## Resumen

Se analiza el concepto, todavía inestable, de ontología como instrumento de organización y representación del conocimiento en dos revistas españolas del área de documentación, a saber, las colecciones completas de "Scire: representación y organización del conocimiento" e "Ibersid: revista de sistemas de información y documentación", publicadas por la Universidad Zaragoza. Se buscó el término "ontología" en los campos de título, palabras-clave y resumen, obteniéndose un corpus de dieciocho artículos disponibles en formato electrónico. El análisis temático del corpus reveló que los enfoques sobre ontología

## Abstract

The concept of ontology as a tool for knowledge organization and representation, which is not yet stable, is analyzed in two Spanish journals of information science, namely "Scire: representación y organización del conocimiento" and "Ibersid: revista de sistemas de información y documentación", both published by the University of Zaragoza. The term "ontology" and its variations were searched in the fields of title, keywords and abstract. A corpus of eighteen articles was obtained. The approaches to ontologies were classified into four categories of analysis: conceptualization, comparison, application and new applica-

# Oncology palliative care: access barriers: bibliometric study

Martins Fideles dos Santos Neto, Carlos Eduardo Paiva, Crislaine de Lima, Adeylson Guimarães Ribeiro, Bianca Sakamoto Ribeiro Paiva 

## ABSTRACT

**Objective** To perform a bibliometric analysis of studies that evaluated the barriers to access to cancer palliative care (PC).

**Methods** This was a bibliometric review using MEDLINE; EMBASE; Web Of Science; LILACS and the Cochrane Library. A search was conducted with the terms Barriers, Palliative Care and Cancer. Articles whose objectives targeted barriers to access to PC were considered, regardless of the year of publication. The setting is articles published from 1987 to 2020.

**Results** A total of 6158 articles were identified, of which 217 were eligible for analysis. The USA and UK being the countries with the largest number of articles on the subject (n=101, n=18, respectively). After expert analysis, the barriers were grouped into nine categories.

**Conclusions** Barriers related to symptom control were identified in 19% of the eligible articles, along with barriers related to health, which with 24% of occurrence in the articles, were the most frequently cited barriers. Countries which have implemented PC for some time were those with the greatest number of publications and in journals with the highest impact factors. Cross-sectional study design continues to be the most frequently used in publications.

## Key messages

### What was already known?

- ▶ Palliative care is not always seen as treatment modality and the referral of patients becomes increasingly late or non-existent.
- ▶ Nonexistent bibliometric analysis that regarding the barriers to access to cancer palliative care.

### What are the new findings?

- ▶ The Scientific evidence resulted in the identification of 19 barriers, which were grouped into 9 classes.
- ▶ The development of palliative care services in a country can be closely linked to knowing the barriers to access to cancer palliative care.

### What is their significance?

- A. Clinical
- Knowing the barriers in palliative care can improve the process of acceptance of this care, and thus, improve patient referral and reception.
  - Knowing the barriers in palliative care offers opportunities for intervention to improve this context.
- B. Research
- Researchers can propose different study designs to identify new barriers and better solutions to overcome them.
  - It is important to know which barriers have been studied and by which

# Influence of advance directives on reducing aggressive measures during end-of-life cancer care: A systematic review

Lillian Ponchio E Silva Marchi <sup>1 2</sup>, Martins Fideles Dos Santos Neto <sup>1 2</sup>, Júlia de Pauli Moraes <sup>1</sup>, Carlos Eduardo Paiva <sup>1 2 3</sup>, Bianca Sakamoto Ribeiro Paiva <sup>1 2</sup>

## Abstract

**Context:** Although the literature recognizes the participation of patients in medical decisions as an important indicator of quality, there is a lack of consensus regarding the influence of advance directives (ADs) on reducing aggressive measures during end-of-life care involving cancer patients.

**Objective:** A systematic review was conducted to analyze the influence of ADs on reducing aggressive end-of-life care measures for cancer patients.

**Method:** We searched the Medline, Embase, Web of Science, and Lilacs databases for studies published until March 2018 using the following keywords, without language restrictions: "advance directives," "living wills," "terminal care," "palliative care," "hospice care," and "neoplasms." Article quality was assessed using study quality assessment tools from the Department of Health and Human Services (NHLBI).

**Results:** A total of 1,489 studies were identified; 7 met the inclusion criteria. The studies were recently published (after 2014, 71.4%). Patients with ADs were more likely to die at the site of choice (n = 3) and received less chemotherapy in the last 30 days (n = 1). ADs had no impact on intensive care unit admission (n = 1) or hospitalization (n = 1). One study found an association between ADs and referral to palliative care, but other did not find the same result.

## Guide Based on Evidence of Multiprofessional Guidance for Fluid Overload in Pediatric Oncological Patients

Maristela Sacchi Facholi  
Andreia Ribeiro Pereira Aguiar de Paula  
Martins Fideles dos Santos Neto  
Luiz Fernando Lopes

**BACKGROUND:** Excessive use of fluids can cause tissue edema and organ dysfunction, which can result in high levels of morbidity, prolonged length of stay and mortality in pediatric cancer patients. The multiprofessional team assists in the recognition of this clinical condition, bringing an important contribution to this scenario, which impacts on improving patient care and reducing admission to the Pediatric Intensive Care Unit. Thus, the present study is justified for the recognition and early approach of these patients, aiming to reduce the morbidity and mortality related to fluid overload, through the construction of an evidence-based multiprofessional guidance flowchart.
