Run modules:

↕ Reorder (http://formr.org/admin/run/randomisierung/ajax_reorder)

0 6 ✕

0

Randomly assign to one of

2

groups counting from one.

You can later read the assigned group using `shuffle$group`.

You can then for example use a `SkipForward` to send one group to a different arm/path in the run or use a `showif` in a survey to show certain items/stimuli to one group only.

Explanations for the modules

Markdown & Knitr

formatting, personalising, plotting feedback

Markdown

You can format your text in a simple way using Markdown  (<http://daringfireball.net/projects/markdown/syntax>). The philosophy is that you should simply write like you would in a plain-text email and Markdown turns it nice. Specifically:

```
* list item 1
* list item 2
```

will turn into a nice list. *italics* and **bold** are also easy to do, as are `[links (http://yihui.name/knitr/)](http://yihui.name/knitr/)`.

Knitr

If you want to customise the text or generate custom feedback, including plots, you can use Knitr (<http://yihui.name/knitr/>). You can freely mix Markdown and chunks of Knitr. Some examples:

Today is ``r date()`` shows today's date.

Hello ``r demographics$name`` greets someone using the variable "name" from the survey "demographics".

You can also plot someone's extraversion on the standard normal distribution.

```

```{r}
extra_norm_mean = 3.2
extra_norm_sd = 2.1
big5$extraversion = (
 rowMeans(
 subset(big5, select = extra1:extra10)
)
 - extra_norm_mean) / extra_norm_sd

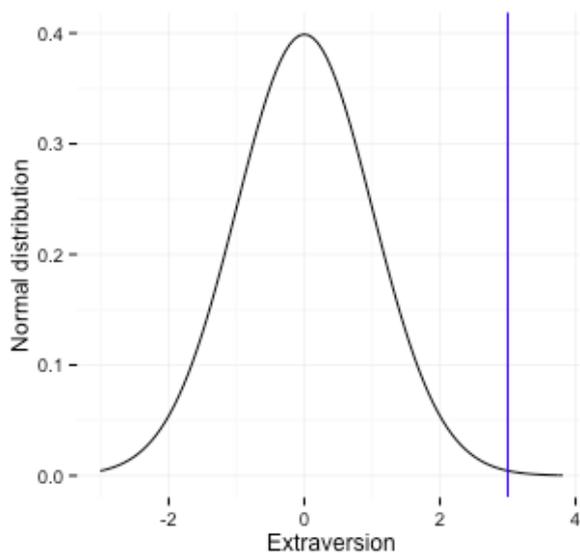

z = rnorm(1000)

library(ggplot2)

qplot(z, geom = "blank") +
 stat_function(fun=dnorm, aes(x = z)) +
 geom_vline(xintercept=big5$extraversion, colour="blue") +
 xlab("Extraversion") +
 ylab("Normal distribution") +
 theme_minimal()
```

```
