

TECH. PARTNER	MAIN POLICY SECTORS	SOCIO-ECONOMIC CONTEXT	MAIN CHALLENGES
NCSRD	Water, biodiversity, agriculture	Agriculture (PDO products), tourism	<b>Hot-spot</b> Sea level raise, flooding and droughts. Preserve biodiversity, food chain & archaeology
FBK	Tourism & energy	Winter tourism, energy production	<b>Hot-spot</b> Rising temperature, unpredictable precipitation patterns, modified seasonal climate dynamics
IVL	Energy, fisheries, forestry, industry	Energy production, reindeer, tourism	<b>Hot-spot</b> Need of upgrading the energy system and allocation of resources for climate adaptation
CARTIF	Water, agriculture	Agriculture, tourism, industry	<b>Hot-spot</b> Desertification due to soil erosion in agricultural systems. Sustainable water management
SIMAVI	Water, tourism, agriculture, energy	Agriculture, low education level, Economical dependency	Environmental and ethnic wealth protection. Sustainable tourism and eco-agriculture promotion Land-use management

The dataset consist of the historical and climate projection (CMIP6) for gridded atmospheric variables and the climate hazards/extreme events alongside the return values (likelihood) of hazards/extreme events. The dataset was developed during NEVERMORE project as part of WP3 from CMCC and NCSRD.

## Sitia, Crete island (Greece) (NUTS 3)

The Municipality of Sitia covers the Eastern part of the island of Crete with 633.22 km<sup>2</sup> and a population of 19,029 inhabitants. It is Europe's municipality most "extreme climate hotspot", mainly due to thermal drought conditions. Sustained high winds at the eastern part, and almost 300 sunshine days/year, with few rain events. Coastal erosion (especially southern coasts) has been accelerated in recent years. The economy is traditionally based on agricultural crops and olive trees, producing multiple Protected Destination of Origin (PDO) products, which has produced a steady increase in exports. Tourism has seen a rapid expansion in recent years.

**Main challenge:** Sitia is the EU region most exposed to climate pressures, mainly heat and droughts, during summer periods due to tourism and agriculture. Besides, the projected sea level rise is over 1m (by 2100) and storm surges will induce unexpected changes in the coastline due to coastal erosion. A main challenge for the region is to maintain sufficient and sustainable freshwater resources, of high environmental quality. Intense local scale weather patterns due to highly complex topography and air-sea interaction are making a sound response very challenging.

**Mitigation and adaptation strategies:** There is a lack of projects related to climate mitigation and adaptation linking local/regional policies to sustainable development and climate resilience, with citizen engagement. However, there is a holistic plan for the sustainable local development and preservation of the natural and cultural environment.

**Preliminary Local Council of Stakeholders:** Policy-makers: Sitia Municipality, Region of Crete; Academia: NCSRD, Primary / Secondary Schools & Youth/citizens (educational courses); Civil society, NGOs, associations: Municipal Organisation of social and cultural development of Sitia (Dokas), Women associations; Private sector: Union of Agricultural Cooperatives, Farmers Cooperatives, Individual Farmers; Associations of Hotels / individual hotels, Wind Farms Operators; Municipal Civil Protection (risk reduction), Local Hospital/Health Centres.
