

for science, and soon became recognized as a safe scientific thinker and investigator. He was one who never rushed to conclusions however enticing the facts discovered appeared, but took time to look into every possible avenue of approach to the subject, being satisfied only when his conclusions rested upon a foundation that could not be shaken. Consequently he was not a prolific writer. Indeed, he gave himself so unreservedly to his teaching and his students that research work was possible only during his brief vacations and at odd hours.

Professor Wright was a modest, retiring man, always shrinking from publicity, yet his service to the community and the state becomes conspicuous in his absence. Oberlin's unrivaled water and sewer systems are largely due to his hard study and keen insight. To him is almost wholly due the inception of the topographical survey of Ohio. In this he was at first defeated, but by untiring efforts and dogged determination saw the issue to a successful finish. He was also among the charter members of the Ohio State Academy of Science, which he served as president.

Probably among his most conspicuous contributions to science was his correction of Dr. Newberry's error in the true arrangement of the ventral armor of *Dinichthys*. While the publications over his own name were relatively few, his inspiration to others and his constant interest and unflinching kindness in spending himself for others who worked under him will continue long to be a potent factor in the advancement of science.

Professor Wright was a fellow of the American Association for the Advancement of Science, a fellow of the Geological Society of America, and member of the Ohio State Academy of Science.

THE NEWFOUNDLAND WHALE FISHERIES.

THE returns of the Newfoundland Whale Fisheries for 1904 show that the eleven steamers employed took 1,270 whales, or an average of 116 each. In 1903 four steamers took 859 whales, or an average of 215 each. The Fisheries' 'Gazette' says that these returns make a very unfavorable showing and that comparison with those for 1903 is most depressing. That it is so is only what might have been expected. One can take out of a bucket only as much water as there is in it, and with the present rate at which whales are being killed, there is no reason to expect that the supply can at all keep up with the demand. Of

course local causes may have been responsible for a part of the decrease, but this remains to be seen, and certainly a catch of 1,200 whales in the limited area around Newfoundland must be looked upon as enormous.

Those familiar with the history of fishing industries are quite aware that the fishermen never admit that their catch has any influence whatever upon the diminution in numbers of animal life; whales, seals and fishes are never exterminated, simply gone elsewhere, although that elsewhere is invariably where the wicked men cease from troubling and the weary animals are at rest.

The question is now being agitated as to what effect the diminution of whales will have upon other fisheries and in Norway the agitation carried on by the fishermen has progressed to such an extent that, right or wrong, the whale fishery in certain districts has been prohibited. That the diminution of whales may have an effect on fisheries is very probable, though it is extremely doubtful if the reasons assigned by the fishermen are the correct ones.

On the Newfoundland coast the whales feed entirely upon small isopods and it may be that the diminution in whales allows a wonderful increase of the *Euphausia*, who in turn feed upon the minute life on which the caplin and herrings are accustomed to feed. That the whales directly affect either herring or caplin or squid is more than doubtful, since none of these animals form any portion of the food of whales on the Newfoundland coast. Of the hundreds of whales examined none have contained anything save *Euphausia*. The smaller finback whales, such as *Balaenoptera acutorostrata*, feed actively upon the schools of caplin, but this species is not common about the Newfoundland coast and certainly has no appreciable effect upon the fishes.
