

Classified Plant Al-Dhahiriya in the South of Palestine

Jehad Mahmoud Hussein Ighbareyeh

Abstract: We studied plant species of Dhahiriya in the period between January to October 2021, and January to Jun 2024, due to the importance of plants in that vital part of Palestine, which is located in southern Palestine, including that region's climate, and unique plants that represent of the Mediterranean region plants, North Africa, Sinai desert, Negev, Dead Sea, and Red Sea. It used the Braun-Blanquet (1979) method for the identification of plants. Moreover, Plants have been studied in Dhahiriya, located in southern Palestine. A total of 770 species from 70 families were identified, of which 86 (11.16%) are endemic. The plant families with the highest representation were Asteraceae (14.54%), Fabaceae (14%), Poaceae (7.41%), and Lamiaceae (5.19%). Regarding plant life forms, Therophytes account for 47%, Hemicryptophytes for 20.35%, Shrubs or Chamaephytes for 14.05%, and Trees or Phanerophytes for 9.05%, with a notable increase in spring.

Keywords: Botany, life form, plant taxa, Taxonomy, Palestine, Al-Dhahiriya.

I. INTRODUCTION

The first volume on plants was published in Palestine in 1966 [1, 2]. Still, many changes took place in the different plant species, over decades, during which a radical change in the life and distribution of plants, resulting from human activities, and bioclimate factors [3, 4, 5], the topography of the region Palestine, and to know the varieties of plants for an important geographical area in southern Palestine, because of its unique plant species, additionally, Dhahiriya is situated near the Sinai Desert, Negev, Red Sea, and Dead Sea. The extension of its fertile vegetation as a part of the highlands of the mountains of Palestine and the occupied Palestinian coast strongly motivated us to know and identify varieties of plants for this region. About 2,750 species of wild plants have been identified and described in historical Palestine within 138 families, and the number of plant species endemic to Palestine is estimated at 261 species, 53 of which are very rare [6]. There are a few studies in which flora has been studied in the south of Palestine, such as [7-9], Negev [10], and regionally such as Sinai [11-14], Lebanon, Jordan, Syria, and Egypt [15].

On the other hand, many scientists and researchers have studied many plants in the Mediterranean region, which consider the plants of Palestine as part of this region [7, 8, 16, 17, 18, 19, 20, 21, 22] [31]. The purpose of the present study is to determine plant species of the Al-Dhahiriya region in Palestine.

II. METHODOLOGY

A. Study Area

Al-Dhahiriya (Al-Zahiriyyah) is one of the Palestinian cities located within the Hebron Governorate, located 23 km southwest of the Hebron city (Figure 1). It has an elevation of about 655 m above sea level with coordinates (31° 24'28N 34°58'20E) and an area is 98 (37.8 square miles) Km², Al-Zahiriya arose above the site of the Canaanite town of Goshen, which may mean "earth mound" (and some residents of the town interpret it as "post"). On the other side, it was called Al-Zahiriya after the Mamluk leader Al-Zahir Baybars, who fortified it to fight the Crusaders, according to the local tradition of the people, and supported by archaeology have that Al-Dhahiriya was founded by Baibars (1223/1228 – 1277) [23], also it was surrounded by the lands of Al-Samu and the Dead Sea to the east, Dura to the north, the district of Beersheba, Sinai desert and the Red Sea to the south and the Mediterranean region to the west.

B. Data Collection and Vegetation

About 230 samples of different plants were selected from the Al-Zahiriya region, including a group of Al-Khrab that contain archaeological sites, the most important of which are: Kafr Gul, Al Ras, Deir Al-Louz, Umm Sir, Al-Rahwa, Al-Jabari, Asila, Badgush, Jawy, Deir Al-Haw, Deir Saida, Attir, Al-Tal, Tal Arad, Takhana, Rajoum, Beit al-Qasr, Umm Nakhla, Umm al-Amad, Al-Rabieh, Khirbet Zanouta, Khirbet Omdimneh, Khirbet T trait in addition to many small inhabited villages affiliated to Al-Dhahiriya, the most important of which are: Douma and Shweika, Annab (small and large), Doha, Al-Bereh, Al-deer and others, as in the (Figure 2).

Fig. 2. Represents Some Villages and Towns in Hebron Governorate, Including Al-Dhahiriyah, in which the Study was Conducted

C. Data Analysis

Moreover, more than 230 plant samples were studied for Al-Zahiriya during the spring and summer of 2021, and January to Jun 2024, and it included herbaceous, forest, steppe, scrubland, and other plants. The Braun-Blanquet [24] [25] (1979) method was used to classify various plants, as more than 770 plant species were found, as shown in (Table 1), where the number is indicated (5: when the variety covers more than 75-100% of the area; 4: when the number of individuals covers 50-75% of the area; 3: when several individuals cover 25-50% of the area; 2: When the plant covers at least 5-25% of the area; 1: when the species has a small coverage value, <5%; and +: when the species is sparsely present as a very small cover, >5% of the area)). On the other side, we found a few plants in the southern areas of Palestine [3, 4, 5, 9] [26,27][28][29][30] and neighboring Egypt, Beersheba, and the Sinai desert which are connected with the area study.

Abbreviations: Life form: Annual (A), Annual vine (A, V), annual, parasite, vine (A, P, V), hemicryptophytes (Hm), hemicryptophytes-Parasite (Hm, P), hemicryptophytes-annual (Hm, A), hemicryptophytes-vine (Hm, V), hemicryptophytes-geophyte (Hm, G), shrubs, semi-shrubs/shrublet or chamaephytes (Cm), chamaephytes-hemicryptophytes (Cm, Hm), Cm, V (chamaephytes-vine), chamaephytes-geophyte (Cm, G), chamaephytes, shrubs-geophyts (Cm,G), chamaephytes-annual (Cm, A), chamaephytes, hemicryptophytes, annual (Cmh, Hm, A), Tree (Tr), phanerophyte (Phs), phanerophyte-tree (Phs, Tr), phanerophyte- shrubs (Phs, Cm), phanerophyte shrubs, vine (Phs, Cm, V), phanerophyte- shrubs-hemicryptophytes (Phs, Cm, Hm), phanerophyte geophyte (Phs, G), geophyte (G), geophyte-vine (G, V), parasite vine (P, V) and helophyte (HE). Status: (Eedimic) (E), native (Na). Climatology: Mediterranean (Mid), Transition zone (Tz), Oromediterranean (OM), Desert (D), and Sd & Xd (semi desert & extreme desert). Pollination: Animals (An), Wind (Wi) and Fer (Fern).

III. RESULT AND DISCUSSION

Due to the important geographical location of Al-Dhahiriya in southern Palestine, the Mediterranean, Turanian, Iranian, Sudanese, and Arab desert vegetation regions overlap in a region with different climates and soil types (Ali-Shtayeh et al., 2003; Ali-Shtayeh et al., 2008; Ighbareyeh et al., 2014c, 2016, 2017, 2018, 2019, 2020, 2021), The flora in this region is also considered part of the African flora such as Egypt, Red Sea & Sinai desert; Negev; Syria; Lebanon; Jordan; Jordan Valley; Dead Sea and Mediterranean region.

A. Plant Taxonomic Cover

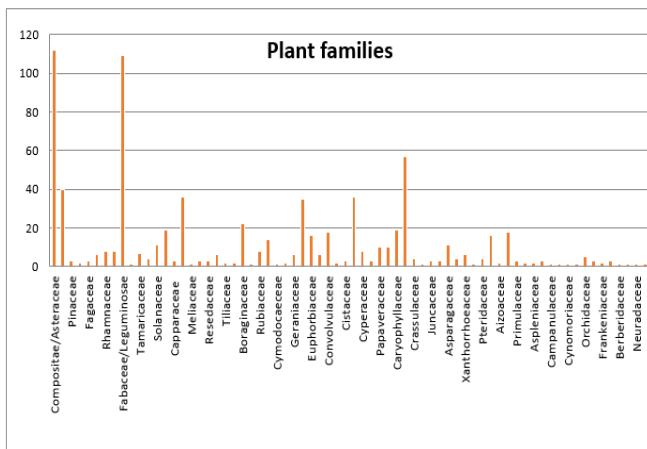

The collection of vascular plants contains 230 specimens belonging to 70 families, 770 species, and the plant families that contributed the most to their existence in terms of the percentage of their plant species are: Compositae (Asteraceae) (112, 14.54%), Fabaceae (Leguminosae) (109, 14.15%), Poaceae (57, 7.41%), Lamiaceae (40, 5.19%), Amaranthaceae (36, 4.67%), Brassicaceae (36, 4.67%), Apiaceae (35, 4.54%), Boraginaceae (22, 2.85%), Malvaceae (19, 2.46%), Caryophyllaceae (19, 2.46%), Amaryllidaceae (18, 2.33%), Convolvulaceae (18, 2.33%), Euphorbiaceae (16, 2.07%), Ranunculaceae (16, 2.07%), and Scrophulariaceae (14, 2.33%), as tabulated in (table 2 and figure 3).

Table 2. Percentage of Flora Families

Family	No. of species	Percentage %
Compositae/Asteraceae	112	14.54
Lamiaceae	40	5.19

**Fig. 3. The Plant Families Studied****B. Life form of the Plants**

Plant life-form diagrams are a way of classifying plants rather than the normal scientific classification of species, genera, and families (Du Rietz, 1931). In our study we recorded 770 plant species, of which annual (364, 47.26%), as annual (348, 45.19%), annual vine (15, 1.94%) and annual, parasite, vine (1, 0.12%); hemicryptophytes (157, 20.35%) as (hemicryptophytes (148, 19.22%), hemicryptophytes-Parasite (2, 0.25), hemicryptophytes –annual (3, 0.38), hemicryptophytes-vine (3, 0.38) and hemicryptophytes-Geophyte (1, 0.12); shrubs or chamaephytes (112, 14.05%) of which shrubs, chamaephytes, semi-shrubs (101, 13.11%), chamaephytes-hemicryptophytes (4, 0.51%), chamaephytes -vine (3, 0.38%), chamaephytes geophyte (1, 0.12%), chamaephytes, shrubs-geophyts (1, 0.12%), chamaephytes-annual (1, 0.12%) and chamaephytes, hemicryptophytes, annual (1, 0.12%); tree (36, 4.67%); phanerophyte (34, 4.38%) as phanerophyte (23, 3%), phanerophyte- tree (3, 0.38%), phanerophyte- shrubs (1, 0.12%), phanerophyte shrubs, vine (3, 0.38%), phanerophyte- shrubs-hemicryptophytes (3, 0.38%) and phanerophyte geophyte (1, 12%); geophyte (52, 6.74%) as geophyte (42, 5.45%) and geophyte-vine (10, 1.29); parasite vine (8, 1.03); and helophyte (7, 0.90), in the (table 3 and figure 4).

Table 3. Life form and Spectrum of the Flora

Raunkiær plant life-form	Number of species	Percentage %
Tree	36	4.67
Phanerophyte	23	3
Phanerophyte- Tree	3	0.38
Phanerophyte- shrubs	1	0.12
Phanerophyte shrubs, vine	3	0.38
Phanerophyte- shrubs- Hemicryptophytes	1	0.12
Phanerophyte-Geophyte	3	0.38
Shrubs, Chamaephytes, semi-shrubs	101	13.11
Chamaephytes-Hemicryptophytes	4	0.51
Chamaephytes -Vine	3	0.38
Chamaephytes-Geophyte	1	0.12
Chamaephytes, Shrubs-Geophyts	1	0.12
Chamaephytes- Annual	1	0.12
Chamaephytes, Hem, Annual	1	0.12
Hemicryptophytes	148	19.24
Hemicryptophytes- Geophyte	1	0.12
Hemicryptophytes-Parasite	2	0.25
Hemicryptophytes -Annual	3	0.38
Hemicryptophytes-Vine	3	0.38
Geophyte	42	5.45
Geophyte Vine	10	1.3
Annual	348	45.2
Annual-Vine	15	2
Annual, parasite, vine	1	0.12
Parasite vine	8	1.03
Helophyte	7	1
Total	770	100%

**Fig. 4. Raunkiaer Plant Scheme**

Furthermore, depending on the geographical distribution of plant species in Al-Dhahiriya, these regions are divided as follows: Irano-Turanian region (Oriental Steppe), Savanna, North African-Eurasian Zone, Saharo-Arabian region, the Sudanese penetration region, and Mediterranean region; and with a different soil type as soil sandy to deep red clay, the arid region includes desert soils, Lysan-Marl soils, and loess areas, while the semi-arid region features Mediterranean steppe soils and dunes (sandstone cemented with calcium carbonate), addition to Rendzina soil.

In addition to that, there are many important studies of plant phytosociological, plant communities have been conducted in southern Palestine, and near Dhahiriya, between 2012 and 2021, including:

- Eight plant groups were identified between 2012-2014, namely: [9]

Pistacio palaestinae - Quercetum lokii*
 Capparido sinaicae - Ceratonietum siliquae
 Cerasus microcarpae-Quercetum ithaburensis*
 Pyro siriaceae - Abietetum ciliciae*
 Abio ciliciae - Ceratonietum siliquae
 Periploco aphyllly - Pinetum halepensis
 Cytisopsis pseudocytiso -Tamaricetum tetragynae
 Crataego sinaicae -Tamaricetum jordanii.

Three new plant groups were described [21]:

Pino halepensis -Quercetum lookii*
 Pistacio palaestinae -Ceratonietum siliquae*
 Quercus libanii -Tamaricetum palestineae*

Also, three associations idenetified in 2020 by Jehad M. H. Ighbareyeh [5], as:

Pistacio lentisci-Quercetum lokii nova. hoc loco
 Ceratonia siliquae-Quercetum callipinii nova. hoc loco
 Pino halepensis-Curessetum sempervirentis nova. hoc loco.
 with three alliances as Pistachio-Quercion lokii, Ceratonia
 siliquae -Quercion calliprinae and Pino halepensis-
 Cupression sempervirentis

IV. CONCLUSION

In this study, more than 770 plant species were recorded, eighty-six endemic species, of which 54 are very rare endemic species, and 70 plant families, the most important of which are Compositae or Asteraceae, Fabaceae or Leguminosae, Poaceae, Lamiaceae and Amaranthaceae.

AUTHOR PROFILE

Jehad M. H. Ighbareyeh, is an Assistant Professor in Botany, holds a Ph.D. degree in Botany-Sciences (2014), a master's degree in “Biotechnology and biomedicine” (2013), a master's degree in “Olive Growing, Olive Oil and Health” (2011) at the Faculty of Experimental Sciences, University of Jaen, Spain, and Bachelor's degree in “Plant Production and Protection” (2003), Faculty of Agriculture, Hebron University, Hebron, Palestine. Published many papers scientific in prestigious scientific journals, some other books, seminars, and various scientific workshops. He is an arbitrator, reviewer, and Editorial board member to several prestigious international Journals in the world. Currently works at the Department of Plant Production and Protection, Faculty of Agriculture, and Faculty of Technology and Applied Sciences, Al-Quds Open University, Hebron Branch, Hebron, Palestine, and researcher at the Department of Animal, Plant Biology and Ecology, Faculty of Experimental Sciences, University of Jaen, Spain, and Lecturer at many Palestinian universities. Jehad Ighbareyeh does research in Systematics (Taxonomy), Flora, Botany, Ecology, climate change, Biology, Biotechnology and Biomedicine. A main investigator for some national and international research” as ERASMUS. Director of a group of researchers at Al-Quds Open University - Faculty of Agriculture - Hebron branch, Hebron, Palestine, with the cooperation of the University of Jaen, Jaen, Spain. Jehad has many scientific papers and books published in prestigious international scientific journals and has participated in many scientific conferences, workshops, seminars, various scientific visits, and academic exchanges between international universities.
