Extragalactic gamma ray sky Dominated by BLAZARS

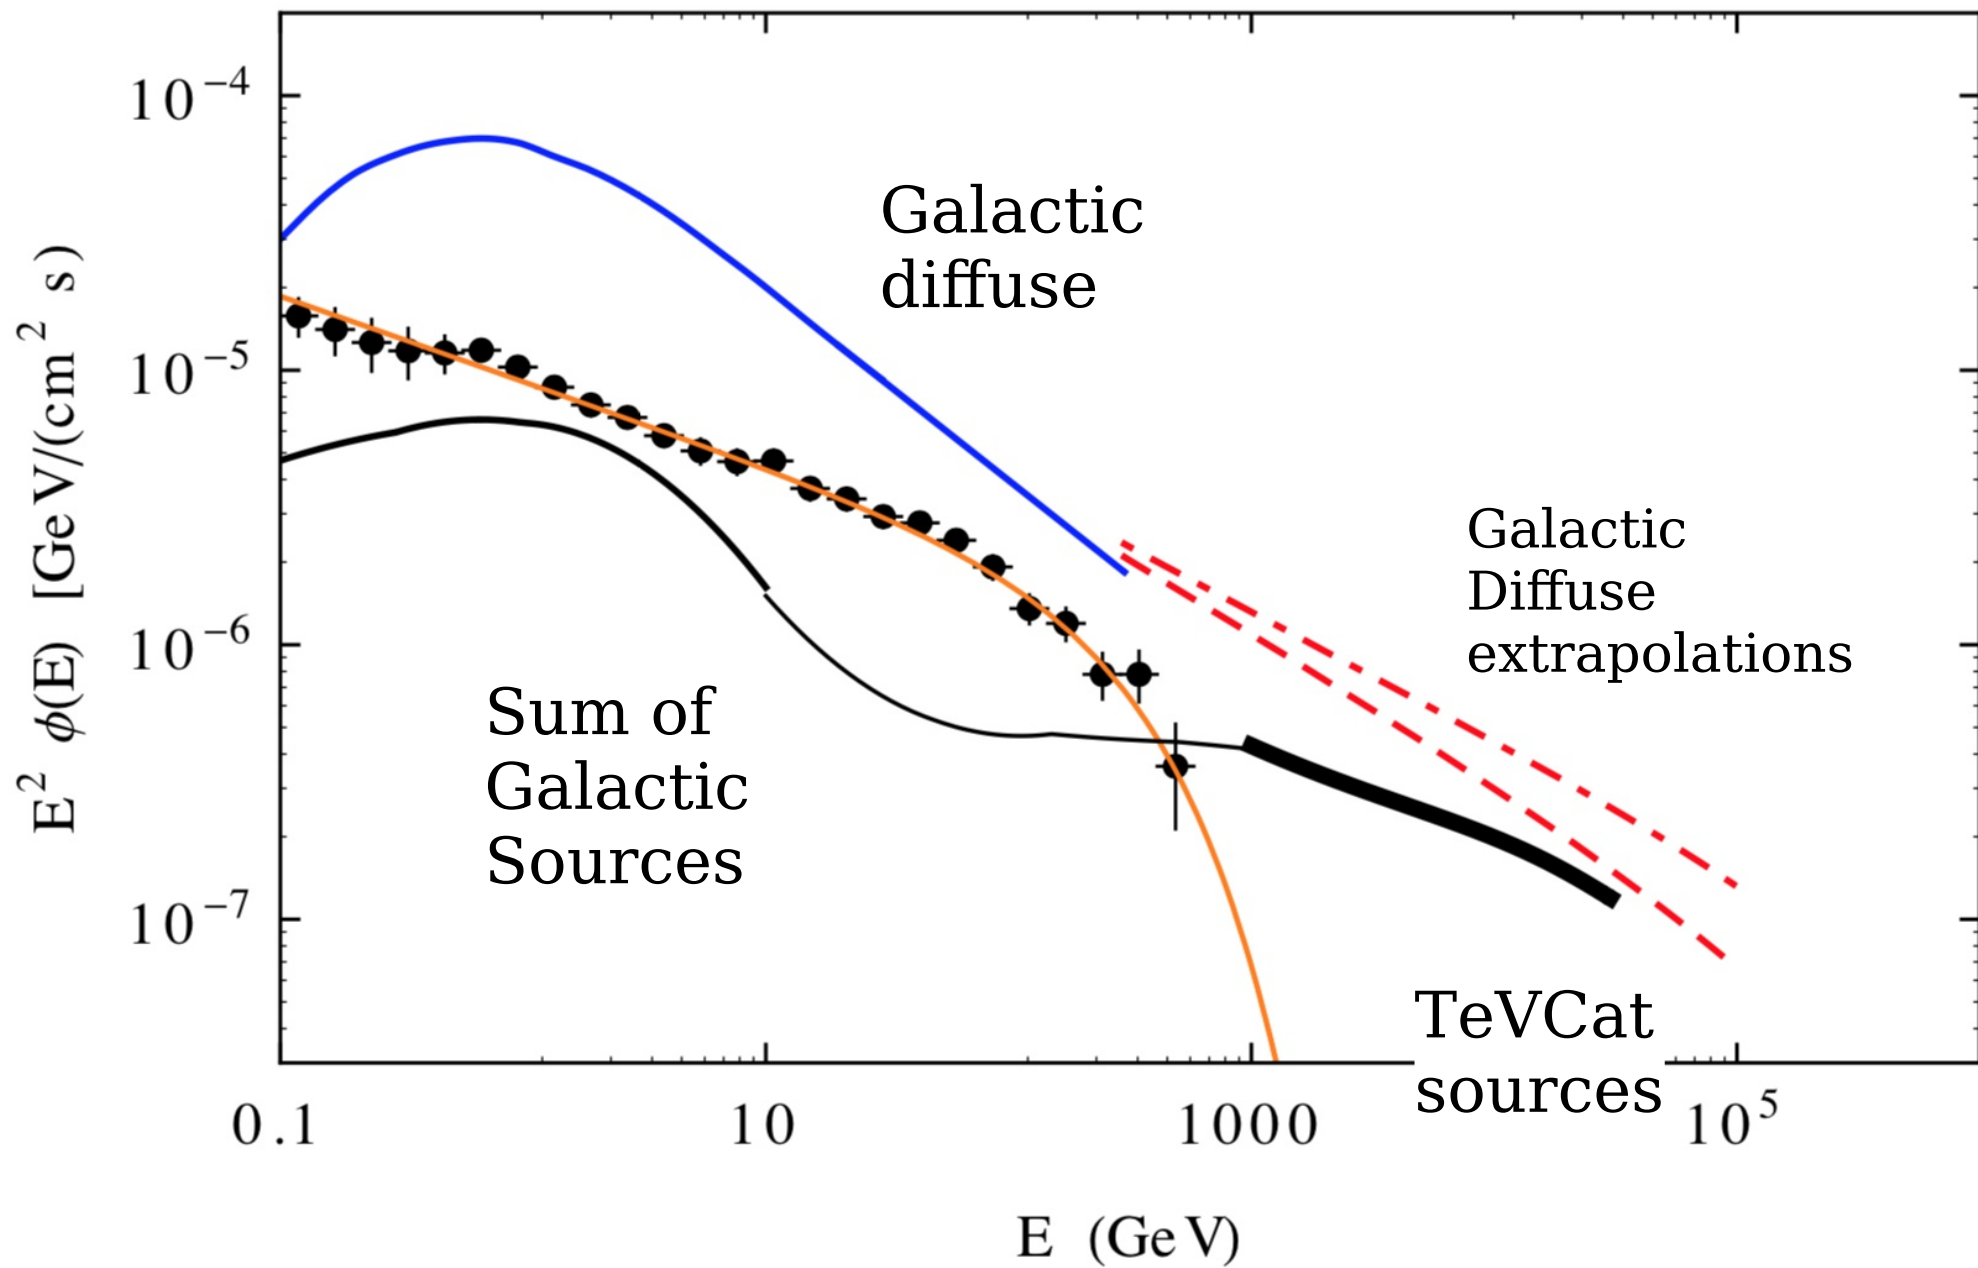

3rd FERMI Catalog

3034 sources

$E > 100$ MeV

Population of relativistic protons: $N_p(E_p)$

Average density of the medium: n

Emission Rates of Photons and Neutrinos:

$$\dot{N}_{\nu,\gamma}(E) = \int_E^\infty dE_p N_p(E_p) [\sigma_{pp}(E_p) c n] \frac{dN_{\gamma,\nu}(E, E_p)}{dE}$$

Simple relation between neutrino and gamma-ray emissions

Fundamental Mechanism:

Acceleration of Charged Particles

to Very High Energy (“non thermal processes”) in astrophysical objects (or better “events”).

Creation of Gamma Rays and Neutrinos via the interactions of these relativistic charged particles.

“Hadronic ”

$$p + X \rightarrow \pi^+ \pi^- \pi^0 \dots$$

$$\pi^0 \rightarrow \gamma \gamma$$

$$\pi^+ \rightarrow \mu^+ \nu_\mu$$

$$\begin{array}{l} \downarrow \\ \rightarrow e^+ \nu_e \bar{\nu}_\mu \end{array}$$

“Leptonic ”

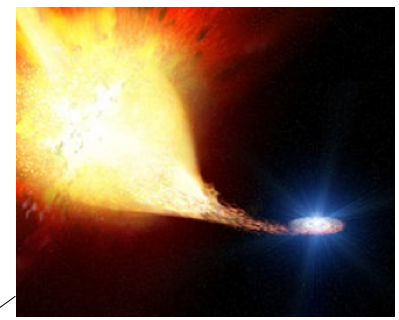

$$e^\pm \gamma_{\text{soft}} \rightarrow e^\pm \gamma$$

$$e^\pm Z \rightarrow e^\pm \gamma Z$$

$$e^\pm \vec{B} \rightarrow e^\pm \gamma_{\text{syn}}$$

$$\phi_{\gamma}^{\text{leptonic}}(E) + \phi_{\gamma}^{\text{hadronic}}(E)$$

Possible absorption in the source
(and in propagation from the source)

Astrophysical
source

At the EeV scale, measuring the cross section to within an order of magnitude could distinguish between SM predictions and BSM modifications; see Fig. 2. This target is achievable with tens of events in the PeV–EeV energy range. Detection will be challenging, since the flux is expected to decrease fast with energy and the cross section is expected to grow with energy, making the Earth opaque to neutrinos. Facing significant uncertainties in the predicted flux of cosmogenic neutrinos [119–123], we advocate for the construction of larger neutrino observatories to boost the chances of discovering and collecting a sufficiently large number of cosmogenic neutrinos.

B. Neutrino Propagation

Standard Flavor Oscillations (in vacuum)

$$\begin{aligned} P_{\nu_\alpha \rightarrow \nu_\beta}(E_\nu, L) &= \left| \sum_j U_{\beta j} U_{\alpha j}^* e^{-i m_j^2 \frac{L}{2E_\nu}} \right|^2 \\ &= \sum_{j=1,3} |U_{\beta j}|^2 |U_{\alpha j}|^2 \\ &+ \sum_{j < k} 2 \operatorname{Re}[U_{\beta j} U_{\beta k}^* U_{\alpha j}^* U_{\alpha k}] \cos\left(\frac{\Delta m_{jk}^2 L}{2E}\right) \\ &+ \sum_{j < k} 2 \operatorname{Im}[U_{\beta j} U_{\beta k}^* U_{\alpha j}^* U_{\alpha k}] \sin\left(\frac{\Delta m_{jk}^2 L}{2E}\right) \end{aligned}$$

$$\begin{aligned}
P_{\nu_\alpha \rightarrow \nu_\beta}(E_\nu, L) &= \left| \sum_j U_{\beta j} U_{\alpha j}^* e^{-i m_j^2 \frac{L}{2E_\nu}} \right|^2 \\
&= \sum_{j=1,3} |U_{\beta j}|^2 |U_{\alpha j}|^2 \\
&+ \sum_{j < k} 2 \operatorname{Re}[U_{\beta j} U_{\beta k}^* U_{\alpha j}^* U_{\alpha k}] \cos\left(\frac{\Delta m_{jk}^2 L}{2E}\right) \\
&+ \sum_{j < k} 2 \operatorname{Im}[U_{\beta j} U_{\beta k}^* U_{\alpha j}^* U_{\alpha k}] \sin\left(\frac{\Delta m_{jk}^2 L}{2E}\right)
\end{aligned}$$

Oscillation terms
vanish in two cases:

1. Decoherence of
the neutrino mass states
2. Average in length/energy

Decoherence

Astrophysical extragalactic neutrinos arrive at the detector as mass eigenstates

Y. Farzan and A. Y. Smirnov,
“Coherence and oscillations of cosmic neutrinos,”

3. Open Problems
in the *ASTROPHYSICS*
of the High Energy Universe

The last decade of studies in High Energy Astrophysics has yielded an extraordinary amount of data and revealed a wealth of new phenomena

But...

Many crucial and fundamental problems remain open, and still poorly understood.

What are the main sources of the Galactic Cosmic Rays ?

What is their maximum energy ?

When extragalactic cosmic rays start to dominate the spectrum ?

What are the sources of the extragalactic cosmic rays.

What is the relation between proton and electron acceleration

Physical mechanisms in
SN explosions, Pulsars, AGN jets
GRB (short and long),

.....

CTA

10x more sensitive than current instruments

Theme 1: Understanding the Origin and Role of Relativistic Cosmic Particles

- What are the sites of high-energy particle acceleration in the universe?
- What are the mechanisms for cosmic particle acceleration?
- What role do accelerated particles play in feedback on star formation and galaxy evolution?

Theme 2: Probing Extreme Environments

- What physical processes are at work close to neutron stars and black holes?
- What are the characteristics of relativistic jets, winds and explosions?
- How intense are radiation fields and magnetic fields in cosmic voids, and how do these evolve over cosmic time?

Theme 3: Exploring Frontiers in Physics

- What is the nature of dark matter? How is it distributed?
- Are there quantum gravitational effects on photon propagation?
- Do axion-like particles exist?

on the photon spectrum

$$E_{\gamma,\min} = E_{\pi} (1 - \beta_{\pi})$$

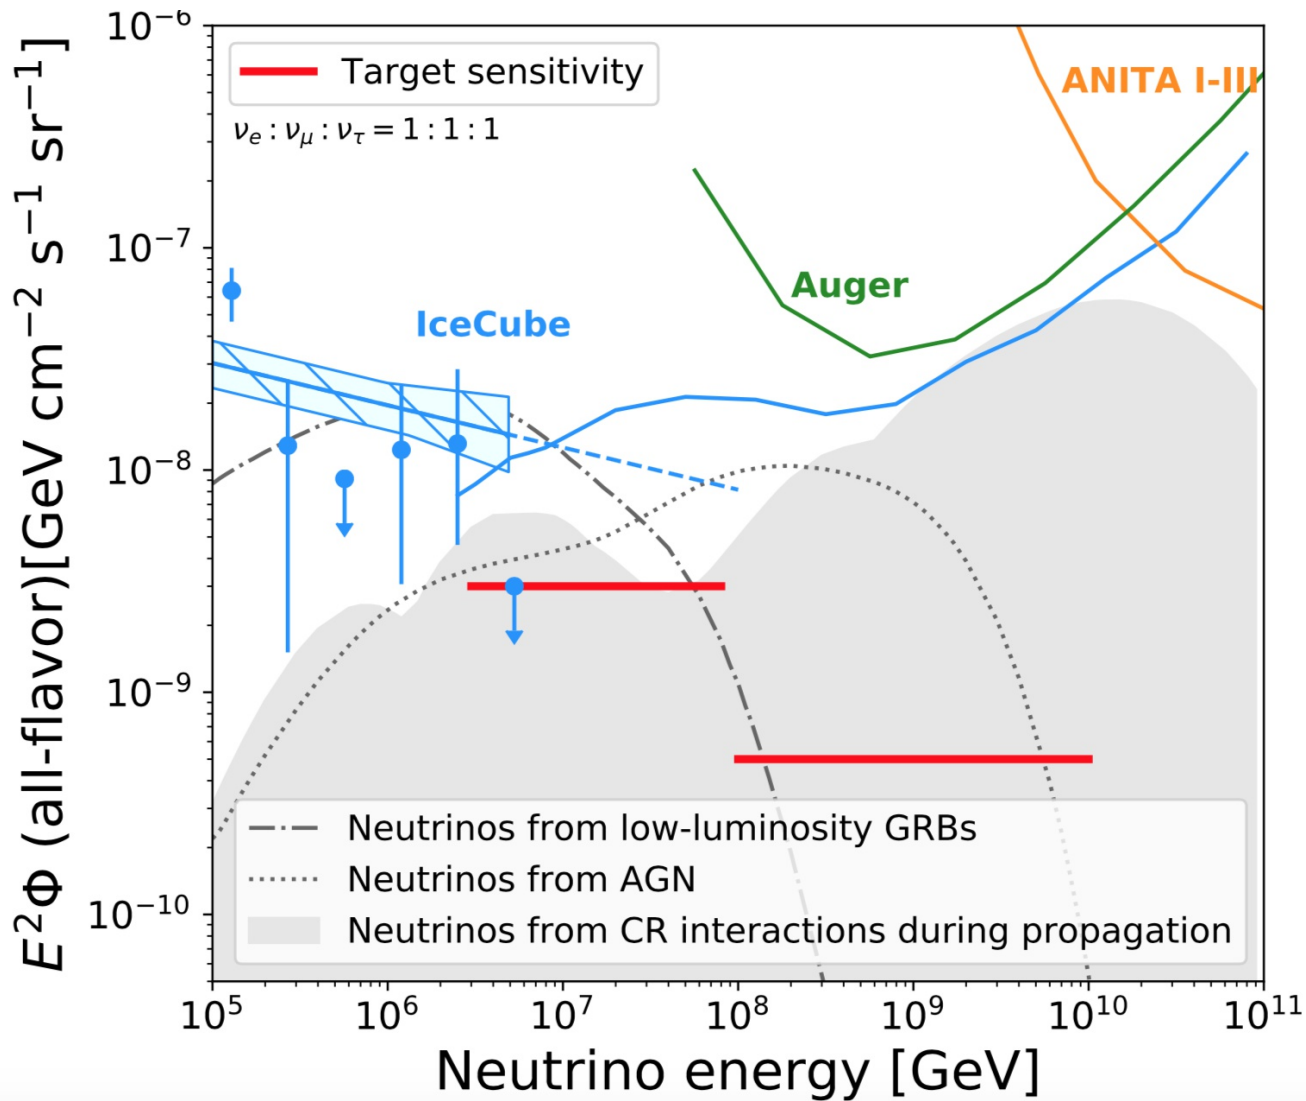

$$E_{\gamma,\max} = E_{\pi} (1 + \beta_{\pi})$$

Spectrum symmetric
around $E_{\gamma} = \frac{m_{\pi^0}}{2}$

$$E_{\pi,\min}(E_{\gamma}) = E_{\gamma} + \frac{m_{\pi}^2}{4 E_{\gamma}} = \frac{m_{\pi}}{2} \left[\frac{2E_{\gamma}}{m_{\pi}} + \frac{m_{\pi}}{2 E_{\gamma}} \right]$$

Very strong case to develop Neutrino telescopes beyond the “beaded string - km³ concept” aiming at the EeV range [Radio the technique with this potential]

"Horizon" (in time) for protons

Conclusions:

- Multi-messenger studies of the High Energy Universe is a vibrant exciting field that explore the most “extreme environment” in the present universe [where *Gravity and Particle Physics meet*].
- High Energy Neutrino Astronomy is a crucial element in this field. The current detectors are barely “scratching the surface” [but this is already exciting]
- “One order of magnitude more data” in the 30 TeV – 10 PeV energy range can be of enormous help in clarifying the “puzzles” about the IceCube signal [and very likely solidly identify the main source(s)]
... and provide very interesting Particle Physics studies
- The EeV range strongly suggests the development of new detector concepts
