RDF BASED MODELING OF RELATIVE AND ABSOLUTE CHRONOLOGICAL DATA:

EXAMPLES FROM THE CENTRAL AFRICAN RAINFOREST AND ROMAN PERIODISATION

Dirk Seidensticker¹, Florian Thiery², Allard Mees² and Clemens Schmid³

Ghent University
 Römisch-Germanisches Zentralmuseum - Leibniz Forschungsinstitut für Archäologie, Mainz

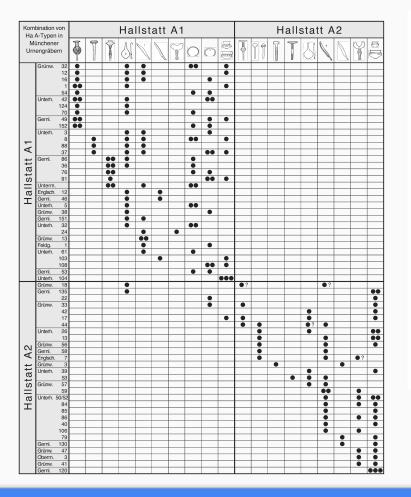

3 University of Kiel

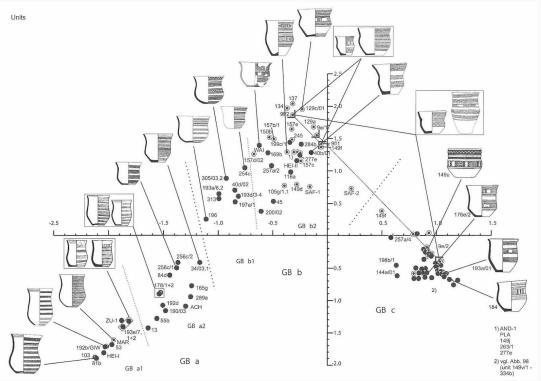

Our Aim

Create a reproducible RDF representation of the state of knowledge concerning the temporal sequences of time intervals

3(0E

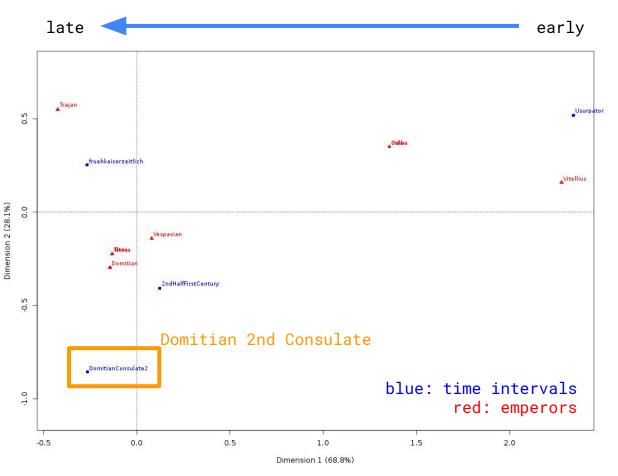

Correspondence analysis and chronology

- ↑ CA of bell beakers of the Rhine-Main-Necker complex (Müller/Hinz/Ullrich 2015: 59 Fig. 6.2)
- Seriation of the Hallstatt A period in the region of Munich (Eggert 2008: 208 Fig. 49)

Method test with Roman emperors

Results in 3D and 2D of a CA of Roman Emperors and reigning years

The Alligator Method (Part 1)

github.com/RGZM/alligator

and the second second states and the second states and the second s

- Each emperor has a starting and end year (e.g. Traian: 98-117 AD)
- Most but not all time intervals have a starting and end year (e.g. 2nd Half First Century: 50-100 AD)
- Some intervals have unknown floating (=schwebend) starting and/or end years (e.g. the unknown time period of the 2nd Domitian consulate)
- The horizontal CA dimension axis defines the amount of overlap between the time intervals

- **Step 1:** All 3D distances between the CA time periods are calculated
- **Step 2:** The nearest 3D CA neighbours for start and end years of the floating intervals towards intervals with fixed values are located
- Step 3: the result is stored as a "calculated virtual fuzzy year"
- Step 4: the intermediate result of the fixed and floating time intervals is stored as a list of "virtual fuzzy start and end years"

The Alligator Method - Procedures Part 1

A	В	С	D	E	F	G
1 name	X	У	Z	von	bis	fixed
2 fruehkaiserzeitlich	-0.2660	0.2530	0.0072	1	150	fixed
3 2ndHalfFirstCentury	0.1235	-0.4078	-0.0481	50	100	fixed
4 Usurpator	23.415	0.5180	0.0610	69	69	fixed
5 Galba	13.550	0.3500	0.0580	69	69	fixed
6 Otho	13.550	0.3500	0.0580	69	69	fixed
7 Vespasian	0.0810	-0.1420	-0.1450	69	79	fixed
8 Titus	-0.1320	-0.2240	-0.1790	79	81	fixed
9 Domitian	-0.1430	-0.2960	0.1180	81	96	fixed

The Alligator Ontology for modeling the results in RDF (Vättern Edition)

The Alligator Method (Part 2)

github.com/RGZM/alligator

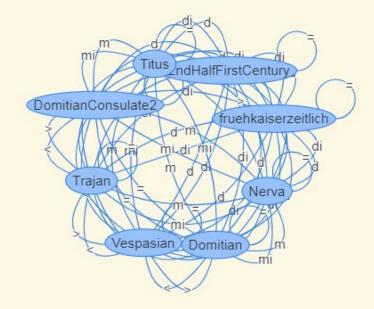

and increasing it was also been been and a second second second

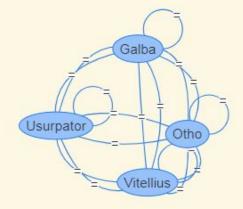

- Step 5: the "virtual fuzzy years" are transformed to relative time intervals using Allen interval algebra
- Step 6: create a RDF representation in order to achieve a representation of the state of knowledge concerning the temporal sequences of time intervals, which is transparent, interoperable, semantically described and machine readable
- **Step 7:** visualisation of the results
- Step 8: look for contradictions
- Step 9: resolve them and start with step 1

		1	2	3	4	5	6	7	8	9	10	11	12

Alligator Output of the Allen relations based on the 'ChronoCongo' dataset

RDF based modelling of relative and absolute chronological data is now reproducible and machine readable, but ...

... visualizations that are a meaningful representation of the data are hard to come by.

Dirk Seidensticker, Florian Thiery

Allard Mees, Clemens Schmid
