

Image data interoperability

with OME-NGFF, RO-Crate and linked data

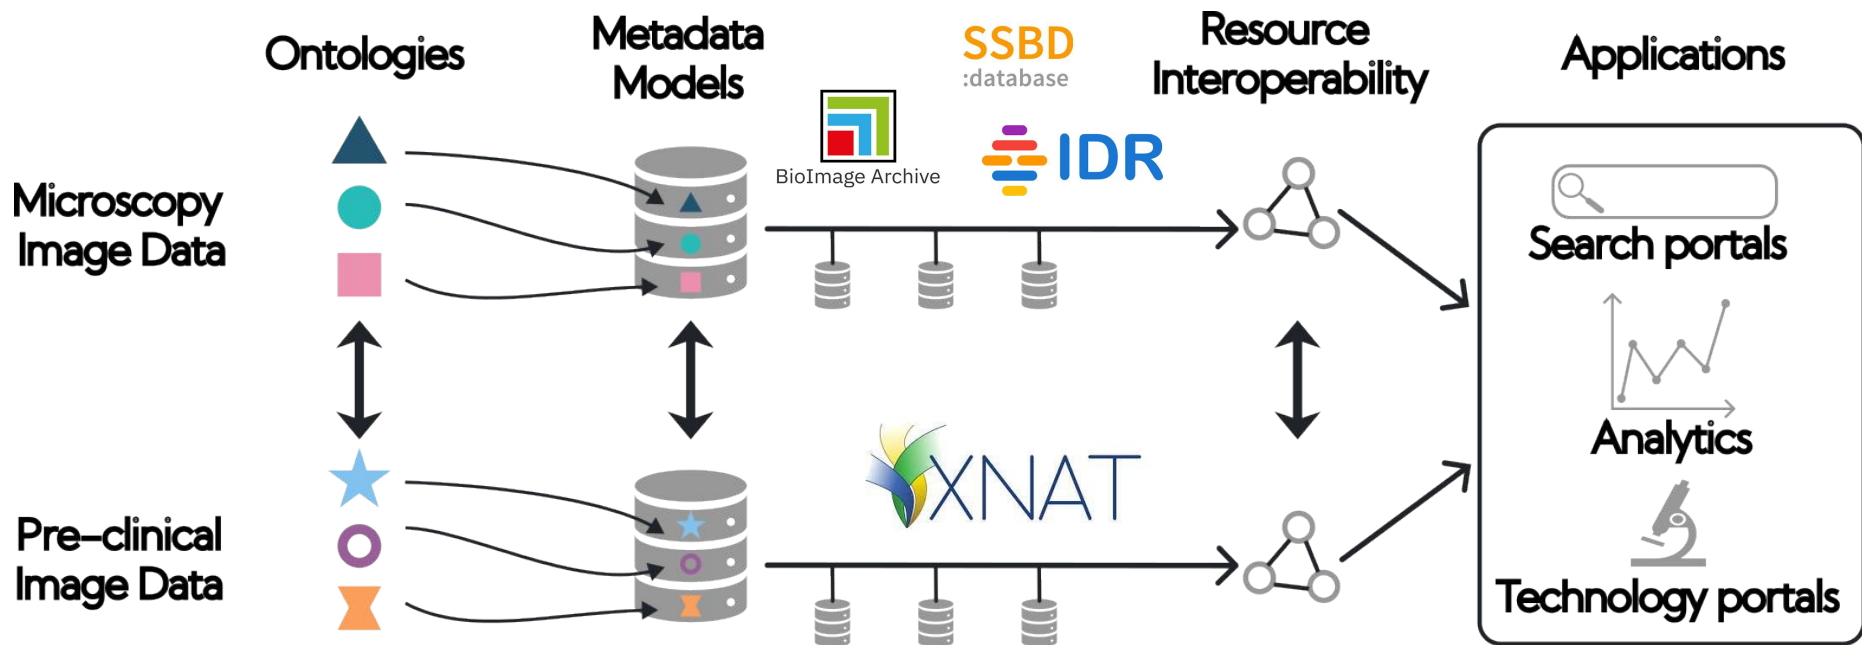

Matthew Hartley

Team Leader, BioImage Archive / EMPIAR

FoundingGIDE Community Event, 2024

FoundingGIDE, technical stream

What is FoundingGIDE bioimaging attempting?

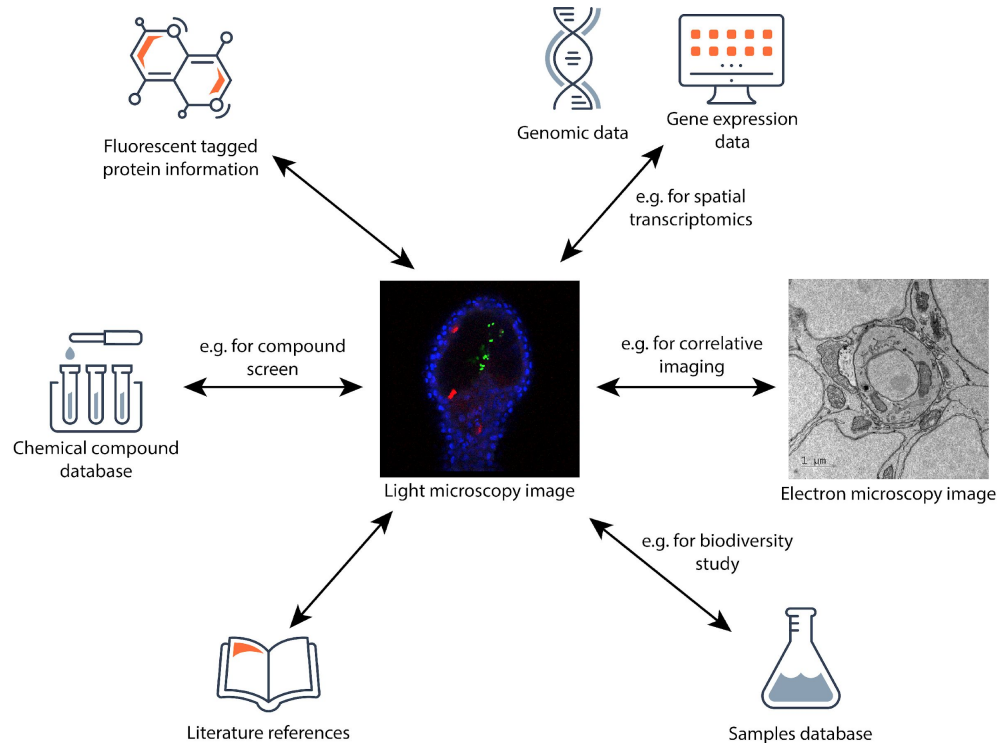

Can we agree on...

- ...enough shared information...
- ...between three repositories...
- ...to enable some interoperability...
- ...proved through search?

Managing image data is very complicated! So...

Let's make more complicated!

How to we link imaging data with other biomolecular data and beyond?

Data integration – image + image

Data integration – image + other biological

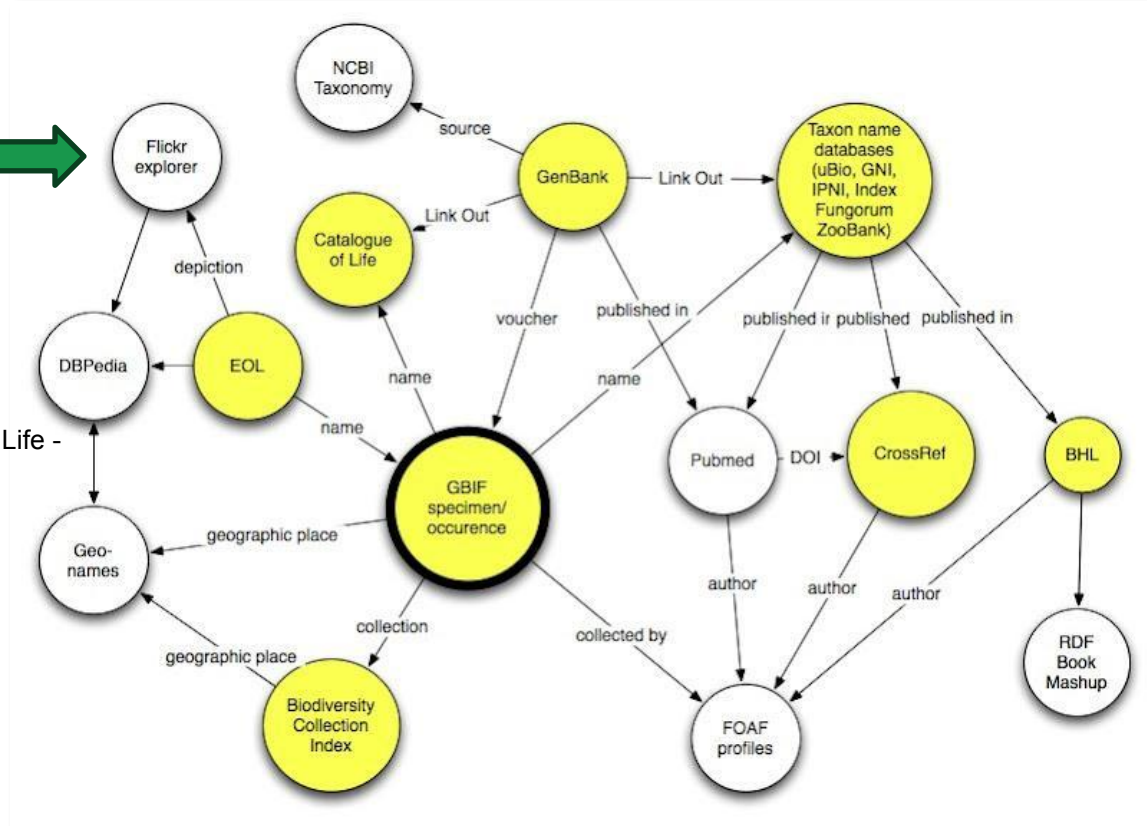

BioImage Archive

Sometimes images are at the periphery

Images here

From **S-BIAD588**, Darwin Tree of Life - NHM samples image catalogue

What are we trying to do (long term)?

“Show me images of how mitochondria in marine organisms respond to differing climate conditions”

- Need to understand the terms
- Need to link across domains
- One repository will not have all of the information!

(one of) The problem (s)

- Biolmaging is many domains together
- Broad / deep
- Local institutions, communities always have specific needs
- Work on some degree of interoperability

The solution (sort of):

Step 1: Do something useful

Step 2: Make it better

OME 2024 NGFF challenge

 2024 NGFF Challenge About 

507.46 TB of public bioimage data in the next major version of OME-Zarr, including Zarr v3 and sharding, with distributed hosting.

Filter by Name or Description

 IDR (23.84 TB)  BioImage Archive (40.40 GB)  JAX (166.04 TB)  Webknossos (315.47 TB)  Crick (10.05 GB)  NFDI4BIOIMAGE (2.00 TB)  SSBD (59.78 GB) ×

JSON

What is the stuff?

Context

How are we describing it?

Structuring of Data and Metadata in Bioimaging: Concepts and technical Solutions in the Context of Linked Data

- Susanne Kunis & Julia Dohle
- [10.5281/zenodo.7018750](https://doi.org/10.5281/zenodo.7018750)

The promise of linked data

The downsides

- More complex
- Tends to be harder for developers to work with

What's in the box?

```

Linked together

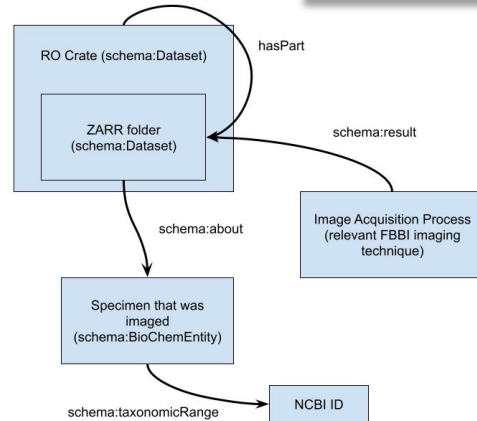

What do we have? Why is it useful?

- Functional, minimal proof of concept of different sources of imaging data coming together
- Allows us to expand and try new things, while ensuring that we continually test what is useful
- Spurs development of tooling
- Forces decisions about ontologies / controlled vocabulary
- Highlights where the missing parts are

Next steps: pilots for subdomains?

** Specimen was split off from ExperimentalCapturedImage(ECI) later in modelling to make creating links from e.g. biosamples backward easier. However, we need to discuss whether this changes the nature of the ECI-Specimen connection

Breakout 2: Harmonizing Metadata Models: Bridging Efforts and Overcoming Challenges

- **Needs** – what do we all need?
- **Challenges** – what are the blockers?
- **What's possible** – what **might** we be able to do?
- **Next steps** – what **should** we try to do next?
