ABSTRACT

We introduce an approach of manufacturing of a field-effect heterotransistor with inhomogenous doping of channel. The inhomogenous distribution of concentration of dopant gives a possibility to change speed of transport of charge carriers and to decrease length of channel.

KEYWORDS

Field-effect heterotransistor; inhomogenous doping of channel; decreasing of dimensions of transistor

1. INTRODUCTION

Development of solid state electronic devices leads to necessity to decrease dimensions of elements of integrated circuits. In the present time are have been elaborated several approaches to decrease dimensions of these elements. One of them is growth thin film devices [1-4]. The second one is diffusion or ion doping of required areas of homogenous sample or heterostructures and laser or ion doping of dopant and /or radiation defects [5-7]. Using one of these types of annealing gives a possibility to generate inhomogenous distribution of temperature. In this situation one can obtain inhomogeneity of structure, which should be doped. The inhomogeneity leads to decreasing of dimensions of the considered devices. Another way to modify properties of materials is radiation processing [8,9].

In this paper we consider manufacturing a field-effect heterotransistor with inhomogenous doping of channel. Inhomogenous doping of channel during technological process gives us possibility to change speed of transport of charge carriers [10] and to prevent the effect of closing the source to the drain after decreasing of length of channel [11]. To illustrate the introduced approach of optimization of doping of channel we consider heterostructure, which presented in Fig. 1. One of ends of the channel has been doped by diffusion or ion implantation. After that the dopant and/or radiation defects have been annealed by using electro-magnetic (microwave) irradiation. In this situation one can find inhomogenous distribution of concentration of dopant. This type of annealing gives a possibility to heat near-surficial area to decrease dopant diffusion deep heterostructure. After finishing of the annealing channel will be overgrown. After the overgrowth it should be manufactured gate. Main aim of the present paper is optimization of annealing time to dope of required part of channel.

2. METHOD OF SOLUTION

We solved our aims by solving the following second Fick's law [10,12-14] to determine spatio-temporal distribution of concentration of dopant

$$\frac{\partial C(x, y, z, t)}{\partial t} = \frac{\partial}{\partial x} \left[D_c \frac{\partial C(x, y, z, t)}{\partial x} \right] + \frac{\partial}{\partial y} \left[D_c \frac{\partial C(x, y, z, t)}{\partial y} \right] + \frac{\partial}{\partial z} \left[D_c \frac{\partial C(x, y, z, t)}{\partial z} \right]. \quad (1)$$

Boundary and initial conditions for the equations are

$$\begin{aligned} \left. \frac{\partial C(x, y, z, t)}{\partial x} \right|_{x=0} = 0, \quad \left. \frac{\partial C(x, y, z, t)}{\partial x} \right|_{x=L_x} = 0, \quad \left. \frac{\partial C(x, y, z, t)}{\partial y} \right|_{y=0} = 0, \quad \left. \frac{\partial C(x, y, z, t)}{\partial y} \right|_{y=L_y} = 0, \\ \left. \frac{\partial C(x, y, z, t)}{\partial z} \right|_{z=0} = 0, \quad \left. \frac{\partial C(x, y, z, t)}{\partial z} \right|_{z=L_z} = 0, \quad C(x, y, z, 0) = f(x, y, z). \end{aligned} \quad (2)$$

In the Eqs. (1) and (2) the function $C(x, y, z, t)$ describes the spatio-temporal distribution of concentration of dopant; the parameter D_c is the dopant diffusion coefficient. Dopant diffusion coefficient will be changed with changing of materials of heterostructure, heating and cooling of heterostructure during annealing of dopant or radiation defects (with account Arrhenius law). Dependences of dopant diffusion coefficient on coordinate in heterostructure, temperature of annealing and concentrations of dopant and radiation defects could be written as [15-17]

$$D_c = D_L(x, y, z, T) \left[1 + \xi \frac{C^\gamma(x, y, z, t)}{P^\gamma(x, y, z, T)} \right] \left[1 + \zeta_1 \frac{V(x, y, z, t)}{V^*} + \zeta_2 \frac{V^2(x, y, z, t)}{(V^*)^2} \right]. \quad (3)$$

Here function $D_L(x, y, z, T)$ describes dependences of dopant diffusion coefficient on coordinate and temperature of annealing T . Function $P(x, y, z, T)$ describes the same dependences of the limit of solubility of dopant. The parameter γ is integer and usually could be varying in the following interval $\gamma \in [1, 3]$. The parameter describes quantity of charged defects, which interacting (in average) with each atom of dopant. More detailed information about concentrational dependence of dopant diffusion coefficient is presented in [15]. The function $V(x, y, z, t)$ describes distribution of concentration of radiation vacancies in space and time. The parameter V^* describes the equilibrium distribution of concentration of vacancies. It should be noted, that diffusion type of doping gives a possibility to obtain doped materials without radiation defects. In this situation $\zeta_1 = \zeta_2 = 0$. We determine spatio-temporal distributions of concentrations of radiation defects by solving the following system of equations [16,17]

$$\begin{aligned}
 \frac{\partial I(x, y, z, t)}{\partial t} &= \frac{\partial}{\partial x} \left[D_I(x, y, z, T) \frac{\partial I(x, y, z, t)}{\partial x} \right] + \frac{\partial}{\partial y} \left[D_I(x, y, z, T) \frac{\partial I(x, y, z, t)}{\partial y} \right] - k_{I,I}(x, y, z, T) \times \\
 &\times I^2(x, y, z, t) + \frac{\partial}{\partial z} \left[D_I(x, y, z, T) \frac{\partial I(x, y, z, t)}{\partial z} \right] - k_{I,V}(x, y, z, T) I(x, y, z, t) V(x, y, z, t) \quad (4) \\
 \frac{\partial V(x, y, z, t)}{\partial t} &= \frac{\partial}{\partial x} \left[D_V(x, y, z, T) \frac{\partial V(x, y, z, t)}{\partial x} \right] + \frac{\partial}{\partial y} \left[D_V(x, y, z, T) \frac{\partial V(x, y, z, t)}{\partial y} \right] - k_{V,V}(x, y, z, T) \times \\
 &\times V^2(x, y, z, t) + \frac{\partial}{\partial z} \left[D_V(x, y, z, T) \frac{\partial V(x, y, z, t)}{\partial z} \right] - k_{I,V}(x, y, z, T) I(x, y, z, t) V(x, y, z, t).
 \end{aligned}$$

Boundary and initial conditions for these equations are

$$\begin{aligned}
 \left. \frac{\partial \rho(x, y, z, t)}{\partial x} \right|_{x=0} = 0, \quad \left. \frac{\partial \rho(x, y, z, t)}{\partial x} \right|_{x=L_x} = 0, \quad \left. \frac{\partial \rho(x, y, z, t)}{\partial y} \right|_{y=0} = 0, \quad \left. \frac{\partial \rho(x, y, z, t)}{\partial y} \right|_{y=L_y} = 0, \\
 \left. \frac{\partial \rho(x, y, z, t)}{\partial z} \right|_{z=0} = 0, \quad \left. \frac{\partial \rho(x, y, z, t)}{\partial z} \right|_{z=L_z} = 0, \quad \rho(x, y, z, 0) = f_\rho(x, y, z). \quad (5)
 \end{aligned}$$

Here $\rho=I, V$. The function $I(x, y, z, t)$ describes the distribution of concentration of radiation interstitials in space and time. The functions $D_\rho(x, y, z, T)$ describe dependences of the diffusion coefficients of point radiation defects on coordinate and temperature. The quadratic on concentrations terms of Eqs. (4) describes generation divacancies and diinterstitials. The function $k_{I,V}(x, y, z, T)$ describes dependence of the parameter of recombination of point radiation defects on coordinate and temperature. The function $k_{I,I}(x, y, z, T)$ and $k_{V,V}(x, y, z, T)$ describes dependences of the parameters of generation of simplest complexes of point radiation defects on coordinate and temperature. Now let us calculate distributions of concentrations of divacancies $\Phi_V(x, y, z, t)$ and diinterstitials $\Phi_I(x, y, z, t)$ in space and time by solving the following system of equations [16,17]

$$\begin{aligned}
 \frac{\partial \Phi_I(x, y, z, t)}{\partial t} &= \frac{\partial}{\partial x} \left[D_{\Phi_I}(x, y, z, T) \frac{\partial \Phi_I(x, y, z, t)}{\partial x} \right] + \frac{\partial}{\partial y} \left[D_{\Phi_I}(x, y, z, T) \frac{\partial \Phi_I(x, y, z, t)}{\partial y} \right] + \\
 &+ \frac{\partial}{\partial z} \left[D_{\Phi_I}(x, y, z, T) \frac{\partial \Phi_I(x, y, z, t)}{\partial z} \right] + k_{I,I}(x, y, z, T) I^2(x, y, z, t) - k_I(x, y, z, T) I(x, y, z, t) \quad (6) \\
 \frac{\partial \Phi_V(x, y, z, t)}{\partial t} &= \frac{\partial}{\partial x} \left[D_{\Phi_V}(x, y, z, T) \frac{\partial \Phi_V(x, y, z, t)}{\partial x} \right] + \frac{\partial}{\partial y} \left[D_{\Phi_V}(x, y, z, T) \frac{\partial \Phi_V(x, y, z, t)}{\partial y} \right] + \\
 &+ \frac{\partial}{\partial z} \left[D_{\Phi_V}(x, y, z, T) \frac{\partial \Phi_V(x, y, z, t)}{\partial z} \right] + k_{V,V}(x, y, z, T) V^2(x, y, z, t) - k_V(x, y, z, T) V(x, y, z, t).
 \end{aligned}$$

Boundary and initial conditions for these equations are

$$\begin{aligned}
 \left. \frac{\partial \Phi_\rho(x, y, z, t)}{\partial x} \right|_{x=0} = 0, \quad \left. \frac{\partial \Phi_\rho(x, y, z, t)}{\partial x} \right|_{x=L_x} = 0, \quad \left. \frac{\partial \Phi_\rho(x, y, z, t)}{\partial y} \right|_{y=0} = 0, \quad \left. \frac{\partial \Phi_\rho(x, y, z, t)}{\partial y} \right|_{y=L_y} = 0, \\
 \left. \frac{\partial \Phi_\rho(x, y, z, t)}{\partial z} \right|_{z=0} = 0, \quad \left. \frac{\partial \Phi_\rho(x, y, z, t)}{\partial z} \right|_{z=L_z} = 0, \quad \Phi_I(x, y, z, 0) = f_{\Phi_I}(x, y, z), \quad \Phi_V(x, y, z, 0) = f_{\Phi_V}(x, y, z). \quad (7)
 \end{aligned}$$

The functions $D_{\phi\rho}(x,y,z,T)$ describe dependences of the diffusion coefficients of the above complexes of radiation defects on coordinate and temperature. The functions $k_I(x,y,z,T)$ and $k_V(x,y,z,T)$ describe the parameters of decay of these complexes on coordinate and temperature. We calculate distributions of concentrations of point radiation defects in space and time by using recently elaborated approach [18-20]. To use the approach let us transform dependences of diffusion coefficients of point defects in space and time to the following form: $D_{\rho}(x,y,z,T) = D_{0\rho} [1 + \varepsilon_{\rho} g_{\rho}(x,y,z,T)]$, where $D_{0\rho}$ are the average values of diffusion coefficients, $0 \leq \varepsilon_{\rho} < 1$, $|g_{\rho}(x,y,z,T)| \leq 1$, $\rho = I, V$. Let us also transform dependences of another parameters to the similar form: $k_{I,V}(x,y,z,T) = k_{0I,V} [1 + \varepsilon_{I,V} g_{I,V}(x,y,z,T)]$, where $k_{0\rho 1, \rho 2}$ are the their average values, $0 \leq \varepsilon_{I,V} < 1$, $0 \leq \varepsilon_{I,I} < 1$, $0 \leq \varepsilon_{V,V} < 1$, $|g_{I,V}(x,y,z,T)| \leq 1$, $|g_{I,I}(x,y,z,T)| \leq 1$, $|g_{V,V}(x,y,z,T)| \leq 1$. Let us introduce the following dimensionless variables: $\tilde{I}(x,y,z,t) = I(x,y,z,t)/I^*$, $\chi = x/L_x$, $\eta = y/L_y$, $\tilde{V}(x,y,z,t) = V(x,y,z,t)/V^*$, $\vartheta = \sqrt{D_{0I} D_{0V}} t/L^2$, $\omega = L^2 k_{0I,V} / \sqrt{D_{0I} D_{0V}}$, $\Omega_p = L^2 k_{0\rho\rho} / \sqrt{D_{0I} D_{0V}}$, $\phi = z/L_z$. The introduction leads to transformation of Eqs.(4) and conditions (5) to the following form

$$\begin{aligned} \frac{\partial \tilde{I}(\chi, \eta, \phi, \vartheta)}{\partial \vartheta} &= \frac{D_{0I}}{\sqrt{D_{0I} D_{0V}}} \frac{\partial}{\partial \chi} \left\{ [1 + \varepsilon_I g_I(\chi, \eta, \phi, T)] \frac{\partial \tilde{I}(\chi, \eta, \phi, \vartheta)}{\partial \chi} \right\} + \frac{\partial}{\partial \eta} \left\{ [1 + \varepsilon_I g_I(\chi, \eta, \phi, T)] \times \right. \\ &\times \left. \frac{\partial \tilde{I}(\chi, \eta, \phi, \vartheta)}{\partial \eta} \right\} + \frac{D_{0I}}{\sqrt{D_{0I} D_{0V}}} \frac{\partial}{\partial \phi} \left\{ [1 + \varepsilon_I g_I(\chi, \eta, \phi, T)] \frac{\partial \tilde{I}(\chi, \eta, \phi, \vartheta)}{\partial \phi} \right\} - \tilde{I}(\chi, \eta, \phi, \vartheta) \times \\ &\times \omega [1 + \varepsilon_{I,V} g_{I,V}(\chi, \eta, \phi, T)] \tilde{V}(\chi, \eta, \phi, \vartheta) - \Omega_I [1 + \varepsilon_{I,I} g_{I,I}(\chi, \eta, \phi, T)] \tilde{I}^2(\chi, \eta, \phi, \vartheta) \quad (8) \end{aligned}$$

$$\begin{aligned} \frac{\partial \tilde{V}(\chi, \eta, \phi, \vartheta)}{\partial \vartheta} &= \frac{D_{0V}}{\sqrt{D_{0I} D_{0V}}} \frac{\partial}{\partial \chi} \left\{ [1 + \varepsilon_V g_V(\chi, \eta, \phi, T)] \frac{\partial \tilde{V}(\chi, \eta, \phi, \vartheta)}{\partial \chi} \right\} + \frac{\partial}{\partial \eta} \left\{ [1 + \varepsilon_V g_V(\chi, \eta, \phi, T)] \times \right. \\ &\times \left. \frac{\partial \tilde{V}(\chi, \eta, \phi, \vartheta)}{\partial \eta} \right\} + \frac{D_{0V}}{\sqrt{D_{0I} D_{0V}}} \frac{\partial}{\partial \phi} \left\{ [1 + \varepsilon_V g_V(\chi, \eta, \phi, T)] \frac{\partial \tilde{V}(\chi, \eta, \phi, \vartheta)}{\partial \phi} \right\} - \tilde{V}(\chi, \eta, \phi, \vartheta) \times \\ &\times \omega [1 + \varepsilon_{I,V} g_{I,V}(\chi, \eta, \phi, T)] \tilde{I}(\chi, \eta, \phi, \vartheta) - \Omega_V [1 + \varepsilon_{V,V} g_{V,V}(\chi, \eta, \phi, T)] \tilde{V}^2(\chi, \eta, \phi, \vartheta) \end{aligned}$$

$$\left. \frac{\partial \tilde{I}(\chi, \eta, \phi, \vartheta)}{\partial \chi} \right|_{\chi=0} = 0, \quad \left. \frac{\partial \tilde{I}(\chi, \eta, \phi, \vartheta)}{\partial \chi} \right|_{\chi=1} = 0, \quad \left. \frac{\partial \tilde{I}(\chi, \eta, \phi, \vartheta)}{\partial \eta} \right|_{\eta=0} = 0, \quad \left. \frac{\partial \tilde{I}(\chi, \eta, \phi, \vartheta)}{\partial \eta} \right|_{\eta=1} = 0,$$

$$\left. \frac{\partial \tilde{I}(\chi, \eta, \phi, \vartheta)}{\partial \phi} \right|_{\phi=0} = 0, \quad \left. \frac{\partial \tilde{I}(\chi, \eta, \phi, \vartheta)}{\partial \phi} \right|_{\phi=1} = 0, \quad \tilde{I}(\chi, \eta, \phi, \vartheta) = \frac{f_I(\chi, \eta, \phi, \vartheta)}{\rho^*}. \quad (9)$$

Let us determine solutions of Eqs.(8) as the following power series [18-20]

$$\tilde{I}(\chi, \eta, \phi, \vartheta) = \sum_{i=0}^{\infty} \varepsilon_I^i \sum_{j=0}^{\infty} \omega^j \sum_{k=0}^{\infty} \Omega_I^k \tilde{I}_{ijk}(\chi, \eta, \phi, \vartheta). \quad (10)$$

After substitution of the series (10) into Eqs.(8) and conditions (9) we obtain equations for initial-order approximations of concentration of point defects $\tilde{I}_{000}(\chi, \eta, \phi, \vartheta)$ and $\tilde{V}_{000}(\chi, \eta, \phi, \vartheta)$, corrections $\tilde{I}_{ijk}(\chi, \eta, \phi, \vartheta)$ and $\tilde{V}_{ijk}(\chi, \eta, \phi, \vartheta)$ and conditions for them for all $i \geq 1, j \geq 1, k \geq 1$. The equations are

presented in the Appendix. We calculate solutions of the equations by standard Fourier approach [21,22]. The solutions are presented in the Appendix.

Farther we determine spatio-temporal distributions of concentrations of simplest complexes of point radiation defects. To determine the distributions we transform approximations of diffusion coefficients in the following form: $D_{\phi\rho}(x,y,z,T)=D_{0\phi\rho}[1+\varepsilon_{\phi\rho}g_{\phi\rho}(x,y,z,T)]$, where $D_{0\phi\rho}$ are the average values of diffusion coefficients. In this situation the Eqs.(6) could be written as

$$\begin{aligned} \frac{\partial \Phi_I(x,y,z,t)}{\partial t} &= D_{0\phi I} \frac{\partial}{\partial x} \left\{ [1 + \varepsilon_{\phi I} g_{\phi I}(x,y,z,T)] \frac{\partial \Phi_I(x,y,z,t)}{\partial x} \right\} + k_{I,I}(x,y,z,T) I^2(x,y,z,t) + \\ &+ D_{0\phi I} \frac{\partial}{\partial y} \left\{ [1 + \varepsilon_{\phi I} g_{\phi I}(x,y,z,T)] \frac{\partial \Phi_I(x,y,z,t)}{\partial y} \right\} + D_{0\phi I} \frac{\partial}{\partial z} \left\{ [1 + \varepsilon_{\phi I} g_{\phi I}(x,y,z,T)] \frac{\partial \Phi_I(x,y,z,t)}{\partial z} \right\} - \\ &- k_I(x,y,z,T) I(x,y,z,t) \\ \frac{\partial \Phi_V(x,y,z,t)}{\partial t} &= D_{0\phi V} \frac{\partial}{\partial x} \left\{ [1 + \varepsilon_{\phi V} g_{\phi V}(x,y,z,T)] \frac{\partial \Phi_V(x,y,z,t)}{\partial x} \right\} + k_{I,I}(x,y,z,T) I^2(x,y,z,t) + \\ &+ D_{0\phi V} \frac{\partial}{\partial y} \left\{ [1 + \varepsilon_{\phi V} g_{\phi V}(x,y,z,T)] \frac{\partial \Phi_V(x,y,z,t)}{\partial y} \right\} + D_{0\phi V} \frac{\partial}{\partial z} \left\{ [1 + \varepsilon_{\phi V} g_{\phi V}(x,y,z,T)] \frac{\partial \Phi_V(x,y,z,t)}{\partial z} \right\} - \\ &- k_I(x,y,z,T) I(x,y,z,t). \end{aligned}$$

We determine spatio-temporal distributions of concentrations of complexes of radiation defects as the following power series

$$\Phi_\rho(x,y,z,t) = \sum_{i=0}^{\infty} \varepsilon_{\phi\rho}^i \Phi_{\rho i}(x,y,z,t). \quad (11)$$

Equations for the functions $\Phi_{\rho i}(x,y,z,t)$ and conditions for them could be obtained by substitution of the series (11) into Eqs.(6) and appropriate boundary and initial conditions. We present the equations and conditions in the Appendix. Solutions of the equations have been calculated by standard approaches [21,22] and presented in the Appendix.

Now we calculate distribution of concentration of dopant in space and time by using the same approach, which was used for calculation the same distributions of another concentrations. To use the approach we transform spatio-temperature approximation of dopant diffusion coefficient to the form: $D_L(x,y,z,T)=D_{0L}[1+\varepsilon_L g_L(x,y,z,T)]$, where D_{0L} is the average value of dopant diffusion coefficient, $0 \leq \varepsilon_L < 1$, $|g_L(x,y,z,T)| \leq 1$. Now we solve the Eq.(1) as the following power series

$$C(x,y,z,t) = \sum_{i=0}^{\infty} \varepsilon_L^i \sum_{j=1}^{\infty} \xi^j C_{ij}(x,y,z,t).$$

The equations for the functions $C_{ij}(x,y,z,t)$ and conditions for them have been obtained by substitution of the series into Eq.(1) and conditions (2). We presented the equations and conditions for them in the Appendix. We solve the equations by standard Fourier approach [21,22]. The solutions have been presented in the Appendix.

We analyzed distributions of concentrations of dopant and radiation defects in space and time analytically by using the second-order approximations on all parameters, which have been used in appropriate series. The approximations are usually enough good approximations to make qualitative analysis and to obtain quantitative results. We check all results of analytical modeling by comparison with results of numerical simulation.

3.DISCUSSION

In this section based on recently calculated relations we analyzed redistribution of dopant with account redistribution of radiation defects. These relations give us possibility to obtain spatial distributions of concentration of dopant. Typical spatial distributions of concentration of dopant in directions, which is perpendicular to channel, are presented in Fig. 2. Curve 1 of this paper is a typical distribution of concentration of dopant in directions of channel. The figure shows, that presents of interface between layers of heterostructure gives us possibility to obtain more compact and more homogenous distribution of concentration of dopant in direction, which is perpendicular to the interface. However in this situation one shall to optimize annealing time. Reason of the optimization is following. If annealing time is small, dopant can not achieves the interface. If annealing time is large, dopant will diffuse into another layers of heterostructure too deep. We calculate optimal value of annealing time by using recently introduced criterion [18-20]. Framework the criterion we approximate real distribution of concentration of dopant by ideal step-wise function $\psi(x,y,z)$. Farther the required optimal value of dopant concentration by minimization of the following mean-squared error

Fig.2. The infused dopant concentration distributions. The considered direction is perpendicular to interface between epitaxial layer and substrate. Increasing of number of distributions corresponds to increasing of difference between values of dopant diffusion coefficient in layers of heterostructure. The distributions have been calculated under condition, when value of dopant diffusion coefficient in epitaxial layer is larger, than value of dopant diffusion coefficient in substrate

Fig.3. Fig.2. The implanted dopant concentration distributions. The considered direction is perpendicular to interface between epitaxial layer and substrate. Curves 1 and 3 corresponds to annealing time $\Theta = 0.0048 (L_x^2 + L_y^2 + L_z^2) / D_0$. Curves 2 and 4 corresponds to annealing time $\Theta = 0.0057 (L_x^2 + L_y^2 + L_z^2) / D_0$. Curves 1 and 2 have been calculated for homogenous sample. Curves 3 and 4 have been calculated for heterostructure under condition, when value of dopant diffusion coefficient in epitaxial layer is larger, than value of dopant diffusion coefficient in substrate

$$U = \frac{1}{L_x L_y L_z} \int_0^{L_x} \int_0^{L_y} \int_0^{L_z} [C(x, y, z, \Theta) - \psi(x, y, z)] dz dy dx. \quad (12)$$

Dependences of optimal value of annealing time are presented on Figs. 3. Optimal values of annealing time of implanted dopant should be smaller in comparison with the same annealing time of infused dopant. Reason of the difference is necessity to anneal radiation defects before annealing of dopant.

Fig.3a. Optimal annealing time of infused dopant as dependences of several parameters. Curve 1 is the dependence of the considered annealing time on dimensionless thickness of epitaxial layer a/L and $\xi = \gamma = 0$ for equal to each other values of dopant diffusion coefficient in all parts of heterostructure. Curve 2 is the dependence of the considered annealing time on the parameter ε for $a/L = 1/2$ and $\xi = \gamma = 0$. Curve 3 is the dependence of the considered annealing time on the parameter ξ for $a/L = 1/2$ and $\varepsilon = \gamma = 0$. Curve 4 is the dependence of the considered annealing time on parameter γ for $a/L = 1/2$ and $\varepsilon = \xi = 0$

Fig.3a. Optimal annealing time of implanted dopant as dependences of several parameters. Curve 1 is the dependence of the considered annealing time on dimensionless thickness of epitaxial layer a/L and $\xi=\gamma=0$ for equal to each other values of dopant diffusion coefficient in all parts of heterostructure. Curve 2 is the dependence of the considered annealing time on the parameter ε for $a/L=1/2$ and $\xi=\gamma=0$. Curve 3 is the dependence of the considered annealing time on the parameter ξ for $a/L=1/2$ and $\varepsilon=\gamma=0$. Curve 4 is the dependence of the considered annealing time on parameter γ for $a/L=1/2$ and $\varepsilon=\xi=0$

4. CONCLUSIONS

In this paper we introduce an approach to manufacture of a field-effect heterotransistor with inhomogeneous doping of channel. Some recommendations to optimize technological process to manufacture more compact distribution of concentration of dopant have been formulated.

Authors:

Pankratov Evgeny Leonidovich was born at 1977. From 1985 to 1995 he was educated in a secondary school in Nizhny Novgorod. From 1995 to 2004 he was educated in Nizhny Novgorod State University: from 1995 to 1999 it was bachelor course in Radiophysics, from 1999 to 2001 it was master course in Radiophysics with specialization in Statistical Radiophysics, from 2001 to 2004 it was PhD course in Radiophysics. From 2004 to 2008 E.L. Pankratov was a leading technologist in Institute for Physics of Microstructures. From 2008 to 2012 E.L. Pankratov was a senior lecture/Associate Professor of Nizhny Novgorod State University of Architecture and Civil Engineering. Now E.L. Pankratov is in his Full Doctor course in Radiophysical Department of Nizhny Novgorod State University. He has 110 published papers in area of his researches.

Bulaeva Elena Alexeevna was born at 1991. From 1997 to 2007 she was educated in secondary school of village Kochunovo of Nizhny Novgorod region. From 2007 to 2009 she was educated in boarding school "Center for gifted children". From 2009 she is a student of Nizhny Novgorod State University of Architecture and Civil Engineering (spatiality "Assessment and management of real estate"). At the same time she is a student of courses "Translator in the field of professional communication" and "Design (interior art)" in the University. E.A. Bulaeva was a contributor of grant of President of Russia (grant № MK-548.2010.2). She has 74 published papers in area of her researches.

APPENDIX

Equations for the functions $\tilde{I}_{ijk}(\chi, \eta, \phi, \vartheta)$ and $\tilde{V}_{ijk}(\chi, \eta, \phi, \vartheta)$, $i \geq 0, j \geq 0, k \geq 0$ and conditions for them

$$\begin{aligned} \frac{\partial \tilde{I}_{000}(\chi, \eta, \phi, \vartheta)}{\partial \vartheta} &= \sqrt{\frac{D_{0I}}{D_{0V}}} \frac{\partial^2 \tilde{I}_{000}(\chi, \eta, \phi, \vartheta)}{\partial \chi^2} + \sqrt{\frac{D_{0I}}{D_{0V}}} \frac{\partial^2 \tilde{I}_{000}(\chi, \eta, \phi, \vartheta)}{\partial \eta^2} + \sqrt{\frac{D_{0I}}{D_{0V}}} \frac{\partial^2 \tilde{I}_{000}(\chi, \eta, \phi, \vartheta)}{\partial \phi^2} \\ \frac{\partial \tilde{V}_{000}(\chi, \eta, \phi, \vartheta)}{\partial \vartheta} &= \sqrt{\frac{D_{0V}}{D_{0I}}} \frac{\partial^2 \tilde{V}_{000}(\chi, \eta, \phi, \vartheta)}{\partial \chi^2} + \sqrt{\frac{D_{0V}}{D_{0I}}} \frac{\partial^2 \tilde{V}_{000}(\chi, \eta, \phi, \vartheta)}{\partial \eta^2} + \sqrt{\frac{D_{0V}}{D_{0I}}} \frac{\partial^2 \tilde{V}_{000}(\chi, \eta, \phi, \vartheta)}{\partial \phi^2}; \\ \frac{\partial \tilde{I}_{i00}(\chi, \vartheta)}{\partial \vartheta} &= \sqrt{\frac{D_{0I}}{D_{0V}}} \left[\frac{\partial^2 \tilde{I}_{i00}(\chi, \eta, \phi, \vartheta)}{\partial \chi^2} + \frac{\partial^2 \tilde{I}_{i00}(\chi, \eta, \phi, \vartheta)}{\partial \eta^2} + \frac{\partial^2 \tilde{I}_{i00}(\chi, \eta, \phi, \vartheta)}{\partial \phi^2} \right] + \frac{\partial}{\partial \chi} \left[g_I(\chi, \eta, \phi, T) \times \right. \\ &\times \left. \frac{\partial \tilde{I}_{i-100}(\chi, \eta, \phi, \vartheta)}{\partial \chi} \right] \sqrt{\frac{D_{0I}}{D_{0V}}} + \sqrt{\frac{D_{0I}}{D_{0V}}} \frac{\partial}{\partial \eta} \left[g_I(\chi, \eta, \phi, T) \frac{\partial \tilde{I}_{i-100}(\chi, \eta, \phi, \vartheta)}{\partial \eta} \right] + \frac{\partial}{\partial \phi} \left[g_I(\chi, \eta, \phi, T) \times \right. \\ &\times \left. \frac{\partial \tilde{I}_{i-100}(\chi, \eta, \phi, \vartheta)}{\partial \phi} \right] \sqrt{\frac{D_{0I}}{D_{0V}}}, i \geq 1, \\ \frac{\partial \tilde{V}_{i00}(\chi, \vartheta)}{\partial \vartheta} &= \sqrt{\frac{D_{0V}}{D_{0I}}} \left[\frac{\partial^2 \tilde{V}_{i00}(\chi, \eta, \phi, \vartheta)}{\partial \chi^2} + \frac{\partial^2 \tilde{V}_{i00}(\chi, \eta, \phi, \vartheta)}{\partial \eta^2} + \frac{\partial^2 \tilde{V}_{i00}(\chi, \eta, \phi, \vartheta)}{\partial \phi^2} \right] + \frac{\partial}{\partial \chi} \left[g_V(\chi, \eta, \phi, T) \times \right. \\ &\times \left. \frac{\partial \tilde{V}_{i-100}(\chi, \eta, \phi, \vartheta)}{\partial \chi} \right] \sqrt{\frac{D_{0V}}{D_{0I}}} + \sqrt{\frac{D_{0V}}{D_{0I}}} \frac{\partial}{\partial \eta} \left[g_V(\chi, \eta, \phi, T) \frac{\partial \tilde{V}_{i-100}(\chi, \eta, \phi, \vartheta)}{\partial \eta} \right] + \frac{\partial}{\partial \phi} \left[g_V(\chi, \eta, \phi, T) \times \right. \\ &\times \left. \frac{\partial \tilde{V}_{i-100}(\chi, \eta, \phi, \vartheta)}{\partial \phi} \right] \sqrt{\frac{D_{0V}}{D_{0I}}}, i \geq 1, \\ \frac{\partial \tilde{I}_{010}(\chi, \eta, \phi, \vartheta)}{\partial \vartheta} &= \sqrt{\frac{D_{0I}}{D_{0V}}} \left[\frac{\partial^2 \tilde{I}_{010}(\chi, \eta, \phi, \vartheta)}{\partial \chi^2} + \frac{\partial^2 \tilde{I}_{010}(\chi, \eta, \phi, \vartheta)}{\partial \eta^2} + \frac{\partial^2 \tilde{I}_{010}(\chi, \eta, \phi, \vartheta)}{\partial \phi^2} \right] - \\ &- [1 + \varepsilon_{I,V} g_{I,V}(\chi, \eta, \phi, T)] \tilde{I}_{000}(\chi, \eta, \phi, \vartheta) \tilde{V}_{000}(\chi, \eta, \phi, \vartheta) \\ \frac{\partial \tilde{V}_{010}(\chi, \eta, \phi, \vartheta)}{\partial \vartheta} &= \sqrt{\frac{D_{0V}}{D_{0I}}} \left[\frac{\partial^2 \tilde{V}_{010}(\chi, \eta, \phi, \vartheta)}{\partial \chi^2} + \frac{\partial^2 \tilde{V}_{010}(\chi, \eta, \phi, \vartheta)}{\partial \eta^2} + \frac{\partial^2 \tilde{V}_{010}(\chi, \eta, \phi, \vartheta)}{\partial \phi^2} \right] - \\ &- [1 + \varepsilon_{I,V} g_{I,V}(\chi, \eta, \phi, T)] \tilde{I}_{000}(\chi, \eta, \phi, \vartheta) \tilde{V}_{000}(\chi, \eta, \phi, \vartheta); \\ \frac{\partial \tilde{I}_{020}(\chi, \eta, \phi, \vartheta)}{\partial \vartheta} &= \sqrt{\frac{D_{0I}}{D_{0V}}} \left[\frac{\partial^2 \tilde{I}_{020}(\chi, \eta, \phi, \vartheta)}{\partial \chi^2} + \frac{\partial^2 \tilde{I}_{020}(\chi, \eta, \phi, \vartheta)}{\partial \eta^2} + \frac{\partial^2 \tilde{I}_{020}(\chi, \eta, \phi, \vartheta)}{\partial \phi^2} \right] - \\ &- [1 + \varepsilon_{I,V} g_{I,V}(\chi, \eta, \phi, T)] [\tilde{I}_{010}(\chi, \eta, \phi, \vartheta) \tilde{V}_{000}(\chi, \eta, \phi, \vartheta) + \tilde{I}_{000}(\chi, \eta, \phi, \vartheta) \tilde{V}_{010}(\chi, \eta, \phi, \vartheta)] \end{aligned}$$
