II. An Argument for Divine Providence, taken from the conftant Regularity obferv'd in the Births of both Sexes. By Dr. John Arbuthnotr, Pbyyitian in Ordinary to Her Majefty, and Fellow of the College of Phyjitians and the Royal Society.

AMong innumerable Fcotfeps of Divine Providence to be found in the Works of Nature, here is a very remarkable one to be obfrved in the exact Ballance that is maintained, between the Numbers of Men and Women; for by this means it is provided, that the Species may never fail, nor perifh, fince every Male may have its Female, and of a proportionable Age. This Equality of Males and Females is not the Effect of Chance but Divine Providence, working for a good End, which I thus demonftrate :
Let there be a Die of Two fides, $M$ and $F$, (which denote Crofs and Pile), now to find all the Chances of any determinate Number of fuch Dice, let the Binome M+F be raifed to the Power, whofe Exponent is the Number of Dice given'; the Coefficients of the Terms will fhew all the Chances fought. For Example, in Two Dice of Two fides $\mathrm{M}+\mathrm{F}$ the Chances are $\mathrm{M}^{2}+2 \mathrm{MF}+\mathrm{F}^{2}$, that is, One Chance for $M$ double, One for $F$ double, and Two for M fingle and F fingle; in Four fuch Dice there are Chances $\mathrm{M}^{4}+4 \mathrm{M}^{3} \mathrm{~F}+6 \mathrm{M}^{2} \mathrm{~F}^{2}+4 \mathrm{MF}^{3}+\mathrm{F}^{4}$, that is, One Chance for $M$ quadruple, One for F quadruple, Four for triple M and fingle F, Four for fingle M and triple $F$, and Six for $M$ double and $F$ double; and univerfally, if the Number of Dice be $n$, all their Chances will be expreffed in this Series

$$
\mathrm{M}^{\mathrm{n}}+
$$

## (187)

It appears plainly, that when the Number of Dice is even there are as many M's as F's in the middle Term of this Series, and in all the other Terms there are moft M's or moft F's.

If therefore a Man undertake with an even Number of Dice to throw as many M's as F's, he has all the Terms sut the middle Term againft him ; and his Lot is to the Sum of all the Chances, as the coefficient of the raiddle Term is to the power of 2 raifed to an exponent equal to the Number of Dice: fo in Two Dice his Lot is $\frac{2}{4}$ Or $\frac{1}{2}$, in Three Dice $\frac{6}{16}$ or $\frac{1}{3}$, in Six Dice $\frac{20}{64}$

To find this middle Termin any given Power or Number of Dice, continue the Series $\frac{n}{\frac{n}{n}} \times \frac{n-1}{2} \times \frac{\mathrm{n} \cdot 2}{\mathrm{Y}}$, Qev. till the number of termsare equal to $\frac{1}{2} \mathrm{n}$. ForExample, the coefficient of the middle Term of the tenth Power is $\frac{10}{2} \times 9 \times \frac{8}{3} \times \frac{7}{4} \times \frac{6}{8}=252$, the tenth Power uf 2 is 1024 , if therefore A undertakes to throw with Ten Dice in one throw an equal Number of M's and F's, he has 252 Chances out of 1024 for him, that is his Lot is $\frac{-252}{1024}$ or $\frac{63}{2559}$, which is lefs than $\frac{1}{4}$.

It will be eafy by the help of Logarithms, to extend this Calculation to a very great Number, but that is not my prefent Defign. It is vifible from what has been faid, that with a very great Number of Dice, A's Lot would become very fmall; and confequently (fuppofing $\mathbf{M}$ to denote Mal and F Femalt) that in the valt Number of Mortals, there would be but a fmall part of all the poffible Chances, for its happening at any affignable time, that an equal Number of Males and Females fhould be born.

It is indeed to be confeffed that this Equality of vales and Females is not Mathematical but Phyfical, which alters mach the foregoing Calculation $;$ for in this Cafe

## (188)

the middle Term will not exactly give A's Chances, but his Chances will take in fome of the Terms next the middle one, and will lean to one fide or the other. But it is vety improbable (if mere Chance govern'd) that they would never reach as far as the Extremities: But this Event is wifely prevented by the wife Oeconomy of Nature; and to judge of the wifdom of the Contrivance, we mutt obferve that the external Accidents to which are Males fubject (who muft feek their Food with danger) domake a great havock of them, and that this lofs exceeds far that of the other Sex, occafioned by Difeafes incident to it, as Experience convinces us. To repair that Lofs, provident Nature, by the Difpofal of its wife Creator, brings forth more Males than Females ; and that in almoft a conflant proportion. This appears from the annexed Tables, which contain Obfervations for 82 Years of the Eirths in Landon. Now, to reduce the Whole to a Calculation, I propofe this.

Problem. A lays againft B, that every Year there fhall be born mote Males than Females: To find A's Lot, or the Value of his Expectation.

It is evident from what has been raid, that A's Lot for each Year is Jefs than $\frac{1}{2}$; (but that the Argument may be ftronger') let his Lot be equal to $\frac{1}{2}$ for one Year. If he undertakes to do the fame thing 82 times running, his Lot will be $\frac{\pi}{2}^{\frac{1}{2}}{ }^{82}$, which will be found eafly by the Table of Logarithas to be But if A wager with B, not only that the Number of Males fhall exceed that of Females, every Year, but that this Excefs fhall happen in a conftant Proportion, and the Difference lye within fix'd limits; and this not only for 82 Years, but for Ages of Ages, and not only at London, but ail over the World; (which 'tis highly probabie is Fact, and defigned that every Male may have a Female of the fame Country and fuitable Age) then A's Chance will be near an infnitely fall Quanity, at leaft
lefs than any aflignable Fraction. From whence it follows, that it is Art, not Chance, that governs.

There feems no more probable Caufe to be affigned in Phyficks for this Equality of the Births, than that in our firf Parents Seed there were at firft formed an equal Number of both Sexes.

Scholium. From hence it follows, that Polygamy is contrary to the Law of Nature and Juftice, and to the Propagation of Human Race; for where Males and and Females are in equal number, if one Man takes Twenty Wives, Nineteen Men muft live in Celibacy, which is repugnant to the Defign of Nature; nor is it probable that Twenty Women will be fo well impreg. nated by one Man as by Twenty.
