  - 2.3.1 Journal Flipping Mechanism
    - 2.3.1.1 Humanities
    - 2.3.1.2 Social Sciences
    - 2.3.1.3 STM
    - 2.3.1.4 2 social sciences journal and 2 STM journals
    - 2.3.1.5 3 humanities journals and 1 social science journal
  - 2.3.2 Library Based Business Model
    - 2.3.2.1 Prototype Phase 1
    - 2.3.2.2 Prototype phase 2
  - 2.3.3 OA Market Place
    - 2.3.3.1 Market place development

3. EOSC INTEGRATION

- 3.1 Books Integration
  - 3.1.1 Pids and metadata
  - 3.1.2 Annotation and metrics
- 3.2 SSH output integration
  - 3.2.1 Standards list
  - 3.2.2 Standards implementation
  - 3.2.3 Discovery Platform integration
  - 3.2.4 Support to multilingualism

4. PLATFORMS

- 4.1 Certification
  - 4.1.1 DOAB prototype
  - 4.1.2 DOAB development
  - 4.1.3 DOAB Operation
- 4.2 Discovery
  - 4.2.1 FR
  - 4.2.2 FR EN ES
  - 4.2.3 Discovery platform multilingual
- 4.3 Research for Society
  - 4.3.1 Blogging platform
  - 4.3.2 Prototype
  - 4.3.3 Production platform

7.   Monitoring progress, Key Performance Indicators

Progress of development is monitored in annual reporting and work plans, and measured through Key Performance Indicators. Table 6 presents the main KPI's.

Table 6: project phases and key performance indicators

Area	Activity	KPI	Metrics	Design	Preparation	Construction
Consortium						
	LoS	partners	number (no.)	23	30	40
	MoU	core group partners	no.	9	11	13
	EoS	supporting countries	no.	3	5	7
	National nodes	partners	no.	9	12	20
Cooperation						
	Associated partners	Global partners	no.	1	4	8
	Research infrastructures		no.	2	3	4
Central platforms						
	Certification	platforms	no.	5	8	15
		publishers	no.	100	150	200

8. SWOT analysis

The Core Group conducted a SWOT analysis towards the end of the OPERAS-D project, to assess the development of OPERAS from different perspectives. The analysis is based on the work in the past 18 months and will be used for further strategic planning after the close of OPERAS-D. The table below presents the high level results.

Table 7: SWOT analysis

Strengths	Weaknesses
OPERAS in its landscape: Diversity of skills combined with shared practices *Consortium:* Diverse and growing, engaging partners *Governance:* Driven by the goal of ERIC *Business models:* Variety, relying on diversity of models *User needs:* Meaningful services across research cycle *Technical environment:* Variety and expertise in digital publishing (HIRMEOS) *Services roadmap:* Structured around central services but flexible Central services based on existing initiatives	*OPERAS in its landscape:* Young and not yet established *Consortium:* Diverse commitment and expectations Lack of mutual understanding, internal comm. *Governance:* Focus on core, insufficient political support outside France *Business models:* No secure base funding, reliance on one country *User needs:* Lack of user feedback *Technical environment:* Interoperability, unequal technical capacity *Services roadmap:* Complex, services are not sufficiently related
Opportunities	**Threats**
OPERAS in its landscape: Needs of SSH are not addressed (i.e. metrics) *Consortium:* Extend network and values within SSH *Governance:* Distributed and diverse, close to SSH community *Business models:* Flexibility in approach to funding *User needs:* 'Research commons' as guiding principle *Technical environment:* Highly dynamic, EOSC lowering entry barriers *Services roadmap:* Engagement with various initiatives (EOSC,	*OPERAS in its landscape:* OA not established in SSH, low recognition Established existing RIs *Consortium:* Unequal participation within the network *Governance:* Lack of resources, insufficient alignment *Business models:* Soft in-kind commitments *User needs:* Lack of engagement with OS *Technical environment:* Diverse capacities, weakness of open source *Services roadmap:* Core group not well aligned Integration into EOSC is not well defined

GoFair, OpenAIRE)	

D. Governance model

The Governance model describes how OPERAS is run, to ensure that the needs of the community are served, that it is supported by its members, that it is responsive to changing needs and demands. OPERAS will develop a cooperative Governance model, which means that the main contributors own & control the service on a collective basis, and provide input into all aspects of service development, operating policies & strategic direction[177].

1.   Organisation

For the preparation phase, the infrastructure will be coordinated by the **Management Office** that undertakes the daily work.
It is composed of:
- 1 coordinator (OpenEdition) who ensures the coordination between partners and committees and is the responsible for project coordination. The project coordinator is responsible for the following management staff:
- 1 project manager (OpenEdition): general management of the project, communication and management of specific tasks and assistant for administrative and financial tasks.
- 1 FTE Communication service ensured by **Core Group** partners with support from OPERAS-D project until 2018.
- 1 Chief Technical Officer (OpenEdition): coordination of technical working groups and the Core Group.

The **Core Group** is composed of representatives from formally committed partner institutions (the contributors to the service). The Core Group oversees tasks, takes major decisions and supports the Management office. In addition, the individual representatives are expected to secure support in their own countries. The Core Group may invite other partners to join the group, based on their specfic contribution (to ongoing projects, overall infrastructure, geografical representation). The Core Group meets 3 times/year.

Steering committee is composed by representatives of the ministries. The meeting will be organised once a year. It monitors the implementation and global coherence of the project.
Advisory Scientific Board (to be constituted in the preparatory phase): for independent scientific monitoring of the project. The Advisory Board will be appointed by the Project Steering Committee, will be chaired by the Project Coordinator and will meet once a year or more if needed.
Ongoing activities within key areas of interest are organised through **Working groups**, led by a representative of the Core Group and consisting of representatives of all OPERAS partners.

OPERAS partners take part in projects (Shared Services and EOSC Integration activities), provide services, and participate in Working Groups.

---

[177] see Raym Crow – The collective provision of OA resources (p.30)

2.   Decision structure for new partners

The Core Group will develop rules for the acceptance of new partners within the OPERAS network.

The rules for new partners will be based on general principles of openness and transparency:

- Openness relates to open access to research outputs, including long term preservation to ensure access over time;
- Transparency relates to costs involved in the publication process, the services offered to authors, measures around quality assurance and peer review procedures;
- The rules may also include a requirement for prospective partners to make clear how they intend to contribute to OPERAS.

The Core Group decides about new applications. The core group can decide to introduce specific membership categories:

- Associate members: have the right to participate in all member activities but do not have voting rights;
- Observers: are invited by the core group to participate in specific member activities.

The core group can re-evaluate partners regarding membership and decide to change the membership status, in the event that membership requirements are not met.

3.   Transition to legal entity

During the Preparation Phase, OPERAS aims to set up as a legal entity. The aim is to prepare the ERIC as the final legal structure. The preferred interim legal entity is the AISBL, the international non-profit association under Belgian law. It is organised to mirror as far as possible the final ERIC.

With the establishment of the AISBL, the following changes occur:

The Steering Committee will transition into a **General Assembly** (GA), consisting of National representatives of Supporting countries. The GA has the same role and responsibilities as the Steering Committee. The Coordinating country chairs the GA. The Director also appoints the Coordinator after consultation of the GA.

The **Director** is appointed as legal representative of the AISBL and is in charge of the OPERAS project. The Director chairs the Executive Assembly and prepares the annual work plan and budget. The Director appoints a **Coordinator** after consultation of the Executive Assembly. The Coordinator manages daily operations, leads the management team and coordinates projects.

The Core Group becomes the **Executive Assembly** (EA). The EA consists of representatives of **National nodes**, the Chair of the Scientific Advisory Board, and Coordinators of the Central Platforms. The EA takes major decisions and is responsible for annual work plans and budgets. The EA can propose changes to the bylaws of the AISBL, to be approved by the GA. The EA can appoint specific representatives: **National contact points** (for countries that do not support OPERAS); and **Institutional contact points** (who act as liaison with specific RIs). These representatives are invited to attend EA meetings as observers. The EA can

also invite **International partners** (important partners from outside Europe) to attend EA meetings.

National nodes are the former Core Group members. They are appointed by their Supporting countries. National nodes coordinate the OPERAS partners within their countries.

Working Groups become **Special Interest Groups** (SIG). SIGs are chaired by members of the EA or EA observers, appointed by the EA.

After the establishment of the AISBL, two other changes occur:
- The EA establishes Stakeholder Committees (SC). Stakeholder Committees are established to coordinate key stakeholder groups across Europe. They consist of OPERAS partners and invitees from the respective stakeholder Planned SCs are: the Academic Committee, the Publisher Committee, the Library Committee, and the Intermediary Committee. SCs are chaired by EA members and appointed by the EA.
- The AISBL will introduce a procedure for Prospective member countries to become OPERAS Prospective members apply for membership through their Ministry and the application is reviewed by the GA, after consultation of the EA. Prospective members are invited to appoint a representative in the GA as observer, and a National contact point as observer in the EA. Upon acceptance and signature, they are bound by the bylaws and provisions for OPERAS members.

4. Decision structure for implementation

Decision for implementation will be reached at 3 levels:

Core Group: representing institutions committing funding and support to OPERAS infrastructure

Scientific Committee: representing the users community across Europe (to be constituted during preparation phase)

Steering Committee: representing countries of the Core Group institutions (to be constituted during construction phase)

Currently, 9 countries are represented in the Core Group. It is planned that 9 to 12 countries will participate to the Core Group and Steering Committee at the end of construction phase.

Decision for implementation will be taken in 2024 by a concording vote of the 3 committees.

5. Future Governance Model

The final Governance model will to a large extent be a continuation of the Transitional model. However, the Governance will be established within an ERIC. The model will consist of a General Assembly (representatives from Member States); a management office (Director, Coordinator and management team); an Executive Assembly (Director, Coordinator,

representatives of the National nodes, Chair of the Scientific Board, Coordinators of the Central Platforms); Stakeholder Committees; Special Interest Groups.

Figure 2: Future governance model
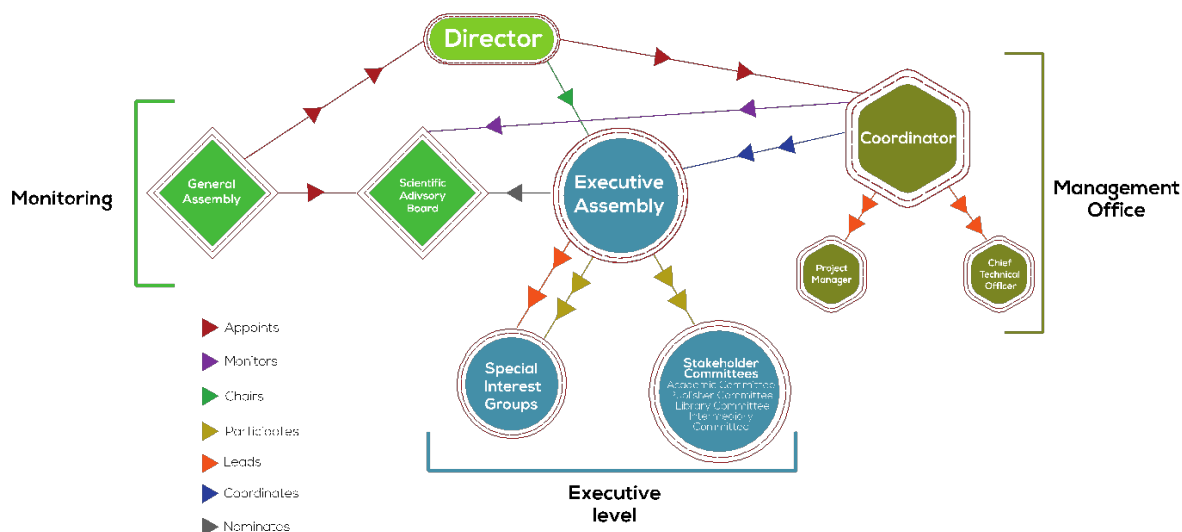

The General Assembly appoints the Director (ERIC obligation) and approves annual work plans and budgets. Strategic decisions are made by the Executive Assembly, as outlined above. The EA is responsible for annual work plans and budgets. The Director chairs the Executive Assembly.

National nodes are member of the EA and can chair Special Interest Groups and/or Stakeholder Committees. They are appointed as chair by the EA. They represent OPERAS partners within their country and have a role in coordinating activities for OPERAS within their country.

Stakeholder Committees coordinate key partners across Europe. EA members will normally join the SC that represents their institution.

Special Interest Groups (SIG) are working groups for key subject areas that can have a temporary or more permanent status, depending on the subject. They are installed by the Executive Assembly and can submit resolutions or propose actions to the EA. SIGs are open to any interested party or individuals, and parties can propose a SIG or respond to a call from OPERAS on a specific subject.

The Scientific Advisory Board (SAB) is consulted by the Executive Assembly on strategic decisions and for evaluating specific projects. The SAB monitors OPERAS on scientific matters and can propose actions to the EA. The SAB is consulted about annual work plans and budgets ahead of the GA meeting.

OPERAS will work closely with funding agencies to provide services that meet their requirements, but it is expected that there will not be an SC for research funders.

In addition to the governance structure, OPERAS will set up a network of National contact points for communication and coordination purposes. National contact points will be invited to attend meetings of the EA as observer.

6. Legal structure

The final structure will be an ERIC as the standard legal structure of ESFRI infrastructures and an effective instrument to ensure involvement of the member states. The transition towards ERIC will be managed through an association

combining legal structuration and flexibility and agility in terms of governance.

The final decision about the legal entity for the transition period is foreseen in 2018, as the last part of WP4 in the OPERAS-D project, but the aim is to establish a Belgian international not-for-profit association (AISBL), as established by some other ESFRI projects.

Main characteristics of the AISBL:
- The location in Belgium considering the neutrality of this country towards the partners of the RI
- Constitute a suitable transitional legal structure on the way to ERIC
- No initial capital needed
- Flexibility when defining the Articles of Association
- Limited liability
- Full legal personality
- Tax exemption
- Fast creation/foundation process (about two months after submission to Belgian Ministry)
- International image and European character
- Flexible governance structure, reallocation of shares, non-profit status and benefits
- Personnel regulations that can be applied to all kinds of employees and allow for staff prerequisites
- Needs an statute in French language
- Head address must be in Belgium
- Not suitable for big investments
- Members may not receive monetary benefits from the association

In T4.3 of OPERAS-D, legal council is employed to prepare the decision about establishing a legal entity, and to draft legal documentation to support the Preparation Phase. This will result in a final decision regarding the Transition phase. If the decision is to establish an AISBL, the legal documentation will include the bylaws, and include provisions for supporting countries and the application procedure to accept new countries that are to become OPERAS members. If the decision is against establishing a legal entity, the legal structure will be to create a Consortium Agreement. In either case, the objective is to establish the Governance structure for the Transition phase outlined above. The final legal framework is planned to be delivered in June 2018, as part of the OPERAS-D project.

7.   Legal framework

In the table below, the legal framework is outlined, in the transition from the Preparation Phase to the establishment of the ERIC.

Table 8: OPERAS legal framework

Preparation 2018	Transition 2019–2020	Construction 2026	Role
LoS, MoU, EoS	AISBL	ERIC	
Steering Committee	General Assembly (GA)	General Assembly (GA)	Representatives of Supporting countries and Prospective countries (observer status) Chair GA is the Coordinating country (FR) Approves annual work plans and annual budgets Appoints Director (ERIC)
Coordinator	Director, Coordinator	Director, Coordinator	Director is Legal representative of AISBL/ERIC Director Chairs EA, Prepares annual work plans and budgets. Coordinator manages daily operations Leads MT, coordinates projects
Management team (MT)	Management team (MT)	Management team (MT)	Administrative, technical and legal operations Communication Project Management
Core Group (MoU)	Executive Assembly (EA)	Executive Assembly (EA)	Representatives of National nodes (and National contact points as observer) Chair of SAB, Coordinator of Central Platforms Annual work plans Annual budgets Major decisions
	Scientific Advisory Board (SAB)	Scientific Advisory Board (SAB)	Nominated by EA Appointed by GA Independent scientific monitoring Advise EA on scientific matters Advise on annual work plans
Working Groups	Working Groups	Special Interest Groups	Ongoing activities within key areas of interest Chaired by EA members or observers, appointed by EA
	Stakeholder Committees (SC)	Stakeholder Committees (SC)	Coordinate key stakeholder groups Chaired by EA members or EA observers, appointed by EA
	National nodes	National nodes	Appointed by Supporting country Coordinate national partners Member of EA
	Coordinators of Central Platforms	Coordinators of Central Platforms	Member of EA
	National/institutional contact points/International partners	National/institutional contact points/International partners	Invited by EA to: Represent non-supporting country/ Liaise with other RIs

Preparation 2018	Transition 2019–2020	Construction 2026	Role
			Coordinate national partners Attend EA as observer
	Prospective member countries	Prospective member countries	Prospective countries preparing to become Supporting country. Attend GA as observer
Partners (LoS)	Partners (LoS)	OPERAS Members	Participant in SIGs Can join SC Can be invited to join projects Can take part in Shared Services and EOSC Integration activities

E. ESFRI Landscape study (UCL Press)

1. Introduction

The ambitions of OPERAS to provide pan-European infrastructure and services for open access to social science and humanities research requires widespread co- ordination and support, as well as funding from supporting countries. This can best be achieved by application to the Roadmap of the European Strategy Forum on Research Infrastructures (ESFRI) which supports the development and implementation of mature pan-European research infrastructures. This study will describe the purpose, origins and development of ESFRI, and will introduce some of the projects and landmarks already on the ESFRI Roadmap that bear similarities with OPERAS. It will also describe the typical lifecycle of an ESFRI project, and the governance and legal structures that have typically been adopted by other ESFRIs, in order to help inform the OPERAS consortium in its application to the ESFRI Roadmap.

2. ESFRI Background Information

The European Strategy Forum on Research Infrastructures (ESFRI) is a strategic organisation first launched in 2002 to develop the scientific integration of Europe and to strengthen its international outreach. Competitive open access to high-quality Research Infrastructures supports and benchmarks the quality of the activities of European scientists, and attracts the best researchers from around the world. (ESFRI website: http://www.esfri.eu/about) ESFRI selects a limited number of projects with a high degree of maturity, that enhance European science and innovation competitiveness. Research Infrastructures of pan-European relevance provide unique opportunities for world-class research and training as well as stimulating knowledge and technology transfer, in brief for European capacity building. (https://ec.europa.eu/research/infrastructures/pdf/esfri/esfri_roadmap/roadmap_2 006/esfri_roadmap_2006_en.pdf)

a. Purpose

ESFRI identifies Research Infrastructures (RIs) to meet the long-term needs of Europe's research

communities across all scientific areas. ESFRI designs Roadmaps every two years that provide a coherent and strategic vision to ensure Europe has excellent RIs accessible to all leading researchers. (ESFRI Roadmap 2016) Via ESFRI, national commitments to the implementation of the Roadmap are ensured, and advice and guidance on overcoming legal, technical and financial obstacles to implementation is provided. (ESFRI Roadmap 2018)

ESFRI's key objectives are to:
- to support a coherent and strategy-led approach to policy making on research infrastructures in Europe;
- to facilitate multilateral initiatives leading to a better use and development of research infrastructures acting as an incubator for pan-European and global research infrastructures;
- to establish a European Roadmap for research infrastructures (new and major upgrades, pan-European interest) for the coming 10-20 years, stimulate the implementation of these facilities, and update the Roadmap as the need arises;
- to ensure the follow-up of implementation of already ongoing ESFRI projects after a comprehensive assessment, as well as the prioritisation of the infrastructure projects listed in the ESFRI Roadmap. (ESFRI Roadmap 2016)

b.   Origins and development

Since ESFRI was set up in 2002 as an informal forum following a mandate of the EU Council of June 2001, it has developed five roadmaps (2006, 2008, 2020, 2016, 2018) which have each time seen an increase in the number of projects as well as development of the programme itself, based on reviews of progress of existing projects, in order to continuously improve the system.

One of the key reasons for setting up ESFRI was a recognition that Europe's centres of research excellence often failed to reach critical mass. By bringing resources together, ESFRI's goal is to build a research and innovation area equivalent to the 'common market' for goods and services. (https://ec.europa.eu/research/infrastructures/pdf/esfri/esfri_roadmap/roadmap_2 006/esfri_roadmap_2006_en.pdf)

Further, the importance of planning future large-scale research infrastructures on timescales approaching one or two decades was recognised. While there are national roadmaps that plan their aspirations on a 10-20 year timescale, many of these will be funded and managed as European facilities so ESFRI proposed a synthesis of such activities to coordinate international activities.

c.   Operation and governance structure of ESFRI

ESFRI meets around four times a year and its key role is to oversee, analyse, enhance, make recommendations and assess ESFRI projects, in order to shepherd them on the Roadmap from the point of acceptance to realisation.

ESFRI is overseen and informed by a number of special interest working groups and strategic working groups. The special interest working groups include Investment Strategies in e-Infrastructures, Long-term Sustainability, Innovation and Implementation. The strategic working

groups oversee key subject categories under which ESFRI projects fall. (http://www.esfri.eu/working-groups)

d.   Development and implementation

European RIs usually develop their scientific case and technical design at a national level, or through 'Design Study' contracts under the EC Framework Programmes (FPs). Once admitted on to the ESFRI Roadmap, the Projects become eligible for competitive 'Preparatory Phase' contracts devoted to the refinement of the technical design, development of the governance, definition of legal status and financial sustainability, leading to the start of the implementation phase. A firm agreement by the stakeholders to proceed to the adoption of a legal status engages substantial funding for implementing the RI. (Lifecycle of a Research Infrastructure, ESFRI Roadmap 2016, https://ec.europa.eu/research/infrastructures/pdf/esfri/esfri_roadmap/esfri_roadm ap_2016_full.pdf)

As seen from some of the case studies below, ESFRIs take a varying length of time to progress from entry onto the Roadmap, through Preparatory Phases towards Implementation. During the Preparatory Phase the members of the RI agree such matters as infrastructure, governance status, legal status, operational procedures, business plan and funding. ESFRIs typically take between three and seven years to go through the implementation phase, and many also use this time to prepare for the establishment of the legal entity ERIC (European Research Infrastructure Consortium).

3.   ESFRI Projects and Landmarks

There are currently 21 ESFRI Projects and 29 ESFRI Landmarks. ESFRI Landmarks are the RIs that were implemented or started implementation under an early ESFRI Roadmap and are now established as major elements of competitiveness of the European Research Area, successfully implementing their operation and effectively advancing in their construction.

The ESFRI subject categories are: Energy, Environment, Health and Food, Physical Sciences and Engineering, and Social and Cultural Innovation. OPERAS will fall into the Social and Cultural Innovation category, in which there is currently one ESFRI Project (E-RIHS – European Research Infrastructure for Heritage Science) and five ESFRI Landmarks: CESSDA, CLARIN ERIC, DARIAH ERIC, ESS ERIC, and SHARE ERIC.

The Social and Cultural Innovation SWG (Strategic Working Group) proposes possible solutions related to RIs that are able to help tackle the Grand Challenges facing society, such as health or demographic change, or the 'Inclusive, innovative and secure societies' challenge from the third pillar of Horizon 2020, called 'Tackling societal challenges'. It establishes possible methods through which social sciences and humanities could be used as an evaluation criterion for the activity of other RIs in the ESFRI roadmap (e.g. social impact). It also explores how RIs can contribute to social innovation or better knowledge transfer towards society. (http://www.esfri.eu/working-groups/social-and-cultural-innovation).

a.   Social and Cultural Innovation category (ESFRI Roadmap 2016)

The following ESFRIs are also Distributed RIs. Below are brief descriptions of the main activities of

each, with some details of their timeline for development and their governance structures.

- E-RIHS – European Research Infrastructure for Heritage Science Supporting research on heritage interpretation, preservation, documentation and management, E-RIHS will comprise fixed and mobile national infrastructures of recognised excellence, physically accessible collections and archives and virtually accessible heritage data. It entered the Roadmap in 2016 and its preparation phase will last until 2019, construction phase 2020-21, and operation start in 2022. It is a distributed RI with numerous participating counties, centrally coordinated from Italy. Due to the nature of the materials being studied, such as artefacts and artworks, the national centres are of key importance, and some are setting up their own Distributed RIs at national level, such as that in the UK.

  This research area was identified as suffering from fragmentation, duplication of efforts and isolation of small research groups, putting at risk the competitive advantage of European heritage science. To address this, E-RIHS will provide state- of-the-art tools and services to cross-disciplinary research committees to advance understanding and preservation of global heritage. Key features are:
  - Cutting-edge scientific infrastructures, methodologies, data and tools
  - Training
  - Public engagement
  - Access to repositories for standardised data storage, analysis and interpretation

- CESSDA – Consortium of European Social Science Data Archives
  This large-scale, integrated and sustainable platform provides access to research data from archives across Europe. It entered the Roadmap in 2006 and started operation in 2013. Norway is its coordinating country and its legal status is a Norwegian Limited Company. There are 14 members of CESSDA and it brings together social science data archives across Europe, with the aim of facilitating social, economic and political research. Members of CESSDA nominate a national service provider and CESSDA integrates the work of the service providers by establishing a one-stop shop for data location, access, analysis and delivery.

  CESSDA plays an active role in the development of standards and encourages and facilitates the use of metadata standards for documenting and publishing the existing inventories of research data available from national as well as cross-national data resources in Europe. Its overall ambition is to organise a range of data collections and to coordinate common activities across different national institutions. The institutions will function as a network in a flexible technical architecture, using standard open protocols and interfaces, designed to contribute to the emerging European and global information commons.

  The overarching vision of CESSDA is to develop a system for data service provision that is open, extensive and evolvable, and provide a single interface to thousands of unique datasets from social science data archives across Europe. In this way, it will widen access to data, permitting European comparative research.

- CLARIN ERIC – Common language resources and technology infrastructure
  CLARIN provides easy and sustainable access for scholars in the humanities and social sciences to digital language data and advanced tools to discover, explore, exploit, annotate, analyse or combine them. CLARIN is building a networked federation of language data repositories, service centres and centres of expertise, with single sign-on access for all members of the academic community in all participating countries. Tools and data from different countries are interoperable so that data collections can be combined and tools from different sources can be chained to perform complex operations to support researchers. It integrates existing data and service centres without major capital investments.

  It entered the Roadmap in 2006 and started operation in 2006 and its construction phase took place between 2011 and 2015. It is a distributed RI based in the Netherlands with numerous participating countries.

  It provides a range of services including (https://www.clarin.eu/content/services):

  - Clarin Portal
  - Depositing services
  - Virtual language observatory
  - Web services and applications
  - Virtual collections
  - Language resource inventory
  - Consulting services

  In addition to the services it provides, CLARIN participates in the development of courseware and organises workshops and data camps to stimulate the uptake and increase the insight in the usability of the services.

  CLARIN stimulates the re-use of available research data, thereby enabling scholars in SSH to increase their productivity and open new research avenues in and across disciplines that address multiple societal roles of language. Working with CLARIN data and tools will increase the skills levels for data analysis among new generations of SSH students, which will be welcomed by the data science sector.

  - CLARIN governance (https://www.clarin.eu/content/governance)
  - General Assembly with representatives from ministries of the member states
  - Scientific Advisory Board
  - Board of Directors for day-today operations
  - National CLARINs
  - Standing Committee for CLARIN technical centres
  - National Coordinators Forum

- DARIAH ERIC – Digital Research Infrastructure for the Arts and Humanities
  DARIAH is a network of people, expertise, information, knowledge, content, methods, tools and technologies from various countries that develops, maintains and operates an infrastructure to support ICT-based research practices. It operates a Europe-wide network of Virtual Competency Centres.

Its key services and features are:
- Shared technology platform
- Scholarly content management
- Advocacy, impact and outreach
- Provides seminars and research and education activities
- Offers teaching materials and teaching opportunities to develop digital research skills

It provides impact by demonstrating how traditional humanities research skills play a prominent role in the digital age, and how such skills can be deployed in a commercial setting. It entered the Roadmap in 2006, its preparation phase was 2008-2011, construction 2014-2018, and plans to start full operations in 2019. It became an ERIC in 2014.

DARIAH governance (http://www.dariah.eu/about/organisation.html)
DARIAH has 17 members from EU member countries. Its governance structure is organised as follows:

- General Assembly
- Board of Directors
- Senior Management Team
- Scientific Board
- DARIAH Co-ordination Office
- National Coordinators Committee
- Joint Research Committee
- Virtual Competence Centres
- Working Groups
- Cooperating Partners
- Affiliates

4. Governance and legal status

In 2016 an ESFRI Exchange of Experience Workshop took place in Amsterdam, which resulted in a report offering general advice to current ESFRI projects and landmarks as well as descriptions by the individual ESFRI projects about some of the challenges they have met in the process of development. http://www.esfri.eu/sites/default/files/u4/StR-ESFRI-1st-EoE-Report_23-11-2016_final_0.pdf)

The general advice coming from the workshop was summarized as follows:

Governance: Keep the governance simple but robust and carefully define the role of scientific, managerial and legal responsibilities; carefully define business models at a very early stage; have a clear agreement about the services the infrastructure will offer and a clear definition of its target group; ensure processes and mechanisms are in place to be able to operate effectively during the interim phase while governance and legal structures are being put in place.

Several individual ESFRIs emphasized that the preparatory phase was long and complex and the governance structure that emerged by the end of the process was very different from the original ideas. Many also focused on the need for clarity of roles, and the need to identify clear roles and responsibilities among the partners. Some also noted the difference in time for different member states' ratification processes and the challenges that had brought, and identified the need for clarity regarding the balance in decision-making between the European and local levels in

order to avoid a lack of framework or loss of momentum. A task force was recommended for the preparatory phase to assist the national nodes in their application processes.

<u>Funding</u>: Governance and funding are inherently connected; clear processes are needed for well-balanced cash and in-kind contribution, management and control mechanisms; there needs to be a co-ordinated approach between management authorities who understand the project as a whole and the interdependence of national and European funding programmes and the nodes of distributed RIs planning to make use of structural funds; funding management questions should not put burdens on the competitive character of the research infrastructure.

Several individual ESFRI projects also commented on the different funding perspectives between countries, with some understanding better than others the need for long-term funding commitments. Some also highlighted the need for a funding strategy, a clear investment proposition to ensure delivery of the work packages. Identifying key performance indicators in funding proposals and measuring them during the preparatory phase was considered crucial by some projects.

<u>Legal</u>: Involve legal services and expertise at an early stage; get informal feedback from the European Commission at an early stage; consider other legal statuses as well as ERIC.

<u>ERIC</u>: Keep close contact with the national ministries as early as possible; involve the finance ministries at an early stage to make sure they will allow tax exemptions; ensure a clear perspective of getting long-term funding.

a. *Legal requirements and options for distributed RIs*

ESFRI projects typically establish an interim legal entity during their preparation phase, and many then progress to the ERIC (European Research Infrastructure Consortium) legal entity, which was specially developed for European RIs. The different options for legal entities and the topics they need to cover are described in more detail below.

The ESFRI Roadmap 2018
(http://www.esfri.eu/sites/default/files/docs/ESFRI_Roadmap_2018_Public_Guide_f
.pdf) lays out the legal requirements for distributed RIs very clearly as follows. A distributed RI is characterised as having a Central Hub and interlinked National Nodes and needs to:

- have a unique specific name and legal status and governance structure with clear responsibilities and reporting lines, including international supervisory and appropriate external advisory bodies;
- have legally binding attributions of coordination competences and resources to the Central Hub;

- identify and agree upon relevant and measurable Key Performance Indicators (KPI) addressing both excellence of scientific services and sustainability of operation;
- have a human resources policy adequate to warrant the necessary competences for the effective operation of the Central Hub and to support the user's programme, and to encompass hiring, equal opportunities, secondments, education and training;
- define a joint investment strategy aimed at strengthening the RI through the Nodes and common/shared facilities. (ESFRI Roadmap 2018: http://www.esfri.eu/sites/default/files/docs/ESFRI_Roadmap_2018_Public_G uide_f.pdf)

The national 'nodes'

Distributed RIs are usually organized into National Nodes around a Central Hub. The capacity and amount of resources devoted to the RI must be clearly identified, coordinated and managed by the Central Hub according to agreed statutes and common rules and procedures of the RI consortium, even though the Nodes may be only partially absorbed by the distributed RI maintaining their national or institutional programmes.

The distributed RI must assign optimal personnel capacity and coordinating power to the Central Hub in order to demonstrate a high level of integration of the National Nodes. Examples of high integration include for example a unique portal with thorough explanation and guidance towards the common access policy; harmonised and coherent IPR & data policies; adequate central resources; procurement and upgrading of technological infrastructure; human resources policy allowing for staff exchange and secondment. It must also display added value compared with the merits of a research cooperation network open to external use. The Central Hub therefore must represent a truly international organisation capable of operating with a high level of efficiency and mediating across different scientific cultures. (ESFRI Roadmap 2018: http://www.esfri.eu/sites/default/files/docs/ESFRI_Roadmap_2018_Public_Guide_f. pdf)

What a legal document should contain

Independent of the legal form the RI chooses to adopt, the basic legal document should contain the following elements:
- The frame of agreement
- The scope and objective
- The governance and management
- The seat
- The resources and commitments
- General provisions
- The option for internal regulations to regulate the functioning of the consortium (monitoring, adjustments, winding-up)

Different legal entities are chosen depending on the type of Research Infrastructure. These include arrangements for commercial entities, European consortia, national organisations, associations, and foundations. OPERAS needs to adopt a legal status that reflects its international nature, and one of the legal entities that would be suitable for the circumstances of OPERAS during its preparatory phase, and which has been adopted by other ESFRIs, is a Belgian legal arrangement called an AISBL (Les Associations Internationales Sans But Lucratif – International Non-Profit Association).

The key features of an AISBL are:
- The location in Belgium considering the neutrality of this country towards the partners of the RI
- Constitute a suitable transitional legal structure on the way to ERIC
- No initial capital needed
- Flexibility when defining the Articles of Association
- Limited liability
- Full legal personality
- Tax exemption
- Fast creation/foundation process (about two months after submission to Belgian Ministry)
- International image and European character
- Flexible governance structure, reallocation of shares, non-profit status and benefits
- Personnel regulations that can be applied to all kinds of employees and allow for staff prerequisites
- Needs a statute in French language
- Head address must be in Belgium
- Not suitable for big investments
- Members may not receive monetary benefits from the association

The ELIXIR ESFRI has drawn up a Consortium Agreement for its preparatory phase which covers the following:
- Objectives and tasks of the infrastructure
- Membership
- Obligations of the Members
- Governance structure (mission and powers of the governance bodies)
- Finance
- ELIXIR Nodes (e.g. selection and evaluation process of Nodes)
- Intellectual Property
- Liability
- Entry into force
- Duration and evaluation of the infrastructure, etc.

ERIC

In the longer term, the most beneficial legal arrangement associated with Distributed RIs at an advanced stage of development is ERIC (European Research

Infrastructure Consortium). A number of ESFRI Landmarks have successfully established an ERIC. ERICs were developed in 2009 in response to the need for a legal framework for global entities like Distributed RIs. The main features include:

- High political acceptance and visibility
- Especially designed for pan-European research organizations
- Very favorable solutions for the issue of the European non-profit character of the organization can accommodate its distributed nature
- Tax exemption
- Very flexible internal structure which is also not based on national law
- Funding might be safer due to internationally binding contacts
- Financial support pro community easier
- Easier for entity to get national funding
- Short regulation
- Limited economic activities are allowed
- No national privileges

b. *Governance models*

The options for the governing structure are linked to the selected legal form (if there is one), and some of the governance models for existing ESFRI projects have been described above. Many ESFRIs advise that it is best to set up a governance structure during the preparatory phase that can easily transfer to an ERIC. A common governance model used among the Distributed Research Infrastructures, regardless of the category or the type of legal form, incorporates a governing body (such as a general assembly) representing the collective interests of the partners and that is the ultimate decision-making body, a director (or Board of Directors) in charge of implementing the decisions of the governing body, and an executive management (secretariat) in charge of operating the infrastructure. Operating the infrastructure is often undertaken by National Nodes. (International Distributed Research Infrastructures: Issues and Options, OECD Publications, 2013 https://www.oecd.org/sti/sci-tech/international-distributed-research- infrastructures.pdf)

The governance structure often also includes a 'Heads of Nodes' Committee and a Scientific Advisory Board, made up of leading academic experts in their field and which is usually an independent body offering scientific expertise to the General Assembly or main governing body. In some cases, Members of the General Assembly are represented by a National Representative (National Representatives are from the Ministries or Research Councils) – this is the case for the ELIXIR ESFRI.

National Nodes enter into a collaboration agreement with the Central Hub and their role is usually to provide the delivery of technical services. Each National Node is usually hosted by an institute that has its own legal personality and provides a defined set of services on behalf of or for the Central Hub. In some ESFRIs, National Nodes are only accepted into the RI after successfully passing a selection process.
Nodes usually provide services that are important on a European or global level and which have an added value for the ESFRI. (https://www.elixir-europe.org/about-

us/governance/).

An alternative structure is that of the European Social Survey, which does not have National Nodes but has a National Representative from member states on its General Assembly, usually a Minister, and then has a Core Scientific Team of seven (a bit like OPERAS Core Group) and four Deputy Directors from among the institutions in the Core Scientific Team. In addition to the General Assembly, ESS also has Scientific Advisory Board, Methods Advisory Board and Finance Committee.

Table 1: ESS ERIC Governance structure

The MIRRI ESFRI has also opted for a lean governance structure, as follows:
The Assembly of Members is the decision-making body of MIRRI-ERIC and is composed of delegates of all Members and Observers of MIRRI-ERIC. It decides the strategic developments and governance of MIRRI as a research infrastructure.

The Advisory Board evaluates the activities of MIRRI-ERIC and advises the Assembly of Members with regard to proposals of the Executive Director on the implementation of the MIRRI-ERIC Work Program. It is an independent body of distinguished scientists or experts in the fields of science, ethics and business appointed in their own right and reflecting the relevant application areas of MIRRI- ERIC.

The Executive Director is the legal representative of MIRRI. He/She will lead and administrate the MIRRI legal entity including the Central Coordinating Unit (CCU), which is the central executive management office for the MIRRI-ERIC. The Executive Director will be assisted in performing his/her managerial functions by staff of the CCU.

The operative level of MIRRI-ERIC is built by the National Coordinators Forum and the mBRC Directors Forum. The National Coordinators Forum consists of all National Coordinators of MIRRI-ERIC. This Forum shall implement the directions and decisions

taken by the Assembly of Members, as well as the counsel from the Advisory Board, at the level of the Partners and their national institutions. One of its members will be appointed as Chair, being the main contact person for the Executive Director in terms of reporting National Nodes' activities. (http://www.mirri.org/legaldocuments.html)

5.   Conclusions

Establishing an ESFRI is a lengthy and complex process that requires considerable planning and preparation, and there are a number of models and options for legal status and governance that need to be considered. ESFRI is looking for projects that can demonstrate that they will be more effective as a Distributed RI on the ESFRI Roadmap than they would simply as a consortium. Clear demonstration of significant communities that require the services of the project, along with maturity and having clear business plans and funding in place are key characteristics of successful ESFRI projects.

X.   Legal study and documentation (X-officio)

A.   Introduction

OPERAS is a distributed European research infrastructure for open access scholarly communication in the social sciences and humanities (SSH). It aims at coordinating and pooling together university-led scholarly communication activities in Europe, in view of enabling a more efficient, fair, inclusive and sustainable scholarly communication ecosystem for European researchers in the SSH. It further seeks to build and maintain a sustainable infrastructure of partners and services and establish open science as the standard practice.

OPERAS-D is a design project, addressing the long-term requirements of OPERAS by defining business and governance models, scientific and technical concepts for future services that the infrastructure will provide and by establishing a roadmap to achieve these goals.

The business and governance model of OPERAS-D consists of three main elements: (1) a plan for the sustained provision (developing, operating and sharing) of services; (2) a governance model to ensure the needs of the community are served, that it is supported by its members, and that it is responsive to changing needs and demands; and (3) the legal framework to establish OPERAS as a legal entity.

In relation to the third element (the legal framework), the OPERAS Design Study of July 2017[178] ('Design Study') suggests that research infrastructures which are not incorporated as a separate legal entity and rely on less formal modes of collaboration, such as through projects, collaboration agreements or MoUs, risk losing consistency and may drift in different directions. Against this background, OPERAS aim at creating a legal entity early in the course of its development and has identified the European Research Infrastructure Consortium (ERIC) as the preferred final structure.

An application to establish an ERIC requires a degree of readiness, in particular, that the scientific community is convinced that there is a real need for a joint action at European level, that clear plans for governance and activities are in place and that funding is committed to the preparatory phase of the project. Although not a pre-condition for establishing an ERIC, in most cases, an application to the Commission for an ERIC legal status follows a successful application to the ESFRI roadmap. That could potentially be advantageous also in case of OPERAS as many of the documents required for a successful ESFRI submission would also be needed as part of the ERIC application. Further, the ESFRI review would likely facilitate the review carried out later by the Commission as part of the assessment of the ERIC application and finally, being admitted to the ESFRI roadmap could facilitates eligibility for additional EU and national funding for the preparatory phase in order to further develop the technical design, governance structure, definition of legal status, operational procedures, business plan and financial
sustainability.

According to the Design Study, OPERAS should prepare for ERIC incorporation through an intermediary stage. The international non-profit association under Belgian law (AISBL) has been identified as the most suitable intermediate model, which will be organised to mirror, to the extent possible, the final ERIC.

The following study aims at facilitating preparation and final decision regarding the transition to a separate legal entity by providing information on the requirements for establishment and governance of AISBL and ERIC. The last part of the study also provides an initial assessment of the relationship between the OPERAS infrastructure and service providers.

B. AISBL

1. Introduction

AISBL ("*Association internationale sans but lucratif*") is a legal entity used for an international, not-for-profit associations based on Belgian law. It is regulated by the Act on Non-profit Associations and the International Non-profit Associations and Foundations of 27th June 1921, as amended (hereinafter "AISBL Law").

The characteristics of the AISBL is a "non-profit-making purpose of an international mission". The concept of "a non-profit-making purpose of an international mission" is parallel to the definition provided by the European Convention on the Recognition of the Legal Personality of International Non-Governmental Organisation[179] and means that AISBLs "carry out work of value to the international community, particularly in the scientific, cultural, charitable, philanthropic, health and education fields, and that they contribute to the achievement of the aims and principles of the United Nations Charter and the Statute of the Council of Europe"[180].

As will be further discussed below, the main characteristics and advantages of the AISBL are that:

- It offers a flexible governance structure with a separate legal personality;
- It has been commonly used by other research infrastructures either as a permanent or as an interim legal structure before transition to an ERIC;
- There is no requirement for initial capital;
- It provides for a limited liability regime;
- It is rather easy and fast to establish;
- The AISBL has its statutory seat in Belgium, close to the European institutions allowing for a more European dimension of the research infrastructure.

2. General questions

a. Who can be a member of the AISBL?

The AISBL can be established by foreign and Belgian natural persons (individuals) and/or legal entities for the purpose of pursuing a non-profit-making international mission. There are no other specific nationality requirements for Directors or managers.

b. Are there any minimum requirements in terms of number of founding members?

The AISBL Law does not prescribe a minimum number of members in the AISBL, however, the fact that the AISBL is an association suggests that it should be composed of at least two members.

For practical reasons, however, and in order to avoid situations of inability to act due to disagreements, it is advisable that the AISBL is composed of at least three members. There is also a possibility to provide for different categories of members in the Articles of Association, such as "associate members" or "honorary members".

For the purposes of OPERAS, it would be advantageous if the members of the AISBL are composed of all or the majority of the representing entities of the future ERIC or other relevant stakeholders in the ERIC.

---

[179] Strasbourg, 24.04.1986 (the "Convention")

[180] See preamble to the Convention.

c. Are there initial capital requirements?

There are no initial capital requirements for establishing an AISBL.

d. Does the AISBL have a separate legal personality?

Legal personality may be granted after the establishment of the AISBL by way of a Royal Decree issued by the Ministry of Justice. The Ministry of Justice signs the Royal Decree by delegation on behalf of the King.

It is important to note that the grant of a separate legal personality is a separate stage from the establishment of the AISBL. The latter is done by way of a 'notarial deed'[181] which takes place before a public notary. The legal personality is granted by a Royal Decree, at a second stage. See section II.3(a) below for further detail.

It is nevertheless possible for the AISBL to conduct activities after its establishment (by way of a notarial deed) but before it has acquired a separate legal personality (by way of a Royal Decree). This may be required, for example, if the AISBL wishes to enter into certain contractual arrangements, such as a lease of office or property, or hire personnel, during the period pending signature of a Royal Decree.

In such cases, the person or persons who enter into a contractual engagement on behalf of the AISBL will be jointly and severally liable for any resulting liabilities, until: (1) the AISBL has been granted legal personality – this must be done within two years from the date of the signature of the contract by the relevant person(s), and (2) the contract is ratified by the competent body of the AISBL at the latest 6 months after the acquisition of the legal personality by the AISBL. If both of the above conditions are met, the contract will be assumed to be contracted by the AISBL from the outset.

3. Procedure for establishment of an AISBL

a. What are the procedural steps for establishing an AISBL?

As implied above, the establishment of the AISBL as a separate legal personality occurs in several steps:
o   the establishment of the AISBL by way of a 'notarial deed'. This takes place in front of a public notary in the presence of all founding members; (2) the grant of a separate legal personality to the AISBL by the signature of a Royal Decree by the Ministry of Justice (by delegation on behalf of the King); and, (3) additional administrative obligations which are summarised below as well.

The notarial deed

OPERAS will need to provide a public notary the following information in order to prepare the Articles of
Associations (See Annex 1 for a full list):

- Proposed name for the AISBL;
- Seat of the head office;
- Objective and activities;
- Founders;
- Bylaws;

---

[181] 'acte authentique'

- Assembly and end of financial year;
- Appointment of administrators.

When this information is received, the public notary will prepare a draft Articles of Associations for OPERAS' approval. The public notary, among others, will verify and attest the non-profit nature of the AISBL, which means that the AISBL must not pursue industrial or commercial activities and is not allowed to strive for a monetary or material gain to its members.

The public notary will then send a copy of the Articles of Association to the Belgian Ministry of Justice for informal approval. The communication with the Ministry of Justice and the informal approval of the Articles of Association may take approximately 1 month.

Once the informal confirmation from the Ministry of Justice is received, the founding members of the future AISBL will meet at the office of the public notary in order to hold a constitutive General Assembly. Since a Belgian public notary may only act on Belgian territory, the constitutive General Assembly must take place in Belgium. If some individuals cannot attend in person, the public notary may prepare proxies so that they are represented at the meeting. The public notary will record the Articles of Association in a notarial deed and at the end of the meeting at the public notary's office the AISBL will be established.

It is important to note that although the AISBL is now established, it does not yet have a separate legal personality. The AISBL at this stage is equivalent to a contract between its members, pursuant to which they decide to pursue a common purpose and pool their resources together in order to achieve this goal. The AISBL will be governed by the terms of the contract (the Articles of Association) and by the supplementary rules that may be applicable to the contract. In that sense, it will resemble a collaboration agreement or a MoU.

There is no obligation to apply for a separate legal entity to the AISBL, however it is recommended to do so. Otherwise, the AISBL will not be able to own assets or have other related rights in relation to such assets used to pursue the purpose of the AISBL. Instead, any assets acquired or held by the AISBL will be considered to be collective property of the members of the AISBL. Moreover, without a separate legal personality, the AISBL will not be able to enter into contracts or act as plaintiff or defendant in legal proceedings. Any such actions will have to be organised through its members or any other agency structure. Further, without a separate legal entity, the members of the AISBL will remain liable for the AISBL's liabilities and obligations. Finally, obtaining a separate legal personality will also facilitate the receipt of grants and will ease a number of practical issues, such as opening a bank account for the AISBL.

Obviously, there are also related obligations associated with the acquisition of a separate legal personality, such as financial reporting[182], publicity obligations[183], and administrative obligations[184].

The Royal Decree

In order to be recognised as a separate legal entity, the approval by Royal Decree is required[185]. Under Belgian law, only the King, represented by the Ministry of Justice, can grant legal personality to the AISBL, provided the AISBL meets the following conditions:

- it has its seat in Belgium;
- it pursues a non-profit activity of an international nature, and;
- its purpose or its activities do not contravene the law or public policy.

The public notary will therefore send the following documents to the Ministry of Justice after the creation of the AISBL (i.e., the completion of the notarial deed):

---

[182] Filing of annual accounts with the Register of the Commercial Court or the National Bank of Belgium.
[183] Publications of directors' appointment and/or resignation in the annexes to the Belgium Official Gazette.
[184] Registration with the Crossroads Bank for Enterprises.
[185] A new royal decree may also be required if there are later changes in the objectives or activities of the AISBL, or other material aspects of the Articles of Association.

- a certified copy of the notarial deed of creation of the AISBL and its annexes;
- a request for the grant of a separate legal personality;
- the list of the members of the Board of Directors[186].

The Ministry of Justice will verify the 'international non-profit purpose and activities' clause contained in the Articles of Association which have been adopted during the constitutive General Assembly and the notarial deed. If all legal conditions are met, a Royal Decree will be issued and the AISBL will acquire legal personality on the day of the signature of the Royal Decree. The Ministry of Justice will send four copies of the Royal Decree to the public notary.

Additional obligations

The AISBL must deposit a host of documents in the file to be kept at the Registry of the Commercial Court[187] of the district in which the AISBL has its seat. These include: a copy of the Royal Decree; the Articles of Association; the act regarding the appointment of the Directors; the act regarding the appointment of the persons empowered to represent the AISBL; the persons empowered with daily management; and if applicable, the statutory auditor. The file is open to the public and any interested party may consult this file and obtain copies of the deposited documents.

In terms of publication obligations, the AISBL must also provide excerpts of the documents mentioned above for publication in the annexes to the Belgian Official Gazette[188].

Finally, the AISBL will have to register with the Crossroads Bank for Enterprises[189] and to provide information on the appointed Directors, the persons empowered to represent the AISBL, the persons entrusted with the daily management of the AISBL, and if applicable, the statutory auditor(s).

b. *Language*

The Articles of Association must be drafted in one of Belgium's official languages: Dutch, French or German. Most AISBLs choose French and provide for an English translation.

c. *What is the expected time-scale for setting up an AISBL?*

Assuming that all the required information has been sent to the public notary in due time, the entire process may take 4-5 months. This included the period required to obtain the approval by a Royal Decree, which is estimated to be around 3-4 months.

d. *Is there a need for a notary to establish an AISBL?*

Yes. The AISBL shall be validly created by a notarial deed. The notary public must, after inquiry, confirm compliance with the provisions of the AISBL Law.

4. Governance of an AISBL

a. *What is the governance structure of an AISBL?*

The basic governance structure of the AISBL is composed of the General Assembly and the Board of Directors.

---

[186] For natural persons: surname, first name, place and date of birth and address. For legal persons: name, legal form and address of the registered office.
[187] Greffe du Tribunal de Commerce.
[188] Moniteur belge.
[189] Banque-Carrefour des entreprises.

It is possible to establish additional governing bodies or to delegate certain powers to third parties. For example, in addition to the General Assembly and Board of Directors, the governance structure may comprise bodies such as a Scientific Advisory Committee, Heads of Nodes Committee, and other committees established by the General Assembly.

The composition and powers of additional governing bodies must be set out in the Articles of Association. There is a high degree of flexibility to delegate powers to such additional bodies, provided that the preparation of the annual accounts and the annual budget remains the exclusive power of the Board of Directors and the approval thereof remains the exclusive power of the General Assembly. If a statutory auditor must be appointed[190], then this will be the exclusive power of the General Assembly.

The General Assembly may also adopt internal regulations for the AISBL, which may regulate in more detail the functioning of the AISBL and its bodies, provided such internal regulations do not conflict with the Articles of Association.

b. What are the statutory bodies of an AISBL?

As mentioned above, the AISBL Law prescribes two mandatory bodies: the General Assembly[191] and the Board of Directors[192]. The statutory bodies of the AISBL will be set out in the Articles of Association.

The following powers are reserved to the General Assembly: (1) approval of the annual accounts and budget and (2) the appointment of the statutory auditors (if applicable). Additional powers may be allocated to the General Assembly in the Articles of Association.

The following powers are reserved to the Board of Directors: approval of draft annual accounts and draft budget. Additional powers may be allocated to the Board of Directors in the Articles of Association.

c. What are the main provisions of the Articles of Association for the AISBL?

The AISBL Law offers flexibility in the drafting of the Articles of Association. The items which must be addressed in the Articles of Association include:

- the name of the AISBL and the address of its registered office (street, number, and municipality);

- the precise description of the purpose or purposes for which the AISBL is created, as well as the activities it envisages to carry out in order to meet such purpose or purposes;
- the conditions and formalities regarding the admission and resignation of the members and, if applicable, of the members of different categories;
- the rights and obligations of the members and, if applicable, of the members of different categories;
- the powers, the assembly modalities and the decision-making modalities of the General Assembly of the AISBL, as well as the conditions pursuant to which its decisions are communicated to the members;
- the powers, the assembly modalities and the decision-making modalities of the Board of Directors of the AISBL, the modalities regarding the nomination, termination and revocation

---

[190] This is the case for 'very large' AISBL, see section II.3(f) below.
[191] Referred to as the 'general directional body' in the AISBL Law.
[192] Referred to as the 'governing body' in the AISBL Law.

of the directors, their minimum number, their term of office, the extent of their powers and the modalities to exercise them, as well as the modalities to designate the persons who shall have the power to bind the AISBL towards third parties and to represent it in actions and in legal proceedings; and,

- the conditions to modify the Articles of Association, to dissolve and liquidate the AISBL and the destination of the assets of the AISBL in case of liquidation.

Modifying the Articles of Association may require the involvement of a public notary or an approval by a Royal Decree, depending on the modifications concerned. For example, modifications concerning the purpose or activities of the AISBL must be approved by Royal Decree; modifications concerning the conditions of liquidation and dissolution require the intervention of a public notary; while other non-material modifications may be done without the intervention of a public notary or approval by a Royal Decree.

d.   *Location of statutory seat*

The registered office of the AISBL must be in Belgium and must be mentioned in the Articles of Association. The AISBL may keep its operations and staff in a third country (outside Belgium) however a separate tax advice should be sought in order to verify the tax status of the ASIBL in that third country, for example, if the AISBL will employ staff in France, tax advise should be sought there.

e.   *Applicable law and jurisdiction*

The applicable law to the AISBL is the AISBL Law and general Belgian law.

All deeds, invoices, announcements, publications and other documents coming from the AISBL shall mention its name, preceded or followed by the words "internationale vereniging zonder winstoogmerk" or

"association internationale sans but lucratif", or by the abbreviation "IVZW" or "AISBL", as well as the address of its registered office.

f.   *What are the accounting obligations of an AISBL?*

According to the AISBL Law, the accounting obligations of an AISBL depend on whether the AISBL is classified as 'small', 'large', or 'very large'.

'Small' AISBLs must maintain simplified bookkeeping and prepare simplified annual accounts according to the so-called 'cash basis – model'. An AISBL qualifies as 'small' if it does not meet the criteria for a 'large' or a 'very large' AISBL.

A 'Large' AISBL must maintain a 'full' double-entry bookkeeping according to the accrual principle. The rules applicable to bookkeeping and annual accounts are based on those applicable to Belgian companies[193]. It must use the full standard annual accounts format as determined by the National Bank of Belgium for associations and foundations. An AISBL is considered 'large' if at the closing of the financial year at least two of the following three thresholds are met:

- an annual average of 5 full-time equivalent ("FTE") employees;
- total revenues of EUR 312,500, excluding VAT and exceptional revenues;
- a balance sheet total of EUR 1,249,500.

---

[193] Among others, the law of 17 July 1975 and the royal decree of 30 January 2001, as amended by the royal decree of 19 December 2003 which takes into account the specific nature and legal status of AISBL.

'Very large' AISBL must comply with the financial obligations of large AISBLs. In addition, they must appoint a statutory auditor. An AISBL is considered 'very large' if the annual average exceeds 100 FTE employees or if at the end of the financial year at least two of the following three thresholds are exceeded:

- an annual average of 50 FTE employees;
- total revenues of EUR 7,300,000, excluding VAT and exceptional revenues;
- a balance sheet total of EUR 3,650,000.

Big and very big AISBLs must file their annual accounts with the National Bank of Belgium.

g. What are the most important points included in the articles of association in relation to management and governance?

As mentioned above, the AISBL Law prescribes specific items that must be include in the Articles of Association and these are considered to be essential – see section II.4(c) above.

The AISBL may include rules on admission and dismissal of members, as long as these are compliant with general EU and Belgian legislation (so as to avoid criminal activity, for example).

There are no specific rules on voting. The common practice is one vote per member at General Assembly and the Board of Directors but it is also possible to grant an uneven number of votes to different categories of members.

h. Liability

Once the AISBL obtains a separate legal personality, a distinction is created between the assets of the association and the assets of its members. This means that the AISBL is liable for its own obligations or faults attributable to the bodies through which it acts. Members of the AISBL and the administrators are not personally liable for the debts and obligations of the AISBL but they may be liable to the execution of their assigned tasks and the faults committed in their management.

5. VAT

An AISBL that supply goods or services to third parties (including to its members) may be considered a VAT subject and depending on the activity conducted, it may be subject to full VAT.

If the AISBL is fully subject to VAT, it will have to charge VAT on all services provided to third parties (including its members), but it will also be able to reclaim its input VAT (i.e., the VAT paid on purchases made by the AISBL to support its activities).

If the AISBL is considered exempt from VAT, it will not have to charge VAT if it provides services against remuneration, but it will also not be able to reclaim input VAT paid by it on its own purchases.

It is also possible that an AISBL will be partially exempt from VAT, in which case it will only be able to reclaim a certain percentage of input VAT paid by it (although the method of calculating that percentage may lack clarity at times).

In order to determine whether the OPERAS AISBL is subject to VAT an expert opinion on Belgian VAT will have to be sought.

6. Estimates costs of establishing an AISBL

The estimated costs of establishing an AISBL are in the range of Euro 1,500-2,000.

C. ERIC

1. Introduction

A European Research Infrastructure Consortium (ERIC) is a legal framework introduced by Council Regulation (EC) No. 723/2009 ("ERIC Regulation"[194]) in response to the need for a legal framework for EU-wide entities, in particular, distributed research infrastructures. The objective of the ERIC Regulation is to facilitate the establishment and operation of European research infrastructures involving several Member States. It is based on Article 187 of the Treaty on the Functioning of the European Union, which provides for the setting up of joint undertakings or any other structure necessary for research and technological development.

Since the adoption of the ERIC Regulation in 2009, 19 ERICs have been established and have their statutory seat in 9 Member States[195] and in one associated country (Norway). Together they currently have more than 20 Member States and associated countries as members and observers.

As will be further discussed below, the main characteristics and advantages of an ERIC are that it offers:

- high political acceptance and visibility reflecting a spirit of a European venture;
- legal and governance structure which is tailored to the needs of pan-European research infrastructures;
- exemption from the EU Public Procurement Directives (as implemented in national law);
- exemption from VAT and excise duty;
- a legal personality recognised in all EU Member States;
- a lighter incorporation process compared to an international organization;
- flexible internal structure which is not subject to national law.

2. General questions

a. *What are the eligibility requirements for establishing an ERIC?*

In order to be established as an ERIC, a research infrastructure must have as its principal task the establishment and operation of a research infrastructure on a non-economic basis[196]. In addition, the research infrastructure must fulfil the following requirements[197]:
- it is necessary for the carrying-out of European research programmes and projects, including the efficient execution of Community research, technological development and demonstration programmes;
- it represents an added value in strengthening and structuring the European Research Area (ERA) and a significant improvement in the relevant scientific and technological fields at the international level;
- it grants effective access, in accordance with the rules established in its statutes, to the European research community, composed of researchers from Member States and from associated countries;

---

[194] Council Regulations (EC) No 723/2009 of 25 June 2009 on the Community legal framework for a European Research Infrastructure Consortium (ERIC), (2009) OJ L206, at 1–8.
[195] Germany, Spain, France, Italy, Netherlands, Austria, Finland, Sweden, the United Kingdom.
[196] ERIC Regulation, Article 3.1., although it may carry out limited economic activities provided that such economic activities are closely related to its principal task and that they do not jeopardies the achievement thereof.
[197] ERIC Regulation, Article 4.

- it contributes to the mobility of knowledge and/or researchers within the ERA and increases the use of intellectual potential throughout Europe; and,
- it contributes to the dissemination and optimisation of the results of activities in Community research, technological development and demonstration.

b.   Who can be a member of an ERIC?

Only states and intergovernmental organisations may become members of an ERIC[198], provided that at least one EU Member State and two other countries which are either EU Member States or EU associated countries, are members of the ERIC at any given time. Further, EU Member States and EU associated countries must hold the majority of the voting rights in the Assembly of Members (also referred to as the 'Council') at all times[199].

The fact that 'states' may be members of an ERIC implies that membership is not restricted to EU Member States only and any non-EU country may become a member or observer of an ERIC, subject to conditions and modalities specified in the ERIC Regulation and the statutes of the ERIC.

Members or observers of an ERIC may be represented by public entities, including regions or private entities with a public service mission, which exercise specified rights or fulfil specified obligations on their behalf[200] ('representing entities'). This would be the case in most ERICs, since expertise on research matters and resources to carry out the activities of the ERIC may be trusted at the hands of legal entities that are separate from the state. The member state or observer state of the ERIC must give a specific mandate to the representing entity according to its own rules. The terms of the representation, including the terms for exercising voting rights, and any change in the designation of the representing entity or in the rights and obligation delegated to it should be communicated to the ERIC.

c.   Are there any other requirements for membership?

An ERIC must have at least one EU Member State and two other countries that are either EU Member States or EU associated countries as members. In addition, and as already mentioned above, the majority of voting rights must be held by Member States and associated countries at all times.

The statutes of the ERIC must also provide for a minimum duration for membership. During this period, no member may withdraw unless the membership has been specifically entered into for a shorter period, as defined in the statutes.

Associated countries, third countries or intergovernmental organisations, which are not subject to EU law, will have to recognise the legal personality and capacity of the ERIC in their legal system and agree to the jurisdiction of the Court of Justice of the European Union, as defined in Article 15 of the ERIC Regulation. They will also have to provide the ERIC an equivalent treatment as if it were an international body or international organisation with respect to VAT and excise duty exemptions.

It is also noteworthy that the ERIC Regulation requires that further Member States or associated countries may join the ERIC on fair and reasonable terms specified in the statutes[201].

d.   What level of memberships are available in an ERIC?

The ERIC Regulation allows for 'members' and 'observers' status in the ERIC.

---

[198] ERIC Regulation, Article 9(1).

[199] ERIC Regulation, Article 9(2) and 9(3).

[200] ERIC Regulation, Article 9(4).

[201] ERIC Regulation, Article 9.2.

The rights of members and observers are set out in the statutes but only members have voting rights in the Assembly of Members.

e.   *Are there initial capital requirements?*

There are no initial capital requirements for establishing an ERIC, however the proposed statutes must include a provisional budget with contributions from members for the first 3–5 years. While contributions may be in-kind, members must commit sufficient financial contributions to ensure that the ERIC meet the objectives laid down in the statutes and the ERIC Regulation.

f.   *Does the ERIC have full legal personality?*

An ERIC has a separate legal personality with the most extensive legal and transactional capacity accorded to legal entities under the law of the Member State in which the ERIC is based. The ERIC gains legal personality as from the date on which the Commission Decision setting up the ERIC takes effect.

The ERIC legal personality and extensive legal capacity are recognised in all EU Member States without requiring transposition into national law or any national legal instrument. In addition, an ERIC must be recognised by its host state as an international body or organisation for the purpose of the directives on value added tax and excise duty.

g.   *Can an ERIC apply as a beneficiary in Horizon 2020 calls?*

An ERIC is eligible to participate as a beneficiary in Horizon 2020 calls either as a sole beneficiary (if this possibility is provided for in the relevant work programme), or in collaboration with other beneficiaries. In the latter case, and in order to fulfil the condition of being established in different Member States or associated countries, the ERIC will be considered to be established in a Member State or associated country which is different from those in which the other participants are established.

3.   Procedure for establishment of an ERIC

a.   *Who can submit an application for the establishment of an ERIC?*

An application for the establishment of an ERIC is submitted to the European Commission by the future members of the ERIC. The request must be signed by all applicants.

In practice, the submission should be sent by the host state's permanent representation to the European Union on behalf of the future members of the ERIC. The application should be submitted electronically and in paper form at the following address:

The Director-General
European Commission
Directorate-General for Research and Innovation
1049 Brussels
BELGIUM
RTD-ERIC@ec.europa.eu

b.   *What should the application for establishing an ERIC contain?*

The application must be submitted in writing and contain the following:

- A formal request to the Commission to set up an ERIC. A template request for setting up an ERIC is available at the Commission website;

- The proposed statutes of the ERIC containing at least the mandatory items listed in section III.4(c) below, in particular the provisions concerning tasks and activities, the rights and obligations of its members, the bodies of the ERIC, the principles covering the different policies and the obligation upon members to make contributions to a balanced budget;

- The technical and scientific description of the research infrastructure to be established and operated by the ERIC, addressing in particular the eligibility requirements for establishing an ERIC listed in section III.2(a) above[202]. According to the European Commission, the technical and scientific description should also include: key performance indicators of the ERIC's activities against which progress of the ERIC can be benchmarked; an adequate risk assessment in order to ensure a smooth implementation; in the case of a distributed infrastructure involving national legal entities in the operation of the research infrastructure, the technical and scientific description should also explain the boundaries and the planned arrangements between the ERIC and those legal entities;

- A declaration by the host Member State recognising the future ERIC as an international body/international organisation in the sense of the directives on VAT and excise duty [203,] as of its setting up. The limits and conditions of the resulting VAT and excise duty exemptions must be contained in the statutes or as a separate agreement between the members.

c. What are the procedural steps for establishing an ERIC?

The submission of an application to an ERIC is conducted in two steps: (1) an informal submission, which focuses on verification of compliance; and, (2) a formal submission.

Step 1- informal submission

Prior to submitting step 1 application to the Commission, it is important that the members of the future ERIC prepare and agree on the documents that are required for the application (as set out in section III.3(b) above). Since members of the ERIC are states, it is important to involve the relevant ministry or national authority in early stages of preparation of the relevant documents.

Once the documents have been prepared and agreed among the members, the application should be submitted electronically to the Commission by the host state's permanent representation to the European Union on behalf of the future members of the ERIC. The application should include all the relevant documents referred to above.

For step 1 application there is no need for all members to sign the application, however the host state must submit a declaration recognising the future ERIC as an international body/international organisation in the sense of the directives on VAT and excise duty respectively.

The Commission will then assess the application to ensure that all relevant documents have been submitted and are in line with the requirements of the ERIC Regulation. See Annex II for a full list of items to be examined by the Commission.

During the process of assessment, the Commission may obtain the assistance of independent experts in the field of the intended activities of the ERIC. The Commission will inform the applicants of the

---

[202] i.e., that the research infrastructure is necessary for the carrying out of European research programmes; represent an added value in the implementation of the ERA and an improvement at international level; grant effective access to the European research community; contribute to the mobility of knowledge and/or researchers within the ERA; contribute to the dissemination and optimisation of the results of the activities.

[203] Articles 143(1)(g) and 151(1)(b) of Directive 2006/112/EC and Article 12(1)(b) of Directive 2008/118/EC.

results of the assessment by sending comments and suggesting modifications to the draft scientific and technical description and to the statutes.

At the end of Step 1 application, the Commission will invite the applicants to submit the formal request (Step 2), signed by all future members of the ERIC after taking into account the comments and suggestions made and revising the documents accordingly.

Step 2 – formal submission

After making the relevant adjustments, the host state's permanent representation to the European Union will submit an application including all relevant documentation on behalf of the future members of the ERIC, this time signed by all members.

The Commission will then seek the opinion of the ERIC Committee and will commence work on the preparation of the relevant Commission Decision establishing the ERIC. Once ready and approved, the Decision setting up the ERIC will be notified to the applicants and published in the Official Journal of the European Union.

d.   *What are the time scales of setting up an ERIC?*

According to the Commission, the estimated time scales for Step 1 is 3 months from submission of the informal application and 6 months for Step 2 from the submission of the formal application.

e.   *Language*

An application to establish an ERIC may be submitted in any one of the official languages of the institutions of the European Union. The Commission Decision establishing the ERIC will be translated into all official languages of the European Union.

4.   Governance

a.   *What is the governance structure of an ERIC?*

The basic governance structure of the ERIC is composed of the Assembly of Members (also known as the 'Council') and a Director or a Board of Directors. The Director or Board of Directors is the legal representative of the ERIC.

Several advisory committees may be set up in the statutes, such as a scientific advisory committee, an administrative and finance committee, or an ethics committee, to support the Assembly of Members. During the lifetime of an ERIC, the Assembly of Members may create additional advisory bodies as it deems appropriate. For ERICs operating distributed infrastructures, the Director may be supported by a heads of nodes committee consisting of representatives of the national facilities.

The statutes also provide for voting rules on quorum or majority rules for the decisions of the Assembly of Members. Further rules may be adopted by the Assembly of Members by way of implementing rules.

The name of an ERIC must contain the abbreviation 'ERIC' as a separate term.

b.   *What are the statutory bodies of an ERIC?*

The ERIC Regulation prescribes two mandatory bodies: (1) the Assembly of Members ('Council'); and, (2) a Director or a Board of Directors.

The Assembly of Members is the body having full decision-making powers. It adopts in particular the

annual budget, the annual work plan and the implementing rules which complement the statutes.

The Director or the Board of Directors is appointed by the Assembly of Members. The Director or Board of Directors is the executive body and legal representative of the ERIC.

c. *What are the main provisions of the statutes of the ERIC?*

The ERIC Regulation requires that the statutes of an ERIC shall contain at least the following:

- a list of members, observers and, where applicable, of representing entities and the conditions of and the procedure for changes in membership and representation;
- the tasks and activities of the ERIC;
- the statutory seat of the ERIC;
- the name of the ERIC;
- the duration, and the procedure for the winding-up of the ERIC;
- the liability regime;
- the basic principles covering:
  - the access policy for users;
  - the scientific evaluation policy;
  - the dissemination policy;
  - the intellectual property rights policy;
  - the employment policy, including equal opportunities;
  - the procurement policy respecting the principles of transparency, non- discrimination and competition;
  - a decommissioning, if relevant;
  - the data policy;
- the rights and obligations of the members, including the obligation to make contributions to a balanced budget and voting rights;
- the bodies of the ERIC, their roles and responsibilities and the manner in which they are constituted and in which they decide, including upon the amendment of the statutes;
- the identification of the working language;
- references to rules implementing the statutes.

d. *In what form can private entities take part in an ERIC?*

According to the ERIC Regulation, only EU Member States, associated countries, third countries and intergovernmental organizations may be members or observers of an ERIC. This means that private entities cannot be members or observers in the ERIC.

However, private entities can take part in the ERIC in various other ways, for example:

- Representing entities: members or observers of an ERIC may be represented by private entities with a public service mission, which exercise specified rights or fulfil specified obligations on behalf of the members of the ERIC. A 'private entity with a public service mission' is an entity which is private, but owned by a public-sector body or the state. It may also be any other private entity that is explicitly granted a public service mission by way of a

decision of a public-sector body. For example, higher education establishments that deliver diplomas recognised by a public authority according to criteria established by the state or perform research with public funding and in accordance with objectives agreed by the state.

- Members of advisory committees: As explained above, the statutes may include several advisory committees, such as a scientific advisory committee, an administrative and finance committee or an ethics committee that will support the Assembly of Members. The ERIC Regulation does not restrict or limit membership in such committees and there seem to be no reason why private entities could not be appointed to such committees.

- Experts: the statutes, or rules of procedure adopted by the Assembly of Members, may specify that members of the ERIC may be accompanied by experts when attending meetings of the Assembly of Members (subject to conditions set out thereof). There are no legal restrictions on the identity of such experts and these may include private entities as well.

- Ex-officio or 'guest' status at Assembly of Members meetings: the statutes, or rules of procedure adopted by the Assembly of Members, may also provide that the Assembly of Members may invite third parties (including private entities) to attend as ex-officio or guests at meetings, without the right of vote.

- Any other contractual relationship: being a separate legal entity with full legal capacity, the ERIC may enter into agreements with third parties. There seem to be no restrictions on the type and content of such agreements, as long as they do not contradict applicable law or public policy. Therefore, it cannot be excluded that the ERIC will enter into a contractual arrangement with a private entity, granting the latter, inter alia, a special status in the ERIC meetings.

e.   Are there restrictions on ERIC to carry out economic activity?

In order to be established as an ERIC, a research infrastructure must have as its principal task the establishment and operation of a research infrastructure on a non-economic basis[204]. However, an ERIC may carry out limited economic activities provided that such economic activities are closely related to its principal task and that they do not jeopardise the achievement thereof[205]. The economic activities must remain secondary and not prevail over the execution of its main task. In practice, if the ERIC carries out an economic activity that is successful enough to be no longer considered as secondary, the ERIC may consider creating a spin-off company or any other subsidiary, and transfer the activity to that separate entity. The ERIC may hold 100% of the shares in that company.

For purposes of establishing whether an activity is considered to be 'economic', the term 'economic activities' is to be interpreted on the basis of EU competition law. In accordance with jurisprudence of the Court of Justice of the European Union, the nature of the ERIC as a non-profit entity is not sufficient to classify its activities as non-economic, and the test will be, inter alia, whether it carries out activity consisting in offering goods and services on a given market[206].

f.   Location of statutory seat

The statutory seat of an ERIC must be located on the territory of a Member State or of an associated country member of the ERIC, where at least some of its activities are carried out.

g.   Applicable law and jurisdiction

---

[204] ERIC Regulation, Article 3.1.
[205] See ERIC Regulation, recital 8, and Articles 3.2 and 3.3. The possibility to carry out 'limited economic activities' is permitted with a view to promote innovation, as well as transfer of knowledge and technology.
[206] See for example Cases C-180/98 to C-184/98 Pavlov and Others EU:C:2000:428, para 75.

ERICs are governed by the ERIC Regulation and by the Commission Decision establishing each ERIC[207]. In the case of matters that are not covered, or only partially covered, by the ERIC Regulation or the ERIC Decision, the law of the state where the ERIC has its statutory seat will apply.

The Court of Justice of the European Union has jurisdiction over litigation among the members in relation to the ERIC, between the members and the ERIC and over any litigation to which the Union is a party. Union legislation on jurisdiction applies to disputes between an ERIC and third parties. In cases not covered by Union legislation, the law of the state where the ERIC has its statutory seat determines the competent jurisdiction.

h. What are the accounting obligations of an ERIC?

The member countries of the ERIC hold the responsibility for the budget of the ERIC and are obliged to make contributions in order to ensure a balanced budget[208].

The ERIC Regulation sets out the minimum budgetary and accounting requirements, as follows[209]:

- all items of revenue and expenditure of an ERIC must be included in estimates to be drawn up for each financial year and shown in the budget;
- the revenue and expenditure shown in the budget must be balanced;
- it is the responsibility of the members of the ERIC to ensure that the appropriations are used in accordance with the principles of sound financial management;
- the budget shall be established and implemented and the accounts presented in compliance with the principle of transparency;
- the accounts of an ERIC must be accompanied by a report on budgetary and financial management of the financial year;
- the law of the host state applies as regards preparation, filing, auditing and publication of accounts.

i. What are the most important points included in the ERIC statutes in relation to management and governance?

As mentioned in section III.4(c) above, the ERIC Regulation prescribes specific items that must be include in the statutes of the ERIC.

In addition, there is flexibility for the Assembly of Members to set up advisory committees in the statutes, such as a scientific advisory committee, an administrative and finance committee or an ethics committee to support the Assembly of Members.

The essential elements of its statutes are annexed to the Commission Decision setting up the ERIC, and include:

- The tasks and activities of the ERIC;
- the statutory seat;
- the name of the ERIC;

---

[207] Including the statutes of the ERIC. A 'Decision' is an EU legal act binding on those to whom it is addressed i.e. the EU member states that are members or associated members of the ERIC. A Decision is directly applicable, meaning, it does not need any other acts of parliament in the member state to make it into law.

[208] ERIC Regulation, Article 10(h).

[209] ERIC Regulation, Article 13.

- the duration, and the procedure for the winding-up;
- the liability regime;
- the basic principles covering:
  - the access policy for users;
  - the scientific evaluation policy;
  - the dissemination policy;
  - the intellectual property rights policy;
  - the employment policy, including equal opportunities;
  - the procurement policy respecting the principles of transparency, non-discrimination and competition.

Any amendment of the essential elements in the statutes must be submitted to the Commission for approval before such changes take effect.

The statutes also provide for voting rules on quorum or majority rules for the decisions of the Assembly of Members. Further rules may be adopted by the Assembly of Members by way of implementing rules.

j.   *Liability*

An ERIC is liable for its debts.

As regards liability of the members, the default regime is for the statutes to provide that members' liability is limited to each member's respective contributions provided to the ERIC (either in total or limited to annual contributions). The statutes may also provide that members will assume a fixed liability above their respective contributions or assume unlimited liability.

If the statutes provide for limited liability of the members, the ERIC must take appropriate insurance to cover the risks specific to its activity (including construction and operation of the infrastructure).

5.   VAT

According to Article 5(1)(d) of the ERIC Regulation, the proposed ERIC must be recognised by its host Member State as an international body in the sense of Articles 143(1)(g) and 151(1)(b) of the VAT Directive[210]. Associated countries, third countries other than associated countries or intergovernmental organisations must give the same recognition to the ERIC of which they are or intend to become members.

Once established, the ERIC benefits from exemption under the VAT Directive granted in respect of goods or services supplied to (or imported by) an international body recognised as such by its host Member State. An associated country, whether hosting an ERIC or not, and any other third country which is a member must therefore provide for VAT exemption.

The limits and conditions of the exemption must be agreed between the members and laid down in the statutes or in a separate agreement. The VAT exemption applies to goods or services acquired by the ERIC or its members that are for: (1) non-economic activities; (2) the exclusive and official use of the ERIC; (3) are wholly paid and procured by the ERIC; (4) exceed a certain value which is indicated in the statutes or in the separate agreement; and, (5) subject to additional limits and

---

[210] Council Directive 2006/112/EC of 28 November 2006 on the common system of value added tax (OJ L 347), 11.12.2006, p. 1.

conditions set out in the statutes (or the separate agreement).

The exemption applies to goods or services regardless of whether they are purchased locally, within the EU or from third countries. However, the exemption does not cover situations where the services or goods procured are subject to VAT in third countries (unless that country has specifically granted an exemption to an ERIC)[211].

6. Estimated costs of establishing an ERIC

The application to the Commission for setting up an ERIC is free of charge. However, there may be significant costs incurred during the preparation of the application, in particular in terms of manpower and resources dedicated for preparing the application.

D. COMPARISON AISBL AND ERIC

1. Comparison table

Criterion	AISBL	ERIC
Membership	Any natural or legal person	Only EU Member States, associated countries, third countries or intergovernmental organisations
Minimum number of members	At least 2, but 3 or more recommended	At least one Member State and two other countries that are either Member States or associated countries
Initial capital requirements	None	None
Separate legal personality	Yes	Yes
Set up procedure	Light	Heavier, especially upfront (pre-submission preparations)
Set up requirements	Light. Preparation and agreement on Articles of Association	Research infrastructures must demonstrate a relatively high degree of matureness in relation to several requirements of a scientific, technological and administrative nature and a pan-European character

---

[211] This would be the case if that third country happens to be a member of the ERIC.

Set up duration	Approx. 4-5 months	Approx. 9 months from submission of step-1 application
Governance structure	Flexible. Must include a General Assembly and Board of Directors	Relatively flexible. Must include Assembly of Members and a Director or a Board of Directors
Pan-European image	Strong	Very strong
Location of statutory seat	Belgium	In a Member State or an associated country which is a member of the ERIC, where at least some of the activities are carried out
Applicable law	Belgian law	the ERIC Regulation and by the Decision establishing the ERIC. In the case of matters that are not covered, or only partially covered by the ERIC Regulation or the ERIC Decision, the law of the state where the ERIC has its statutory seat
Limited liability regime	Yes. Members of the AISBL and the administrators may be liable to the execution of their assigned tasks and the faults committed in their management only	Yes. Members' liability is limited to each member's respective contributions, or as may be otherwise provided in the statutes
Estimated costs of establishment	Euro 1,500 - 2,000	None. However, preparation for the application for setting up an ERIC may require significant resources
Other privileges	None	Exemption from the EU directives on public procurement and from VAT and excise duty

2. What benefits does an ERIC legal structure offers for OPERAS?

Since its establishment in 2009, the ERIC legal structure has been in use for 19 different research infrastructures with more than 20 Member States and associated countries participating as members and observers.

The benefits that an ERIC legal structure offers could be summarised as follows:

- high political acceptance and visibility within the scientific community, reflecting a spirit of a European venture;
- legal and governance structure which is tailored to the needs of European research infrastructures allowing more capacity to participating members to make decisions and shape the structure of the ERIC independently;

- exemption from the EU Public Procurement Directive 2014/24/EU (as implemented in national law), hence eliminating the need to follow excessive formalities and potentially lengthy procedures when purchasing services or goods in the market;
- exemption from VAT and excise duty on purchases made by the ERIC or its members under the limits and conditions set out in the statutes (or a separate agreement);
- a legal personality recognised in all EU Member States;
- facilitates eligibility for EU and national funding, especially for the preparatory phase;
- a lighter incorporation process compared to an international organization;
- flexible internal structure which is not subject to national law;

E.   LEGAL AND BUSINESS MODELS FOR THE PROVISION OF SERVICES BY AND TO OPERAS

1.   What is the relationship between the headquarter and the national nodes under the AISBL?

There are various ways in which the relationship between the headquarter (Hub) and the national nodes (Nodes) may be established. In general, it would be useful to distinguish between relationships established on the basis of a governance model and relationships established on the basis of a contractual model, or relationships that are based on a combination of the two.

Under a governance model, the Nodes could be members of the governance of the AISBL. For example, membership in the AISBL itself will allow maximum integrity whereby the Nodes become direct stakeholders in the AISBL. Each Node will take part in General Assembly meetings and will have voting rights like all other members of the AISBL. As members of the AISBL and the General Assembly, the Nodes will participate as equals in the decision-making process of the AISBL.

Alternatively, the General Assembly may establish additional governing bodies and delegate certain powers to such governing bodies, or assign them a general advisory role. The composition and powers of such additional governing bodies must be set out in the Articles of Association. For example, the General Assembly could establish a Heads of Nodes Committee which will be composed of one representative, acting as the head of the relevant Node. The Heads of Nodes Committee may be charged with the general responsibility of advising the General Assembly on the activities carried out by OPERAS[212] and that the General Assembly and Board of Directors are obliged to seek the advice of the Heads of Nodes Committee prior to taking decisions concerning certain matters.

Representatives of the Nodes may also participate in other committees, such as a Scientific Advisory Committee.

Instead of, or in addition to the governance model, the relationship between the Hub and the Nodes may be based on a contractual model (binding or non-binding), in which the Hub will enter into a collaboration agreement with each Node. The details of the collaboration agreement would need to be determined by the Board of Directors (subject to approval by the General Assembly), but it may include issues such as the terms and conditions for the provision of technical or other services through the OPERAS Nodes to OPERAS, to users or to other third parties, and set out the mechanisms for their provision. It is also possible that OPERAS would like to establish a procedure for applications to become an OPERAS Node as well as a procedure for evaluating Node applications, including eligibility and evaluation criteria before entering into any collaboration agreement. During the life time of the collaboration agreement, OPERAS may also decide to carry out regular evaluation (to be carried out by a Scientific Advisory Committee, for example), in order to determine whether the collaboration

---

[212] The exact scope of responsibility of the Heads of Nodes Committee could be defined in a Terms of Reference and Rules of Procedure documents.

with the Node should continue or be terminated.

2. How are services provided to OPERAS users (e.g., libraries, publishers, researchers) by the central hub, the national nodes, OPERAS members and external private parties?

According to OPERAS Design Study, the OPERAS infrastructure will coordinate services, practices and technology across main actors in the SSH scholarly communications in Europe with a view to providing joint services, to align activities of strategic actors and stakeholders (research institutions, libraries, platforms, publishers, funders) in their transition to Open Science, and in particular scholarly communication; to develop common good practice standards for digital open access publishing, infrastructures, services, editorial qualities, business models and funding streams, explore alternative measurements of impact in the SSH; offer sustained training along common standards to researchers and other stakeholders on all of the above.

It is further envisaged that OPERAS will operate on the basis of the principle of subsidiarity, i.e., that each Node will provide publication and communication services to their own scientific community, but collaborate and share their technologies, know-how, practices and efforts with other Nodes and with the Hub. This will be done with a view to align OPERAS activities to increase the quality of services; to integrate into the European Open Science Cloud (EOSC) and achieve interoperability; and, to provide integrated services at European level when there is a clear and defined added value.

As a general remark, it is worth mentioning that services provided to users (by the Hub and/or by the Nodes) will likely be agreed between the Hub and the Nodes on the basis of a contractual arrangement, such as collaboration agreements or service level agreements. The collaboration agreements or service level agreements could include provisions on reporting duties, quality assurance and scientific evaluation processes, provision of facilities and staff dedicated to OPERA's mission, as well as financial commitments.

The coordination of OPERAS tasks, mission and activities would be executed by the Hub. The Hub would manage the organisational, technical and administrative issues with the Nodes and other research infrastructures or third parties and provide services to support the Nodes and the user community. It may also serve as a focal contact point for the user community in the host country in which it is established.

Assuming that OPERAS will operate on the basis of a federated model, then OPERAS Nodes, which have entered into a collaboration agreement or a service level agreement with the Hub, will play a central role in the provision of services to users within their communities. Each of the Nodes will likely be hosted by an institute that has its own legal personality and will provide defined set of services on behalf of OPERAS. As mentioned above, the services and the terms and conditions of their delivery will be addressed in the collaboration agreement or service level agreement entered into by the relevant Node and the Hub. The actual provision of services to external users may be regulated by a tailored service agreement.

In relation to other entities, which are not accepted as nodes, in particular private entities, the provision of services will be based on regular service agreements which may include remuneration.

Finally, in case the purchaser of the services is a "contracting authority" within the meaning of EU Directive 2014/24/EU on public procurement[213], and where the volume in monetary terms is above

---

[213] According to Directive 2014/24/EU, the 'ccontracting authorities' means "the State, regional or local authorities, bodies governed by public law or associations formed by one or more such authorities or one or more such bodies governed by public law".

the applicable thresholds[214], there will be a need to consider EU public procurement implications and, unless a specific exemption applies[215], a competitive procedure will have to be followed.

3.   Can the ERIC utilize a freemium model? If yes, at what conditions?

A freemium model suggests that while some services are provided to users free of charge, other (premium) services, will be provided against remuneration.

It was mentioned above, that an ERIC must have as its principal task the establishment and operation of a research infrastructure on a non-economic basis, however, it may carry out limited economic activities provided that such economic activities are closely related to its principal task and that they do not jeopardise the achievement thereof.

The fact that under a freemium model a fee might be charged for the provision of premium services does not automatically render the provisions of such services as an 'economic activity'. The question whether a certain activity is considered 'economic' will require a case-by-case assessment, which will be based on the interpretation of EU law, taking account of the specific circumstances, such as market conditions, the way the activity is organised and other relevant considerations in accordance with the jurisprudence of the

Court of Justice of the European Union.

Even if the provision of premium services against remuneration is considered as an 'economic activity', the ERIC will be allowed to carry out such activity as long as it remains secondary and not prevail over the execution of the main (non-economic) task of the ERIC. If the provision of premium services becomes successful enough to be no longer considered as secondary, the ERIC may consider creating a spin-off company for example, and transfer the activity of premium services to the responsibility and ownership of that separate entity. The ERIC may hold 100% of the shares of that separate entity.

F.   Annex 1: Information to be provided to the public notary in order to prepare the Articles of Associations of the AISBL

- Name;
- Seat of the head office;
- Objective and goals:
    - List of the goals of the AISBL;
    - List of the activities that the AISBL will carry out in order to reach the goals.
- Founding members of the AISBL:
    - For natural persons: full name, profession, address and a copy of their passport or identity card;
    - For legal person: name; seat of the head office; juridical form; corporate number and information of the person(s) who can represent the corporation with a copy of their passport or identity card; latest version of the bylaws; a confirmation of the powers of the person(s) who can represent the corporation; an extract of the chamber of commerce or company register (for non-Belgian entities).

---

[214] These are depended on the type of contract awarded and the entity awarding the contract. The basic thresholds are €221,000 for the purchase of services or supplies, and €5,548,000 for the purchase of works.

[215] There are various grounds for exemption that are listed in Directive 2014/24/EU.

- Information for the bylaws:
  - Minimum number of members;
  - Maximum amount of membership-fee or contributions by the members;
  - The destination of the funds of the AISBL in case of dissolution, this destination has to be altruistic.
- Assembly and end of financial year:
  - Date and hour of the annual assembly;
  - End date of the financial year;
  - Date of the first assembly and date of the end of the first financial year.
- Administrators:
  - For natural persons: full name, profession, address and copy of their passport or identity card;
- For legal persons: name; seat of the head office; juridical form; corporate number and information on the person(s) who can represent the corporation; latest version of their bylaws; a confirmation of the powers of the person(s) who can represent the corporation; an extract of the chamber of commerce or company register (for non-Belgian entities).

G. Annex 2: Verification of completeness and conformity by the Commission of an application to establish an ERIC

Verification of Completeness of the application

- A request to the Commission to set up the ERIC;
- A technical and scientific description;
- A declaration by the host Member State recognising the future ERIC as an international body/international organisation in the sense of the VAT and excise duty directives, as of its setting up;
- the limits and conditions of the resulting VAT and excise duty exemptions — either contained in the statutes or as a separate agreement between the members;
- proposed statutes (Article 5(1)(b)) containing all elements listed in Article 10.

Verification of the principal tasks to establish and operate a research infrastructure

- only limited economic activities;
- Requirements relating to the research infrastructure:
  - important for European research;
  - excellent in its field at international level;
  - provides effective access for European researchers;
  - contributes to the mobility of knowledge and/or researchers within the ERA;
    - contributes to dissemination/optimisation of the RTD results;
  - Statutory seat located in Member State or associated country.
- Name of the ERIC contains 'ERIC';
- only states and intergovernmental organisations as members;
- fair terms for joining of new Member States and associated countries;
- Majority of voting rights held by Member States and associated countries;
- Bodies of the ERIC: Assembly of Members; Director or Board of Directors;
- Liability regime: insurance foreseen in case of limited liability.

XII. Bibliography: Open Access Research Studies and Publications of the OPERAS Consortium

A. Introduction

OPERAS partners have been involved in a number of research projects and international events to gain experience with and develop models for the OPERAS distributed Research Infrastructure (RI). They have more than ten years of experience in open access (OA) publishing and related research studies and publications.

This part is comprised of two sections. The first section summarizes the research studies and publications of the OPERAS Consortium. The second one lists the events and meetings they have organized.

B. Research Studies and Publications

The first section of this part considers research studies and publications of the OPERAS Consortium from 2009 to 2017. The studies and publications in this bibliography are not exhaustive but represent the extensive work of the OPERAS Consortium. While the OPERAS Consortium has been active in the field for much longer, the bibliography only covers findings from the last decade. It pays special attention to research from the OPERAS Core Group, as they have been most active in this field, and introduces their studies with short abstracts.

The research studies and publications of the OPERAS Consortium focus on the SSH and digital OA publishing, as well as on the need for OA publishing and the impacts that derive from it. OpenEdition/Cléo, in particular, has offered the academic community four international-scale publication and information platforms in the SSH since 1999: Revues, OpenEdition Books, Calenda, and Hypotheses. These platforms host more than 400 journals and 1,800 books, as well as academic blogs and scientific programs. EKT, the Greek national institution for documentation, is actively involved in issues regarding OA to scientific publications and research data. IBL PAN manages two electronic platforms for dissemination of research results and scholarly communication: New Panorama of Polish Literature and Polish Studies Newsletter. The Consortium's research also looks at best practices, case studies, and policy recommendations, e.g. for coordinated OA policies in Europe and business models. UCL Press is the first fully OA university press in the UK and has done a lot of research on best practices and policy recommendations. UC Digitalis, operating the three digital libraries Alma Mater, Pombalina and Impactum, has undertaken research on threats and opportunities of OA publishing. The OPERAS Consortium's research more specifically considers the special case of OA monographs and considers OA journals. OAPEN is particularly dedicated to open access to scholarly monographs and operates the OAPEN Library, a platform for hosting, dissemination and preservation of open access books, and the Directory of Open Access Books (DOAB), a service for OA books. MWS, on the other hand, focuses on journals. It operates its journals (Francia-Recensio, Discussions, Essays of the Forum Transregionale Studien, Friedrich300, Joachim-Lelewel-Gespräche, Kulturgeschichte Preußens, Orient-Institut Studies, Recensio Moskau and many more) on its publication platform perspectivia.net. The University of Zadar is also very active in this field and operates HRCAK, a portal of Croatian scientific journals.

While many research studies and publications were published in English, a lot of studies are only available in their national language, stressing the great need for a coordination of university-led scholarly communication activities in the SSH in Europe.

1.   SSH and Digital OA Publishing

IBL PAN – Maryl, Maciej. 'Literary Life Online: Writers, Institutions and Readers Facing Technological Changes'. Warszawa: Wydawnictwo IBL. 2015.

This study concerns the ways in which new communication technologies have reshaped literary life, understood as the social institution of producing, publishing, reading and evaluating literary texts. The field of online literary life remains unexplored in literary scholarship. This situation seems to stem from the lack of an adequate methodology – one that would allow for a more or less equal treatment of both actual and virtual literary worlds. Such a methodology should target not only the novelty but also the continuity of cultural phenomena. Online literary life does not exist in a vacuum, far removed from the 'traditional' communication patterns of print (sender-institution-receiver). On the contrary, it has become an indispensable component of literary communication today. In this work I propose an anthropological approach to literary practices, which, I argue, helps us bridge the gap between those two worlds.

EKT – Tsoukala, Victoria; Panagopoulou, Alexia; Stavrou, Giorgos; Angelidi, Eleni; Sachini, Evi; and Alexandros Nafpliotis. 'Developing the Greek Reference Index for the Social Sciences and Humanities'. *Let's Put Data to Use: Digital Scholarship for the Next Generation: Proceedings of the 18th International Conference on Electronic Publishing,* 59–67. 2014. ISBN:978-1-61499-409-1. helios-eie.ekt.gr/EIE/handle/10442/14318.

The ways in which research data is used and handled continues to capture public attention and is the focus of increasing interest. Electronic publishing is intrinsic to digital data management, and relevant to the fields of data mining, digital publishing and social networks, with their implications for scholarly communication, information services, e-learning, e-business and the cultural heritage sector. This book presents the proceedings of the 18th International Conference on Electronic Publishing (Elpub), held in Thessaloniki, Greece, in June 2014. The conference brings together researchers and practitioners to discuss the many aspects of electronic publishing, and the theme of 2014 was 'Let's put data to use: digital scholarship for the next generation'. As well as examining the role of cultural heritage and service organisations in the creation, accessibility, duration and long-term preservation of data, it provides a discussion forum for the appraisal, citation and licensing of research data and the new developments in reviewing, publishing and editorial technology. The book is divided into sections covering the following topics: open access and open data; knowing the users better; researchers and their needs; specialized content for researchers; publishing and access; and practical aspects of electronic publishing. Providing an overview of all that is current in the electronic publishing world, this book will be of interest to practitioners, researchers and students in information science, as well as users of electronic publishing.

EKT – Wessels, Bridgette; Finn, Rachel L.; Linde, Peter; Mazzetti, Paolo; Nativi, Stefano; Riley, Susan; Smallwood, Rod; et al. 'Issues in the Development of Open Access to Research Data', 49-66. 2014. doi:10.1080/08109028.2014.956505. tandfonline.com/doi/abs/10.1080/08109028.2014.956505.

This paper explores key issues in the development of open access to research data. The use of digital means for developing, storing and manipulating data is creating a focus on 'data-driven science'. One aspect of this focus is the development of 'open access' to research data. Open access to research data refers to the way in which various types of data are openly available to public and private stakeholders, user communities and citizens. Open access to research data, however, involves more than simply providing easier and wider access to data for potential user groups. The development of open access requires attention to the ways data are considered in different areas of research. We identify how open access is being unevenly developed across the research environment and the consequences this has in terms of generating data gaps. Data gaps refer to the way data becomes detached from published conclusions. To address these issues, we examine four main areas in developing open access to research data: stakeholder roles and values; technological requirements for managing and sharing data; legal and ethical regulations and procedures; institutional roles and policy frameworks. We conclude that problems of variability and consistency across the open access

ecosystem need to be addressed within and between these areas to ensure that risks surrounding a data gap are managed in open access.

OAPEN – Adema, Janneke; and Eelco Ferwerda. 'Publication Practices in Motion: The Benefits of Open Access Publishing for the Humanities'. *New Publication Cultures in the Humanities: Exploring the Paradigm Shift,* **131-146. Amsterdam University. 2014.** academia.edu/12282828/Publication_Practices_in_Motion_The_Benefits_of_Open_Access_Publishing_for_the_Humanities**.**

This paper will show how open access publishing can aid humanities scholars in transition – from the English professor who hardly touches a computer (except for the occasional email or to search for something in an online library catalogue) to the digital humanist building collaborative virtual environments to present and communicate the newest version of her (and her groups') data sets. In particular, open access publishing will serve the scholar that finds himself positioned somewhere in between these two extremes: the scholar who occasionally reads and browses a book that her communication with her peers is increasingly taking place in an online environment; the same scholar who is afraid that her work might be stolen or plagiarized in the online world and who is skeptical about how authority, quality and integrity can be maintained in digital publishing; and who, moreover, is all too aware that tenure and promotion committees still judge a book by its (printed) cover.

OpenEdition/Cléo – Mounier, Pierre. 'Internet Governance and the Question of Legitimacy (Chapter 8) - Governance, Regulation and Powers on the Internet'. *Governance, Regulations and Powers on the Internet, Cambridge University Press***. 2012. doi:**10.1017/CBO9781139004145.011. cambridge.org/core/books/governance-regulation-and-powers-on-the-internet/05E4340987B5F57F3D376B37A2EB1861

Digital technologies have prompted the emergence of new modes of regulation and governance, since they allow for more decentralized processes of elaboration and implementation of norms. Moreover, the Internet has been raising a wide set of governance issues since it affects many domains, such as individual rights, public liberties, property rights, economic competition, market regulation, conflict management, security and the sovereignty of states. There is therefore a need to understand how technical, political, economic and social norms are articulated, as well as to understand who the main actors of this process of transformation are, how they interact and how these changes may influence international rulings. This book brings together an international team of scholars to explain and analyse how collective regulations evolve in the broader context of the development of post-modern societies, globalization, the reshaping of international relations and the profound transformations of nation-states.

OpenEdition/Cléo – Mounier, Pierre. *Read/Write Book 2 : Une introduction aux humanités numériques***. OpenEdition Press. 2012. books.openedition.org/oep/226.**

Qu'est-ce que les humanités numériques ? Apparue en 2006, l'expression connaît depuis un véritable succès. Mais au-delà du slogan à la mode, quelle est la réalité des pratiques qu'il désigne ? Si tout le monde s'accorde sur une définition minimale à l'intersection des technologies numériques et des sciences humaines et sociales, les vues divergent lorsqu'on entre dans le vif du sujet. Les humanités numériques représentent-elles une véritable révolution des pratiques de recherche et des paradigmes intellectuels qui les fondent ou, plus simplement, une optimisation des méthodes existantes ? Constituent-elles un champ suffisamment structuré pour justifier une réforme des modes de financement de la recherche, des cursus de formation, des critères d'évaluation ? L'archive numérique offre-t-elle à la recherche suffisamment de garanties ? Quelle place la recherche « dirigée par les données » laisse-t-elle à l'interprétation ? Telles sont quelques-unes des questions abordées par ce deuxième opus de la collection « Read/Write Book ». Ces dix-huit textes essentiels, rédigés ou traduits en français par des chercheurs de différentes nationalités, proposent une introduction aux humanités numériques accessible à tous ceux qui souhaitent en savoir plus sur ce domaine de recherche en constante évolution.

OpenEdition/Cléo – Mounier, Pierre; and Marin Dacos. 'Electronic Publishing'. *Communications No 88*/1, 47–55. 2012. doi:10.3917/commu.088.0047. cairn.info/revue-communications-2011-1-page-47.htm.

Electronic publishing is gradually gaining its independence from traditional publishing. This booming sector can be broken down into three distinct areas: digitization reproduces printed publications in the digital environment; native digital publishing occurs when the editing process is exclusively grounded in the digital format and doesn't undergo the printing process; network publishing takes advantage of the opportunities for collaborative writing allowed by the Internet. Starting at different times in the history of electronic publishing, these three approaches now coexist within the same environment centered around the notion of text.

OpenEdition/Cléo – Dacos, Marin. *Read/Write Book : Le livre inscriptible*. OpenEdition Press. 2010. books.openedition.org/oep/128.

En entrant dans l'ère de l'informatique en réseau, le livre devient inscriptible. Son développement ne suit plus la ligne droite de la traditionnelle chaîne du livre, mais se diffuse par ramifications réticulaires. Comme un oignon, il se pare de multiples couches d'informations, ajoutées par différents métiers, mais aussi par les lecteurs. Ensemble, ils participent à une vaste entreprise d'enrichissement documentaire qui multiplie les grilles de lecture du texte et en fait miroiter les multiples sens. Inscriptible, le livre s'insère désormais dans un système d'information riche, polymorphe, mouvant et encore très fragile. C'est le Read/Write Book.

OpenEdition/Cléo – Dacos, Marin; and Pierre Mounier. 'Les carnets de recherche en ligne, espace d'une conversation scientifique décentrée' *Lieux de savoir, T.2, Gestes et supports du travail savant*. Albin Michel. 2010. archivesic.ccsd.cnrs.fr/sic_00439849.

Le carnet de recherches produit un décentrement des lieux d'écriture vers des espaces moins codifiés et moins formels que les espaces de publication traditionnels, prenant ainsi le relais de formes plus volatiles et moins individuelles de conversation. Ce qui est en jeu est moins une économie de l'écriture que de la lecture. En jetant les bases d'une nouvelle relation au lectorat, le carnet de recherche offre l'opportunité de réinventer l'écriture scientifique autour du paradigme de la conversation, renouant ainsi avec une vieille tradition de débat scientifique, tout en se dotant d'une rhétorique adaptée au nouvel espace qui se met en place.

OpenEdition/Cléo – Mounier, Pierre. L'édition électronique : un nouvel eldorado pour les sciences humaines ? *OpenEdition Press.* 2010. doi:10.4000/books.oep.169.

En guise d'introduction, il me semble nécessaire de faire le point sur un certain nombre de questions qui ont structuré les débats sur l'édition électronique depuis dix ans. À mon sens, ces questions sont aujourd'hui largement obsolètes.

OpenEdition/Cléo – Mounier, Pierre; and Marin Dacos. 'Sciences et société en interaction sur Internet. Éléments pour une histoire de l'édition électronique en sciences humaines et sociales'. *Communication & languages*, 159, 123–35. 2009. archivesic.ccsd.cnrs.fr/sic_00439828.

The rise of digital networks is a critical time in the complicated history of the relationship between science and society, both in terms of technological development and its impact on scientific communication. The example of humanities and social science highlights their mediating role in the relationship between science and society.

OpenEdition/Cléo – Dacos, Marin; and Pierre Mounier. 'Le livre numérique est dans l'impasse, faisons le choix de l'édition électronique ouverte !'. *Le Monde.fr*. 2017. lemde.fr/2uRbxZi.

Après plus de dix ans d'attentisme et d'aveuglement, il s'agit de proposer un livre numérique lisible, manipulable et citable.

IBL PAN – Dallas, Costis; Chatzidiakou, Nephelie; Maryl, Maciej; et al. 'European Survey on Scholarly Practices and Digital Needs in the Arts and Humanities'. Highlights Report. 2016. doi:10.5281/zenodo.260101. zenodo.org/record/260101.

The highlights of the European survey on scholarly practices and digital needs in the arts and humanities carried out by DARIAH Digital Methods and Practices Observatory WG (DiMPO). This research is the outcome of collaborative work of European researchers from different countries, working within the DiMPO Working Group. It has been designed as a multiregional longitudinal survey, to be conducted online across European countries and to be repeated every few years. Its aim is to provide an evidence-based outlook of scholarly practices, needs and attitudes of European humanities researchers towards digital resources, methods and tools across space and time. Results of the first run of the survey (completed in March 2015) are presented in a multi-authored report, which includes comparative and consolidated analyses, as well as five country profiles.

OAPEN – 'Researcher Survey 2012'. 2012. oapen-uk.jiscebooks.org/research-findings/researchersurvey.

This presentation reports on the findings of our survey of humanities and social science (HSS) researchers. We carried out the survey between February and May 2012, and achieved 690 usable responses. The survey covers issues including attitudes to open access publishing and Creative Commons licensing, researchers' preferences and priorities as both authors and readers, and their views of the overall aims of the scholarly communications system. The survey will be used to shape our work in the third year of the OAPEN-UK project, as we begin to consider some of the cross-cutting issues such as licensing regimes, discoverability and formats which are likely to affect an open access business model for HSS monographs.

OpenEdition/Cléo – Mounier, Pierre. 'Le libre accès : entre idéal et nécessité'. 2010. doi:10.4267/2042/38634. documents.irevues.inist.fr/handle/2042/38634.

Much of the current debate on the open access issue has been akin to ideological warfare, using militant language registers around the concept of public common goods. The high level of visibility of the debate masks two important points that could change perceptions on its real impact. Our analysis of the development of open access initiatives shows that the political dimension of the issue is by no means predominant in all disciplines and varies considerably among different communities. Furthermore, the profound changes in scientific communication practices brought about by the expansion of digital networks could lessen the relevance of the militant approach to open access. The proliferation of documents, the relative blurring of boundaries between different forms of publishing and the fact that barriers to access to publications are being lowered are lessening the perceived influence of systems that artificially manufacture rarity, and the scientific communication system is gradually being forced to conform to the attention economics. This makes it possible to anticipate changes in scientific publishing comparable to those in the press and music publishing sectors.

3. The Impact of OA Publishing

OAPEN – Snijder, Ronald. 'Do Developing Countries Profit from Free Books?: Discovery and Online Usage in Developed and Developing Countries Compared'. *Journal of Electronic Publishing, 16/1*. 2013. doi:10.3998/3336451.0016.103. quod.lib.umich.edu/j/jep/3336451.0016.103?view=text;rgn=main.

For years, Open Access has been seen as a way to remove barriers to research in developing countries. In order to test this, an experiment was conducted to measure whether publishing academic books in open access has a positive effect on developing countries. During a period of nine months the usage data of 180 books was recorded. Of those, a set of 43 titles was used as control group with restricted access. The rest was made fully accessible. The data shows the digital divide between developing countries and developed countries: 70 percent of the discovery data and 73 percent of online usage data come from developed countries. Using statistical analysis, the experiment confirms that open access publishing enhances discovery and online usage in developing countries. This strengthens the claims of the advocates of open access: researchers from the developing countries do benefit from free academic books.

OAPEN – Snijder, Ronald. 'The Profits of Free Books: An Experiment to Measure the Impact of Open Access Publishing'. *Learned Publishing, 23/4*, **293–301. 2010. doi:10.1087/20100403. bit.ly/2w1AdwD.**

This article describes an experiment to measure the impact of open access (OA) publishing of academic books. During a period of nine months, three sets of 100 books were disseminated through an institutional repository, the Google Book Search program, or both channels. A fourth set of 100 books was used as control group. OA publishing enhances discovery and online consultation. Within the context of the experiment, no relation could be found between OA publishing and citation rates. Contrary to expectations, OA publishing does not stimulate or diminish sales figures. The Google Book Search program is superior to the repository.

4. Best Practices, Case Studies, and Policy Recommendations

UCL Press – Speicher, Lara. 'UCL Press: a New Model for Open Access University Presses'. *Positioning and Power in Academic Publishing: Players, Agents and Agendas, Proceedings of the 20th International Conference on Electronic Publishing, IoS Press.* **2016. doi:10.3233/978-1-61499-649-1-99. ebooks.iospress.nl/publication/42902.**

UCL Press was relaunched at UCL in June 2015, as the UK's first fully open access university press. It publishes scholarly monographs, textbooks, edited collections, scholarly editions and journals. All publications are made freely available online in open access form and print books are also sold via retailers at an affordable price. UCL authors are funded to publish open access with the Press. This article describes its activities in more detail and offers the model as one that other institutions can follow.

UCL Press – Speicher, Lara. 'A Fully Open Access University Press'. *BookBrunch.* **2016. bookbrunch.co.uk/page/free-article/a-fully-open-access-university-press.**

Lara Speicher argues that open access publishing can disseminate knowledge to an extent impossible under traditional models.

UCL Press – Lockett, Andrew; and Lara Speicher. 'New University Presses in the UK: Accessing a Mission'. *Learned Publishing, 29/S1*, 320–29. 2016. doi:10.1002/leap.1049. onlinelibrary.wiley.com/doi/10.1002/leap.1049/abstract.

In the space of just a year, five new university presses were launched in the UK. Although very different in size and stages of development, all but one were launched first and foremost as open access presses, based in or supported by their university's library. Why should there have been such a significant flurry of activity in such a short space of time, and what can the stated objectives and activities of these presses tell us about the current UK scholarly publishing environment? To answer some of those questions, this article looks back to the original mission of the founding university presses, examines the policy and funding environments in which the new presses are operating, looks at overseas developments in recent years for comparison, and concludes with a review of the challenges these young presses face as well as the benefits all university presses, but particularly open access ones, can confer to their institutions.

UCL Press – Ayris, Paul; and Lara Speicher. 'UCL Press: The UK's "First Fully Open Access" University Press'. *Insights* 28/3. 2015. doi:10.1629/uksg.257. insights.uksg.org/articles/10.1629/uksg.257.

The purpose of this article is to set in context the launch of University College London Press (UCL Press), which describes itself as the UK's first fully open access (OA) university press. The drivers for this launch are bound up with the global movement towards open access and Open Science – developments in which UCL is acknowledged as a European leader. The first part of the article looks at these movements and relates them to the relaunch in May 2015 of the UCL Press imprint as an OA imprint. This analysis has been undertaken by Dr Paul Ayris, Director of UCL Library Services and Chief Executive of UCL Press. The second half of the article is a personal account by Lara Speicher, Publishing Manager at UCL Press, of the relaunch of the Press. This section looks at staffing structures, business models, technical infrastructures, publishing programmes and content. In the final part of the article, Paul Ayris draws some conclusions from the history of the relaunch of UCL Press and sets these in the context of the global Open Science discussion.

UC Digitalis – Leão, Delfim. 'Academic Publishing in Portugal: Threats and Major Opportunities'. *Insights,* 28/1. 2015. doi:10.1629/uksg.179. insights.uksg.org/articles/10.1629/uksg.179.

This article begins with an analysis of the current state of scientific publication in Portugal, with reference to the impact of the open access (OA) policies of commercial and academic publishers. It then explores the relationship between academic publishing and institutional repositories, discussing the way they should complement one another, taking as reference the activities of the Portuguese Association of Higher Education Publishers (APEES). Final remarks deal more specifically with the UC Digitalis project from Coimbra University Press (CUP), and the way it is committed to the goal of fostering science produced in Portuguese-speaking countries.

IBL PAN – Szleszyński, Bartłomiej; Niciński, Konrad; and Agnieszka Kochańska. 'How to Communicate Scholarly Knowledge on the Internet: Remarks on the "PrusPlus" Collection'. *New Panorama of Polish Literature, 21.* 2015. napis.edu.pl/pdf/Napis021_artykuly/NAPIS-2015_SERIA-XXI_s348-359_Bartlomiej-Szleszynski_Konrad-Nicinski_Agnieszka-Kochanska.pdf.

Nowa Panorama Literatury Polskiej (The New Panorama of Polish Literature, NPLP.PL) is a platform for the presentation of research results in the digital environment. It is a part of the Digital Humanities Centre at the Institute of Literary Research of the Polish Academy of Sciences. It consists of separate collections, each telling a different 'scientific story' and using a different form to present content. The interdisciplinary team of the New Panorama of Polish Literature includes literary and culture researchers, graphic designers and typographers.

Following on from Eelco Ferwerda's introduction to different OA monograph business models (http://dx.doi.org/10.1629/2048-7754.46), Hazel Newton (Palgrave Macmillan), Marin Dacos and Pierre Mounier (OpenEdition Books) and Yrsa Neuman (Åbo Akademi University) explain the different OA business models that they are currently working with.

UC Digitalis – Leão, Delfim. 'Imprensa Universitária: oportunidades e desafios'. *RUA-L: Revista da Universidade de Aveiro. Letras 0/3, 51–55.* **2014.**

The paper starts by analyzing the situation of scientific publication in Portugal, taking as reference the activities of the Portuguese Association of Higher Education Publishers (APEES); it then explores the relation between academic publication and institutional repositories, discussing the way they should complement themselves, in connection with the impact of open access policies over commercial and academic publishers. (Publication in Portuguese)

UCL Press – Ayris, Paul; McLaren, Erica; Moyle, Martin; Sharp, Catherine; and Lara Speicher. 'Open Access in UCL: A New Paradigm for London's Global University in Research Support'. *Australian Academic & Research Libraries.* **2014. tandfonline.com/doi/abs/10.1080/00048623.2014.956462.**

Open Access provides an opportunity for researchers to disseminate their research globally, but it comes with challenges. This article looks at the various ways in which UCL (University College London) has addressed those challenges, by investing in open access activities at the university.

EKT – Nafprliotis, Alexandros; Tsoukala, Victoria; Houssos, Nikos; Kalaitzis, Andreas; and Evi Sachini. 'EKT EPublishing: Developing an Open Access Publishing Service for the Greek Research Community'. *Let's Put Data to Use: Digital Scholarship for the Next Generation: Proceedings of the 18th International Conference on Electronic Publishing,* **112–18. 2014. doi:10.3233/978-1-61499-409-1-112. ebooks.iospress.nl/publication/36556.**

The present contribution concerns a case study of open access scholarly publishing in Greece, its history and effect in helping the local researcher community transition from a print-only mode of work to online working environments and in rendering Greek publications and scholarship more relevant to the international scholarly community. The paper elaborates on the goals of the project and the challenges that were encountered and addressed during its implementation. The project, which started in 2007 with the transition of three print journals in the humanities to an online and print format and online working environment, culminated in the development of an online platform that provides access to content and services from a single point in the web, ePublishing.ekt.gr. As part of the National Documentation Centre (EKT)'s services, we systematize and upgrade the journals' policies according to international standards, provide an online working platform and training, digitize and release in open access academic articles (more than 3,000 articles in established journals, published by small, non-profit, academic/scholarly society publishers, so far), provide DOIs, as well as concentrate on electronic books and conference proceedings – also to include purely online books in the future, starting with a born-digital monograph in a Humanities subject (onlineBook). In a nutshell, we have focused on providing publishers of scientific journals a range of comprehensive services which are constantly updated and improved in the light of the developments in scholarly communication, and which foster the internationalization, visibility, and preservation of research in these fields.

EKT – Tsoukala, Victoria; and Evi Sachini. 'MedOANet: Facilitating Coordinated Open Access Policies and Strategies in Mediterranean Europe'. *Uma Decana de Acesso Aberto Na UMinho e No Mundo.* **2013. helios-eie.ekt.gr/EIE/handle/10442/13731.**

The Mediterranean Open Access Network supports the development of coordinated policies aligned to the European Commission's policies on access to and preservation of scientific information in Greece, Turkey, Italy, France, Spain and Portugal. In two years of work the project mapped the open access landscape by performing surveys among research funders, researcher performing organizations and publishers; it developed the Open Access Tracker, an online tool that profiles countries on the basis of their available open access policies and initiatives. The project facilitated the coordination of action and policy development in each country through engagement with policymakers and coordination events and facilitated coordination at the regional level among the six countries. Finally, MedOANet developed guidelines for policy implementation directed to policymakers of the six countries.

OAPEN – Ferwerda, Eelco; and Caren Milloy. 'Europe Needs a Unified Approach to Open-Access Books'. *Research Europe.* **2013. researchresearch.com/news/article/?articleId=1338074.**

The first European-level meeting on open access monographs revealed important national differences in publishing and funding cultures. But there is still a scope and need for international cooperation, argue Eelco Ferwerda and Caren Milloy.

UC Digitalis – Leão, Delfim; and Carla Marques. 'As revistas da Universidade de Coimbra. Dinâmicas de produção científica e cultural'. *Rua Larga, 38.* **2013. digitalis.uc.pt/en/artigo/revistas_da_universidade_de_coimbra_din%C3%A2micas_d e_produ%C3%A7%C3%A3o_cient%C3%ADfica_e_cultural.**

Short presentation of the aims and scopes of the scientific journals published at the University of Coimbra (Publication in Portuguese).

IBL PAN – Bolecki, Włodzimierz; Maryl, Maciej. 'The Web of the Senses – Online Methods of Presenting Academic Research Results.' *Polish Academy of Sciences, Annual Report, 25, 26-27.* **2013. doi: 10.5281/zenodo.837254. zenodo.org/record/837254.**

Institute of Literary Research, PAS has developed a multimedia website containing several hundred articles on the representations of the senses in Polish culture. This interdisciplinary project is the first of its size within the Polish humanities to employ online presentation of academic research results (digital humanities). It must be pointed out, however, that the method does not merely consist in uploading the text, but in applying Internet logic to the arrangement and organization of research data, which facilitates users' access to the desired content. The website is an outcome of a research and development project entitled Sensuality in Polish Culture: 'Representations of the Human Senses in Language, Literature, and Art from the Middle Ages to the Present' (NCBiR No. 17 0005 06/2009), conducted between 2010 and 2012 by the Department of Historical Poetics of the Institute of Literary Research, PAS.

OpenEdition/Cléo – Mounier, Pierre. 'Revues.org : une plateforme d'édition électronique au service des sciences humaines et sociales'. *Bulletin de psychologie Numéro 511/1, 55–56.* **2011. cairn.info/revue-bulletin-de-psychologie-2011-1-p-55.htm.**

Revues.org est une plateforme d'édition électronique qui diffuse aujourd'hui plus de 280 revues et collections de livres en ligne dans toutes les disciplines des sciences humaines et sociales. Il s'agit d'une initiative du Centre pour l'édition électronique ouverte (Cléo). Le Centre est soutenu par quatre établissements français de recherche et d'enseignement supérieur : le CNRS, l'École des hautes études en sciences sociales, l'université de Provence et l'université d'Avignon.

OpenEdition/Cléo – Mounier, Pierre. 'Freemium as a Sustainable Economic Model for Open Access Electronic Publishing in Humanities and Social Sciences'. *Information Services and Use* **31/3. 2011. content.iospress.com/articles/information-services-and-use/isu652.**

Between the two paths of open access - green and gold - the latter is the harder to develop and has the least support from the research community. The main difficulty is finding a sound economic model. Open access journals usually depend on two funding sources: subsidies and/or donations from institutions and publication fees from research units in the author-pays model. These two ways of funding open access journals and books have proved effective in some cases (Plos), but are not flawless. The Center for Open Electronic Publishing, a French initiative for open access publishing in humanities and social sciences, has recently developed a new economic model based on 'freemium' for its full open access journals and books series, in order to address two issues: improve their economical soundness and give them more visibility in libraries. Freemium, the contraction of 'free' and 'premium', preserves open access to information together with the marketing of premium services.

5. OA Monographs

OAPEN/KU Research - Ferwerda, Eelco; Pinter, Frances; and Niels Stern. 'A Landscape Study on Open Access and Monographs: Policies, Funding and Publishing in Eight European Countries'. Knowledge Exchange 2017. 2017. doi: 10.5281/zenodo.815932. knowledge-exchange.info/event/open-access-monographs.

The monograph is one of the most prestigious publication outlets - a hallmark of reputation, a tool for career progression and a means of disseminating fundamental ideas of scholarship. Open access policies from funders, publishers and institutions have been relatively quiet on monographs and other long form publications, predominantly focusing on journals. However the beginnings of a transition to open access for monographs has commenced and there are several projects and initiatives exploring and experimenting in this area. The primary goal of the Landscape study was to assemble comparable data and analysis from Germany, Finland, Denmark, United Kingdom, The Netherlands, Norway, Austria and France. This includes the costs of OA books; the fees being charged for OA books; the range of non-BPC models; the adoption of OA policies for books by funders (both public and private), universities, and publishers. An overview of OA book publishing along with a review of policies and mandates highlights the various national differences as well as similarities. The report also presents a number of proposals for all stakeholders to consider.

OAPEN – Milloy, Caren. 'Investigating OA Monograph Services – Final Report'. *Jisc Scholarly Communications.* 2017. scholarlycommunications.jiscinvolve.org/wp/2016/10/11/investigating-oa-monograph-services-final-report.

This report presents the main activities and results of the 'Investigating OA monograph services' project. It starts with a brief description of the Project Preparation Phase and continues with the Project execution, covering each of the original work packages with a description of activities. The final section presents recommendations for next steps in the ongoing effort to establish the necessary infrastructure and services to support OA monograph publishing.

OAPEN – Snijder, Ronald. 'The Influence of Open Access on Monograph Sales: The Experience at Amsterdam University Press'. *LOGOS: The Journal of the World Book Community, 25/3, 13–23.* 2014. doi:10.1163/1878-4712-11112047. booksandjournals.brillonline.com/content/journals/10.1163/1878-4712-11112047.

The hybrid model of Amsterdam University Press (AUP) combines monograph sales with open access publishing. This paper investigates the effects of open access publishing on the sales of monographs, taking into account the influence of: commercial potential; frontlist and backlist; and language. The data set contains sales figures of 513 books, spread over 36 months: 2010 to 2012. Over 70 per cent of those books are published on open access and are distributed through the OAPEN Library. Each influence is relevant, which makes it harder to single out the effects of apen access. The large

difference between frontlist sales figures and those of the backlist leads to a separate analysis. The frontlist sales are affected by a combination of commercial potential and language; open access publishing has no effect in this situation. For the backlist, open access publishing is a significant influence on sales only in the subset of books whose print run is between one and 2000. No significant effect on books with a print run of zero, or on books with a print run between 2001 and 3000 could be measured. The hybrid model does not lead to more sales of open access monographs, and the loss of sales is negligible. The data suggest that a hybrid model is not an option to improve the sustainability of monograph publishing.

OAPEN – Snijder, Ronald. 'Modes of Access: The Influence of Dissemination Channels on Open Access Monographs Use'. *Information Research, 19/3*. 2014. informationr.net/ir/19-3/paper638.html.

This paper studies the effects of several dissemination channels in an open access environment by analysing the download data of the OAPEN Library. Download data were obtained containing the number of downloads and the name of the Internet provider. Based on public information, each Internet provider was categorised. The subject and language of each book were determined using metadata from the OAPEN Library. Quantitative analysis was done using Excel, while the qualitative analysis was carried out using the statistical package SPSS. Almost three quarters of all downloads come from users who do not use the Website www.oapen.org, but find the books by other means. Qualitative analysis found no evidence that channel use was influenced by user groups or the state of users' Internet infrastructure; nor was any effect on channel use found for either the language or the subjects of the monographs. The results show that most readers are using the 'direct download' channel, which occur if the readers use systems other than the OAPEN Library website. This implies that making the metadata available in the user's systems, the infrastructure used on a daily basis, ensures the best results.

OAPEN – 'Researcher Survey 2014: Survey of Use of Monographs by Academics – as Authors and Readers'. 2014. oapen-uk.jiscebooks.org/research-findings/researcher-survey-2014.

This paper reports the findings of the second OAPEN-UK researcher survey, carried out in early summer 2014. In collaboration with the HEFCE open access and monographs project, we surveyed UK humanities and social science researchers and achieved 2,231 usable responses. The survey explores the role of the monograph for researchers, as both authors and readers. It looks at issues around publishing, including what motivates researchers to change publisher and how they handle rights issues. It also looks at researcher preferences when reading books, including how and why they read them, and explores how desirable and realistic they consider open access to be.

OAPEN – Ferwerda, Eelco. 'Open Access Monograph Business Models'. *Insights, 27/0.* 2014. doi:10.1629/2048-7754.46. insights.uksg.org/articles/10.1629/2048-7754.46.

In recent years, a number of business models have been developed for open access (OA) monographs in the humanities and social sciences (HSS). While each model has been created in response to specific circumstances and needs, some commonalities can be observed. This article outlines some of the main types of model to support the costs of publishing OA books and provides examples of these models across the world. It is followed by three short sketches providing more depth on: firstly, a traditional publisher's OA monograph offer; secondly, a licensing-based model which draws from existing library budgets; and finally, an experiment with delayed open access for books in philosophy.

OAPEN – Snijder, Ronald. 'Measuring Monographs: A Quantitative Method to Assess Scientific Impact and Societal Relevance". *First Monday, 18/5.* 2013. firstmonday.org/ojs/index.php/fm/article/view/4250/3675.

In the Humanities and Social Sciences (HSS), the monograph is an important means of communicating scientific results. As in the field of STM, the quality of research needs to be assessed. This is done by bibliometric measures and qualitative methods. Bibliometric measures based on

articles do not function well in the field of HSS, where monographs are the norm. The qualitative methods which take into account several stakeholders are labour intensive and the results are dependent on self-assessment of the respondents, which may introduce bias. In the case of humanities, the picture becomes even less clear due to uncertainties about the stakeholders. This article describes a method that may complement the current research on scientific impact and societal relevance. This method measures the usage of online monographs and identifies the internet provider involved. The providers are categorized as academic; government; business; non-profit organisations and the general public. The usage is further categorised in national and international. Combining this data makes it possible to assess the scientific impact and the societal relevance of the monographs. The method is quantitative, which makes the results easier to validate. It is not necessary to know the stakeholders in advance: the readers are identified through the method. The used data set consists of over 25,000 downloads by more than 1,500 providers, spread over 859 monographs. More than two thirds of the usage can be categorised, and almost 45% of all usage comes from non-academics. This might indicate that the monographs have an relevance in society. Two possible influences on monograph usage were analysed: subject and language. Most of the subjects that received a higher than average number of downloads come from the field of the social sciences; the humanities were less 'popular'. Books in English – the 'lingua franca' of science – were downloaded the most. Languages such as Dutch were read much less outside of national borders that Italian or German. A Dutch or Belgian scholar would need a translation in order to have more influence abroad; this applies far less for Germans or Italians. While further research is needed, the results are promising and the proposed method could be used as an addition to the existing tools to measure the scholarly impact and societal relevance of the field of HSS.

OAPEN – Ferwerda, Eelco; Snijder, Ronald; and Janneke Adema. 'OAPEN-NL: A Project Exploring Open Access Monograph Publishing in the Netherlands. Final Report', 2013. bit.ly/2uRqkD8.

This final report presents the results of OAPEN-NL. Chapter 5 aims to give an overview of open access for monographs, looking at the benefits of open access, the motives for the transition to open access and early examples of open access book publishers, the various open access publication models and examples of policies supporting open access monographs and a short description of emerging open access business and funding models. The main outcomes of the project are presented in chapter 6, OAPEN-NL: Research Outcomes. The first section of chapter 6 provides an analysis of the qualitative aspects of the OAPEN-NL project, looking at the experiences and needs of users with respect to open access books and the project as a whole, as well as their expectations and requirements with respect to the OAPEN-NL publication fund and model. The following section investigates the costs of publishing a monograph in the Netherlands and discusses the implications for funders. The last section describes the effects of open access publishing on book sales, discovery, online consultation and citations. The final chapter collects the recommendations for open access monographs, drawn from both OAPEN-NL and developments elsewhere. In this report we use the term open access (OA) as defined by Peter Suber, as literature that is digital, online, free of charge, and free of most copyright and licensing restrictions (Suber, 2012). We use the term monographs (sometimes called research monographs, or academic books, or simply books) for peer reviewed academic books. This report does not deal with other genres, such as dissertations, textbooks, reference works or trade books.

OAPEN – Adema, Janneke. 'Overview of Open Access Models for Ebooks in the Humanities and Social Sciences: OAPEN Project Report.' 2010. project.oapen.org/images/documents/openaccessmodels.pdf.

This research has looked at a variety of initiatives and specifically at their publishing models, business models and publishing processes. Within these divisions, special attention has been paid to the nature of the content, the level of open access provided, the peer review and copyright policies and, finally, the strategies of collaboration. The open access book publishing initiatives analyzed in this report have been classified according to their publishing models, they have thus been categorized into commercial publishers, presses established by societies or academies, presses established by libraries, library-university collaborations, university presses, presses established by academics and press-commercial publisher partnerships.

OAPEN – Ferwerda, Eelco. 'Open Access Monographic Publishing in the Humanities'. *Information Services & Use,* **30/3–4, 135–41. 2010. doi:10.3233/ISU-2010-0611. content.iospress.com/articles/information-services-and-use/isu611.**

In recent years, it has become widely recognized that in the case of monographs, the traditional business model for books is losing its sustainability. Academic publishers have been forced to become more selective in the books they publish, and authors, in particular young researchers and first time authors, have found it harder to find a press willing to publish their work. In response to the economic restraints of printed monographs, many publishers and academic institutes, in particular research libraries, have started to experiment with digital and open access publication of monographs. OAPEN is the first international project to develop an open access model for publishers and stakeholders in scholarly communication. OAPEN stands for Open Access Publishing in European Networks.1 It is a 30 month project co-funded by the European Union,2 to develop and implement an open access (OA) publication model for peer reviewed academic books in the Humanities and Social Sciences (HSS).

6. OA Journals

OpenEdition/Cléo – Langlais, Pierre-Carl. 'Critical Study of the New Ways of "Editorialising" Open Access Scientific Journals. Steering Committee: Bauin, Serge; Corne, Emmanuelle; Lafait, Jacques; and Pierre Mounier. 2017. hal.archives-ouvertes.fr/hal-01399286.

This report commissioned by BSN 4 and BSN 7 for the French Ministry of Research is concerned with the new ways in which open access journals can be editorialised. The transition to open access has accelerated in recent years. Several countries have established a legal framework to secure the depositing of articles in open archives (in France, a provision of this type is included in the Digital Bill). In May 2016, the Council of the European Union called for open access to be made a 'default option' in all Member States by 2020. While the conversion of scientific publishing to open access distribution appears to be a given in the short term, the ways and means remain uncertain: is the process confined to simply transferring budgets from subscription to the payment of publishing rights, without fundamentally changing the existing publishing structures ('journal flipping')? Or does it entail new models that reconfigure the existing parameters as a whole (review procedures, writing practices, business models, governance)? This dynamic of change opens up the prospect of large-scale reforms. The initial remit of the present study falls into this framework: what publishing forms can the state encourage in a digital age that is witnessing the transformation of scientific publishing and the failure of scientific peer review? This report maps four aspects of the emerging practices and initiatives: publishing tools, writing forms, peer review and economic models. The different 'dimensions' we have mapped are interdependent and raise common issues, addressed in the final part. In an ecosystem as "interdependent" as digital scientific publishing, this reform would imply the implementation of infrastructure policies which, above and beyond supporting specific usages and tools, would define the convergent linkages between mechanisms, actors and practices.

EKT – Tsoukala, Victoria; and Evi Sachini. 'E-Journal and Open Access Journal Publishing in the Humanities: Preliminary Results from a Survey among Byzantine Studies Scholars. 2011. helios-eie.ekt.gr/EIE/handle/10442/8755.

This paper presents the preliminary results of a survey conducted by the National Documentation Centre/NHRF in the fall of 2010 among specialists in Byzantine Studies. The survey sought to assess needs and satisfaction with the electronic version of the journal 'Byzantina Symmeikta' and to assess scholarly attitudes about and practices in publishing in e-journals and open access journals among scholars in Byzantine Studies. The paper focuses on the latter part. Survey result suggest that scholars in Byzantine Studies increasingly rely on e-journals to carry out their research, they are predominantly positively disposed towards electronic publishing and open access, but most of them have not published in an electronic journal. Use of e-journals, experience with publishing in e-journals and open access journals and positive attitudes toward the above are especially high among younger scholars.

EKT – Sachini, Evi; Tsoukala, Victoria; Houssos, Nikos; Stathopoulou, Rania; Paschou, Christina; and Aggeliki Paraskevopoulou. 'Open Access in the Humanities: A Case Study of Developing Three Open-Access Electronic Journals in Greece'. 2009. helios-eie.ekt.gr/EIE/handle/10442/13355.

The international movement for open access to scientific content along with advances in information and communication technologies and the Internet are bringing about revolutionary developments in scholarly publishing and communication: the availability of e-infrastructures supporting the management and exchange of the research output in digital format leads to the transformation of existing processes. It allows new ways of collaboration among researchers and facilitates the widespread dissemination of research results. Pioneering applications related to these trends have first appeared in scientific fields that inherently have a closer relationship with technology like natural sciences, engineering and medicine. However, significant relevant activities in the Humanities are also beginning to emerge worldwide. The present contribution concerns a case study of open access publishing in the Humanities, in particular a project that created freely accessible electronic versions of three pre-existing print-only journals of this subject area published in Greece but with international participation and perspectives. The paper provides Greek context in scholarly communication with an emphasis on the Humanities; it elaborates on the goals of the project and the challenges that were encountered and addressed during its implementation. One of the main reported successes of the project was the increased awareness among Greek researchers in Humanities of the capabilities and potentials of modern scholarly communication systems and the creation of a demand originating from the corresponding research community itself for the continuation and expansion of similar activities in the future.

C. Events

The second section of the bibliography and events part considers meetings, such as conferences, workshops, seminars and lectures, which the OPERAS Consortium has organized since 2012.

Partners of the OPERAS Research Infrastructure have long been organizing events relating to OA in general, and to OA in the SSH in particular. EKT, for instance, has hosted the Open Access Week in 2016 and the University of Zadar the Open Access Week Croatia in the same year. UC Digitalis has co-organized a panel on the impact of OA in the scientific community as part of the International Congress on the University Library, stressing the strong need for and effect of OA on the SSH, while UCL Press has presented OA publishing options at the Open Access Week 2015 and IBL PAN has co-organized a workshop on public humanities in 2017. The OPERAS Consortium has been especially involved with organizing and hosting events on best practices and case studies, as well as policy recommendations for OA publishing. E.g. OpenEdition/Cléo has been discussion leader for a workshop on non-profit OA ventures of significant scope in Europe in the framework of the 18ᵗʰ International Conference on Electronic Publishing. OAPEN in particular has focused on OA monographs, organizing a conference on that topic in 2013.

XIII. Annex: Support to ESFRI application

A. ESFRI submission form

Questionnaire For Submission Of Proposals For Roadmap 2018

Fields marked with * are mandatory.

This questionnaire consists of three parts to be completed fully:
PART A: GENERAL INFORMATION is used for the eligibility check by the EB and – if selected - for the public description of the Project in the Roadmap 2018.
PART B: SCIENTIFIC CASE and PART C: IMPLEMENTATION are used by the SWG to evaluate the scientific case of the proposal and by the IG to assess its implementation.

- Some questions require to tick a bullet, to fill a text section with a strictly limited number of characters or to upload supporting documents in PDF at maximum 1 MB each.

- If you believe a question does not apply to your proposal, you may enter 'not applicable', but you should explain why the question is not relevant in your case.

- Only the electronic version of this questionnaire may be used to submit proposals for the Roadmap 2018 until the 31st August 2017 at 18:00 CET.

RESOURCES:

- ROADMAP 2016 at http://www.esfri.eu/roadmap-2016 for landscape analysis
- PUBLIC ROADMAP 2018 GUIDE at http://www.esfri.eu/sites/default/files/u4 /ESFRI_Roadmap_2018_Public_Guide_f_0.pdf for definitions, models, methods and procedures
- SUPPORT DOCUMENT from e-IRG at http://e-irg.eu/catalogue/eirg-1004 for Part B, Section 4: e-NEEDS

SUPPORT

- General questions: national ESFRI Delegations – contact details available at http://ec.europa.eu/research /infrastructures/index_en.cfm?pg=esfri
- Helpdesk for the Online Submission Form: ESFRI Secretariat at esfri@ec.europa.eu

PART A: GENERAL INFORMATION

NAME

Provide the name of your RI:

* FULL NAME (maximum 200 characters with spacing)
Text of 1 to 200 characters will be accepted

> Open Access in the European Research Area through Scholarly Communication

* ACRONYM (maximum 20 characters with spacing)
Text of 1 to 20 characters will be accepted

> OPERAS

TYPE

* Identify the type of your RI:
- ○ SINGLE-SITE
- ◉ DISTRIBUTED

CLASS

* Indicate the class of your RI:
- ○ MAJOR UPGRADE OF EXISTING RI
- ◉ NEW RESEARCH INFRASTRUCTURE
- ○ GLOBAL RESEARCH INFRASTRUCTURE

TIMELINE

* Indicate the timeline of the lifecycle of your RI:

	from (year)	to (year)
DESIGN	2015	2017
PREPARATION	2018	2022
IMPLEMENTATION (CONSTRUCTION)	2022	2026
OPERATION	2026	no decommissioning planned

ESTIMATED COSTS

* Summarise the real or estimated costs for your RI:

	€
CAPITAL VALUE:	20 000 000
DESIGN:	2 420 000
PREPARATION:	8 642 000
IMPLEMENTATION (CONSTRUCTION):	9 230 000
AVERAGE ANNUAL OPERATION COSTS:	1 580 000

HEADQUARTERS

If available, indicate prospective hosting institution and location:

* FULL NAME, CITY and COUNTRY (maximum 200 characters with spacing)
Text of 1 to 200 characters will be accepted

```
Aix-Marseille University, Marseille, France
```

WEBSITE

If available, provide the Internet address:

* URL: (maximum 200 characters with spacing)
Text of 1 to 200 characters will be accepted

```
http://operas-eu.org
```

IMAGE

Upload an image which represents your RI: (upload with limit 1 MB; length =12cm x height = 10cm; 300 dpi resolution)

Please upload your file
227cb888-f281-4381-9f6d-27eae3a1b528/Operas-logo.pdf

BACKGROUND

* Summarise the science background of your RI, the reference scientific community (-ies) and the current landscape: (maximum 2000 characters with spacing)

> OPERAS tackles the challenge of renewing scholarly communication practices in the context of Open Science. Its scope is multidisciplinary with a focus on social sciences and humanities (SSH). The landscape in this domain reveals an important array of initiatives (university presses, library projects, platforms, service providers, research networks), innovative and with disruptive potential for some, but mostly small-sized, localized, fragmented and hardly collaborative. The players populating the scholarly communication landscape, particularly in Europe and in SSH are fragile, and lack resources (in terms of skills, know-how, funding and outreach options) to manage efficiently their digital transition and their integration into the European Open Science Cloud. As a distributed research infrastructure, OPERAS aims at opening the locks that prevent the sector from upgrading its practices and integrating with the Open Science paradigm.
>
> OPERAS will enable actors from across Europe to work together in a joint vision that will strengthen their investment and work in the future. It is envisioned that this Research Infrastructure (RI) will attract a significant pool of European researchers who will benefit from its services and collaborate in future innovative research and communication initiatives.
>
> OPERAS will coordinate services, practices and technology across main actors in the European landscape of SSH scholarly communication to provide joint services; to federate activities of strategic actors and stakeholders (research institutions, libraries, platforms, publishers, funders) in their transition to Open Science; to develop common good practice standards for digital open access publishing, infrastructures, services, editorial qualities, business models and funding streams; to explore alternative measurements of impact in the SSH; and to offer sustained training along common standards to researchers and other stakeholders on all of the above.

DESCRIPTION

* Summarise the general characteristics and aim of your RI, including the impact on the quality and quantity of European research in the main field of action and the interdisciplinary aspects: (maximum 1000 characters with spacing)

> Currently, OPERAS gathers 31 organizations from eleven countries coordinated by a Core Group of nine members. See the list at: http://operas.hypotheses.org/partners
>
> OPERAS will provide pan-European infrastructure dedicated to open scholarly communication including publications, particularly in SSH. Its organization and operation follows the principle of subsidiarity adopted by European Union: all partners provide publication and communication services to their own scientific community, but collaborate and share their technologies, know-how, practices and efforts to:
>
> 1. Bring closer their activities to increase the quality of services (Shared services)
>
> 2. Integrate into the European Open Science Cloud, in particular to achieve interoperability with other infrastructures (EOSC Integration)
>
> 3. Provide integrated platforms at European level to deliver relevant services (OPERAS platforms)

IMPLEMENTATION

* Summarise the actions that led to the presentation to ESFRI, your plans for preparation and implementation in terms of schedules and milestones, including Preparatory Phase or other pre-implementation actions, acquisition of legal status: (maximum 1000 characters with spacing)

Text of 1 to 1000 characters will be accepted

> Since the project launched in 2015, the Consortium has performed its design study which has been validated by the partners. The Consortium has expanded and has been structured with the creation of a Core Group of committed partners in coordination with their ministries. In 2016 the leading partner OpenEdition was put into the French Roadmap. A management team was constituted and the coordinating institution (Aix-Marseille University) participated in the expression of interest to be financed via the highly strategic French investment programme for the priority equipment 'Investissement d'Avenir'.
>
> The preparatory phase will be supported by the creation of a transitional legal entity (AISBL) before the creation of an ERIC, and the siting of the project's Central Hub in a new building in Marseille from Sept. 2017.
>
> The development of the three OPERAS platforms is continuous throughout the project phases and is planned to be funded by already targeted H2020 future calls.

POLITICAL SUPPORT

A) LEAD COUNTRY/ENTITY

Identify the Member State (MS), Associated Country (AC) or the EIROforum Member, which leads the preparation of your RI:

* COUNTRY NAME FOR MS OR AC

◉ Albania

- ○ Austria
- ○ Belgium
- ○ Bosnia and Herzegovina
- ○ Bulgaria
- ○ Croatia
- ○ Cyprus
- ○ Czech Republic
- ○ Denmark
- ○ Estonia
- ○ Faroe Islands
- ○ Finland
- ● France
- ○ Germany
- ○ Greece
- ○ Hungary
- ○ Iceland
- ○ Ireland
- ○ Israel
- ○ Italy
- ○ Latvia
- ○ Lithuania
- ○ Luxembourg
- ○ Malta
- ○ Moldova
- ○ Montenegro
- ○ Netherlands
- ○ Norway
- ○ Poland
- ○ Portugal
- ○ Romania
- ○ Serbia
- ○ Slovakia
- ○ Slovenia
- ○ Spain
- ○ Sweden
- ○ Switzerland
- ○ The former Yugoslav Republic of Macedonia
- ○ Tunisia
- ○ Turkey
- ○ Ukraine
- ○ United Kingdom
- ○ N/A

* EIROFORUM MEMBER

- ○ CERN
- ○ EUROfusion

○ EMBL

○ ESA

○ ESO

○ ESRF

○ European XFEL

○ ILL

● N/A

* Upload the Expression of political Support (EoS) of the lead country; in the case of a EIROforum member, please upload the Council resolution: (upload with limit 1 MB)

4d71c891-7ff0-41da-baad-71333c01db1a/EoS-France.pdf

B) PROSPECTIVE MEMBER COUNTRIES/ENTITIES

Identify at least two MS and AC, which have submitted Expressions of political Support (EoS) signed by the national ministries responsible for RI or other entities such as EIROforum members of which the mandated authorities have expressed interest to join your RI. You may also identify any additional third country that has signed an EoS:

* COUNTRY NAME FOR MS OR AC

```
none
```

Please specify, per country, the amount of funds earmarked for or already allocated to your RI in the framework of this (their) national RI roadmap (-s): (maximum 500 characters with spacing).

Text of 1 to 500 characters will be accepted

> The funding is specified in the letter of commitment of the French Ministry for
> research and innovation

FINANCIAL COMMITMENT

A) LEAD COUNTRY/ENTITY

Identify the authority[1] from the lead country that has signed Expression of Commitment (EoC) or provided a Council resolution to financially contribute to the preparation and implementation:

_____

[1] Any legal entity from a MS, AC and third country that can take binding decisions to financially support the RI can submit an EoC. It may concern a regional or national government (agency), an umbrella organisation negotiating and redistributing funding on behalf of its members, a Research Funding Organisation (RFO) or a Research Performing Organisation (RPO).

* NAME (maximum 200 characters with spacing)

Text of 1 to 200 characters will be accepted

> French Ministry for Higher Education, Research and Innovation

* CONTACT PERSON (maximum 200 characters with spacing)

Text of 1 to 200 characters will be accepted

> Marin Dacos

* EMAIL (maximum 200 characters with spacing)

Text of 1 to 200 characters will be accepted

> marin.dacos@openedition.org

* TELEPHONE (maximum 50 characters with spacing)

Text of 1 to 50 characters will be accepted

> +33(0)6 88 89 52 85

Upload the corresponding EoC or Council resolution: (upload with limit 1 MB)

f1516397-7720-4efc-bc7f-a9edfa24eb77/EoSC-France.pdf

B) PROSPECTIVE MEMBER COUNTRIES/ENTITIES

* Identify the authorities from prospective member countries that have signed an Expression of Commitment (EoC) and other entities such as EIROforum Members that have provided a Council resolution to financially contribute to the preparation and implementation:

	Country name or EIROforum member	Institution (maximum 200 characters with spacing)	CONTACT PERSON (maximum 200 characters with spacing)	EMAIL	TELEPHONE
1.	Under discussion	–	–	–	–
2.	–	–	–	–	–
3.	–	–	–	–	–
4.	–	–	–	–	–

SCIENTIFIC DOMAIN

* Indicate which Strategy Working Group you believe to be the most suitable to evaluate the scientific case of your RI:

- ◉ ENERGY
- ◉ ENVIRONMENT
- ◉ HEALTH & FOOD
- ◉ PHYSICAL SCIENCES & ENGINEERING
- ⦿ SOCIAL & CULTURAL INNOVATION
- ◉ e-INFRASTRUCTURE

* In case the scientific case of your RI should - in your view - be also evaluated by one or more additional SWG, indicate which:

- ☐ ENERGY
- ☐ ENVIRONMENT
- ☐ HEALTH & FOOD
- ☐ PHYSICAL SCIENCES & ENGINEERING
- ☐ SOCIAL & CULTURAL INNOVATION
- ☐ e-INFRASTRUCTURE
- ☑ N/A

PART B: SCIENTIFIC CASE

SECTION 1: SCIENTIFIC EXCELLENCE

* 1.1 Identify the scientific field (-s) and - if applicable - the inter- or multidisciplinary scope of your RI: (maximum 500 characters with spacing)

Text of 1 to 500 characters will be accepted

```
OPERAS is primarily focused on humanities and social sciences disciplines but
will impact other disciplines by dealing with a cross-disciplinary domain :
scholarly communication. Hence OPERAS can provide a model and a framework to
help STM disciplines to renew their publication models, so far hampered by the
domination of a small number of commercial publishers. Eventually OPERAS will
provide a platform to support multidisciplinary research projects addressing
societal challenges.
```

* 1.2 Outline the scientific vision and mission, its short and long term impact on the main research field (-s) and its potential impact on other fields - if any - as well as on innovation: (maximum 5000 characters with spacing)

Text of 1 to 5000 characters will be accepted

```
Full Case: http://operas.hypotheses.org/scientific-case
The vision of Open Science is premised on a paradigmatic shift in research
practices and scholarly communication. With its multidisciplinary scope and its
focus on social sciences and humanities (SSH), OPERAS addresses those
disciplines that are particularly in need of a major initiative to effect the
transformation towards Open Science and achieve their innovative potential.
The traditional approach for the representation of scholarly communication,
which separates publication from research and considers publications as a
subsequent output, is based on a flawed communication model. This
misinterpretation affects the approach of open access as it entails the
implementation of global models detached from the reality of research as a
communication practice. For some time researchers, such as Latour and Woolgar,
Garvey, Galison and recently Nielsen have evidenced on the contrary how science
should be literally conceived as a communication practice. Furthermore, as a
social activity involving a wide range of interactions, the continuous model of
communication in scholarship requires a new form of dynamic and networked
infrastructure. The concept of an extensive scholarly record including
innovative methods and formats demands a framework of fluid but identifiable,
distributed but interlinked units. OPERAS adopts these concepts throughout its
full research lifecycle support and the synergies build on the connection of
distributed infrastructures, institutions and entities. SSH communication
practices differ substantially from STM, which has benefited from greater
exposure via electronic publishing, culminating in the primary publication
format of journal articles in STM, versus monographs in the SSH. The monograph
format reveals other specificities in terms of episteme, workflow,
collaboration, relationship between theory and fieldwork, elaboration and
construction of the argumentation based on evidence in those disciplines.
Academic books are poorly integrated in commercial databases and the format of
monographs is often excluded from OA policies, initiatives, and platforms. The
evaluation of research outputs in areas with low uptake of bibliometric and
scientometric evaluation is an issue at European level. In addition, more
reports suggest that the scholarly communication ecosystem is currently
suboptimal, lacks the transition to Open Science and doesn't support enough
innovation, while changes are prevented by few commercial players. OPERAS
addresses these barriers by strengthening scholarly-led initiatives, publicly
funded research institutions and infrastructure service providers, and by
developing domain-specific models for scholarly communication and implementing
```

tailor-made services in order to close the gap in the research fields of SSH as an immediate impact while fostering the evolution of open scholarly communication practices in the long run. SSH research is frequently grounded in specific cultural areas, which implies communication in native languages and not only in English as the scientific lingua franca. The approaches towards internationalization of the humanities and transregional research lead to international collaborations and communication networks, but do not result in the domination of few core journals like in the STM, because books and articles in the native languages remain dominant, as evidenced by the INTERCO-SSH project. A connection of the distributed publication and communication infrastructures with the implementation of a multilingual discovery service provides a direct beneficial impact on the outreach and internationalization potential of SSH research. The impact of SSH research on society has been a rising topic in both the academic and the public sector. While SSH research is fundamental to the production of knowledge, it also contributes to the economic domain, although the centre of its impact lies in the increase of civic capital. However, suggestions point the SSH towards a more intense engagement with the public. An adequate framework for open scholarly communication adopting the models for collaboration and participation, as proposed in OPERAS, will serve for different stakeholders including the non-academic sector and citizens. Based on engagement, research and public will be able to collaborate during the research period and upfront traditional publication. While ideas and concepts of innovative scholarly communication have been discussed broadly, implementations at larger scale remain a desideratum. Finally, the iterative and discursive process in hermeneutic methods, which have truncated the SSH from developments in the publishing system, as well as the bond to local communities in native languages, which has decelerated the internationalization of the SSH, now hold an immense potential for an inspiring model of Open Science with direct societal impact, based on continuous communication.

* 1.3 Describe if and how your RI corresponds to a long term science programme by a well-established science community and if and how your RI addresses a (inter- or multidisciplinary) scientific frontier opening novel possibilities in (several) research (fields): (maximum 2000 characters with spacing)

Text of 1 to 2000 characters will be accepted

OPERAS achieves the implementation of Open Science in SSH community. As such it integrates the digital humanities (DH) approach that aims at renewing research practices in the humanities and social sciences through intensive use of digital technologies. The diversity of the fields of SSH makes it impossible to cover them in their entirety by a single infrastructure. In the humanities, DARIAH focusses on digital methods for analysis and data-centered lifecycles. CLARIN specializes in text and language data and its processing. CESSDA connects the digital archives of the social sciences contributing to a rich data pool on a European level which also includes the European Social Survey and SHARE. The focus on data-driven research of all these ERICs reflects the fundamental importance of open data and digital source material in the SSH as a catalyst for innovative research. OPERAS cooperates with these consortia on several levels for exchange of knowledge and connects to the underlying infrastructures for exchange of data, but addresses the gaps from a more general, wider scope through substantial additions to the infrastructure

```
landscape: from digital methods and open data towards digital scholarship and
Open Science.
The transition to Open Science and the adoption of the open innovation
principles relies not only on open data sources but also on open communication
and participatory processes. Thus, in addition to computer-aided analysis, the
sharing of findings through scientific conversation, the quality assurance and
review processes, the editing and writing workflows, and the tracking and
acknowledgement of core research activities, all have to be supported and
integrated in the research infrastructure landscape. These activities have been
defined as scholarly primitives by John Unsworth, a renowned DH scholar, in his
conference 'Scholarly Primitives: what methods do humanities researchers have
in common, and how might our tools reflect this?'
```

* 1.4 Identify the scientific leadership that was recruited to lead the preparation of your RI and elaborate how you will recruit and consolidate the scientific leadership and overall competences for the implementation and operation of the proposed RI: (maximum 500 characters with spacing)

Text of 1 to 500 characters will be accepted

```
The scientific leadership of OPERAS is provided by OpenEdition and by the Core
Group partners. It will be completed by the constitution of a Scientific
Advisory Board during preparation phase.
The list and details of OPERAS Scientific Team are available here:
https://operas.hypotheses.org/?page_id=503
As coordinator, OpenEdition will bring together the Scientific Committee of
OPERAS from its own committees across Europe and with the help of Core Group
members.
```

* 1.5 Describe how the scientific concept of your RI was tested and found feasible and summarise the main findings concerning the scientific case from the design (and feasibilty) study report and the feedback from the relevant scientific community (-ies): (maximum 5000 characters with spacing)

Text of 1 to 5000 characters will be accepted

```
OPERAS integrates existing components that have demonstrated their scientific
relevance at medium or national level and are widely used by their scientific
communities. The OPERAS-D design study revealed that rather than creating new
platforms or services from scratch, there is a need for coordinating and
aligning existing ones across Europe to open the barriers preventing massive
adoption of Open Science, particularly in SSH.
The design study has tested OPERAS' scientific concept through a multi-
dimensional process, achieved within OPERAS-D project:
1. Consortium relevance
The partners' activities were evaluated following the principles of Enterprise
Architecture Framework. The results showed an important complementarity between
partners to support research needs in terms of communication all along the
research lifecycle. At the same time it showed a real diversity in terms of
size, organization, business models and workflows. The discrepancy between
complementarity and diversity led to the decision to plan a distributed
infrastructure rather than a centralized one, with a hub totally managed by the
OPERAS coordinator to ensure strong coordination between partners, as well as
the adoption of subsidiarity as a principle to define the infrastructure
```

functions and the distribution of these functions in three levels (sharing, integration, platforms).

2. Landscape study

A desk review of academic and grey literature to identify and examine existing and emerging practices in OA SSH publishing within the OPERAS network and beyond in Europe was carried out early in the project. The desk review also identifies the key stakeholders involved in OA publishing landscape in SSH. This research, outlining recent developments and challenges in the institutional open access publishing landscape serves as the basis for further work in the project and the work packages. It examines the role of various actors, important initiatives taking place in Europe and beyond, and identifies potential issues to be addressed by the OPERAS infrastructure.

In examining all emerging trends in journal and monograph publishing, the report outlines key challenges and potential issues to be addressed by future initiatives including the OPERAS infrastructure. Recently introduced and experimental models (such as scholar-led publishing bodies, and new university presses) share common orientations towards increased participation of researchers in the publishing process and overcome certain deficiencies of the commercial publishing model.

Notwithstanding the importance of such initiatives, as the report concludes, fragmentation (both in terms of the size and nature of publishers and of their business models) is a key characteristic in the academic publishing landscape. In this context, the main challenge in adopting effective open access publishing practices is to identify and assess current needs and limitations that permeate the academic publishing landscape, in operational and communication terms.

The report confirms that successful research relies primarily on unrestricted access to high quality scientific output and cross-disciplinary, international collaboration. Shared and remotely accessed digital infrastructures constitute an important factor in the realisation of the European Research Area, and OPERAS aspires to be actively engaged in the implementation of a new mode of science that overcomes fragmentation and enables unrestricted access to high quality scientific output.

3. User-driven design for future services

An online survey was undertaken to collect feedback from the different stakeholders that compose the scientific community (namely: researchers, libraries, academic publishers, funding agencies) on the existing services and those that are to be developed by OPERAS. From the answers, we can observe that the open scholarship movement is well known and that satisfaction with the quality of open access publications and the services provided by the OPERAS partners is generally good. Nevertheless, some confusion still persists between open and free access, particularly among researchers, and open access is often related to article processing charges and book processing charges issues. These issues confirm the need for open access advocacy which is part of the 'Communication' OPERAS working group, and the improvement of business models as planned in the future development of the infrastructure.

More directly interesting for the OPERAS infrastructure, questions about the future platforms revealed a great interest on the part of the different stakeholders.

A workshop was held in June 2017 with OPERAS partners to validate the different reports.

```
The OPERAS-D design study also addresses the technical feasibility and
governance and business models of the future infrastructure, which are outside
the scope of this question.
Read the Full Design Study with annexes: https://operas.hypotheses.org/design-
study
```

* 1.6 Upload the design (and feasibility) study final report, if available: (upload with limit 1 MB)

687c5a29-86e9-4f0d-9551-cfd3c7667f58/Operas-design-study.pdf

SECTION 2: PAN-EUROPEAN RELEVANCE

* 2.1. Describe if and how your RI addresses a gap in the current RI landscape in Europe (and beyond) and thus responds to unaddressed needs of user communities, i.e. describe the `uniqueness` of the RI. If not, describe which value your RI adds to the existing European research capacity in one or more fields of research and innovation: (maximum 2000 characters with spacing)

Text of 1 to 2000 characters will be accepted

```
OPERAS is built upon existing European infrastructures such as CLARIN, DARIAH,
CESSDA or SHARE. All of them work essentially with primary research data, in
specific fields. But results are neither easily visible nor accessible. OPERAS
will bring a sustainable answer to this issue by ensuring its services and
infrastructure are usable from the beginning to the end of the publication
process.
Scattered among multiple small-scale actors and far from user-friendly, SSH
scholarly communication is particularly fragile. Its academic and editorial
output varies in quality and is poorly funded, inaccessible and poorly
referenced. This is the issue that this infrastructure project will address,
not by supplanting actors but by reinforcing their presence. OPERAS will help
to harmonize publications processes in Europe to give to those actors better
visibility and sustainability. It will show to other international actors, who
are not engaged in open access, that another model is possible.
OpenAIRE, which is in part an infrastructure but largely a joint programme, is
focused on archiving already published material. And although the recently
launched follow-up OpenAIRE 2020 includes a pilot for Gold open access,
OpenAIRE's objective is only to a small extent shaping the scholarly
communication process. More importantly, OpenAIRE doesn't address a specific
scientific community and mixes all sorts of documents for all disciplines in
its database, making it very hard to use by researchers, and one of the reasons
for its very low usage.
OPERAS therefore  fills an important gap in the European landscape of RIs
because it deals with the entire ecosystem of scholarly communication, from
production to access. The development of Open Science, particularly in the
perspective of the European Open Science Cloud, needs such an RI to fill the
void by taking care of SSH communication output, which has until now largely
been considered as secondary data.
```

* 2.2 Indicate current infrastructures or services that are operational and accessible for the relevant science communities, if any, and explain why they are not adequate: (maximum 3000 characters with spacing)

Text of 1 to 3000 characters will be accepted

```
OPERAS is an infrastructure that focuses on publications (in a large sense).
The current publishing systems in the Social Sciences and Humanities are still
late in exploiting the full potential of the open web. The landscape, as
mentioned above, is dotted with myriads of small enterprises, some of them
being adaptive to the new web environment, some of them still devoted to the
paper format and suspicious of online diffusion. In such a fragmented
environment, the quality of the editorial workflow and the tools to provide
quality assurance can range from innovative online features to no features at
all, a situation that negatively affects research evaluation systems.
The services and tools that are operational and accessible already, do not
match with OPERAS' goals. Institutional repositories, for example, are very
useful to preserve local research output at the level of a university but their
heterogeneity in terms of formats (reports, articles, books, short paper,
presentations, etc.) and quality (peer-review, editing) are very different from
scientific publications platforms. Another example can be seen with OpenAIRE.
There again, the diversity of documents is a problem, as well as the fact that
it isn't specific to SSH publications that need specific platforms. For those
reasons, OpenAIRE has not been able to fully integrate SSH publications in the
EOSC. Yet, most of their work enlightens OPERAS' project and explains the
ongoing collaboration with members of OPERAS. The proposed RI will also draw on
OASPA's principles (https://oaspa.org/principles-of-transparency-and-best-
practice-in-scholarly-publishing-2/), however, OASPA doesn't help with
implementation, which many actors in this landscape need.
Finally, several tools that OPERAS will use require scaling up to a European
level. OPERAS will be built on three different platforms, using existing
services: DOAB (http://doabooks.org), a platform of certification, Isidore, a
discovery platform (https://www.rechercheisidore.fr/), and Hypotheses, a
platform for scientific blogging (http://hypotheses.org/). Isidore and
Hypotheses are mostly used in France at present and are available in other
languages (English and Spanish for both of them and German for Hypotheses). To
become adequate, they need to be opened up to the whole European Research Area.
Similarly, DOAB needs to be developed on a larger scale. The same principle
applies to a number of initiatives dedicated to SSH scholarly communication in
Europe (such as OAPEN, OpenEdition, Ubiquity Press, Share Press, Perspectivia,
UC Digitalis, and Huma-Num among others) which need to synergize and grow to a
European level and subsequently drive other smaller and less advanced players
onto the path to Open Science.
OPERAS will enable them to create an efficient and reliable ecosystem for each
actor of SSH communications.
```

* 2.3 Explain why your RI is the most appropriate solution to address this need and what the added value is of performing the research activities within a RI instead of a research programme: (maximum 3000 characters with spacing)

Text of 1 to 3000 characters will be accepted

There is currently no European infrastructure designed to support open scholarly communication in the humanities and social sciences. There are, however, a number of projects of various sizes whose organisational, technical, and financial sustainability is not guaranteed. Those other types of organization are too weak and give too few incentives to prevent the different players from diverging, experimenting their own way without coordination, and reinventing the wheel several times. Professional associations (OASPA, AEUP), networks (Going for Gold) and national infrastructures (OpenEdition, OAPEN, Hrcak, EKT, UC Digitalis) already exist but they are unable, separately, to structure on their own the landscape in the long term at European level.
RIs are defined as legal entities able to join together facilities, resources and services that are used by the research communities to conduct research and foster innovation in their fields. Two strong points make the difference between a RI and a programme : first, a RI must be sustainable. And secondly, a RI creates a new structure with an identity which implies a dedicated team and not only a network, as in a project. Actually, one can say that a project implies partners in a network and a RI implies members in a team.
Both of those strong points are necessary regarding the OPERAS project which implies a strong structure and the development of specific services that can be used by the whole scientific community. A programme is not enough. An infrastructure like OPERAS will harmonize the SSH communication process in Europe (following the Open Science guidelines), thanks to legal status and governance structure. The external advisory bodies of OPERAS will help to answer to the users' needs and to develop services in a long-term perspective as well as to integrate with the EOSC. If OPERAS was only a cooperation network it would be unable to move to a wider and more global level of integration. Given the very fragmented landscape of academic publishing in Europe, especially concerning SSH, the sector obviously needs a major initiative that engages the players more effectively than a loose network and more permanently than a project. Moreover, cooperation networks and projects are unable to change sustainably the landscape of a sector. What is needed is a common set of technologies, standards, services and models shared by a large number of players (several hundreds of publishers, researchers, libraries, aggregators), across ERA countries in order to defragment the sector and build a common space allowing the development of open scholarly communication in SSH. The ambition of the project, which has no equivalent even in other scientific fields, implies the creation of an infrastructure. It will guarantee its sustainability. This shows why OPERAS' proposed RI is the most evident way to achieve these goals.

* 2.4 Describe how your RI contributes to the enhancement and realisation of the European Research Area [1]: (maximum 3000 characters with spacing)

[1] Please consider the Communication on A Reinforced European Research Area Partnership for Excellence and Growth COM (2012) 392.

Text of 1 to 3000 characters will be accepted

OPERAS will make a strong contribution towards implementing ERA priorities, and in particular priority 5 (optimal circulation and transfer of knowledge) and priority 2 (optimal transnational cooperation and competition).
It will dramatically increase the optimal circulation and transfer of

scientific knowledge, since this will be the rationale behind the creation of the open access infrastructure for scholarly communication in the SSH in Europe, bringing together the main stakeholders and actors. OPERAS will enable open science in the SSH disciplines by providing a distributed publication infrastructure to potentially all European researchers in these disciplines, and by promoting digital research practices in parallel. It will contribute to maximising and strengthening the use and re-use of research results. Reports of publicly funded research will be disseminated more broadly and faster, for the benefit of research, industry and society as a whole. OPERAS will also contribute towards changing the relationship between researchers and citizens, by giving the latter direct access to research and knowledge and by organizing collaboration with media and other intermediaries that facilitate uptake of the research results in the society. Thanks to this, the visibility of European research in SSH will be boosted. It will be a major support for the dissemination of research that addresses societal challenges through transfer of knowledge in social sciences publication, especially towards health, security, environmental actions, and inclusive society issues.

Beyond contributing to the optimal circulation and transfer of scientific knowledge, OPERAS is expected to spearhead developments in transnational cooperation and competition, the second ERA priority, by effectively bringing together SSH researchers from all over Europe and beyond. The distributed scholarly communication infrastructure in the SSH is envisioned as a hub of content, services and people, the European researchers. The RI is thus expected to act as a catalyst in pushing forward future collaborations and spearheading research projects that would not be possible otherwise. When, in most cases, players in the field tend to focus on their immediate environment, with a lack of collaboration between north and south Europe, western and central Europe, OPERAS will organize the change through the building of a common infrastructure across ERA. Indeed, during the first two years the OPERAS Consortium will be extended by at least 10 partners, increasing the members to more than 30. Particular attention will be given to Central European Countries to become part of the OPERAS consortium.

Above all, having a single infrastructure for the whole SSH scholarly communications in Europe offers strong visibility and high coherence to the rest of the world. OPERAS will contribute to build and to define the ERA thanks to its uniqueness in and outside Europe.

* 2.5 Describe how your RI will contribute to aligning national investments in your field (-s) at the European level: (maximum 3000 characters with spacing)

Text of 1 to 3000 characters will be accepted

The infrastructure will be primarily developed by coordinating and pooling existing services and tools. By working together in the OPERAS framework and in ongoing and new projects, partners ensure efficient development and optimal scope of the proposed infrastructure and create a new functional whole, which is greater than the sum of its parts. Therefore the national investments for scholarly communication, particularly in SSH, will not feed diverging strategies alongside national traditions and habits but will converge on a path towards a common mode of communication, peer-reviewed, digital and open access, with high impact and evolving rapidly through innovation.

Most of the partners involved in OPERAS are supported by national investments that match with the objectives of OPERAS as a RI. OPERAS contributes to the raising of standards of national services which are funded by Member States. But moreover, all those individual services need to be gathered to create a strong and efficient platform. The pooling of services, which involves several steps, will be done by the RI. The final result is that each service will be interoperable with the others, allowing the whole European SSH community to use any of the tools. This is a virtuous circle insofar as the RI contributes to national investments by sharing services and tools with other communities. Millions of digital resources are already available in Europe thanks to national services but there needs to be a common way of processing, analysing, signalling and exposing them : OPERAS will provide the interoperability to achieve this. This explains why a distributed infrastructure is needed : OPERAS will build the hub for the coordination of the scaling-up and the interoperability of these many national activities. It will play a strong role regarding the harvesting and hosting of data, the creation of common standards, references and thesauri. Moreover, the generated data needs to be indexed, connected and enriched and OPERAS will make it possible thanks to the development of the common discovery platform.

The recognition of OPERAS as an ESFRI infrastructure project will help different partners to get involved in their national roadmaps (which is not yet the case for most of them), hence will facilitate inclusion of different types of actors in national funding schemes, because of the favourable context of Europe-focused strategic orientations. OPERAS will contribute to aligning national investments in SSH by scaling-up national services to a European level. To conclude, OpenEdition (OE Books, Revues.org, Hypothèses), OAPEN (OAPEN Library), EKT (ePublishing), Unito (Sirio), MWS (Perspectivia), Huma-Num (Isidore), UC (UC Digitalis), IBL PAN (e-publikacje) are already efficient thanks to national investments. Yet all of them need to be able to work together to offer a real ecosystem of SSH scientific communications and this will be done by the proposed OPERAS RI.

* 2.6 Describe how your RI will effectively (re-) orient resources from the relevant science communities and stimulate `joint programming`, e.g. contributing complementary instrumentation, activating partnerships, training of young researchers in the relevant field (-s) of science: (maximum 2000 characters with spacing)

Text of 1 to 2000 characters will be accepted

Key partners are supported by public funds at national level to develop scholarly communication services for their respective scientific communities. Budgets are uneven but already existing and invested to build platforms and services intensively used inside the communities. By pooling those platforms and services and developing new ones at European level on top of the already existing ones, resources initially built up for a limited community will become available inside the whole ERA. The infrastructure will encourage the circulation of scientific information inside Europe and intensify its usage (downloads and citations). The combination of open access and the building of an integrated publication area will multiply scientific cooperations across Europe. Beyond this, however, extensive training programmes involving specific disciplinary groups within the SSH, as well as the function of the single access point of the infrastructure as a hub, are strongly expected to foster

developments, scientific and strategic, at various levels, raising the issue of joint programming, among other things. The RI will help pinpoint new emerging areas and the discussion for joint programming in those areas within existing programmes, such as the HERA (Humanities in the European Research Area). Targeted conversations with HERA may help in expanding this particular joint programming scheme to other European countries through the participation of the latter in OPERAS. Eventually, the planned Research for Society platform will be entirely dedicated to the development of an environment stimulating joint and collaborative research projects gathering research teams from different disciplines, countries and with different types of socio-economic actors.

* 2.7 Describe the (potential) linkages between your RI and existing (European) platforms, networks and other (ESFRI) RI, e.g. European Technology Platforms (ETP), Joint Programming Initiatives (JPI), ERA-nets, Public-Private Partnerships (PPP) and projects under FP7 or Horizon 2020: (maximum 3000 characters with spacing)

Text of 1 to 3000 characters will be accepted

OPERAS has several links with different platforms and initiatives in Europe and abroad :
1. Infrastructures
OPERAS is linked to several existing infrastructures such as DARIAH or CLARIN. For example, Huma-Num coordinates the French participation in DARIAH and is engaged in CLARIN. It hosts, as well as UGOE, a part of the DARIAH Coordination Office. Moreover, IBL PAN and MWS are both involved in DARIAH and CLARIN thanks to their national infrastructures.
2. European platforms and networks
Members of OPERAS are involved either in H2020 projects or in strong networks. One of the members, OAPEN, was developed through a eContentplus-program and then became a foundation.
OpenEdition and OAPEN are members of OASPA. IBL PAN participates in the network NEDIMAH and is a member of RCiN consortium, the Digital Repository of the Scientific Institutes. UCL Press is a member of the Library Publishing Coalition, of the Association of European University Presses and of LIBER (http://libereurope.eu/). Very different networks have been created between most of the OPERAS's members and different partners in Europe.
The same can be said regarding the participation of members in H2020 or FP projects : EKT was coordinator of PASTEUR4OA FP7 program. Project PARTHENOS has engaged both DARIAH and Huma-Num which is also involved, with OE, in the project Humanities at Scale, an H2020 program launched by DARIAH. EKT and UGOE are actively engaged in OpenAIRE.
Lastly, OPERAS' development is supported by two H2020 projects :
- OPERAS-D which involves four members of OPERAS Core Group (OE, MWS, EKT, OAPEN)
- HIRMEOS, 'High Integration of Research Monographs in the European Open Science Infrastructure' (http://www.hirmeos.eu/) which also gathers four members of the Core Group (OE, OAPEN, EKT, GOEU) as well as DARIAH as a Work Package leader.
3. National platforms
OAPEN works closely with scientific infrastructures in different countries: JISC and Wellcome Trust in the UK, NWO in the Netherlands, FWF in Austria, and

```
SNSF in Switzerland.
OE's content is preserved through automatic harvesting by the French National
Library (BNF) and CINES. MWS runs Perspectivia, an international platform,
while UGOE runs the Göttingen University Press and open-access.net, the
information platform on open access.
UC Digitalis hosts the digital libraries ALMA MATER, POMBALINA and IMPACTUM
which are integrated into the B-On (Online Knowledge Library), and IBL PAN
manages two electronic platforms: New Panorama of Polish Literature and Polish
Studies Newsletter. University of Zadar partners with University of Zagreb to
provide the Croatian national platform Hrcak.
4. Public-Private Partnerships
UCL Press has developed specific partnerships with OAPEN, JSTOR, Ingenta
Connect and Worldreader platforms, ensuring that its books are made available
throughout the world in open access form.
```

* 2.8 Describe how your RI will leverage European competitiveness in research and innovation, e.g. uniqueness of technical offer, advancement of technical standards, innovation in research process, effective impact on the innovation of research products and setting reference standards in data management: (maximum 3000 characters with spacing)

Text of 1 to 3000 characters will be accepted

```
European initiatives in scholarly communication sector are highly competitive
compared to other areas but lack critical mass and are impeded by a fragmented
continental space in terms of policies, communities, languages. JSTOR in the
United States, Scielo in South America, Redalyc in Mexico which operate in SSH
and open scholarly communication sector are less innovative than OpenEdition,
Ubiquity Press, Perspectivia, EKT to take a few examples in terms of adoption
of technical standards, semantic annotation, usage of social media, alternative
metrics, open peer review, multi-format dissemination, engagement with society,
and innovative business models among others. But the former dominate the sector
by the mere power of their size.
By gathering a consortium encompassing the largest number of OA players in ERA,
OPERAS will allow the less innovative partners to benefit from others and share
their research and development costs. Hence it will leverage existing
innovation in Europe to bring the whole ecosystem together at the highest level.
The development of OPERAS' integrated service for certification, discovery and
citizen science will ensure Europe's leadership in these domains. The existing
platforms from which those services will be developed are highly innovative:
-DOAB increases discoverability of open access books. Academic publishers are
invited to provide metadata of their OA books to DOAB. Metadata is harvestable
in order to maximize, visibility and impact. Aggregators can integrate the
records in their commercial services and libraries can integrate the directory
into their online catalogues.
-Isidore is a search platform allowing access to digital data of SSH. Open to
teachers, researchers and students, it relies on the principles of Web of data
and provides access to data in free access (open access).The Isidore platform
differs from traditional search engines in many ways, including targeted
harvesting of metadata and scientific data structured according to
international and available standards in free access on Web; indexing of
unstructured data and of structured data; standardization of metadata and
```

```
enrichment of the data resting on vocabularies recognized in the community.
-Hypotheses is the largest academic blogging platform in the world with more
than 2000 living blogs and 250,000 documents on the platform. Hypotheses has
contributed to renewing scholarly communication practices for more than 11,000
researchers in several countries and languages. Hypotheses is used by
researchers to communicate with their peers and with society in a new way:
openly, without delay and interactively, on every part of their research
activities: field work, data analysis, seminar and conferences, editorial
projects, science management and others.
By supporting the development and the scaling of these three services, OPERAS
positions Europe as a champion at international level regarding innovation in
open scholarly communication.
```

* 2.9 By testing your RI against the [ESFRI pan-European ex ante indicators](#), identify which indicators your RI meets and describe how: (maximum 3000 characters with spacing)

Text of 1 to 3000 characters will be accepted

```
Background :
●       Previous Design Study Project :  successfully completed within operas-
d project: http://cordis.europa.eu/project/rcn/206231_en.html
●       Addressing: Amsterdam Call for Action. 6: Set up common e-
infrastructures : whole OPERAS RI project ; 4 : Create transparency on the
costs and conditions of academic communication : Business Models component of
OPERAS shared services. 8 : Stimulate new publishing models for knowledge
transfer: Best Practices component in Shared Services.
●       Upgrade: OPERAS is the upgrade of OpenEdition RI at European level.
See French roadmap:
●       Re-orientation: the siting of OPERAS in Technopole in Marseille in a
new building will increase the importance of SSH.
●       Landscape analysis: ESFRI Roadmap 2016. Part 3: p.172 : "The
multiplicity of initiatives for OA publishing in SSH is good news, but the lack
of coordination between them is obvious: this growing and very dynamic
community needs a place to engage in discussions, share ideas, tools and
solutions, and to agree upon .. standards." It is the aim of OPERAS.
Membership
●       1.1 : Low. Highly centralized around coordinator for supporting
management costs during (a) and (b)
●       1.2 : Medium. An MoU signed by Core Group of nine partners, reinforced
by two H2020 projects CA signed by 5 and 9 partners. AISBL to prepare the ERIC.
●       1.3: High. 30 organizations. Capacity to attract a high no. of players.
●       1.4: Low. Cf 1.3.
●       1.5: Medium. Partners small in budget and workforce, outnumbered by
the strength of the coordinator (3M annual budget and 60 FTEs), but with nine
national nodes is medium size.
User strategy
●       2.1 : High. 100% of researchers across the ERA could use the
infrastructure.
●       2.2 : High. Usage of platforms. Isidore receives 1,300,000 visits  and
Hypotheses 17,000,000 per year.
●       2.3: High. As a virtual infrastructure, almost all the investment to
```

```
manage and develop platforms.
Networking
●        3.1 : Low. OPERAS has not yet undertaken outreach to its user
consortia, particularly to negotiate usage contracts.
●        3.2 : High. Delivering open access content coming from Europe and in
several languages, it is expected that OPERAS will attract a significant number
of international users.
●        3.3 : High. OPERAS covers all disciplines of humanities and social
sciences.
Excellence
●        4.1: Medium. As an innovative project with international perspective,
OPERAS can attract highly qualified personnel from SSH disciplines where this
type of activity is rare. This high attractiveness is counterbalanced by
relatively low wages offered by French public institutions.
Knowledge Transfer
●        5.1: Low. No formal agreements yet with OPERAS. But with its R&D
department 'OpenEdition Lab', the coordinator  already hosts two-three PhDs
annually.
●        5.2: Low. HIRMEOS involves two SMEs. Huma-Num has a continuous
procurement with an SME to develop Isidore.
●        5.3: Low. In general, profit organizations have a low usage of SSH
resources.
```

SECTION 3: SOCIO-ECONOMIC IMPACT

* 3.1. Describe the expected direct economic impact of your RI, e.g. the economic impact from direct
spending in the site and region hosting the facility or the headquarters and the nodes of a distributed RI:
(maximum 3000 characters with spacing)

Text of 1 to 3000 characters will be accepted

```
The development of OPERAS will eventually create six jobs in France, in
Marseille. As a distributed and virtual infrastructure the direct economic
impact is very low but will be counterbalanced by indirect economic impact
through intense collaboration with publication SMEs across Europe and other
industrial partners.
```

* 3.2. Describe the expected mid and long term socio-economic benefits of your RI, e.g. in terms of
replacing/re-orientating costly infrastructures that are already in place and support to public policy:
(maximum 2000 characters with spacing)

Text of 1 to 2000 characters will be accepted

```
Academic presses throughout Europe are mainly oriented towards print
dissemination of their content at this stage. While a large proportion of
journals are now available online (but not all of them and mainly behind
paywalls), the majority of books are still available in print only e.g.
unavailable online. The maintenance of distribution infrastructures for print
materials is very costly and the impact of this system is poor since print
sales are very low. The whole chain of players from publishers to libraries and
bookstores, with the different intermediaries, has to support the cost of
```

fabricating, transporting, stocking, managing, indexing, selling, recycling
objects which are only the physical manifestation of content that is natively
digital on the computer of authors and publishers. OPERAS will accelerate the
transition of the whole chain to digital from end to end, driving the sector to
a digital centered workflow where print will be a byproduct of digital content,
especially with print-on-demand which reduces dramatically the costs. Such a
system will not mean a global diminution of publishing costs but rather a
reorientation of the costs from print to digital. Therefore the costs of
distribution infrastructure, moving from print to digital, particularly open
access digital, will be invested in much more efficient distribution channels,
multiplying the impact of research publications.

In addition, by pooling existing services provided by partners for open access
publications (primarily OpenEdition, OAPEN, Perspectivia, EKT, Share Press,
Ubiquity, Hrcak platforms), OPERAS will increase socio-economic impact of these
infrastructures already in place and strengthen the capacity of different
countries in the ERA to enforce their open science policies, particularly for
social sciences and humanities.

* 3.3. Estimate the impact on the innovation activity in the production of goods and services that will result from your RI, e.g. in terms of well-trained people, knowledge transfer, access programmes and services provided: (maximum 2000 characters with spacing)

Text of 1 to 2000 characters will be accepted

The principal sector impacted by the infrastructure will be the information
industries: the academic publishing sector particularly in SSH is not
sufficiently innovative and has difficulties managing the transition to the
digital realm. The infrastructure will help the sector to share and reduce R&D
costs and risks to accelerate its transition. New services will be proposed,
particularly in terms of usability and discoverability based on semantic
structuring and description of content as well as development of alternative
impact metrics.
Moreover, OPERAS plans to develop large scale training programmes for
researchers, publishers and librarians on the issues, technologies, and best
practices of open access publishing, facilitating their ability to adapt their
professional practices to the ongoing innovation process in this field.
Specific actions will be set up within the infrastructure to support innovative
and fair business models for open access academic publishing, opening a market
currently hampered by the domination of a few actors. The outcome of this
specific action will be to give way to fair and unbiased competition on a
transparent market and promote innovation and best quality services as a key
element for success on this market.
In addition, by making a large corpus of open access research output available,
the infrastructure will enable the development of innovative services related
to societal issues for socio-economic actors and society more widely. Large
scale open access repositories of data and metadata with liberal licenses for
reuse and TDM (text and data mining) will give the opportunity to a whole range
of information services companies and SMEs to propose services to professionals
and the general public on the societal challenges that European society has to

```
face. We plan to set up the collaborative platform dedicated to societal
challenges during the Construction Phase in order to accelerate the transfer
from research to society.
```

* 3.4. Describe the potential and role your RI can play in technological and social innovation: (maximum 2000 characters with spacing)

Text of 1 to 2000 characters will be accepted

```
The implementation of the infrastructure will reduce entry costs for new actors
in the field of open access academic publishing and will introduce new
editorial practices across the sector as a whole.
It will enable the emergence of innovative economic models for open access
publishing as some of the most innovative existing ones are participating in
the Consortium: OpenEdition (freemium), OAPEN (upfront funding), Knowledge
Unlatched and OLH (library subscriptions), Lingoa (fair APC) and they will be
supported by specific actions in the infrastructure.
OPERAS will assist existing SMEs in the SSH publishing sphere that have a
cooperative partnership with researchers or scholarly societies and wish to
offer even better services by adopting open access and open science methods.
The last years have shown that many individual SMEs lack the innovation power
or economic resources to develop the necessary new business and access models
or the respective technologies. Cooperation and the planned specific projects
on tools R&D will unlock the situation in this regard.
Specific innovative development will be achieved on different topics such as
multilingualism, TDM, semantic annotation, editorial innovation (open-peer-
review, data journals) across the different levels of OPERAS activities, to
enable a continuous upgrade of current services and platforms operated by the
infrastructure partners and give them the ability to acquire cutting-edge
technologies.
Eventually, the collaborative platform dedicated to societal challenges will
directly benefit a wide array of stakeholders such as the media, SMEs, and
administrations that contribute everyday to the shaping of the the public
debate in Europe. Therefore, it will increase the impact of research
(particularly in social sciences) on different sectors of society and
accelerate social innovation.
```

* 3.5. Describe how your RI will attract innovation-oriented resources from business, industries and public services, e.g. as users or suppliers: (maximum 2000 characters with spacing)

Text of 1 to 2000 characters will be accepted

```
The infrastructure will play an important role in sharing tools developed in
digital publishing R&D and transferring them to industry actors able to
leverage them.
The Coordinator OpenEdition has strong experience in developing innovative
projects in cooperation with industry partners in its Lab department, oriented
towards data and text mining (Bilbo project with Google, Inter-textes project
with 2 SMEs, Agoraweb project). For its industrial development, OpenEdition is
working with ProtisValor Méditerranée (a subsidiary of Aix-Marseille University
promoting and managing multi-partner and European research contracts).
Huma-Num, the infrastructure operating the Isidore platform, works with several
```

industrial partners and has been developing a strong partnership for several years with Antidot. This SME has developed the enrichment module (AIF) and the search engine (AFS). Huma-Num has also launched a project Veille.Science, which consists of observation of Isidore's use thanks to the company Plume. Generally speaking, Huma-Num calls on different SMEs' services to develop specific tools such as Isidore or Nakala.

OAPEN has longstanding experience working with the publishing industry in several countries (NL, UK, D and CH) and with the main players of the sector to elaborate business plans and economic studies to develop their open access strategy.

EKT coordinates an FP7 program to operate knowledge transfer towards Greek SMEs (Enterprise Europe Network-Hellas).

Based on the longstanding and intensive tradition of cooperation with industrial partners from some of its key members, OPERAS will be able to develop new and bigger joint programmes with major industrial actors of innovation in the sector and allow access to these programmes to every member of the Consortium. It is planned that the development of these programmes will be funded via applications to H2020 calls that are oriented towards innovation.

* 3.6. Describe how your RI will contribute to tackling (grand) societal challenges: (maximum 2000 characters with spacing)

Text of 1 to 2000 characters will be accepted

By nature, OPERAS will make a major contribution to tackling societal challenges:

● the object of the infrastructure is scholarly communication in an open context which is one of the principal ways of transferring research results to socio-economic actors.

● the principal targets of the infrastructure in terms of disciplines (SSH) work on and reflect on all the six challenges (and not only one).

In addition, OPERAS will develop a multidisciplinary platform during its construction phase based on collaboration between research teams and different stakeholders involved in tackling societal challenges (OPERAS Research for Society Platform). The innovative approach will be based on continuous collaboration all along the research cycle up to publication and exploitation. Based on the model successfully developed by SGC http://www.thesgc.org/ the platform will simultaneously offer a funding mechanism, a collaborative tool and a communication venue to disseminate openly the results of the projects. It will communicate with existing data repositories but provide incentives to orient research towards the identified societal challenges, produce materials adapted to the socio-economic actors' needs in different fields and offer exploitation tools to improve uptake of research results in different communities.

The platform testbed is provided by Hypotheses platform which holds many examples of cooperation between research teams and socio-economic actors. See for example: http://www.openedition.org/17473 http://www.openedition.org/17445 http://www.openedition.org/16653 and http://www.openedition.org/catalogue-notebooks?limit=30&typeblog%5B%5D=Carnet+de+terrain for other cases. A small-

size demonstrator is under preparation at OpenEdition. It is planned to answer
the next SWAFS-15-2018-2019 call to set up a pilot for the future development
of the project.

* 3.7 If available, upload a socio-economic *ex ante* impact study: (upload with limit 1 MB)
   6e4e012d-6162-4126-8900-899a5f3c26f9/Non_available.pdf

SECTION 4: e- NEEDS

*** 4.1. Outline the Data Management Plan (DMP) and data access policy of the RI. If applicable, describe
how data would become accessible to the public: (maximum 3000 characters with spacing)**
Text of 1 to 3000 characters will be accepted

OPERAS DMP is being prepared during OPERAS-D and HIRMEOS projects. It follows
two principles:
-Distribution: each partner hosts, disseminates and preserves its data
according to common rules adopted by the Consortium and implemented through
shared services and EOSC integration actions. The three OPERAS platforms will
be operated by OAPEN, OpenEdition and Huma-Num according with their own DMP.
-FAIR principles will apply to all data produced within OPERAS. Data must here
primarily be understood as the main research outputs in SSH, namely books,
articles and other text and multimedia productions. However, the principles
will also apply to statistical or other usage data resulting from monitoring
processes.
Discoverable: the data will be associated with PIDs following the example of
HIRMEOS and exposed through partners' repositories as well as Discovery
Platforms and Sparql Endpoint. Metadata will be translated, increasing its
discoverability in a multilingual context, and enriched by adoption of
standards.
Accessible: as an infrastructure dedicated to open access scholarly
communication, OPERAS already embraces strong principles of accessibility.
Almost all data is accessible to the reader through web platforms. Restrictions
can apply to additional formats in the case of the freemium model used by
OpenEdition.
Interoperable: metadata will be machine-readable through OAI repositories and
Sparql Endpoint. An effort will be led by Huma-Num to align metadata on
disciplinary ontologies across different languages, increasing interoperability
dramatically for large quantities of metadata through the development of the
discovery platform. Regarding data, most of the work remains to be done as the
main format used in SSH publications is PDF, a very low interoperable format.
It's the purpose of the Tools R&D component to facilitate SSP adoption by
partners, particularly based on machine-readable formats such as XML and HTML.
Regarding XML structuration of content, OPERAS pushes for convergence between
schemas used across the industry (TEI and JATS mainly).
Reusable: OPERAS will encourage its partners to use liberal licenses whenever
possible, as part of its Best Practices component. As a first step for the
development of the certification service, the DOAB already includes use of an
open license as one of its requirements.

```
Being part of national and/or public infrastructures, most OPERAS partners
ensure long-term preservation of their data within national plans. For example:
●Data distributed by OpenEdition is archived by the CINES via Huma-Num within a
national programme for long-term archiving.
●Data distributed by Perspectivia is archived by the Bavarian State Library
(BSB).
●Data distributed by OAPEN is archived by the e-deposit service of the Royal
Library of the Netherlands (KB).
More information can be found in the Technical Mapping section of the Design
Study where each partner's technical framework is extensively described.
```

* 4.2. Describe and quantify what e-infastructure services - e.g. resources for storage, computing, networking, tools for data management, security, access, remote analysis, etc. - your RI will need: (maximum 2000 characters with spacing)

Text of 1 to 2000 characters will be accepted

```
As previously mentioned, most of OPERAS partners are already supported by or
part of public research institutions that provide storage, computing and
network services either on their own or within joint e-infrastructures. There
is no plan to merge access to those services for all partners as they already
benefit from robust partnerships.
The e-infrastructure services needed by common platforms (Certification,
Discovery, Research for Society) will be provided by the partners supported by
their institutions: OAPEN by the University of Amsterdam Library, Huma-Num and
OpenEdition by CNRS.
A more detailed and informed evaluation of the needs has been provided by
OPERAS-D Technical Mapping report, creating a full description of technologies
used by the Consortium partners for OPERAS. It takes the form of technical
review (software, programming languages, metadata and data) of the framework
and content structures used by OPERAS partners. The review was validated by
partners during the Amsterdam workshop of the 27th of June 2017.
```

* 4.3.Describe how the e-infrastructure services needed by your RI will be implemented, specifying the potential need of external e-infrastructure resources and the relations to external e-infrastructures: (maximum 2000 characters with spacing)

Text of 1 to 2000 characters will be accepted

```
OPERAS services, including the three integrated platforms, will be developed
through specific projects (INFRAEOSC, SWAFS and INFRADEV). The institutions
that will lead the technical work packages of the projects will ensure hosting
and technical support for the services operations after the development phase.
Existing services will continue to be supported by partners. The following list
summarizes the relations with e-infrastructure providers for the Core Group
partners. More details for all OPERAS partners are available in the Technical
Mapping part of the Design Study.
●      OpenEdition: CC IN2P3 https://cc.in2p3.fr/  - CINES (preservation):
https://www.cines.fr/
●      OAPEN: Digital Production Centre (University of Amsterdam Library):
http://uba.uva.nl/en/services/other/dpc/digital-production-centre.html - Royal
Library of Netherlands (preservation): https://www.kb.nl/en/organisation
```

```
/research-expertise/long-term-usability-of-digital-resources

portale-elearning
```

* 4.4. Describe how the RI will contribute to the development of the European and global e-infrastructure landscape at all levels (institutional, regional, national, international) - including e.g. the e-infastructure commons and the European Open Science Cloud (EOSC): (maximum 2000 characters with spacing)

Text of 1 to 2000 characters will be accepted

```
As a distributed RI providing powerful e-infrastructure services for SSH,
OPERAS will contribute to a future 'e-infrastructure Commons' at European
level. It will foster a convergence of targets among main players and make them
adopt common standards, practices and policies, independent of their
functional, geographic, and user-type specificities, by providing a common
virtual infrastructure, engaging in joint R&D programs, developing shared e-
services to user communities and offering a forum to share points of view,
needs and strategies.
Regarding the e-IRG white paper recommendations for international e-
infrastructure organizations, OPERAS will be instrumental in developing
'services registry, discovery and provisioning' and in tackling the 'financial,
legal, business development and procurement issues'. As for the involvement of
users in these efforts, it should be noted that the OPERAS key players operate
at a level very close to users, as they represent not only platforms, but also
publishers and university services.
Realizing the EOSC requires a high level of alignment at strategy level,
standardization and interoperability at technical level and cooperation
regarding business models. OPERAS has the objective to fulfil exactly these
requirements in the SSH domain, among scholarly communication stakeholders.
Three OPERAS Working Groups (Standards, Best practices, Business models) are
related to EOSC topics, and are intended to implement the FAIR principles for
all the forms of data produced.
HIRMEOS already contributes to EOSC by providing standard identifiers (DOI,
ORCID, FundRef) to five OA books platforms within OPERAS. The project acts as
prototype, to be replicated for other types of data.
The three key platforms that OPERAS will provide (Certification, Discovery,
Research for Society) are in line with EOSC principles by efficiently
connecting publications to other research outputs, making optimal use of
existing initiatives and infrastructures.
```

For background information please consult the E-IRG Roadmap at http://e-irg.eu/roadmap

PART C: IMPLEMENTATION

SECTION 5: STAKEHOLDER COMMITMENT

* 5.1 If applicable, identify the regions/countries which have included your RI and the field (-s) it is operating in their National/Regional Research and Innovation Strategies for Smart Specialisation (RIS3). If applicable, elaborate your plans to obtain funding from the European Structural and Investment Funds (ESIF). If applicable, elaborate if and to what degree the inclusion in the Roadmap 2018 is made conditional for applying to the ESIF by the respective authorities: (maximum 2000 characters with spacing)

Text of 1 to 2000 characters will be accepted

```
non applicable
```

* 5.2 Complementing the identification of the lead country/entity, prospective member countries/entities, coordinator and participants from PART A, describe the envisaged final stakeholder community of your RI and elaborate on your strategies and plans on how your RI will obtain their commitment, including your plans to get listed in additional national RI roadmaps and regional Smart Specialisation Strategies: (maximum 2000 characters with spacing)

Text of 1 to 2000 characters will be accepted

```
The perimeter that defines OPERAS stakeholders list follows different criteria:
●Geographical: all ERA countries
●Disciplinary: SSH and multidisciplinary
●Types of stakeholders: researchers, research libraries, academic publishers,
funding organizations, socio-economic actors.
The detailed strategy to reach out to new stakeholders is in OPERAS-D
communication and dissemination guide:
https://f.hypotheses.org/wp-content/blogs.dir/2465/files/2017/05/OPERAS-D-D5.1-
Communication-and-Dissemination-Guide.pdf
The main difficulty to involve new partners is their size: most have extremely
limited human resources (under 10 FTE) to ensure daily services. This situation
informs the way the project is structured. By its size and ability to access
national and EU funding, the lead partner OpenEdition (50-60 FTE) bears most of
the effort and requests a small contribution from each partner (10% FTE for
ordinary partners, 20% FTE for Core Group partners) which makes it more
feasible for new partners to join. OPERAS will attract new members by offering
access to several services: participation in projects at EU level, use of new
generation technologies, access to training sessions, and discoverability
improvement for their content through access to OPERAS dissemination platforms.
Regarding partners' inclusion in national roadmaps, most of them, due to their
size and their SSH specialization, currently don't have access to this funding
instrument, which is primarily dedicated to STM disciplines and large
infrastructures. Being part of a large, federated European initiative will
support their inclusion: while many partners aren't even known by the
infrastructure department of their ministry, though they clearly provide RI
services to their scientific community, the process of ESFRI application has
```

35

> driven them to engage communication with their ministry and for their ministry to notice their existence as Research Infrastructure service providers.

SECTION 6: USER STRATEGY & ACCESS POLICY

* 6.1 Upload a table describing quantitatively (in estimated absolute figures as well as %) the targeted user community in terms of 1) scientific field (-s), 2) origin (i.e. local/regional, lead country, prospective member countries, participants, other European countries, other non-European third countries) and 3) sort (i.e. academia, business & industries, public services, other): (upload with limit 1 MB)

6f562b70-6ee7-4149-8127-9776f4582b6f/User-community.pdf

* 6.2 Elaborate how your RI has verified the above-described expected user community, e.g. through a survey: (maximum 2000 characters with spacing)

Text of 1 to 2000 characters will be accepted

> The main user community targeted by OPERAS is composed of the total number of researchers and PhD students in SSH worldwide, with a core in Europe and America. To undertake a full survey of these communities would be beyond the current resource of OPERAS, and there is excellent existing data: the UNESCO World Social Science Report 2016 provides recent data about the size of these communities, as do other sources (OECD, Eurostat, national statistics).As pointed out in different parts of the document, services provided by OPERAS are also of interest to publishers (especially to academic presses), university and research libraries, as well as, for some aspects, funding organizations. As OPERAS supports citizen science, in particular through its Research for Society platform, non-academic users are also included into the user communities, although this 'socio-economic actors' category is difficult to quantify. The most relevant source that provide the aforementioned figures is indeed UNESCO World Social Science Report 2016, particularly table A3: Researchers by sector of employment and field of science (in headcounts and full-time equivalents), 2014 or latest available year (extracted and uploaded separately): www.worldsocialscience.org/activities/world-social-science-report/2016-report-inequality/. UNESCO Statistics Institute doesn't provide detailed information about the underlying methodology. Figures for libraries rely heavily on data provided by international libraries' associations and by the LibWeb directory (https://www.lib-web.org/). Getting global figures for publishers in the SSH domain turns out to be the most difficult in our context, for outside Core Group countries they are obtained through extrapolation of region- and country-specific data. For funding organizations (including academies) various lists are available online and can be compiled. Percentages of user types are roughly estimated according to current usage profiles of partners' services.

* 6.3 Describe the user strategy agreed within your consortium and the possibilities to develop a reasonably sized user community considering costs and services based on your identification of demands and needs: (maximum 5000 characters with spacing)

Text of 1 to 5000 characters will be accepted

In contrast to other types of infrastructures, a purely quantitative evaluation of the user communities is of low relevance for OPERAS. What matters most, to plan the development of the infrastructure, is not just how many researchers, libraries and academic presses could benefit, but rather the diversity of their practices and organization and how the infrastructure can address this diversity to encompass the entire European user community. That's why, within the OPERAS-D project, a Landscape Study was undertaken between January and June 2017. It consists of a desk review of academic and grey literature to identify and examine existing and emerging practices in OA SSH publishing within the OPERAS network and beyond in Europe. The desk review identified the key stakeholders involved in OA publishing landscape in SSH. This research, outlining recent developments and challenges in the institutional open access publishing landscape, serves as the basis for further work in the OPERAS-D project. It examines the role of various actors, important initiatives taking place in Europe and beyond, and identifies potential issues to be addressed by the OPERAS infrastructure. The desk review was completed by an online survey addressing user needs (see the Design Study). The online survey will be completed in the next stages of development of the infrastructure and expanded continuously as and when new partners and new countries join the project.

One of the aims of OPERAS is to tackle the challenge of multilingual research outputs in SSH. This is another reason to address the user community via a federation rather than by merging. Here again, OPERAS partners are in a strong position to manage their community. The Working Group on multilingualism will help partners to align their strategy on this topic and provide support in documentation and training.

The strategy planned to develop our user community was elaborated through the OPERAS-D project and validated during the Amsterdam Workshop in June 2017.

As a distributed and federative infrastructure, most of OPERAS' services are provided by the partners to their own users. They rely on sharing of know-how, technologies and tools, training, information. The ability of each partner to share their resources with others is evaluated on a case-by-case basis inside projects. The method of sharing has been designed and put into practice in the HIRMEOS project. Following these principles, the growth of the user community will follow logically the growth of partners inside the Consortium and will be managed in a distributed manner: each partner brings in and manages its own users, and can rely on shared services from the infrastructure to do so.

Regarding the integrated platforms, the growth of the user community is defined through their own roadmap, based on different situations:

-Certification Platform: the users of the service are mainly libraries that retrieve information (metadata) from the platform. The costs are fixed and the cost per user is marginal. DOAB has been awarded the Open Access IFLA/Brill Award in 2015. The strategy to build a user community will rely on partnership with library consortia at European level, such as LIBER.

-Discovery Platform: the users of the service are researchers and PhD students that perform search and retrieve information from the platform. Costs are fixed and the user cost is marginal. As the aim of the discovery platform is to index content across several languages aligning national thesauri and ontologies, it will progressively attract users from different countries and linguistic areas.

-Research for Society Platform: the users are research teams using the platform to communicate and manage their project. User costs are expensive in this case.

> The user strategy for this last component of the infrastructure has to be refined and more clearly determined. It will be done within the pilot project during the preparation phase.

* 6.4 Describe how you have involved the above-described (potential) user community in the development of your RI proposal, e.g. in the definition of the scientific case and of the technical design specifications, in analysing costs versus benefits, in planning and funding (parts of) the RI: (maximum 1000 characters with spacing)

Text of 1 to 1000 characters will be accepted

> The user community has been involved at several stages of the preparation of the proposal:
> -Through presentations in conferences and workshops in different countries (such as COASP conference, AEUP conference, ENRESSH workshop, NGM 2017 conference)
> -In OPERAS-D project with an online survey directed towards different types of stakeholders and primarily researchers (see the Design Study for details)
> -By presentations to OpenEdition scientific committee and the High Committee for Large Research Infrastructures of the French Ministry of Research
> -By the different partners of OPERAS who presented the project to their representative to sign a support letter or the MoU in case of the Core Group members.
> -OPERAS-D and HIRMEOS communication Work Packages were also instrumental in involving the user community in the preparation of the proposal.

* 6.5 Upload a table linking quantitatively (in estimated absolute figures as well as %) the above-identified user communities to access units, access modes and funding, i.e. provide a quantitative overview of your business case/delivery strategy: (upload with limit 1 MB)

efc40ce1-cf45-43b2-bd15-5e555c7bcc73/users-access.pdf

* 6.6 Describe the envisaged (common) access policy[1] of your RI in terms of access units, the access mode (-s), the conditions for access, the processes and interactions involved in the access and the support measures facilitating the access: (maximum 5000 characters with spacing)

[1] For more information and support, please consult the `European Charter for Access to Research Infrastructures` at https://ec.europa.eu /research/infrastructures/pdf/2015_charterforaccessto-ris.pdf

Text of 1 to 5000 characters will be accepted

> Access policy: Open access is the general principle of scientific dissemination in OPERAS. The scientific publications hosted by the platforms will nevertheless keep the usual rules of those platforms, to respect the contracts established with scientific publishers. However, the project aims to show how open access leverages scientific excellence to address growth, competitiveness and societal challenges, using its network and communication channels to the stakeholders to increase awareness of how open access is improving research. Overall, the infrastructure guarantees the open access distribution of content, with variations possible in terms of embargo periods, formats and licenses that respect the specific needs of the SSH scholarly community and stakeholders in

scholarly communication (including research funders, libraries, and publishers). The data and metadata will already be accessible via OAI-PMH repositories in most cases.

The objective is to guide and encourage content publishers to distribute content under the most permissive licenses possible, at the very least licenses that provide free and unrestricted access and permit some forms of reuse. Thus, the infrastructure participates in the development of Open Science, which guarantees everyone access to – and free reuse of – data. All metadata will be reusable under an open license and accessed through common catalogues and repositories.

Access mode: within the three modes in the indicated European charter for Access to Research Infrastructure OPERAS will adopt the 'Wide mode'. The wide access mode guarantees the broadest possible access to scientific data and digital services provided by the Research Infrastructure to users wherever they are based. The aim is to maximise availability and visibility of the data and services provided.

Different modes of open access will be served through the infrastructure's platforms depending on funding models. Mainly:

● Full Open Access, mostly with CC licenses (OAPEN, Perspectivia, partly OpenEdition, UGOE, Unito, Unina, Hrcak, MorePress, Knowledge Unlatched, OLH, Ubiquity Press, UCL Press, UC Digitalis) (70%)

● Freemium open access (HTML format open access, PDF and eBook formats licensed to libraries and retail market) (OpenEdition, OBP) (20%)

● delayed Open Access for digital and print publications (OpenEdition, UC Digitalis) (10%)

Delayed Open Access is usually linked to the preservation of classic print dissemination alongside digital dissemination. Full open access with CC licence is usually permitted by full upfront funding. Freemium Open access is a business model used by publishers who want to develop their capacity to publish open access without having substantial upfront funding or wishing not to use an author-pays model.

Access process and interaction: Regarding data production, access to the scholarly communication services provided by partners will be managed by each partner based on the perimeter of their core mission. Different types coexist:

Global services: OAPEN, OpenEdition, Ubiquity Press, OBP, OLH, KU Research, UCL Press, MWS, Huma-Num

Regional and local services: UGOE, MWS, Unito, Unina, ISCTE, EKT, C2DH, Hrcak, MorePress, UC Digitalis, IBL PAN, LingOA, Nova, Roma TrE Press, University of Liège

MWS service Perspectivia is local and global because content contribution to the platform is limited to MWS institutes and their partners but those are localized in different countries worldwide and develop scientific collaboration with local institutions.

Support measures facilitating the access: OPERAS will provide support measures to users such as guidelines for the services implemented by the RI, for example, new methods and tools for annotation, peer reviewing, dissemination of research outcomes and measuring their impact.

Each partner (node) will provide training in its own specialization with important support in terms of funding from the infrastructure.

SECTION 7: PREPARATORY WORK

* 7.1 Describe what type and level of assessment - including successful design and feasibility study (-ies) - your RI already has undergone: (maximum 1000 characters with spacing)

Text of 1 to 1000 characters will be accepted

> The design and feasibility study of the OPERAS RI was achieved in two stages:
> during the Design Phase the partners undertook different studies, prototypes
> and reports to accompany the development of their services. Bilateral projects
> were also achieved, particularly between the coordinator and different partners
> (OAPEN, MWS, ISCTE, Unito) and multilateral through HIRMEOS in particular.
> The second stage of the Design Study will be undertaken collectively within the
> OPERAS-D project (INFRASUPP-3-2016). The project addresses long-term
> requirements for the development of the RI and community building and network
> development. The whole Design Study establishes a roadmap for the OPERAS
> Consortium that includes RI service providers (publishing platforms, libraries)
> and research and education communities (universities and university presses).
> The comprehensive list of the studies realized can be found in the Design Study
> document accompanying the questionnaire.

* 7.2 Elaborate on the prior work that led to this proposal, e.g. the RI is based on an international networking activity like Integrated Infrastructure Initiatives (I3) or other programmes with external international evaluation: (maximum 1000 characters with spacing)

Text of 1 to 1000 characters will be accepted

> In 2015, 16 organisations representing a variety of players in the SSH open
> access publishing ecosystem from six European countries decided to combine
> their efforts to develop a distributed e-infrastructure: OPERAS. By June 2017
> the network was composed of 21 organisations from 10 countries. The Core Group
> is composed of nine partners having signed the MoU and each of them has an
> important international activity. (See http://operas.hypotheses.org/partners)
> There is common participation with relevant EU projects for the topic:
> OpenEdition (OE), EKT, IBL-PAN and UGOE are participating in OpenAIRE 2020 and
> DARIAH.
> There are existing collaborations between OPERAS partners:
> ●   OPERAS-D Consortium : five OPERAS core members
> ●   HIRMEOS Consortium gathers: nine OPERAS members
> ●   Bilateral partnerships:
> O   OpenEdition is partner with Unito, ISCTE, UC Digitalis, OAPEN, MWS,
> AEUP, IBL-PAN
> O   OAPEN is partner with: UGOE, OpenEdition, AEUP, KU

* 7.3 Describe how the implementation of your RI was tested and found feasible and summarise the main findings concerning the implementation from the design (or feasabilty) study report (-s): (maximum 5000 characters with spacing)

Text of 1 to 5000 characters will be accepted

> Implementation of OPERAS, which is essentially an infrastructure that allows
> the actors of the field to share components of their activities, has been

carefully prepared and tested through (1) a long cooperation process between partners, and principally the coordinator on specific projects, as well as permanent cooperation to ensure shared services, (2) with the HIRMEOS project that works as a proof-of-concept regarding cooperation between partners for the common development of tools and services, (3) the operation of the services that form the base from which future OPERAS platforms will be developed, finally (4) the achievement of a Design Study within OPERAS-D project.

1.   Initial cooperations led by the coordinator (OpenEdition)

a.   with OAPEN, for the development of DOAB : this project, which started in 2015, was initiated for implementation of a French language version of DOAB. It continued with the preparation of a new foundation (a Dutch stichting) held on a 50-50 basis by OAPEN and OpenEdition. This first stages of cooperation tested the feasibility of a shared governance on DOAB enabling the platform to be integrated in OPERAS in the near future. This cooperation has been permitted in Diloh (PIA2) project.

b.   with Unito, ISCTE and UC Digitalis, OpenEdition signed MoUs to collaborate on the development of open access in Italy and Portugal. The collaborations resulted in OpenEdition Italia http://openeditionitalia.it and Lusopenedtion http://lusopenedition.org projects. OpenEdition Italia is currently testing interoperability between OJS (a widely used publishing tool in this country) and Lodel (the OpenEdition publishing tool). Lusopenedition is currently defining a permanent collaboration with the Portuguese Ministry of Research and the FCC to ensure international visibility of Portuguese journals as well as technical quality.

c.   with MWS, OpenEdition has been collaborating for four years on the development of the German-speaking research blogging community.

d.   with IBL-PAN, OpenEdition is currently preparing a project to start OpenEdition Poland through transfer of technology and know-how regarding open scholarly communication to Polish partners.

These experiences and projects clearly demonstrate the capacity of the coordinator to achieve different types of collaboration at different levels which are relevant to OPERAS implementation plans. In a way, OPERAS is mostly the scaling and systematization of a partnership strategy that has been tested and implemented by OpenEdition since 2012.

2. HIRMEOS project : this highly technical project, aiming at implementing five added value services on top of five open access book publishing platforms with highly heterogeneous technologies and types of organisation, is a proof-of-concept for OPERAS future projects. It tests the capability of the Consortium to achieve shared R&D projects to develop tools and services, using a common implementation methodology (see HIRMEOS website: http://hirmeos.eu for more details)

3. Platform developments: DOAB, Isidore and Hypotheses have been in existence for years and are widely used by the scientific community. DOAB capacity to scale has been tested and is under development in the HIRMEOS project. Isidore's capacity for multilingual expansion has been successfully tested with English and Spanish languages. Hypotheses' extension to new functionalities in a multilingual context has been tested successfully in the Diloh (PIA2) project.

4. Design Study: the OPERAS-D project covers the feasibility of the implementation of the umbrella infrastructure, namely:

●   Mapping OPERAS technical environment: Creating a full description of technologies used by the Consortium partners for OPERAS. This takes the form of

```
a technical review (softwares, programming languages, metadata and data) of the
framework and content structures used by OPERAS partners. The mapping evidenced
a certain heterogeneity between partners in terms of funding, organization and
size, and even the software used, but based on close technological bases
(information system structurations, software development languages, DBMS).
●       Business Plan and Governance Model :  this consists of three main
elements: a plan for the sustained provision (developing, operating and
sharing) of services; a governance model to ensure the needs of the community
are served, and that it is supported by its members and is responsive to their
changing needs and demands; and the legal framework, including legal
documentation, to establish OPERAS as a legal entity. The construction of
OPERAS' legal entity and operation rules were found feasible on the condition
of a distributed structure coordinated by a strong hub allowing each partner
autonomy to manage its own services but aligning with other partners to adopt
common standards, practises, tools, business models.
```

* 7.4 Concerning the Technical Design Report (TDR), describe if all the relevant technologies are available or if and how much Research and Development (R&D) is needed in order to assess the full technical feasibility and draw a cost-book: (maximum 1000 characters with spacing)

Text of 1 to 1000 characters will be accepted

```
Most technologies are available. R&D is an output of OPERAS infrastructure, not
a condition to its development. The technologies used by the infrastructure are
already used by the partners at local level and, for some of them, already
mature (Lodel, OJS, OMP, Wordpress, ARNO, DSpace, RUA, NERD, Bilbo). The R&D
activities for tools will implement, adapt, integrate and develop
interoperability between existing technologies rather than create new ones.
●       The setup of the tools list is evaluated to 30,000 during Preparation
(P)
●       The development of a toolbox at 375,000 during (P) and 200,000 during
Construction (C)
●       The effort to support the uptake of the technologies by partners is
evaluated at 50,000 during (P) and 130,000 during (C)
●       The training effort to help users implement and effectively use the
toolbox is evaluated to 50,000 during (P) and 270,000 during (C)
```

* 7.5 Describe whether the industrial capacity for the implementation (construction) and operation is already in place (EU or international market) or whether it needs to be developed in relation to your RI, e.g. spin off companies, joint-ventures: (maximum 2000 characters with spacing)

Text of 1 to 2000 characters will be accepted

```
The industrial capacity is already in place and just needs to be coordinated,
which is one of the main aims of the infrastructure. The technologies needed by
OPERAS are developed in-house by the partners (Ubiquity, OpenEdition, for
example) or in partnership with SMEs (OAPEN and SemperTool, Huma-Num and
Antidot for example). Others are simply used by the partners and developed by
strong and sustainable ecosystems of SMEs in the open source software
development field (Wordpress, DSpace). A coordinated strategy regarding the
relationships between partners and their technology providers will be worked
out by the Tools R&D Working Group.
```

7.6 Elaborate on the business case of your RI effectively linking the described scientific case, funding commitments, user strategy, access policy and Cost-Benefit Analysis (CBA) demonstrating the long term sustainability of the operations of your RI and explain whether and how this business case has already been reviewed: (maximum 5000 characters with spacing)

Text of 1 to 5000 characters will be accepted

```
OPERAS is an initiative gathering a large number of scholarly-led partners
across Europe, most of them supported by public universities, particularly
research libraries, with a few exceptions. Most of them can sustain their own
activity but lack resources to upgrade their technical infrastructure and/or
develop new innovative services, or to scale them up. OPERAS will not directly
fund partner activities which should remain supported by the regional or
national communities they serve based on their own CBA. The infrastructure will
support them indirectly by helping them improve the quality of service they
offer through R&D and mutualization projects. OPERAS infrastructure has to fund
its own construction up to its incorporation as an ERIC and then support its
own operational costs for coordination. It is planned that OPERAS operational
costs after Preparation and Construction phases will remain low (1,500,000
annual). The business case for each of the three integrated services will be
independent and self-sustaining.
OPERAS costs can be divided into four parts:
1.Operational costs of the partners
2.Project development costs and Infrastructure construction costs
3.Infrastructure operational costs
4.Integrated services operational costs
1. OPERAS partners operational costs
Each partner will remain independent for its activities funding. A large
majority of partners provide public infrastructure services to their regional
or national scientific community. Their activity is therefore funded
structurally by the public institutions supporting them. A minority of them are
SMEs or not-for-profit independent organizations. The following lists
summarizes the economic model of the Core Group members by name, type,
institution and business model:
●OpenEdition, public (CNRS, University of Aix-Marseille, University of Avignon,
EHESS) Structural funding, freemium revenues, projects funding
●OAPEN, Not-for-Profit foundation (University of Amsterdam, University of
Leiden, University of Utrecht, Netherlands Academy of Science, National Library
of the Netherlands, Amsterdam University Press), Projects funding, https://www.
oapen.org/content/about-annual-report-2015
●Perspectivia, Public foundation (Max Weber Stiftung) Public funding, Projects
funding;
●EKT, Public foundation (National Hellenic Research Foundation) Public funding,
Projects funding
●UCL Press, Public (University College of London (library), Public funding and
commercial revenues
●IBL PAN, Public (Polish Academy of Science) Public funding, Projects funding;
●UC Digitalis, Public (Coimbra University) Public funding, Projects funding
●University of Torino, Public (University of Torino), Public funding, Projects
funding
The economic model of others partners is detailed in the Design Study.
```

```
2. Infrastructure development
Infrastructure development will be funded through projects (SWAFS, INFRAEOSC
and INFRADEV calls) and coordinator funding from French national investment
plan (2019-2026): http://www.gouvernement.fr/pia3-5236 and structural funding.
It is expected that FP8 (H2020) and FP9 EC funding will cover shared services
and R&D projects as well as the development of the integrated platforms.
Coordinator funding will cover the Central Hub costs in terms of labour costs
and physical hosting of the personnel (see siting section). Core Group partners
will support in kind the development of the infrastructure (20%FTE).
3. OPERAS operation business model
After Preparation and Construction phases, the operational costs will be
divided between coordination costs supported by the Member States contributing
to the ERIC, coordinator specific funding (for physical hosting) and the
project funding supported by future EC calls within FP9.
4. OPERAS integrated services operational costs
The operation of the three integrated services will be supported by mixed
funding composed of public funding coming from operators, sponsorship and
commercialization of premium services (freemium model):
The Certification service (DOAB) will be supported by OpenEdition (CNRS and Aix-
Marseille University) and OAPEN joint venture through an independent
foundation. The low operational costs of DOAB will be supported by shareholder
contributions, sponsorship and premium services commercialization.
The Discovery service (Isidore) will be supported by public funding through
Huma-Num infrastructure.
The Research for Society service (Hypotheses) will be supported by public
funding through OpenEdition infrastructure with additional revenues coming from
commercialization of premium services.
More details can be found in the investment plan below as well as in the
accompanying design study. The overall principle that governs the OPERAS
business case is similar to its structuration: modularity. Its sustainability
is ensured by the conjunction of different streams of funding and a diversity
of models used (local funding, structural funding, project funding, commercial
revenues.
```

* 7.7 Describe your strategy for site selection and for siting. If your RI is single-site, explain how the site was or will be chosen. If your RI is distributed, explain how you have (will) select the headquarters and (national) nodes: (maximum 1000 characters with spacing)

Text of 1 to 1000 characters will be accepted

```
OPERAS headquarters will be located in Aix-Marseille University in Marseille,
France where OpenEdition is located. The location was chosen in consideration
of France and Aix-Marseille University investment in the development of the
infrastructure (PIA2 and PIA3) and approved by the Core Group members. Aix-
Marseille University has committed to allocate a 1000 square meter building to
OpenEdition, extending its capacity to enable it to host the OPERAS Central Hub
of eight persons (one will be based in Paris). The location of the National
nodes will depend on the institutions that commit to play a coordination role
at national level (members of the Core Group).
```

* 7.8 Elaborate on the (prior) context of the site (-s) of your RI, e.g. a 'green-field', part of a broader plan of site development (including synergetic initiatives, installation in the premises of pre-existing facilities of similar or different scope) and the 'value' transferred to your new RI in terms of infrastructure, services and human resources: (maximum 1000 characters with spacing)

Text of 1 to 1000 characters will be accepted

```
The OpenEdition site is located in Château-Gombert Technopôle, in Marseille. It
is one of the privileged areas of economic development in the Aix-Marseille
Provence area. It lies at the crossroads of the economic world and the
university resources in the Etoile cluster, which includes the Saint-Jérôme and
Château-Gombert campuses: 180 hectares, 380,000 sqm built-up usable space,
including 196,000 sq m dedicated to economic and academic activities, 170
businesses including over 50 start-ups, 4,016 private and public jobs,
including 660 teaching researchers,2,600 students, 2 engineering Grandes
Ecoles: Centrale Marseille and Polytech Marseille, 8 public research
laboratories,15 technology platforms,2 departments from the Science Training
and Research Units of Aix-Marseille University: 1 interuniversity incubator,1
European Business and Innovation Centre (CEEI) with two business incubators: 1
Carnot Institute: Carnot STAR Institute,1 FabLab, 3 private computer science
schools
```

SECTION 8: PLANNING

* 8.1. Describe the detailed planning for your RI as approved within the consortium complementing the timeline provided in PART A by specifying all phases, Work Breakdown Structure (WBS), deliverables and milestones, including investments decisions and possible updates and decommissioning: (maximum 5000 characters with spacing)

Text of 1 to 5000 characters will be accepted

```
The life cycle of OPERAS is composed of four phases: design, preparation,
construction and implementation and four transversal components : 1. Core
infrastructure, 2. Shared services, 3. EOSC Integration, 4. Platforms, which
are structured in Work packages and tasks. (cf. WBS)
1.  Design phase : 2015 – 2017 (OPERAS-D and HIRMEOS projects)
1.1 Consortium building
In 2012 the coordinator OpenEdition received a grant of 7 million euros from
the French government to develop its platforms, a business model adapted to OA
(freemium) and to internationalize its services. This preparatory phase allowed
it to prepare the OPERAS Consortium in 2015 and two H2020 projects in 2016. In
2016 the Core Group was constituted. Several meeting have been organized. Seven
Working Groups have been established on the following topics: communication,
tools, standards, business models, best practices, multilingualism, platforms.
The Working Groups will deliver white papers in the second semester of 2017. An
MOU has been prepared with nine OPERAS members.
1.2 Design study
– Design phase is achieved within the OPERAS-D project founded by INFRASUPP-03-
2016. OPERAS-D started on 1 January 2017 and will last for 18 months. The
project addresses long-term requirements for the development of the
infrastructure and community building. More information: http://operas.
hypotheses.org/operas-d
```

– OPERAS Consortium obtained in 2016 an RIA project to E-INFRA-2016 call: HIRMEOS that stands as a prototype for the development of future services. (Cf. components: two Shared services and three EOSC integration projects) HIRMEOS improves five important publishing platforms for OA monographs in the SSH and enhances their technical capacities and services, rendering technologies and content interoperable and embedding them fully into the EOSC through common adoption of PIDs. (Design phase of component three: EOSC integration) HIRMEOS prototypes innovative services for monographs in view of full integration in the EOSC. More information: http://www.hirmeos.eu/
1.3 HIRMEOS is dedicated to development of DOAB as the OPERAS certification service.
Deliverables : 1.1 Design study, 1.2 Working Group white papers, 1.3 DOAB deliverables.
2. Preparation phase: 2018 – 2021 (supported by HIRMEOS, INFRAEOSC and INFRADEV projects)
The preparation phase will be supported by HIRMEOS, INFRAEOSC and INFRADEV projects and workforce commitment from coordinator and Core Group members.
●Core infrastructure
National nodes will be formally constituted and transitional association will be created. A legal study will be provided in May 2018 within the OPERAS-D project. Management and logistical work will be structured and implemented (within INFRADEV calls).
●Shared services
R&D tools will be developed (2.1). for example, OJS/Lodel together with a publishing tools catalogue and a publishing toolbox.
OPERAs Consortium will adopt best practices guidelines (2.2) on Shared services. Business models for OA (2.3) will be tested within a journal flipping mechanism, OA market place and library based BM.
●EOSC integration
In 2018 and 2019, the HIRMEOS project will implement other added-value services to the OA books platforms: indexing enrichments through named entities recognition, open annotation and usage and alternative metrics and a list of standards to be implemented by the partners to prepare global interoperability between them and with other EOSC infrastructures.
●Platforms
Development of three platforms: Certification, Discovery and Research for Society service. The certification platform will be implemented through the development phase of the DOAB platform. The discovery platform is based on Isidore. The aim is to allow Isidore to harvest content from as many content providers as possible in the Consortium and to allow the service to manage multilingualism.The project will be lead by Huma-Num infrastructure and submitted within INFRAEOSC 02 call – 2019 Prototyping new innovative services. The Research for Society platform is based on Hypotheses.org and will be developed within a SWAFS-15: Exploring and supporting citizen science. The project will add collaborative functionalities to the platform, better ability to manage multilingualism as well as improvement in interoperability with data repositories.
3. Construction phase: 2022 – 2026 (supported by INFRADEV project)
●Core infrastructure
OPERAS will be incorporated as an ERIC and the association will be terminated. Special Interest Groups will be established.

```
●Shared services
Mutualized training services and a publishing toolbox will be set up. The
partners will be supported to implement the standards listed during the
Preparation phase and in their adoption of best practices.
●EOSC Integration
Within the SSH output integration, multilingualism will be further supported
with a large translation programme.
●Platforms
Production of the third integrated service based on Hypotheses platf

* 8.2 If available, upload a visual illustration of your planning: (upload with limit 1 MB)

cbf44c7a-8422-4b37-b5f6-5dd87d8f27ec/OPERAS-WBS-GANTT.pdf

* 8.3 If you intend to apply for a Preparatory Phase under Horizon 2020, define what the main objectives and deliverables of such a project will be and what aspects of readiness-to-implement will be within its 2-3 years reach. If you do not intend to apply for a Preparatory Phase under Horizon 2020, explain why not: (maximum 1000 characters with spacing)

Text of 1 to 1000 characters will be accepted

```
Future INFRADEV Project:
1. Project management, reporting structure and logistical work
Planning of staff recruitment; organisation of the logistic support.
Deliverable (D): Project operational plans
2. Legal framework, governance, business model
Legal work for the setting-up and operation; agreements. Based on initial legal
study of OPERAS-D
D: Final legal study and establishment of the first legal entity
- Governance work: plans for decision-making, management structure
- Financial work, for the construction, operation and decommission of the
facility, new mechanisms for financing solutions; business model
D: Finalization of the initial governance and business plan, update of the cost
model.
3. Strategic work
Analysis of the socio-economic impact of RI
D : report on socio-economic impact
4.Technical work
Plans for development of demonstrators and prototypes and to develop the
business model of OA publications
D : prototype of 'market place' for OA business models
```

* 8.4 Explain how your RI will reach the firm decisions for implementation by the involved stakeholders and the financial commitment by a critical mass consortium within the permanence time on the ESFRI Roadmap, i.e. maximally ten years: (maximum 1000 characters with spacing)

Text of 1 to 1000 characters will be accepted

```
The decision for implementation will be reached at three levels:
●Core Group (CG) (will transform into Executive Assembly in AISBL):
representing institutions committing funding and support to OPERAS
```

```
infrastructure
●Scientific Advisory Board (SAB): representing the user community across Europe
(to be constituted during Preparation phase)
●Steering Committee (SC) (will transform into General Assembly in AISBL):
representing countries of the Core Group institutions (to be constituted during
Construction phase)
Currently, nine countries are represented in the CG. It is planned that at
least 10 will participate in the CG and SC at the end of Construction phase.
Decision for implementation will be taken in 2024 by a vote of the three
Committees. The prospective Member States represented in the General Assembly
and the consortium members in the Executive Assembly will decide prior to
implementation the level of financial commitment needed to trigger the creation
of the ERIC.
```

SECTION 9: GOVERNANCE AND MANAGEMENT

* 9.1 Describe the project organisation for the preparation - and if able for the implementation - of your RI as approved within your consortium with clearly defined skills, responsibilities and reporting lines: (maximum 1000 characters with spacing)

Text of 1 to 1000 characters will be accepted

```
Management Office (MO): undertakes daily work
Core Group (CG):  oversees tasks, takes major decisions and supports MO
Steering Committee (SC): representatives of the supporting countries. Monitors
the implementation and coherence of the project. SC approves annual budgets and
work plans. Representative of the coordinating country chairs SC
Scientific Advisory Board (SAB): responsible for independent scientific
monitoring. SAB nominated by CG and appointed by SC. SAB elects  chair, who
attends CG meetings. SAB reviews annual work plans ahead of SC, and gives
advice on scientific matters to CG.
Working Groups (WG), gather partners with key area interests, led by a
representative of CG and consisting of representatives of partners
OPERAS aims to set up as a legal entity to prepare the ERIC as the final legal
structure. The preferred interim legal entity is an AISBL, organised to mirror
as far as possible the final ERIC.
For the next stage of the AISBL, see the Design Study.
```

* 9.2 Upload an organisation chart of the project organisation for the preparation: (upload with limit 1 MB)
51baf189-1a3c-4164-b927-52a14a2c641d/preparation-organization-chart.pdf

* 9.3 Outline the (final) governance for operation with clearly defined responsibilities and reporting lines, including all bodies, senior managers, Supervisory and other Advisory Boards such as a Ethical Board - if appropriate: (maximum 2000 characters with spacing)

Text of 1 to 2000 characters will be accepted

```
The governance model will be a continuation of the transitional model. However,
the governance will be established within an ERIC. The model will consist of a
```

```
General Assembly (representatives from member states) (GA); a Management Office
(Director, Coordinator and management team) (MO); an Executive Assembly
(Director, Coordinator, Representatives of the National nodes, Chair of the
Scientific Advisory Board, Coordinators of the Central Platforms) (EA);
Stakeholder Committees; Special Interest Groups.
GA appoints the Director and approves annual work plans and budgets. Strategic
decisions are made by the Executive Assembly. The EA is responsible for annual
work plans and budgets. The Director chairs the EA.
National nodes are members of the EA and can chair Special Interest Groups and
/or Stakeholder Committees. They are appointed as chair by the EA. They
represent OPERAS partners within their country and have a role in coordinating
activities for OPERAS within their country.
Stakeholder Committees coordinate key partners across Europe. EA members will
join the SC that represents their institution.
Special Interest Groups (SIG) are working groups for key subject areas that can
have a temporary or more permanent status. They are installed by the Executive
Assembly and can submit resolutions or propose actions to the EA. SIGs are open
to any interested party, and parties can propose a SIG or respond to a call
from OPERAS on a specific subject.
The Scientific Advisory Board (SAB) is consulted by the Executive Assembly on
strategic decisions and for evaluating specific projects. The SAB monitors
OPERAS on scientific matters and can propose actions to the EA. The SAB is
consulted about annual work plans and budgets ahead of the GA meeting. In
addition to the governance structure, OPERAS will set up a network of National
contact points for communication and coordination purposes. National contact
points will be invited to attend meetings of the EA as observer.
```

* 9.4 Elaborate on the chosen or preferred legal structure, how you intend to implement it with particular attention to the transition from the project organisation to the (final) governance: (maximum 1000 characters with spacing)

Text of 1 to 1000 characters will be accepted

```
The final structure will be an ERIC as the standard legal structure of ESFRI
infrastructures and an effective instrument to ensure involvement of the member
states. The transition towards ERIC will be managed through a transition
association combining legal structuration, flexibility and agility in terms of
governance. The methodology here is to transition smoothly from the natural
flat and ad hoc structuration that emerged during the design phase from
cooperation between partners to the complex and rigid structuration requested
by an ERIC. The transition structure will then have to reflect the initial
structuration and prepare for the ERIC by adopting stricter governing lines and
attributing clearer lines of responsibility. Its main aim will be to
differentiate power attribution to partners according to their commitment and,
progressively, the implication of their country, keeping an open structure to
new and international partners that allows them to commit progressively.
```

* 9.5 Describe the managerial skills and competences – other than scientific - needed for the preparation, implementation (construction), operation and termination of your RI and how you will recruit them: (maximum 1000 characters with spacing)

Text of 1 to 1000 characters will be accepted

```
The management of the project will continue to be ensured by OpenEdition. The
four key positions in the current project management team and the future
Management Office will be the Director (decision-making), the Coordinator
(community management), the Project Manager (EU project management), the
Technical Coordinator (technical), complementing each other. The four key
positions are already recruited and have been working together for years within
OpenEdition. Three of them hold permanent position (public servants) in
OpenEdition's main supporting organizations (CNRS, EHESS, Aix-Marseille
University), which guarantees stability in the Office,  and that they can be
easily replaced in case of accident.
Profiles:

```

* 9.7 Describe your plans for the independent scientific monitoring and evaluation of your RI when in operation: (maximum 1000 characters with spacing)

Text of 1 to 1000 characters will be accepted

```
Independent scientific monitoring is done through the Scientific Advisory
Board. Members of the board will be asked to provide a review of the projects,
based on their interest for the scientific community. Each year, the
Coordinator of the infrastructure will prepare a report on the activities of
the infrastructure during the past year. The report will be presented to the
three committees of the infrastructure among which is the Scientific Advisory
Board. The same way, a roadmap for the year to come will be presented to the
three instances altogether which has to be formally approved. A special
attention will be given to obtain disciplines, gender, nationality and
languages balance with the Scientific Committee to reflect the diversity of the
scientific community the infrastructure serves.
```

SECTION 10: HUMAN RESOURCES POLICY

* 10.1 Describe how your RI will help European scientific communities' mobility and internationalisation, i. e. link your access policy - particularly the excellence-driven access mode - to your (scientific) human resources policy: (maximum 2000 characters with spacing)

Text of 1 to 2000 characters will be accepted

```
Creating an international pan-European infrastructure for open scholarly
communication facilitates research internationalization.
Scientific production in the SSH still has little presence online. By providing
online access to research carried out in individual countries in any national
language, OPERAS can maximise the visibility of scientific outputs at European
and international level. The circulation of such studies can create a wider
international interest in specific subjects, or can develop a more
interdisciplinary approach which can bring new, international partnerships. The
key partners already work on an international level outside Europe. OpenEdition
(OE) has collaborations with several publishers in Canada and South America. OE
is the first European partner of PKP on content management software tools (for
example OJS).Other key partners such as OAPEN and OE are active partners in
OASPA a society which acts on an international level with OA publishers for
journals and books. Moreover, networking is developed by other partners (for
example Knowledge Unlatched) with the Association of American University
Presses, the Library Publishing Coalition and with OASPA, SPARC, Scielo and
```

Redalyc (OE). AEUP participates in the International Convention of University Presses. It represents the European network within this new international academic publisher network for SSH. The goal is to create an international synergy for the maintenance of values for publishers around assessment, international standardized procedures for editing, and digital distribution of documents in order to increase their visibility.

In OPERAS the international span and OA will be guaranteed by scientific excellence developed through quality assessment criteria such as those established in DOAB, for peer review and other selection criteria. The final aim is to provide a quality label at European level for SSH publications. This work will be done in cooperation with the ENRESSH project..

* 10.2 Describe the approved staffing plan for the preparation - and if able for the implementation (construction) - of your RI, i.e. the skills and competences needed and how they will be recruited: (maximum 2000 characters with spacing)

Text of 1 to 2000 characters will be accepted

The lead partner OpenEdition will manage the procedure for gathering the necessary competences and the staff hiring.

1 Director, 1 Coordinator, 1 Chief Technical Officer, 1 Chief Administrative Officer and 1 Communication Officer, and 4 European Project Officers with respective skills and competences are planned to be part of the OPERAS Management Office.

The Director, Coordinator, Chief Technical Officer and one of the four European Project Officers are already recruited. The others will be recruited via coordinator funding. the Chief Administrative Officer will have to coordinate administratively with Aix-Marseille University as host of the hub. Therefore this position will be filled within OpenEdition administrative department (currently four persons). The three remaining Project Officers will be monitored by the current Project Manager. They will have complementary specialisations, such as fund raising, community management, projects design and complementary linguistic competences (currently in the team: english, french, german, italian, spanish, slovenian).

The staff other than permanent will be hired within a two-step procedure. The job vacancies will be diffused through public announcements and within the European channel. The initial jury composed of the Coordinator with an external expert will establish a short list. After a first selection, a second interview will be held with all partners' representatives of the Core Group.

These procedures will be finalized during the Preparatory phase but will be compliant with OpenEdition's and its supporting organizations' regular recruitment procedures.

* 10.3 Outline the human resources policy for the operation of your RI, i.e. skills and competences needed, hiring, equal opportunities, secondments, education and training of staff and users: (maximum 2000 characters with spacing)

Text of 1 to 2000 characters will be accepted

As the staff will be recruited by Aix-Marseille University, HR policy will be governed by the policy of the University.Explicit criterion will be established for hiring, guaranteeing equal opportunities and transparency, for the

```
description of the job position, the selection of candidates, the level of
remuneration, the employment contracts. The roles will be structured to meet
specific needs. The job vacancies will be advertised and disseminated on
European channels.Specific support will be implemented for staff career paths.
Successful integration of the new recruits will be ensured by the line manager
on arrival. An initial meeting and one annual evaluation interview will be
established. The recruit will benefit from the supports of social action and
preventive medicine services.The staff will benefit from vocational trainings
and education opportunities. A training programme and plan will be structured.
The training needs will be analysed during the initial
interview with the line manager. Staff will be also encouraged to follow the
required training to improve and update their skills related to the job
position, participate in international conferences and undertake secondments or
short work placements with other partners to learn new skills.For user
training: Information and support for all user group will be created and
translated into several languages.Basic information, such as manuals, user
guides and FAQs will be made available to all user groups.Workshops around
linked topics will be organized with local partners as well as 'on the spot'
training with other services that will be provided.
OPERAS will coordinate access to training at a pan-European level, provide
joint training if needed, share best practices and mutualise the training
level. Open calls will be organized in coordination with other European
programs.A virtual agenda for several OA publishing trainings will be created.
At least 25 training events per year will be delivered.
```

SECTION 11: FINANCES

* 11.1 Complementing the estimated costs as provided under PART A, describe the top-level breakdown
of cost elements with overall order of magnitude estimates for all phases, including – in case of a
distributed RI - for Central Hub, National Nodes and main upgrades. Please indicate the confidence levels
of your estimates for each element. Please indicate if they are based on suppliers' quotations. (maximum
4000 characters with spacing)

Text of 1 to 4000 characters will be accepted

```
Note 1 : Design Phase: (D); Preparation Phase: (P); Construction Phase: (C).
All costs in €
Note 2: most of costs in salaries. Other costs: IT hardware, offices occupation
are marginal and supported by the partners in their offices. Specific costs are
specified when applicable in the description below.
The cost structuration of OPERAS development is divided into four main elements:
1.Core infrastructure: all management functions of the infrastructure
2.Shared services: services to support partners to improve and upgrade their
own activities
3.EOSC Integration: developments needed to integrate content into EOSC
4.Platforms: three pan-European platforms

1.Core Infrastructure (5,600,000)
a.Design study (400,000): achieved (D). Costs covered by OPERAS-D project
b.Consortium building (1,300,000): partners' time to participate in the
Consortium groups : unstructured (D), in Working Groups and projects
```

preparation (P), in Special Interest Groups (C). Calculated in in-kind contribution model (0.1FTE per partner)

c.Governance and Legal Framework (920,000) : constitution of the Core Group (D) (calculated by in-kind contributions from members, 0.2FTE per partner), continuing in (P) and (C). Legal consulting costs will be added in (P) for preparation of AISBL and in (C) for preparation of ERIC

d.Management and logistical work (3,000,000) : Personnel costs in all phases (2FTE in (D), 8 in (P) and (C). Siting costs not declared as part of OpenEdition offices and included in personnel salaries

2.Shared services (4,792,000)

a.Tools Research and Development (1,370,000) : POC achieved through HIRMEOS project (D). Development of toolbox (P) and supporting documentation and training (C) in salaries, printing, distribution and travel costs, marginally

b.Best Practises (400,000): consulting cost (P) to set up guidelines and a fund will be attributed through annual tender calls to partners in (P) and (C) to enable them to reconfigure their workflow in accordance

c.Business Models (3,000,000): three modules have done design studies during (D) but costs partially available. Journal flipping development in (P) and (C) phased by discipline. Costs mainly to cover APCs during transition phases and support management and marketing activities (salaries). Development of market place and library based business model in (P) will entail IT development, management and marketing costs in salaries and subcontracting. Development of three modules will be supported during Transition period during (P) and/or (C) depending on the case, but will be self-sustainable afterwards

3.EOSC integration (4,470,000)

a.Books integration (1,220,000): costs supported by HIRMEOS project (D) and (P) (IT developments)

b.SSH output integration (3,250,000): will be done first through constitution of standards list (P) (consulting costs) and implementation on partners platforms (C) (IT development); then by the integration of the Discovery Platform into EOSC (P) (IT development). Specific action on multilingualism will develop in two parts: first through alignment of ontologies on Discovery Platform during (P), then through fund distributed to partners to support metadata translation through annual tender calls (C)

4.Platforms (5,340,000)

a.Certification Platform (1,030,000) development costs in (D) and (P) covered by HIRMEOS project. Operating costs (P) and (C) in subcontracting for hosting, salaries for management

b.Discovery Platform (2,680,000): mainly salaries (P) for development of the platform in IT, management, Information Science, communication

c.Research for Society Platform (1,700,000) : rough estimations in (P) and (C)

Annual Operating Costs (1,580,000)

1.Core Infrastructure (750,000): eight full-time salaries, travel costs and participation of partners in OPERAS working groups and Core Group, through in-kind contribution

2.Integration projects (500,000): recurring funding to support small projects

3.Platforms (330,000): hosting costs and pl

* 11.2 Please upload your cost models and cost-book analysis, if available: (upload with limit 1 MB)

a9edeea1-edd6-4887-a52b-e4d8a921f701/Operas-Costs.pdf

* 11.3 Describe the essence of your investment plan – in terms of current level of financial commitments, the (conditional) intentions to (co-) fund the implementation (construction) costs and access, site-premium and kind of formal investment commitments (in cash and/or in-kind), the plans to fund operating costs - and to what (sub-) set of stakeholders you have presented your investment plan: (maximum 2000 characters with spacing)

Text of 1 to 2000 characters will be accepted

```
Investment plan relies on different levels of funding:
●Important from OpenEdition to operate Central Hub (coordination staff) funded
by (PIA 2 and 3)
●Moderate contribution in-kind from partners depending on their level of
commitment (Core Group or partners in Working Groups)
●FP8-9 to develop services and platforms
Consortium Building costs covered through in-kind from partners: 0.1FTE
/partner, 0.2FTE/Core Group partner. OPERAS-D project (2017-18, 400,000 euros)
provides additional support.
Hub funded by OpenEdition. In (D) PMT was composed of three persons. Growth of
PMT up to eight in (P) and (C) will be funded through the highly strategic
French investment programme 'Programme Investissements d'Avenir' stage 2 (PIA2)
(2012-2017: 7,000,000) and stage 3 (2019-2029) (PIA3): 18,000,000).
Hosting of the Hub ensured in OpenEdition premises at Aix-Marseille University
(1000 sq. meters) from Sept. 2017.
Development of OPERAS activities will be funded through H2020 and FP9 projects:
●HIRMEOS (2017-19) : 2,000,000 for Shared Services and EOSC Integration
activities.
●SwafS-15-2018-2019 (2018-21): 2,000,000 for Research for Society prototype
●INFRAEOSC-02-2019 (2019-23): 6,000,000 for EOSC Integration and Discovery
Platform development.
●INFRADEV-02-2019-2020: (2019-23): 4,000,000 for development of Shared Services
and Certification Platform in (P) and first year of (C)
●Second INFRADEV in FP9 (2024-28): 4,000,000 for all dimensions of (C).
INFRADEV funding in (C) will prepare ERIC and support its operation in the
first two years
Funding Plan has been approved by Core Group committed through MoU and
presented to all partners during OPERAS workshop on 07/27/2017.
Funding Plan has been approved by French Ministry committees (HC TGIR and CD
TGIR) in May and June 2017.
Part already committed: OPERAS-D, HIRMEOS, PIA2, in-kind contributions
Part of funding to be confirmed: PIA3, SwafS-15-2018-2019, INFRAEOSC-02-2019,
INFRADEV-02-2019-2020, Second INFRADEV
```

* 11.4 Indicate whether you intend to apply for loans of the European Investment Bank (EIB) - or equivalent national credit systems - and use the Access to risk finance under Horizon 2020: (maximum 3000 characters with spacing)

Text of 1 to 3000 characters will be accepted

```
No
```

* 11.5 Indicate whether your RI is going to replace existing RI that will become obsolete, how you will ensure that funding and users from the obsolescent infrastructure (-s) are transfered to the new one and what political steps are needed to ensure this: (maximum 2000 characters with spacing)

Text of 1 to 2000 characters will be accepted

> There will be no replacement, but rather making existing infrastructures interoperable and sustainable. Globally, OPERAS project aims at upgrading existing infrastructures whether they are supported through national funding schemes (OpenEdition, EKT, Perspectivia, Hrcak, UC Digitalis) or not (Ubiquity Press, OAPEN).

SECTION 12: RISKS

* 12.1 Describe the scientific developments or competing projects elsewhere that could affect the research outputs expected from your RI: (maximum 1000 characters with spacing)

Text of 1 to 1000 characters will be accepted

> There is the risk of similar infrastructural projects, primarily in the USA, creating critical mass in English language, thereby attracting a large portion of European research output. JSTOR for ex. has a large power of attraction for European researchers. The risk for the academic production of Europe is to be cherry-picked by such players according to the interests of the American market and captured behind paywalls.
> More generally, the dominant commercial publishers extend their reach by vertical integration between services (evaluation, publication, distribution, discovery, metrics), providing all-in-one platforms to the scientific community. This is a risk of dependence on major commercial players acting as research infrastructures. One of the fundamental principles of OPERAS is to provide an open and distributed infrastructure on which a diversity of players, commercial and public, small and medium size, can provide services in a fair and undistorted competing environment.

* 12.2 Identify the scientific, technological, political and financial risks that your RI could face in the different phases and describe your mitigation strategies to tackle them: (maximum 3000 characters with spacing)

Text of 1 to 3000 characters will be accepted

> As the Design phase is completed we are not including it in the risk mitigation strategy.
> Preparation phase
> Scientific risk: OSPP ignorance of SSH (few representatives) for the development of EOSC. Mitigation: Stronger cooperation with other ESFRI infrastructures and OpenAIRE. Strong communication policy towards OSPP.
> No further uptake in the scientific community. Mitigation: redesign working groups and refine definition of services provided. Deeper engagement with Scientific Advisory Board and new usage survey to correct services development trajectory to be prepared in construction phase.
> Technical risk: Inability to determine standards between partners. Mitigation: Strong inclusion policy and flexibility to reach minimal consensus.

Inability to develop fully the certification and discovery platforms due to unexpected technical problems. Mitigation: roll back projects to existing platforms and prepare for iterative developments on existing platforms.
Political risk: Hard Brexit (no agreement on ERA). Consequences: on data hosting outside EU privacy data protection regulation, on allocation of EU funding to UK partners. Mitigation: Inclusion of UK partners as international partners, request to UK partners to host data in EU country (Ireland). Help to UK partners to move headquarters to EU country.
Financial risk: No PIA 3, no INFRAEOSC. Mitigation: Reduction of Central Hub to current staff of 3FTE, slow development of Discovery service through voluntary cooperation
Construction phase
Scientific risk: Strong changes in SSH researchers' communication practices. Mitigation: Constant watch, particularly through the continuous usage survey and adaptation strategy discussed in the consortium. As a small and agile infrastructure, OPERAS can reorient the development of its services quickly and adapt to new contexts.
Technical risk: Partners' lack of ability to implement standards and innovative publication practices. Mitigation: Redirection of funding from integrated services to local services support.
Difficulty to fully develop Research for Society platform due to unexpected technical problems. Mitigation: roll back project to existing blogging platform and prepare for iterative developments on existing platform.
Political risk: Other exits. Disintegration of ERA. Mitigation: Reorientation of OPERAS as international consortium. Changes in the governance scheme.
Financial risk: No commitment from Member States. Mitigation: Concentrate OPERAS activities on projects rather than coordination. The contribution principles of partners by in-kind is very robust and makes OPERAS flexible to adapt to financial drawbacks.
In general, and for preparation and construction phases, the risks will be defined more precisely and addressed properly through mitigation measures in grant agreements of H2020 and FP9 projects.

* 12.3 Describe the risks that could delay, increase costs of or make the realisation of your RI impossible (maximum 1000 characters with spacing)

Text of 1 to 1000 characters will be accepted

The main risk is that OPERAS does not achieve convergence of infrastructural services, due to diverging strategies of partners (i.e. non-compliance to technical standards) and in the context of diverging national policies in a dynamic and rapidly changing environment. That's why we need a strong signal from ESFRI to encourage the partners to work together and on a converging path. It could take the form of categorization of OPERAS as 'emerging' infrastructure if its maturity is not evaluated to be 'feasible' immediately. It would at least provide incentives to the partners to continue their effort and apply for an INFRADEV call to continue the development of the project to greater maturity. ESFRI Roadmap is long-term process: this is a risk because scholarly communication and open access publishing are dynamic areas, requiring an adaptive and flexible approach to be successful. OPERAS will reduce the development time of services and make use of existing services from partners.

12.4 If available, upload a technical options analysis: (upload with limit 1 MB)

QUESTIONS

QUESTION
computing power & EOSC

A Which is an approximate evaluation of the Computing Power that is/will be needed to provide the services?

B How will this resource be available and who will provide it?

C Does OPERAS have an evaluation of the use of private (OPERAS partners) resources and/or commercial Clouds? Please define the strategy for the possible integration with EOSC.

1

1A

OPERAS
COMPUTING
POWER
NEEDS

Users	Researchers, Libraries, Publishers, Funders, Socioeconomic actors
Services and Usages	Applications and services
Platforms	Softwares, data processing
Digital Infrastructures	Systems and networks, computing, storage
Hosting Infrastuctures	Real estate, energy, air conditionning, networks, security
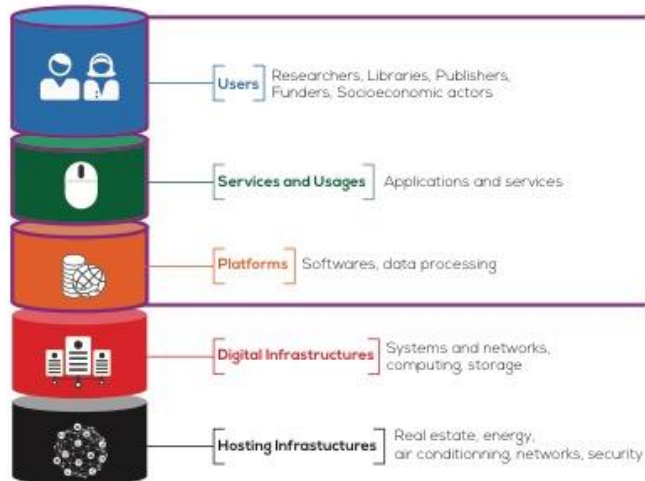

Most of its services are close to users

Most of the OPERAS efforts rely on high or mid levels of services

The low level services are today mostly provided by national data centers

15

1A

OPERAS
COMPUTING
POWER
IN 2018

The needed computing power is relatively small

	Number
U	80
Cores (nb)	1000
RAM (GB)	5300

National nodes and central platforms

16

1B DETAIL OF COMPUTING POWER

PARTNER	OPENEDITION	Huma-Num (Isidore)	EKT	Ubiquity Press	MWS	Unito	OAPEN	OAPEN (DOAB)	Univ. Coimbra	Univ. Zadar	IBL PAN	UCL press
CPU cores	724	192	72	31	12	12	4	4	6	4	OpenEdition	OAPEN

17

1B EVOLUTION OF COMPUTING POWER NEEDS

Computing power needs (CPU cores)

18

1C
EOSC
INTEGRATION
STRATEGY

OPERAS :

a single SSH access point to EOSC

◆ **Most members already connected:**
  - ↘ National research and education network (GEANT)
  - ↘ National data center or universities data centers. Example : France, CC CNRS-IN2P3 (EGI, EOSCpilot, PRACE)

◆ **Cooperation with DARIAH : CLARIN, ESS, SHARE and CESSDA :**
  - ↘ In INFRAEOSC-4-2018
  - ↘ In continuation of HIRMEOS and Humanities at Scale projects

◆ **Central platforms will contribute to EOSC for:**
  - ↘ Interconnection with EOSC hub
  - ↘ Data storage
  - ↘ Computing services

19
QUESTION
storage and preservation

2

A Which is/will be the amount of storage needed for all the objects (i.e. DB, documents, Books, Multi-media, etc.)?

B How will this resource be available and who will provide it?

C Is the long-term data preservation organised to take into account also disaster recovery? How is this tackled by the OPERAS?

2

OPERAS STORAGE IN 2018

2A

- ◆ **Storage :**
  - ↘ DBMS : 2,2TB (including central platforms and core members)
  - ↘ Mostly texts : videos hosting by dedicated platforms outside OPERAS
  - ↘ Total storage : 580TB

2A DETAIL OF STORAGE

PARTNER	Huma-Num (Isidore)	EKT	IBL PAN	MWS	Open Edition	OAPEN	OAPEN (DOAB)	Ubiquity Press	UCL press	Univ. Coimbra	University of Turin	Univ. Zadar

QUESTION
choice of platforms

3

OPERAS builds on three existing platforms, DOAB, Isidore, and Hypotheses. What is the reasoning for including these particular three platforms rather than other existing platforms (e.g. OpenAire)?

3

OPERAS
Platforms

3 World leaders

That address the needs of the different stakeholders of the academic community

27

3 Certification

28

Design Study

3 Discovery

	2011	2012	2013	2014	2015	2016
Unique users	440 000	564 888	618 722	825 273	1 033 588	1 085 331
Harvested repositories	1 255	1 932	2 259	2 384	3 559	4 181

Isidore aligns metadata with controlled vocabularies in European languages

3 Research for Society

hypotheses
ACADEMIC BLOGS

Hypotheses 2500 blogs

Brings 20 000 researchers to OPERAS

Two new applications per day coming from researchers

WHY OPERAS PLATFORMS ?

The three identified platforms answer the needs of the stakeholders outside the consortium

Name	Area	Target	Identified needs	Service
OpenAIRE	All	Policy makers	Open Access monitoring + advocacy + training	**Harvesting**, indexing
OPERAS doab				
OPERAS isidore				
OPERAS hypotheses				

3 WHY OPERAS PLATFORMS ?

The three identified platforms answer the needs of the stakeholders outside the consortium

Name	Area	Target	Identified needs	Service
OpenAIRE	All	Policy makers	Open Access monitoring + advocacy + training	**Harvesting**, indexing
OPERAS doab	SSH	Researchers Funders Libraries	Quality assurance Monitoring	**Certification** of scientific quality
OPERAS isidore				
OPERAS hypotheses ACADEMIC BLOG				

35

3 WHY OPERAS PLATFORMS ?

DARIAH + OPERAS

Towards Semantic Enrichment of Newspapers: A Historical Ecology Use Case

DECEMBER 12, 2017

Introduction: Ecologists are much aided by historical sources of information on human-animal interaction. But how does one cope with the plethora of different descriptions for the same animal in the historic record? A Dutch research group reports on how to aggregate 'Bunzings', 'Ullingen', and 'Eierdieven' ('Egg-thieves') into a useful historical ecology knowledge base.

Zur Epistemologie digitaler Methoden in den Geisteswissenschaften

DECEMBER 12, 2017

Introduction: What is the precise impact of digital humanities on the humanities in general? That this influence exists seems a given, but how the digital humanities impact humanities methodology en epistemology is still an open question. This article delves deeper into this problem of epistemology and presents a model of five 'polarities' along which these influences can be positioned.

QUESTION
user needs and access policy

7

A Provide more clarity around user's needs. Please provide an overview of the user engagement plan.

B What is the common access policy going to look like? Please detail access strategies for each stakeholder community.

7A USER NEEDS

7A USERS ENGAGEMENT PLAN

◆ **Experience**

↘ Long standing experience of most partners to engage with users : OpenEdition (1999), HRČAK (2006), Huma-Num (2006), Perspectivia (2007), OAPEN (2008)...

◆ **Commitment**

↘ 1 Project Manager specialized on users' engagement.

↘ Continuous feedback collecting process through surveys extending the design study

↘ Involvement of research communities via social web tools

◆ **Hub support to national nodes outreach activities**

↘ Projects facilitation and support

↘ Educational workshops and testing for users feedbacks

61

7B ACCESS STRATEGY TO READ

Read access : towards Open Science for all (EU13)

70% Full Open Access, mostly with CC licenses

20% Freemium Open Access

10% Delayed Open Access for digital publications

62

7B ACCESS STRATEGY TO PUBLISH

Write Access : excellence and best practices

- ◆ **Publication platforms:**
  - ↘ defined by each partner : publisher and platforms.
  - ↘ access policies will align through Best Practices WG.

- ◆ **Central platforms:**
  - ↘ open to the whole scientific community, scientific selection criteria set by scientific committee

63
QUESTION
trainings

8

Please provide details of the training programmes to be put in place across all the nodes.

8

64

8

OPERAS TRAINING BY TYPES OF USERS

AEUP Association of European University Presses

OpenAIRE

FOSTER

◆ **Researchers**

CONCLUSION

◆ **OPERAS** is the missing piece in the SSH RI landscape serving researchers needs :

> ↘ Complement data infrastructures with publications
> ↘ Integrates a fully functional Open Science ecosystem
> ↘ Adresses the needs of all SSH disciplines

◆ **OPERAS** community is highly mature and outstanding at international level :

> ↘ The first Open Access academic books community
> ↘ The first Open Access journals community
> ↘ The first academic blogging community

◆ **OPERAS** is a game changer in the scholarly communication system for all :

> ↘ Regains control of the scholarly communication system
> ↘ Engages deeply with societal challenges through open science

84

C.   ESFRI Evaluation report

Brussels, 16 July 2018

Subject: Evaluation of new proposals for ESFRI Roadmap 2018

Dear Project Coordinator,

I would like to thank you for submitting the proposal 'Open Access in the European Research Area through Scholarly Communication' – OPERAS to the ESFRI Roadmap 2018.

Your proposal was comprehensively analysed by the ESFRI Working Group on Implementation and the ESFRI Strategy Working Groups relevant for the domain of your proposal. The full evaluation report, approved by ESFRI, is available in the Annex to this letter.

Based on the results of this evaluation ESFRI concluded that your project is not mature enough to include it in the ESFRI Roadmap 2018. However, the topic addressed by your proposal has been recognised by ESFRI as High Strategic Potential Area, which will be described in the Landscape Analysis section of the Roadmap.

If you have any questions about this process or the evaluation report, please do not hesitate to contact me or the ESFRI Secretariat.

I would also like to take this opportunity to invite you to the Launch event of the Roadmap, which will take place on 11 September 2018 in Vienna as well as to the Exchange of Experience Workshop on Preparatory Phases on 12 September 2018 also in Vienna. The participation in these events could be an important opportunity to help you strengthen the concept of your proposal in the future.

Best regards,

Giorgio Rossi

ESFRI — European Strategy Forum
on Research Infrastructures

SWG & IG

CONCLUSIONS AND RECOMMENDATIONS

Name:	Open Access in the European Research Area through Scholarly Communication
Acronym:	OPERAS
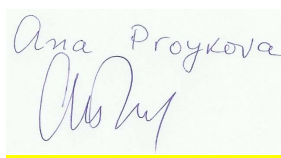

Signature SCI- SWG **[Scientific part]**	May 30, 2018
Signature SWG DIGIT:	April 23rd, 2018,
Signature IG:	April 23rd, 2018

Ana Proykova

SCIENTIFIC CASE

SCIENTIFIC EXCELLENCE	☐ VERY HIGH ■ HIGH ☐ MEDIUM ☐ LOW

The Scientific excellence of OPERAS is high. OPERAS address a crucial issue in open science: the lack of shared infrastructure and its long term viability. It specifically aims to develop solutions within SSH, which is the area that is currently the least well developed in open science. Its strength is that "OPERAS integrates existing components that have demonstrated their scientific relevance at medium or national level and are widely used by their scientific communities." The model is based around a central hub, which would seem an appropriate way to develop at least the first phase of this project, though as it grows subsidiary hubs might need to be considered and it would be interesting to know if there has been any planning for that. OPERAS approach, of starting with three stages with the last having three specific projects is appropriate and will allow these projects to be used as test beds for the overall approach. There is no doubt fact that comprehensive, competent and thorough work underlies this RI proposal. Nevertheless, the OPERAS proposal suffers from a lack of focus and theoretical strength, which may come to limit also its practical usefulness. The proposal very much departs from platforms and services already in existence, though of course with the objective of enhancing these and in some cases also introducing new ones. This feature designates the proposal as a relatively conservative extension of the

ESFRI
European Strategy Forum
on Research Infrastructures

present day status, also visible in the traditional attention to publication channels such as monographs and journals. Despite this critique, OPERAS will be very important for the field.

PAN-EUROPEAN RELEVANCE	☐ VERY HIGH ☒ HIGH ☐ MEDIUM ☐ LOW

The Pan-European relevance of OPERAS is high. European SSH research may fall behind if it does not gain visibility on a global level, and promoting open access is a key factor in gaining more visibility. OPERAS clearly address the fragmentation of the academic publishing landscape, a common European and Global problem within SSH. OPERAS is designed to serve all of Europe and most European languages. Even though the initial platforms do not represent all European nations and languages, OPERAS will develop with close attention to pan-European relevance. OPERAS' success will depend on how it will work (or is already working) with other well established open infrastructure initiatives within Europe.

SOCIO-ECONOMIC IMPACT	☐ VERY HIGH ☒ HIGH ☐ MEDIUM ☐ LOW

The socio-economic impact of OPERAS is high. The goal of establishing "a common framework to collaborate with research teams to achieve research projects that tackle their specific concerns, namely societal challenges" is perhaps the most visionary element of OPERAS. One benefit of open science is that it accelerates research, and thereby accelerates the development of all the goods that depend on research. While the evidence for the impact of open access is strong, it's based on the impact of open access to the STEM fields, not the SSH fields. The blogging platform, Hypotheses, has the potential to provide direct social benefit. In general, the impact of open science in SSH will be smaller than the impact of open science in the STEM fields, because it does not include the development of new technologies or medicines. However, open access will still be significant in reducing, for example, the costs that universities pay for journals and books, the costs spent on researching topics of social significance, and the costs of leaving urgent social problems unsolved.

E-NEEDS	☐ VERY HIGH ☐ HIGH ☒ MEDIUM ☐ LOW

Good description of the data **distribution**, a modern platform is proposed that is the state-of-the-art today. Plans for the data to be **discoverable, accessible, reusable, and interoperable** are adequately laid out. Several nice examples are given that show that the authors have good knowledge of the best practices in this field today. **No mention** is made of procedures for data collection, draft agreement involving future users, embargo periods, and IPR issues.

In this part it is mentioned that the project partners are already supported by public research institutions, and their needs will all be satisfied by these institutions. But no details at all are given about what quantitative needs they will have, as it is required in the Guidance description. There is a Reference to a Technical Mapping Report that the authors suggest that all such information is included there, but again, no details are given here. If such details are included in the Technical Mapping Report, then it is deemed that the partners have good knowledge of the required needs in terms of technical specifications.

A general discussion is given about which services this project will develop and use. These are all based on services of previous ongoing projects. There is also a general list of the Web sites of the partners pointing to the services that they provide in general. But no specific ones are mentioned here and no mention is made of the implementation construction cost as it is asked in the Guidance. To provide an answer to this specific requirement, the authors point to other projects that they are involved in. However good experience has been gained by the partners from previous projects, thus it is expected that such services will be properly implemented.

ESFRI

European Strategy Forum
on Research Infrastructures

The proposal includes a detailed description as to how they will make use of the EOSC platform. It gives an adequate plan to attain a convergence of targets of the main players. It lists activities that will contribute to the development of the global e-Infrastructure landscape. Three (3) separate Working Groups will relate to the EOSC topics, each according to a different area. There is already an experience by the consortium members of the EOSC principles, since they have already developed related platforms.

FINDINGS EVALUATION SCIENTIFIC CASE	☐ VERY HIGH ☑ HIGH ☐ MEDIUM ☐ LOW

This is a comprehensive, competent and thorough proposal. OPERAS address a crucial issue in open science and specifically aims to develop solutions within SSH; it is highly likely to be very important in the field. OPERAS' strength is that it integrates existing components that are widely used. OPERAS three stage design is appropriate, and one elegant feature of OPERAS is that it address problems at multiple levels, so that efforts at one level, e.g., increasing progress toward open access, do not interfere with efforts at another level, e.g., decreasing fragmentation.

We believe the proposal could be further improved on some areas to increase the scientific excellence of OPERAS. In particular,

- OPERAS practical usefulness would significantly improve if it would look explicitly beyond the present-day status and consider the digitization and datafication of SSH. From the current focus on books and journals, it is not evident how OPERAS will actually contribute to a movement towards digital scholarship and open science in SSH.

- OPERAS should be explicit about how the success of the various parts of the projects can be measured. Specifically, OPERAS should develop specific metrics for each of the pilot projects and have a plan for publishing these.

- OPERAS need to show how it will relate to, work with, and exploit relevant initiatives elsewhere, in Europe and internationally.

- OPERAS should describe how it will align with new thinking on initiatives for impact metrics in SSH and how these metrics will improve on current academic incentive structures. Incentives drive global behaviour by universities, and thus of academics, and hence solutions need to be global.

IMPLEMENTATION

STAKEHOLDER COMMITMENT	☐ VERY HIGH ☐ HIGH ☑ MEDIUM ☐ LOW

OPERAS satisfy three of the four required minimal key requirements: political support, lead country financial support and an inter-institutional signed agreement. However, it is not clear how OPERAS will secure financial commitments from other countries. Indeed, within the application the applicants state that "OPERAS will attract new members by offering access to several services…" but as indicated by one expert reviewer, simply offering access to services may or may not be sufficient. On that note, no clear strategy has been provided as to how the necessary financial commitments will be gathered.

At first glance it appears that there is considerable institutional support (over 30 letters of support), however it has been noted that some date back as far as 2015 and indeed one references in-kind support for inclusion to the 2016 Roadmap. It is unclear if this is in error or if this commitment holds true for the (current) 2018 application. France is currently the only partner with OPERAS listed on its Roadmap.

No clear idea has been provided as to how to gather the necessary financial commitments. Apart from the Lead country (FR) no other MS/AC have submitted a LoC.

All in all, while the political commitments are there the strategy of how it will develop from this in terms of securing viable, tangible commitments remains unclear.

EoS have been provided from the following countries.

ESFRI European Strategy Forum
on Research Infrastructures

France (LEAD, ministry for higher education, research and innovation)

Germany (BMBF). Italy (ministry for research). The Netherlands (dept. for research and science policy). Portugal (ministry of Science, Technology and Higher Education). Greece (ministry of Education, Research and Religious Affairs). Croatia (ministry of Science and Education).

As indicated in the EoS, France through the Ministry for higher education, research and innovation state that: "at national level the project is financed via state funding from the research partner institutions of about €3M per year".

A signed MoU has been provided, which states that the MoU 'sets for the terms and understanding between OpenEdition, Oapen, MWS, EKT, UCL, UC, PAN, Unizd, Unito to develop OPERAS as a research infrastructure at European level and constitute OPERAS Core Group to govern its development.'

ESFRI recommends that a robust strategy for how to secure finances needs to be considered.

ESFRI recommends that the duration of the support provided should be clarified in the letter of support from the French Ministry for Higher Education, Research and Innovation and should make clear what support is for OpenEdition and what is for OPERAS.

Clarifications should be sought from the coordinator on the level of in-kind support that will be provided during the preparatory phase.

USER STRATEGY AND ACCESS POLICY	☐ VERY HIGH ☐ HIGH ☐ MEDIUM ☒ LOW

Generally speaking, the overall strategy plan for user and access policy is not clear and appears to lacking. The applicants indicate that the number of users is not an appropriate parameter for the RI and state that '*in contrast to other types of infrastructures, a purely quantitative evaluation of the user communities is of low relevance for OPERAS.*' For that reason, it could be assumed that developing a sizeable user community for the benefit and future sustainability of the RI is not a high priority. Furthermore, and as indicated by one expert reviewer, the approach to be taken (of having a federation of current standalone communities) is weighted towards providing services to providers who will use them in support of users rather than providing services directly to users.

The value and significance of the survey is questionable. The survey appears to have only run for one month with a relatively low response rate (half of the 526 respondents contacted completed it). In addition to this, responses were not received from stakeholders in two core partner countries (the Netherlands and UK) – where, according to one expert reviewer, the RI and shared services for OA are mature.

There is no common access policy with each technical part (possible node) of the RI managing its own users and developing its own business model. It is therefore the view that this disparate approach cannot be considered sustainable to the level expected from an ESFRI project.

ESFRI recommends the applicants to create a user strategy and devise a common access policy for all partners. A clearer sense of how user needs assessment and engagement will be progressed in the short term should be provided.

ESFRI recommends the applicants to develop an updated user survey and/or review of key findings relating to the DOAB platform should be undertaken to augment the 2012 results.

PREPARATORY WORK	☐ VERY HIGH ☐ HIGH ☒ MEDIUM ☐ LOW

A Design Study was performed between January and June 2017. However the applicants indicated that this is the first of a two-part design study with the second phase still to be carried out (supported

ESFRI European Strategy Forum
on Research Infrastructures

through INFRASUPP-3-2016, support to policies and cooperation of international e-infrastructures). The study performed to date comprised of a desk study plus a survey. The HIRMEOS project is a technical project that serves as a proof of concept study that the partners can work together and deliver tools and shared services. However, as indicated by one expert reviewer *'based on the levels of engagement outlined in the design study, there is a risk that the required levels of membership won't be met during the preparatory phase…..as institutions and academic publishers are the communities who will pay for the RI, a clearer understanding of the size and needs of this community would be necessary to ensure effective targeting for new members.'*

The basic elements of a business strategy have been outlined but insufficient detail has been presented to suggest that a clear business case has been made. Technological and construction issues have not been addressed.

A Design Study has been performed, however as indicated in the assessment it is questionable if an adequate study has been carried out.

ESFRI recommends the applicants to develop a business case and develop a plan to tackle potential technological and construction issues.

ESFRI recommends the applicants to undertake a means of assessing the size of the academic publishing community outside current partner countries and define KPIs for attracting new partners from this community.

PLANNING	☐ VERY HIGH ☐ HIGH ☒ MEDIUM ☐ LOW

The proposal includes a well described Gantt Chart and Work Breakdown Structure that will be carried through seven work groups. However detail on this structure and how it will operate is as yet unclear. The closest indication is that each work group will submit a white paper in the second semester of 2017 - the details therein however were not provided. There is a Consortium building work package but there does not appear to be a strategy in place for the engagement of new partners, which is very important as the project is centred on providing many small-scale, under-resourced groups with interoperable services. This lack of clarity is compounded by the fact that the proposers appear to have run out of space (section 8.1) in mid-sentence while trying to explain the planning.

There is no overall strategy for establishing the training programmes during the preparatory phase. Each partner will provide training in its own area of expertise. This approach has its merits but it is not clear from the work plan how these different strategies will be pulled together into a consistent training plan for the whole RI.

The applicants indicate that they plan to build off existing platforms and then integrate with EOSC; the details of how this would be done is lacking, although this is not surprising perhaps as the plans for EOSC governance and structure have yet to be finalised.

While the applicants considered that no plan for decommissioning was necessary, there were no details provided regarding the services when the project completes (or funding ceases).

ESFRI recommends the applicants to develop a plan for the preparation and implementation of the proposed project. A plan for the operation and for the eventual decommissioning should also be created. ESFRI recommends that some attempt to develop KPIs for the usage of the three key platforms (especially beyond France and French-speaking communities) should be developed in the short term.

GOVERNANCE AND MANAGEMENT	☐ VERY HIGH ☐ HIGH ☒ MEDIUM ☐ LOW

ESFRI
European Strategy Forum
on Research Infrastructures

All the key minimal requirements have in some respect been addressed however none have been met as defined. The governance structure for Boards and the senior management team is described however the operational level activities below that are not clear as little detail is provided. It has been proven with other ESFRI projects that having the basis for this structure in place is a critical aspect for projects during the preparatory phase prior to leading into the Implementation phase. The proposed interactions between the central hub and planned nodes is not well defined.

The Design Study outlines a list of KPIs but again the lack of detail results in a scant overview as opposed to a coherent list of measurable, relevant KPIs.

The reviewers were of the view that as a project progresses from the design phase, through preparatory and into implementation, impact assessment initiatives should be conducted on a regular basis as they will demonstrate the value of a project to other groups in addition to aiding recruitment. Such initiatives are lacking from the proposed project.

ESFRI recommends the applicants to consider a deeper project plan for the preparation and implementation phases with clearly defined skills, responsibilities and reporting lines.

Measurable Key Performance Indicators with associated metrics should be considered and drawn up. More consideration should be given to the structure and composition of the various boards and management committees (advisory, ethical, operational, etc.)

HUMAN RESOURCES POLICY	☐ VERY HIGH ☐ HIGH ☒ MEDIUM ☐ LOW

The HR policy is reasonably well explained and covers within the page limits offered the general recruitment plan and training plans for staff.

Approximately half of the key leadership positions have been filled (Director, Coordinator, CTO and a Project Officer). It is indicated that the remaining positions including three other project officer posts will be filled but timelines are lacking. It is indicated that staff will be working through multiple projects simultaneously but it is unclear as to how this will be managed or guided. Also, clarification on management of each of the work packages needs to be clarified. Some training plans are indicated but no details are provided. Again, much appears to have been considered but the lack of detail hinders a thorough assessment.

As the hub is through Aix-Marseille University the HR policy is currently following the university policy.

Recommendation is to develop an approved staffing plan. An overall HR policy plan for the implementation and operation, for hiring, education and training should be considered.

FINANCES	☐ VERY HIGH ☐ HIGH ☐ MEDIUM ☒ LOW

The cost breakdown of OPERAS is divided into four areas: the core infrastructure, shared services, EOSC integration, and platforms. Overall costs are provided for each area and within each area there are a list of aspects with subtotals provided against these. However, again, there is no detail provided to justify each or explain each cost line. That being said, the associated key minimal requirement must be classed as being met but the lack of detail tempers this outcome and while estimates are provided confidence levels are not.

The investment plan provided is disjointed and lacks any clarity or realism, for example it is indicated that development of OPERAS will be funded through H2020 and FP9 projects. The applicants then go on to provide a list of calls – many of which do not even exist – "Second INFRADEV FP9 (2024-2028)" which has been provided with an allocated budget of €4m by the proposers. This supposition makes for an

ESFRI   European Strategy Forum
         on Research Infrastructures

implausible investment plan.

It could be argued that the response provided to section 11.4 ("No") illustrates a lack of foresight and drive to identify and secure other sources of funding.

Greater consideration should be given to identifying other sources of funding. More information relating to financing in general should be taken into account including the development of estimates and confidence levels fort each element of the proposed project. More consideration should be given to an in-kind contributions policy plan.

RISKS	☐ VERY HIGH ☐ HIGH ■ MEDIUM ☐ LOW

A concise list of risks and associated mitigation strategies has been presented. However that said, the applicants state that '*the main risk is that OPERAS does not achieve convergence of infrastructural services, due to diverging strategies of partners*' but to mitigate against this the proposers request '*that's why we need a strong signal from ESFRI to encourage the partners to work together and on a converging path*.' This lack of preparation prior to entering the roadmap would suggest that the project in its current state lacks the maturity expected from a roadmap project.

More detail should be given to the risk register and ensure that all aspects of the proposed project are taken into account with realistic mitigation plans.

FINDINGS ASSESSMENT OF IMPLEMENTATION	☐ VERY HIGH ☐ HIGH ■ MEDIUM ☐ LOW

As with many of the preceding sections of the proposal, it is indicated quite frequently that further details on specific (often critical) aspects '*will be finalised during the preparatory phase*'. This lack of forethought makes it difficult to fully assess the maturity of OPERAS.

The project needs more time to plan out the levels of support from partner countries and the details of how the various components of the proposed project would be integrated to form the basis of a distributed RI.

OVERALL CONCLUSIONS & RECOMMENDATIONS

OVERALL FINDINGS	☐ VERY HIGH ☐ HIGH ■ MEDIUM ☐ LOW

The proposal OPERAS seems to us very promising and timely in the new context of Open Science. Nevertheless, even though its science case is relatively strong, it demonstrated significant deficiencies in implementation and therefore the proposal is not considered mature enough to enter the ESFRI Roadmap.

D. Evaluation of the Coordinator (OpenEdition)

Evaluation of OpenEdition - An analysis of Strengths, Weaknesses, Opportunities, and Threats to Inform OpenEdition's future strategy. Report commissioned by: Aix-Marseille University, on behalf of the stakeholders in Cléo. Report authors:
Rob Johnson, Mattia Fosci, Andrea Chiarelli www.research-consulting.com
Contact: rob.johnson@research-consulting.com
Report dated: July 2017

1. Introduction

OpenEdition brings together four platforms dedicated to electronic resources in the humanities and social sciences, including OpenEdition books, with over 4,000 titles, and Revues.org, with almost 500 journals. In order to inform its future development and strategy, the University of Aix-Marseille commissioned an evaluation of OpenEdition on behalf of its four partners. The evaluation was undertaken by Research Consulting, a UK consultancy specialising in the management and dissemination of research, and provides an external perspective on OpenEdition's development over the next 5-10 years.

2. Methodology

The evaluation of OpenEdition was approached through four steps:
- Review of usage, performance, and operating model: We reviewed the relevant operational data and processes used at OpenEdition by meeting key staff members and other stakeholders. We also discussed the Lodel publishing platform.
- Review of the competitive landscape: We reviewed the relevant literature on the landscape where OpenEdition operates, considering both the French and the European open access policies. We also studied competitors and comparator services, which were then validated through a discussion with Cléo staff.
- Stakeholder consultation: We interviewed nineteen international stakeholders and then coded their comments to build a SWOT analysis to inform OpenEdition's future strategy.
- Feedback and reporting: We gathered our findings in the present report and then discussed with OpenEdition staff for validation. We then finalised our report based on all feedback received.

3. OpenEdition's position in the open access market

- OpenEdition is a major player in the international open access (OA) landscape. Despite strong year-on-year growth, the OA book market is still less than 1% of all scholarly and professional e-book publishing: according to some estimates there were only around 10,000 titles in 2016, with humanities and social sciences (HSS) accounting for almost three quarters of all OA books published. Within this market, OpenEdition has cemented a leading position with a catalogue of over 4,100 e-books, most of which are open access. Competitor platforms in the HSS have much smaller catalogues, ranging from a few hundred to just over 2,000.
- Similarly, with 461 journals and over 100,000 articles, OpenEdition is almost unique as publicly-funded platform delivering a high volume of open access journal content within the social sciences and humanities. Large digital libraries in HSS, such as JSTOR, only publish a small proportion of their large catalogues in open access. By contrast, pure open access platforms typically have much smaller catalogues of HSS content, ranging from Hrcak's 200 titles to the Open Library of Humanities' 16 journal titles.
- Comparative data is more difficult to locate for Hypotheses and Calenda, but we are not aware of any other academic blogging platform which comes close to the 2,000+ blogs hosted by OpenEdition.

4.   Analysis of strengths and weaknesses

Drawing on the outcomes of our stakeholder consultation, we have prepared an analysis of strengths, weaknesses, opportunities and threats. Key strengths included:

- OpenEdition's technical capability
- The freemium model
- The increased visibility OpenEdition offers to small publishers
- A strong 'niche' offer

The most significant weaknesses were:

- Poor communication of editorial quality to the international market
- Weak international profile
- A perceived lack of interoperability for librarians
- Poor usability for publishers

5.   Opportunities and threats in the OA market

- Our consultation highlighted a wide range of opportunities and threats for OpenEdition. The importance of the English-language market is widely acknowledged, and increasing English content is highly desirable, but likely to be difficult in practice. Most stakeholders instead saw greater opportunities for expansion in Germany and/or Eastern and Southern Europe. We also note the existence of opportunities to source content from Latin America and Africa, but these regions were not within the scope of our consultation. With regard to disciplines, there may be scope for limited expansion, but this should not compromise OpenEdition's primary identity as a platform for social science and humanities.
- Finally, there are clear opportunities for OpenEdition to play a leading role in the harmonisation of metadata, development of open source software, and establishment of European OA infrastructure. The OPERAS project, which is led by OpenEdition/Cléo, represents an important step in this direction. OpenEdition is highly regarded by the other project partners, and its involvement in the project should help to consolidate its position as a provider of critical Research Infrastructure, in partnership with other European players.

6.   Strategic options

OpenEdition's future development is limited by three main factors:
1) Low levels of awareness outside France
2) Predominance of francophone content
3) Focus on the social science and humanities

The consensus view from our work is that addressing the first two of these should be a priority, and that this is best achieved by:

- developing OpenEdition's identity as a European multilingual platform for the social sciences and humanities
- promoting the OpenEdition brand as a clear badge of quality for content on the platform
- redefining OpenEdition as one platform with four inter-related services
- There may also be scope for some expansion of content into interdisciplinary areas, but it would be inadvisable to pursue international expansion, an increased range of languages and additional disciplines simultaneously
- Finally, we note that OpenEdition occupies a unique position in the publishing landscape, being aligned neither with the dominant Anglo-Saxon publishing world, nor the Global South. There may be opportunities for OpenEdition to capitalise on this position in order to play an important bridging role between these two worlds.

7.   Operational recommendations

We recommend that OpenEdition's management and Steering Committee consider the value of the following actions to improve its operational activities:

1. Communicate quality - Take steps to communicate the quality of its content and editorial controls more effectively to an international audience
2. Increase efficiency - Conduct a business process mapping and redesign exercise to identify and address delays and inefficiencies in the publishing process
3. Improve usability - Improve usability and support for the Lodel tool for existing publishers, potentially as part of the ongoing 'Lodel 2' development
4. Adopt a modular approach - Explore opportunities to extend and scale the platform via a modular approach to new features and services (for example 'OpenEdition sources')
5. Open up metadata for discovery - Improve distribution of metadata and uptake of the freemium model by libraries via a three-step process:

a.   Deliver metadata to library discovery tools/library catalogues at no cost to facilitate discovery of OpenEdition's content

b.   Capture IP address information to allow identification and tracking of usage (potentially on a free trial basis)

c.   Promote adoption of the freemium model

6. Pursue partnerships - Explore partnerships with other European OA publishers and platforms, to present a collective proposition to North American/Northern European libraries
7. Gather feedback - Review and enhance processes for obtaining structured feedback from publishers and libraries of the platform, in order to monitor quality of service and relationships.
8. Improve transparency - Improve transparency around the freemium model, and take steps to articulate its value to publishers more clearly
9. Extend international reach - Evaluate possible mechanisms to obtain ongoing input from international stakeholders, for example via an international advisory board and/or the development of 'OpenEdition Ambassadors'.

XIV. Annex: Publication on Network sustainability (Max Weber Stiftung)

The Value of Network Sustainability: Why We Join Research Infrastructures

Elisabeth Heinemann

Submitted on 15 Jun 2018

The Value of Network Sustainability: Why We Join Research Infrastructures

Elisabeth Heinemann

Introduction

1   In the social sciences and humanities, scholarly communication is at the heart of researchers' activities. Scholarly communication practices differ greatly from those in other disciplines. An example of this is the format of the monograph, which reveals other particularities such as the workflow, the way researchers collaborate, the correlation between fieldwork and theory, and the way arguments are elaborated and constructed (OPERAS Consortium, 2017). The publication can thus not be considered the last step of the research process or merely as the output produced, but it is indissolubly linked to the whole research process (OPERAS Consortium, 2017).

2   The research landscape in the social sciences and humanities, however, is diverted and fragmented into an environment of many small players who are highly specialized. This is mainly due to multiple disciplines and sub-disciplines, as well as different languages (Mounier, 2017). This specificity in the social sciences and humanities should not be considered a flaw but rather an adaption to the reality of the research landscape. Nonetheless, the fragmented scientific community becomes disintegrated if the different players act in isolation and negatively impact one another (Mounier, 2017).

3   To tackle the situation, the European Commission works on setting up the European Open Science Cloud, an infrastructure to support open science in Europe (European Commission, 2016). At the same time, a research-driven approach to the

internationalization of scholarly communication in the social sciences and humanities is needed. This approach can bring together researchers from multiple disciplines and various infrastructures using different tools and languages and integrate their research into the European Open Science Cloud.

4   This paper explores how OPERAS (open access in the european research area through scholarly communication), a research infrastructure that addresses these particular challenges in the social sciences and humanities, implements network sustainability and how such a sustainable network benefits and at the same time arises from its partners. The Max Weber Foundation, an OPERAS core group member, is used as an example. The paper provides an overview of the Max Weber Foundation and the OPERAS research infrastructure and uses a network analytical approach to OPERAS as a community network. It then investigates the concept of network sustainability and presents concrete examples of how this is implemented within the research infrastructure.

Max Weber Foundation

5   The Max Weber Foundation is a legal entity, funded by the German Ministry of Education and Research, but nonetheless independent in its activities as a research organization. The foundation is comprised of ten humanities research institutes abroad. Its goal is to promote research focusing on history, culture, economy and on the social sciences, and to foster a mutual understanding between Germany and the guest countries. The electronic publication platform perspectivia.net is the international, cross-epochal and interdisciplinary portal of the foundation (Max Weber Foundation, 2018).

6   The Max Weber Foundation closely works with national infrastructure partners, especially DARIAH-DE, to develop services at a national level. DARIAH-DE is a consortium developing and providing digital infrastructure and services to support research in the humanities and social sciences with digital methods and procedures (DARIAH-DE Consortium, 2018). With joint research projects and cooperation partners, such as the "Forum Transregionale Studien," the Max Weber Foundation takes part in the internationalization of research in the social sciences and humanities. The forum is a national German organization with partners from different research centers. It seeks the internationalization of research by enabling scholars from abroad to work on transnational research topics as invited fellows or at conferences (Forum Transregionale Studien, 2018).

7   Without having any significant service provider for an information infrastructure in their own organization, the Max Weber Foundation relies on direct partnerships and national or international initiatives including libraries, computing centers, digital humanities centers and joint infrastructure projects. As a core group member of OPERAS, the Max Weber Foundation has a vital interest in shaping a sustainable research infrastructure and integrating research in the social sciences and humanities internationally.

OPERAS–distributed research infrastructure

8   OPERAS was born from a clear understanding that the specific challenges in scholarly communication in the social sciences and humanities have to be addressed in a common effort. The research infrastructure presently gathers 35 organizations from thirteen

European countries as well as one international partner and is coordinated by a nine-member core group. It is led from France by OpenEdition, an infrastructure dedicated to electronic resources in the humanities and open sciences. OPERAS members' backgrounds are very diverse: publishers and publication platforms, infrastructure providers and libraries, universities and research organizations. OPERAS is supported by OPERAS-D (design) and HIRMEOS (High Integration of Research Monographs in the European Open Science Infrastructure), two projects funded under Horizon 2020, the biggest research and innovation program of the European Union. The projects' results are the backbone for the future services that the OPERAS research infrastructure will deploy. Not all OPERAS partners are actively involved in both of the projects and some partners only participate in one of them. The Max Weber Foundation is a project partner in both, OPERAS-D and HIRMEOS, and a core group member of OPERAS.

9   As key objective, the OPERAS-D project has prepared a design study that defines governance models, scientific and technical concepts for future services that the infrastructure will provide, and has established a roadmap to achieve these goals according to the requirements for long-term sustainability. The study's main findings are

1. the need to consider scholarly communication as the heart of scientific research and not as one of its outputs, particularly in the social sciences and humanities;

2. the fragmentation of the field; and

3. the need and the conditions for integration at European level (OPERAS Consortium, 2017).

10   The design study serves as a basis on which the future of OPERAS is built. The Max Weber Foundation's formal role in OPERAS-D is to ensure a clear and efficient communication and dissemination of the project's results.

11   HIRMEOS aims to integrate open access monographs into the open science ecosystem in a systematic and coordinated fashion. To improve interoperability between publishing

platforms and referencing and indexing service providers, five sets of data and metadata are implemented on participating platforms: identification metadata, named entities data, certification metadata, annotation data and metrics metadata (HIRMEOS Consortium, 2018). The Max Weber Foundation, while not being one of the implementing platforms, formally participates in the communication and dissemination of HIRMEOS' project results.

12 Using the two projects' results, the research infrastructure OPERAS will deploy services at three levels. At a first level, shared services between partners will offer communication and publication services to their communities. This includes advocacy for open science, trainings, definition and adoption of best practices, research and development activities, as well as developing sustainable and fair business models for open access. At a second level, integration into the European Open Science Cloud will be achieved, especially through the HIRMEOS project. Finally, unified services in the European Research Area will be offered: a certification service, a discovery service, and a research for society service (OPERAS Consortium, 2017).

13 To ensure the continuity of OPERAS after the two projects OPERAS-D and HIRMEOS have ended, the research infrastructure is currently applying to the Roadmap 2018 of the European Strategy Forum on Research Infrastructures (ESFRI), the European Commission's most important instrument to develop the scientific integration of Europe.

OPERAS as a community network

14 Social networks have increasingly been studied since the early 20th century. With the rise of social network analysis, an interdisciplinary approach that works on the premise that all social life is formed by relations and on the patterns that these create, scholars of all disciplines have started to systemically study social networks (Marin and Wellman, 2011). Within social network theory, a network is often defined as "a set of nodes (or network members) that are tied by one or more types of relations" (Wasserman and Faust, 1994). In principle, everyone and everything can be a network member; including organizations, companies, web pages, countries, or positions (Marin and Wellman, 2011).

15 In the case of OPERAS, the partners that have signed a letter of support to the research infrastructure and have been accepted as members can be seen as the nodes of the social network. Even though the term social network is commonly synonymously used for social media networks such as Twitter and Facebook, a social network is not necessarily an online network. To avoid confusion, however, I will in the following use the term community network for the network of OPERAS partners rather than social network.

Img. 2: OPERAS partners
16 An attempt at grouping OPERAS members is useful for understanding the community network's structure. Partners can be grouped according to the countries they are based in (see img. 2), according to their formal function in OPERAS (nine partners are core group members, see img. 1) or according to the type of their organization. A categorization according to the type of organization could involve publishers and organizations that are dedicated to open access publishing (*Association of European University Presses; Institute of Literary Research of the Polish Academy of Sciences; Lexis Compagnia Editoriale; Linguistics in Open Access; Open Books Publisher; Open Library of Humanities; Quality Open Access Market; Ubiquity Press; UCL Press*), libraries (*Scientific Electronic Library Online; Stockholm University Library; Georg-August-University Göttingen; UiT The Arctic University of Norway*), universities and research organizations (*Conference of Italian University Rectors; Italian National Research Council; Luxembourg Centre for Contemporary and Digital History; Max Weber Foundation – German Humanities Institutes Abroad; Napoli University Federico II; NOVA School of Social Sciences and Humanities; Roma Tre University; University Ca'Foscari Venice; University Computing Centre of the University of Zagreb; University Institute of Lisbon; University of Coimbra; University of Liège; University of Milan; University of Turin; University of Zadar*), and infrastructures for open access operating mostly on a national level (*Associazione Italiana per la promozione della scienza aperta; Huma Num; Hypothesis; Knowledge Unlatched; KU Research; National Documentation Centre; OAPEN; OpenEdition, SciELO*).

17 While it is helpful to have a clearer understanding of what types of stakeholders are partnering in OPERAS, a grouping of the individual stakeholders within the network is not advisable. A categorization according to countries does not take into account the different functions a member has within OPERAS nor the various types of stakeholders that are members of the research infrastructure. The same holds true for categorizing

partners according to their function in OPERAS, which does not include the national differences between stakeholders nor does it differentiate between the types of organizations. Lastly, a grouping according to members' types of organizations creates the problem of multiple group memberships. The Max Weber Foundation, for instance, is comprised of ten humanities research institutes abroad. Yet, the foundation also operates a publication platform. It is thus not only a member of the group of universities and research organizations but at the same time also a quasi-publisher. Another example is Georg-August-University Göttingen, which is a public German university but is participating in OPERAS through their university library. Therefore, in chapter 6, which introduces the implementation of network sustainability within OPERAS, I will not group the research infrastructure's members but rather look at all partners as interdependent but individual nodes.

18   What then are the benefits to a network analytical approach to the sustainability of a research infrastructure? I could find little literature that explicitly deals with the centrality of community networks for the sustainability of research infrastructures. There is, however, research on the role of social networks for project stakeholder management. Provan and Kenis show that the form of governance has a huge impact on the effectiveness of a network (Provan and Kenis, 2007) and Chung and Crawford, for example, propose to use social network theory to identify stakeholders and improve project management (Chung and Crawford, 2015). In the field of technology clusters and companies, there is research that shows that social network formation is crucial to the sustainability of technology clusters and economic activities in some regions (Casper, 2007) and an influential paper has shown that the success of Silicon Valley can largely be understood through network analysis (Saxenian, 1996). For research infrastructures, a network analytical approach takes the attention away from the "static" expertise and formally defined tasks of a single member and draws it towards the "mobile" connections that this member has with other partners and to the work that is done "informally". It thus recognizes the value of sharing expertise and knowledge and of the informal connections within research infrastructures (Marin and Wellman, 2011). I argue in the following that these are crucial aspects to the sustainability of a distributed research infrastructure such as OPERAS.

Network sustainability

19   Concepts for sustainable research infrastructures in the social sciences and humanities have only recently entered the international agenda.

20   The Brundtland Report of 1987 triggered a worldwide discussion on sustainability and environmental concerns. The report defines sustainable development as "development that meets the needs of the present without compromising the ability of future generations to meet their own needs" (United Nations, 1987). It furthermore outlines three areas of sustainability: economic, social, and environmental sustainability. This widely used definition of sustainability, even if not clearly inclusive of research infrastructures, can be adapted to them. Research infrastructures also need to satisfy present requirements while staying flexible and resilient to meet future needs–needs which are not at all self-evident. Sustainable research infrastructures must therefore constantly evaluate how the requirements they serve are developing and adjust to them.

21   The 2030 Agenda has enhanced the Brundtland definition in 2015 with 17 Sustainable Development Goals (SDGs) and 169 targets – none of which include the social sciences and humanities or target research infrastructures (United Nations, 2015). Goal no. 17, however, which asks for a revitalization of global partnerships for sustainable development, defines "multi-stakeholder partnerships that mobilize and share knowledge, expertise, technology and financial resources" as an important systemic issue (United Nations, 2018).

22   Adapting the Brundtland definition and the SDGs to research infrastructures, three areas of sustainability arise:

   1. *economic sustainability* which guarantees the research infrastructure's funding and the efficiency of its governance;

   2. *technical sustainability* that includes data storage and the resiliency of dynamic software; and

   3. *network sustainability* which includes gaining access to other networks and interest groups, sharing knowledge and increasing each other's visibility, and staying current and state-of-the-art.

23   When is a network sustainable? Granovetter, who in 1973 introduced the now famous idea of the strength of weak ties, argues that while it is obvious that strong ties are beneficial to a network–they share information readily and communicate frequently–weak ties enable the network to gain information and access to nodes that are more distant and therefore to information that is original (Granovetter, 1973). Applying this to a distributed research infrastructure means that the network needs a strong core as well as diverse and distributed partners. More recently, Krebs and Holley have identified five general patterns that can be observed in effective networks: nodes share common attributes and goals, they are diverse, there are several paths between nodes, the average path length is short, and some nodes are more important than others (Krebs and Holley, 2005). They furthermore argue that because networks are often left unmanaged, nodes sharing similar attributes connect and close by, resulting in a lack of diversity and effective paths of communication within the network (Krebs and Holley, 2005). Effective community networks, they argue, arise with an active leader taking responsibility and forming a hub. The leader then usually connects to outside potential partners, making them part of the network and thereby extending it. In an efficient and sustainable network, the leader needs to encourage connections between the nodes according to the individual needs. Some interactions might lie dormant, but the paths need to be created (Krebs and Holley, 2005). This "hub-and-spoke" model, however, should only be a temporary structure as it places too much power and liability in the hub. The network becomes more resilient the fewer nodes include the hub for their connections. The transition of the leader from the weaver of the network to a facilitator of network weaving is crucial for a sustainable network (Krebs and Holley, 2005). While Krebs and Holley exemplify their research on economic networks, it is an important insight that is also useful when looking at distributed research infrastructures. Thus, a sustainable network in the context of a distributed research infrastructure does not merely imply forming connections to exchange information during professional and scientific conferences in the short run–although the importance of this should not be underestimated–but to achieve long-term and large-scale integration and unification as a basic service for researchers.

24   Network sustainability for research infrastructures is, although phrased differently, included in the report on long-term sustainability of research infrastructures published

by the ESFRI Long-Term Sustainability Working Group. They argue that "a robust long-term vision is the most important prerequisite in order to successfully and sustainably build and operate" a research infrastructure (ESFRI, 2017). This vision goes well beyond financing mechanisms and business models for research infrastructures. The report suggests, among others, to launch continued and practically-oriented initiatives to improve the management of research infrastructures "through the exchange of best practices and lessons learnt, and contribute to strategic planning, evaluation, and training" (ESFRI, 2017).

25 Taking into account the research that has been done on the sustainability of networks and bearing in mind the specificities of a distributed research infrastructure, I will show in the following chapter that a sustainable network enables a distributed research infrastructure to understand future needs, to then address those needs, and finally to also shape them. This is not only beneficial for the research infrastructure but also for the partners individually, as shown on the example of the Max Weber Foundation.

Network sustainability: practical implementation

26 The projects OPERAS-D and HIRMEOS have substantially increased the sustainability of the research infrastructure OPERAS. OPERAS-D has developed a concept for economic sustainability, which includes a governance model and a future roadmap for the research infrastructure in the OPERAS Design Study. The HIRMEOS project addresses the technical sustainability of the services developed within OPERAS. While both, economic and technical sustainability, are closely interlinked with network sustainability, the following seeks to isolate how network sustainability is achieved and why this is not only beneficial for OPERAS but also for its partners.

Understanding future needs

27 A clear benefit for the Max Weber Foundation and other partners arises from *gaining access to other networks and interest groups* that they can rely on when organizing workshops or conferences or are in need of specific information or expertise. The community network connects the foundation with other interest groups, for instance national infrastructures but also European initiatives as e.g. CESSDA–a consortium promoting international research cooperation and results, CLARIN–a European research infrastructure for language resources and technology, DARIAH-EU–a pan-European infrastructure supporting digital research and methods in the social sciences and humanities, and OpenAIRE–a project promoting open scholarship. While some of these are formal partners of the OPERAS infrastructure (DARIAH-EU, e.g., is a partner of the HIRMEOS project) the connection to other networks and interest groups takes place through other members. In most cases, more than one partner in OPERAS can connect other members to these networks and interest groups.

28 At the same time, OPERAS benefits from the Max Weber Foundation's knowledge of and connections within Germany and the host countries of its institutes. An example of this is the OPERAS-D final conference, to take place in summer 2018, that brings together different stakeholders from and outside of OPERAS. Regardless of the conference's topic, the selection of relevant speakers was only possible because of the OPERAS community network. In addition, the conference will grant access to a larger international

community to all OPERAS partners. The same holds true for the HIRMEOS project, where partners conduct webinars and workshops together.

29 This reciprocal network sustainability ultimately ensures that OPERAS stays and becomes aware of future needs which can only then be addressed. Gaining access to other networks and interest groups is only possible with a network of diverse partners, the strong "weak ties." It can also only be robust if there are several partners that can connect others to outside networks and interest groups.

Addressing future needs

30 The strongest benefits from research infrastructures with a sustainable network arise from *sharing knowledge, information, and experience.* OPERAS has set up working groups which develop white papers on the topics of advocacy for open access, tools (research and development), standards, business models, best practices, multilingualism, and platforms and services. The working groups represent groups of partners sharing the same goals but who have diverse backgrounds. While in the beginning OPERAS' coordinator OpenEdition has acted as a hub for the research infrastructure, the working groups are a first step to facilitate network weaving for the core group members of OPERAS who act as contact points for the working groups (see img. 1). The Max Weber Foundation is the contact point of the advocacy working group and thus unites the expertise of various OPERAS members in this area. The working groups enable the Max Weber Foundation to actively pass on its expertise while at the same time acquiring knowledge from other partners. The working group papers are a result of this process where sharing information with a network benefits all partners. This especially holds true for the identification of future projects that OPERAS partners can work on together, which is an essential part of the working groups.

31 Another example from the HIRMEOS project is the metrics collection tool. Javier Arias from Open Book Publishers describes this and the benefits for organizations with fewer resources in "Collecting inclusive usage metrics for Open Access publications: the HIRMEOS project" (Arias, 2018).

32 Sharing knowledge, information and expertise aids OPERAS in becoming sustainable as it prepares the infrastructure in solving challenges that it has previously identified and addressing future needs. To sustainably share knowledge, information and expertise, however, communication needs to happen via short paths but be organized through partners that are especially committed to the research infrastructure.

33 Another aspect that supports OPERAS in addressing future needs is that the research infrastructure *increases the visibility* of the Max Weber Foundation as a research organization internationally and contributes to the reputation of its researchers. This is important as a main obstacle to publishing open access for researchers is the perceived lower reputation (OPERAS "Advocacy Working Group", 2018). Increasing one's own visibility and reputation outside the national context can thus help to meet this challenge. At the same time, OPERAS can more effectively address future requirements if it is visible, which becomes possible with more widely known partners.

Shaping future needs

34 More than merely addressing future needs, a sustainable community network supports partners of a research infrastructure in shaping the future landscape. The community network of OPERAS has for example supported the Max Weber Foundation in participating in an active discourse on open access and legal issues in Europe. It thus supports partners in *staying current and state-of-the-art.* More concretely, OPERAS has signed the Scholarly Publishing and Academic Resources Coalition's (SPARC) open letter protesting against the planned reform of the European Union's copyright directive and has led the Max Weber Foundation to sign the Jussieu Call for open science and bibliodiversity, thus supporting a flourishing and diverse academic publishing landscape.

35 Another example stems from the HIRMEOS project, which enables the platforms that directly benefit from its services to develop and provide their own services within OPERAS and to integrate into the European Open Science Cloud. The Max Weber Foundation is a project partner of HIRMEOS without being one of the implementing platforms. The network value for the foundation arises from actively participating in the shaping of future services and the processes of standardization. The latter is urgently needed for the foundation as it specializes in transnational and transregional research projects.

36 Staying current and state-of-the-art is a prerequisite for partners of a distributed research infrastructure to actively shape future needs. This only becomes possible if partners of a research infrastructure share some common attributes and goals but are diverse enough to influence the landscape from different angles.

Obstacles to network sustainability

37 Implementation of network sustainability does not always work smoothly. Some of the aspects described in the previous chapter can be achieved through the management of the research infrastructure and the business model. This includes, for instance, creating a core group to facilitate the network weaving of strategic partners, implementing regular video conferences to assist a continuous communication, and forming working groups to connect partners with similar goals. Also the formal requirements of funded projects supporting a research infrastructure contribute to a sustainable network.

38 Yet, the intrinsic commitment of partners involved is crucial. It stems on the one hand from the benefits of network sustainability for themselves and on the other hand on the sustainability and thus effectiveness of the infrastructure it creates. This causes a virtuous circle where partners' commitments stem from the direct benefits of network sustainability, which increases the network sustainability, which in turn intensifies the advantages mentioned before. However, while the benefits are huge, they often do not show immediately. This can lead to a lower level of dedication than desired. Reasons for this include time constraints, a lack of labor force, money constraints, and a misjudgment of the overall work that participation in a distributed research infrastructure requires.

39 While this lowers the overall effectiveness of a distributed research infrastructure, it does not necessarily impede a sustainable network that can understand, address and shape future needs. The level of commitment does not have to be equally high for all partners at

all times because a sustainable network has several paths between the nodes. One can lie dormant and others can be used in its place. Yet, oftentimes research infrastructures do not have several paths between the nodes. OPERAS has, for instance, only one partner in some geographical regions (see img. 2) and within the core group there is only one partner each who is the responsible contact point for a working group (see img. 1). If the level of commitment of one of these partners is low, the research infrastructure's network sustainability risks impairment.

40   Another problem is the length of the average path between nodes, which should be as short as possible in a sustainable network. In the case of OPERAS, OpenEdition, which has in the beginning acted as the hub of the research infrastructure, began to enable the core group members to act as network weavers themselves. Yet, this does not shorten the communication paths of all members of the network equally, especially if they are only involved in one of the working groups. A network with long communication channels quickly becomes inflexible and unable to perform its function of understanding, addressing and shaping future needs.

41   Not all these obstacles will necessarily impede network sustainability. Yet, every research infrastructure is well advised to take these possible risks into account.

Conclusion

42   In order to become and stay sustainable, distributed research infrastructures must satisfy present requirements while staying flexible and resilient to meet future needs. This means that it is not enough to only consider their economic model and technical viability. Research infrastructures with a sustainable network can understand, address and shape future requirements through granting their partners access to other networks and interest groups, through sharing knowledge, information and experience and increasing each other's visibility, and by enabling their partners to stay current and state-of-the-art. They can only do so if partners share common attributes and goals but are diverse at the same time. Communication between members of a research network has to follow short paths while some partners (a core group) are more important to the communication within the research infrastructure than others. Finally, there needs to be more than one path between partners to make a research network sustainable.

43   While some of these aspects can be achieved through the management of the research infrastructure and the business model, most derive to a large extend from an intrinsic commitment of the partners involved. The level of commitment does not have to be high at all times if the research infrastructure has more than one path of communication between its partners. However, this is not yet the case with many partners in OPERAS, making the research infrastructure vulnerable. In addition, the length of the average path of communication between partners should be as short as possible in a sustainable network. OPERAS has shortened the lengths of the communication channels by establishing working groups but they are still long for members of only one communication group. This risks inflexibility and therefore the sustainability of the network.

44   Network sustainability deserves permanent efforts. While funded research projects are clearing the path for a sustainable community network, stakeholders of a research infrastructure need to actively engage. Shared services, such as conferences, trainings,

and advocacy for open science require constant exchange of information. Projects may serve as development sprints and content providers, yet keeping track of new developments and evaluating techniques is a permanent task for all partners and goes beyond every project's lifetime. While the project OPERAS-D has identified current challenges for scholarly communication in the social sciences and humanities, a sustainable research infrastructure needs to constantly reevaluate the status quo. The solutions, particularly for unified services such as certification, discovery, and research for society, require continuous adaption to future needs. To be able to also shape those future needs, a sustainable research infrastructure must actively participate in a discourse in the respective field. Solutions to the challenges distributed research infrastructures face can for that reason only be sustainable if addressed by an international consortium.

ABSTRACTS

This paper develops the concept of network sustainability. To become and stay sustainable, distributed research infrastructures must satisfy present needs while at the same time be flexible and resilient to meet future requirements. For this it is not enough to merely build a resilient economic model and be technically viable. Research infrastructures that can understand, address and shape future needs have a sustainable community network. Clear characteristics of a research infrastructure with a sustainable network are that partners gain access to other networks and interest groups, that knowledge, information and expertise is shared freely among partners, that the infrastructure increases partners' visibilities and vice versa, and that partners are enabled to stay current and state-of-the-art. This is shown on OPERAS (open access in the

european research area through scholarly communication), a research infrastructure for open scholarly communication in the social sciences and humanities, and its partner the Max Weber Foundation, a German research institution.
