# Validation on Utrecht Work Engagement Scale: Multisample and Multi Sectors Analysis

Iwan Sidharta Sekolah Tinggi Ilmu Ekonomi Pasundan, Bandung E-mail : iw.sidh@gmail.com

#### ABSTRACT

Research on work engagement has proven by previous studies that showed constructive, positive behaviors related to work. Several studies used the Utrecht Work Engagement Scale (UWES) instrument, but evidence of instrument construct validity is only available in some countries. This study investigates the validity of UWES constructs using a multisample in several sectors in the Greater Bandung Region, Indonesia. The approach to testing validity uses confirmatory factor analysis with the Lisrel 8.8 program tool. The results of the study showed that version 17 of the Utrecht Work Engagement Scale (UWES) instrument was valid and realistic in a multisample in several industrial sectors in the Greater Bandung Region, Indonesia. The research implications can recommend the use of version 17 of the Utrecht Work Engagement Scale (UWES) instrument to measure Work Engagement at the individual level in the organization.

Keywords: work engagement, validity, confirmatory factor analysis.

#### INTRODUCTION

In an organization of individual behavior is one of the essential focuses that are considered by policymakers (Hersona & Sidharta, 2017), this is related to what behavior desired to achieve organizational goals. (Silva, Hutcheson & Wahl, 2010) The role of individuals in an organization is an intangible asset when viewed from the Knowledge Base View approach (Machmud & Sidharta, 2016) and needs to be improved.(Vogl, (2015) Individual behavior is undoubtedly a positive behavior so that the target by the organization can carry out well. Positive behavior contribute to the achievement can of organizational performance; in this case, is the company. (Riketta, 2002). One of the goals of

the company is to achieve superior performance compared to similar companies (Saridakis, Lai & Cooper, 2017) so that they can have an edge in business competition. (Delery & Roumpi, 2017)

One of the behaviors desired by the company so that the organization's goals achieved is work engagement. (Shuck, Reio Jr & Rocco, 2011) Evidence of research shows that engagement work can contribute to organizational effectiveness such as increasing employee satisfaction (Christian et al., 2011), organization behavior (Newman, Joseph & Hulin, 2010) meaningful work (Duffy at al., 2012), Callings (Hirschi, 2012) as well as self efficacy (Hirschi, 2011) and occupational identity (Luyckx, Duriez, Klimstra & De Witte, 2010), job involvement (Dobrow & Tosti-Kharas, 2011) positive behavior related to outcome organizational and organizational success (Xanthopoulou, Bekker, Demerouti & Schaufeli, 2009).

Individual behavior within an organization when referring to the job attitudes approach (Albrecht, 2010) consists of outcomes individual behavior in an asset organization using work evaluation based on cognitive, affective and behavioral aspects (Macey & Schneider, 2008; Shuck et al, 2013; Zigarmi et al., 2011; Zigarmi et al., 2012). The work engagement construct is an evaluation of the work of individuals from a practical aspect (Breif & Weiss, 2002; Rich, Lepine & Crawford, 2010) which is an emotional aspect of their work experience. While referring to Schaufeli et al., (2002); Schaufeli and Bakker (2003); Schaufeli, Bakker & Salanova (2006) who developed the Utrecht Work Engagement Scale (UWES) stated that work engagement is a positive behavior concerning vigor, dedication, and absorption in well being at work. Several studies have shown that work engagement is a predictor and antecedents such as job demands, burnout, (Crawford, LePine & Rich, 2010) effectiveness of work (Knight, Patterson & Dawson, 2017) job involvement, organizational commitment (Hallberg & Schaufeli, 2006) employee satisfaction and business outcomes (Harter, Schmidt & Hayes, 2002).

However, several studies have shown that there is an overlap between the constructs of work engagement and job satisfaction, such as the research shown by Nimon, Shuck & Zigarmi (2016) by comparing the Utrecht Work Engagement Scale (UWES) construct (Schaufeli et al., 2002), Job Engineering Scale (Rich , Lepine & Crawford, 2010), Harmonious Passion Scale (Vallerrand et al., 2003) and Job Satisfaction Scale (Hackman & Oldham, 1980; Luthans et al., 2006) with a semantic analysis approach. However, several studies show that work engagement with job satisfaction shows contract differences as evidenced by Mackay, Allen & Landis (2017) that there is a difference

between job attitude constructs consisting of job satisfaction, job involvement and organizational commitment with work engagement with sample 49 results published research representing 22,090 individuals. Apart from differences above the empirical evidence in measuring work engagement, many use the Utrecht Work Engagement Scale (UWES) instrument (Farndale et al., 2014). There are several variations of the Utrecht Work Engagement Scale (UWES) instrument, namely version 17 items, version 9 items, and ultra-short versions.

The research conducted by Shimazu et al. (2008) validates in Japan with 2,334 samples, study conducted by Fong & Ng (2012) validates using Chinese version, research conducted by Balducci, Fraccaroli & Schaufeli (2010) validates Italian version, research conducted by Naude & Rothmann (2004) confirmed in the Gauteng Province of South Africa with a sample of 318 people, a study conducted by Vazquez et al. (2015) validated the Brazilian version, a study conducted by Zecca et al. , (2015) confirm the French version, and research conducted by Sulaiman & Zahoni (2016) proves the Malaysian version.

The results of the meta-analysis prove that the stable validity of the across time is the 17 version of the Utrecht Work Engagement Scale (UWES) with the Confirmatory Factor Analysis approach. (Seppälä et al., 2008). Research conducted by Klassen et al. (2012) using multinational samples, namely Australia, Canada, Hong Kong, Indonesia, and Oman with a sample of 853 teachers using the Utrecht Work Engagement Scale (UWES) version 9 shows that samples from Indonesia have a low internal consistency compared to other countries, the Multidimensional model has good fit indices as well as the one factor model has a good indice fit model. The results showed that the multidimensional model was the best result compared to the one factor model, but when referring to the results of the meta-analysis analysis by Seppälä et al., (2008) showed that best model was the Utrecht Work the

Engagement Scale (UWES) version 17 compared to version 9, it is necessary to do validation by using multisample from several sectors to prove this with samples in Indonesia with different sectors.

This research was to investigate and validate version 17 of the Utrecht Work Engagement Scale (UWES) in Bandung Raya, Indonesia. The results of the study are expected to contribute to the work engagement study using the version 17 Utrecht Work Engagement Scale (UWES) instrument.

### METHOD

This study aims to validate the version 17 Utrecht Work Engagement Scale (UWES) instrument with the Confirmatory Factor Analysis approach. Confirmatory Factor Analysis refers to the validity and reliability of constructs that make up the factors studied, in this case, there are three factors that dimension of work engagement, namely vigor, dedication, and absorption. This approach included in the quantitative approach where verification is done by calculating statistically data samples used in answering the proposed hypothesis. The analytical tool used is LISREL 8.8 (Joreskog & Sorbom, 2006), where the program by the data is one of the good and comprehensive analysis tools in conducting confirmatory factor analysis tests.

Utrecht Work Engagement Scale (UWES) instrument version 17 is a questionnaire distributed to respondents. Respondents in this study were employees in 3 different sectors, namely the creative industry sector, the construction service sector and the tour and travel service sector in the Bandung Raya region which consisted of Bandung City, Cimahi City, Bandung Regency, and West Bandung Regency. Respondents in the creative industry sector consisted of 300 respondents. respondents in the construction services sector with the classification of M2 as many as 241 respondents and respondents in the tour and travel services sector as many as 350 respondents. Respondents were asked to fill out the version 17 Utrecht Work Engagement Scale (UWES) questionnaire, which was first translated into Indonesian by professional translators. Respondents were asked to fill in a five-point Likert scale. The original version and Indonesian version can see in the appendix. The dimensions of the Vigor instrument used are as follows: At work, I feel that I am bursting with energy (VI1), I feel strong and vigorous (VI2), When I get up in the morning, I feel like going to work (VI3), I can continue working for very long periods (VI4), at my job, I am very resilient, mentally (VI5) and at work I always persevere, even when things do not go well (VI6). The Dedication Dimension consists of 5 instruments namely I find the work that I do full of meaning and purpose (DE1), I am enthusiastic about my job (DE2), My job inspires me (DE3), I am proud of the work that I do (DE4) and To me, my job is challenging (DE5). The absorption dimension consists of 6 statements as follows: Time flies when I'm working (AB1), When I am working, I forget everything else around me (AB2), I feel happy when I am working intensely (AB3), I am immersed in my work (AB4), I get carried away when I'm working (AB5), and it's difficult to see myself from my job (AB6).

Psychometric analysis of Work Engagement Scale (UWES) version 17 refers to the contract of validity and reliability which refers to the value of Variance Extracted (VE) and construct reliability (CR), constraints on construct validity loading factor> 0.5 and CR> 0.7 (Fornell & Larcker, 1981). The observed parameters were 17 indicators with three factors that formed Work Engagement so that the degree of freedom (df)> 0 because the number of estimated parameters is positive and can be said to be an overidentified built model (Boomsma, 2000).

After that, further analysis was carried out using the confirmatory factor analysis approach to prove the validity of version 17 of the Utrecht Work Engagement Scale (UWES) as a multidimensional factor.

### **RESULT and DICUSSION**

The multidimensional Utrecht Work Engagement Scale (UWES) version 17 model consisting of dimensions of vigor, dedication, and absorption described figure 1 as shown below: Figure 1. Multidimensional Utrecht Work Engagement Scale (UWES) Model 17

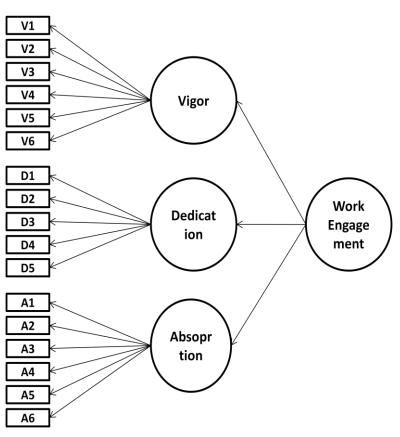

Figure 1. Multidimensional Utrecht Work Engagement Scale (UWES) Model 17

The results of the psychometric analysis indicate that loading factor> 0.5 and CR> 0.7, as shown in table 1, see at appendix.

The results of the psychometric analysis are following the recommendations proposed by Fornell and Larcker (1981). Furthermore, the results of confirmatory factor analysis refer to fit indices (lacobucci, 2010) based on different chisquare test criteria (Satorra & Bentler, 2001), Root Mean Square Error of Approximation (Browne & Cudeck, 1993), CFI and NFI (Hu & Bentler, 1999). The calculation results of the fit indices can see in table 2. The calculation results showed that version 17 of the Utrecht Work Engagement Scale (UWES) instrument had psychometric analysis and good fit indices. One sample with RSMEA was 0.091, and CFI was 0.96, NFI was 0.95, and  $\chi^2$  / df was 2,948. The second sample with RSMEA was 0.102, and CFI was 0.93, NFI was 0.92 and  $\chi^2$  / df as big as 2.997. The third sample with RSMEA was 0.95, and  $\chi^2$  / df was 2.939. Based on the reference established by Fit Indice (Iacobucci, 2010), it can say that the CFA model is good so that it can be recommended for measurement Work Engagement in the creative industry sector, construction service sector, tour

Table 2. The fit indices of the Utrecht Work Engagement Scale (UWES) 17				
	RSMEA	CFI	NFI	χ²/df
Sample 1	0.091	0.96	0.95	2.948
Sample 2	0.102	0.93	0.92	2.997
Sample 3	0.098	0.96	0.95	2.939

and travel service sector as well as for teachers (Klassen et al., 2012). The results of this study complement previous studies in several countries as conducted by Shimazu et al., (2008); Fong & Ng (2012); Balducci, Fraccaroli & Schaufeli (2010); Naude & Rothmann (2004); Vazquez et al. (2015); Zecca et al., (2015) and Sulaiman & Zahoni (2016).

#### CONCLUSION

Work Engagement is currently one of the many constructs recognized in various countries. Research on Work Engagement refers to Schaufeli et al. (2002); Schaufeli and Bakker (2003); Schaufeli, Bakker & Salanova (2006) who developed the Utrecht Work Engagement Scale (UWES) stated that work engagement is a positive behavior in relation to vigor, dedication, and absorption in well being at work. Vigor refers to the energy and endurance of an individual when working has a durable fighting power. Dedication refers to the feeling of enthusiasm for inspiration and pride and willingness to face challenges in work. While absorptions refer to individuals, who focus on carrying out their work and can overcome all difficulties in the work that occurs and positive behavior is one of the management focus in shaping its employees so that it can produce positive outcomes for the organization. The results of this study fill the gap validation of the Utrecht Work Engagement Scale (UWES) instrument version 17 as a multidimensional construct. However, there are still some weaknesses regarding this research, where only a few sectors of respondents need further investigation using a wider industry so that the results of the study can be generalized.
