- Motivation & Goals
- Data characterization
- Metrics
- Methodology
- Results
 - Nominal classification
 - SMOTE
 - OVERSAMPLING
 - Regression approach
 - SMOTE for regression
- Final Remarks

Motivation & Goals

Use of data mining tools for slope
condition state identification

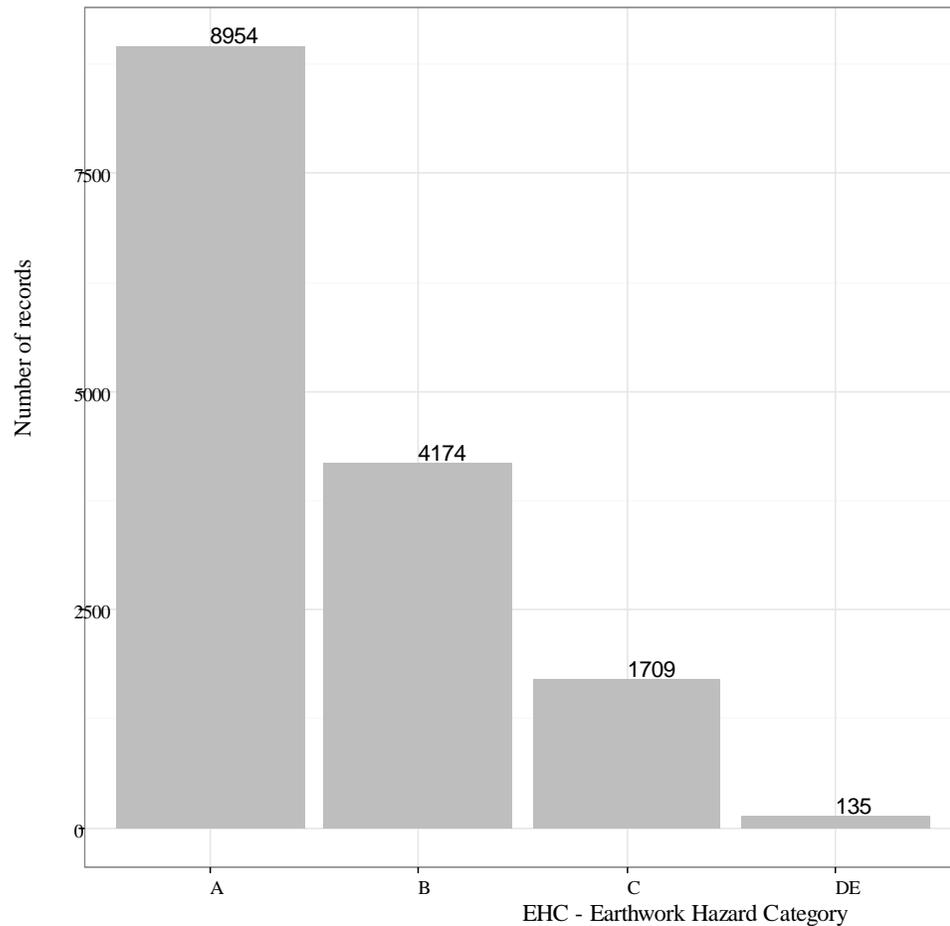

Develop a slope
classification system

- ✓ Based on advanced statistical analysis;
- ✓ Use of standard information usually collected during routine inspections;
- ✓ Label each slope into a pre-defined set of classes;
- ✓ Applicable during the slope exploitation phase.

Data characterization

- ✓ Slope data kindly made available by *UK NetworkRail*;
- ✓ *Very unbiased data!* → **60%** of the slopes are classified as **A**;
- ✓ More than 100 variables were considered as model inputs:
 - Slope geometry;
 - Existence of trees;
 - Animal activity;
 - Ground cover,;
 - Number of dangerous trees;
 - Root balls locations;
 -

Metrics (model assessment)

Metrics:

- ✓ **CE** – classification error [0% ; 100%] (lower is better);
- ✓ **Average Utility Score (AUS)** [-Inf ; 1] (higher is better);
- ✓ **Recall and Precision** [0 ; 100%] (higher is better);
- ✓ **F1-score** – trade-off between recall and precision [0 ; 100%] (higher is better)

Cost benefits matrix (cbm):

Obs/Pred	A	B	C	DE
A	1	-4	-8	-16
B	-2	1	-4	-8
C	-4	-2	1	-4
DE	-8	-4	-2	1

Methodology

Modeling strategies:

- ✓ Nominal classification;
- ✓ Regression approach;

Unbalance data approaches:

- ✓ **SMOTE** – Synthetic Minority Over-sampling Technique : creates 'new data' by looking at nearest neighbors to establish a neighborhood and then sampling from within that neighborhood. It operates on the assumptions that the original data is similar because of proximity;
- ✓ **OVERSAMPLING** – randomly adds samples (with repetition) of the minority classes to the training data, such that the final training set is balanced;

Classification performance

ANN :: Normal - Nominal Classification

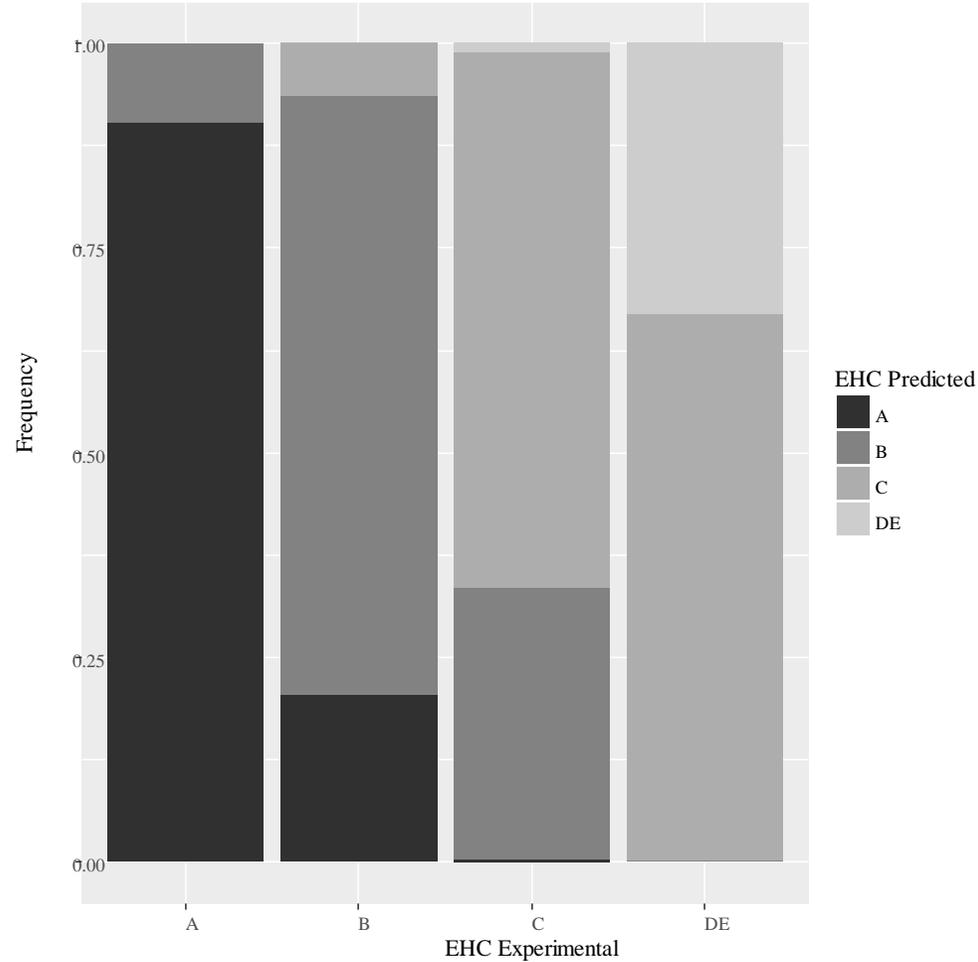

ANN :: OVERed - Nominal Classification

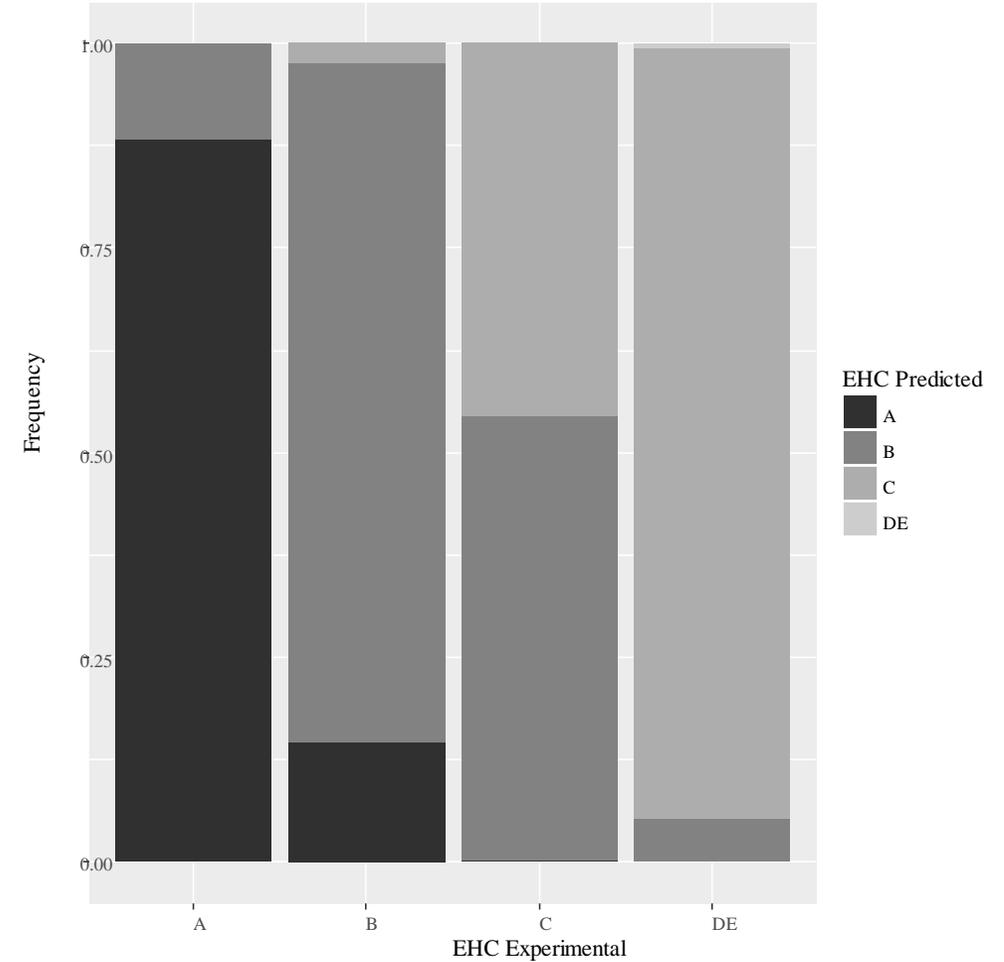

Regression performance

ANN :: SMOTEd - Regression [1-2-4-10]

SVM :: SMOTEd - Regression [1-2-4-10]

Final Remarks

- ✓ Although some lacks of accuracy, interesting results were achieved;
 - Good prediction for classes A and B;
 - Records of classes C and DE (highest probability of failure) when not correctly predicted are classified as belong to the closest class;
- ✓ It is important to assure that the defined EHC class is realistic → compare failure records database;
- ✓ Work on models accuracy improvement:
 - Feature selection techniques;
 - Optimization techniques.
