Recovery Studies.

ABSTRACT

The present study was undertaken to develop and validate a simple, accurate, precise, reproducible and cost effective UV-Visible spectrophotometric method for the estimation of Selexipag. The solvent used throughout the experiment was Dimethyl sulphoxide (DMSO). Absorption maximum (λ_{max}) of the drug was found to be 306 nm. The quantitative determination of the drug was carried out at 306 nm and Beer's law was obeyed in the range of 5-25 μ g/mL. The approach of this work includes preliminary literature survey followed by the practical method development, applicable to be used on regular basis. The major outcomes of this method includes following: method was shown linear in the mentioned concentrations having line equation $y = 0.045x - 0.039$ with correlation coefficient R^2 of 0.9963. The recovery values of Selexipag for 80%, 100% and 120% were found to be 99.16%, 99.7% and 99.00% respectively. The percent relative standard deviation (RSD %) of interday precision was 0.490% and intraday precision was 0.28%. The limit of detection and limit of quantification was 0.477 μ g/mL and 1.44 μ g/mL. The percent relative standard deviation of robustness and ruggedness of the method was 1.78 and 0.38% respectively. It can be concluded that proposed method was precise, accurate and cost effective and it could be applicable for quantitative determination of the bulk drug as well as dosage formulation.

INTRODUCTION

Selexipag is pale yellow coloured crystalline substance having chemical name 2-{4-[5,6-diphenylpyrazin-2-yl](propan-2-yl)amino]butoxy}-N-methanesulfonylacetamide. It is soluble in Dichloromethane Dimethyl sulphoxide, insoluble in aqueous solution, (insoluble at pH 2 to 4, freely soluble at pH 8 and very soluble from pH 9 to pH 12)^{1,2}.

Selexipag is used as antihypertensive agent³. Selexipag is a selective prostacyclin (IP, also called PGI₂) receptor agonist. The key features of pulmonary arterial hypertension include a decrease in prostacycline and prostacycline synthase (enzyme that helps to produce prostacyclin) in the lung. Prostacyclin is a potent vasodilator with anti-proliferative, anti-inflammatory, and antithrombotic effects; Therefore, there is strong rationale for treatment with IP receptor agonist. Selexipag is chemically distinct as it is not PGI₂ or a PGI₂ analogue and has high selectivity for the IP receptor. It is metabolized by carboxylesterase 1 to yield an active metabolite (ACT333679) that is approximately 37 times more potent than selexipag. Both selexipag and its metabolite are selective for the IP receptor over other prostanoid receptor^{1,4}.

Statistical parameters like mean, mode, standard deviation were used to analyse the obtained data and draw suitable conclusions based on their results.^{5,6}

The main problem being tackled is that there is no such reported simple UV spectrophotometric method yet for the analysis of Selexipag. So the development of such method justifies the research and its need. The purpose of this investigation was to develop and validate a simple, rapid, sensitive, precise, accurate and spectrophotometric method for the estimation of Selexipag in bulk and dosage form.

Selexipag.

The objectives of this work includes:

1. To develop rapid, sensitive and precise UV spectrophotometric method for estimation of Selexipag.
2. To validate this method as per ICH Q2 R1 guidelines.
3. To be able to estimate the drug in API as well as in its Bulk dosage form via recovery studies.

MATERIALS AND METHODS

API:

Selexipag was kindly procured as gift sample from Megafine pharmaceuticals, Nashik. Dimethyl sulphoxide was purchased from Modern chemical laboratory, Nashik, Maharashtra, India.

Instruments:

For Weighing, a calibrated weighing balance (Make- Shimadzu) of 1mg sensitivity was used. For analytical purpose Shimadzu- 1800 UV Spectrophotometer and Shimadzu 2501 PC UV-Vis Recording Spectrophotometry was used. All other glasswares and apparatus were made of Borosilicate and were calibrated.

Experimental Work:

Method Development:

Preparation of API standard Stock solution:

The standard stock solution of 1000 µg/mL of Selexipag was prepared by weighing 100 mg of the drug, taken in 100 mL volumetric flask and diluted with Dimethyl sulphoxide.

By appropriate dilution of standard stock solutions with Dimethyl sulphoxide, different solutions containing different concentration (5, 10, 15, 20, & 25µg/mL) of Selexipag were prepared.

Preparation of tablet stock solution:

Ten tablets were triturated in a mortar and weighed to take 10 mg equivalent of API. This was dissolved in 100 ml of Dimethyl Sulfoxide solution to get 100ppm solution. This solution was sonicated for 5 minutes and then filtered. The filtered solution was then accurately diluted further as needed.

Determination of wavelength of maximum absorption: ^{7,8}

The API stock solution further diluted was scanned in the range of 200-400 nm to determine the wavelength of maximum absorbance. Selexipag has shown maximum absorption at 306 nm.

Validation: ^{9,10}

The proposed method was validated according to ICH Q2 (R1) guidelines for validation of analytical procedures. As per the ICH guidelines the method was validated for Linearity, Precision, Accuracy, Limit of Detection, Limit of Quantification Robustness and Ruggedness.

Linearity:

Different volumes of stock solutions were suitably diluted with corresponding medium (5, 10, 15, 20 and 25 µg/ml) to get the desired concentrations. Each solution was analysed in triplicate. The absorbance values were plotted against the corresponding concentrations to obtain the linear calibration curve with equation:

$$y = mx + c$$

Along with that regression is calculated, to establish linearity.

The dilutions for linearity were prepared as follows:

Table 1: Linearity.

| Sr. no | Concentration in ppm | Absorbance |
|--------|----------------------|------------|
| 1 | 5 | 0.181 |
| 2 | 10 | 0.401 |
| 3 | 15 | 0.653 |
| 4 | 20 | 0.892 |
| 5 | 25 | 1.064 |

Precision

It is the measure of repeatability of the results. For precision studies dilutions of 10ppm were prepared in six replicates and absorbance of each was checked. It was performed for intra as well as interday precision. Standard deviation and relative standard deviation was calculated for all these results. The precision should be within limit of 2% RSD (Relative Standard Deviation).^{11,12} Concentration of 10 ppm was selected for the precision studies. Dilutions were prepared as follows:

Table 2: Precision.

| Sr. no | Concentration in ppm | Absorbance |
|--------|----------------------|------------|
| 1 | 10 | 0.403 |
| 2 | 10 | 0.407 |
| 3 | 10 | 0.408 |
| 4 | 10 | 0.408 |
| 5 | 10 | 0.402 |
| 6 | 10 | 0.403 |

Intraday precision:

The same dilutions were used on same day again to note the absorbance and calculate the relative standard deviation.

Table 3: Intraday Precision.

| Sr. no | Concentration in ppm | Absorbance |
|--------|----------------------|------------|
| 1 | 10 | 0.401 |
| 2 | 10 | 0.399 |
| 3 | 10 | 0.402 |
| 4 | 10 | 0.405 |
| 5 | 10 | 0.396 |
| 6 | 10 | 0.401 |

Interday precision:

Dilutions of the precision taken above were kept overnight and analysed on the next day for standard deviation.

Table 4: Interday Precision.

| Sr. no | Concentration in ppm | Absorbance |
|--------|----------------------|------------|
| 1 | 10 | 0.409 |
| 2 | 10 | 0.408 |
| 3 | 10 | 0.405 |
| 4 | 10 | 0.411 |
| 5 | 10 | 0.407 |
| 6 | 10 | 0.411 |

Accuracy:

The accuracy studies were performed by using 80%, 100% and 120% of the solution of 10 ppm. Thus 8, 10 and 12 ppm concentration were used in triplicates for accuracy.

Table 5: Accuracy.

| Sr. No | % concentration | Concentration in ppm | Volume of API Stock in ml | Volume of Tablet stock in ml | Absorbance |
|--------|-----------------|----------------------|---------------------------|------------------------------|------------|
| 1 | 80 | 8 | 0.5 | 0.3 | 0.317 |
| | | | | | 0.319 |
| | | | | | 0.319 |
| | | | | | 0.412 |
| 2 | 100 | 10 | 0.5 | 0.5 | 0.404 |
| | | | | | 0.414 |
| | | | | | 0.498 |
| 3 | 120 | 12 | 0.5 | 0.7 | 0.496 |
| | | | | | 0.496 |
| | | | | | 0.496 |

Limit of Detection and Limit of Quantification:

The Limit of Detection (LOD) is the smallest concentration of the analytes that gives the measurable response. LOD was calculated using the following formula

$$\text{LOD} = 3.3 \sigma / S$$

The Limit of Quantification (LOQ) is the smallest concentration of the analytes, which gives response that can be accurately quantified. LOQ was calculated using the following formula

$$\text{LOQ} = 10 \sigma / S$$

Where, σ is standard deviation of the response and S is the slope of the calibration curve.

The slope used in this equation is from the linearity curve and the standard deviation is obtained from precision.

Robustness

In robustness the capacity of method to remain unaffected by the small deliberate changes is calculated. The study includes change of wavelength of maximum absorbance and analysing the absorbance. The results are interpreted with respect to relative standard deviation.

Table 6: Robustness.

| Sr. no | Wavelength in nm | Absorbance |
|--------|------------------|------------|
| 1 | 301 | 0.320 |
| 2 | 302 | 0.326 |
| 3 | 303 | 0.330 |
| 4 | 304 | 0.334 |
| 5 | 305 | 0.336 |
| 6 | 306 | 0.340 |
| 7 | 307 | 0.340 |
| 8 | 308 | 0.338 |
| 9 | 309 | 0.335 |
| 10 | 310 | 0.333 |
| 11 | 311 | 0.329 |

Ruggedness

The ruggedness study includes change of analyst and change of UV Spectrophotometer for determining the capacity of method to remain unaffected by any external environment changes.

For both the cases, the precision was performed by a different analyst on a different UV Spectrophotometer.

Table 7: Ruggedness.

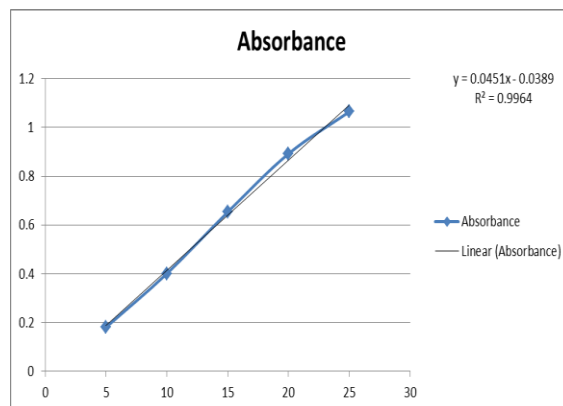

| Sr. no | Concentration in ppm | Absorbance |
|--------|----------------------|------------|
| 1 | 10 | 0.401 |
| 2 | 10 | 0.398 |
| 3 | 10 | 0.399 |
| 4 | 10 | 0.402 |
| 5 | 10 | 0.400 |
| 6 | 10 | 0.402 |

RESULT AND DISCUSSION**Determination of wavelength of maximum absorption:**

The wavelength of maximum absorption was found to be 306 nm.

**Fig 1: Ultra Violet Spectrum of Selexipag.****Linearity:****Table 8: Linearity.**

| Sr. no | Concentration in ppm | Absorbance |
|--------|----------------------|------------|
| 1 | 5 | 0.181 |
| 2 | 10 | 0.401 |
| 3 | 15 | 0.653 |
| 4 | 20 | 0.892 |
| 5 | 25 | 1.064 |

The method for Selexipag was found to be linear in the range of 5-25 ppm with $R^2 = 0.9964$ and the straight line equation as:

$$y = 0.0451x - 0.0389$$

Precision

The study was performed and relative standard deviation was calculated.

Table 9: % RSD of results of Precision.

| Sr. no | Concentration in ppm | Absorbance (y) | (y- \bar{y}) | (y- \bar{y}) ² | S.D | %RSD |
|--------|----------------------|-------------------|-----------------|------------------------------|--------|------|
| 1 | 10 | 0.403 | 0.002 | 0.000004 | 0.0025 | 0.61 |
| 2 | 10 | 0.407 | 0.002 | 0.000004 | | |
| 3 | 10 | 0.408 | 0.003 | 0.000009 | | |
| 4 | 10 | 0.408 | 0.003 | 0.000009 | | |
| 5 | 10 | 0.402 | 0.003 | 0.000009 | | |
| 6 | 10 | 0.403 | 0.002 | 0.000004 | | |
| | | $\bar{Y} = 0.405$ | | $\Sigma = 0.000039$ | | |

Intraday Precision:

Table 10: % RSD of results of Intraday Precision.

| Sr. no | Concentration in ppm | Absorbance (y) | (y- \bar{y}) | (y- \bar{y}) ² | S.D | %RSD |
|--------|----------------------|----------------|-----------------|------------------------------|--------|------|
| 1 | 10 | 0.401 | 0.002 | 0.000004 | 0.0025 | 0.61 |
| 2 | 10 | 0.399 | 0.002 | 0.000004 | | |
| 3 | 10 | 0.402 | 0.003 | 0.000009 | | |
| 4 | 10 | 0.405 | 0.003 | 0.000009 | | |
| 5 | 10 | 0.396 | 0.003 | 0.000009 | | |
| 6 | 10 | 0.401 | 0.002 | 0.000004 | | |
| | | | | $\Sigma = 0.000039$ | | |

Interday Precision:

Table 11: % RSD of results of Interday Precision.

| Sr. no | Concentration in ppm | Absorbance (y) | (y- \bar{y}) | (y- \bar{y}) ² | S.D | %RSD |
|--------|----------------------|-------------------|-----------------|------------------------------|--------|------|
| 1 | 10 | 0.409 | 0.001 | 0.000001 | 0.0021 | 0.49 |
| 2 | 10 | 0.408 | 0.000 | 0.000000 | | |
| 3 | 10 | 0.405 | 0.003 | 0.000009 | | |
| 4 | 10 | 0.411 | 0.003 | 0.000009 | | |
| 5 | 10 | 0.407 | 0.001 | 0.000001 | | |
| 6 | 10 | 0.411 | 0.003 | 0.000009 | | |
| | | $\bar{Y} = 0.408$ | | $\Sigma = 0.000029$ | | |

Accuracy:

The concentration is calculated by using straight line equation:

$$y = mx + c$$

$$y = 0.0451x - 0.0389$$

% Recovery=

$$\frac{x}{8} * 100$$

Table 12: % Recovery (1).

| Sr. no | % concentration | Concentration in ppm | Absorbance | % Recovery |
|--------|-----------------|----------------------|-----------------|------------|
| 1 | 80 | 8 | 0.317 | 99.12 |
| | | | 0.319 | |
| | | | 0.319 | |
| | | | $\bar{Y}=0.318$ | |

Table 13: % Recovery (2).

| Sr. no | % concentration | Concentration in ppm | Absorbance | % Recovery |
|--------|-----------------|----------------------|-----------------|------------|
| 2 | 100 | 10 | 0.412 | 99.12 |
| | | | 0.404 | |
| | | | 0.414 | |
| | | | $\bar{Y}=0.410$ | |

Table 14: % Recovery (3).

| Sr. no | % concentration | Concentration in ppm | Absorbance | % Recovery |
|--------|-----------------|----------------------|-----------------|------------|
| 3 | 120 | 12 | 0.498 | |
| | | | 0.496 | |
| | | | 0.496 | |
| | | | $\bar{Y}=0.496$ | |

Limit of Detection and Limit of Quantification:

It is calculated by using slope and standard deviation from linearity and precision respectively:

Limit of detection (LOD):

$$LOD = 3.3 \times SD / Slope$$

$$LOD = 0.182 \text{ ppm}$$

Limit of quantification (LOQ):

$$LOQ = 10 \times SD / Slope$$

$$LOQ = 0.554 \text{ ppm}$$

Robustness:**Table 15: % RSD of results of Robustness.**

| Sr. no | Wavelength in nm | Absorbance (y) | (y- \bar{y}) | (y- \bar{y}) ² | S.D | %RSD |
|--------|------------------|-----------------|-------------------|------------------------------|--------|------|
| 1 | 301 | 0.320 | 0.012 | 0.000144 | 0.0059 | 1.78 |
| 2 | 302 | 0.326 | 0.006 | 0.000036 | | |
| 3 | 303 | 0.330 | 0.002 | 0.000004 | | |
| 4 | 304 | 0.334 | 0.002 | 0.000004 | | |
| 5 | 305 | 0.336 | 0.004 | 0.000016 | | |
| 6 | 306 | 0.340 | 0.008 | 0.000064 | | |
| 7 | 307 | 0.340 | 0.008 | 0.000064 | | |
| 8 | 308 | 0.338 | 0.006 | 0.000036 | | |
| 9 | 309 | 0.335 | 0.003 | 0.000009 | | |

| | | $\bar{Y}=0.400$ | $\Sigma=0.000014$ | | | |

CONCLUSION

The UV-spectrophotometric method was developed and it is found to be simple, accurate, precise, highly sensitive, reproducible and inexpensive. The proposed method was found suitable for determination of Selexipag in in API and its bulk dosage form without any interference from the excipients. The validation procedure confirms that this is a workable method for their quantification in the raw material and also in the formulations. Hence it can be effectively applied for the routine analysis of Selexipag in bulk drug. Its advantages are low cost of reagents, speed and simplicity of sample treatment, satisfactory precision and accuracy. It can be concluded that proposed method was precise, accurate and cost effective and it could be applicable for quantitative determination of the bulk drug as well as dosage formulation.
