# Content Overview

- Impact Monitor overview
- Demonstration Use Cases “philosophy” and objectives
- Demonstration Use Cases implementation process
- Demonstration Use Cases status and key results
- Conclusion and perspectives

# Impact Monitor at a glance

- Impact Monitor is a 2-year EU Project to deliver a **coherent, collaborative and holistic demonstration framework and toolbox** for technology and policy assessment of the environmental, economic, and societal impact of European aviation R&I.
- Focus of the Impact Monitor project is to **demonstrate with approximate use cases** the collaborative assessment of future Technologies, Vehicles and Operational Strategies.

# Use Cases – “Philosophy”

## Demonstration UCs

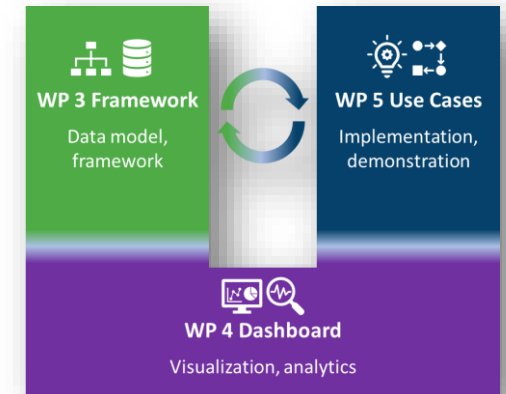

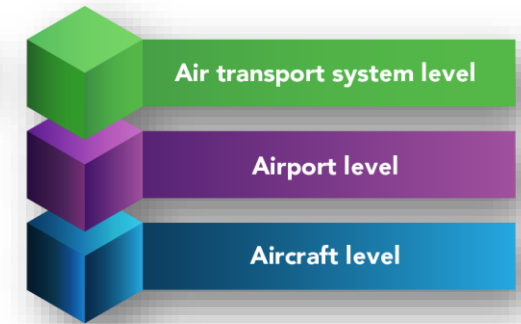

- Cover up to **3 assessment levels** (aircraft, airport, and ATS).
  - Produce key performance indicators (**KPIs**)
- &
- Implemented in the **Impact Monitor framework**
  - Results accessible through the **Impact Monitor Dashboard Application**

## But **representative UCs**

- Inspired from R&I from Horizon Europe for 3 streams:
  - **Aircraft technology/concepts** (e.g. Clean Aviation),
  - **ATM and aircraft operations** (e.g. SESAR3),
  - **Policies/regulations/market-based** measures (e.g. CORSIA).

→ The Impact Monitor Framework should be able to **demonstrate its capabilities to assess** the impact of such R&I at the appropriate assessment level(s)

**Assessment**  
is carried out at

# Use Cases – Main Objectives

- **UCs specificity**

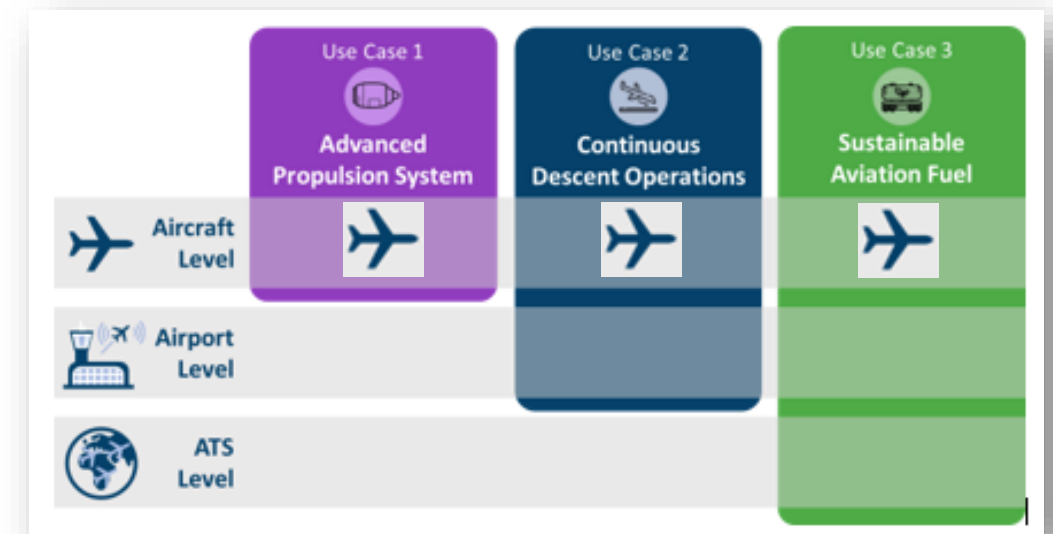

Each UC should focus on **specific demonstration** aspects

- In terms of **assessment level(s)** coverage
  - *Aircraft / Airport /ATS*
- In terms of **R&I streams**
  - *Technos/ operations / policies*
- In terms of **Framework & Dashboard** development
  - *Data model extension, Technos*

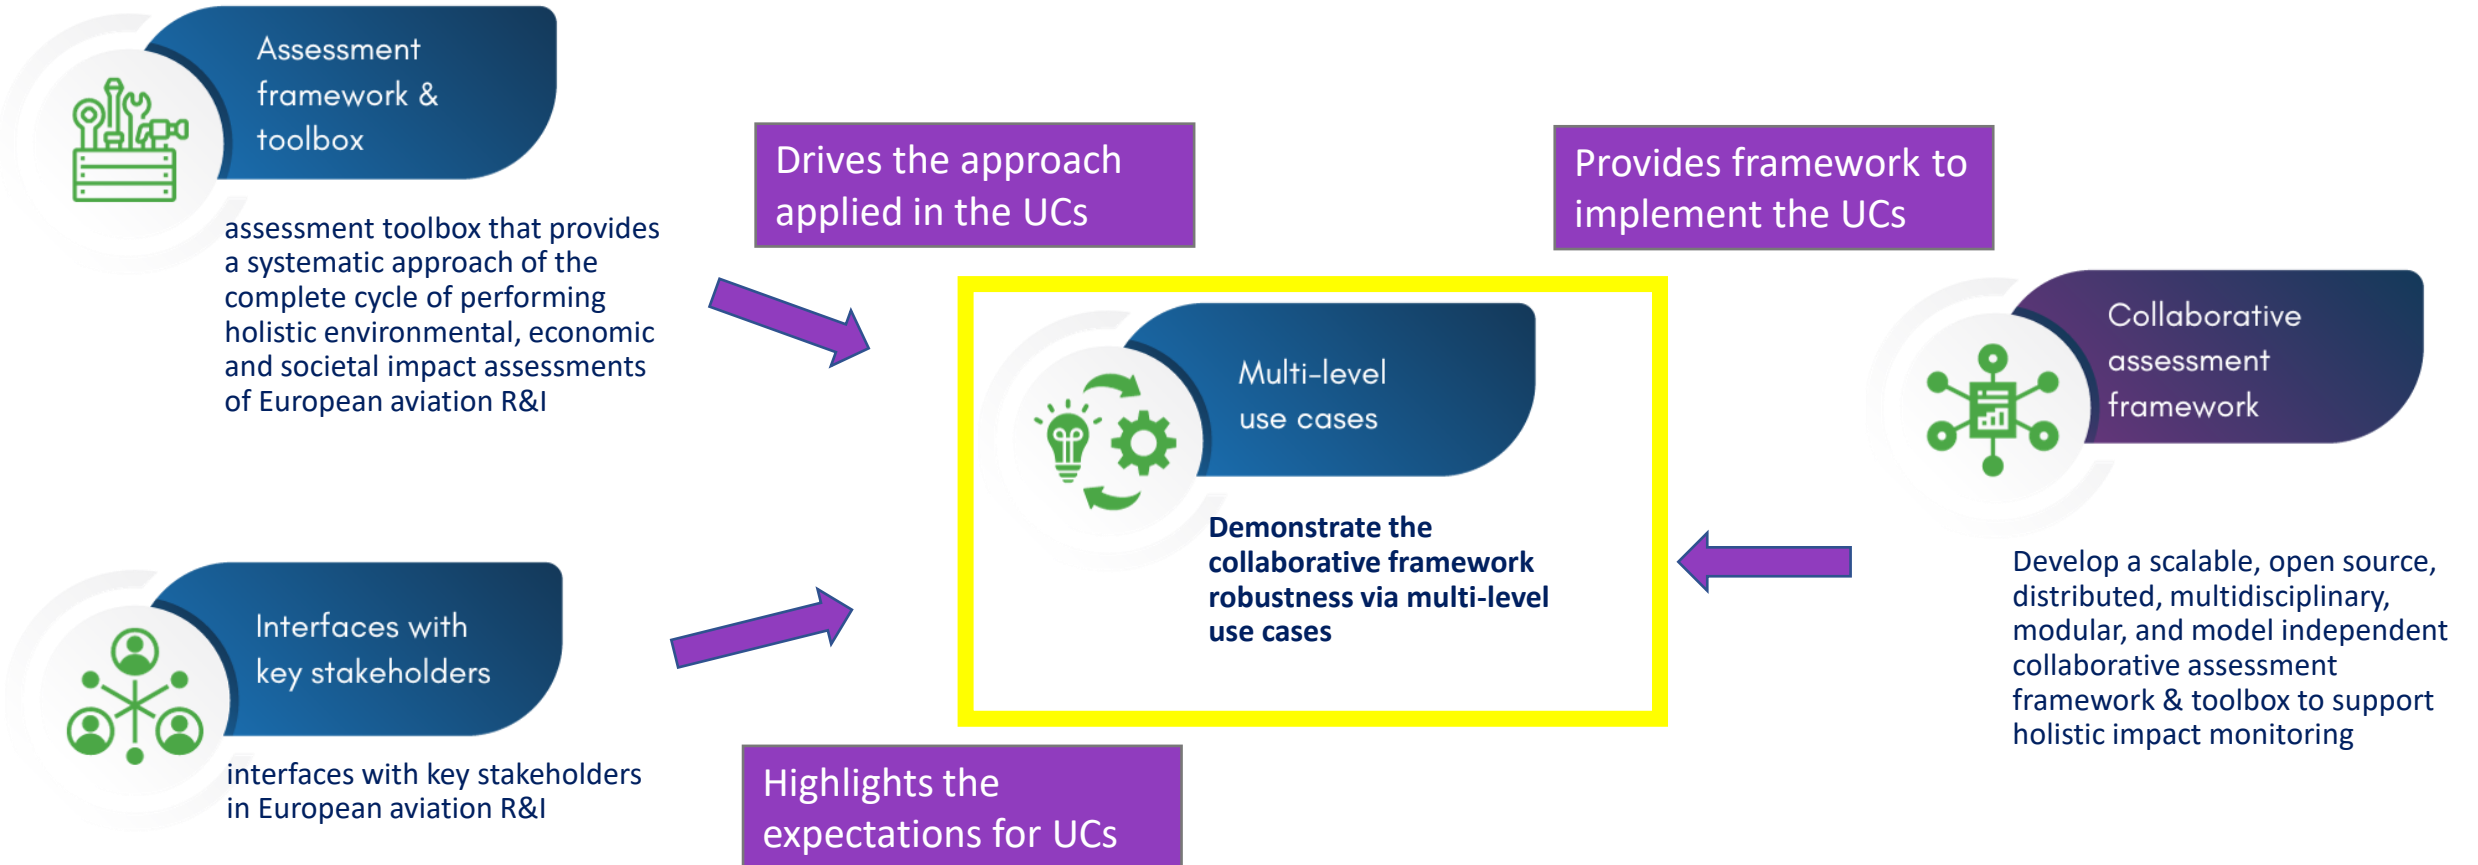

- **UCs Commonality**

All UCs should share **common features**

- **SAF** topic is common to all UCs
- **New Aircraft concepts** generated in UC1 are considered in UC2 / UC3 studies

# Use Cases as part of Impact Monitor

# Starting Point

## Models catalogue

- More than **15 models** selected for the 3 UCs ... but **none was already compliant** with the Framework technos

**DLR FORMO**  
Marc Gelhausen (FW-LVF)  
Purpose: Forecast of annual global airport pair-specific passenger and flight volume as well as fleet composition. Includes initial airport capacity.  
Software: Excel and R, self-developed

**AECCI (Aircraft Emissions and Contrails for Climate Impact)**  
Danet B., Sarraf C. (ONERA)  
Purpose: aircraft emissions and contrail formation  
Software: Python, ONERA in-house

**TRAFUMA (Transport Fuel Markets model)**  
Inge Mayeres (TML)  
Purpose: Economics – evaluation of fuel policies in transport fuel markets in the EU and the rest of the world (e.g. blending mandate, subsidy, carbon tax...)  
Software: Programming language: GAMS (https://www.gams.com). TRAFUMA is developed and owned by TML.

**Tuna, LEAS-IT, STACKS & TRIPAC**  
Peter Hoogers, Jan Middel, Yuk Shen Cheung (Royal NLR)  
Purpose: Environmental impact: Noise, emissions, air quality and fuel early risk  
Software: Java, C++

**Propulsion System Perf. Simulation/ TURBOMATCH**  
Dev Nalianda (CU)  
Purpose: Propulsion system performance simulation  
Software: Fortran, in-house developed, licensed, available for student and research use

## Framework initial «building blocks»

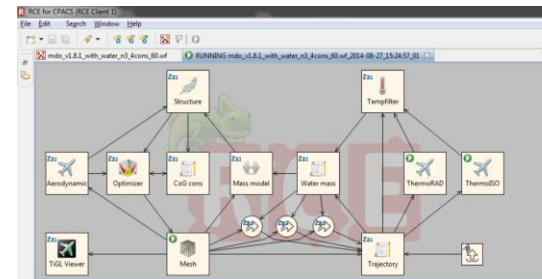

data schema for system of interest representation

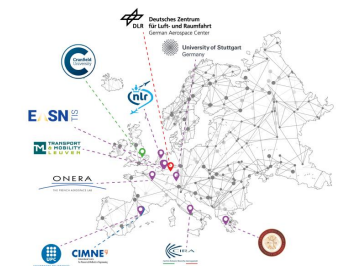

MDO system formulation environments

Executing simulation workflows

Cross-organization workflow enabler

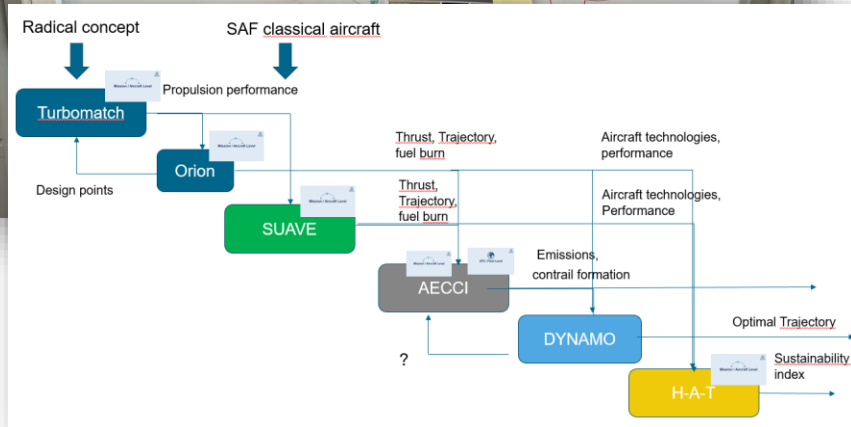

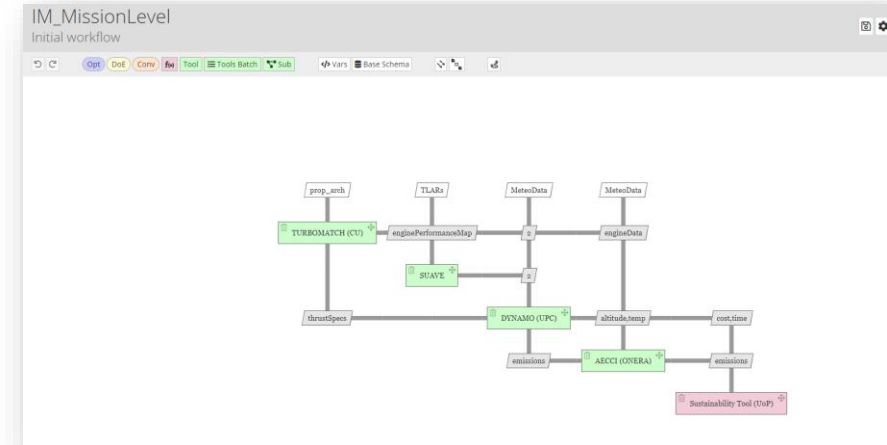

# Overall Approach – UC1 Workflow Story

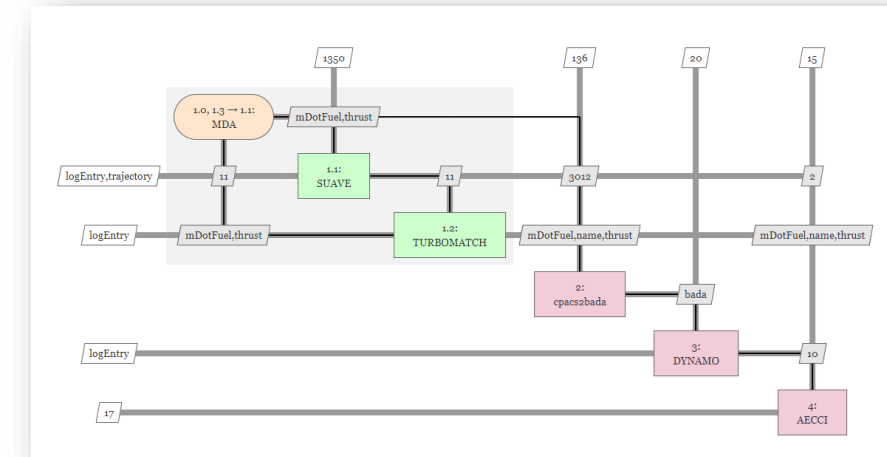

## Example: UC1 – Aircraft techno

### Identification of data to be exchanged

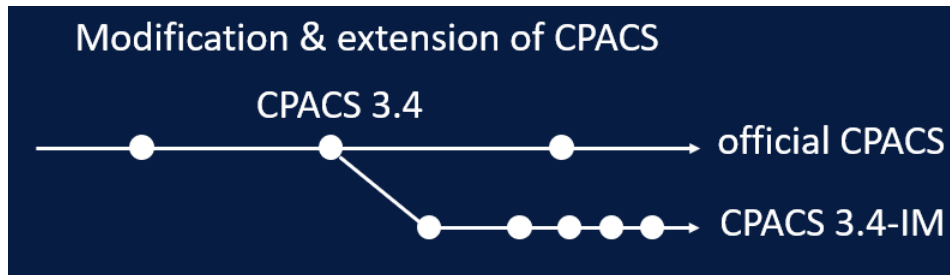

### Connection of tools to CPACS

# Overall Approach – Framework & Dashboard

## Framework

- CPACS schema extended:
  - Schedules
  - Flights
  - Missions
  - Airports
  - Studies

## Dashboard

# Use Case 1 – Advanced Propulsion System

## **Objective :**

- Investigate the viability and competitiveness of **future SAF fuelled** long range **aircraft concepts**

## **Scenario :**

- Design Mission + Long range mission + Payload Range analysis + Trajectory amendment for contrail avoidance

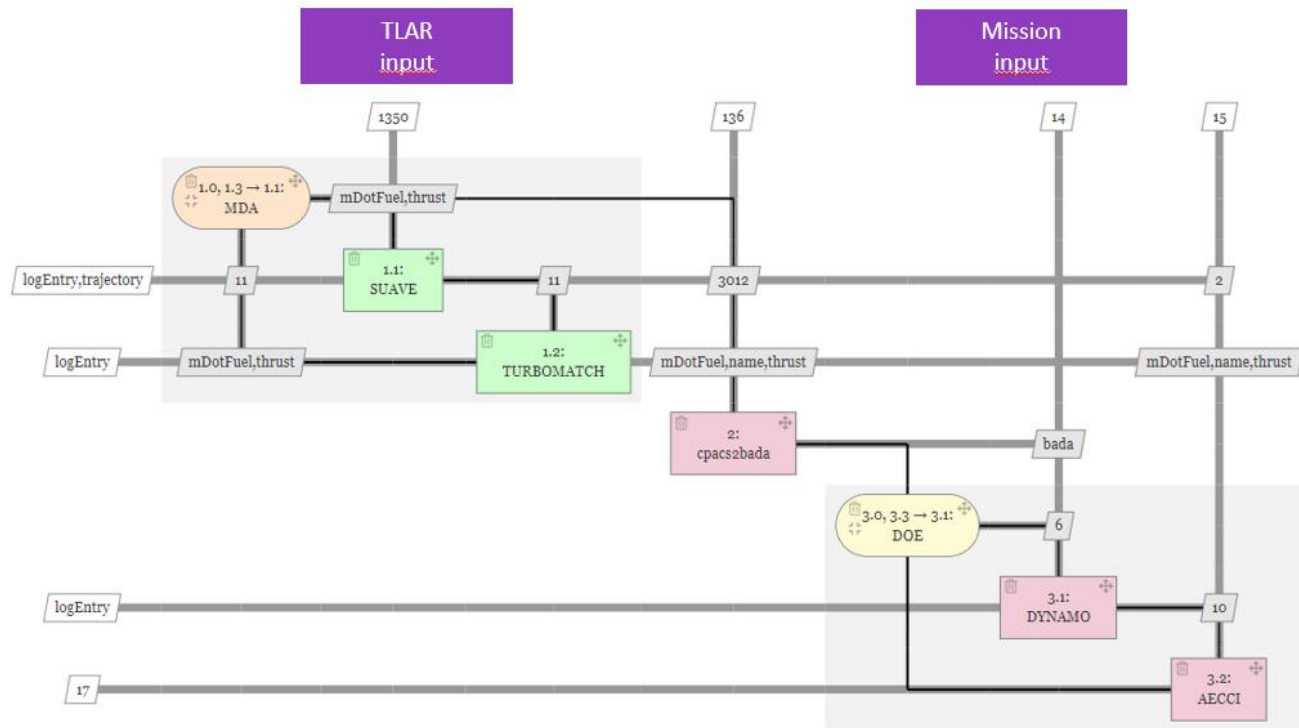

## **Aircraft and Engine Models :**

- Single Aisle (SMR) , Wide Body (LR)
- **VHBR (9-10) , UHBR 15+ with Gearbox - KER + SAF**

## **Metrics:**

- Fuel burn - design mission and operating mission
- Emissions - CO<sub>2</sub>, NO<sub>x</sub>, SO<sub>x</sub>, CO, HC, H<sub>2</sub>O and contrail formation
- Sustainability

# Use Case 1 – Advanced Propulsion System

## UC approach

- 2 steps approach
  - Aircraft / engine sizing loop
  - Analysis of emissions (incl. contrails) on a set of realistic trajectories

## Framework focus

- Take advantage of RCE capabilities with
  - MDA loop
  - DOE loop

# Use Case 2 – Continuous Descent Operations

## Objective:

- Investigate the implementation of **continuous descent operations at airports**

## Scenario:

- Continuous descent operations for a reference and future scenario at an **example airport**

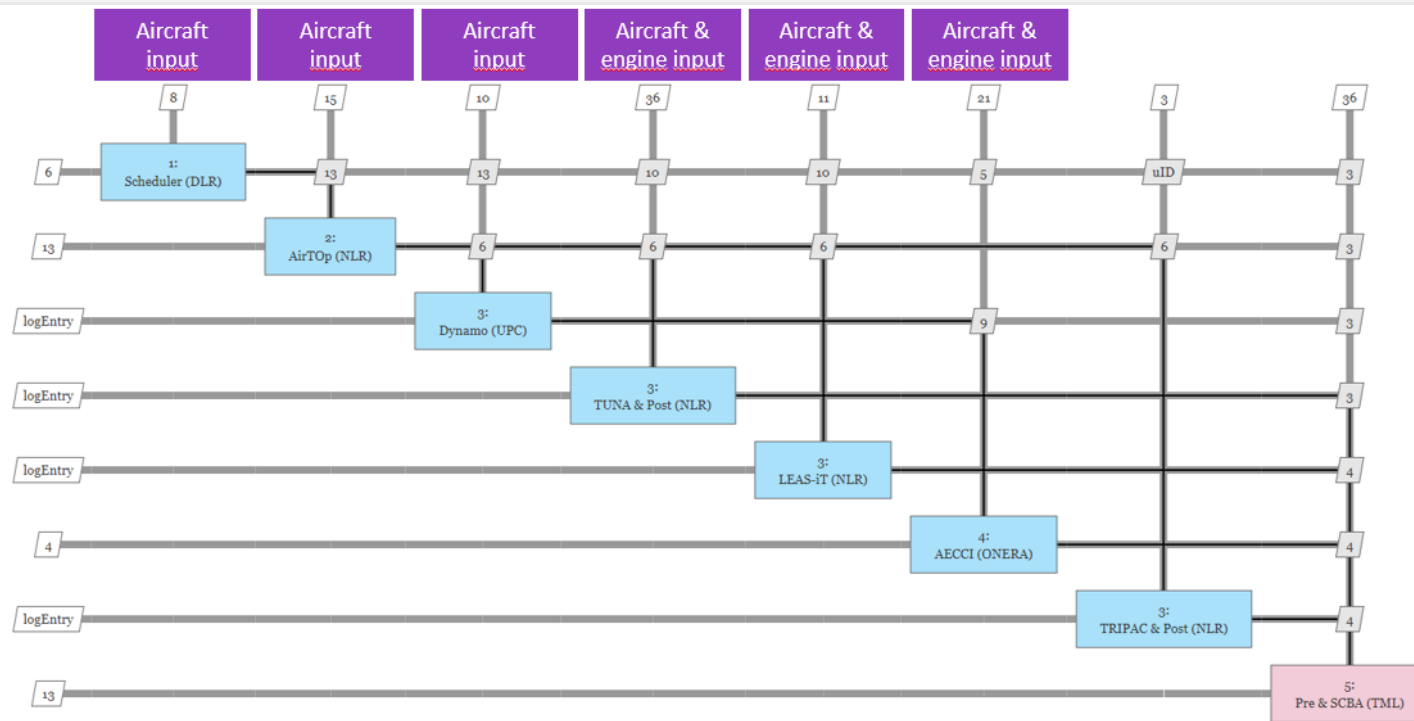

## Main Models:

- Fleet and schedule forecast model
- Airport and airspace simulation
- Noise and emissions model
- Risk assessment model

## Metrics:

- Punctuality
- Fuel burn
- Emissions and noise
- Social cost benefit analysis

# Use Case 2 – Continuous Descent Operations

## UC approach

- Extension of classical approach with
  - Social cost benefit analysis
  - Refined analysis with higher fidelity tools for a set of trajectories

## Framework focus

- Collaborative versatility with the use of both BRICS and Uplink
- Scalability assesement

# Use Case 3 – Sustainable Aviation Fuel

## Objective:

- Analysis of **SAF policies at the air transport system level**

## Scenario:

- Future forecast of global fleet operations and demonstrative impact assessment for Reference scenario + **two policy scenarios for 2035 and 2050**

## Main Models:

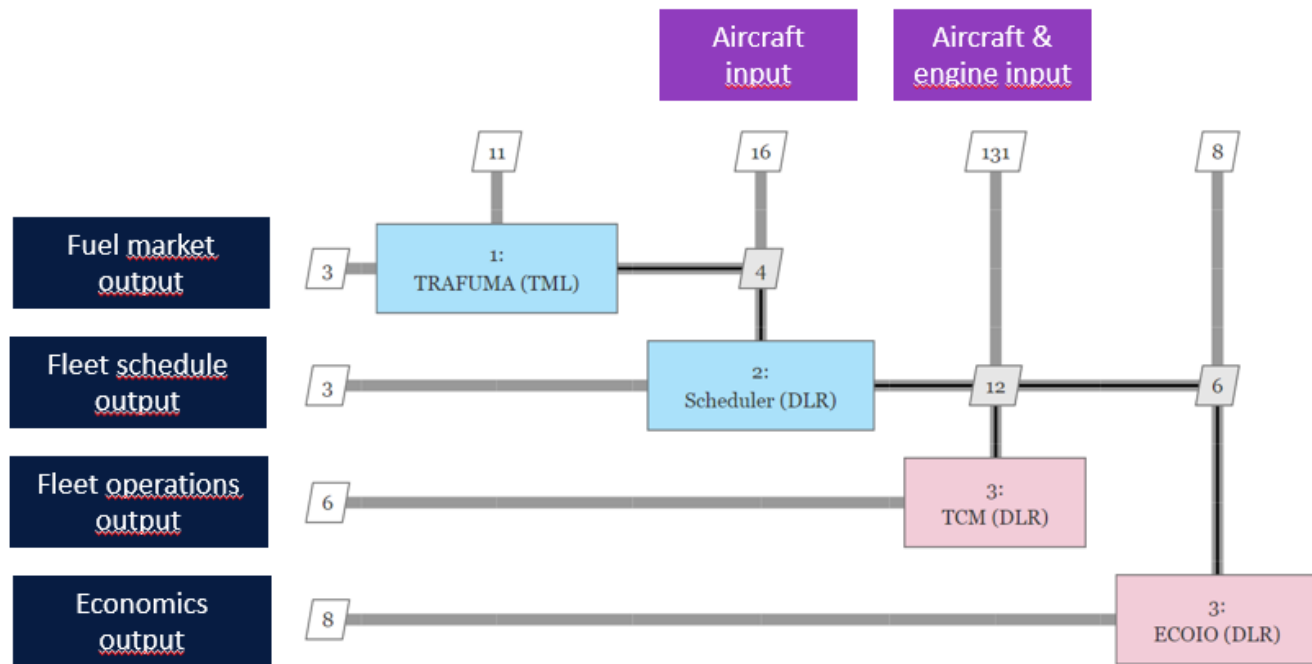

- Transport fuel market model
- Fleet and schedule forecast model
- Emissions tool
- Economics assessment model

## Metrics (selection)

- Total fuel demand and CO2 emissions over the entire life cycle
- Flight schedule and fleet forecast
- Gross value added and employment impacts in the aviation sector

# Use Case 3 – Sustainable Aviation Fuel

## UC approach

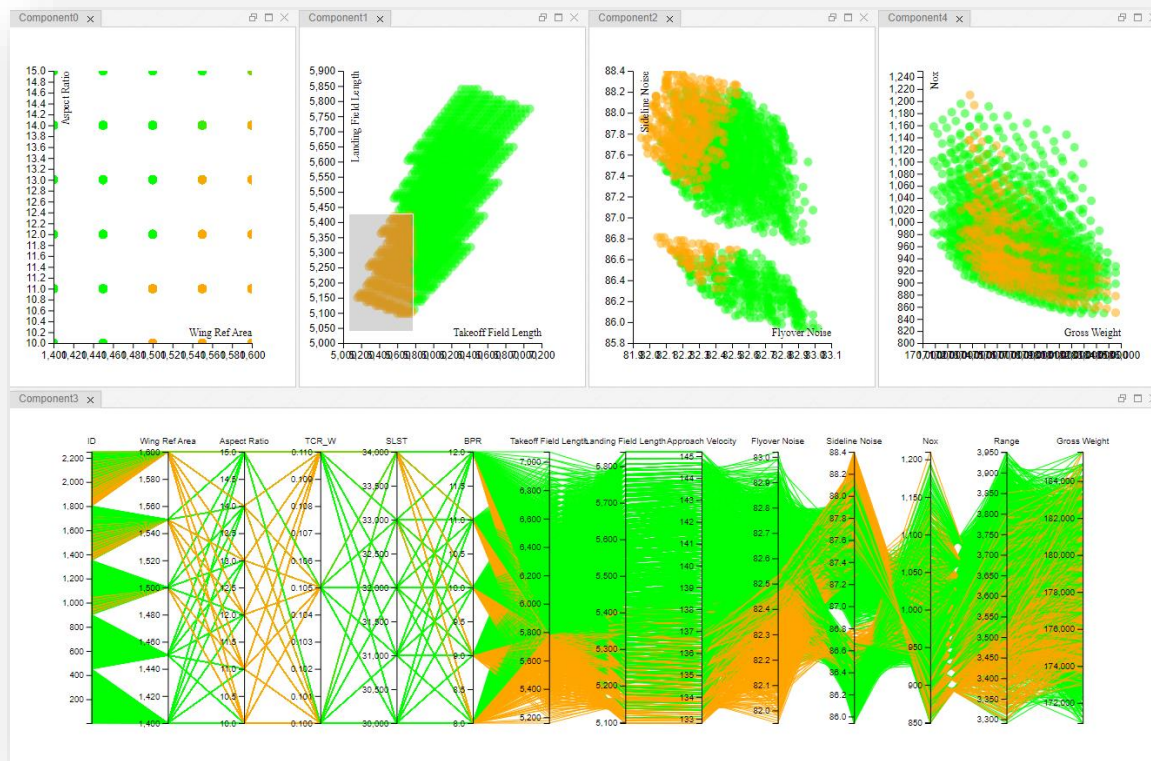

- 2 – steps approach
  - Calibration exercise to tune TRAFUMA elasticity
  - Scenario analysis

## Framework focus

- Inclusion of complex / costly models not natively exchanging data
- Scalability assesement

# Overview of Results: UC1

## UC1 – Engine / airframe exploration

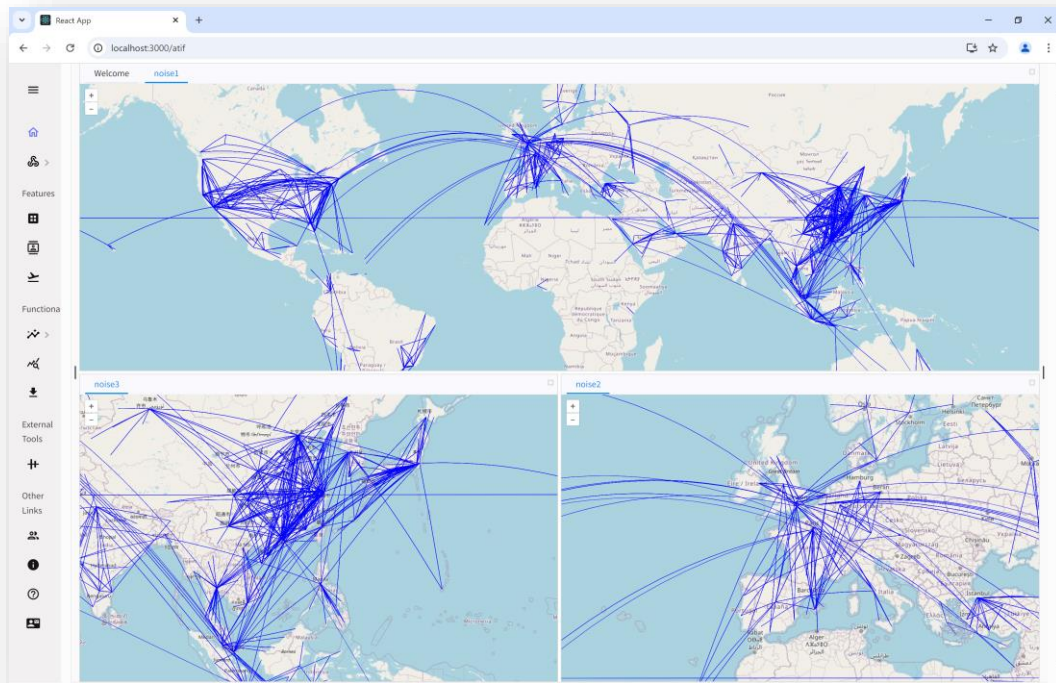

## UC1 – Performance focus

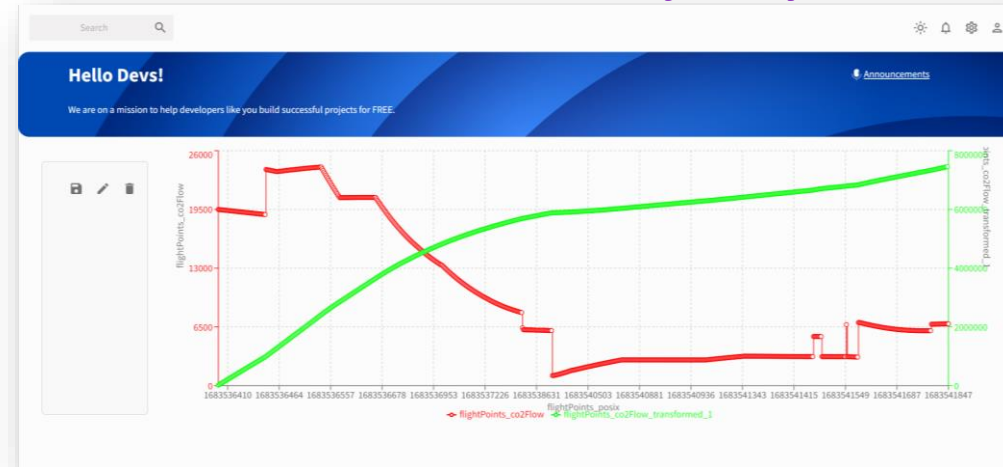

# Overview of Results: UC2

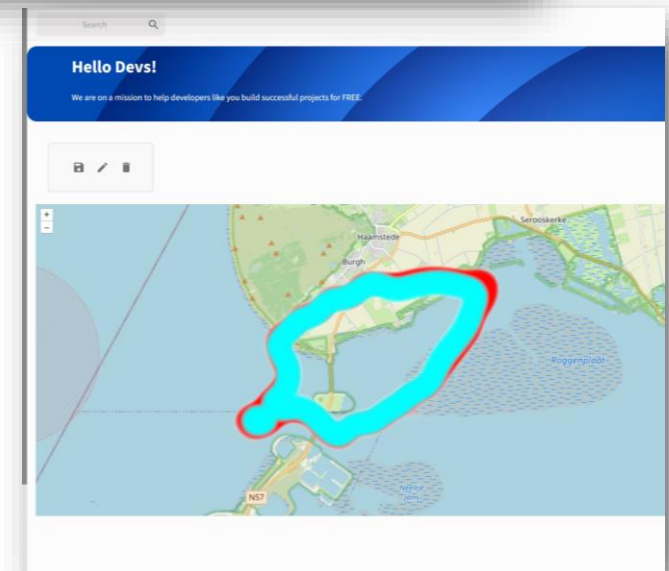

## UC2 – Trajectories overview

## UC2 – Emissions on 1 selected trajectory

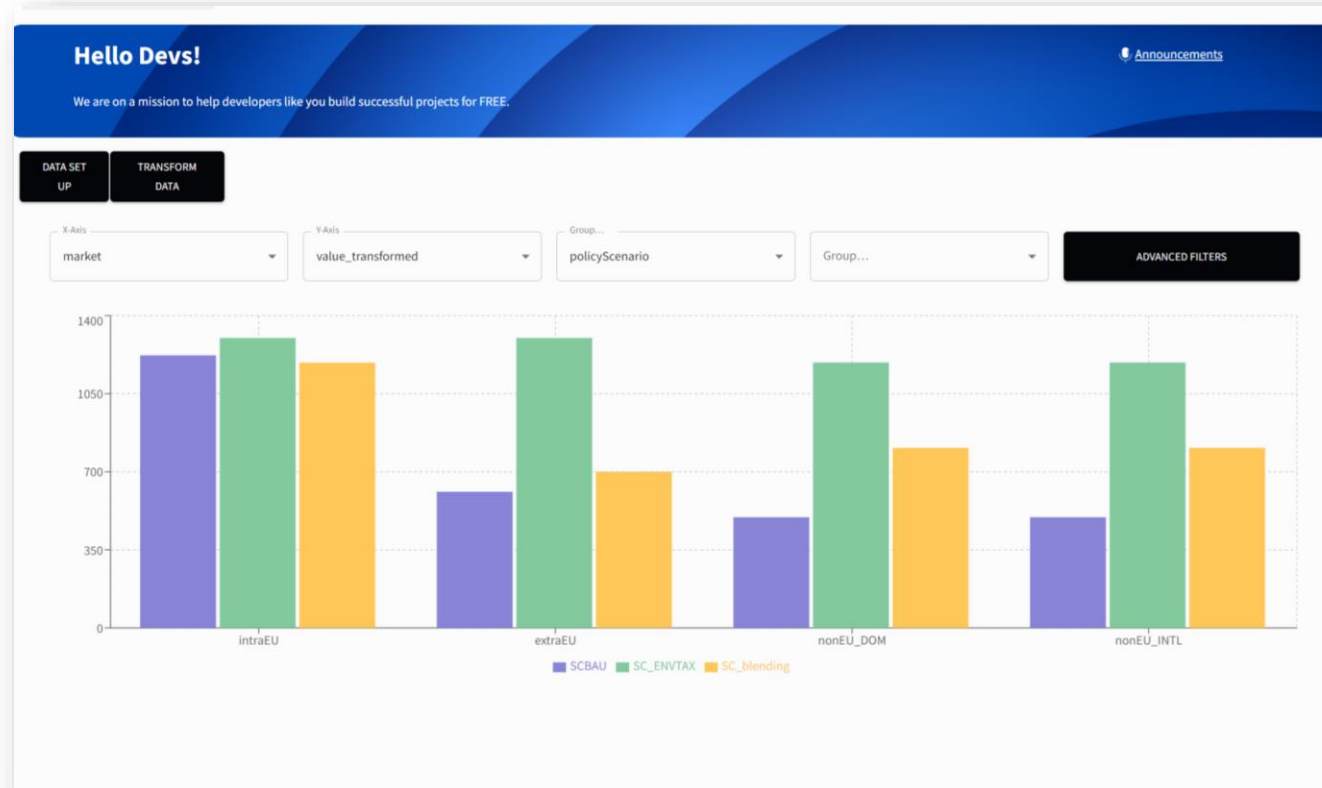

## UC2 – Risk contour (example !)

# Overview of Results: UC3

## UC3 – Fuel cost per market

# Conclusion and perspectives

## Achievements

- **Set up phase**
    - UC scenario including **models, studies** and **metrics** have been **defined**
    - All selected models / associated workflows have been **implemented** in the **Framework**
  - **Operational phase**
    - **Collaboratives cross organizational** workflows are running
    - **Results** can be visualized through the **Dashboard**
    - Studies are still on going !
- The Impact Monitor framework is on **the right track** to **demonstrate its capabilities to assess** the impact of such R&I at the appropriate assessment level(s)

## Perspectives

- Collect and provide **lessons learnt** and **roadmap** (in addition to **final results**) to the community

→ **Extend** IM catalogue with **more models** / partners : *New models - Air quality, Non CO2 impact / Higher fidelities models - Propulsion ...*

- Consider **new studies** according to stakeholders' expectations (and available funding)
- Move to **assessment workflows** !
